- *Data Analysis:* Machine learning is used by the data analysis module. The science of teaching computers to behave without being explicitly programmed is known as machine learning. Machine learning has given us clever cars, practical speech recognition, efficient online search, and a far better knowledge of how to maximize a performance criteria using example data or previous experience. Machine learning must be used to summarize relevant results from stored data; otherwise, computers would spend processing time dealing with insignificant data. Machine learning is accelerated by improved data collecting, networking, and faster computers, while human specialists struggle to extract information from vast amounts of data. The degree of dependability in the analysis results is improved by using an algorithm approach. Figure 5 depicts the algorithm's approach. Because the definition of "enough data" is unclear, it is considered a condition of enough data if it has been recognized as a successful practice for more than three times. The study's findings help the system offer real-time advice and warnings to medical personnel and assistants about changes in vital signs or patient transitions, as well as significant changes in environmental factors, so that preventive treatment may be provided.

DISCUSSION

A smart health monitoring system based on the Internet of Things (IoT) is a patient monitoring system that can monitor a patient 24 hours a day, seven days a week. In today's world, the Internet of Things (IoT) is transforming the technological infrastructure. IoT has allowed us to implement many complicated systems such as smart home appliances, smart traffic control systems, smart office systems, smart environment, smart cars, and smart climate control systems in very little area by enabling easy interaction among different modules. One of the most well-known IoT applications is health monitoring. Many different designs and patterns have previously been developed to use IoT to monitor a patient's health. A review of IoT-based smart health monitoring systems is given in this article. The newest novel technologies created for IoT-based smart health monitoring systems have been addressed, along with their benefits and drawbacks. The goal of this study is to identify common design and implementation trends for intelligent IoT-based smart health monitoring devices for patients.

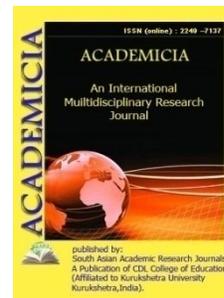

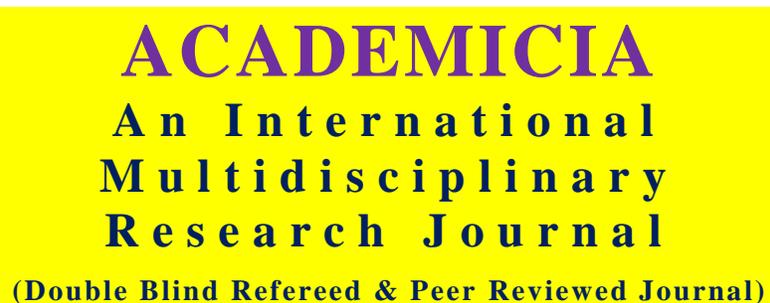

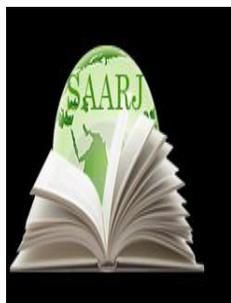

CONCLUSION

It has been outlined how IoT is being used in health monitoring systems. Despite the fact that IoT is being utilized in all areas of medical science, there is always space for development and study. Early detection of any health issue may assist the patient in taking the required emergency steps, which may save his or her life. In this case, the Internet of Things (IoT) may assist. Patients may be monitored in real-time by IoT-based health monitoring devices, which can alert them to any anomalies. However, the IoT architecture must include features that guarantee sensitive data is kept secure. In addition, the sensors utilized must be small enough to be readily

integrated into a variety of systems. Finally, the application of different machine learning and deep learning methods may improve the accuracy and robustness of the systems. The concept of a smart health monitoring system based on IoT architectures is a new addition to medical research that will help to decrease health problems and prevent unnecessary deaths.

AN EVALUATION OF BIOMASS GASIFICATION MODELLING

Dr Durgesh Wadhwa*

*SBAS, Sanskriti University,
Mathura, Uttar Pradesh, INDIA

ABSTRACT

Corn fermentation competes with the world food supply, while sugarcane fermentation contributes to deforestation. As a result, even if it is economically possible, the renewable and sustainable development of these two bio-based energy sources may not be desired. Biomass gasification, on the other hand, is far more versatile in terms of the bio-feedstock or waste that may be used to create biofuels or co-generate power and heat on demand. Downdraft gasifiers are well-suited for small-scale heat and power co-generation, whereas fluidized bed and entrained flow gasifiers currently reach promising economies of scale for fuel production. The frequency of different modeling options used, as well as the patterns shown by this data, are presented. This article offers a concise guide to the modeling decisions that must be made early in a modeling study or project for novice researchers. A comprehensive technique characterization is presented, which includes important modeling decisions that have not been clearly addressed in previous assessments. This survey gives seasoned researchers their first statistical snapshot of what their peers are working on.

KEYWORDS: *Biomass Gasification Equilibrium model Stoichiometric model Kinetic model Tar.*

INTRODUCTION

The main three fossil fuels now provide approximately 80 percent of the world's primary energy needs. Biomass and trash make up the second largest contribution, accounting for around 9%. Nuclear, hydropower, and the trio of fast increasing renewables geothermal, solar, and wind provide the rest of the world's energy requirements. The use of fossil fuels to generate energy has severe social, political, and environmental consequences, as fossil fuel combustion has raised global concentrations and accelerated climate change. These ramifications are powerful

motivators for the development of renewable and locally accessible energy sources. Biochemical and/or thermo chemical procedures are required to recover energy from biomass or organic solid waste. Biomass is transformed to biofuels via the digestive activity of living organisms during biochemical processes like fermentation[1]. Thermo chemical processes, on the other hand, use heat and/or pressure to transform biomass into biofuels, gases, and chemicals. Gasification, which is also often used to gasify coal and natural gas, is the most well-known thermochemical biomass-to-energy and waste-to-energy conversion process, and it is attracting increasing scientific and commercial attention. Gasification, in comparison to more traditional methods such as incineration, produces syngas from biomass for future biofuel synthesis and generally achieves higher power generation efficiency[2]. When compared to alternatives such as incineration or biogas from digesters, gasification recovers more power per kilogram of biomass or per kilogram of municipal garbage. With current or little changed infrastructure, energy may be produced from syngas using gas engines, gas turbines, or fuel cells.

There is currently a large body of work that uses models of several kinds of gasifiers with varying degrees of sophistication. However, there are few reviews of these modeling and simulation research. Our search yielded seven more evaluations, which would seem to be adequate if not for the fact that many of them are very similar[3]. There is a specific need for reviews that evaluate modeling methods and address key questions about what is known about the relative advantages of various modeling approaches, rather than just listing kinds of models and previous research. For example, the present study is the first to look at whether stoichiometric and nonstoichiometric models provide the same results. The current study is also the first to address one of the most important decisions a modeler must make: whether to adopt a complete equilibrium or semi-equilibrium method[4]. The inclusion of sample data showing the frequency of usage of the different competing modeling options in the literature to date is another aspect of the current research that sets it apart from previous studies.

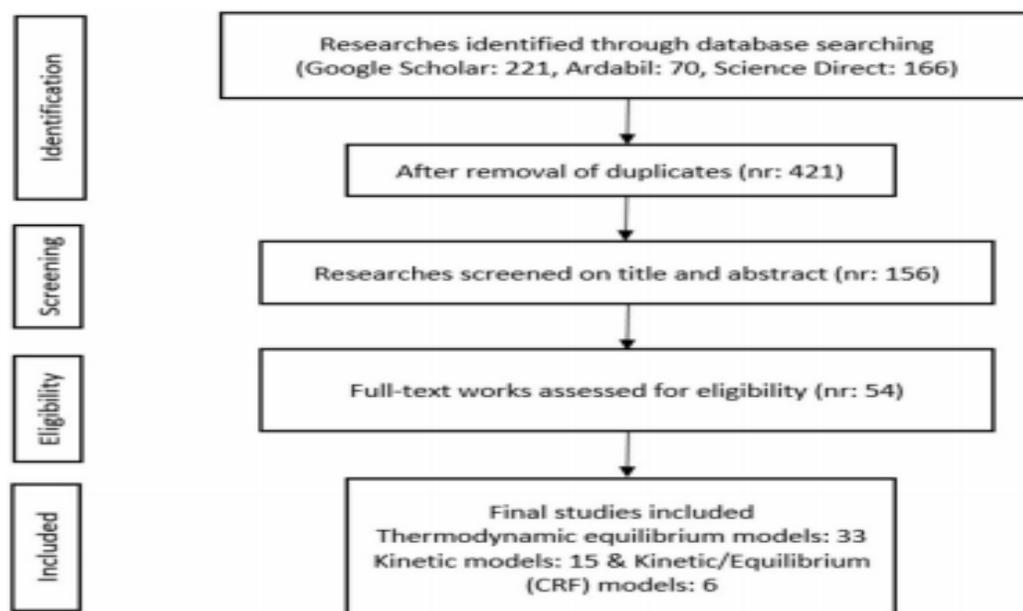

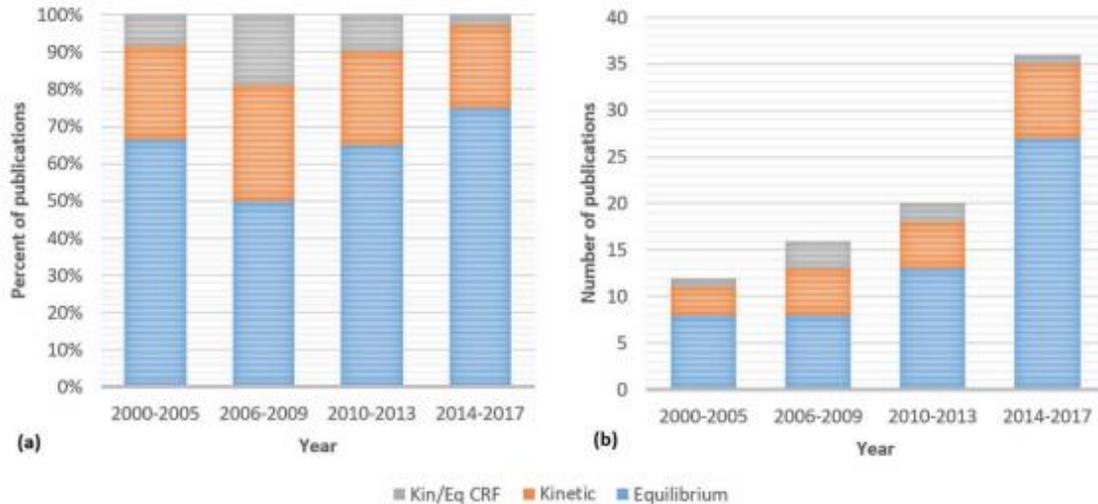

Figure 1:Flow diagram depicting the details of the literature search.

This section explains how the systematic search approach (shown in Fig. 1) was used to select articles for inclusion in the review's statistics and comments. To begin, keywords gasification and modeling or modeling were searched in three databases: Google Scholar, Ardabil Science, and Science Direct. Further evaluation of eligibility based on full-text publications resulted in the selection of 54 research, including 33 thermodynamic equilibrium models, 15 kinetic models, and 6 kinetic/equilibrium (CRF) models. One goal of the present study was to get a better grasp of how common these methods are.

**Figure 2:Overview of gasification models since 2000, (a) as percent, (b) absolute number of studies**

Gasification process and technologies

Gasification process overview

The combustion of solid or liquid fuel into syngas is known as gasification. Syngas may be used as a chemical feedstock or directly as a fuel to produce heat, power, or both. The phases of the gasification process are: drying, pyrolysis, oxidation, reduction, and cracking (Fig. 3). The moisture content of biomass feed typically varies from 5 to 35 percent, but it is decreased to less than 5 percent throughout the drying process. The biomass is heated from 200 to 700 °C in the pyrolysis phase with little oxygen or air. The volatile components of the biomass are evaporated under these circumstances. Furthermore, the hydrogen in the biomass may be oxidized, resulting in the production of water[5]. The reduction processes that take place within the gasifier are endothermic, and the energy needed for them comes from the burning of char and volatiles. Through a series of processes, biomass reduction produces combustible gases such as hydrogen, carbon monoxide, and methane; the major reactions in this subcategory are as chooses to follow:

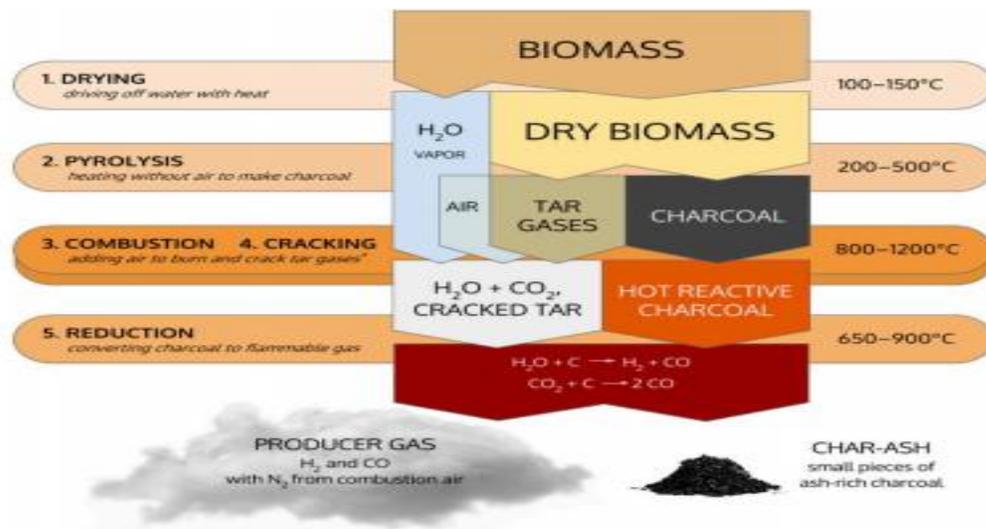

Figure 3: Gasification process steps

Biomass gasification technologies Fixed beds and fluidized beds are the two most common kinds of gasifiers.

- **Fixed-bed:** Gasifiers having a bed filled containing solid fuel particles and the gasifying medium and gas ascending, descending, or migrating horizontally through the reactor are classified as fixed-bed gasifiers. Air, steam, oxygen, or a combination of these may be used as the gasifying medium. When compared to fluidized bed alternatives, fixed-bed gasifiers have two major practical advantages: they are substantially more cost-effective for small-scale applications and they generate a clean product gas with minimal dust and tar content.
- **The fluidized bed:** A fluidized bed is a cylindrical column that holds particles and flows fluid across it. The fluid's velocity is high enough to suspend the particles inside the column, resulting in a wide surface area for the fluid to touch, which is the main benefit of fluidized beds. Fluidized beds' primary potential benefits are better heat and material transmission between the gas and solid phases.

Fluidized bed generators and entrained flow digester seem to be the most viable options for biofuel production facilities among these gasifier types[6]. Downdraft gasifiers have emerged as the most appropriate choice among gasifier types for small-scale distributed power generation.

Models for biomass gasification

Equilibrium and kinetic models are the two major types of gasification models. According to this study of gasification modeling options, about 60% of biomass gasification simulations use an equilibrium model, while the remaining 30% use a kinetic model. The major variants of both of these methods will be discussed in this part, but first a short overview of the reasons for modeling and simulating biomass gasification will be discussed. Furthermore, the advantages and disadvantages of various techniques are collected[7]. To obtain a desired syngas composition and production, a gasification plant operator must optimize the feedstock flow rate, agent flow rate, equivalence ratio, reactor pressure, and temperature. Any of these variables may have a significant effect on the product compositions and gasifier performance.

Furthermore, since the chemistry and fluid dynamics of gasification are very sensitive to changes in feedstock composition, moisture, ash content, particle size, and density, the permissible range for feedstock characteristics is relatively limited. In reality, laboratory experiments, pilot facilities, and field experience may and do give knowledge on the best conditions and feedstock for a reactor, but these lessons are often more time-consuming and costly than modeling.

Models of thermodynamic equilibrium

Based on the premise that the components react in a completely mixed state over an indefinite length of time, the thermodynamic equilibrium method predicts the composition of the output gases.

When compared to kinetic models, thermodynamic equilibrium calculations are simple and independent of gasifier design. In the simplest, most ideal case, general thermodynamic properties can be used for equilibrium modeling, whereas kinetic modeling requires a larger set of difficult-to-find and accurate kinetic parameters.

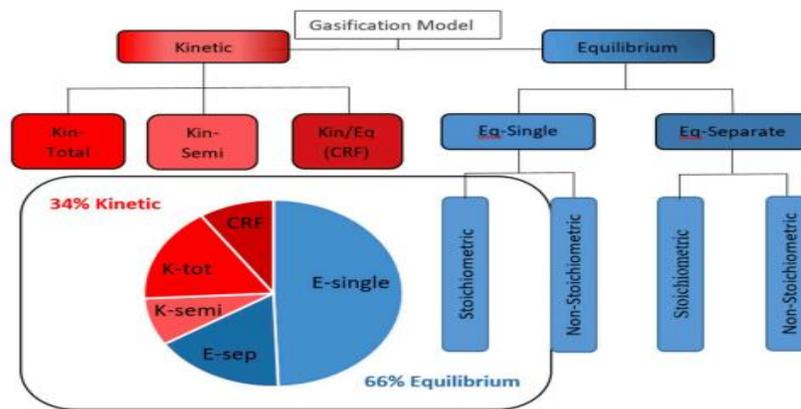

Figure 4: A categorization of gasification model types.

Stoichiometric vs non-stoichiometric models

Stoichiometric and nonstoichiometric models are the most often mentioned subcategories of equilibrium models. According to this study and a complementary more thorough theoretical examination of the S versus NS technique elsewhere, the NS method is used in about 70% of equilibrium simulations in the literature, while the S method is used in the remaining 20%. S and NS models, on the other hand, provide almost similar predictions in practically all actual biomass gasification situations, as has been thoroughly shown elsewhere. As a result, the second classification proposed in this paper, namely Eq-single and Eq-separate models, is more important. The yield and product composition anticipated by the model are usually affected by the model option between an Eq-sing and an Eq-sep. Given these facts, it's possible that past evaluations and research have paid too much attention to a model choice that has little impact on model prediction. The equilibrium of a preselected set of reactions is computed in the stoichiometric case, while the equilibrium of a preselected set of chemical species is computed in the nonstoichiometric case[8].

The nonstoichiometric technique has the following specific steps:

1. Make a list of all of the species that will be included in the simulation (in principle, all the chemical species that the modeler deems might be in the gasifier effluent in non-negligible amounts)
2. Then, for a particular feed composition (which may be described simply as the elemental composition of the feed at the reaction temperature and pressure), calculate the resultant minimal Gibbs energy distribution among all these chemical species.

Models that are eq-single vs. models that are eq-separate Consistent framework may be categorized as Eq-sep or Eq-sing methods, in conjunction to stoichiometric or nonstoichiometric. This classified based about whether the char detonation is modeled as achieving a distinguishable balance point independent of the reduction of the VM and un-combusted char, as in the Eq-sep situation, or whether the combustion and reduction reactions achieve a single global equilibrium as one reactive chemical system, as in the case of the Eq-sep scenario.

LITERATURE REVIEW

Massimiliano Materazzi studied the most significant barrier to using fluid bed gasification for waste treatment is tar generation and ash disposal, which can only be met with expensive cleaning systems and additional processing. Any use of plasma in a different heat process allows for efficient crack propagation of complex organic life to primary synthesis gas constituents while lowering electric power consumption. This research looked at the advantages of a two-stage thermal methodology over a single-stage approach in terms of thermodynamics. The simple truth that the foremost thermal waste decomposition is carried out in conditions of optimized stoichiometric ratio for the gasification reactants is one of them. Besides which, staggering the oxidant injection into two separate intake levels improves the system's efficiency and lowers plasma power consumption. After the two-stage process, a flexible model capable of providing reliable quantitative predictions of product yield and composition has been developed. This same method follows a systematic structure that incorporates atom conservation principles and equilibrium calculation routines, taking into account all conversion stages from waste feed to final products. Experimental data from a demonstrator plant was also used to verify the model. The study successfully demonstrated that a multiple gasification system improves the system's gas yield and carbon conversion efficiency, both of which are critical in single-stage systems, while simultaneously increasing performance parameters[9].

Marco Formica studied the Aspen plus was used to create a novel steady-state zero-dimensional simulation model for a full-scale woody biomass gasification facility with fixed-bed downdraft gasifier. The model takes into account the technical features of all of the plant's components and operates in line with the plant's current primary control logics. The simulation findings are consistent with those found during a large-scale experiment. Following model validation, the effect of operational factors such as the equivalent ratio, biomass moisture content, and producer gas air temperature on syngas composition was investigated in order to evaluate the experimental plant's operative behavior and energy performance. It is feasible to achieve greater values of the gasifying air temperature and an increase in overall gasification performance by recovering the sensible heat of the syngas at the gasifier's output[10].

DISCUSSION

Even if the study is attempting the more difficult job of developing a kinetic model, it may be prudent to additionally run an equilibrium model for the same application. Equilibrium may play the same function in gasification as it does in any other chemical system, showing the thermodynamic limitations of operation and how they are affected by operating parameters and inputs. The inability to assess the effect of hydrodynamic factors on gasification when simply utilizing equilibrium modeling is a disadvantage. A kinetic model is needed if the aim is to optimize or understand the impact of factors such as particle size distributions, feed density, and reactivity on the output gas composition, carbon conversion, and system performance. However, kinetic models often include difficult-to-find kinetic and transport parameters. Even if these parameters are measured, the resultant model will be constrained to the particular gasifier sort and design, feedstock, agent, and operating range combination wherein the rate expression form associated parameter values are valid to some extent.

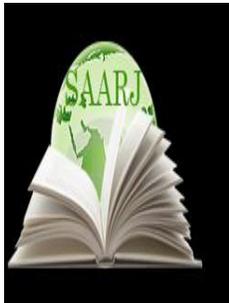

CONCLUSION

A new categorization of the most significant gasification modeling methods was provided, as well as representative data on their usage frequency. But even though the best model to use relies on a variety of variables like the simulation's objectives, the kind of gasifier, feedstock, and operating parameters, a few basic conclusions may be made. Equilibrium models, in particular, are an excellent place to start when modeling downdraft gasification. Along with its relatively simple shape and the relatively high operating temperature they usually utilize, downdraft gasifiers often function close to equilibrium. Additionally, both pyrolysis and gasification products are pushed through the oxidation zone with downdraft gasifiers, resulting in equilibrium after a short time. Due to the obvious critical significance of tar avoidance in creating viable and ecologically acceptable biomass and waste gasification technologies, tar modeling is expected and become one of the greatest active areas of study. The most pressing issue facing the biomass gasification modeling community is developing modeling methods that can sufficiently offer scientific understanding and/or practical operator advice here about how to control tar formation.

FUNCTIONAL-STYLISTIC COLOR LIMITS THE USE OF PHRASES IN CERTAIN SPEECH CIRCLES AND STYLES

Umida Mansurovna Rashidova*

*Doctor of Philosophy in Philology (PhD),
 Faculty of Preschool Education, Samarkand State University,
 UZBEKISTAN
 Email id: umida_rashidova@bk.ru,

ABSTRACT

The phenomenon of polysemy present in linguistics is inherent in both speech and expression, but the degree of distribution of this phenomenon in vocabulary and phraseology is not the same. The article provides information on the phenomenon of ambiguity, in particular, on the expression of this phenomenon among somatic phraseological units in the Uzbek language. Somatic phraseology, that is, words related to the name of parts of the human body, describes the phenomenon of ambiguity. In world and Uzbek linguistics, there are some comments on the work carried out in this direction. Numerous phraseological expressions of the somatic component in the Uzbek language were used to explain the causes of this phenomenon, as well as the methodological branch. The article analyzes ambiguous phrases with the components "eye", "hand", "mouth" in the Uzbek language. The results of the analysis are confirmed by examples from fiction. The homonymy of somatic phrases allowed them to be studied by analogy, relying on the material of linguistic dictionaries of the Uzbek language, which, in turn, helped to better understand the semantic and grammatical nature of phraseological meanings. The study of polysemantic meanings in each of them on the basis of distributed analysis methods has proved that the secondary meaning, separated from the leading meaning, has the right to exist in the language as an independent lexical unit.

KEYWORDS: *Somatism, Somatic Phraseology, Phraseological Meanings, Methodology, Methodological Colorfulness.*

INTRODUCTION

Phrasema often not only expresses and evaluates a reality, but also signals the specific linguistic features of a particular style of speech. The functional-stylistic component is less relevant to the structure of phraseological meaning than the expressive-evaluative component of the phrase, because it is outside the meaning of the phrase. Functional-methodological component is included in the classification and interpretation of phrases only in rare places. It is known that the explanations given to lexical units (words) in dictionaries are given in a neutral style, regardless of the functional direction of the word. However, such a lexicographical rule for the interpretation of phrases is not always correct, because the state of expression of a positive or negative assessment of a phrase is specific to the oral style or other style of speech, its classification is also reflected in the interpretation. For example, the meaning of the phrase “putting both hands on the nose” could be interpreted as “nothing, a dry return” in neutral style, except for its expressive-assessment and functional-stylistic color. In Annotated dictionary of the Uzbek language and ADUL-5, the interpretation of this phrase is also referred to as “dry, nothing” [ADUL, 1, 152; ADUL-5, 2, 382]. However, the phrase «return without incident» is more appropriate for this phrase, which includes words typical of the oral style. In this regard, the interpretation of this phrase in the dictionary of Sh. interpretation [Phraseological dictionary of the Uyghur, 74-75] is somewhat closer to its functional-stylistic nature.

The following two comments on the verbal phrase «not to give a day» // «do not give a day» reflect its content more: [PhDUL, 130]; “He does not give a day: he does not allow to live in peace, he always pushes and suffers” [ADUL, 1, 405; ADUL-5, 2, 428].

The interpretation of the phrase «not in one's own self» in four lexicographic sources complements the other: 2, 495; ADUL5, 5, 135]; 2. He does not have it - «incredibly, very much» [PhDUL, 326] 3. He does not have joy - рад до безумия[URD, 193]; 4. Hedoesnothave [joy] - он находится на седмом небе от радости”[BURPhD, 293].

The functional direction of phrases should be taken into account, especially in the interpretation of phraseological synonyms, because they do not have the same dimension in terms of functional-stylistic, expressive. For example, the phrase «stubborn» is synonymous with the phrase «unable to think» But while one of these phrases («stubborn») is stylistically neutral, equally applicable to both oral and biblical styles, the latter is more biblical. However, they are cited in Sh. Rakhmatullayev's dictionary and interpreted in the same way as «inability to think long and come to a definite conclusion» [PhDUL, 330]. Similarly, although the expressions “to argue” are synonymous, to “reach the level of conflict” without taking into account their functional-methodological aspect [PhDUL, 18], The interpretation of “reaching the level of quarreling, controversy” [PhDUL, 232] seems to be less plausible.

It seems that the relationship between the two components of the stylistic meaning of expressions in our language is different. Accordingly, its expressive-evaluative color is not always the main criterion in determining the functional-stylistic character of a phrase.

The interpretation of these two synonymous phrases in other dictionaries is also not functionally and stylistically required. While the phrase “to go to hell” was not used in an Annotated dictionary of the Uzbek language [ADUL, 1, 27], this phrase was recorded in Annotated dictionary of the Uzbek language -5 [ADUL-5, 1, 40]. The phrase “to go argue (adi-badigabormoq)” is said to belong to the style of speech and is interpreted as “to mourn, to fight”

[ADUL, 2, 19], but in OTIL-5 for some reason this phrase was dropped [ADUL- 5, 3, 440]. M. Sodikova's dictionary also contains the phrase «misunderstandable speaking (adi – badigapirmoq)», which emphasizes the specificity of the speech, the tone of disapproval, and the phrase «adi-badi», which is semantically close to that phrase not recorded [BURPhD, 14]. Although the phrase “go to San-manga” is mentioned, it is forgotten that it is specific to the spoken word or emphasizes the ottenka of meaning [BURPhD, 228].

When linguists talk about the functional-stylistic division of phrases, they often divide them into lexical units - inter-stylistic, biblical, colloquial and simple colloquial types, such as words [1]. This does not seem to take into account the specifics of the use of phrases in cases other than words.

Common words such as «home», «water», «bread» have zero stylistic color, they are called intellectual lexicon because they express only a certain concept and do not have additional emotional-expressive color. [2]. They are methodologically, expressively-color-neutral, and functionally general-style or inter-stylistic in nature, as they can be used in all functional styles of language, and such common words can also be found in biblical, formal styles. Among the phrases, only a few [«open letter», «open heart», «be an open way», «break up», «intervene», «start a family», «shake the family», «beautiful world»Etc.] can be used freely in all styles. This is self-evident, because, as V.D. Devkin rightly points out, there can be no pure neutrality in the field of phraseology [3].

For example, phrases such as «stand on feet», «break the gap», «lock the foot», «pass from hand to hand», «open spaces» do not have emotional and evaluative properties. but these expressions are also expressive in relation to their imagery. Accordingly, these phrases cannot be classified as stylistically neutral or general-style: “Otaqo’zi scolded you did not read my son’s work,you destroy it before you read, I’ll do feud to scientific leader, you are locking my son’s foot- said that»Yoqubov.Diyonat]; - «... You will still go and fry with your worries again, you will burn, you will shed tears» [Mirmuhsin. Umid];«...- You were sheddingtearsnow that if the Aziz wrestler came, I would go back» [S.Ahmad. Ufq]

In our opinion, it is expedient to divide phrases into two groups in terms of functional and stylistic color:

a) Phrases related to a particular style in terms of usage: “raise your hand”, “fall into a trap”, “play a role”, “be a dead soul”, “strike a blow” ,“ Stitching the collar ”,“ taking off the foot ”,“ falling on the field ”,“ not falling asleep for seven ”,“ like pulling a piece of dough ”,“ light hand ”,“ butterfly flew ”,“ show with tip of the foot”etc .;

b) Phrases that are not functionally related to a particular style: «in one of two sentences», «to die», «to come down from the sky», «to fall down», «to play the drum».

The phrases in the first group can be divided into biblical, colloquial, and simple colloquial types, respectively.

In linguistics, there are different views on the recognition of the expressive-evaluative and functional-stylistic coloring of phrases as components of stylistic meaning, the relationship between them. For example, according to A.I. Molotkov, the expressive-emotional color of phrases is not directly related to their use in certain speech styles: -not related to the modern

description. The phrase acquires one or another expressive-emotional color in the process of speech, regardless of its simple, outdated, dialectal features”[4].

Another group of scholars argues that these two components [the two colors] are inextricably linked, that they act as a whole in the semantic structure of the phrase [5].

As mentioned earlier, these two components [two colors] in a phrase can be compared to different aspects of the same event in the same phrase. Sometimes the expressive-evaluative color of a phrase interacts with its functional-stylistic color, and a cause-and-effect relationship develops between them, that is, one requires the other. produces. The brighter the expressive-evaluative color of the phrase, the more it is functionally and stylistically limited [for example, compare: «dog-like», «dog-like», «dog-like» such as «pig in the grave», «sucking the dirt of his teeth»]. Or the “market has not passed” with a negative rating [ADUL, 1, 127; ADUL-5, 1, 299], “self-marketing” [ADUL, 2, 126; ADUL-5, 1, 299] “sprinkling poison” [ADUL, 1, 302; Phrases such as ADUL-5, 2, 142] remain more characteristic of the style of speech.

In most cases, the combination of the two evaluation tenses present in the phrases is not taken into account, they operate separately, independently of each other. For example, even if a phrase has an emotional color or a positive tone, not everything may be biblical, or, conversely, a phrase with a negative, negative color may always be typical of the style of speech. 'Imaydi. The following examples confirm our opinion: «the dog's next leg» [ADUL, 1, 334; ADUL-5, 2, 241], “dog touched” [ADUL, 1, 334;ADUL-5, 2, 241] “the calf ran to the hayloft” [ADUL, 1, 146; Phrases such as OTIL-5, 1, 364] have a negative connotation, but they are more specific to the biblical style of the Uzbek language: “My lord,” said Begijon in despair. - Forgive me. I turned it into a dog ...”[Said Ahmad. Wheel]; «If you know, digesting dog soup is like death» [B.Khudoyberganov. Female Harmony] et al.

Similarly, «throwing the skullcap into the sky», «walking the skullcap in half», «falling into the mouth», «opening the mouth», «pointing to the mouth», «no strings attached» Phrases such as “gain prestige”, “gain prestige” are typical of the biblical style, with a positive expressive-evaluative tone.

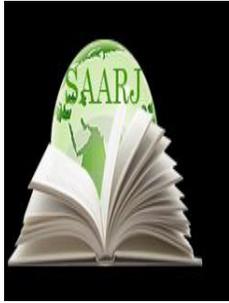

“My eyes were flying”, “to make friend with a leper”, “warm your breath”, “show a number”, “shut up”, “kick your feet”, “All of the phrases “enjoyed” and “fell asleep” are mostly in the style of speech, but the last two of these phrases have a positive tone, and the rest have a negative tone: “Shut up! - Now Madamin felt it and shouted angrily”[B.Khudoyberganov. Female Harmony] et al. The phrase «my eyes are flying» means enantiosemia, which means both positive and negative assessment.

“Stuttering”, [BURPhD, 324], “hitting the armpit” [BURPhD, 322], “mouthless” [BURPHD, 206], “let the devil strike” [URD, 105], «slap in the face», [URD, 104] express the negative and partly positive [«demon» assessment of the person, his behavior, but all of them are characterized by a simple style of speech. can be classified.

SINGAPORE'S ROAD TO GOOD GOVERNANCE

Khurliman Maratova*

*Researcher of the Academy of Public Administration under the President,
 Republic of UZBEKISTAN

ABSTRACT

This article analyzes the key factors that determine Singapore's path to Good Governance and its success. The purpose of this article is to discuss the level of trust and governance in Singapore and how their political leaders have responded to the various challenges facing their country. The article concludes that the higher level of trust and governance in Singapore can be attributed to its effective political leadership, which has benefited and succeeded in curbing corruption during its 50 years in power and in the context of its policy.

KEYWORDS: *Singapore, Public Service, Corruption, Social Development, Good Governance, Government Bodies, Effectiveness, Dynamic Governance, Model Of Development, Strategic Thinking.*

INTRODUCTION

Nowadays, there is a growing interest in learning Asian models of development, especially in Third World countries. Singapore is a unique case because, unlike most other Asian countries, it has been able to break away from rampant corruption as a way of life. It is the most widely discussed Asian model due to its unchallenged position as the least corrupt country in Asia¹. What stands behind the development and success of Singapore? How work is being done in Singapore, how all state plans and programs are being implemented? What can other states learn from Singapore's development path?

In fact, Singapore was a poor Third World country in 1960 with a GDP per capita of \$443². However, today Singapore is among the most affluent countries in Asia with a GDP per capita of \$58,480³. Singapore's exemplary public service cadre is regarded as one of the most disciplined bureaucracies in the world, because of its *efficiency, low levels of corruption and a high standard of accountability* to the government and the political leadership of the country. Its contribution since independence to the success of Singapore is widely recognised. This is particularly noteworthy because the economic success of Singapore has been and continues to be strongly

driven by a government that is heavily involved in a number of key sectors, such as housing, education, and industrial policy⁴.

Methods

Understanding of significant role of government bodies, Singapore transformed governance system and public sector. They created an environment, which sustain social development and growth. Before making ambiguous goals, they recognized their weakness and current realities honestly as well as take in account future possible threats and challenges. Therefore, Singapore's leadership is conceptualizing a long-term strategy with eventual results. In shaping national development concept, they conceptualize three vital capabilities of governance: *thinking ahead*, *thinking again*, and *thinking across*. These three capacities of government make Singapore as a long-term success.

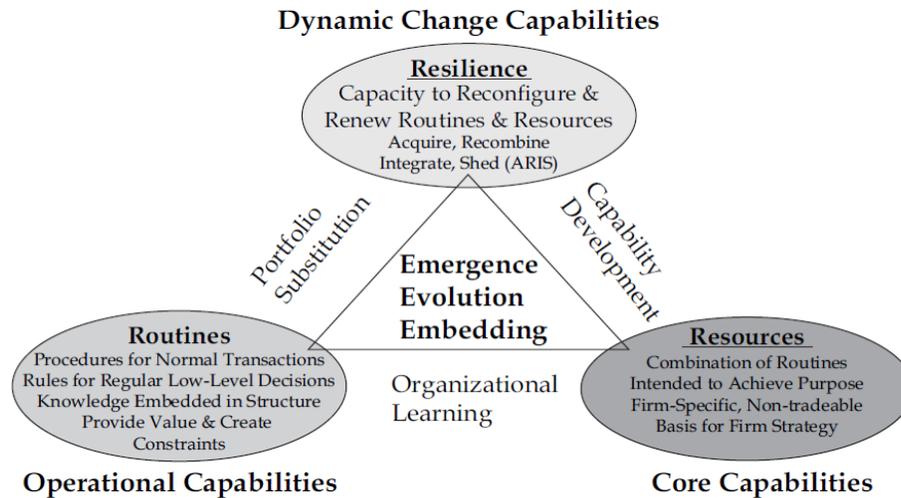

Thinking ahead is clarifying long-term goals of nation and strategy vision for future. It demands a deep understanding of current level of development, making scenarios of future changing's through analyzing current changes in the world. Strategic vision is critical for attaining sound results as measures we take can be ineffective and outdated because of abrupt changes in all spheres.

Thinking again is an ability to accept reality, find mistakes, and rethink to take new measures. Thinking again in this matter means thinking out of box and approach to problem with various ways before choosing the best one. Singapore government uses this capacity to address unemployment problem. In that period many Singaporeans were lack of motivation and responsibility to their work. They lost hope for better live and future. Singapore government bodies concerned about unemployment issue and tried to create equal opportunities for all people. They used different approaches to strengthen people's belief in themselves and their emotional condition. One of them was to engage population to be active in nation development. Understanding the fact that they did not have necessary skills to contribute to the development of the country, made them work on themselves and improve their capacity and working skills. As a result, even older generation began to learn new knowledge, skills and broaden their outlook.

Thinking across is a key element in the process of forming strategy of national development. It is openness to new ideas, willingness to learn from the experience of others, analyzing their approach, mistakes and make a conclusion. It is not blind imitation of successful models rather than it is learning from others and adapted it to fit local condition and renew it to achieve new goals. In Singapore case, they adjusted experience of a work-based welfare program Wisconsin Works⁵. It assisted to achieve national goals such as finding job, family support and social mobility of people. Understanding their commitment to provide basic infrastructure and condition needed for an ordinary citizen to live, work, and eventually raise the standard of living, government transformed industrial economy into a new innovative economy.

Another important lesson from Singaporeans is *dynamism*. It demands not only transformation and redevelopment periodically but also right policy to implement properly in all sphere. Innovative needs to be new, surprising and beneficial. Therefore, governance must be dynamic. In this turn, public sector officials who implement policy, provide service and ensure security should be dynamic and innovative. When we look to the process of working public sector, it seemed slowly and in a bureaucratic way. Singapore dynamic governance approach managed to work dynamic, stay relevant despite of hierarchical governance, formal rules, and detailed

procedure. They created three organizational capabilities of public sector into one framework as shown in figure 1.1⁶.

Routines are regular ways of doing the repetitive tasks of voluminous daily business activities, which are often executed semi-automatically in response to internal or external input flows. They involve recognizable patterns of interdependent actions involving multiple people and organizational units.⁷

Routines form operational capabilities to define rules and procedures in order to achieve fulfill tasks and transactions regularly, quickly, feasibly and in high standard. In turn, resources are also important factor as they are the main tacit assets such knowledge and skills which come from experience and continuous learning. They play an important role as they enable an organization to formulate and execute strategies to achieve its mission and desired goals. Third capability of dynamic governance is a strategic resilience. *Resilience* is not about responding to a one-time crisis or setback, but it is about continuously anticipating and adjusting to deep secular trends that may impair the effectiveness of an organization.⁸ Resources are the main potential (knowledge, skills) used for implementing programs, renew and readopt. Dynamic governance methods might be used not only in state government system, but also companies, organizations can use these methods to increase effectiveness and income. For instance, a university can adapt a new curriculum and new standards to meet the changing requirements of global economy. Dynamic change capabilities for manufacturers might comprise research and development, mergers and acquisition integration, and customer relationship management and human resources planning and management. These three capabilities develop a condition to execute all-purpose and make them reality.

The effectiveness of these capabilities is checked through achieved results, executed plans, implemented tasks. Describing the Singapore's model of success, Neo Boon Siong, professor of Lee Kuan Yew School of Public Policy National University of Singapore, pointed out that: "The main secret of Singapore's success, if there is one, is that policies are made to be executed and that they are actually implemented. Observers of Singapore often put it much more simply: "everything works here". Policy options are generated, evaluated and designed with

implementation as the main driver". The implementation of policies affects the reputation of government agencies and the image of the leader. If they cannot achieve their goals, they lose their legacy in front of the population. For this reason, the public sector is considered as the main actor of government. After gaining Independence in 1959, Prime Minister Lee Kuan Yew recognizing the effective execution of policy, said to civil servants that:

"You and I have a vested interest in the survival of the democratic state. We, the elected Ministers, have to work through you and with you to translate our plans and policies into reality. You should give of your best in the service of the people... If we do not do our best, then we have only ourselves to blame when the people lose faith, not just in you, the public service, and in us, the democratic political leadership, but also in the democratic system of which you and I are working parts."⁹

Decision-making and execution process

As many countries in Singapore decisions are made by Cabinet of Ministries after collectively discussion with ministries and public sector agencies. Cabinet of Ministries allocate power and resource to responsible ministries for implementation. In this process it is important to understand that government gives a political power to execute and shield civil servants from political interference. It gives from more freedom to think rationally and strategically, creates an environment for *Good Governance*, political support and collectively responsibility for common future. People know their role and contribution to the development of nation. That makes them continuous learn, grow professionally, think innovatively, find right solutions.

The figure below shows three stages of policy execution process in Singapore decision making and implementation process cycle.

1. Identifying issues for policy review
 - a. Reacting to external crisis or policy consequences
 - b. Identifying improvement opportunities
 - c. Surfacing issues from consideration of future scenarios
 - d. Identifying and sponsoring strategic issues
 - e. Learning from leadership exposure to different views and practices
2. Influencing design of policy options
 - a. Setting standards for policy analysis and design
 - b. Recommendation courses of actions through staff analysis and papers
 - c. Studying policy options through inter-agency project teams
 - d. Engaging external advisers and experts
 - e. Forming review committees and conducting public consultations
3. Implementing policy decisions
 - a. Selecting key leaders
 - b. Structuring an appropriate organization

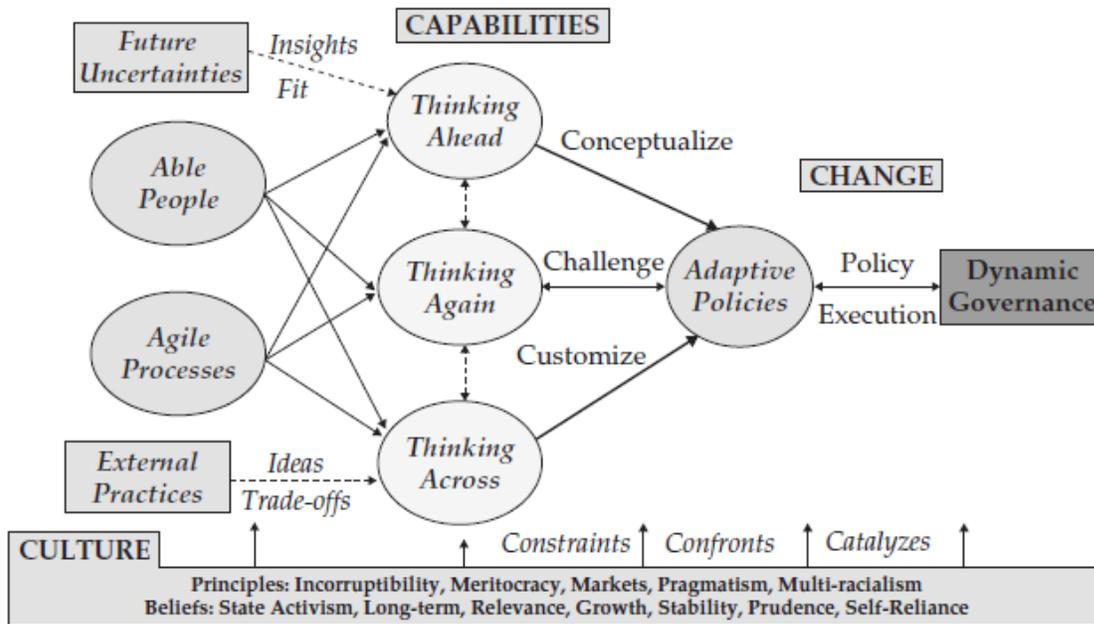

- c. Planning major strategies and the resources needed
- d. Initiating projects, processes and programs
- e. Monitoring progress and gathering feedback¹⁰

In first stage, it is critical important to understand clearly the main purpose of policy and stages of road you should go in order to achieve intended outcomes. As without clear understanding of them, civil servants might undermine discipline or lose hope in intellectual and mental capabilities. They might think why we need to change if everything works well and as a result, government bodies might involve in a red tape. Another prominent factor of strategic thinking is that developing scenarios for future. It is widely believed that scenarios are predictions or planning of the future. Making scenarios is drawing future implication through analyzing impact of today's decisions. While you are making scenarios, you should pay attention to today's trends and learn every possible impact on this. It is useful hint and learn in terms of everything ranging from business scenarios to international relations. Develop making scenarios make people think where they are going, where their destinations, what they should do, and what kind of measures they should take.

In the policy analysis and design step, leader and civil servant should accept the reality like the way they are. They should consider their weakness in order to turns them into strengths. Therefore, civil servants should be realistic and simultaneously they should acquire rationalism, pragmatism and result oriented willingness. Next step is one of the principles of Good Governance is public engagement in decision-making and implementation process. Public awareness is a key driver to engage people in development of country. Singapore government consulate with educated and demanding population through various ways before the policy approved and implemented. It might gather feedbacks, interviews with opinion-makers, senior generations, open discussion at the web sites, posting e-portals, social networks etc.

Last step is an implementation of decisions, in this step; the main task is selecting leaders and experts for implementation. As Lee Kuan Yew believed that "best man for the most important tasks".¹¹ Selected key leaders develop a detailed plan of policy proposals with Review committee who is responsible for gather feedbacks, analyze, and give recommendations. After a detailed plan approved, the team identify human and financial resources, they initiate specific detailed programs and projects for implementation of policy. In the implementation process, agency gather feedbacks from population in order to identify opportunities for improvement and meet the expectations of people. As we can see, in all processes public involvement is the basic element because all intentions, policy and programs for human prosperity and development of nation who live in this country. Human interests are above everything.

Figure.1.2. Framework for dynamic governance system

Dynamic governance system is a combination of culture, change and capabilities as shown in Figure 1.2. This systematic linkage reinforces their government system.

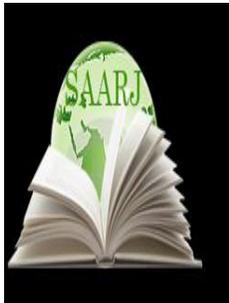

Government leaders should change mindset and cultural values of people to be hopeful, optimistic and hard worker. Uzbekistan in order to achieve desired goals should change attitude of people towards life, work such as break social constraints ranging from improvement the role of women in family and society, combat against nepotism and corruption, openness to new ideas and changing's. Moreover, government should formulate critical pillars of organizational capabilities of populations from early age: think critically, learn continuously and be dynamic. One of the attributes of the Good Governance is to be critical to a given policy starting from initial formulation stages. The ability of being open to different perspectives and analyzing the issue thoroughly prevents policy from the failure. For this, it is highly recommended to develop critical thinking in our education system. As in Uzbekistan inherited repetitive learning system from Soviet Union which lacks of critical thinking. Students are expected to repeat what they read and what has taught and not question it. Because of our culture and mentality, students venerate their professors. This is, of course, a very good part of education system and it helps to keep discipline in the class; however, students with this feature tend to receive all information delivered by professors without thinking and questioning them. This kind of system can impede professional and personal development of students and, consequently, produce graduates with a narrow and outdated view. On the other hand, young people who think critically, can find and compare information from different sources, contemplate ideas and make conclusions. Meanwhile, constructive feedbacks communicated to their professors will be mutually beneficial leading both students and professors to work on their knowledge and skills continuously.

Continuous the previous recommendation, we would like to suggest evaluating public policy issues from different perspectives. Each problem has economic, social, cultural, political and environmental and other types of consequences and all of them interconnected. One cannot resolve an issue only by allocating finances or locating environmental solutions. The issue must be considered from various fields and points of views. Supporting the functionality of existing research centers and networking among them can be crucial step taken towards the nation development. Researchers can study this problem from economic, ecological and innovative perspectives and they can share their finding with each other. It creates a scientific and dynamic environment that broadens researchers' outlook and builds a capacity that while addressing one problem considering all external and internal factors of problem.

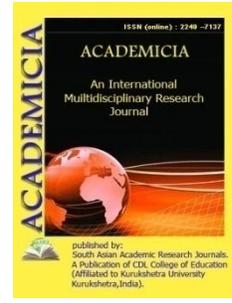

Dynamic governance is not one time change or one-time success, but it is continuous learning, innovating and improving and making life better, making the country in better place to live. As professor of Lee Kuan Yew School of Public Policy National University of Singapore, Boon Siong Neo mentioned, "We cannot change the past and we cannot determine the future. We can only hope to be better prepared to face the future by starting the dynamic journey of change today."

ANAPHORA, EPIPHORA AND THEIR LINGVOPOETIC FEATURES IN HALIMA AHMEDOVA'S POETRY

Iroda Bekmuradova*

*3rd Years student,
 Faculty of Philology of Samarkand State University,
 UZBEKISTAN

ABSTRACT

This article explores these features of anaphora and epiphora, which are types of repetition. The meanings that emerge from them, the types of repetitions according to their place of use, are analyzed. Anaphora and epiphora are considered as stylistic devices and are said to serve as an emotional color and poetic tone to the language units that make up oral and written speech. These ideas are proved by the example of anaphora and epiphora types of repetition used in the poems of the poet Halima Ahmedova.

KEYWORDS: *Repetition, Anaphora, Assonance, Consonance, Rhyme, Tautology, Imagery.*

INTRODUCTION

It is important to clarify the meaning of the word used in each style of our language in the eyes of the listener or reader. This can be achieved by emphasizing the meaning, highlighting it, and re-applying it where necessary. In this sense, repetition is one of the most actively used stylistic methods in art. "The function of repetition in artistic style is not limited to distinguishing and emphasizing a particular event or situation. In art, as in all stylistic devices, repetition is the task of giving emotional units, special tones, and charms to language units. If possible, in addition to carrying out these tasks, he should be able to give the author or the protagonist a subjective attitude to reality. " [3, 55-56] There are several types of repetition, depending on where the language units, especially the word, sometimes the phrase, are repeated, and in total they number about thirty. There are different forms of repetition in the scientific literature, such as alliteration, anaphora, epiphora, rhyme, assonance, consonance, tautology.

Accordingly, the word, phrase, or sentence that appears at the beginning of a poem or verse is repeated at the beginning of each verse or verse. The poetess Halima Ahmedova, who has a special place in the world of literature with her appropriate repetitions and uniquely attractive

verses, has often used this type of repetition - anaphora in her poems. Undoubtedly, this provides the poem with an attractive tone and color. The simplicity of the anaphoras used by the poet makes the scene that comes to life in the poet's eyes more vivid and clear:

There is forty-six springs I like

This is a monument to my enemy

A chorus growing right in front of my eyes

There is silence in this...

There is hope in that.

Still struggling to give up

There is a lot of grass in the pot

It's hard not to say something.

There is debate between light and dark is heated

They live without each other for days... [1, 102]

The repetition of the word in these verses of the poet was methodologically anaphora, and artistically, it emphasized the expression of the idea in the poem, as well as provided melody.

Clean...

Remained in the transparent heart of childhood

With the wings of an elegant butterfly

The mountains wept with longing

With the song of the cuckoo in the cage.

Clean -

The chain of insults is broken

In the heat of the moment

In the eyes of a beggar who comforts hunger

In the bliss of the shining light

Clean -

It is easy to clean

In contrast to the moon playing in the shadows...

The wind blew the silk curtain

From the bright window of the dark night

Clean... [1, 98]

From the above examples, it can be seen that anaphora is used not only as a stylistic tool to reinforce the idea, but also as a factor that determines the compositional basis of the poem. For

example, the idea expressed in the poet's poem "Clean" is that the author's address is reflected in the word "clean" repeated in the first verse of each verse, and only this word itself clarifies what the author means. The following lines complete the first verse and explain it. And, of course, in the process of repeating the word, a unique tone and rhythm is formed. Another type of artistic repetition is the epiphora, in which an epiphora is formed by the repetition of vowels or consonants at the end of words, and by the repetition of a particular word, phrase, or sentence at the end of a line. Literally, the epiphora is the opposite of anaphora. "Anaphora is used in oral and written speech, and the epiphora is mainly used in written speech." [4, 64] In this sense, the epiphora is the most frequently used repetition in poetry.

I wish I could one day my dream *end*
 My tongue doesn't say what's in my heart at the *end*
 My life my guest left at the *end*
 Bury me in the rose petals[2, 8]

The epiphora in this quartet is formed by the use of the last word repeated at the end of each line.

The longing that gnawed at the heart of the night,
The longing to drink the sunshine,
The longing that has ruined my life,
 I know your longing.
 Do you know that I am a soil?
You are always burning in the dark,
You are bleeding in my heart,
You are the one who denies me out of love.
 I know your longing
 Do you know that I am a soil?[1, 11]

In this example, at the end of the verse, miss, no, and repeat the words you

In this example, the epiphora is formed at the end of the verses with the words nostalgia, no, and you repeated. It is used to create melody, thoughtfulness and emphasis. At first glance, the word repeated at the end of the paragraph reminds me of a radif. In many cases, it is difficult to separate the two concepts. Because a radif is also a word or a combination of words that is repeated at the end of a poem. But for a repeated word to be a radif, the word before it must be rhymed, and one radif must be repeated from the beginning to the end of the poem. Epiphora has no such requirement. It does not require rhyming the word that comes before it. That is, it can be used after non-synonymous words and can be observed during a paragraph.

Are you the one who made my soul miserable?

Are you the one who turned my heart to stone

Are you the one who erased the word happiness from forehead?!

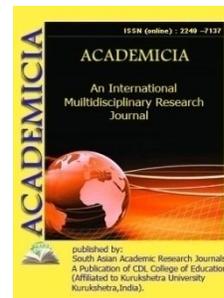

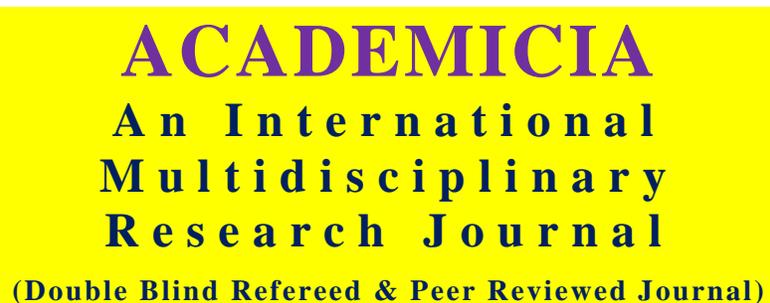

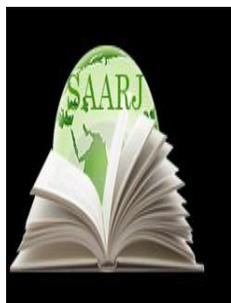

The color of the water of lies

The foot of life crushed by my shoulders. [1, 40]

Analyses show that in Halima Ahmedova's poetry, various forms of repetition are appropriate, skillfully used for a specific purpose. This, as mentioned above, gave the poem a special charm as a means of melody, charm, and musical refinement. In short, while repetition does not create a specific image when used in a work of art, it is a means to their creation, to the refinement of expression, to the expressive and effective expression of thought.

USE OF GAMES IN LEARNING FOREIGN LANGUAGE AT THE UNIVERSITY

Sodikova Yulduz Furkatovna*

*English Teacher,
Samarkand State Institute of Foreign Languages,
UZBEKISTAN

ABSTRACT

The article discusses the possibilities of using word games in the process of teaching a foreign language at a university. The main classifications of games are given, with the main focus on games of a lexical nature. The article substantiates the conditions allowing to use word games as efficiently as possible in foreign language classes, as well as examples of games at different stages of work with students.

KEYWORDS: *Teaching A Foreign Language, Game Technique Of Teaching A Foreign Language, Language Games, Lexical Games, Teaching Adults.*

INTRODUCTION

Mastering a foreign language at a university implies the formation of a number of competencies among students. In particular, graduates should be able to communicate verbally and in writing in a foreign language and solve the problems of interpersonal and intercultural interaction. Consequently, students must have certain knowledge (for example, knowledge of linguistic means) and mentality (use the formulas of verbal communication, formulating their point of view, etc.), and also be able to correlate language means with specific situations of intercultural speech communication.

The solution to this complex, "global" problem occurs during the entire period of teaching a foreign language at the university and requires the use of rational and effective approaches and technologies, forms and methods of teaching. In this context, it is customary to talk about the use of new information and communication technologies, active teaching methods, and a differentiated approach. However, the "basic element" is the methods and techniques of teaching a foreign language, which the teacher uses in the classroom, directly working with students.

Students' knowledge and possession of linguistic means, their use in communication depends on how effectively this material was presented, consolidated, worked out.

A method that allows: a) to motivate students to study the subject, b) promotes the development of language and speech competence, c) promotes faster and more durable assimilation of the material, is a game. Is the use of games in a student audience justified? And if so, which games will best promote language development?

In modern science, games are considered as a method that can be effectively used in teaching a foreign language to both children and adults. It would be appropriate to give classifications of games, which will allow you to navigate which games can contribute to the development of certain language skills.

So, M.F.Stronin distinguishes the following types of games: 1. Lexical. 2. Grammar. 3. Phonetic. 4. Spelling. 5. Creative [5. 81p.].

The first four can be attributed to the so-called linguistic, the purpose of which is the formation of relevant skills. Creative games are complex in nature, imply the creative application of the acquired knowledge and skills in a game situation.

There are other classifications of games. A. V. Konyshева divides games according to their goals into linguistic and speech (communicative) games. E.V. Dushina talks about linguistic games and divides them into non-communicative, pre-communicative and communicative, depending on the competencies being formed [2.56p.]. Obviously, in all classifications we are talking about 1) games, in the process of which there is the assimilation of material (new lexical units, grammatical structures), the development of individual language skills (phonetic, grammatical) and 2) games aimed at transferring the studied material and worked skills in non-standard situations, in communication within the game. At the same time, it is important to take into account the principle of didactic sequence: first, tasks are performed for memorization, for reproduction (including according to the model), and then for the creative application of the studied material.

For the games, which will be discussed in the article, we suggest the name "word games" - they are all associated with a word, its spelling, meaning, compatibility with other words (in Stronin's terminology, both lexical and spelling games can be referred to here). Word games allow learners to:

- expand vocabulary by getting to know new lexical units;
- To assimilate familiar lexical units more firmly;
- practice the spelling of words;
- To intensify speech-thinking activity;
- gets acquainted with the compatibility of lexical units, set expressions, phraseological units.

Word games include the following:

1. Anagrams
2. Crosswords
3. Search for words among alphabetic chaos (Wordsearch)

4. Hangman
5. "Missing letters" (guess the word only by vowels / consonants).
6. "Words" (composing shorter words from one long one, often for a while).
7. "Unscramble" (composing a word from an existing set of letters).
8. Wordchain (compiling a list of words by replacing one letter in each subsequent word, possibly based on definitions).
9. Constructor (composing words from morphemes presented on separate cards).
10. "One letter - many words" (students name words they know by a certain letter of the alphabet).
11. "Last letter" (name a word starting with the last letter of the previous one; it is worth noting that in English, taking into account the unpronounceable -e at the end of a word, it may be suggested to start a word with the last sound of the previous one).
13. Hot Chair (guess the word by its definition, synonyms, antonyms, etc.) and others.

Some of the games involve group work, team competition (for example, Hot Chair, Constructor, etc.),

Some work in pairs; games such as "Hangman", "Anagrams", "Wordchain" are appropriate to carry out frontally, presenting the material on the board.

In general, students find the use of games in English classes "an interesting, effective method to help them remember the material better."

Of course, word play in English classes at a university should not be an end in itself, although in some cases it can serve as a kind of "relaxation" after hard work. By organizing a game in a lesson on

foreign language at the university, the teacher should take into account the general methodological principles, as well as the principles of pedagogy of teaching adults (after all, the student audience often claims to be "adult", and at the same time equally willingly responds to the techniques and methods used with children):

- Adults need to know why they are learning this or that material. Therefore, the teacher should be ready to explain how the game will help students in learning a foreign language;
- Adults see learning as a solution to problems, they learn from their own experience, "in practice", and

The use of word games can provide more opportunities for this than simply doing the exercises from the textbook;

- The game should be well thought out, have clear rules and simple conditions, be supervised by a teacher;
- The game should be conducted in a friendly atmosphere, providing the student with opportunities for self-expression, self-development;

- The game should contain an element of competition (under the initial condition of equality of participants / teams), which can activate the mental activity of students, encourage their active participation.

Here are examples of the use of various games at different stages of organizing a foreign language lesson. At the warm-up stage, when the teacher's task is to update the students' knowledge, experience on a particular topic, "attunement" to work, students can be invited to play "Missing Letters", "Unscramble", "Constructor".

In this case, the word must either be already familiar to most students, or it can be predicted based on the topic. For example, the word "adventure" in the game "Missing Letters" might appear on the board as ". d v. n t. r. " as part of the discussion of the general topic "adventure holidays".

Games like Word search, crosswords, unscramble are often used when practicing vocabulary on a specific topic. In school and foreign textbooks / workbooks, such a task is not uncommon, however, textbooks for higher education, especially professional ones, do not often offer students such an exercise-game. A rather effective technique is when, as a creative task, students themselves create a "letter chaos" / crossword puzzle and offer it in class for work in small groups.

The team game Hot Chair can be offered to students at the completion of work on a topic, when lexical units / phrases have already been repeatedly presented to students in texts and exercises. The essence of the game is as follows:

the team representative needs to guess the word written on the board, which may be suggested by the teacher or another team, according to the prompts and explanations of their team. The student sits with his back to the blackboard and does not see the word. Associations and ways to explain a word that come to mind of modern students sometimes amaze with originality and creativity, showing that students are trying to actualize and transfer knowledge from other subject areas in a foreign language. It is necessary to encourage students to express ideas in a foreign language, thus they are involved in communication, practice the skills of constructing sentences, certain speech formulas. At the same stage, you can play the "gallows"; usually students are actively thinking, suggesting options, not wanting the game to end in a loss.

Word Chain can be played with entry-level students as it often contains short, simple words of 3-4 letters. However, if definitions of mutable words are used, the task becomes more difficult for students. Some games can be used to introduce new words by focusing on their spelling.

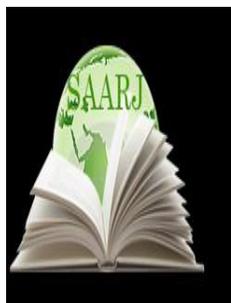

In conclusion I can say that the task of the teacher is to find the maximum of pedagogical situations in which the student's desire for active cognitive activity can be realized. The game helps communication, it can contribute to the acquisition of new knowledge, the correct assessment of actions, the development of a person's skills, perception, memory, thinking, imagination, emotions, such traits as collectivism, activity, discipline, observation, attentiveness. The game is simple and a way of knowing the surrounding reality for a person close to him should be the most natural way available to mastering certain knowledge, skills, and abilities. It is, of course, not the only one, but one of the most important teaching assistants, designed to awaken students' interest in the material being studied and to keep this interest throughout the entire study.

The teacher can be advised not to "take the full blow" in composing the game on himself, but to delegate part of the work to students - for example, on the choice of lexical units in the game within the framework of the topic. Thus, they feel involved, responsible for the correct presentation of the material, for the success of the game. And in this case, the use of the game in a foreign language lesson actually becomes an effective technique.

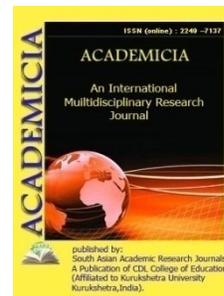

Thus, the use of the game in a foreign language lesson makes the educational process of higher quality, more successful, since the game involves all students in cognitive activity and stimulates students to learn a foreign language.

THE PROBLEM WITH THE FOUR CONDITIONALS OR CAUSALITY IN ENGLISH

Khamraeva Z.Kh*

*Teacher,
 Samarkand State institute of foreign languages,
 UZBEKISTAN

ABSTRACT

*This article touches on the problem of expressing **causality** in the English language by means of various conditional constructions, such as causal, temporary and concessive shades. Logical-semantic, functional-semantic and functional-grammatical analysis of means of expressing semantics conditions allowed the author to identify those aspects of it that seem important for the formation of a cognitive-functional model of representation of conditional relationships.*

KEYWORDS: *Causality; Conditional Constructions; The Concept Of Condition; Concessional Meaning; Conjunction; Cause; Goal; Concession; Consequence; Objective Modality; Semantic Heterogeneity.*

INTRODUCTION

Starting a conversation about the specifics of the representation of the category of conditionality in the English language, it should be said that in modern linguistics, a certain experience has been accumulated in the analysis of conditional constructions.

Conditional relations have been studied by linguists in various aspects: in the historical plane - from the point of view of the origin of constructions expressing conditional relations; in comparative terms; in terms of identifying means of expressing conditional semantics at the level of a simple and complex sentence, as well as in a wide context; in terms of the formation of various types of complex subordinate sentences with conditional and causal relationships.

Traditionally, when linguists study the means of expressing a condition, the object of study is complex sentences (CS) with subordinate clauses. CS with subordinate clauses are complex structures, within which the subordinate part (situation-condition) and the main part (situation-consequence) are informationally equal, while the subordinate clause is focused on the predicate of the main part.

The content of the subordinate clause is qualified as a hypothesis, that is, a situation that conditionally corresponds to reality. The relationship between the clause and the main sentences are interpreted as a necessary, natural, obligatory connection. In logic, such relations are considered as a sign of implication.

Thus, in the most general form, the meanings of conditionality (which are also called logical) include the meanings of cause, effect, condition, purpose and concession. Their common feature is that "in sentences with the meaning of conditionality, two situations are correlated, of which one is made dependent on the other" or, in a more generalized formulation, "two states of affairs such that one state of affairs is accompanied by another or leads to it."

The word "condition", are polysemantic and difficult to define, therefore the very presence of these words in the definition cannot be perceived unambiguously and unconditionally be considered an indicator of the concept of a condition. In addition, the concept of a condition itself does not have a full-fledged definition and an exhaustive description: most often there is a description of a condition in conjunction with a description of a cause, and this relationship is characterized as follows: conditionality, causality, i.e. causality in the broad sense of the word, assumes such a connection of situations in which one serves as a sufficient basis for the implementation of the other.

In many works on linguistics, it is said about the possibility of complicating the semantics of a condition with causal, temporary, yielding shades. This is due to the fact that these meanings are included, together with the value of the condition, in one semantic class, that is, they are varieties of the generalized meaning of the condition. In particular, the differences between conditional and other types of sentences can be rather unstable, and standard indicators of a conditional meaning, primarily conjunctions, as well as verb forms in certain contexts have a different meaning.

Conditional meanings differ in the degree of semantic complexity. The most elementary among them are usually the meanings of cause and effect, which boil down to the fact that "phenomenon A causes phenomenon B". The goal additionally presupposes the presence of an agent who sets this goal in front of himself. The condition differs from the cause and the purpose by the assumption of the possibility of an alternative development of events, which either still exists (in the case of a real condition), or took place sometime earlier (in the case of an unreal condition).

Let us compare one of the proposed interpretations of the meaning of an unreal condition, expressed in sentences like "*If you came yesterday, you would find her*": "*It could have been A, but / however [for this] there had to be B; but it was not, therefore there could not be A.*" The most difficult among the meanings of causality is the concessional meaning, in which the meaning of "contradiction" is layered on the "meaning" (causal / conditional) implication; in other words, "in the subordinate clause, a cause is expressed, which should have entailed the opposite effect." Therefore, in the sentence "*Having caught a cold, he did not go to work*" the relationship between situations is interpreted as *causal*, and in the sentence "*Having caught a cold, he (anyway) went to work*" - as *concessive*.

This kind of "implicative" dependence between situations presupposes their obligatory chronological ordering, namely: the conditioning situation either precedes the one which is conditioned by it, or is simultaneous with the latter. Thus, conditional relationships are based on temporal-taxis, representing more or less their semantic complication and modification; Consider

the following explicit formulation: "The causal statement " P caused Q " can be interpreted as a conjunction of two statements: 1) the succession of one event after another in time and 2) the presence of the corresponding general law " .

The feeling of a connection between temporal relations and relations of conditionality was reflected in the famous Latin proverb "post hoc, ergo propter hoc" ("after this means, because of this"). E.V. Paducheva comes to the same conclusion, believing that "the circumstance of time after that hints at some reason."

In the works of V. B. Evtyukhin (school AB Bon-darko), conditioning as a whole (cause, condition, goal, assignment, effect) is considered as a functional-semantic category of syntactic type, since 1) as well as categories of morphological type, categories of syntactic types are structures based on opposing forms and meanings; 2) syntactic constructions are the main way of expression; 3) when expressing syntactic categories, morphological forms of different types can be used; 4) morphological categories, working within the expression forms of the syntactic category, transform their paradigmatic meaning and connection. Conditionality relations (including conditions) are interpreted as bi-situational and asymmetrical: one part of the minimal structure is conditional, and the other is conditional; asymmetry is marked with subordinate conjunctions and prepositions.

Wherein the semantics of conditional relations is described as objectively / subjectively motivated hypotheticalness (of varying degrees of activity), allowing for different signs (presence / absence of negation).

As a result, "conditioning" is defined as "an undeniably semantic category of language, as one of the most important categories of linguistic thinking. Logical-semantic, functional-semantic and formal-logical analysis of the means of expressing the semantics of a condition made it possible to identify those aspects of it that are important for the formation of a cognitive-functional model of representation of conditional relations, namely, cognitive, functional and pragmatic.

Cognitive (conceptual) aspect semantics of the condition manifests itself before all through the ratio of conceptual categories "condition / effect", which is realized in discourse as a "condition due to", which means their interaction and interdependence and is reflected both in conditional semantics in general, and at the base of each of the semantic functions (SF) we have identified.

In this case, the functional aspect of the semantics of the condition consists in the implementation of the dominant principle "reality / unreality".

"Imposing" on these values the modality of "assessing the situation from the point of view of its possibility, necessity, desirability, etc." does not fundamentally change the type of condition / consequence (real, hypothetical, unreal).

Finally, the pragmatic aspect of the functional semantics of the condition includes the epistemic attitude (positive, neutral and negative), which reflects "the speaker's assessment of the degree of his confidence in the reliability of what is being reported."

The functional-grammatical approach to the interpretation of conditional relations operates with the concept of functional grammar, the concept of functional-semantic fields (FSF). The functional-semantic field is a two-sided (content-formal) unity formed by the grammatical (morphological and syntactic) means of a given language together with lexico-grammatical and

word-formative elements interacting with them, belonging to the same semantic zone. This approach allows assume the following: at the base of the FSF conditions is the ratio of the universal concepts "condition-effect", which at the level of linguistic content categorization are presented by FGC conditions. The expression plan of the FSF condition includes various semantic-structural grammatical unity. The core of the FSF conditions are complex sentences (CS) with subordinate clauses introduced by unions " *if, unless, supposing (suppose) that, assuming (assume) that, in case, provided (providing) that, etc.*", as the most specialized constituent for expressing a given value, conveying it most uniformly and systematically used. Wherein The "functional dominant of the field" (the component with the highest frequency of use) is a sentence with a clause introduced by the union *if*. The periphery of the field includes multilevel lexical and grammatical means of representation of conditional relations: CS with non-union connection (inversion); complex sentences, in particular with an imperative; simple sentences, including structures with gerund, participle, infinitive and prepositional-substantive combinations; simple proposals within the SFU.

The FSA of the condition (as part of the group of fields of "conditioning") is in relations of interconnection and intersection with the complex of FSA of modal-being relations, in particular, with the FSA of modality and its segment - the field of objective modality. At the heart of the content plan of the FSA modality, which has a heterogeneous structure and covers a whole complex of modal meanings, lies the FSC modality, which in the broadest sense expresses the speaker's assessment of the way of existence of the connection between the object of reality and its signs, as well as the degree the knowledge or desirability of this connection by the speaker.

Within the framework of the functional-semantic approach of the FSC, modalities are considered as a universal-linguistic category that correlates with the corresponding conceptual category and representing in the content plan a multifaceted association of more particular functional and semantic unities. In terms of expression, this FSC covers the system of grammatical forms of the verb mood, as well as syntactic and lexical means.

The content plan of the field of objective modality is formed by the relationship between the concepts of reality / unreality and potential (hypothetical). Objective modality shows how the speaker qualifies the reflected reality in his utterance, thereby establishing the relationship of the content of the utterance to reality in terms of its reality or unreality. This type of modality contains the component "it is so" and is present in every utterance.

From the above it follows that

- 1) When speaking about the attitude to reality, we mean "reality in the representation of the speaker";
- 2) the attitude towards reality, associated with modality, receives a qualitative definiteness when it is indicated that this attitude is manifested in the dominant signs of reality / unreality ..

At the same time, the work of N.A. Davydova "Representation of conditional relations in an English discourse" is of particular interest, in which the author models the functional-semantic field of a condition in modern English. In the FSA conditions in English, N. A. Davydova distinguishes the micro field of a real condition, a micro field of a hypothetical condition, and a micro field of an unreal condition. Each micro field implements semantic functions, the content of which "is made up of the meanings of linguistic units, their components and combinations."

As the author notes, the principle of opposition lies at the heart of identifying semantic functions in micro fields of a condition: positive - negative condition, positive - negative consequence.

We will give examples of different statements that differ in linguistic semantic content when expressing conditions, guided by the classification described by N.A. Davydova:

(1) a) an affirmative conditional attributable clause in the indicative expresses a sufficient condition, that is, such, the presence

which is associated with the implementation of some consequence, positive or negative: *If anything happensto us, he will know who is responsible for it;*

b) a conditional clause in a negative form expresses a necessary condition, the absence of which is associated with the failure of the corresponding positive or negative consequence: *“But if we don’t get him back, it’s*

a publicity nightmare ”. Or consider the following example: If I don’t leave, he won’T / will return). Here my "non-departure" will entail his non-return or, with the affirmative form of the verb in the main clause, his return.

In the CS indicative mood with subordinate clauses, the verb can be presented in any tense required "by sense", including in the past: *It was a sick and violent history. If the Indians were peaceful and tried to cooperate with the colonists, they were subject to strange diseases - smallpox, measles, yellow fever, influenza, tuberculosis - for which they had no natural defenses. If they did not cooperate, they were slaughtered by men using weapons more sophisticated than arrows and poison darts (Jerome*

K. Jerome. Three Men in a Boat).

(2) CS with subordinate clauses with the Subjunctive I non-perfect form in the dependent part and the Subjunctive II non-perfect form in the main part express the following: its factor: *If I had (didn ’t have) the book, I should / would (not) give it to you.*

(3) The counterfactual consequence-condition related to the past tense is expressed by Subjunctive I perfect in the dependent part of the PSD and the form Subjunctive II perfect in the main part of the CS.

If I had (not) had the book, I should (not) have given it to you.

CS expresses an unreal condition and an unreal consequence that follows from it, (in (2) and (3), as in (1), the presence and absence of explicit negation marks the sign (+ or -) of the corresponding condition / consequence).

Thus, on the basis of the review made, we can conclude that, despite the fact that the conditional relations underlying the semantics of the condition and having a universal character, being included in the conceptual picture of the human world, are characterized by, in addition to semantic heterogeneity, a significant variety of means of expression that require clarification and detailed description.

ABSTRACT

The article discusses the origins of the Jadid movement and its impact on the literature of the period. The main idea of Jadidism, that is, the desire to enlighten the people, is reflected in the works and their heroes. In the literature of this period, ignorance was cited as an important cause of the tragedy of the nation, and it was revealed that it was fought against. It is based on the fact that the views put forward by the representatives of the Jadid movement are extremely important even today.

KEYWORDS: *Jadid Movement, Literature Of The Period, Ignorance, Tragedy Of The Nation, Fate Of The Nation, Enlightened Scholars.*

INTRODUCTION

Our President Sh.M.Mirziyoyev in his address to parliament in 2020 24-th year: "in 2020, the 145-year old date of birth of the scientist and writer Mahmudkhujja Behbudiy, who raised the torch of enlightenment in difficult moments of the history of our people, is widely celebrated. In general, we need an intensive movement, an in-depth study of the heritage of our great-grandfathers. The more we learn about this spiritual treasure, the more we find the right answers to many questions that still concern us today. The more actively we promote this invaluable wealth, the more our people, especially our young people, will realize the value of today's peaceful and free life."

In fact, as we get deeper and deeper into the content of the works of our jadid ancestors, we can see that the problems raised in them remain relevant even today, although these works have been more than a hundred and fifty years since they came to the world. The nation's failure to seek the solution of the jadids, the problems associated with women's education still cast a shadow on the development of society. By the end of the XIX beginning of the XX century, a difficult and extremely turbulent historical environment arose in Turkestan, which undermined the fate of the

nation. The reasons for this were, first of all, that the Russian empire, with the aim of destroying Turkistan and strengthening its colonialism there, pursued a very chauvinistic policy of Russianits population, dividing the common people from men, breaking its pride, on the one hand, when on the other hand, in the Muslim fanaticism, the spirit of resistance to secular knowledge and progress, on the Losing national pride, native language, literature, centuries-old traditions of the people occupied by colonialist states in the history of mankind, the tendency to destroy considered the priority. The oppressed people are accustomed to such views of the tier evil. In such a political turbulent situation, a group of intellectuals of the people, the original Sons of the nation, the progressive movement emerged. The selfless lochins of the people tried to awaken the Native people, to grieve for their future, although their wings were burning. They united under the so-called "jadid" great name and went a long and laborious path for spirituality, for pride and freedom without a head-on collar.

Reflecting such a difficult situation at the beginning of the XX century, literature differs from literature of all other epochs by the fact that ideas such as awakening the general public, expelling the people from a low standard of living, thinking about the interests of the nation, the Uzbek people want to see among the peoples with scientific potential are put forward. In all the works of our creators, such as the Almighty, the Fitrat, the Steppe, lies the idea that enlightenment of the people will pave the way to its civilization. And such artists as Avloni and Hamza not only through their own works, but also through practical actions in this regard (theater, newspaper, organization of magazines, opening of schools, etc.) through those who tried to enlighten the people. As we read each of their works, the black spots of the past, the height of the tragedies of that time, will hurt our dim. In particular, in the work of Abdulla Qadiri "The past days", it should be noted that Yusufbek Haji spoke of himself: "the tax collection of two coins from the fire... do not let it remain after a week... the right to lay down the counterparty in the tax collection, to hang it when it is seen in accordance with the suction given to me... there is a conscience to come, there is religion, there is faith. Let our people swallow the Earth. On the tip of Azizbek's amulet, he forgot about his yesterday's atrocities..."[1,108] - or if not," - I could not create any contentment other than torment myself by spending lives for the peace of this land. I could not imagine that we would be our people, who do not know the Union, who eat each other alone in their own interests, and who do not disappear from the comfort of Turkistan, who are mercenaries, secular and ambitious. In this case, if we go and pour water on each other's tags, it is close-that Russian march will smear our Turkestan with his dirty feet, and we will wear with our own hands the Russian neck of our next generation. Our blind and foolish fathers descended, of course, from the curse of God - the impostor, my son! The Holy godfather of the grandfathers going to make our Turkestan a pig, and now we will definitely go to the wrath of the dog creator!..."[1,296] through the image of Yusufbek Haji and his speeches like those above, the silent tribulations of Qadiri's experiences of that time, the rebellion of the heart, are clogged up like poison in our joints.

Professor Naim Karimov, while expressing his thoughts about the events of that period, touched upon the tragic point: "during this period the despotic regime had driven one child of the people to the other, forced him to write summons over it, to keep an eye on every step of it, and when necessary to carry it to the brink of a bottomless pit.

"Divide et impera". "Break up and rule" - this was the motto of the colonialists at all times.

Tsar and Shura authorities were also no exception in this sense. On the contrary, they, unlike other colonialist states, constantly sow the seeds of discord among the people and destroy those who have his mind, conscience, or reputation and future.”[2,455]

Nabijan Baqiy describes the tragedy of the jadid period as follows: “during the time of the murder, our culture, art, literature, science were destroyed: prominent state and public figures, the original children of the Uzbek people were gathered and sorted. As if the victims had no namesakes!.. Who were they?... Do you know who they were?...Abdulla Qadiri was one of those, but only" [3,358]

If we pay attention to the above views and comments, we can say that the eternal tragedy of the people who threw their lives into the fire of hell by all means tried to bring their people out of this disgusting swamp, tied their hands without touching the shackles of the enemy, tried to spare their lives to someone else's soul Who did we live to believe?!

Indeed, the fact is that during the reign of the Khan times and the tyrannical councils, the people had a completely backward and sad state, the fraction of the males suffered by an ordinary people, the rise to the position of the king of Zoroastrianism, who had not yet learned in the hope of career, property, the illiteracy of almost the majority of the people, Qushboshi - we witness that period, when he was stumbling in a restless sleep.

Through the image of the Fatherland in the”The past days”, the pain in the people's hearts of the ill-wishers irritates our hearts. Throwing stones of slander against the father, the box and others, plunging into the swamp of conspiracy, turning into an innocent culprit, and even the most severe, to be sentenced to death, of course, at that time, incompetence, career-giving, oppression and violence prevail in the country. The main goal of Abdulla Qadiri was also to change this disgusting system with a base-vein. The image of Uzbekayim is also of special importance in the work. The fact that he was given the euphoria, extreme arrogance, the misfortune of luxury, property, the fact that he made his dear charming unhappy behind him, until he brought not only the father, but also the honesty of his family to the brink of a precipice, the nation testifies to the women's blightlessness, the lack of their religious and secular knowledge. Here is my Uzbek mother-in-law, who keeps her place in the family higher than her husband, who has gone off to the rags, who has taken her child's life to the level of being above the level of her desire for air, who dreams of life as a treatise, does not touch the face of her mother-in-law of the present!

"I will bequeath it to you. Work in the enlightenment, wipe the head of teachers! Raise discord in the middle! The phrase” do not put children of Turkistan without knowledge " is an obvious proof of the idea of the jadids. They were truly teachers of the nation. They became a bridge that brought the nation out of the spiritual abyss with its enlightenment and education, which led to the centuries-old Bliss, preserving the nation from destruction and disaster.

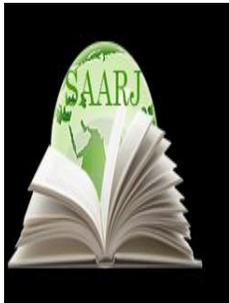

In short, the image of Zebi in the work of the Chulpon “The night and day”, the image of Mirzo Hamdambay, Abdukodirboy, Mahmudhon, Sarah, Eshon, Zaynab, the image of Maryam in the work of Niyazi “The victims of toxic life or work” and "Is advokat easy?” through the various images in Fitrat's work, it is reflected in the comprehensive development of society that enlightenment of the people living in this society plays a big role. In general, for the jadids, it was the main goal to educate the people, especially the women who brought up the nation.

The jadids not only ideologically spread the foundations of the above-mentioned national ideology to the consciousness of the people, but also penetrated the hearts of the people through their works and took a deep place, returning the lost male, making the younger generation a scientific potential, blindly obeying the existing system.

It is known that for the colonial states in the history of mankind, the tendency to destroy national pride, native language, literature of the people is considered a priority. Because the worldview of the people can be changed by exactly these means.

"SHAJARAYI TURK"-AS A HISTORICAL SOURCE

Mehroj Isaev* ; Abduraimov Ruziboy**

^{1,2}Students of History department,
 Samarkand State University,
 UZBEKISTAN

ABSTRACT

This article discusses the book "Shajarayi Turk", which is considered an important source in the field of history. The book also contains the names of about 40 Turkish-Mongol peoples and their genealogies. Another important aspect of the book is that it is written in a very simple language. There is a Turkish proverb: "The arrow cut its own navel", which means that there is no one worthy of writing the history of this period. And he starts writing this book himself. The book consists of a short introduction and 9 chapters.

KEYWORDS: *Oguzkhan, Mangul, Uyghur, Tutak, Genghis Khan, Kipchak, nine, Turkish-Mongol people.*

INTRODUCTION

There are many historical books in the world. In particular, there are many historical books dedicated to the history of the Turkish peoples. Many historians and scholars have left behind unique books in this area. One of them is the king and scientist Abu al-Ghazi Bahadur ibn Arab Muhammadkhan (1603-1664). Abu-l-Gazi-Khan was a nobleman and a crown prince. He ruled Khorezm for almost 20 years (1644-1664), but left his mark in history not as a supreme ruler, but as a great scientist. In fact, Abu-l-Gazi-Khan was a man of broad and profound knowledge. He started the Khorezm School of historiography. He wrote two historical books: "Shajarayi turk" ("Turklar shajarasi") or ("Shajarayi turk va mo'g'ul tarixi") and "Shajarayi tarokima" ("Turkmanlar shajarasi"). It is believed that the book "Shajarayi tarokima" was written in 1658-1661. This book provides valuable information about the origins of the Turkish tribes, especially the Turkmen people. The book summarizes the history of the legendary king of all Turks, Oguzkhan, and his descendants, as well as the origins of the Turkmen tribes. According to Abu-l-Gazi-Khan, the Shajarayi Tarokima was written at the request of Turkmen mullahs, sheikhs and beys. There are parts of this book that are similar to "Shajarayi Turk". For example: some of the events in the first chapter and the second chapter are written in the same way. Another

interesting aspect is that both books consist of 9 chapters. The second book of Abulgazi Bahodirkhan, "Shajarayi Turk" was written in 1663-1664. It describes the socio-political history of Khorezm in the first half of the XVI-XVII centuries. Regarding the reasons for writing the Shajarayi Turk, the author himself says: "But the indifference of our fathers and brothers and the ignorance of the Khorezm people are the two reasons why our church and Abdullah's fathers did not finish their history from the place where our fathers left us." , - he noted.

Abu-l-Gazi-Khan also mentioned that he started writing this book himself: We decided to offer this history to one person. We couldn't find anyone worthy. It was necessary. That's why we said it ourselves. There is a Turkish proverb: "The arrow cut its own navel", which means that there is no one worthy of writing the history of this period. And he starts writing this book himself. The book consists of a short introduction and 9 chapters. These chapters describe the dhikr (events) of those who ruled in the land of Khorezm from the creation of Adam to the descendants of Shayban. Abu-l-Gazi-Khan has already written a part of chapters VII, VIII and IX (history of events up to 1644). His book was left unfinished in 1664, when he fell seriously ill and died shortly thereafter. According to his testament, the book was completed by another man on the orders of Anushakhan (1664-1674) and a scientist named Mahmud ibn Mullo Muhammad Urganji, a continuation of Chapters I-VI and IX (events of 1644-1664). The following notes are written about this in the book: For this reason, Abulmuzaffar valmansur Anushakhan ibn Abulgazikhan, the deceased and the forgiving, said, ", - it is noted. The book contains a number of historical books written before Abu-l-Gazi-Khan. There are 18 of them. Only two of them are mentioned: Sharafiddin Ali Yazdi's ("Muqaddimayi zafarnoma") and the famous Iranian historian Rashiddin's "Jome ut-tavorix" ("History Complex"). This indicates that these books were used in the writing of the book. It is worth noting that the book has some similarities with the book of Mirzo Ulugbek (1394-1449) "Tarikh-i araba 'ulus" ("History of the Four Nations"). Evidence that he used this book as well, or that he made extensive use of this book in writing both books. The Turkish book consists of a light translation of the part of Rashid's book "Jome ut-tavorix" about the origin and emergence of the Turks. In addition, in writing the original part, chapters VII, VIII and IX, the author made extensive use of the information he knew and collected from inquiries. Chapter IX of the book is directly devoted to the socio-political history of 1512-1663. He gave a brief explanation of why the book was written in nine chapters. The foreword to the book states:

The date is one thousand seventy-four Hijri, so we started this book and named it Shajarayi Turk. We did nine chapters. These nine chapters are wonderful. For him, the rulers say, "Nothing is higher than nine, in the end it is nine." The sentence states that the number nine is sacred to the Turkish-Mongol peoples. There were different customs associated with the number nine. For example: the names of nine Uyghur people, gifts (nine horses, nine weddings, nine different dishes, etc.). According to Abu-l-Gazi-Khan, this custom was established in honor of 9 Turkish khans: Karakhan, Oguzkhan, Aykhan, Kunkhan, Tengiz and others. This information is ethnographically very important. There is another important piece of information in "Shajarayi Turk". It is reported that after the death of Turkhan, Tutak was replaced by him. One day, when Tutak is out hunting and eating deer, a piece of meat falls to the ground, and when he eats it, the meat becomes sweeter than before. From the time of Tutak, the Turkish people used to add salt to food. In this book, he gives the following description of the history of naming the Mongol people: "The original word of Mongol is Mangul. The meaning of "Ul" is a simple tongue, that

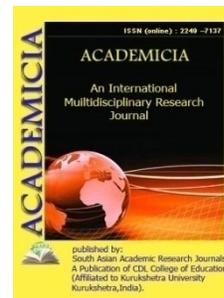

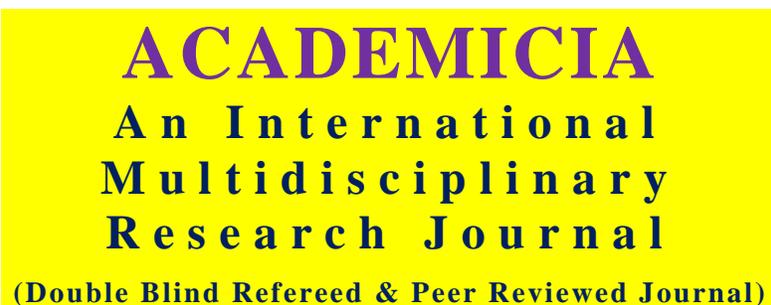

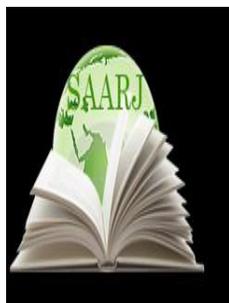

is, a sad simple temak. " The book begins with praise and blessings on Allah and His Messenger Muhammad (peace and blessings of Allah be upon him) in keeping with the traditions of the Middle East. Religious legends such as the creation of Adam, the flood of Noah, as well as the origin of the Turkish peoples, the birth of Oguzkhan, the relationship between Karakhan and Oguzkhan, Oguzkhan's Turan and India, The marches to Iran, Damascus, Egypt, the birth and political emergence of Genghis Khan, his relations with the Khorezmshahs, the conquest of Movarounnahr, Khorezm and Khorasan, the rule of his sons and grandsons in the conquered lands, and the kings of the Shayban dynasty who ruled in Khorezm important, reliable and valuable historical information.

Abu-l-Gazi-Khan also provided important information about how he entered the political arena in Khorezm. The play deals with the crisis of the Khorezm state and the personality of Jaloliddin Manguberdi (1098-1231). The Shajarayi Turk is considered to be an important source for all Turkish scholars, as it contains a wealth of valuable information about the customs, traditions, language, way of life, occupation and culture of the Turkish-Mongol tribes. This is very important ethnographically. The book also contains the names of about 40 Turkish-Mongol peoples and their genealogies. Another important aspect of the book is that it is written in a very simple language. He wrote in Shajarayi Turk that he did not use Chigatay Turkish: "I told this story in Turkish so that all great people and ordinary people could understand it. I didn't add a word of Persian or Arabic to Chigatoy Turkish. "This means that the book was written in pure Turkish, which is confirmed by the following information: We have not done any of this, so whoever reads and listens to this book will surely become a Turk. Shajarayi Turk is highly regarded by literary critics, orientalist and linguists. This book was first published in Kazan in 1825 by Count Ramantsev in the original text. The book "Shajarayi Turk" was translated into English, Russian, German, French and many other languages.

In short, "Shajarayi Turk" is rich important informations about the period from ancient times to the time of the Khanates, and this book is being studied with great interest by many scientists. To this day, the book has not lost its historical significance. Abu al-Ghazi Bahadurkhan's book "Shajarayi turk" deserves recognition as an important historical source.

ABSTRACT

The article deals with the establishment of equestrian clubs in the Surkhandarya oasis in the last century, the activities of masters of sports who grew up in them, the popularity of equestrian sports in the oasis, the worthy participation of oasis athletes in regional, national and union equestrian competitions.

KEYWORDS: *Master of sports, spartakiada, riders, "girl chase" competition, "Cotton holiday" sports competitions, "Pakhtakor" sports society, "Spartak" sports society, chavgon, "Boks", "Bazzafil", "Bedakur".*

INTRODUCTION

Equestrian sport is one of the ancient sports of the Uzbek people, which demonstrates the courage, bravery, agility and pride of the young man.

Today, the development of equestrian sports is clearly visible. In Tashkent, Fergana, Jizzakh, Kashkadarya and Surkhandarya regions, equestrian competitions and kupkars are often held. Sufficient attention is paid to improving the breed of horses, replenishing the ranks of athletes and riders at the expense of young people. This work, in turn, is yielding positive results, and world-famous riders are emerging. If we take the Surkhan oasis as an example, we can see that a lot of positive changes are taking place there.

The end of the third quarter and the fourth quarter of the last century entered the pages of history as a unique positive stage in the development of equestrian sports in the Surkhandarya oasis. In 1966, the first equestrian club was established in our region. The site for the club was selected and allocated from the collective farm named after U. Aliyev (former) in Sariosiya district. That year, work began with the participation of only two riders. It can be said that the opening of this

club was the prelude to the great work of the following years, the foundation of future great victories.

Since then, it has been observed that the level of interest in equestrian sports among the people is extremely high. In a short time, the number of members of the club exceeded thirty. As early as 1967, one of the members of the club, Robak Sigov, was nominated for Master of Sports. Badilla Buriev and Shamil Murtazaev became masters of sports of the first level. [1]

The members of the club went to the Republican Games in 1967 in preparation for it. They finished second in the Spartakiad. It was a huge success for the club members who had just started work. Soon the participants of the club took the first place in the competitions among rural athletes.

Of course, after that, the members of the club worked hard to further consolidate the achievements. Particular attention was paid to increasing the number of club members at the expense of energetic and talented young people.

Efforts were made to ensure that the athletes' skills continued to improve. It should be noted that the selfless man, the coach of the club, master of sports Stepan Vasilevich Ilyasov played a significant role in this work.

Of course, great things could not be accomplished by desire alone. In the first club, favorable conditions were created for training. Young people capable of equestrian sports are constantly involved in the club. Secondly, special attention was paid to the selection and care of purebred racehorses. Because good riders needed good horses. This later served as the basis for great success.

Later, taking into account the growing interest in equestrian sports in the district, a branch of the equestrian club was opened on the territory of the former collective farm "Communism". This, in turn, was a factor in the further expansion of the ranks of riders.

In 1971, a cotton festival was held in the Republic. It can be said that this holiday, with its richness in sports performances, aroused great interest among many. In particular, equestrian competitions attracted a lot of attention. Surkhandarya riders, who took an active part in these competitions, spoke again. The national team of our region, consisting of talented riders, took first place in these festive competitions and raised the flag of victory. Members of the regional equestrian club took an active part in 13 rounds of the competition program in classical equestrian sports. For example, Badilla Buriev, a student of school No. 56 in Sariosiya district, won the first prize in the crowd jumping competition, further strengthening the team's position. Mirza Tursunov, Mamat Khudoynazarov, Shamil Murtazoev and other skilful members of the team achieved great success in the competitions on jumping over obstacles. [2]

The second day of the competition began with the national equestrian sports. It is well known that overturning an opponent on horseback requires strength, agility and skill from the rider. Two participants of the regional team took part in the competitions in this round. Turob Mamashukurov and Ergash Suvonov from Surkhandarya impressed the audience, beating all rivals. They took first place with great honor and superiority.

Flyura Otakhonova and Ergash Suvonov from Surkhandarya took the second place in the competition "Kyz Kuvmoq".

Then began the championship in kupkari, one of the most popular and favorite types of equestrian sport. In this case, the riders of our region showed real skill. For example, such skilled riders as Turob Mamashukurov, Rakhmon Khushbokov, Layli Berdiev, Nurmon Boymurodov, Mamarayim Juraev, Rakhmat Omonov, Odima Zoirov, Bekmazar Kurbanov, Ergash Suvonov defeated the riders of Bukhara, Namangan and Kashkadarya regions one after another. Thus, for the first time, Surkhandarya athletes won the grand prize of the Republican "Cotton Holiday" sports competitions - the mobile cup.

MATERIALS AND METHODS

Speaking about the development and progress of equestrian sports in the Surkhandarya oasis, it is worth mentioning the organizers who have sacrificed and cared for this cause. The services of such leading officials as B. Omonov, U. Mamajonov, B. Kholmatov from Sariosiya were invaluable in the formation of a strong team of skilled riders in the region. Zokir Valitov, former chairman of the Pakhtakor Voluntary Sports Association of Sarnosiy district, has not only helped to increase the number of riders, but also to improve their skills, increase the number of thoroughbred horses and ultimately ensure the success of the team. In addition, it is worth mentioning the services of A.Dilmatov, T.Khalikov, B.Tashkulov.

Later, interest in equestrian sports began to be observed not only in Sariosiya district, but also in other districts. This time, in December 1970, the regional cotton festival was held in the territory of the collective farm "Namuna" in Termez district. The festival was attended by many spectators from different districts of the region. Renowned riders from almost all districts also came to demonstrate their skills. Then the riders had a great time. The riders raced a thousand meters. They rode along a special path. Thousands of spectators watched the riders without taking their eyes off them, shouting. F.Boymurodov, a rider from Namuna collective farm in Termez district, was the first to cross the finish line and won the race. The second place was taken by K.Murodov from Sherabad and Muhammadi Boykulov from Baysun. The riders also took an active part in the kupkari competitions held on the same day. In this case, the great interest in the masses was once again proved. It was a very interesting show. Kuldosh Yodgorov from Zharkurgan demonstrated in practice that he is a great rider and took the first place. Odina Zoirov, the Republican champion in equestrian sports, was awarded the second place. [3]

It should be noted that in those years, in the competitions in the classic equestrian sports, the riders of our oasis have always steadfastly defended the honor of our region. The coach of one of the sports clubs in Sariosiya district, master of sports Sharof Badalov, masters of sports from Sariosiya Isak Sodikov, Fayzulla Mirzaev raised the flag of victory in many competitions in classical equestrian sports. In other words, the same riders contributed to the further strengthening of the prestige of the regional team.

Later, an equestrian club was opened at the Istara farm in Qizirik district. Five breeds of horses were brought to the club from the former Union Central Horse Plant. Since the 1970s, there has been a growing interest and encouragement to establish equestrian clubs in the districts of the region. For example, the establishment of equestrian clubs in the collective farms named after Juma Pirnazarov in Sariosiya district, named after Akhunboboev in DeNOV district, named after P. Nabiev in Muzrabad district can be a bright proof of our opinion. Turob Mamashukurov, Zokir Valitov, Yuri Turin and Vladimir Favorsky were instrumental in finding, selecting and admitting talented young people to the clubs, improving their sports skills. Through their direct

efforts, many breeds of horses were brought from Dnepropetrovsk, Rostov-on-Don, as well as from the neighboring Republic of Turkmenistan. All of this work required a great deal of effort, hard work, and a love of sports. Shukur Irmatov, an experienced specialist and chairman of the Pakhtakor (former) Voluntary Rural Youth Sports Society, led the event. [4.26.]

The number of equestrian clubs increased to ten by 1970 due to the efforts of direct equestrian enthusiasts. There were 100 good horses and 135 of them. Thirteen of the trainees were first-class athletes. By 1990, equestrian sport had risen to a higher level in terms of quality and quantity. At that time, the number of equestrian clubs reached 14, the number of horses - 600, and the number of active riders - 856. 80 breeds of horses were brought from abroad. At that time, the number of masters of sports was 32, and the number of first-class athletes was 113. The heyday of equestrian sports was observed in those years. [5]

Analysis of evidence and figures shows that in 1970-1999 in the Surkhandarya oasis there was a great increase in the development of equestrian sports. In particular, in 1977 the establishment of a horse-drawn carriage in a beautiful place in Termez district paved the way for even greater work. It is no exaggeration to say that this was one of the most beautiful and envied horsemen of Uzbekistan. An equestrian school was established on the basis of Otchopar. Hundreds of young people began to develop skills at this school. This school has repeatedly helped the champions of Uzbekistan, masters of sports - Muhammadi Buriev, brothers Kholiddin za Isok Sodikov, Mirza Tursunov, Fayzulla Mirzaev, Adham Alpomishev, Muhiddin Jabborov, Valery Chekalin, Svetlana Chekhalima to conquer the ladder of mastery.

Boxes, Bazzafil, Bedakur and other thoroughbred horses, trained at the Termez equestrian sports school, have consistently won the Republican and former Soviet championships and spartakiads. In fact, our horses, nicknamed "Bazzafil" and "Bedakur", took part in the 1976 Olympic Games in Montreal, where they won under the leadership of Valery Dvoryaninov and won a gold medal.

RESULTS AND DISCUSSION

In the last quarter of the last century, kupkari developed rapidly in the territory of our region, and dozens or even hundreds of famous riders emerged. Significant progress has also been made in the breeding and breeding of domestic horses. During these years, Surkhandarya riders have won seventeen consecutive competitions in Tashkent on the occasion of the Harvest Festival. In addition, the riders of our oasis have won five kupkari competitions between the former Soviet republics. These competitions were held in 1974 in Bishkek (Kyrgyzstan), in 1976 in Almaty (Kazakhstan), in 1982 in Dushanbe (Tajikistan), in 1985 in Pyatigorsk (Russia), in 1987 in Tashkent (Uzbekistan). It should be noted that the national team of Uzbekistan, which took part in these prestigious competitions, consisted mainly of skilled riders from Surkhandarya. Fans still remember that the honor of the national team was defended by the famous runner, coach Turob Mamashukurov, Odina Zoirov, Ergash Suvonov, Holly and Saman Yusupov, Kurbanmurad Kholmurodov, Tovashar Niyazov, Chori Norboev, Shoberdi Gundaev, Tura Kholmatov, Omon Juraev. [6]

It is necessary to speak again and again about the Termez equestrian, which has made a great contribution not only to the region, but also to the development of equestrian sports in our country. 300 hectares of land were allocated for the horse-drawn carriage. A new garden was built here. Initially, 50 students from grades 5-10 were involved in the equestrian school

established under the auspices. Famous equestrian coaches began to teach them equestrian sports. The famous riders who grew up later belonged to this school.

Karim Mardonov and Muhiddin Jabborov, students of this equestrian school, became candidates for masters of sports at the Republican Youth Games in Tashkent in May 1980, and Turgun Sunnatov and Bahodir Hayitov became first-class athletes.

In October 1979, equestrian competitions for the Republican Prize were held in Termez. It was attended by more than 120 masters and famous riders from the Central Asian Republics and all regions of the country. Horsemen from Surkhandarya, such as Kholiddin Sodiqov, Mirza Tursunov, Marat Mamadiyorov, demonstrated their skills in these competitions and became masters of sports.

In May 1954, the Central Asian Equestrian Championship for the prize of Uzbekistan was held in Tashkent and Chirchik. Along with the national teams of Kazakhstan, Turkmenistan, Kyrgyzstan and Uzbekistan, riders from Surkhandarya, Tashkent, Fergana and Andijan regions also took part in the championship. Olga Fedulova and Bakhtiyor Yorov, our young riders, became masters of sports. Olga Fedulova, Alexander Fedulov and Valery Chekalin have been included in the national team of Uzbekistan. [7]

Valery Chekalin, who competed in the former Union Championships, took third place and won a bronze medal.

It should be noted that in those years, the members of the equestrian club, which was opened on the territory of the Akhunboboev collective farm in Denau district, also achieved great success. In a short period of time, the number of young people participating in the sports club has significantly expanded. Here the training of horses became an intensive part of the training of young athletes. Master of sports Jura Mamatov and a leading specialist in equestrian sports Fayzulla Mirzaev enthusiastically joined this work. Directly under their leadership there was a strong movement. At that time, the club had 16 horses at its disposal. Seven of them were thoroughbred horses. Complex exercises such as putting horses into play, jumping from heights, and overcoming obstacles were performed on a regular basis. There were 20 riders involved in these exercises. They learned to move left-handed on horseback. Young riders Munira Jalitova, Abdusamad Rakhmatov, Nemat Jumaev, Abdurahmon Hayitov have achieved significant success. They took an active part in regional competitions and won the right to participate in Republican competitions. Club members have won over the years.

As we turn the pages of history, we come across interesting facts and figures. Here we would like to cite another example from the past many years. In October 1975, equestrian competitions among riders of the former Soviet Union were held in Rostov-on-Don. On the field, the chagon game was getting hotter and hotter. The riders were working hard to bring extra points to their teams. The referee's whistle blows when the game reaches its climax. He scored an eleven-meter penalty kick towards the goal. The captain of the national team of Uzbekistan Kurbanmurad Kholmurodov scored the penalty kick. People still remember that the ball was clearly aimed at the goal. A few minutes later, the referee's whistle blows. It was a sign that the game was over. So, in this game, the hands of the Uzbek riders were high. At the equestrian competitions held here, riders from the Central Asian Republics competed in kupkari, equestrian basketball and Surkhan games. In these games, our compatriot Kurbanmurad chapagon Kholmurodov actively

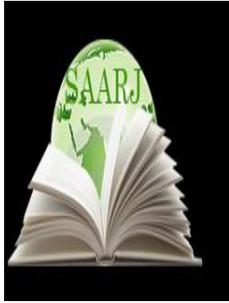

participated in the national team of the Republic and achieved great success and won the national championship. From then on, this rider's stellar career in equestrian sports began. [8.78-82.]

CONCLUSIONS

In conclusion, the last quarter of the last century went down in history as a memorable period in the development of equestrian sports in the Surkhandarya oasis. During these years, the classic types of equestrian sports became widespread in our region and developed rapidly. Our riders, who rode fast on the fields of the world, showed great skill. At the same time, thousands of our young people began to look at equestrian sports with great interest and love. Secondly, they also have extensive experience in the restoration, cultivation, reproduction and maintenance of the park. The acquired skills helped him a lot in his later work.

FACTORS OF INCREASING SOCIO-ECONOMIC EFFICIENCY IN SERVICE ENTERPRISES

Baxit Abdireymovich Ismailov*

*Karakalpak State University,
 UZBEKISTAN

Email id: Ismailov_Bakhit79@mail.ru

ABSTRACT

This article classifies the factors influencing the socio-economic efficiency of service enterprises, structural changes in the industry, sources and directions of socio-economic efficiency, the role of the human factor in improving socio-economic efficiency, labor potential and quality of services to consumers, service processes, areas for improvement have been explored.

KEYWORDS: *Service Economy, Socio-Economic Efficiency, Factors, Labor Potential, Service Quality, Service Process, Consumers.*

INTRODUCTION

In the current situation, the socio-economic development of sectors and industries of the country should be based on a qualitatively new system, and this system should be characterized by specific laws of operation and regulation. The regulation of the service process and the formation of a special institutional system of new approaches will allow to achieve the set strategic indicators of development in all sectors and areas of activity.

The new economic relations that have emerged in the country on the basis of economic reforms implemented during the years of independence have created favorable conditions for the development of the service sector. That is, economic reforms have allowed to improve the activities of service enterprises and organizations, the emergence of new forms and methods of service.

Today, in the process of modernization of the economy of the republic, the steady economic development of enterprises in the service sector requires the improvement of mechanisms to increase socio-economic efficiency, which is an important factor in ensuring the intensity of their economic activities. In this process, the tasks related to the mechanism of improving the efficiency of service enterprises, increasing labor productivity in enterprises, economical use of

economic resources, achieving efficiency in the use of labor resources, ensuring the quality and efficiency of services produced, fully meeting the needs of consumers is one of the problems. This is one of the urgent tasks to increase socio-economic efficiency by improving service processes in the industry.

LITERATURE REVIEW

The scientific literature has scientifically and theoretically and methodologically studied some aspects of the efficient use of resources in the service economy, the achievement of socio-economic efficiency of services, improving the quality and competitiveness of services provided by businesses and improving service processes.

Avanesova G.A. [1, p. 215] in her work explored the effective use of resources in the service sector, increasing socio-economic efficiency in the field, improving the quality of services provided to consumers in accordance with their needs, achieving labor efficiency.

In the work of Erofeeva A.P. [3, p. 141] to improve the process of service in enterprises, ensuring the competitive advantage of service entities, the relationship of quality of services in the industry with their consumer characteristics, criteria and indicators of service quality assessment the processes of modernization of personnel management system are studied.

The textbook, edited by Pardaev M.K. [4, p. 133], examines the problems of development of services, services and tourism, ways of efficient use of labor resources in the service sector, factors and directions to increase labor productivity. Also, the social, economic and institutional bases of the development of the service and tourism sectors have been scientifically studied in this regard.

Qualitative and quantitative assessment of economic growth factors in the service sector, based on previous research in this article, to determine the contribution of each of these factors to the growth of the service sector and industry is still an important scientific issue. The works of the abovementioned authors identify general aspects of economic growth based on an assessment of the impact of various factors on socio-economic efficiency. In this study, the factors and directions of increasing socio-economic efficiency in service enterprises have not been systematically studied. Accordingly, the scientific essence of our research is that ways to increase socio-economic efficiency in service enterprises have been studied.

RESEARCH METHODOLOGY

The study used a dialectical and systematic approach to the study of economic systems and ratios, complex assessment, comparative and comparative analysis, statistical and dynamic approaches, and grouping methods to increase economic socio-economic efficiency in service enterprises.

Economic efficiency reflects the results of the activities of entrepreneurs, while social efficiency reflects the social efficiency of economic entities, its impact on various aspects of society. At the same time, social and economic efficiency were found to be somewhat interrelated. In addition, the indicators of economic efficiency in the service economy were classified and factors for improving labor efficiency were studied.

Analysis and results

For the successful implementation of strategic tasks in the field of increasing socio-economic efficiency in service enterprises, the study of factors influencing the full use of resources is of paramount importance for improving the scientifically based framework for planning and analysis of social and economic indicators and production processes.

High rates of efficiency of the organization of economic activity in the enterprises as a whole provide scientifically based use of complex factors influencing socio-economic efficiency. This is especially relevant today. It is especially important to develop measures to ensure that most companies operating in the country survive at the expense of resources that do not require large expenditures.

However, in modern management theory and practice, theoretical and practical developments on this topic are insufficient. This leads to the fact that at present, the issues of assessing the impact of various factors are either addressed from the point of view of common sense, without taking into account the real state of the economic situation or a generalized presentation of various similar indicators. The question of the correct classification of factors influencing socio-economic efficiency is important. It should be noted in the structure of such a classification that these factors are affected not separately but interrelatedly.

The theoretical significance of the classification of factors affecting socio-economic efficiency is that it allows to fully reveal the essence of efficiency, taking into account certain areas of enterprise activity, to determine the ratio between factors, to highlight the characteristics of individual factors. The use of such a classification allows to determine the individual impact of each factor on the basis of prevention of recurrence, as well as to take into account the effectiveness of factors that allow to accurately identify and use the growth of socio-economic efficiency as a whole.

Recommendations for the classification of factors for increasing the efficiency of human resource use in service enterprises have been made several times in the economic literature. According to the general principle, this classification was, in their essence, a combination of factors in a larger or smaller range in an enlarged group. Factors affecting socio-economic efficiency in service enterprises should be classified according to the purpose of the study. In the analysis process, this classification is used not only to assess the achievement of the planned level, but also to determine the actual impact of individual factors on socio-economic efficiency [1, p. 137].

There are various factors and key areas for increasing socio-economic efficiency in service enterprises. The available factors can be divided into groups according to three characteristics: by source, by key areas of production development and improvement, by the role of factors, and by the level of implementation.

The classification of influencing factors according to the sources of increasing socio-economic efficiency helps to determine at what expense social labor savings can be achieved. In this regard, the main factors include: labor capacity, material capacity, capacity of funds and reduction of capital requirements, rational use of resources and time savings. However, such classification does not meet sufficient demand. To find answers to these questions, it is necessary to group the total factors of increasing socio-economic efficiency by key areas of production development. They consist of a set of physiological, technical and technological, organizational-

economic and socio-psychological measures aimed at saving social labor. These areas are diverse. The most important are:

- improving the content of services;
- development of innovative activity, increase in technical and economic level of service processes, reduction of time of introduction of innovations;
- increase the level of specialization, cooperation and territorial location of service processes;
- improving the management structure, financing, economic evaluation, lending and incentives;
- to increase the professional activity and initiative of employees based on the development of cognitive factors.

Modernization of service processes and deepening of reforms in the sector are the main directions of increasing socio-economic efficiency. One of the main directions of increasing production efficiency in service enterprises is to accelerate the development of science and technology. The technical and technological factor provides at least two-thirds of the increase in labor productivity.

TABLE1. CLASSIFICATION OF FACTORS AFFECTING THE PRODUCTIVITY OF EMPLOYEES IN SERVICE ENTERPRISES¹

Factors	The content of the factors
Physiological	Gender, age, health, mental ability, physiological ability, etc.
Technical and technological	The nature of the issues to be addressed, the complexity of labor, technical innovation, the level of use of scientific and technical achievements, the technical and economic level of production, the level of armament with funds, etc.
Organizational	Working conditions, ratio of personnel categories, size of the enterprise, work schedule, length of service, qualifications of employees, level of staff use, etc.
Socio-economic	Material incentives for workers, insurance, social benefits, living standards and quality of life, and more.
Socio-psychological	The spiritual environment in the team, the psychophysiological state of the employee, status and recognition, the organizational culture of the enterprise, employee satisfaction with the work, the prospects for promotion, and more.

Therefore, it is a key factor in increasing socio-economic efficiency in the industry, and also involves the identification of factors that affect the efficiency of staff labor. Based on their economic nature, we propose the following classification of factors influencing the labor efficiency of employees in service enterprises (Table 1).

Today, in order to comprehensively study and understand the social and economic efficiency of the service sector, it is necessary to develop its own criteria and indicators. However, this does not mean that the criteria and indicators of social and economic efficiency are not interrelated. On the contrary, they are inextricably linked and complement each other.

If economic efficiency in the service sector is not calculated and measured in terms of quality, it is impossible to carry out the work set for its steady increase. Criteria and indicators of efficiency in service enterprises, such as certain sectors of the economy, are divided into criteria of economic and social efficiency. In the study of economic efficiency in the service sector, it is important to correctly understand and calculate its essence, criteria and indicators. If economic efficiency is not qualitatively calculated and measured, it will not be possible to carry out the planned measures to increase it on a regular basis.

There is currently no single approach to setting general criteria for the efficiency of service enterprises. According to some economists, the criterion for the effectiveness of economic activity is to fully meet the needs of the population with a high level of service and rational use of all resources.

While many economists say that the level of satisfaction of consumer demand for consumer goods is a general criterion of service efficiency, others say that the efficiency of the service process should be determined by a system of interrelated key indicators, the amount of gross income generated by this system, which fully reflects the amount of services provided to the population.

A comprehensive analysis of the efficiency of business enterprises should not be limited to its criteria, as the criterion mainly reflects the essence and main objectives of efficiency, but can not serve as a means of measurement and evaluation. These tasks are performed by performance indicators.

Achieving high efficiency in service enterprises on the basis of full and quality satisfaction of the population's demand for services through the efficient use of material, financial and labor resources is the main criterion for the effectiveness of service activities (Table 2).

The growth of economic efficiency is an objective law of development of any form of production, because the development of society requires an increase in the volume and quality of products, a decrease in production and transaction costs, an increase in capital to implement expanded reproduction. The essence of economic efficiency is the result obtained per unit of resource expended. It is well known that results and costs summarize key aspects of the recycling process, with the service enterprise interested in achieving high efficiency at low cost. This network is a general economic principle of the process of mass production and circulation, which emerges as a law that increases the efficiency of activities, which consists of the relationship between the use of resources and its consequences. [3, p. 45].

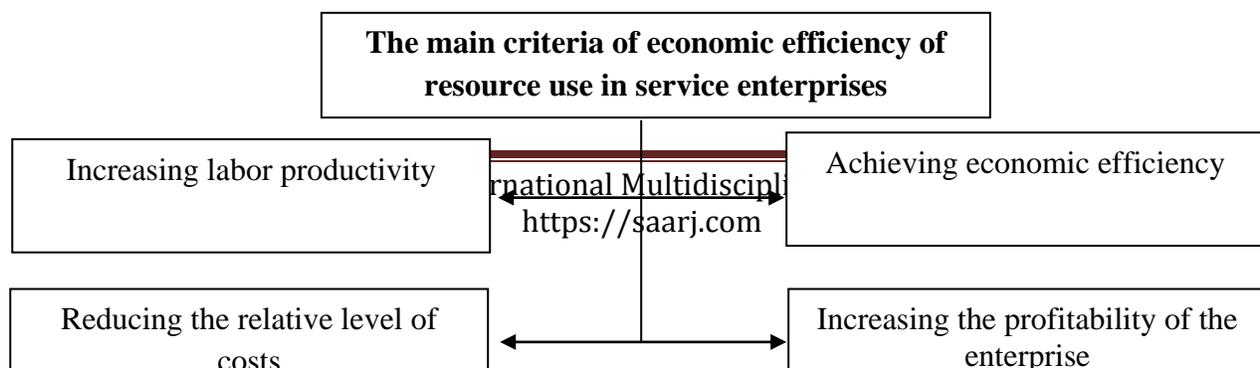

TABLE 2. DIAGRAM OF THE MAIN CRITERIA FOR COST-EFFECTIVENESS OF RESOURCE USE IN SERVICE ENTERPRISES²

Although the concepts of social efficiency and effectiveness are found in many economic literatures, there is still no clear answer to the question of how the criteria and indicators of social efficiency and effectiveness are evaluated and calculated.

In general, the achievement of the social goal of a society, which aims at the comprehensive and harmonious development of man, is a criterion of social effectiveness. There are different views on this concept. At the current stage of development of society, the criterion of social effectiveness is a tool that promotes the development of a harmoniously developed person. Social effectiveness has not one, but several criteria. Its first criterion is the level of satisfaction of the needs of the people and the improvement of the social structure of society, while the second criterion is the reduction of consumption processes that indirectly affect the growth of efficiency (Table 3).

In our opinion, it is understood to fully meet the demand for socially effective goods and services as a service sector by providing high sales services, improving the working conditions of the service enterprise with quality business activities, increasing the level of staff funding and service culture.

It is understood that the efficiency of resource use in service enterprises is directly related to and inextricably linked to the above criteria of economic and social efficiency, and is reflected in the economic relations of the balance of social and economic efficiency in achieving economic results.

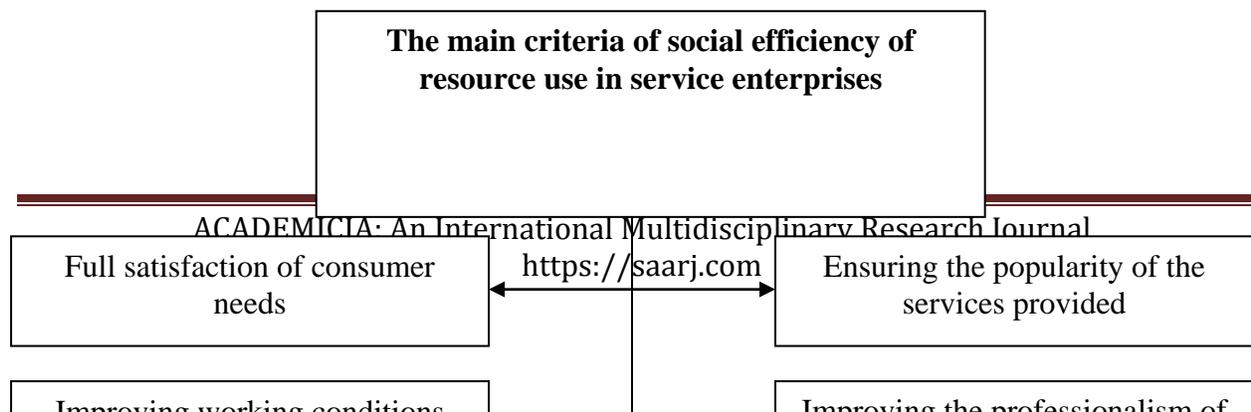

TABLE 3. DIAGRAM OF THE MAIN CRITERIA FOR SOCIAL EFFICIENCY OF RESOURCE USE IN SERVICE ENTERPRISES³

Economic efficiency is the result of the activities of economic entities, social efficiency is the social efficiency of economic entities, its impact on various aspects of society. In this case, social and economic efficiency were considered to be to some extent inextricably linked. Social efficiency is the improvement of the social life of the people, which serves to increase economic efficiency [6, p. 95].

Ultimately, it has a positive impact on the employee's ability to work and creates conditions for increasing labor productivity. Accordingly, there must be an economic basis for the implementation of a clear social program. This economic basis is achieved by increasing the economic efficiency of service enterprises.

Thus, the new essence of effective activity in the service economy can be summarized as follows: the achievement of performance efficiency is not determined by the content of the concept of efficiency, but is assessed by indicators of social efficiency. These indicators have a broader meaning than indicators of economic efficiency. Changes in the quality indicators that make up the efficiency show the need to assess the effectiveness of business entities. Accordingly, social efficiency cannot be reduced to a precise quantitative measure. This can only express the economic nature of efficiency in the traditional way, its social and socio-economic aspects are difficult to measure by quantitative criteria. Such an approach is now widespread in economics. At the same time, research on the evaluation of efficiency in the service economy is becoming more relevant, and the demand for research in this area, in our opinion, is much higher.

In the system of indicators of social and economic efficiency of service enterprises, the indicators of efficient use of economic resources have a special place.

The relationship between the growth rate of labor productivity in service enterprises and the reduction of labor capacity of the product is characterized by the following formula:

$$MY_{yc} = \frac{M_{cuz} \times 100}{100 - M_{cuz}}, \quad (1)$$

there: MY_{yc} – labor productivity growth rate;

M_{cuz} – labor capacity.

$$MC_{nac} = \frac{MY_{yc} \times 100}{100 + MY_{yc}}, \quad (2)$$

there: MY_{yc} – the rate of growth of labor productivity relative to the base period (%);

MC_{nac} – decrease in labor capacity over the base period (%);

The total increase in labor productivity (ΔMY) in service enterprises is divided by the increase in the volume of services provided and the decrease in the number of employees, and it is determined by the following formula:

$$\Delta MY = \frac{100 \times (\Delta B + \Delta IC_{\kappa})}{100 + C_{\kappa}}, \quad (3)$$

there: ΔB – increase in production volume in the reporting period at the enterprise, %.

ΔIC_{κ} – reduction in the number of employees in enterprises, %.

If the number of employees in the enterprise does not decrease, and vice versa increases, then the percentage of the number of employees is expressed in reverse.

The contribution of net product growth due to increased labor productivity in service enterprises D_{cm}

$$D_{cm} = \left(1 - \frac{\Delta Y_u}{\Delta Y_{cm}} \right) \times 100\% , \quad (4)$$

there: ΔY_u – the growth rate of the number of employees in service enterprises %;

ΔY_{cm} – growth rate of pure product production, %.

For a comprehensive and comprehensive analysis of the efficiency of service enterprises, generalized indicators are used along with its specific indicators. Generalized indicators in the economic literature include such indicators as: profitability of the enterprise, the relative level of costs, the efficiency of fixed and working capital, the fund efficiency of all resources expended.

Profitability of the enterprise is one of the performance indicators of the service enterprise. Profitability of the enterprise (R_k) is determined by the percentage of net profit in the service sector to the total amount of fixed and current assets of the enterprise:

$$R_k = \frac{C\Phi \times 100}{\sum A\Phi + \sum HAA}, \quad (5)$$

there: $C\Phi$ – net profit margin

$\sum A\Phi$ – the total value of fixed assets;

$\sum HAA$ – the amount of current assets under the norm.

Achieving the ultimate social goal of a society that aims to create opportunities for all-round and integrated human development is a key criterion of social effectiveness.

The next criterion of social efficiency in the sectors and industries of the economy is to reduce consumer spending, which indirectly affects the achievement of social production efficiency.

Social efficiency in the service sector cannot be measured on the basis of a single criterion, as the criteria for the social efficiency of the development of the sector are different. If the criterion of social efficiency reflects its content and objectives, the indicators serve as a tool for evaluating efficiency [4, p. 114].

Statistical indicators of social efficiency in service enterprises and organizations can be divided into the following groups:

1. Statistical indicators of consumer satisfaction;
2. Indicators of reduction of service time;
3. Statistical indicators of improvement of working conditions and nature.

Indicators that fully meet the needs of consumers include the following: volume of services per capita; volume of gross services per capita; growth rate of services provided; indicators of reduction of service time; coefficient of reduction of time spent by consumers in service enterprises and organizations; time spent on service of one consumer; the time spent for each customer to re-visit the service facility. This figure indicates a decline in social effectiveness; the amount of time spent for a person who needs to be serviced once in a moderate amount.

Indicators of working conditions and the nature of work in service enterprises include: automation of labor processes (the level of application of new equipment and technologies); the level of modernity of buildings and structures of enterprises; the level of use of advanced labor experience in the service process; level of advanced techniques and technologies, equipment and mechanisms; qualification, education and professional level of employees engaged in service; the level of organization of training, retraining, advanced training of personnel required for the service sector.

CONCLUSION AND RECOMMENDATIONS

In the system of indicators of social and economic efficiency of service enterprises, the indicators of efficient use of economic resources have a special place.

To increase the socio-economic efficiency of service enterprises, it is necessary to implement the following measures:

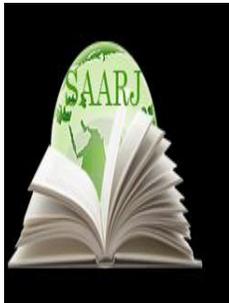

- ensuring the balance of jobs in terms of quantity and quality with available labor resources;
- creation of effective ways to increase the volume of production or services based on the participation of labor resources in labor activities;
- mechanization and automation of service processes;
- improving the conditions and forms of employment;
- improving the quality of labor resources;

- improving the professional level of labor resources.
- Increasing labor productivity in service enterprises should be done in the following stages:
 - definition of goals and principles of increase of labor productivity;
 - development of the necessary tools (planning the service process, evaluating the effectiveness of the use of reserves to increase productivity, etc.);
 - identification of reserves and opportunities to increase labor productivity;
 - labor productivity growth planning (targeting of planning indicators, system of other indicators of measurement (for example, product quality, quality of life, innovations), methods of assessment and control, list of specific actions to be taken, identification of responsible persons);
 - development of measures to ensure continuity of labor productivity monitoring and control of its dynamics;
 - evaluate the effectiveness of measures to increase productivity.

Thus, the intensification of service processes aimed at increasing efficiency in service enterprises is of particular importance. This process requires the use of innovative management methods and technologies in the production of services. This process will not only increase the use of innovative factors of service, but also improve the quality of services provided.

THEORETICAL ISSUES OF ENTERPRISES INNOVATION AND ITS MANAGEMENT IN INCREASING THE COMPETITIVENESS OF PRODUCTS OF INDUSTRIAL ENTERPRISES

Dildora Rakhmonberdievna Tukhtasinova*

*Senior Lecturer,
Fergana Polytechnic Institute,
UZBEKISTAN

ABSTRACT

This article discusses issues related to the competitiveness of industrial products, the role and management of innovation, clarifies the meaning of the terms and develops relevant scientific conclusions and recommendations.

KEYWORDS: *Innovation, Innovation Potential, Combination, News Diffusion, Science And Technology Development, Technology, Competitiveness, Economics, Economic Growth.*

INTRODUCTION

In the context of digitalization of the country's economy, the wide use and management of the innovative potential of industrial enterprises play an important role in increasing the competitiveness of industrial products. Numerous scientific studies can show that innovation is recognized as one of the most important factors driving economic development. At the same time, it should be noted that innovation is a separate source of growth that ensures the development of not only the economy but also the entire system.

Main part

Since the late 70s of the twentieth century, the concept of "innovative potential" began to actively enter the science, and a number of scientists have conducted research in this area. It should be noted that although there are a number of definitions of innovation, there is no single universally accepted definition of this concept. Each scientist approached from the perspective of his or her own research and the characteristics of his or her own state. Therefore, the absence of a universal innovation theory [1] has led to the emergence of many meanings and concepts. The first scientist to define the concept of innovation was J. Schumpeter. In 1911, he described

innovation in his Theory of Economic Development. He used the terms "creative state" and "new combinations" [2] and meant:

- production of a new product or improvement of product quality;
- creation of a new method of production;
- conquest of new markets;
- conquest of new markets for raw materials and semi-finished products;
- Implement organizational changes.

In the development of the world economy, the management of large companies and any changes in their economic activities will increase the positive and negative effects on the world economy. "By the beginning of the 21st century, more than 80,000 companies with more than 700,000 foreign branches are registered, and the total foreign exchange reserves of multinational companies are several times greater than the combined reserves of all the world's central banks. A 1-2% shift in the amount of money in the private sector could change the parity of any two national currencies. " The management structures of companies are based on the internal interrelationships of companies. According to UN experts, more than 60% of foreign branches and companies of TMCs belong to the United States, Britain and Japan. A list of well-known and well-known US companies has been compiled and compiled by Forchun magazine. It is evaluated on a 10-point scale and studied on eight indicators. They are formed on the basis of indicators such as quality of management, quality of products and services, introduction of innovations into the life of the company, attracting talented people to the company, promoting sustainable development, promoting narrow and large-scale development of society. In their joint research, James D. Mooney and A. K. Reilly focused on modern management at General Motors. The main goal of the research is to increase the efficiency of the organization in the broadest sense. Today, a new direction of the corporation is to study the problems of the general public management of the corporation. In the late twentieth century, modern management systems began to be introduced in 1,200 large firms. Transnational companies are located in the United States, Western Europe, Japan, they have undergone the process of diversification and localization of their activities. Large corporations have new innovation centers, such as the Central Service. These centers began to be established after the companies deepened their specialization processes. They began to take on new responsibilities in the company's operations. The centers create a unified management system, which includes such departments as the service structure of the organization, marketing department, planning, public relations department, legal department, management structures. Their main task is to service production, minimize production costs, develop ways to achieve high profitability. Innovation centers serve to accelerate scientific and technological progress, the development of scientific research, experimental and design development. As a result of the activities of such innovation centers, computer technology began to enter the activities of multinational companies. As a result, new technological platforms have been formed with the application of new technologies in practice. It is understood that the automation of working machines, the modernization of technological lines and blocks, the introduction of information technology (IT), its widespread use in the production of programmed robots and microprocessors. As a result, compact automated production systems began to take shape. And to achieve high efficiency, multi-nomenclature and multi-series

production has been developed. Flexible-manufacturing systems are manufacturing processes that are highly automated and have no losses in compact production.

Compact manufacturing was formed in the 1970s under the influence of intensification of production with the application of new technologies in many large companies. Compact production was one of the most popular types in the United States and now in Japan. Compact production is changing and evolving from year to year through the practical application of new technologies.

RESULTS AND DISCUSSION

German researchers Jürgen Hauschildt and Klaus Brockhoff are among the scientists who have conducted research on innovation. How the process of producing the innovations described by them [3] is important. It is especially important that Brockhoff distinguishes between the origin of the idea, the invention itself, and the processes that shape the production of a ready-to-sell product. In the above steps, he described the concept of innovation in more detail, taking invention and product creation as the basis for understanding innovation. Each stage involves the decision-making process of accepting or rejecting an idea, its technological suitability, and the proposed economic achievement. Broadly defined as a set of scientific and technical capabilities of the economic system, the existence of a fund of ideas and developments, which characterizes the scientific and technical potential, the level of development of this system, depending on the quality and quantity of resources. In the process of practical implementation of innovations, the application of scientific and technical potential occurs. Scientific and technical potential is characterized, on the one hand, by the real possibilities of objective use of the achievements of the state in science and technology (FTT), and, on the other hand - by its direct participation in it.

The analysis of the work of scientists conducting research in this area revealed the following conclusions and differences in the views of scientists on the subject, object of innovation:

First, scientists B.Twiss, V.Rappoport, V.L.Makarov, I.E.Artemev, who considered innovation as a process, believed that innovation is a process that occurs as a result of new changes in social and economic life as a result of social activity. However, the innovation process consists of a series of stages and cycles. One of the innovations will come in before it is completed, continuous innovations such as the theory of “news diffusion” will be developed and will continue to penetrate all systems.

Second, according to scientists N.I. Lapin, A.I. Kabanova, A.N. as a system. As a result of innovative activities, the use of new types of raw materials, the emergence of new types of products, services and the creation of new jobs.

Thirdly, S.D. Beshelov, F.G. Gurvich considered that innovation is a result. According to them, the results achieved as a result of innovative changes in the management of enterprises and economic, social, scientific and technical changes were considered important.

Fourth, according to scientists F.Valenta, Yu.V.Yakovets, L.Vodachek, who believe that innovation is a change, under the influence of innovations there are clearly targeted changes.

Hence, the concept of scientific potential is inextricably linked with the concept of scientific and technical potential. Scientific potential is a set of resources and conditions aimed at the implementation of scientific and fundamental research. Scientific and technical potential is a set

of conditions and resources (primarily scientific and technical) for the implementation of applied research, including experimental design and technical work.

Thus, scientific, scientific-technical and innovative potentials are interrelated and complementary components of a single innovation cycle: the emergence of ideas - fundamental research - applied research - experimental design and technical developments - experimental design - industrial testing - mastery in production - serial production - commercialization - practical application of the product (machinery, equipment, technology).

Innovative activity of any system is one of the main directions that ensures its profitability, high rate of development and competitiveness. The concept of innovative potential includes the number of organizations engaged in various developments and research, productivity, efficiency, intellectual property, innovation specialists, scientists, staff, funding and material production base, scientific information in the country and abroad, innovation and innovation activities is a resource for innovative activities that includes information, scientific schools and their role in national and world science [4].

CONCLUSIONS

In our opinion, innovative potential is the development of new developments, discoveries or inventions, utility models, their introduction into any business entity, regardless of the enterprise, organization or industry in general, the form of ownership, organizational and legal status, size. is the sum of all available intellectual, financial, personnel, information, logistical and other resources and capabilities for effective use in its activities.

as a set of resources that can be involved in the implementation of innovative activities;

as an opportunity to carry out innovative activities;

as a preparation for innovative activities;

as an opportunity and readiness to implement innovative activities;

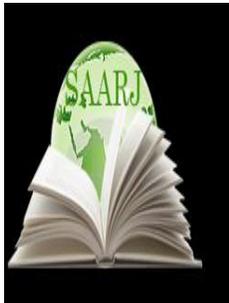

as the ability to carry out innovative activities.

In conclusion, the above approaches have the power to interact, to have innovative activities, the ability to have a number of opportunities, which in turn is one of the important conditions that provide the opportunity and the necessary level of readiness to realize innovative potential.

ABSTRACT

Our approach to the problem has to do with trying to raise its relevance in terms of a systematic approach to the organization of extracurricular activities that is relevant to the current socio-cultural situation. In organizing extracurricular activities in the middle grades, the teacher should take into account the psychological characteristics of students. This helps him not only to build the learning process competently, but also to ensure that students master the learning materials with high quality. In this article pedagogical and psychological factors of the organization of science circles is researched and illuminated.

KEYWORDS: *Extracurricular Activities, Circles, Science, Pedagogical, Psychological, Groups, Mother Tongue.*

INTRODUCTION

Extensive work is being done in our country to bring up and bring up a harmoniously developed young generation that is physically healthy, spiritually mature, independent-minded, has deep knowledge and a modern outlook and is able to take responsibility for the fate and future of our country being carried out.

At the same time, the implementation of five initiatives, including comprehensive measures aimed at creating additional conditions for the education of young people, in the rapidly developing socio-political, socio-economic and other spheres in the country. reforms to further develop the talents of adolescents, to train highly qualified personnel, to further increase the effectiveness of out-of-school education in the public education system, to develop high moral qualities in students, to organize their leisure time meaningfully One of the priorities of today is

to ensure their active participation in the development of the country, preparing them for independent life through vocational guidance.^[1]

An important requirement today is to develop scientifically based methods of the organization process, taking as a scientific basis the pedagogical and psychological factors of the organization of science circles. Equipping field leaders with specialized knowledge and skills requires a theoretical and practical justification of key aspects of out-of-school education management. This situation helps to properly address the problems that arise in the management process, as well as out-of-school education.

MAIN PART

Extracurricular education can rightly be called an integral part of modern society. It requires constant attention and support from society and the state as an education that organically integrates the upbringing, education and development of the student's personality.

Extracurricular activities on the subject of mother tongue perform the following tasks:

- improving the knowledge, skills and abilities acquired in native language classes;
- broadening students' worldviews;
- increase interest in the subject;
- Effective use of free time;
- meeting cognitive needs;
- Creativity, independence of students;
- Linguistic knowledge;
- developing oral and written speaking skills;
- To form love and respect for their homeland and people.

An important factor in the successful implementation of these tasks is to take into account the psychological and pedagogical features of teaching circle lessons in the native language.

In organizing extracurricular activities in the middle grades, the teacher should take into account the psychological characteristics of students. This helps him not only to organize the learning process competently, but also to ensure high-quality mastery of learning materials by students.

Based on the spiritual and physical development of the student, he develops scientific-theoretical and logical thinking, develops objective and mental actions, and develops problem-solving skills by performing extracurricular tasks. Students who take part in the club develop the ability to adjust their actions to the planned result, to critically evaluate the results of its activities^[2].

The tasks of forming a creative approach to learning in schoolchildren, the formation of activity and independence in the search for knowledge are especially relevant today. High school plays an important role in developing the independence of thinking, activating each student's cognitive interest and his or her creative abilities.

The modern stage of historical development is characterized by huge dynamism, global contradictions, radical changes in all spheres of social life. This has led to the emergence of various uncontrolled processes that require a rethinking of areas of public life, established views and opinions, including in education and upbringing. Many pedagogical innovations are aimed at schools and teachers, distracting attention from the assimilation of knowledge, developing the child, creating conditions for a full life of childhood, the ability to think, communicate, understand others and themselves, and the ability to form a willing individual (as the main goal of education) is an important factor in making independent responsible decisions. In this context, the systematic conduct of extracurricular activities in the native language remains relevant. Unfortunately, at present, such work is not carried out at the school level.

"The mother tongue is the greatest teacher," said the great scientist Kdushinsky. Indeed, language enriches and develops a child's spiritual world both before and during school, introducing him or her to the moral norms of life, the customs and attitudes of people. From an early age, children develop language skills, speech creativity, aesthetic sense, love of art.^[3]

Unfortunately, the enormous educational potential of the mother tongue is not yet fully exploited in school. The number of problems that occur in secondary schools is very high. Some of them are of a general nature, others are related to the teaching of individual academic subjects.

All this cannot but affect the organization of extracurricular activities on the mother tongue in school. The fact is that the problem of organizing extracurricular activities in the native language has been studied to some extent by some teachers.

Our approach to the problem has to do with trying to raise its relevance in terms of a systematic approach to the organization of extracurricular activities that is relevant to the current socio-cultural situation. In organizing extracurricular activities in the middle grades, the teacher should take into account the psychological characteristics of students. This helps him not only to build the learning process competently, but also to ensure that students master the learning materials with high quality.

Psychological factors of the organization of science circles:

- knowledge of the characteristics of a person of a certain age allows to correctly determine the content and form of extracurricular activities in the field of mother tongue.
- students show great social activism aimed at acquiring certain forms of behavior and values. Reading new, interesting, books, they strive to understand them.
- memory develops in the direction of intellectualization, memorization becomes purposeful, speech management develops^[4].

In the process of working on the circle, it is necessary to take into account both the psychological characteristics of the individual and the psychological characteristics of the team: his level of development, organizational, psychological, intellectual and emotional unity, the focus of the team. The relationship between the zones is considered an important tool.

Classroom activities are a well-organized, sustained process aimed at assessing the student's ability, taking into account their desires and interests, and shaping their abilities and creative abilities. In this process, the further development of the student's abilities creates a favorable

pedagogical environment that allows him to achieve a brighter manifestation of his inner potential and promotes the free organization of activities by him. ^[5].

Pedagogical sources emphasize that extracurricular activities are a unique form of organization of spiritual and educational, general secondary education and upbringing among students.

Pedagogical factors of the organization of science circles:

- creation of a pedagogical environment between teacher and student;
- formation of knowledge, skills and abilities in science;
- meaningful organization of leisure time of students;
- determination of measures for the full realization of the abilities and potential of students;
 - achieving the enrichment of the educational process with theoretical resources and improving the methodological support;
 - establishment of mutual exchange of experience between teachers;
 - joint organization of spiritual and educational events on various topics.

The concept of “extracurricular education” was first associated with the establishment of public libraries, public houses, public universities, Sunday schools, working clubs and other cultural and educational institutions for adults in a number of European countries began in the second half of the XIX century.

During the former Soviet regime, out-of-school education was included in the general system of public education, and its activities were first supervised by an institution called the Political-Enlightenment Department and then the Department of Cultural and Enlightenment Affairs. increased

Out-of-school education is regulated by out-of-school educational institutions. The first out-of-school educational institution in the former Soviet Union was established in 1918 in Moscow as a “biological station for young nature lovers” and in Leningrad (now St. Petersburg) as an “art school”. Beginning of 1923, student houses (called “Pioneer Houses”) were established. 1935 - students in the Kharkov Palace (Palace of Pioneer's name) began its activity. Later, out-of-school educational institutions as state, public and referral-methodical structures worked in close cooperation with general secondary schools and children's organizations. Such institutions differ from each other in their activities with children and adolescents in the fields of science, technology, culture, sports and tourism. The following types of out-of-school educational institutions are popular: student palaces and houses; children's clubs organized under the houses of culture and clubs of trade unions; children's parks; special educational institutions (young technicians, young naturalists and children's excursion and tourist stations, children's and youth sports schools, children's railways, clubs for young motorists and young sailors, children's camps, etc., as well as children's libraries, theaters including ^[6].

During this period, the activities of out-of-school educational institutions were organized on the basis of standard programs, which carried out work in the following areas:

- 1) public-organizational work, holidays, lectures, film festivals, competitions, contests, meetings, exhibitions, games, etc.;

- 2) outreach activities among activists of children's organizations, mentors, group leaders and primary school leaders (teachers), teachers, leaders of clubs and so on, as well as out-of-school educational achievements generalization and popularization;
- 3) educational work - providing theoretical resources for the activities of various clubs, societies, societies, song and dance ensembles, theaters, orchestras, etc.

The work carried out by these institutions had the following content:

- 1) socio-political - the Red Army, museums of local lore, war and labor glory, history of children's organizations, international friendship clubs, agitation brigades, etc.;
- 2) educational circles, clubs, student scientific societies, exhibitions of children's art, etc.;
- 3) assistance to socially useful constructions and farms based on agricultural production, landscaping, training and production brigades, museums and research institutions, etc.
- 4) physical culture, sports and tourist clubs, clubs, societies, military games, competitions for the prize of children's newspapers, etc.
- 5) artistic and creative - ensembles, choreographic ensembles, orchestras, puppet theaters, music clubs, Olympiads, competitions, festivals and others.

The study of the sources of the problem revealed that the following factors play a leading role in the organization of the out-of-school education system: social development of society and social relations to the development of education; the system of continuing education of the republic and its content; history of formation of the system of out-of-school educational institutions and experience of foreign countries; economic situation and financial support of preschool educational institutions; the level of provision of out-of-school educational institutions with qualified pedagogical staff; educational and awareness of advanced technology in their activities implemented in order possession; the existence of the necessary subjective conditions for the full expression of personal abilities and abilities of students in these educational institutions; students' ability to self-assess and work on themselves; the establishment of interaction between the family and the general public in the organization of extracurricular activities, etc.

Extracurricular activities are voluntary forms of extracurricular activities conducted by students under the guidance of a teacher in order to expand and supplement the topics covered in the curriculum of the circle.

Achieving deep and solid mastery of the basics of science by students, the organization of independent work with the help of additional textbooks, visual aids, observation and experimentation on selected topics, the development of students' interests and knowledge. The organization of differentiated education, taking into account the needs of students, the development of their creative abilities, independent and logical thinking, the development of oral and written speaking skills, the expansion of the scientific worldview, career guidance, the consciousness of students and in order to inculcate in the heart the idea of national independence, to link education with productive physical and mental labor, the general circle conducts extracurricular activities .

There are 3 types of extracurricular activities:

1. Individual lessons with individual students
2. Classes with a group of students.
3. Mass classes with students.

The types of extracurricular activities mentioned above are inextricably linked, complementary and demanding.

Type of extracurricular activities	The content of extracurricular activities
Some students alone within order classes	In addition to the club's academic literature study, testing of computer knowledge with the help of educational, modeling, control programs, organization of creative research through multimedia, purposeful observation and experiments, lectures and demonstration materials on various topics
Students' groups with classes	Creating a circle "Harmonious person" in grades 5-6, "Mother tongue - my soul" in 7th grade, "Our encyclopedia - our law" in 8th grade and "Navoi - a great genius" in grades 9-11 .
Students with the media classes.	Different topics evenings, holidays, lectures, "Attention to the language - attention to the people", "Poetry of sharp-witted people", quizzes.

CONCLUSION

The didactic purpose of this circle is to increase students' interest in academic subjects, expand their scientific outlook, work independently on additional textbooks, to form a conscious attitude to the native language and literature, to reveal their hidden abilities, conscious choice of profession, independent and creative thinking, increase of linguistic knowledge, study of works of writers and poets, increase of oral literacy .

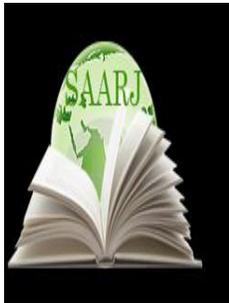

The general name of the circle is "Language and speech" and in grades 5-7 "Mother tongue" taking into account the subject, age and psychological characteristics, interests and needs of students A circle will be formed.

INTRODUCTION

When a person is born, he wants to live a happy and prosperous life. It is no secret that our people have suffered many hardships during the long period of oppression, deprived of many rights and freedoms.

Therefore, after gaining independence, first of all, special attention was paid to ensuring the welfare of our people.

During the years of independence, strong social protection of the population has become a top priority of public policy. The only goal of all the reforms implemented in the Republic of Uzbekistan over the past years has been to create a normal lifestyle for citizens, to provide continuous economic support to the poor and needy. "Before the introduction of market mechanisms," said Islam Karimov in his 1992 book "Uzbekistan's own path to independence and development," social protection measures must be taken. A state is considered humane only if it can protect its population. The state should provide timely assistance to people, especially those in need, the socially vulnerable, orphans, children, students, pensioners and the disabled, single mothers, large families and low-income families "[1, p. 41].

It is known that the policy of social protection has been declared a priority of state policy since the early days of independence. The purpose of this direction is, first of all, the interests of man, his full satisfaction. Strong social policy, regulation of relations in the social sphere, full expression of the human factor, creation of decent living conditions for the population have become a strategic task of the country's leadership. The social protection of the poor, the needy, the disabled, pensioners, the lonely elderly, and the material and moral support of women with young children have undoubtedly shown their results.

During the past period of independence in the country, social protection of the population was carried out mainly in three directions. First of all, there was the liberalization of prices, the devaluation of property. Under these conditions, the minimum and average levels of income of the population have been steadily increasing. Second, the measures taken to protect the domestic consumer market, to maintain a certain level of consumption of basic types of food and non-food products, provided social protection to the population. Third, measures have been taken to provide social protection to pensioners, the disabled, the needy, large families and low-income families, the unemployed.

In particular, the President of the Republic of Uzbekistan Shavkat Miromonovich Mirziyoyev continues this work, paying special attention to social protection and employment. Speaking about the urgency of the work on social protection, the President said, "The most important socio-economic task is to implement the program to increase employment, approved by the chambers of the Oliy Majlis. We need to create more than a million new jobs by the end of the year.

The issue of employment of 480,000 graduates of professional colleges requires special control. [2].

The positive work carried out in Uzbekistan under the leadership of President Shavkat Mirziyoyev has quickly shown its results and led to an increase in public confidence in the future. Speaking about the positive achievements in the field of social protection of the population under the state program for 2016, the President said, "As part of the program, about 9 million women of childbearing age and about 10 million children have undergone medical examinations and rehabilitation.

In particular, cochlear implantation operations were performed at more than 350 children with hearing impairments at the Republican Specialized Pediatric Research and Practice Medical

Center. 21 billion soums were spent for this purpose. But what matters to us is not how much money is spent, but the health of hundreds of our children.

Among such activities, 700,000 children were vaccinated against pneumococcal infection and other infectious diseases.

Within the framework of the program, great work has been done to create the necessary conditions for our women, to build modern housing and social infrastructure in rural areas on the basis of standard projects.

At the same time, \$ 100 million has been attracted with foreign investment to provide rural areas with drinking water and modernize water networks in districts and cities. ”[3]

The announcement of 2017 in our country as the "Year of dialogue with the people and the interests of man" also has great significance. “The main goal of these reforms is to ensure a decent standard of living and quality of life for the population. The main priority is to consistently implement the noble idea that "human interests take precedence over everything else."

Today, the main goal of our life, which is reflected in our Constitution, is to ensure the full protection of human interests. In order to ensure the interests of the people, first of all, it is necessary to communicate with people, with the people, to know their worries, dreams, problems and needs. The people should serve our people, not government agencies, and this fact should be well understood by leaders at all levels. ”[4]

The fourth direction of the "Strategy of actions on five priorities of development of Uzbekistan for 2017-2021" [5], adopted on February 7, 2017, is called "Priorities for the development of the social sphere", which includes increasing real incomes and purchasing power, low-income families. further reduction of the number and level of income inequality of the population;

creation of new jobs and employment of the population, first of all, graduates of secondary special and higher educational institutions, ensuring balanced development of the labor market infrastructure, reducing unemployment;

Improving the social protection and health care system, increasing the socio-political activity of women;

Provision of compulsory social guarantees to the population, strengthening social protection of the needy and state support of the elderly and people with disabilities, improving social services, development of public-private partnership in the provision of social services to the population;

Increasing the socio-political activity of women, strengthening their role in government and society, ensuring the employment of women, graduates of professional colleges, their broad involvement in entrepreneurial activities, further strengthening the family base;

further development and improvement of the system of medical and social assistance to pensioners, the disabled, lonely elderly and other needy groups of the population to ensure their full life;

The President also noted that the living conditions of the population, especially young families, citizens living in dilapidated houses and other citizens in need of housing, should be improved

through the provision of mortgage loans on favorable terms and the construction of affordable housing in urban and rural areas. is an example of humanity and devotion to the field.

Regarding the work done in 2017 "Year of dialogue with the people and the interests of man", the President said, "During 2017, the issue of creating new jobs, which is very important for us, was in the center of our attention. In 2017, more than 336,000 new jobs were created due to the construction of new industrial enterprises, commissioning of service facilities, development of small business and private entrepreneurship.

It is obvious that we have given priority to employment, so we need to pay special attention not only to quantity but also to quality.

The implementation of the adopted programs on reforming the social sphere, which is a very important direction of state policy in Uzbekistan, is gradually being ensured. It is known that the housing problem has long plagued our population, especially public sector workers, low-income families. There is a fact that we have almost ignored this serious social problem. Taking into account the needs and desires of our people, this year we have launched a project to build affordable housing on the basis of soft mortgage loans.

In total, more than 3.5 million square meters of standard houses and multi-storey houses have been built in our cities and villages. If we compare this figure with previous years, we can see that 20 times more houses were built than in 2007, 3.5 times more than in 2010, when the standard housing program was launched, and 2 times more than in 2014. It is worth noting that for the first time in the last 25 years, we have begun to build affordable, multi-storey housing for the population. In 2017 alone, more than 800,000 square meters of such housing were built and commissioned. In Tashkent alone, 420,000 square meters of multi-storey housing have been commissioned this year. This is almost three times more than last year. "[6] The mahalla is a social institution that reflects the character, lifestyle and content of the Uzbek people, and usually unites, organizes, directs and encourages the nation to act on a community basis.

MATERIALS AND METHODS

In accordance with the Decree of the President of the Republic of Uzbekistan Shavkat Mirziyoyev "On radical improvement of activities in the field of support of women and strengthening the institution of the family" from April 1, 2018 instead of advisers on religious enlightenment and spiritual and moral education In 2000 and more civic gatherings, the position of a specialist in working with women and strengthening the spiritual and moral values in families was introduced. At the same time, the fact that the service houses of the mahalla supervisors are located in the mahalla and they are given a car at a discount is an example of the great attention paid to the mahalla.

Speaking about further strengthening social protection, the President said, "Economic development and social protection are inextricably linked concepts and cannot be imagined in isolation. Improving the living conditions of the population, providing them with decent housing, improving the welfare of our people will always be in the center of our attention. "[7]

In 2019, it can be observed that the following tasks have been implemented for the further development of the social sphere.

- The procedure for full payment of pensions to working pensioners has been introduced. The amount of benefits for people in need and in need of social assistance has been doubled.

- Last year, 634 private medical institutions were established due to the increase in the number of medical activities from 50 to 126 and the provision of a number of benefits.

“Large-scale construction and beautification works have been carried out in 479 villages and auls, 116 urban mahallas within the framework of the “Obod Qishloq” and “Obod Mahalla” programs.

- 6.1 trillion soums or 1.5 trillion soums more than in 2018 were spent on this.

- 17,100 houses were built in rural areas, 17,600 in cities, a total of 34,700, or almost 3 times more than in 2016.

- More than 116 billion soums were paid to 5,000 low-income families in need of improved housing, including women with disabilities, to purchase affordable housing on the basis of mortgage loans.

The reforms we are carrying out are being praised by the world community.

In particular, one of the world's leading publications - "Economist" magazine recognized Uzbekistan as the country with the most rapid reforms in 2019 - "Country of the Year".

Touching upon the positive work to be done in 2020, the President said, “In 2020, 5.5 thousand women will be provided with soft loans worth 100 billion soums for small business projects. To do this, we allocate resources to banks from the state budget.

In addition, 1,576 women will receive an initial payment from the budget to acquire new housing.

The training of our sisters in need of social protection in Women's Entrepreneurship Centers will be organized in short training courses within the framework of 5 important initiatives”[8].

We all need to understand one thing in depth: such priorities that we have set ourselves are very complex and truly huge goals.

At the same time, over time, the world is changing, and the demands of our people for a better life are growing. Now we cannot please our people with yesterday's result.

Today, every day requires research and innovation. Only by working on the basis of such requirements can the life of our people be changed for the better. Our President is also showing humanity and dedication to reducing poverty in Uzbekistan.

In 2020, \$ 700 million in poverty reduction programs will be implemented. This was stated by President of Uzbekistan Shavkat Mirziyoyev in his speech at the celebration of International Women's Day.

Poverty reduction has been identified as a priority in Uzbekistan, and we have begun to implement large-scale measures in this direction. We need to clearly understand one fact - to reduce poverty, we must first reduce unemployment. First of all, it is necessary to train the population in modern professions, increase their economic and financial literacy, inspire people, especially women, to entrepreneurship, - said the President. President of the Republic of Uzbekistan Shavkat Mirziyoyev on March 26, 2020 approved Decree No. PF-5975 on measures

to radically update the state policy on economic development and poverty reduction. According to the decree, 100 billion soums will be allocated to the Ministry of Economic Development and Poverty Reduction in 2020 to finance measures to reduce poverty.

RESULTS AND DISCUSSION

On April 20, President of the Republic of Uzbekistan Shavkat Mirziyoyev held a video conference on ensuring the full operation of enterprises in industry, construction and infrastructure.

It was noted that families who are temporarily unemployed and in need of assistance should be identified and the scope of providing them with food and medicine on a targeted basis should be further expanded. It is natural that during the current pandemic, the number of unemployed, the population in need of assistance and support will increase. Along with the fight against the disease, various countries are doing everything possible to save jobs and prevent a sharp economic downturn. put forward an initiative to set up the movement.

- In the coming days, the holy month of Ramadan will come. Helping needy and needy families this month is both a debt and an obligation. Therefore, in this holy month, every entrepreneur should actively support the population in need of social protection, especially their neighbors, - said the head of state.

As a result, donations and donations during Ramadan will be targeted, and funds for iftars and food will be directed to the poor. Depending on the opportunity, one entrepreneur can help, for example, 10 families a month, and another 20 families, and most importantly, hire members of needy families. As part of charitable activities, charitable assistance is provided to lonely elderly people, people with disabilities and the unemployed, people who have lost their regular income due to quarantine, and low-income families.

A video conference chaired by Shavkat Mirziyoyev was held on May 13, 2020 on the issues of mitigating the negative impact of the coronavirus pandemic on living standards and sectors of the economy. The meeting also paid special attention to the issue of social protection. "Tasks have been set to ensure the rights of employees of quarantined institutions, quarantined citizens and their caregivers, to increase the number of social pensioners by at least 10 percent or 60,000. Parents caring for their quarantined children are paid a temporary incapacity benefit. At a time of declining economic activity, the issue of employment requires special attention. Therefore, an additional 200 billion soums will be allocated from the Anti-Crisis Fund to the Public Works Fund." [9]

A video conference was held on July 8, 2020 under the chairmanship of Shavkat Mirziyoyev. The meeting focused on the work being done to reduce poverty. The head of state noted the need to "employ at least 257,000 needy families, provide loans to 37,000 households in the framework of family business" [10]. In 2021, the comprehensive work on comprehensive social protection and poverty reduction will be continued. At the solemn ceremony dedicated to the 30th anniversary of state independence of the Republic of Uzbekistan on August 31, 2021, President Shavkat Mirziyoyev in his speech "Independence of our country is a source of strength and inspiration for us, the basis of development and prosperity." has ushered in a new era of Uzbekistan. "

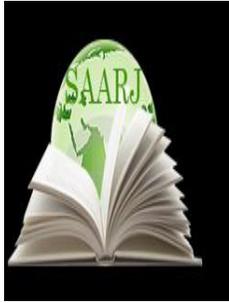

At a meeting with voters in Surkhandarya on October 8, 2021, President Shavkat Mirziyoyev acknowledged that "the state will allocate 50 trillion soums for economic and social development of Surkhandarya region in the next five years" [11].

CONCLUSIONS

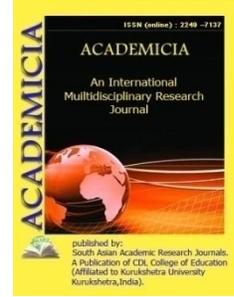

In conclusion, it should be noted that the humanitarian policy of Uzbekistan to ensure the well-being of our people serves for the well-being and happiness of our people.

RURAL DEVELOPMENT SCHEMES AND RESPONSIBILITY OF LOCAL SELF GOVERNMENT: A CRITICAL ASSESSMENT ON MGNREGA

Amom Thoinu Devi*

*Asst. Prof. in Political Science,
 Kumbi College, Manipur, INDIA

ABSTRACT

Various developmental programmes have been taken up by government with a vision for rural development. Despite planned efforts for rural development expected target seems to be very far in one sense. The problems of poverty, illiteracy, erosion, environmental degradation, pollution, unemployment, hunger, starvation, death, mass migration, inequality, etc. prevail in rural India, in the context of India's effort for rural development.

KEYWORDS: *Starvation, Death, Mass Migration, Inequality*

INTRODUCTION

As a term 'Rural' fundamentally means an area where people live in a non-urban style and majority people engage in agriculture and allied activities. 'Development' refers to improvement in the standard of living where equality of income is increasing along with the developing capacity of the people to sustain continuous improvements. In other words, development implies change that is desirable (Bulbuli, 2015). There are at least three basic elements which are considered to constitute the meaning of rural development. They are as follows (Tripathi, 2000): **Basic Necessities of life:** People have certain basic needs, without which it would be impossible for them to survive. The basic necessities include food, clothes, shelter, basic literacy, primary health care, and security of life and property. **Self-respect:** Every person and every nation seeks some sort of self-respect, dignity or honour. Absence or denial of self-respect indicates lack of development. **Freedom:** In this context, freedom refers to political or ideological freedom, economic freedom and freedom from social servitude. As long as society is bound by the servitude of men to nature, ignorance, other men, institutions and dogmatic beliefs, it cannot claim to have achieved the goal of 'development'.

Integrated rural development has been defined by Sharma and Malhotra as a systematic approach aiming at total development of the area and the people by bringing about the necessary institutional, attitudinal changes and by delivering a package of service through extension methods to encompass not only the economic field, i.e., development of agriculture, rural industries, etc., but also the establishment of the required special infrastructure and services in the areas of health and nutrition, education and literacy, basic amenities, family planning, etc. with an ultimate objective of improving quality of life in the rural areas (Sharma and Malhotra, 1977). Thus Rural Development can be defined as integrated development of area and the people through optimum development and utilization (and consideration when necessary) of local resources – physical, biological and human and by bringing about necessary institutional, structural and attitudinal changes by delivery of a package of service to encompass not only the economic field, i.e., agricultural, allied activities, rural industries, but also establishment of required social infrastructure and service in the area of health and nutrition, sanitation, housing, drinking water, literacy, with ultimate objective of improving quality of rural poor and the rural weak. Thus, rural development means to the process of improving living condition (Tripathy, 2000).

Objective of the study

This paper attempted

- To understand various schemes of rural development programmes undertaken by government of India
- To examine the developmental schemes that focus of socio economic development
- To review the Mahatma Gandhi National Rural Employment Guarantee Act

REVIEW OF LITERATURE

Since independence, Government of India has undertaken various strategies for the all-round development of the rural areas in the Five-Year Plans. During the First Five Year Plan the Government of India launched the Community Development Programme (CDP) on 2 October, 1952. Under this programmes the first 55 Community Development Projects were inaugurated (Mukta, 1995). With the passage of time, more and more such projects were developed and at the end of the first plan about 5,028 Blocks were developed to cover almost all villages of the country. The CDP could not make much headway as it failed to entrust the villages into the spirit of self-help, self-reliance and cooperative effort. Till the 5th plan, various strategies for agriculture development like High Yielding Varieties Programme (HYVP) and the Intensive Agricultural District Programme (IADP) had been taken to yield best results out of these (Rajakuttet *et al.*, 2002). Since the sixth plan onwards, various strategies for self-employment, rural housing and wage employment have been introduced. Among these strategies Indira Awaas Yojana (IAY), Swarnjayanti Gram Swarozgar Yojana (SGSY) and Mahatma Gandhi National Rural Employment Guarantee Act (MGNREGA) are the most notable ones (Jamge, 2002).

Housing is one of the basic requirements for human survival. For a normal citizen owning a house provides significant economic security and status in society. IAY was initially a sub-scheme of Rural Landless Employment Guarantee Programme (RLEGP) and there after it became a part of Jawahar Rozgar Yojana (JRY) (Indira Awaas Yojan, 1988). Since January 1996 it

has been implemented as an independent scheme for rural housing and thereby providing them one of the basic necessities of human life. The objective of Indira Awaas Yojana is primarily to help construction of dwelling units by members of Scheduled Castes/ Schedule Tribes, freed bonded labourers and also non- SC/ST rural poor below the poverty line by providing them with grant-in-aid (Ugra, 1995). Swarnjayanti Gram Swarozgar Yojana (SGSY) was undertaken in 1 April 1999 by restructuring the existing schemes namely, Integrated Rural Development Programme (IRDP), Training of Rural Youth for Self Employment (TRYSEM), Development of Women & Children in Rural Areas (DWCRA), Supply of Improved Toolkits to Rural Artisans (SITRA), Ganga Kalyan Yojana (GKY), Million Wells Scheme (MWS) (Swarnjayanti Gram Swarozgar Yojana, 1999). Firka Development Scheme: The Firka development scheme emphasized the attainment of the Gandhian ideal of “Village Swaraj” by bringing about not only the education, economic, sanitary and other improvements of village along with the revitalization of the spirit of people and to make them self-confident and self-reliant. The scheme involved close co-ordination with the various government services like agriculture, irrigation, industries, medical and communication departments. In 1953-54 the scheme was merged with the National Extension Services (Sahu, 2003).

Rural Development Programmes in Plan Period: According to Census Report 2011, 68.84 per cent of the total population of India still lives in villages which are characterized by massive poverty. India started her planned economic development through Five Years Plans in the year 1950-51. The economy of the country is dominated by the rural and traditional economic sectors. But the productivity of these sectors is not satisfactory. The existence of massive unemployment and poverty is the common feature of Indian economy in general and rural economy in particular (Tewari, and Sinha, 1988). Community Development Programme (CDP): The Community Development Programme was launched on 2nd October, 1952 during the First Five years plan. The first 55 Community Development Projects were inaugurated throughout the country where each project was having 3 Development Blocks. With the passage of time, more and more such projects were developed and at the end of the Fifth Plan about 5,028 Blocks were developed to cover almost all villages of the country (Vasant, 1993). National Extension Service (NES): One year later of Community Development Programme, in 1953, the Government of India launched another programme of rural development known as the National Extension Service. This programme had similar aim with the Community Development Programme (Raju, 1999). Intensive Agricultural District Programme (IADP): In the year 1960, on the basis of the report of the Ford Foundation Team known as “India’s Food Crisis and Steps to Meet it” a significant feature took place and a new programme known as “Intensive Agricultural District Programme” based on the principles of concentration and better management of resources and efforts in potential and responsive areas with assured water supply was introduced (Das, 2007).

Intensive Agricultural Area Programme (IAAP): Intensive Agricultural Area Programme (IAAP) was launched in 1964-65 in order to bring about a progressive increase in the production of main crops in selected area by an intensive package approach i.e. the use of inter related factors physical, social and institutional-in-strategic combination which were likely to exert an impact on agriculture production (Laxmi and Venkata, 1999). High Yielding Varieties Programme (HYVP): The High Yielding Varieties Programme (HYVP) was launched in the country from the kharif seasons of 1966-67 as a major plank of new agricultural strategy under the economic planning system. The basic objective of the programme was to attain self-sufficiency in food by

the end of 1970-71 (Ibid). Small Farmers Development Agency (SFDA): The schemes to ameliorate the small and 'sub marginal' farmers and agricultural labourers were sanctioned during 1970-71 but in most cases the programmes only began to be implemented during 1970-71. To administer the programmes, two new agencies the Small Farmers Development Agencies (SFDA) and the Marginal Farmers and Agricultural Labourers Agency (MFAL) were set up as corporate bodies (Maheshwari, 1995). Marginal Farmers and Agricultural Labourers Development Agency (MFALDA): The Marginal Farmers and Agricultural Labourers Development Agency (MFALDA) was set up along with SFDA on the recommendation made by Rural Credit Review Committee (1969). The focus of the attention of MFALD agency was to identify eligible marginal farmers and agricultural labourers to be covered by the project, to investigate their problems, to formulate economic programmes for providing gainful employment to them, to promote rural industries, etc. (Ibid).

Drought Prone Area Programme (DPAP): Drought Prone Areas in India are marked by degraded environment with soil erosion, water and moisture stress and lack of adequate protective cover which resulted in damaged crops, low soil productivity and scarcity of fodder and drinking water. All these adversely affect the living standard of the people which demands ameliorative action. Hence, a special programme named Drought Prone Area Programme (DPAP) was introduced in 1970-71 in the country. Cash Programme for Rural Development: This Programme was sponsored by Central Government and implemented through the agency of state government in April, 1971 for a period of 3 years. The objectives behind this scheme were – (a) direct generation of employment for 1000 persons, on an average, continuously over a working season of 10 months in a year in all rural districts of the country (Uday, 1987). Integrated Tribal Development Agencies (ITDA): The characteristic of economic backwardness of tribal population has always been the centre of attention among policy makers and planners of the country. Though from 1st to 3rd Five Years Plans different efforts were taken for the development of tribal people but these efforts did not bring about substantive change among the majority of the tribal population (Venkata, 1988).

Modified Area Development Approach (MADA): Article 46 of the Constitution of India enjoins up on the state to promote with special care the educational and economic interest of the weaker sections and in particular scheduled castes and scheduled tribes and to protect them from social injustice and all forms of exploitation. A new programme called Modified Area Development Approach (MADA) was launched in 1978-79 for the all-round development of the tribal who are outside the Sub-plan areas (Jamge, 2002). Command Area Development Programme (CADP): The Command Area Development Programme (CADP) was introduced in the country in 1974-75 with a view to realise a fast and optimum utilization of the irrigation potential created in the major irrigation projects. The basic concept of this programme was to set up agriculture production, create additional employment opportunities and boost up level of income in the rural areas (Maheshwari, 1985). 20-point Programme: The 20-point Economic programme was announced on 1st July 1975. The prime concerns of this programme were – (a) to ensure social Justice (b) to relieve unemployment (c) to eradicate poverty (Mathur, 2000).

Integrated Rural Development Programme (IRDP): The sixth plan proposed to integrate multiplicity of agencies for providing rural employment such as Employment Guarantee Scheme (EGS), Small Farmers Development Agency, (SFDA), Marginal Farmers and Agricultural Labourers Development Agency (MEALDA), Drought Prone Area Programme (DPAP),

Command Area Development Programme (CADP), Desert Development Programme (DDP) etc.(Laxmi and Jaya, 1999).DWCRA: The programme of Development of Women and Children in Rural Areas (DWCRA) aims to improve the socio-economic status of the poor women in the rural areas through creation of group of women for income generating activities on a self-sustaining basis (Dhar, 2008).National Rural Employment Programme (NREP): The National Rural Employment Programme (NREP) replaced and restructured the Food for Work Programme in October 1980. NREP was a centrally sponsored scheme implemented with 50:50 sharing basis between the Centre and the states. This programme was conceived as wage-employment programme. The main objectives of NREP were- (a) generating additional gainful employment opportunities to the extent of 300-400 million man-day's as per year for the unemployed and underemployed persons in the rural areas (MRD, 2000).Rural Landless Employment Guarantee Programme (RLEGP): The Rural Landless Employment Guarantee Programme (RLEGP) was launched on 15th August, 1983 with the objective to generate gainful employment opportunities, to create productive assets in rural areas and also for the improvement of overall quality of rural life. In 1989-90, the RLEGP and NREP were merged with JawaharRozgarYojana (Maheshawari, 1995).

Jawahar Rozgar Yojana (JRY):It was launched on 28th April, 1989, by the then Prime Minister Late. Rajiv Gandhi. In the programme all the existing rural wage employment programme were merged into JRY. The NREP and RLEGP were merged within the single umbrella. The main features of JRY are- (i) The JRY has set a target for reaching every single panchayat (Vithal, 2001).National Social Assistance Programme (NSAP): This multi-dimensional programme was launched by 15th August, 1995 for the poor old age pension, family benefit in case of death of the bread earner and maternity benefit. It is a centrally sponsored programme with 100 percent central funding and it is intended to ensure that social protection to the beneficiaries throughout the country (Publication Division 1998).Rural Group Life Insurance Scheme (RGLIS): The Government of India had launched a new scheme, namely Rural Group Life Insurance Scheme (RGLIS) on 15th August, 1995 in order to provide life insurance coverage to the rural poor of the country. The objective of the scheme is to promote social insurance in the rural areas with the active involvement of the Panchayat and to partly alleviate the distress caused by the death of the bread earner among the rural poor (Economic Survey, 2002-03).Indira AwaasYojana (IAY). It was launched during 1985-86 as a sub-scheme of RLEGP. IAY thereafter continued as a sub-scheme of JawaharRozgarYojana (JRY) since its launching in April, 1989. IAY was de-linked from JRY and made an independent scheme with effect from 1st January 1996. The Indira AwaasYojana (IAY) is a flagship scheme of the Ministry of Rural Development to provide houses to the poor in the rural areas (Krishna, 1980).Swarnjayanti Gram SwarozgarYojana (SGSY):It was launched on 1st April, 1999 by restructuring the existing schemes namely Integrated Rural Development Programme (IRDP), Training of Rural Youth for Self Employment (TRYSEM), Development of Women & Children in Rural Areas (DWCRA), Supply of Improved Toolkits to Rural Artisans (SITRA), Ganga KalyanYojana (GKY), Million Wells Scheme (MWS) (MRD, 1999).

Jawahar Gram SamridhiYojana (JGSY):JawaharRozgarYojana (JRY) has been restructured with effect from April 1999, and has been renamed as Jawahar Gram SamridhiYojana (JGSY). This is basically a wage employment programme. The primary objective of JGSY is creation of demand

driven village infrastructure including durable assets at the village level to enable the rural poor to increase the opportunities for sustained employment. Sampoorna Grameen Rozgar Yojana (SGRY): It was launched in September 2001. It is to provide wage employment in rural areas and also food security, along with the creation of durable community, social and economic assets. The scheme is being implemented on a cost sharing ratio of 75:25 between the Centre and the states (Chattopadhyay, 1985). Pradhan Mantri Gram Sadak Yojana (PMGSY): It was launched on 25 December 2000 as a 100 percent centrally sponsored scheme. The primary objective of PMGSY is to provide all weather connectivity to all the eligible unconnected habitations in the rural areas. It is targeted on village level development in five critical areas i.e., health, primary education, drinking water, housing and rural roads with the overall objective of improving the quality of life of people living in the rural areas (Economic Survey, 2002-05). Food for work Programme (FFW): It was initially launched on February 2001 for five months and was further extended. The programme aims at augmenting food security through wage employment in the drought affected rural areas in eight states. The centre makes available appropriate quantity of food grains free of cost for each of the drought affected states as additionally under the programme (Dhar, 2008). Annapurna: The Annapurna Scheme came into effect from 1 April 2000 as a 100 percent centrally sponsored scheme. It aims at providing food security to meet the requirement of those senior citizens who though eligible for pension scheme under the NOAPS, are not getting the same. Food grains are provided to the beneficiaries at subsidized rates of Rs. 2 per kg of wheat and Rs.3 per kg of rice (Gopal, 1997). National Food for Work Programme (NFFWP): It was launched as Centrally Sponsored Scheme in November, 2004 in the 150 most backward districts to generate additional supplementary wage employment with food security. States received food grains under NFFWP free of cost. The focus of the programme is mostly related to works relating to water conservation, drought proofing (including afforestation and tree plantation), land development, flood control / protection (including drainage in waterlogged areas) and rural connectivity in terms of all-weather roads (Deb, 1986).

Mahatma Gandhi National Rural Employment Guarantee Act (MGNREGA)

National Rural Employment Guarantee Act (NREGA): It was implemented from 2 February 2006 after passing of the NREG act in the parliament in September 2005. The act was notified in 200 districts in the first phase with effect from 2 February 2006 and then extended to additional 130 districts in the financial year 2007-08. The remaining districts have been notified under NREGA with effect from 1 April 2008. National Rural Employment Guarantee Act (NREGA) was renamed as Mahatma Gandhi National Rural Employment Guarantee Act (MGNREGA) in the year 2009. This is for the first time a job guarantee scheme has been introduced in the country for the social economic upliftment of the rural folk (Operational Guidelines, 2008). This scheme was notified in 5th September 2005 by the government of India. And, it came into being in 2th February 2006. It was introduced in phased basis. In the first phase, 200 districts were assigned to take up the scheme. In the second phases, 130 districts were included in 1st April 2007 and further it was extended to different districts of the country from 1st April 2008 as a third phased. It is the biggest poverty alleviation programme in the world in terms of the capacity in employing peoples and the economic sanctions to create rural assets. It is started with an initial outlay of Rs. 11,300 Crore in the year 2006-07. Article 39, the right to work enshrined in the Directive principles of state policy in the constitution of India is realize by the people under this Act (Devkanta, 2020). It has a set striking objectives and goals that involve both the

approach and outcomes of community development. The scheme further aims at strengthening decentralization and deepening process of democracy by making grass root level democratic institutions, such as Panchayati Raj Institutes (PRIs) as the principal implementer of MGNREGA with greater accountability in governance for better results (Kabita, 2017). It is an environment friendly government sponsored scheme which aims at the creation of clean environment through the various undertaking works like plantation works, perennial works (plantation of fruit trees), and renovation of drainage for agricultural purposes etc. To acquaint the MGNREGA functionaries with the new provision mentioned in the operation guidelines 2013, the Minister in accordance with the National Institute of Rural Development (NIRD) & Panchayati Raj (PR) conducted Ten Training of Trainers Programme (TOTs). It created State Resource Teams (SRTs) to develop an expert/ trainers in the subject matters of MGNREGA implementation in the States. Among the ten programmes, seven were conducted at NIRD and PR, Hyderabad and three at North East Region. For Manipur the training of SRTs was conducted during the period 08-10 January, 2014. It was the eight TOTs at NIRD and PR, Guwahati. State MIS officers, Accountant, State Institute of Rural Development–Faculty (SIRD), State Nodal officer, Social Audits and training Coordinator attended the training programme. (Ghosh, 2009).

Critical assessment and findings

- Currently, MGNREGA wage rates of 17 states are less than the corresponding state minimum wages. Various judgements have upheld that the MGNREGA wage rate cannot be less than the minimum agricultural wage rate of the state. Fund transfer delays even in the processing of signed, for which the Management Information System (MIS) does not calculate compensation. Despite the order of the Supreme Court and initiatives and GO (Government Order) by the Union Ministry of Finance, no provision has yet been worked out in the MIS for calculation of full wage delays and payment of compensation for the same (Debmalya, 2018).
- Besides, the ministry withholds wage payments for workers of states that do not meet administrative requirements within the stipulated time period (for instance, submission of the previous financial year's audited fund statements, utilisation certificates, bank reconciliation certificates etc.). The increase in corruption and weakening accountability has roots in the excessive dependence of implementation of MGNREGA. It has also painted a picture that is far from the truth on the ground. One needs to think about delinking the implementation of MGNREGA from real-time MIS (Ibid).
- There are a huge number of unemployment allowances being shown in the MIS currently. But inaction from the Central government in ensuring payments of the same has shown that the government wants to use the MIS as per its convenience and is not honouring its own database. Genuine job cards are being randomly deleted as there is a huge administrative pressure to meet 100 per cent Direct Benefit Transfer (DBT) implementation targets in MGNREGA (Ibid).
- A real-time MIS-based implementation and a centralised payment system has further left the representatives of the Panchayati Raj Institutions with literally no role in implementation, monitoring and grievance redress of MGNREGA schemes. It has become a burden as they hardly have any power to resolve issues or make payments (Ibid).

- The over-centralisation of the scheme has completely depoliticised the implementation of MGNREGA and local accountabilities have been completely diminished. MGNREGA could be a tool to establish decentralised governance. But, with the administration almost dictating its implementation, it is literally a burden now for the people and especially for the local elected representatives (Ibid).
- The governments always use the bottom-up people's planning strategy to gain political mileage but never honour local priorities while implementing the schemes. Further linking MGNREGA to construction of PradhanMantriAwasYojana (PMAY), individual household toilets, anganwadi centres and rural 'haats' have been destroying the spirit of the programme and gram sabhas and gram panchayats' plans are never honoured (Ibid).

CONCLUSION

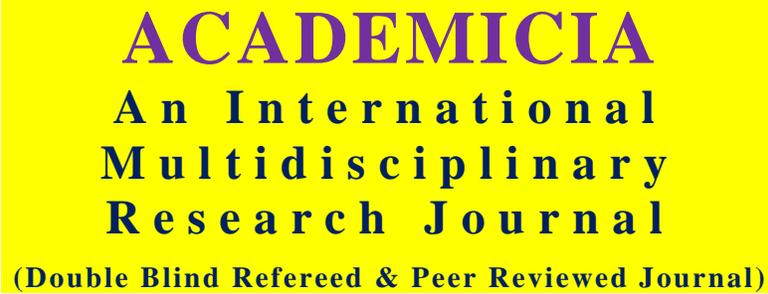

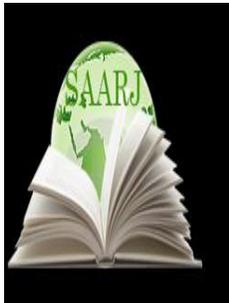

The above analysis reveals that various strategies have been adopted by the Government of India for rural development in the plan period. The above mentioned strategies can be broadly grouped as development of agricultural, area development, wage employment, self-employment and basic necessities of life. But these strategies failed to function properly throughout the country due to various reasons such as frequent changes of programmes, illiteracy and ignorance of the common people, political interference and bureaucratic attitude etc. These strategies are expected to bring tremendous changes in the development of rural people in India but it still presents a dismal picture while looking into the implementation of the schemes in various states. In spite of these strategies adopted by the Government of India for the economic upliftment of rural people, poverty is still having a strong hold in the rural areas. It is basically an agro based state in which almost all the villages demonstrating both homogeneous and heterogeneous features of rural life (Thaha, *et al.*, 1992). Keeping aside all the diversified features, the Government of the state as well as the Centre has made attempts to bring progressive changes in the villages by adopting different strategies. The ridiculously low wage rates have resulted in lack of interest among workers in working for MGNREGA schemes, making way for contractors and middle men to take control, locally.

THE STRUCTURE OF PROFESSIONAL COMPETENCE OF PEDAGOGUES AND PSYCHOLOGICAL REQUIREMENTS

Saydullayev Jamoliddin Yaxshiboevich*

*The Teacher,
Samarkand State Institute of Foreign Languages,
UZBEKISTAN

ABSTRACT

This article presents the pedagogical basis of the professional competence of pedagogues and its structure, the means and methods of formation of competence in teachers, and the current problems of socio-psychological features of the formation of competence.

KEYWORDS: *Pedagogue, Education, Qualification, Purpose, Method, Technology, Competence, Pedagogical-Psychological, Social.*

INTRODUCTION

You can't imagine a modern teacher who is specially trained, professionally competent, and uses psychological knowledge, skills and abilities in the educational process on the basis of the principles of effectiveness. The essence of the concept of "competence". Being able to withstand strong competition, which is a priority in the labor market in the context of market relations, requires every specialist to have professional competence, which is constantly increasing. Professional competence does not mean the acquisition of specific knowledge and skills by a specialist, but the acquisition of integrative knowledge and actions in each independent area. Competence also requires the constant enrichment of professional knowledge, the ability to learn new information, to understand important social requirements, to be able to search for new information, process it and apply it in their work.

A number of studies have directly explored the professional competence and specificity of the educator. Such research includes the research conducted by A.K. Markova and B. Nazarova. In her research, A.K. Markova states that the professional competence of a teacher consists of the following components. In Uzbekistan, the professional competence of teachers, their peculiarities, including the research conducted by B. Nazarova and S. Musinov, are of particular importance. According to the researcher, the basis of professional competence of a teacher is the

following. Self-improvement and self-development are important in gaining professional and pedagogical competence. Self-improvement tasks are defined through self-analysis, management, and self-assessment. Stages of pedagogical work on self-development of professional competence:

As an educator specialist:

- Improving the pedagogical and psychological process on the basis of a clear goal, aspiration;
- increase the effectiveness of the process of pedagogical psychology, increase their activity;
- acquisition of constantly updated pedagogical and psychological knowledge; be aware of the psychological basis of advanced technology, methods and tools;
- effective implementation of the latest pedagogical and psychological innovations in science and technology;
- Improving professional pedagogical and psychological skills and competencies; the practical action he takes to seek psychological prevention and resolution of negative pedagogical conflicts represents his work on himself.

Educators need a project-based approach to work in a consistent, effective way. It is desirable that they be able to formulate the following model based on a project approach. The model outlines the steps to be taken and the tasks to be performed at each stage. The effective solution of the tasks set for each stage allows you to move on to the next stage. Self-analysis is also important for a teacher to become professionally competent.

Self-analysis is the study of the nature of one's own practical actions organized by the educator in professional activities. Through self-analysis, the educator is able to make an objective self-assessment. for it is also important that educators have the skills of self-assessment in order to acquire the qualities of professional competence.

Self-Assessment (SAA) is an individual's self-assessment through self-analysis. Self-assessment is the calculation of a person's personal capabilities, objective self-assessment, and self-satisfaction. Self-esteem should help a person develop his or her abilities on his or her own. Self-assessment is difficult, but it can be done directly. As with any professional, there are a number of factors that can affect a teacher's ability to evaluate themselves effectively.

Another important component of the overall structure of professional psychological competence in pedagogical activity is social competence, because the modern teacher not only imparts knowledge, information, but also acts as a mediator between the developing individual and society. The "child-society" relationship, the purposefulness of the interaction, also depends on how competent and efficient the teacher is in social life. Key functions of social competence include adaptation, social orientation, and a combination of personal and social experiences.

The level of social competence of an individual is important in the process of interaction and organization of activities. At the same time, according to psychologists, the formation of the level of social competence of people in the process of adaptation of citizens to the new social conditions of globalization plays a special role. Environmental, political, ideological, and social changes not only determine the development of social thinking, but also affect people's self-awareness, life values, and personal problems. The task of psychology is to create programs

aimed at increasing the level of competence of a person in solving problems related to socialization and social adaptation. In our view, this task is particularly relevant to the work of educators, who are responsible not only for themselves, but also for the formation of their students as well-rounded individuals.

Social competence is one of the most important forms of psychological competence studied in modern psychology. It also reflects the creative qualities of man as a subject of social partnership and cooperation. Mechanisms of formation of competent social behavior of the subject, tendencies of manifestation, motivation, interest in the content are characterized, first of all, by the influence of the nature of "human-society" interaction on social development. A number of studies, in particular, A.K.Markova, S. Musinov and B. Nazarova, have noted the structural foundations of pedagogical competence. The professional competence of the teacher ensures the effective and successful organization of the pedagogical (teaching and education) process. In order to gain professional competence, a teacher must focus on consistent self-improvement. The "Individual Development Program" helps the educator to develop himself.

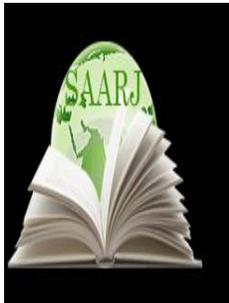

Because in this program, the qualities of competence that a teacher has and the qualities that need to be developed, the BKM can be clearly and objectively expressed. A number of studies, in particular, AK Markova, S. Musinov and B. Nazarova, have noted the structural foundations of pedagogical competence. The professional competence of the teacher ensures the effective and successful organization of the pedagogical (teaching and education) process.

In order to gain professional competence, a teacher must focus on consistent self-improvement. The "Individual Development Program" helps the educator to develop himself. Because in this program, the qualities of competence that a teacher has and the qualities that need to be developed, the BKM can be clearly and objectively expressed. Many arguments have been made that the development of professional psychological competence depends not only on the amount and quantity of psychological knowledge, skills and abilities, but also on the subject's aspirations to acquire and implement a competent model of professional behavior. In this case, the nature of a particular individual subject, the direction of values, way of thinking, worldview, beliefs, ideals, self-concept, self-awareness, motivation to be competent play an important role. In particular, the content of motivational characteristics is important in determining the effectiveness of competence.

It is important to pay attention to the desire of a person to develop their professional and personal qualities. An analysis of the scientific literature in the field of motivational psychology, devoted to the study of the development of professional qualities of the individual, shows that there are many types of motivational tendencies involved in the management and control of this process.

NECESSARY CONDITIONS FOR THE IMPLEMENTATION OF THE DIVERSIFICATION STRATEGY IN THE ECONOMY

Yusupova Raushan Edilbekovna*

*Doctoral Student at Karakalpak State University,
UZBEKISTAN

ABSTRACT

This article discusses the types of diversification strategies and their role in the economy, as well as the concept of diversification. The experience of our country during the years of independence shows that in any country, the industrial sector, which is the basis of the economy, must develop on the basis of active integration. In other words, the development of the enterprise requires the use of diversification strategies to expand the scope of activities. Diversification strategy means that the company is expanding its activities. The degree of diversification can vary.

KEYWORDS: *Diversification, Economy, Uzbekistan, Strategy, State, Competition, Export, Agriculture, Industry*

INTRODUCTION

The process of economic diversification around the world began to develop in the mid-1950s. Initially, diversification took place in the United States, Japan, and Western Europe in the fields of industry, transportation, construction, and finance. Therefore, the nature of diversification is determined by the socio-economic factors of these countries, as well as the general factors that belong to other countries (scientific and technological revolution, the struggle for high profits, competition, not to lag behind in technical progress, etc.). In diversification, firms, especially monopolies, become more diversified. They start out in high-income, fast-growing industries. In addition to producing products, companies also begin to produce the raw materials needed for these products. They spend money on low-income sectors that save a lot of money.

Without increasing the competitiveness of our economy, it is impossible to carry out such a strategic task as bringing the economy of our country to the level of developed democracies in the medium term. Comprehensive measures are being taken to ensure the competitiveness of the country's economy.

The Development Strategy Program for the five priority areas of development of the Republic of Uzbekistan for 2017-2021, selected by the head of state, includes an active investment policy aimed at modernization, technical and technological renewal of production, implementation of production projects and high-tech. It is planned to accelerate the development of processing industries, primarily the production of high value-added finished products based on deep processing of local raw materials.

The experience of our country during the years of independence shows that in any country, the industrial sector, which is the basis of the economy, must develop on the basis of active integration. The positive changes that have taken place in our economy have led to a significant diversification of its structure. Petroleum, chemical, automotive, modern agricultural machinery, building materials industry, railway machinery, consumer electronics, pharmaceuticals, food, textiles, footwear and a number of other completely new industries. The establishment of which laid the groundwork for this.

As a result, over the years of independence, industrial production has increased 4.6 times, and in the last 10 years, the average annual growth rate of the industrial sector has exceeded the GDP growth rate. While high, it was 8.9 percent. In the 1990s, agriculture accounted for about 33 percent of the country's gross domestic product, while industrial output did not exceed 14 percent. Industrial production also included cotton ginning and the production of agricultural machinery.

Today, as a result of reforms, the share of industry in GDP has reached 32.9%, while the share of agriculture in GDP, despite the rapid growth, has reached 17.6%. The share of the broadcasting sector reached 49.5%.

The main task, as noted by the head of state, is to accelerate the development of industry through diversification in the economy and increase its share in GDP to 40% by 2030, reduce energy consumption by about 2 times due to the widespread introduction of modern energy-saving technologies. to achieve.

It should be noted that localization in the production of finished products plays an important role in more sustainable and consistent development of the economy, reducing its dependence on external factors, accelerating the introduction of new efficient technologies in production processes. That is why localization in Uzbekistan is one of the main directions of industrial development. This will ensure the extensive use of local raw materials and production resources, as well as the production of import-substituting, modern and competitive products.

Our country has a great potential for agriculture. Therefore, in recent years, extensive work has been done to reform agriculture and introduce market mechanisms.

In particular, the Strategy of Agricultural Development of the Republic of Uzbekistan for 2020-2030, the concept of efficient use of land and water resources in agriculture and other organizational and legal measures were adopted. The goal is not only to provide economic benefits, but also to ensure food security and increase the well-being of the people.

It is no exaggeration to say that the Resolution of the President of the Republic of Uzbekistan "On Additional Measures for the Implementation of the "Agricultural Diversification and Modernization" Project with the Participation of the International Fund for Agricultural Development" signed on 15 September this year is an important step in this direction.

At the same time, the establishment of new high-tech production facilities, more active involvement of the regions in the development of competitive and export-oriented modern industrial products, production, engineering communications, road transport, social infrastructure and logistics services. In order to expand the attraction of foreign direct investment to ensure rapid development, 14 free economic zones and 96 small industrial zones have been established in the country.

It is advisable to increase the above figures, first of all, to use the diversification strategy in order to achieve further development of the economy. In other words, the development of the enterprise requires the use of diversification strategies to expand the scope of activities. Diversification strategy means that the company is expanding its activities. The degree of diversification can vary. The degree of diversification can be in the following forms: limited diversification, linked diversification, unbound diversification.

-bounded diversification- usually occurs when an enterprise leads one business, but other businesses that do not have a large volume also develop;

-related diversification is the development of several activities that are somehow interconnected (production, technology, sales, etc.).

-Unconnected diversification is the development of several different unrelated activities. For example, in the field of consumer services, in addition to manufacturing activities.

The content of the diversification strategy is based on the following objectives:

The essence of a diversification strategy is to distribute the assets and capital of a company between different areas of activity to reduce the risk of losing future income. The main advantages of an unrelated diversification strategy are that the company can find and develop more profitable businesses in the future, as well as reduce the impact of seasonal declines in core business sales. The disadvantages (or risks) of such a diversification strategy are the need to allocate large resources to develop a new line of business and investment.

An international diversification strategy can take one of two forms, described above: linked or unbound. But we talk about it separately because it means a lot to the company. International diversification is one of the main strategic ways to diversify the company's activities. They will move on to it once national diversification is complete. This process requires high management skills and a properly built management structure.

Selection and analysis of new production lines for the enterprise. Management needs to determine which markets are potentially promising and attractive to enter, what opportunities and resources are available in them, and how this will affect the overall profitability of the company.

Exploration of opportunities for useful combination of value chain blocks of different business units. To increase the operational and strategic efficiency of management, SEBs should look for opportunities to use and redistribute resources. For example, using one company's strong market brand to promote another.

Implement measures to increase the value of the company at the expense of existing divisions. Management should seriously assess the existing environmental conditions and opportunities of

existing companies, abandon inefficient areas, strengthen the position of promising products by developing internal resources and purchasing ancillary enterprises.

Key Methods of Diversification Buying an existing SEB is the most expensive and fastest way to get a business ready and working without additional effort to overcome industry barriers. Creating an SEB based on internal capabilities Identify internal resources to create a business unit from scratch. It is usually applied when the company has sufficient funds and powers to overcome market barriers in the area selected for the activity. This is also common for companies that have valuable resources for their chosen field.

The creation of joint ventures is applied in complex and high-tech industries that require significantly more resources than the enterprise has: They are in poorly studied industries with high levels of risk and uncertainty; diversification applies to operations in another country.

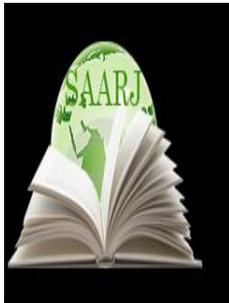

Types of diversification strategies are: Elements of the associated diversification value chain involve entering a new market by forming a business unit that is similar to the elements present in the corporate portfolio.

Unrelated diversification involves entering a new market by acquiring a business unit that is incompatible with the corporation's current trends in the value chain, but has the potential to increase the profitability of the entire company.

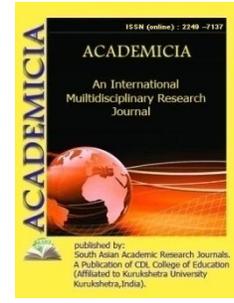

Thus, the diversification strategy is related to new products designed for new markets. Of course, this strategy is difficult and risky because it takes the enterprise into new areas. Their success requires the involvement of large human and financial resources.

CONTENT, FORM AND MEANS OF FORMATION OF BASIC COMPETENCES IN PRIMARY SCHOOL STUDENTS

Suvonqulova Aziza Abdurazzoq qizi*

*Gulistan State University Master of Education,
 Theory and Methods of Education (Primary Education), 2nd stage,
 UZBEKISTAN

ABSTRACT

In selecting learning technologies for the formation of core competencies in students, the science teacher identifies the core competencies identified for that class in the calendar theme plan. After that, the method of teaching is chosen, taking into account the topic to be studied and the competencies to be formed. This article discusses the content, form, and means of developing core competencies in primary school students.

KEYWORDS: *Primary School Students, Basic Competencies, Development, Content, Form, Means, Higher Education, Pedagogical Principles, Interactive Methods, Interactive Lessons.*

INTRODUCTION

The study of pedagogy today and the relationship of time to it is becoming a separate scientific problem. A person, as an independent creative activity and a skilled expert in his field, must be able to influence the development of the nation's social thinking. Independent creative activity, creativity serves as a criterion for ensuring the level of preparation of students for social life on the basis of social knowledge and consciousness. The system of higher pedagogical education is an important step in this direction, especially in pedagogical faculties, where the formation and development of professional skills, ethics, etiquette and necessary qualities of future primary school teachers is a priority.

Interactive approach. Teachers create a comfortable environment for better organization of the teaching process. Students are given the opportunity to exchange ideas. They discuss and resolve the issues that need to be resolved together. They find a solution together to get out of the situation. They demonstrate their knowledge to each other based on the information they receive.

Design method. The design method is a system of teaching in which students acquire knowledge, skills, and competencies in the planning, construction, and execution of a practical task that is constantly becoming more complex. Students carry out a wide range of problem-solving (creative, information, communication and problem-related) projects. For this method to be highly effective, it is necessary to have a high level of motivation in the project. personal competencies are formed:

- Teamwork;
- Feelings of responsibility;
- Self-confidence;
- Fast thinking;
- Be able to see the progress of the process;
- Ability to observe;
- Motivation.

The problem-based modular teaching method involves the practical application of theoretical knowledge. This method forms the didactic basis of various models of teaching and differs in the use of teaching aids and pedagogical techniques. It refers to the division of the subject into relatively small parts - modules. The main purpose of education aimed at the development of the student's personality is in fact the development of additional competencies such as thinking, mastering, writing and arithmetic of children from the primary school. A person who enters into social relations and actively participates in social development is called a person. A person who is born as an individual then becomes a person. In the notion of the individual, a person's lineage is embodied.

The design method is a system of teaching in which students acquire knowledge, skills, and competencies in the planning, construction, and execution of a practical task that is constantly becoming more complex. Students carry out a wide range of problem-solving (creative, informational, communication and problem-related) projects. For this method to be highly effective, students must have a high level of motivation in the project. The following personal competencies are formed: teamwork ; activity; sense of responsibility; self-confidence; teaching; quick thinking; ability to see the process; ability to observe; foresight; diagnosis; accelerates the activation of knowledge; helps to attract new and interconnected ideas freely and openly.

Communicative competence - adherence to etiquette in communication; to be able to listen to the opinion of the interlocutor, to express one's opinion; self-control adherence to the culture of communication in communication; including elements such as respect for the opinion of the interlocutor in the conversation, which is manifested through the study of the proverbs related to language. National and multicultural competence - continuous self-development of physical, spiritual, mental, intellectual and creative development, striving for perfection, independent learning throughout life, continuous improvement of cognitive skills and life experience it involves acquiring the skills to go, alternatively evaluate one's own behavior, and make independent decisions.

National and multicultural competence refers to the ability to find, sort, process, store, use, secure, and develop the capacity for media culture to obtain the necessary information from media sources.

Complete a variety of problem-solving assignments in a variety of academic disciplines, such as reporting, writing test questions, and more. Students will be able to complete a variety of challenging assignments independently in a variety of disciplines at several stages of the education system. For example, in general secondary education, time is allocated for practical training. As students participate in these hands-on activities, they will develop the basic skills to participate independently in production. In later stages of education, such as lyceums and vocational colleges, they are in a variety of internships, completing problem-solving assignments independently, compiling reports, and writing essays. In higher education, students participate in industrial, graduate and pedagogical internships. Pedagogical internships are organized for 14 weeks for final students in the fields of music, fine and applied arts, labor education, primary education and psychological education, where the field of education is the humanities.

During the internship, students organize and observe a variety of lessons and extracurricular activities, analyze, write conclusions. During the internship, they prepare for lessons independently, initially under the supervision of a teacher, and during the main period, independently develop lesson and extracurricular activities and implement them in the educational process. At the end of the internship, reports will be prepared and presentations will be made.

And when faced with a difficult situation, they are constantly looking for solutions. Here are some suggestions on how to look or get an appointment for hair extensions. The following are the names of independent creative works that can be effectively used in the training of future primary school teachers in higher education. They can be successfully implemented taking into account different regional, regional, local characteristics.

- Production of various shapes, toys, objects from paper, cardboard, wires and fabrics, as well as various natural and artificial materials on the basis of the subject of labor education methods;
- to draw and describe various processes, landscapes, objects and objects in fine and applied arts classes;
- Participate in the development of methodological developments in the education system, the educational process and the organization of educational work (during the internship);
- Development and implementation of electronic trainings;
- Presentation of articles, lectures, theses in scientific, practical, methodological, pedagogical and psychological content in thematic conferences and conferences in magazines, newspapers, collections;
- Participate in the preparation of scientific reports (for research on the basis of economic contracts);
- Participate in the development of methodological recommendations, developments for the improvement of individual parts of the curriculum and program of the educational institution (preschool, general secondary, secondary special, vocational education);

- Design, development, construction of didactic tools of education. Preparation of technological and perforation maps, creation of slides;

- In the development and implementation of guidelines for improving the organization of various activities of students (games, games, labor, sports, health, creativity, production, community, etc.) to participate; - Participation in various pedagogical, psychological, didactic, methodological and scientific research and observation, experimental work;

- Participate in tests, questionnaires, interview questionnaires, observation cards, interviews, discussion and editing;

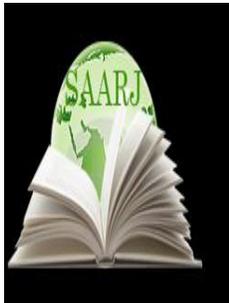

- participation in science olympiads, competitions, various contests, scientific-methodical conferences and seminars.

Active participation of the educational institution in various cultural, spiritual and educational events, hashars, etc. with representatives of public organizations, mahallas, authorities. In general, the following suggestions and recommendations can be made for the successful organization of independent creative work of future primary school teachers at the level of modern requirements. The diversity of independent creative work plays an important role in preparing future primary school teachers for professional pedagogical activities, as the more creative tasks students complete during their studies, the more diverse aspects of independent pedagogical activity become. Particular attention should be paid to the continuity, continuity and continuity of the organization of independent creative activity of students. Because in such cases, it is advisable to follow the principles of "simple to complex" and "easy to difficult" in the performance of problematic tasks. Students are encouraged to keep copies of independent creative work done during extracurricular and classroom activities, spiritual and educational activities, and internships, as they can also be used as direct examples in independent pedagogical activities.

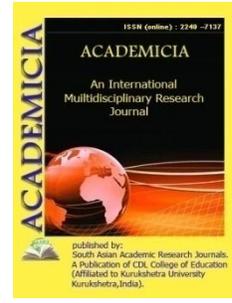

In conclusion, in order to effectively address the issue of ensuring the acquisition of professional skills and abilities of students, special attention should be paid to the forms of organization of independent practical creative activity. This will help alleviate the problem of training an aspiring creative elementary school teacher. In general, primary school students need to use interactive methods with the content, form, and means of developing core competencies.

COGNITIVE COMPETENCE AS A SCAFFOLD TO BE BOOSTING CRITICAL THINKING

Isakhanova Yulduz*

*Master Degree In Jdpi,
 UZBEKISTAN

ABSTRACT

This paper sheds light on critical thinking and creative thinking as two of the core elements of the cognitive competence, and also it looks back to some reviews about these two core features of cognitive competence, highlighting important points on it. Because we know that cognitive competence is not a self-regulated but is a learned process either naturally or unnaturally, still with some facing challenges in enhancing this quality. Hence, cognitive competence could be hailed as an important quality for nurturing critical thinking abilities and skills in children.

KEYWORDS: *Cognitive Competence, Critical Thinking, Self-Discipline, Self-Development, Techniques For Applying Critical Thinking, Effective Communication*

INTRODUCTION

As we are fully aware of different thinking that could be made up cognitive thinking, and also might as well greatly assist in improving critical thinking, divided into various types of thinking such as creative thinking, analytical thinking, critical thinking, concrete thinking, abstract thinking, divergent thinking and convergent thinking. So, according to Stefan Mitrovich, he had already pointed out that creative thinking an ability to conceive new and innovative ideas by breaking from established thoughts, theories, rules, and procedures. People who use this thinking often hear that they think outside the box. [1]. However, we are discussing interrelations between creative and critical thinking, hence we will be much more elaborating on these types of thinking. Besides, he also noted that critical thinking is not just a breaking down the actual received information, but evaluating and giving a fair judgment on some complicated cases with pitting some wits on it to find a solution to the problematic case. A way of observing problems or situations from a fresh perspective that means unorthodox solutions (which may look unsettling at first). Creative thinking is often stimulated both by an unstructured process like brainstorming,

and by a structured process like heuristic program. Moreover, it can be mean observing something during a new way. It's the very definition of "thinking outside the box." [2]

MATERIALS AND METHODS

Motivating and engaging students is the goal of most teachers—priming them to receive instruction, or otherwise align themselves to a pre-set process you've sketched out that you hope will yield a learning goal you selected beforehand.

In this process we are looking at the technique that is so called Brain Shifter to help to increase the capacity of level of critical thinking in children as they are at a turning point that could be guided towards easily at their early ages. And the following stages how to set up Brain Shifter method:

Purpose:

Create new ideas that you never thought about before. Bonus: Laugh and have fun in your group while you learn more about yourself and the group.

Instructions:

- 1) Start by putting up a large paper on a wall (at least A1 size)
- 2) Get in to character by changing your mindset and try to think like another person. For example, imagine that you are a child, a lawyer, a salsa dancer or why not a superhero? The ambitious ones can also dress up as their chosen character to give extra effect to their brainstorm.
- 3) Start by drawing your thoughts on the paper. Let's say you have chosen to be a dancer, then you could for example dance salsa while you draw your ideas on the idea-mind map. Be sure to take turns in the group.
- 4). When the time runs out you should kill your darlings and select the best idea by using Idea voting.

Do:

- Think and play around as much as you can.
- Use a lot of colors when you draw the mind map.
- Always build on the ideas of others in order to make this a crazy idea-mind map

Don't:

- Forget to challenge your comfort zone by choosing new characters.

Timeframe

Total time for the brainstorm will be 1 hour. A 45 minutes' session with a 10 min break, 15 minutes to kill your darlings.

During the break you need to do 5 handstand pushups times 3. Take a glass of water and start again. The purpose with this energizer is to get blood to your brain as well as helping you stay in shape.

Facilitator's role

Take time on actual brainstorm and to signal when it's time for a break. The Facilitator should also bring props for the people in your group to fully get into their characters.

Reflection questions

- How was it?
- Did you feel that this was valuable for your work? In what way? [3]

The machine project to create a unite atmosphere and joyful collaboration inside the classroom, as well as facilitating the needs to overcome extreme shyness in either in public or on board.

THE MACHINE PROJECT:

Quick introduction

The Machine is an exercise to get the creativity flowing.

Purpose

A short break in work creates energy.

Instructions

One person starts making a sound and a movement, such as a “woop”-sound, flapping one arm.

The next person connects to the first part in our machine, also making a sound and a movement.

You keep repeating the sound/movement until everyone in the group is connected, making it a giant moving noisy machine! Works best with big groups.

RESULTS AND DISCUSSIONS

So, it is a lucid that critical thinking is the analysis of facts to form a judgment. The subject is complex; several different definitions exist, which generally include the rational, skeptical, and unbiased analysis or evaluation of factual evidence. Critical thinking is self-directed, self-disciplined self-monitored, and self-corrective thinking. It presupposes assent to rigorous standards of excellence and mindful command of their use. It entails effective communication and problem-solving abilities as well as a commitment to overcome native egocentrism and socio centricism [4]. Someone with critical thinking skills can:

Understand the links between ideas, determine the importance and relevance of arguments and ideas, recognize build and appraise arguments, identify inconsistencies and errors in reasoning, approach problems in a consistent and systematic way, reflect on the justification of their own assumptions, beliefs and values. One of the most important aspects of critical thinking is to decide what you are aiming to achieve and then make a decision based on a range of possibilities.

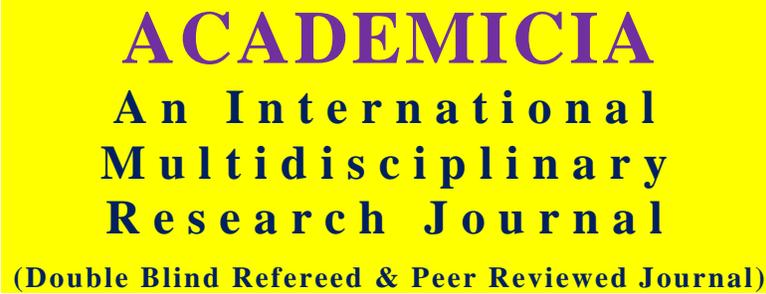

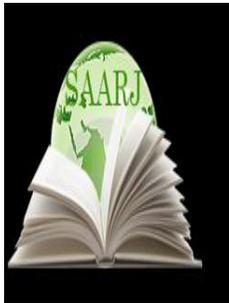

Once you have clarified that aim for yourself you should use it as the starting point in all future situations requiring thought and, possibly, further decision making. Where needed, make your workmates, family or those around you aware of your intention to pursue this goal. You must then discipline yourself to keep on track until changing circumstances mean you have to revisit the start of the decision making process.

However, there are things that get in the way of simple decision making. We all carry with us a range of likes and dislikes, learnt behavior and personal preferences developed throughout our lives; they are the hallmarks of being human. A major contribution to ensuring we think critically is to be aware of these personal characteristics, preferences and biases and make allowance for them when considering possible next steps, whether they are at the pre-action consideration stage or as part of a rethink caused by unexpected or unforeseen impediments to continued progress. The more clearly we are aware of ourselves, our strengths and weaknesses, the more likely our critical thinking will be productive.[5].It might be thought that we are overextending our demands on critical thinking in expecting that it can help to construct focused meaning rather than examining the information given and the knowledge we have acquired to see if we can, if necessary, construct a meaning that will be acceptable and useful.

After all, almost no information we have available to us, either externally or internally, carries any guarantee of its life or appropriateness. Neat step-by-step instructions may provide some sort of trellis on which our basic understanding of critical thinking can blossom but it doesn't and cannot provide any assurance of certainty, utility or longevity.

HOW TO IMPROVE LISTENING SKILLS FOR ESL STUDENTS?

Jolibekov Maryash Risnazarovna*; Abdiganiyeva Nadira Abdinazarovna**

*Docent, scientific Advisor,
Karakalpak State University after named Berdak,
UZBEKISTAN

**2ndyear Student,
Karakalpak State University after named Berdak ,
UZBEKISTAN

ABSTRACT

In this article, we will teach ESL students how to understand English speech by ear, how to choose and listen to a podcast appropriate to the topic and level of English, the usefulness of listening lessons, how to learn English correctly from audio materials, what podcasts are, detailed information about the term ESL is given.

KEYWORDS: *ESL, Term, Category, Representative, Nationality, Education, Perfect, Vocabulary, Grammar, Stability, Listening, Skill, Task, Skill, Celebrity, Fluent Speaking, Attention, Podcasts.*

INTRODUCTION

ESL - this term refers to English as a second language and requires students to be taught English in countries where English is the main language of communication. Canada, the United Kingdom, the United States, Australia, etc. fall into this category, where English is spoken everywhere, but students learning English are of different nationalities c. These students must be fluent in English to meet the requirements of education and employment.

When learning English, many face difficulties in understanding and listening to English. In addition, the person can read and write perfectly without error.

Learning English can be relatively easy in some ways. For example, memorizing vocabulary or learning grammar are issues that can be easily learned with consistency. However, learning to understand the words of others is not at all easy to know by listening to words called Listening.

Listening to English is one of the key skills in the whole foreign language learning process. Listening encourages a person to speak, that is, develops another basic skill - speech.

The most important thing to remember is that listening to English is a skill, and the task for the requirements is to develop it.

The only way to develop hearing ability is to teach the listener to differentiate and understand the words in a sentence.

To improve ESL students' listening in English, they must first learn the techniques of working with text.

The following guidelines will help you work with text and develop listening skills:

1. Students should always listen. Even if students are very busy, they should take time to listen for 30 minutes a day. The main thing here is regularity.

2. Before students start listening, they need to adjust the performance, they need to separate the world, concentration is the most necessary detail. Students should promise themselves that in the next 30 minutes, they will only practice their listening skills.

Hearing ability is the ability to hear and understand English. Listening is one of the basic skills of learning English.

Once a student begins to learn English, he or she must select texts for listening that are appropriate for the level of knowledge of that language.

Once the student has stopped working with the text, he or she can listen to many audio and video tutorials in the foreign language, such as dialogues, thematic texts, and audio stories, in order to master the ability to listen and speak fluently in a foreign language. should listen to them again.

This is the main reason why audio books in English are so popular among students. The more they listen, the faster they become accustomed to foreign speech and begin to understand it. And given that most free audio books are spoken by non-professional native language experts, they can also listen to people with different pronunciations. Someone whispers, someone makes vague sounds, someone speaks too fast - it's a great exercise for your listening ability.

If students really want to learn, they must listen to English every day. We all know that this is the most important step needed to develop a student's listening ability. Listening to the English language used allows you to learn more about its natural use.

The main way to develop English language skills through active listening is to listen to conversational topics from a variety of sources. This then introduces students to unfamiliar dictionaries and broader accents.

ESL students need to develop a strategy in a specific direction. This strategy should have a step-by-step tracking system.

ESL students who are learning English should not lose focus when listening to any audio for their own benefit.

One of the biggest challenges for students learning a language is speaking it, working it out loud. The main reason is embarrassment or embarrassment for saying something wrong and an inability to think about what to say in the first place.

But there is no better way to learn a language than to speak it, as they can learn countless words and, if they wish, must memorize an English dictionary completely. If the students are never practicing it, if they don't speak the same language to other people, it will be difficult for them to use it when they need to.

As we have said many times about listening, students can find the best learning tool to listen to songs and audios because the brain is ready to memorize the lyrics of the songs without the person having to feel them. When they listen to a song, they like it over and over again. This is something that is done automatically, even before you speak.

Listening Rules:

- 1) Students listen to the audio recording a maximum of 2 times and try to understand the main meaning of what is being said.
- 2) Each student reads the text of the audio recording and analyzes each word in detail, using dictionaries if necessary.
- 3) The student likes the audio recording again and listens to it again based on the text, pausing in places that are difficult to understand.

It is very important to listen carefully to the pronunciation of each phrase, to compare it with its analogue in the text in order to understand how to pronounce it.

- 4) The final step is to listen to the writing without relying on the text to reinforce the material.
- 5) If this is the case, then the final stage can be a stage of performing various tasks related to the text, which is better to do without relying on it.

When a student chooses audio recordings, of course, they have to choose according to their level. We encourage teachers to select podcasts based on their level to improve this skill.

1. The student must choose the right level of interesting material
2. You need to find the best way to work with the podcast

In their spare time, language learners can listen to audio recordings or use other tactics:

- Listen to the audio material and try to understand as much information as possible from it. If this is difficult, try to understand the main message of the post.
- Find, read the text of a message and translate phrases they do not know.
- Turn on the sound again and try to listen to the text they know.
- Tell your friends, family, or yourself what you have heard in the mirror, trying to imitate the speaker's speech.

This tactic does not seem to take much time. The student spends only 15-20 minutes analyzing the five-minute audio material.

The reader is also involved in the order in which these processes are performed

The main tasks of the teacher in the class are:

- Listening to a variety of listening comprehension tasks to engage the learner, drawing attention and knowing the vocabulary before listening;

- listening assistance - teaching to listen to important moments and the information they need while listening and removing difficulties in paying attention to some;
- Listening, after the hearing, as well as the conclusions after the hearing, not only to strengthen the audit, but also to verify that there was a reason for the audit.

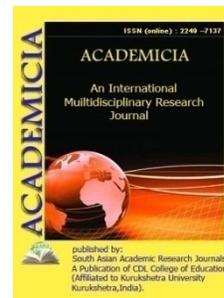

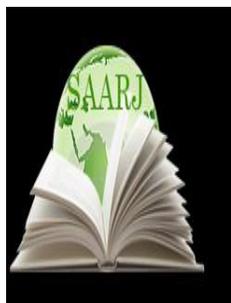

In fact, it is better to start learning a foreign language at a very young age. As the brain activity of young children continues to develop steadily, they are able to absorb new information much faster than adults, whose brain activity is fully formed. It is advisable to plan the lesson taking into account these features. For example, the use of games, pictures, songs, poems, and cartoons is an effective way to teach a foreign language to preschool children.

During the audition, students will be able to:

- find out what we are talking about at the scene;
- pay attention to what is unclear and raises questions about it;
- determination or denial obtained during the hearing;
- It is necessary to draw conclusions and bring.

ABSTRACT

The catalytic aromatization reaction of the propane-butane fraction was carried out on a mesoporous catalyst containing Pt, Zn, Ga and Cd / N-ZSM-5 under the following optimal conditions: Catalytic conversion of propane-butane alkanes at atmospheric pressure went. The reaction was carried out under conditions of temperature 723 to 873 K and volumetric velocity of the raw material from 50 to 150 h. The conversion reaction of a mixture of alkanes containing C₂H₆ = 2.2; C₃H₈ = 73.7; N-S4N10 = 24.1%. In high-silicate zeolite catalysts with the structure ZSM-5 ([SiO]₂ / [Al]₂ O₃ = 30, 50, 70 and 100) and ZSM-11 ([SiO]₂ / [Al]₂ O₃ = 100), the catalytic contacts the relationship between their structural and acidic characteristics and their activity in the formation of conversion products was studied. Depending on the silicate modulus, it was found that the conversion rate of the alkane mixture S₂-S₄ varies and is 96% at [T = 823K and v = 100 s]⁻¹. The distribution curves of the volume of the pores to the equivalent diameters were compared. The largest part of the pores is 13 to 20 diametri in diameter. YuK zeolites also have medium (25-50 Å) and large (50-90 Å) mesocytes. The distribution corresponds to 32–35 bo'yicha along the curves. The sizes of the largest mesocytes for these catalysts vary - from 63 to 80 Å.

INTRODUCTION

The most efficient way to process propane-butane fractions is to chemically process them to obtain aromatic hydrocarbons. Aromatic hydrocarbons are important primary products in the main organic synthesis industry. At present, aromatic hydrocarbons are processed into liquid products of oil catalytic reforming and pyrolysis processes. Changes in the petrochemical complex raw material base are leading to a shortage of these hydrocarbons. Therefore, the search for alternative energy sources to replace petroleum products to obtain aromatic hydrocarbons remains an important task. Alternative sources today are natural gas and petroleum gases. A number of scientists are conducting research on the catalytic synthesis of aromatic hydrocarbons [1-5]. In this reaction, high-silicon zeolites containing Zn, Zr, and Pt have high catalytic activity [2,5,6]. The disadvantage of the catalytic interaction of these systems is that the reaction produces a certain amount of methane and high molecular weight aromatic hydrocarbons (naphthalene, alkyl naphthalene). As a result, the stable service life of catalysts is reduced.

Currently, scientists around the world are interested in the process of obtaining aromatic hydrocarbons from natural gas and petroleum gases in one step.

Zeolite catalysts, especially those modified with metals and metal oxides, are widely used in petroleum refining and petrochemistry [7-11]. The traditional method of obtaining such catalytic systems is to absorb the metal salts into the zeolite and gradually decompose the introduced precursor [12 - 19]. However, in this method, the modifiers are not evenly distributed throughout the entire volume of the zeolite, but are localized on the surface of the zeolite crystals. This reduces the performance efficiency of the catalyst. However, the acidity centers of the catalyst also play an important role in the catalytic activity of the catalytic system. Hydrothermal synthesis is important in ensuring the isomorphic exchange of aluminum or silicon in the zeolite crystal lattice for modifiers. The acidity and texture characteristics of the catalyst are improved due to isomorphic exchange in hydrothermal synthesis. This paper presents the results of the study of the kinetic laws of the catalytic aromatization reaction of propane in the catalyst Pt, Zn, Ga and Cd / N- ZSM-5.

A large value of selectivity for aromatic hydrocarbons was obtained by adding Zn⁽²⁺⁾ cations. In [120, 121], the catalytic properties of Zn / N-ZSM-5 samples prepared by ion exchange and pentacyl in the first-burned form Zn⁽²⁺⁾ during propane conversion were compared. , while the selectivity of aromatization doubles. During the modification of the propane and butane mixture, 5% Zn / N-ZSM-5, in which case $S_{(AY)} = 65.1\%$. Synthesis of high silica-zeolite catalysts (YUKs) was carried out in steel autoclaves at a temperature of 448 K for 6 days. The initial reaction mixture was prepared and mixed by adding an aqueous solution of aluminum salts $Al_2(SO_4)_3 \cdot xH_2O$ analytical and hexamethylenediamine to the liquid glass (29% SiO₂; 9% Na₂O; 62% H₂O). The pH of the reaction mixture was adjusted by the addition of HNO₃ solution. YuKTs powder (1.5 g) was added to the reaction mixture.

The aim of this work is to obtain a mesocellular catalyst containing Zn, Ga and Cd / N- ZSM-5, to study its physicochemical and catalytic properties in the aromatization reaction of propane.

EXPERIMENTAL PART

A mixture of gases: ethane - 2.2%, propane - 73.7%, N -butane - 24.1% by weight, the lower alkanes were used as raw materials for the conversion reaction. The studies were performed in a

reactor with a flow rate of 5 cm^3 at atmospheric pressure. The reactor was heated using a quartz furnace located in a thermostat. The temperature in the quartz furnace was measured with VRT-3. After passing through the catalyst mixture, the reaction products and the remaining unconverted raw material go to the water condenser for condensation. The liquid reaction products are placed in a Dewar tube filled with ice and collected in a collector. The volume of exhaust gases was measured using a GSB-400 gas meter, and a gas sample was taken for analysis using a metering valve. Catalytic conversion of low molecular weight alkanes was carried out under atmospheric pressure at a reaction temperature of 723 to 873 K and a bulk rate of the raw material from 50 to 150 h. The reaction products were obtained for analysis after 30 min. VTK fractions, C₉₊ hydrocarbons, naphthalene and methylnaphthalene. C₂-C₄ alkane conversion products were analyzed using gas chromatography on a chromium chromatograph with a thermal conductivity detector. Analysis of gaseous products - in a column filled with Al₂O₃ (0.25-0.5 mm, column length - 4 m, inner diameter - 3 mm), in the temperature programming mode from 298 to 423 K, with heater, speed 12 degrees / min. Carrier (He) gas velocity - 50 cm^3 / min. The chromatogram of gaseous products is shown in Figure 2.5. Liquid hydrocarbons were analyzed on a S₂₊ base at a temperature programming mode of 352 to 473 K at a rate of $12 \text{ }^\circ\text{C} / \text{min}$, and then at an isothermal mode at 473 K on a PFMS-4 stationary phase packed column. The chromatogram of gaseous products is shown in Figure 2.5. ZSM-5 and $[\text{SiO}]_2 / [\text{Al}]_2 \text{O}_3 = 50$ structured YuK zeolite were used as the basis for catalytic studies. Modification of zeolite was carried out by impregnation with solutions of salts and acids of the corresponding metals, as well as by obtaining five modified catalysts with boric acid: 5% V-VKTs; 5% Mn- VKTs; 1% Rt- VKTs; 1% Rt - 5% Mn / VKTs; 1% Pt - 5% Sn / VKTs. The catalytic activity of the obtained zeolite catalysts was studied in units of flow at atmospheric pressure. During the experiments, the effect of process temperature and voltmetric consumption rate on the conversion rate and the selectivity of aromatic hydrocarbon formation was studied.

Additives of various metals - Zn, Pd, Mo, W and Zn - increase the service life of pentacycl catalysts by 2-10 times []. Cadmium ions are added to zeolite to activate aromatization activity and selectivity. At $T = 873 \text{ K}$ $v = 110 \text{ Cd} / \text{N-ZSM-5}$, the selectivity in the propane and butane mixture converts to a mixture of aromatic hydrocarbons at 64.1%, with a conversion of 80–84%. Metal-containing zeolite catalysts were prepared by soaking zeolite in an N-shaped salt or with solutions of certain salts or acids. A certain amount of zeolite was mixed with a certain amount of modifying solution, and the mixture was kept for two hours with constant stirring. The mixture was then immersed in a water bath. After that, the sample obtained is dried at 383 K for 6 hours and baked in a muffle furnace at 793 K for 8 hours. Thus 1% Pt-H / ZSM-5 with the following content; 5% B- H / ZSM-5; 5% Mn - H / ZSM-5, catalysts were obtained: (as a modifier we used solutions of H₄ PtCl₆, boric acid H₃ $[\text{BO}]_3$ and manganese nitrate salt $[\text{Mn}(\text{NO})_3]_2 \times 6 \text{ H}_2\text{O}$. The second catalyst was 5% Mn with 1% 1% Pt-H / ZSM-5 and 5% Sn 1% Pt-H / ZSM-5. Platinum-modified zeolite catalysts were activated prior to the experiment at atmospheric oxygen flow at 573 K for 3 h and then at hydrogen flow at 793 K for 4 h.

IC spectroscopy and X-ray analysis were performed using physicochemical methods to study YuKTs: IR spectra of the studied zeolites (Figure 2.1) were recorded on a UR-20 spectrophotometer in the mid-wavelength part of the spectrum at 400-2000 cm^{-1} , where the

absorption ranges were AlO_4 of the base. $[\text{SiO}]_4$ are the principal oscillations of the tetrahedron. To do this, 1-2 mg of the sample and 400 mg KBr of potassium bromide are poured into a special ring placed in a mold, then the sample ring is inserted into the holder and placed on a spectrophotometer. Absorption lines in the observed spectrum can be divided into 2 types of oscillations.

The first type of oscillations corresponds to oscillations at 1120 cm^{-1} , 820 cm^{-1} and 470 cm^{-1} found in the whole zeolite spectrum. The strong absorption range at the apex of 1120 cm^{-1} is related to the antisymmetric oscillations of the tetrahedron $[\text{SiO}]_4$, while the 820 cm^{-1} length 3104 cm^{-1} tetrahedra represents the oscillations mainly involved. - The presence of strong absorption lines 1300-900, 820, 400-600 cm^{-1} in the region of all spectra testifies to the fact that all samples belong to zeolites.

- that all tested specimens belong to the ZSM constructive type, since all IR spectra obtained include the absorption peaks line 560 cm^{-1} . the ratio of the optical absorption ranges to 560 and 460 cm^{-1} (I560 / I460) [173], the crystallization rate of all studied samples was calculated: $\text{SiO}_2 / \text{Al}_2\text{O}_3$ (3) for ZSM-5 zeolites with a ratio of 30, 50, 70, 100; crystallinity level 89, 2, respectively; 93.3; 91.5; 88.2% are equal. For the ZSM-11 catalyst ($\text{SiO}_2 / \text{Al}_2\text{O}_3 = 100$), the crystallization rate is 88.1%. There are no significant differences in IR spectra for ZSM-5 and ZSM-11 zeolites; therefore X-ray analyzes were performed to improve the structure of the zeolites in detail. X-ray analyzes (Mo-anode, Ni-filter) were performed using Dron-3. Processing of the diffraction lines of zeolites was carried out by determining the distances and intensities of the lines (peaks) of the studied zeolite sample by comparing the distance lines between the planes (their position and relative intensity) with the corresponding line sample.

Thermal desorption measurements were set by programming heating the sample and recording the signal from the detector on a flat potentiometer sheet PDP 4-002 (or on the lines of the KSP-4 potentiometer). The chromatographic version of thermal desorption is that the catalyst sample, which is a molecule of a previously adsorbed substance, is heated at a certain constant rate in a stream of carrier gas and it passes through a detector. During desorption, the detector signal is recorded on a diagram sheet of the potentiometer.

A test sample of 0.3–0.5 g was placed in a quartz reactor and purified with carrier gas (He) at 373 K for 2 h. Carrier gas velocity 170 $\text{cm}^{-1} / \text{min}$. The sample reactor was then cooled to 373 K and ammonia adsorption was performed until the sample was completely saturated. With the sample, the reactor was cooled to 298 K. Thermal desorption of NH_3 was carried out at a rate of 170 $\text{cm}^{-1} / \text{min}$ of carrier gas (helium) with a programmed heating of the sample at -10 degrees / min.

After device inspection, the adsorbent (35-45 mg) was trained at 723 K in vacuum to remove contaminants for 6 h. The catalyst thus transferred is considered ready for adsorption measurements. Benzene and propane were used as adsorbates. Adsorption of benzene was studied at 293 K. The adsorption value is calculated according to the following formula.

$$a = (D \cdot l \cdot x_f) / m$$

a = mmol / g adsorption amount;

f = spiral constant mmol / mm;

Dl = elongation of the spiral, mm;

m = sample weight, g

The size distribution of the pores was calculated from the desorption networks of benzene adsorption isotherms using the Thomson-Kelvin equation:

$$d_{\text{ekv}} = (4\sigma V_m) / (RT \lg P_s / P)$$

d_ekv = equivalent pore diameter. Å;

s is the surface tension of benzene, din / cm;

V_m - molar volume of liquid, cm³ / mol;

P - equilibrium pressure, mm.Hg

Saturated vapor pressure of P_s-adsorbate, mm of mercury column

Changes in the structure of micropores were determined by the theory of volumetric filling according to the Dubinina-Radushkevich equation [71]:

$$\lg a = \lg \frac{W_0}{V_M} - 0,434 \frac{BT^3}{\beta^3} \left(\lg \frac{P_s}{P} \right)^3$$

a is the value of adsorption at temperature and equilibrium pressure R-mol / g

W_0 - total volume of micropores, cm³ / g;

V_M is the molar volume of the adsorbate, mol / cm³

T is the temperature of the experiment, in K;

R is the equilibrium pressure of the adsorbate, mm of mercury;

P_s is the saturated vapor pressure of the adsorbate, mm of mercury

b is the proximity coefficient;

The B-parameter reflects the size of the micro-pores in the sample, the smaller the micro-pores in the adsorbent, the lower the B-value.

The B-coefficient is directly related to the adsorption energy (E):

$$B = (2,303 R/E)^3$$

When constructing the dependencies in the coordinates lga - (lg (lgP_s) / P) ^ 3, B-parameters for the studied zeolite catalysts were determined.

The total volume of the adsorption gap (W_s) and the volume of the micro-pores (V_ (m.g).) Were determined from the experimental adsorption isotherm [23, 180]:

$$W_s = a_s x V_m; V_ (p.p) = W_s - V_ (m.g.); M_ (m.g) = a_0 x V_m;$$

a_s-adsorption value P_s / P_s = 1, such as mmol / g;

V_m is the volume of millimol adsorbate in the liquid state, cm³ / mmol;

a_0 is the value of adsorption at the relative pressure corresponding to the onset of capillary condensation in the transition pores, mmol / g.

$V_{(p.p)}$ is the volume of the passing mesentery.

Propane adsorption was performed in the temperature range of 293–393 K.

The adsorption temperature of propane was determined from the adsorption isosters

$$a = \text{const}, \ln p = -\frac{q}{RT} + B$$

The chemical composition of the sample was analyzed by energy-dispersion spectrometer and radiographic method with a scanning electron microscope.

Acidic, alkaline and thermal activation of bentonite is a common method in obtaining porous sorbents for the synthesis of organic and inorganic substances.

EXPERIMENTAL RESULTS AND THEIR DISCUSSION

It is known from the scientific literature that the catalytic properties of modified catalysts are directly related to their acidic properties. The acidity centers of zeolite catalysts are an important factor in determining their catalytic activity, as such centers are of 2 types. Weak and strong acid centers. The study of the acidic properties of catalysts by the TPD method of ammonia showed that ammonia is adsorbed in two forms on YuK zeolites, indicating the presence of two peaks in the TPD curve (Figure 3.3). Low-temperature peaks in the 393–613 K region indicate desorption of ammonia from weakly acidic centers, and high-temperature peaks in the 613–823 K region indicate strong Brønsted and Lewis acid centers. []. The amount of desorbed ammonia in the specified temperature range can serve to measure the number of these and other centers, and the maximum state of the ammonia in the TPD curve and the activation energy of NH_3 desorption ($E_{(a.des)}$) are given in Table 1.1.

It follows from the data presented that with an increase in the silicate modulus of zeolite from 30 to 100, a decrease in the total concentration of acid fields is

observed from 1.08 to 0.38 mmol / g. As the ratio of $[\text{SiO}]_2 / [\text{Al}]_2 \text{O}_3$ increases from 30 to 50, the strength of the acid centers increases.

Table 1.1. Thermal desorption of ammonia in high silica zeolite catalysts (sample heating rate 10 degrees / min)

The catalytic properties of TsSK were studied in a unit of catalytic bed flow with atmospheric pressure, temperature 673–873 K, and volumetric velocity of the raw material 150 s⁻¹. A 70-module ZSM-5 type zeolite sample was used for the study. The structure of the original zeolite was modified by the method of mechanical-chemical activation in a spherical vibrating mill for 24 h and by the introduction of amorphous matrices into the mechanized zeolite to obtain three CSKs:

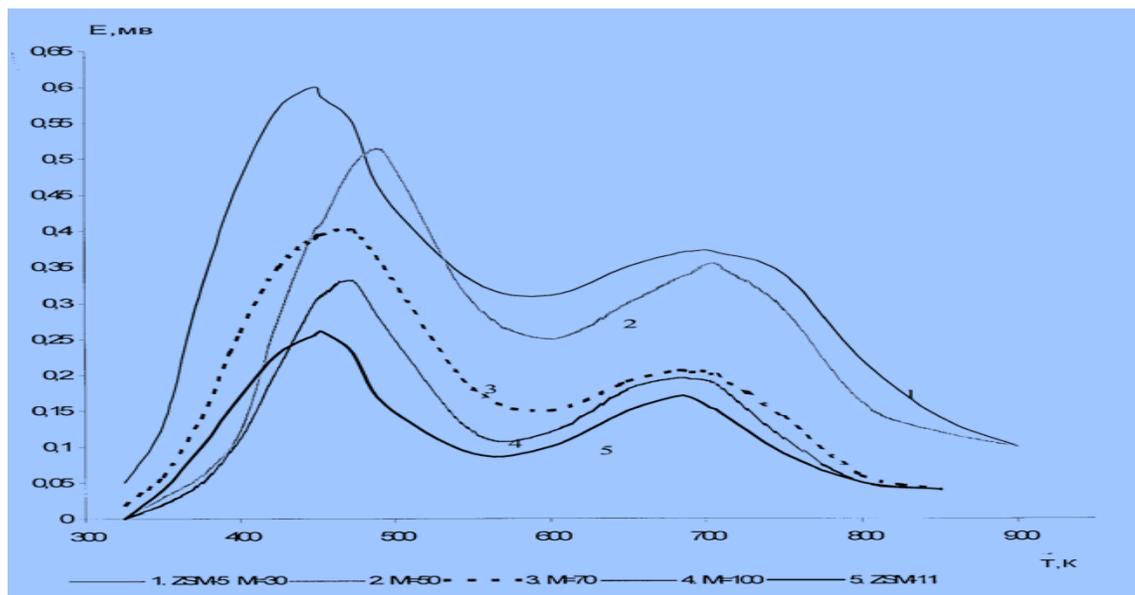

Figure 3.3

Thermal desorption spectra of ammonia adsorbed at 373K in zeolites with different $[\text{SiO}]_2 / [\text{Al}]_2\text{O}_3$ ratios.

Theoretical calculations of cluster quantum chemical models, as well as data obtained using IR spectroscopy and NMR [40, 45], showed that three major types of hydroxyl groups represent the presence of zeolites in large pores (one, two, or three aluminum atoms). As the ratio of $[\text{SiO}]_2 / [\text{Al}]_2\text{O}_3$ increases, the acidity of the bridged hydroxyl groups increases, because as the number of negatively charged alumino-oxygen tetrahedrons in the zeolite lattice decreases, the negative charges of the ON groups decrease, their polarity increases, and their polarity increases. This is confirmed by the results of the strength of the acid fields with an increase in the modulus of the silicate from 30 to 50.

Thermal desorption measurements of acid characteristics of zeolite catalysts 1.2. are given in the table.

The original zeolite YuKTs -1 have two different weak and strong acidic centers with activation energy of ammonia desorption - 25 and 115 kJ / mol and acid concentrations - 0.38 and 0.23 mmol / g. As a result of mechanical-chemical purification of zeolite, the total concentration of acidic centers decreases, mainly due to a decrease in the concentration of weak acid centers, while the concentration of strong acidic centers remains practically unchanged.

Figure 3.28 shows the isotherms of propane adsorption in primary pentacyl, mechanized zeolite, CSK, and matrices, of which the maximum value of propane adsorption is observed in the sample YuKTs-1 and is 1.48 mmol / g (at R = 60 mm Hg). Implementation of mechanochemical activation leads to a slight decrease in the propane adsorption capacity of zeolite.

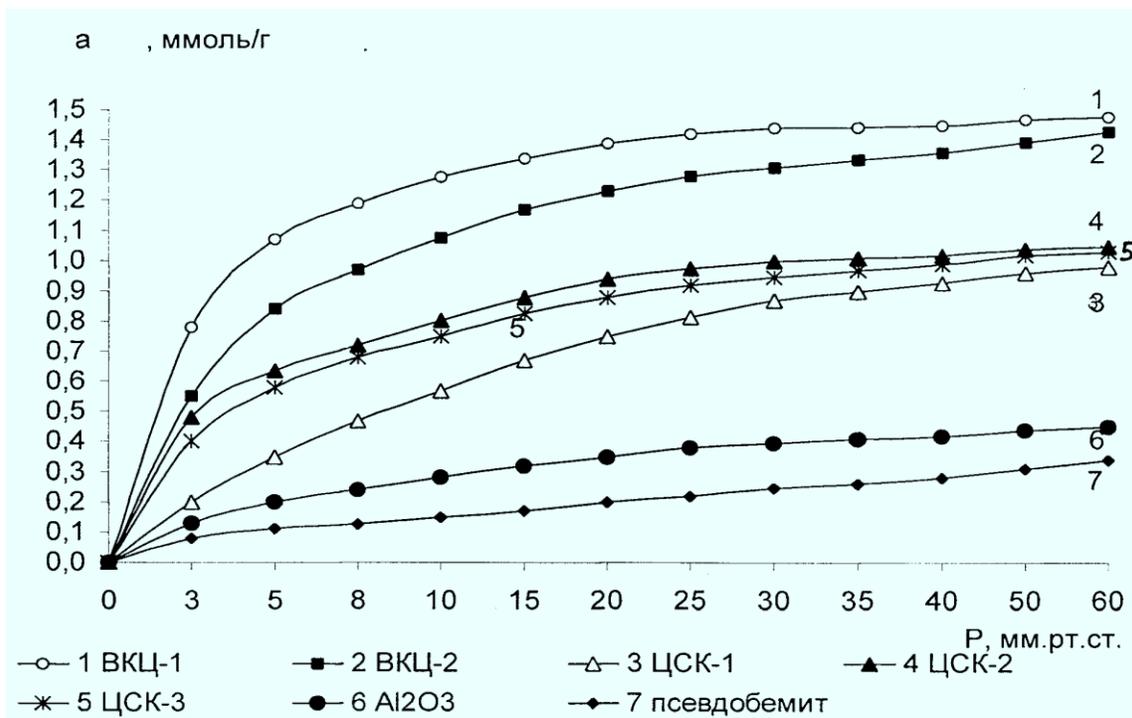

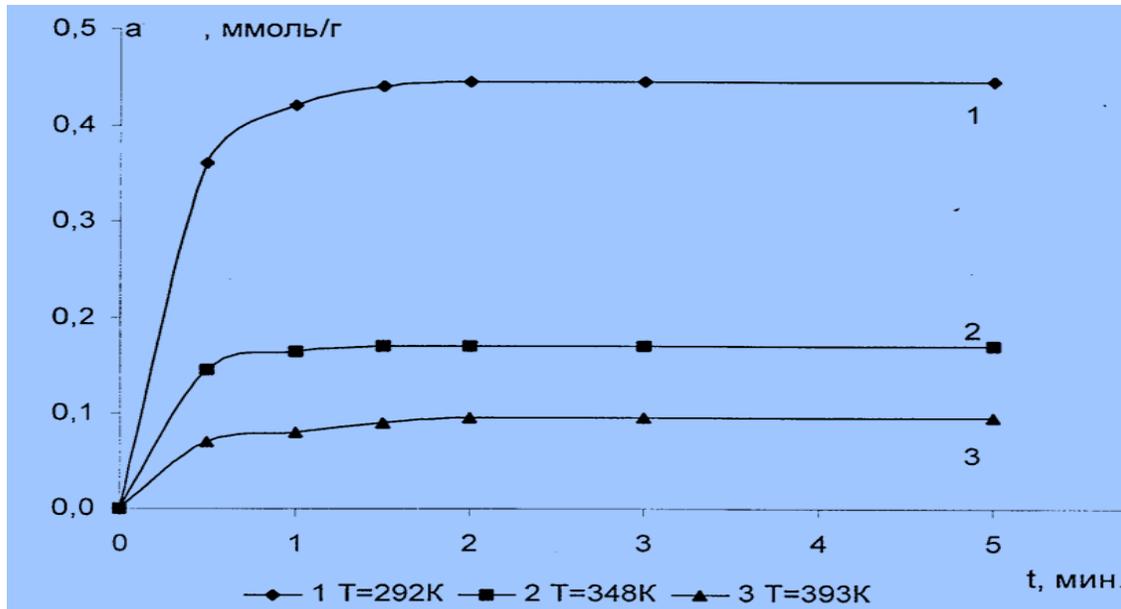

Figure 3.28 Isotherms of propane adsorption in zeolites, CSK and matrices (T = 292 K)

When zeolites are introduced into the matrices, the amount of adsorbed propane is significantly reduced, and the isotherms for mechanically active zeolite (TsSK-2, TsSK-3) zeolite catalysts are higher than the TsSK-1 isotherm. Propane is also absorbed into small amounts of carriers. For the UD Al₂O₃ matrix, the adsorption capacity of propane is high. Figure 3.29 shows the kinetic isotherms of propane adsorption on the TsSK-2 catalyst at T = 292, 348 and 393 K.

As can be seen from the figure, an increase in the experimental temperature leads to a decrease in the time required to establish the adsorption equilibrium and a decrease in the amount of adsorbed substance. The same property is retained for all the catalysts studied. The calculation of propane adsorption values on pure zeolite in CSK is based on the rules given in paragraph 3.2. The results of the calculations are shown in Figure 3.30, which means that the value of propane adsorption in zeolite containing CSK is higher than the original YuKTs-1 and YuKTs-2.

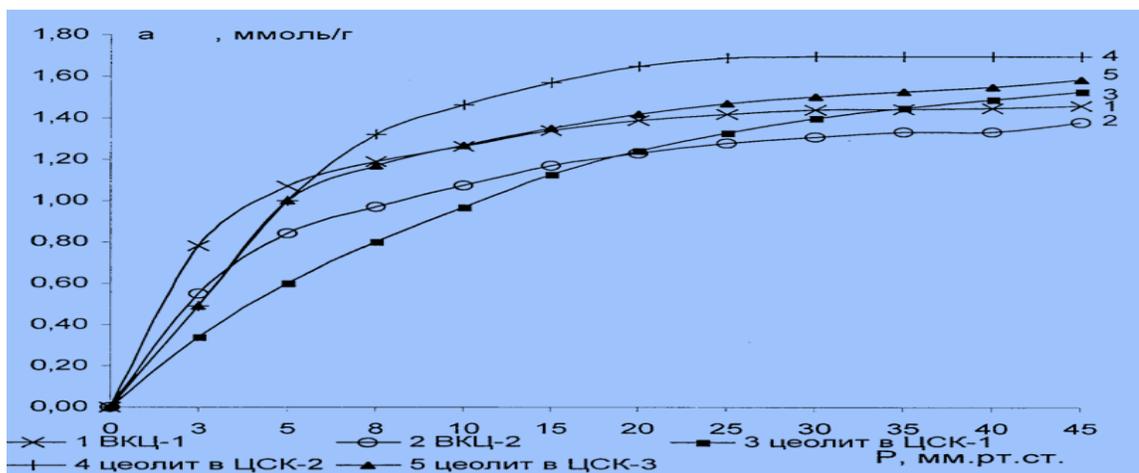

The highest adsorption capacity has a zeolite of 1.7 mmol / g with a propane adsorption value of R = 50 mm Hg in TsSK-2. The isotherm of adsorption on zeolite in TsSK-3 is slightly lower and also lower in TsSK-1. Thus, the mechanochemically activated zeolite that is part of the CSK has more adsorption capacity for propane than the zeolite introduced into the CSK without prior activation. The kinetic curves of propane adsorption on zeolites containing CSK drawn at R = 2 mm Hg and T = 292 K are shown in Figure 3.31. shown.

As can be seen from the figure, as at high pressure, the amount of adsorbed propane is higher in the initial pentacyl of YuKTs-1 than in YuKTs-2. The adsorption rate is also high in YuKT-1 and the time to establish the adsorption equilibrium in both zeolites is the same and is 6 minutes. The kinetic curves of activated zeolite in TsSK-2 and TsSK-3 are higher than in YuKTs-2, and the value of propane adsorption in TsSK-3 is 1.4 times higher than in YuKTs-2. and the value of propane adsorption in zeolite at TsSK-2 is almost twice that for YuKTs-2. Among all the samples studied, the highest rate of propane adsorption was observed in zeolite containing TsSK-2. The rate and amount of propane adsorbed on pentacyl containing TsSK-1 (R = 2 mm Hg) is the smallest of all the samples studied.

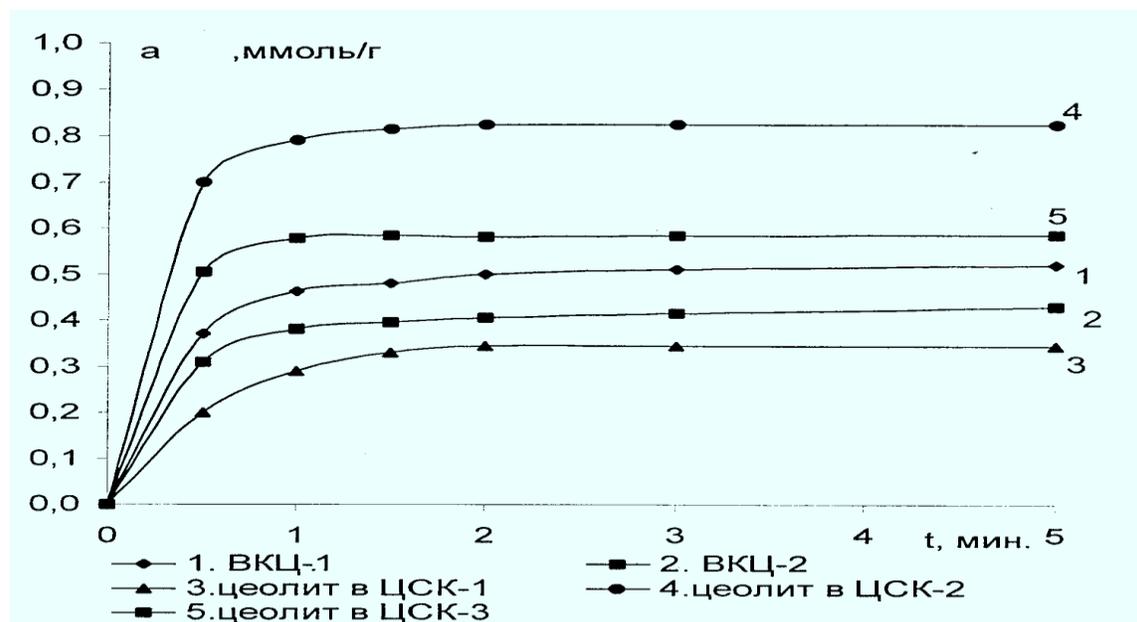

3.29 -image

Kinetic curves of propane adsorption in TsSK-2

3.30 -Picture

Isotherms of propane adsorption on zeolite in CSK (T = 292 K)

3.31 -Picture

Kinetic curves of propane adsorption in primary YuKTs and pure zeolite in TSK ($T = 292$ K).

A comparison of the adsorption properties of zeolite catalysts with the structural properties showed that for CSK there is a clear relationship between the B coefficients of the Dubinin-Radushkevich equation and the amount of adsorbed propane: the higher the B coefficient, the more adsorbed the propane is. Pure zeolite in TsSK and TsSK ($TsSK -2 > TsSK -3 > TsSK -1$).

In practice, a similar sequence is obtained by comparing the adsorption properties of TsSK with the number of strongly acidic sites and their selectivity for arenas: $TsSK -2 > TsSK -3 > TsSK -1$.

Thus, the introduction of mechanically-chemically activated zeolite into the CSK leads to a change in its structural, adsorption and acidic properties, which in turn affects the CSK activity in the aromatization reaction.

Indeed, the results of calculating the rate of accumulation of aromatic hydrocarbons in continuous conversion showed that the aromatization of isobutane in Zn and Ga -pentacil is 9 and 12.5 times faster than in the normal forms, respectively [142]. Separation of a hydride ion from an alkane molecule in the presence of Zn^{2+} cations can occur according to the following scheme [120, 143]:

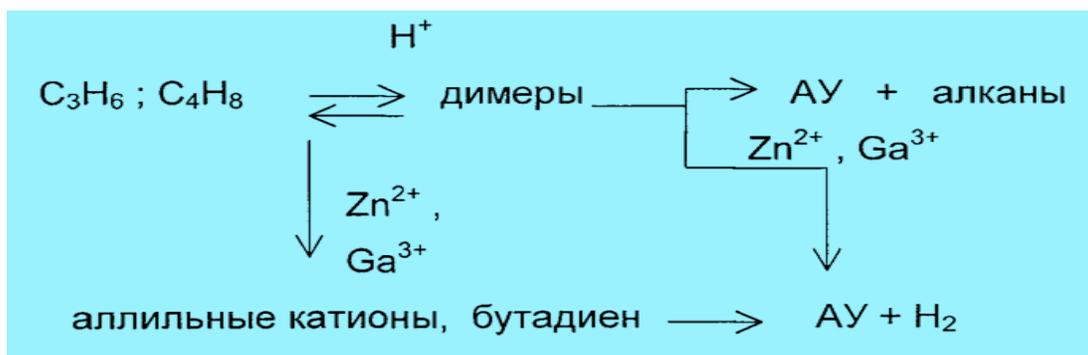

In this case, the cation Zn^{2+} acts as an acceptor of hydride ions. In addition to the first stage, dehydrogenation of saturated carbons, Zn and Ga, which are part of pentacil, is involved in the separation phase of the hydride ion from olefin molecules with the formation of allyl intermediates:

Based on the experimental data, a scheme for the conversion of lower olefins in pentacil modified with Zn and Ga was proposed.

[144]:

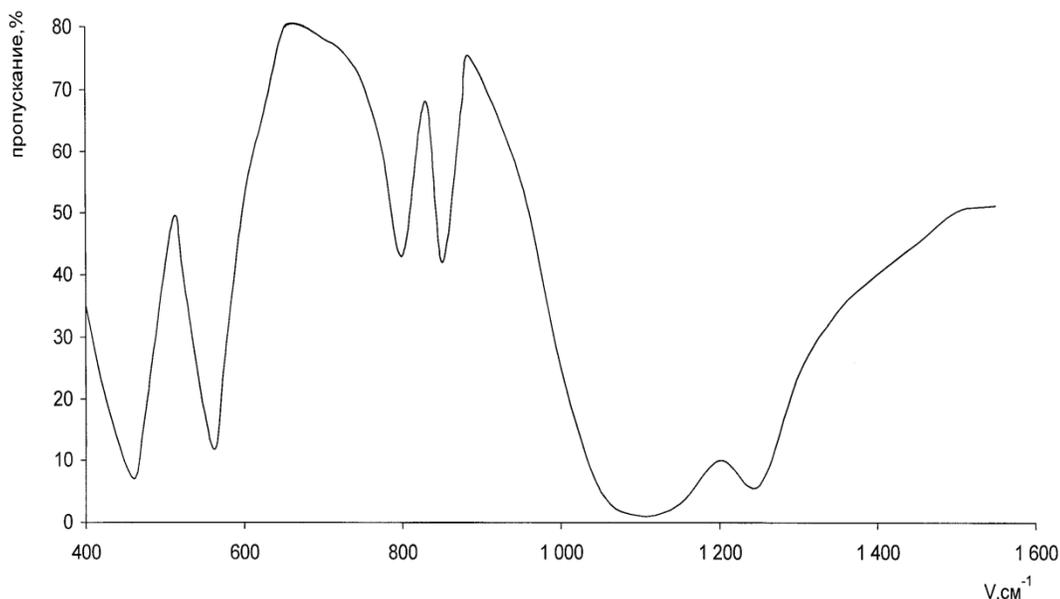

It follows from the scheme that aromatic hydrocarbons are formed as a result of the sequential separation of hydride ions from high-molecular-weight olefin molecules, as well as the interaction of two allyl structures with the simultaneous destruction of a hydrogen molecule.

IC spectroscopy and X-ray analysis were performed using physicochemical methods to study YuKTs: IR spectra of the studied zeolites (Figure 2.1) were recorded on a UR-20 spectrophotometer in the mid-wavelength part of the spectrum at 400-2000 cm^{-1} , where the absorption ranges were AIO_4 of the base. $[SiO]_4$ are the principal oscillations of the tetrahedron.

To do this, 1-2 mg of the sample and 400 mg KBr of potassium bromide are poured into a special ring placed in a mold, then the sample ring is inserted into the holder and placed on a spectrophotometer. Absorption lines in the observed spectrum can be divided into 2 types of oscillations [23, 171]:

1. $[SiO]_4$ oscillations within a tetrahedron, they are primary structural units. These oscillations do not reflect the specific properties of the zeolite structure.
2. Vibrations in the external connections of tetrahedrons. The second type depends on the zeolite structure, the ability to join in secondary structural units, as well as in structures that form entrance pores in the zeolite cavity. The first type of oscillations corresponds to oscillations at 1120 cm^{-1} , 820 cm^{-1} and 470 cm^{-1} found in the whole zeolite spectrum. The strong absorption range at the peak of 1120 cm^{-1} is related to the antisymmetric oscillations of the $t SiO]_4$ tetrahedron, while the 820 cm^{-1} length 3104 cm^{-1} tetrahedra represents the oscillations mainly involved []. The location of this group is affected by the Si / Al ratio in the zeolite content.

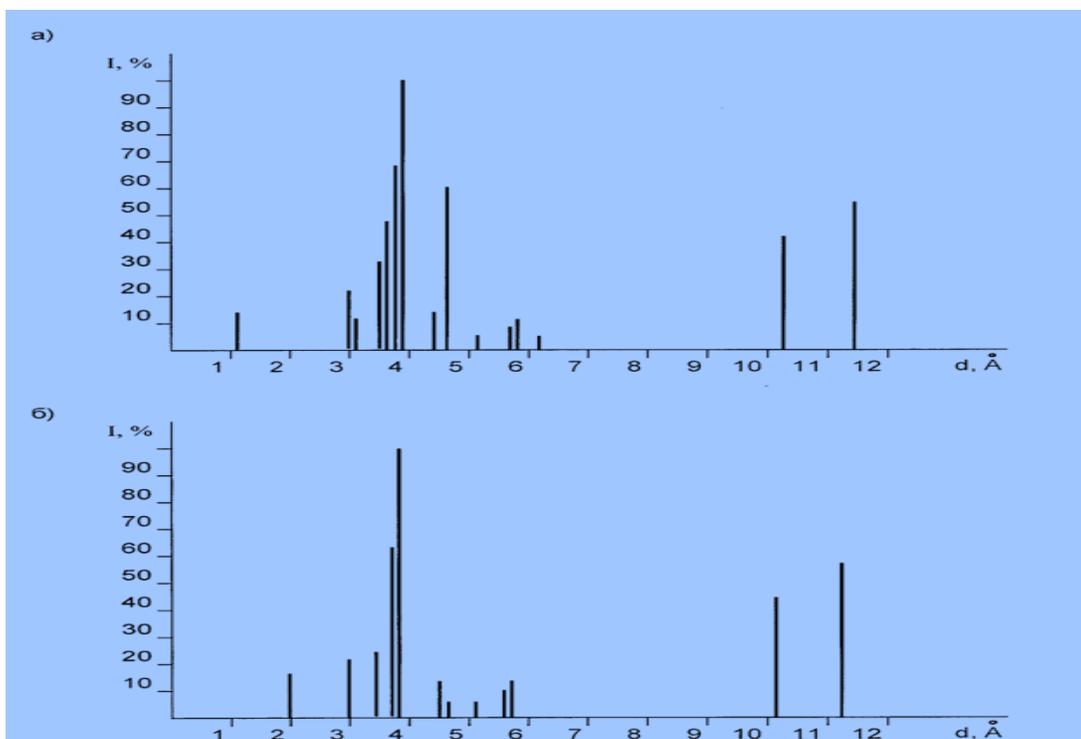

2.1 -Picture .

IR spectrum of zeolite synthesized ZSM -5 ($\text{SiO}_2 / \text{Al}_2\text{O}_3 = 70$).

As the composition of the Al tetrahedron coordinated atoms increases, the absorption ranges shift to the low frequency region [23, 482]. Intensive absorption lines correspond to bending oscillations in a tetrahedron of 460 cm^{-1} [SiO_4]. The second type of vibration, which is sensitive to the nature of the dependence on the type of environment of the secondary connecting units in the tetrahedron, topology, and zeolite, corresponds to absorption 560 cm^{-1} lines. - The presence of strong absorption lines $1300\text{-}900$, 820 , $400\text{-}600 \text{ cm}^{-1}$ in the region of all spectra testifies to the fact that all samples belong to zeolites.

- that all tested specimens belong to the ZSM constructive type, since all IR spectra obtained include the absorption peaks line 560 cm^{-1} . the ratio of the optical absorption ranges to 560 and 460 cm^{-1} (I_{560} / I_{460}) [173], the crystallization rate of all studied samples was calculated: $\text{SiO}_2 / \text{Al}_2\text{O}_3$ for ZSM-5 zeolites with a ratio of 30, 50, 70, 100; crystallinity level 89, 2, respectively; 93.3; 91.5; 88.2% are equal. For the ZSM-11 catalyst ($\text{SiO}_2 / \text{Al}_2\text{O}_3 = 100$), the crystallization rate is 88.1%. There are no significant differences in IR spectra for ZSM-5 and ZSM-11 zeolites; therefore X-ray analyzes were performed to improve the structure of the zeolites in detail. X-ray analyzes (Mo-anode, Ni-filter) were performed using Dron-3. Processing of the diffraction lines of zeolites was carried out by comparing the distance between the planes (their position and relative intensity) with a sample of the corresponding lines and determining the distances and intensities of the lines (peaks) of the studied zeolite sample. Figure 2.2 shows the signs of linear X-ray diffraction of zeolites ZSM-5 and ZSM -11. Compared with the data in Table [23], the relationship between the relative intensity of the line and the distance between the planes ($d, \text{\AA}$) made it possible to determine the structural types ZSM -5 and ZSM -11.

2.2-image.

Signs of X-ray diffraction of synthesized zeolites noted

(*a*- ZSM -5; *b*- ZSM -11).

The marked diffraction characteristics of these samples are that for ZSM-5 there are three intensive lines in the region of small plane distances (d , Å: 3.84; 3.74; 3.62). There are only two intensity lines for the zeolite ZSM-11 (d , Å: 3.86; 3.73). The crystals of ZSM-11 zeolite differ from the crystals of other pentacycls by more perfect symmetry, with fewer lines in their diffractogram. VTK fractions, C₉₊ hydrocarbons, naphthalene and methylnaphthalene. C₂-C₄ alkane conversion products were analyzed using gas chromatography on a chromium chromatograph with a thermal conductivity detector. Analysis of gaseous products - in a column filled with Al₂O₃ (3) (0.25-0.5 mm, column length - 4 m, inner diameter - 3 mm), in the temperature programming mode from 298 to 423 K, with heater, speed 12 degrees / min. Carrier (He) gas velocity - 50 cm³ / min. The chromatogram of gaseous products is shown in Figure 2.5.

Liquid hydrocarbons were analyzed on a S2 + base at a temperature of 352 to 473 K in the programming mode at a rate of 12 OC / min and then in an isothermal mode at 473 K on a PFMS-4 stationary phase packed column. The chromatogram of gaseous products is shown in Figure 2.5.

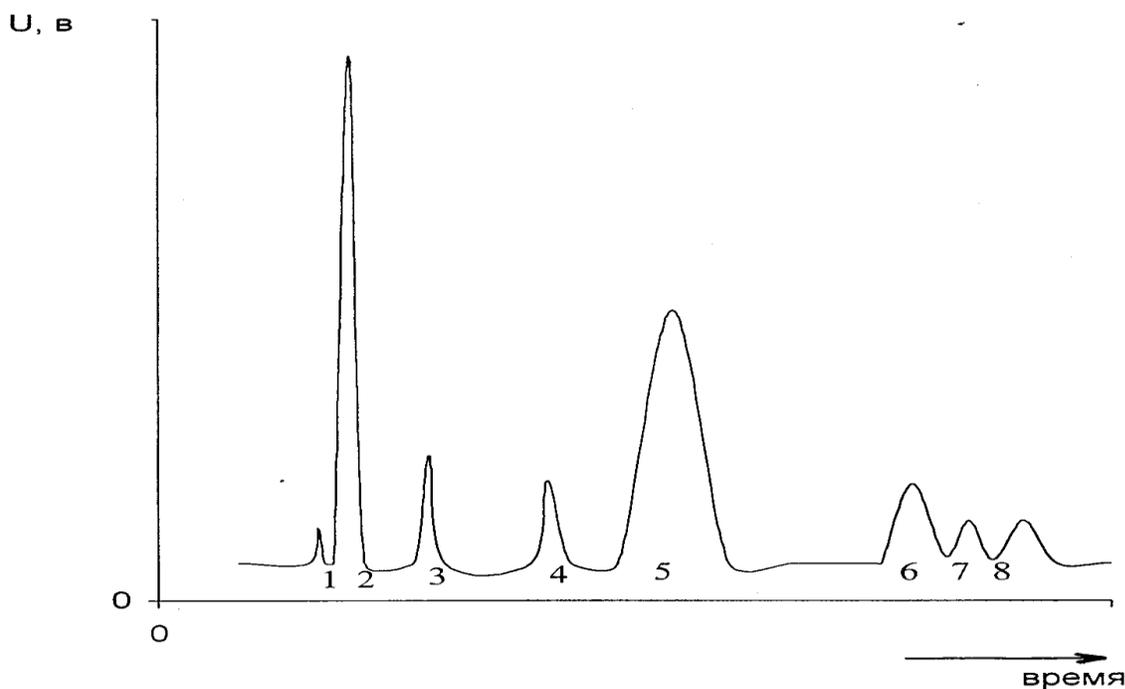

Figure 2.5 Chromatogram of gaseous products of alkane conversion S2 -S4

6. propylene 7. Butane 8. Butylene

Carrier gas (He) velocity - 4.5 cm³ / min. The chromatogram of the liquid products is shown in Figure 2.6. Quantitative analysis of reaction products was performed using the internal optimization method [175]. The calculation consisted of converting half-width products to 100% of the height of all peaks of the chromatogram.

$$C_i = \frac{(k_i h_i I_i)}{(\sum k_i h_i I_i)} \times 100\% \quad C_j = \frac{(k_j h_j I_j)}{(\sum k_j h_j I_j)} \times 100\%$$

C_i is the concentration of i-components in the gas phase, % by weight;

S_j - j is the concentration of components in the liquid phase, % by weight;

i, j are half-width peaks

h_i, j - high peaks

where j is the coefficient determined by the sensitivity of the detector to a particular component.

In the calculation, we used the detector sensitivity correction factors given in [176]. The experimental data are as follows.

- 1) Calculate the mass of gas formed as a result of the reaction:

$$m = \frac{V \times M_r}{22,4}$$

V-Volume of gas

Mr- Molar mass of gas

22.4-Volume of gas under normal conditions

The mass of liquid hydrocarbons was determined by weighing the products formed at the end of each experiment. m_j can also be calculated using the following formula:

$$m_{ж} = V_{ж} \times \rho_j$$

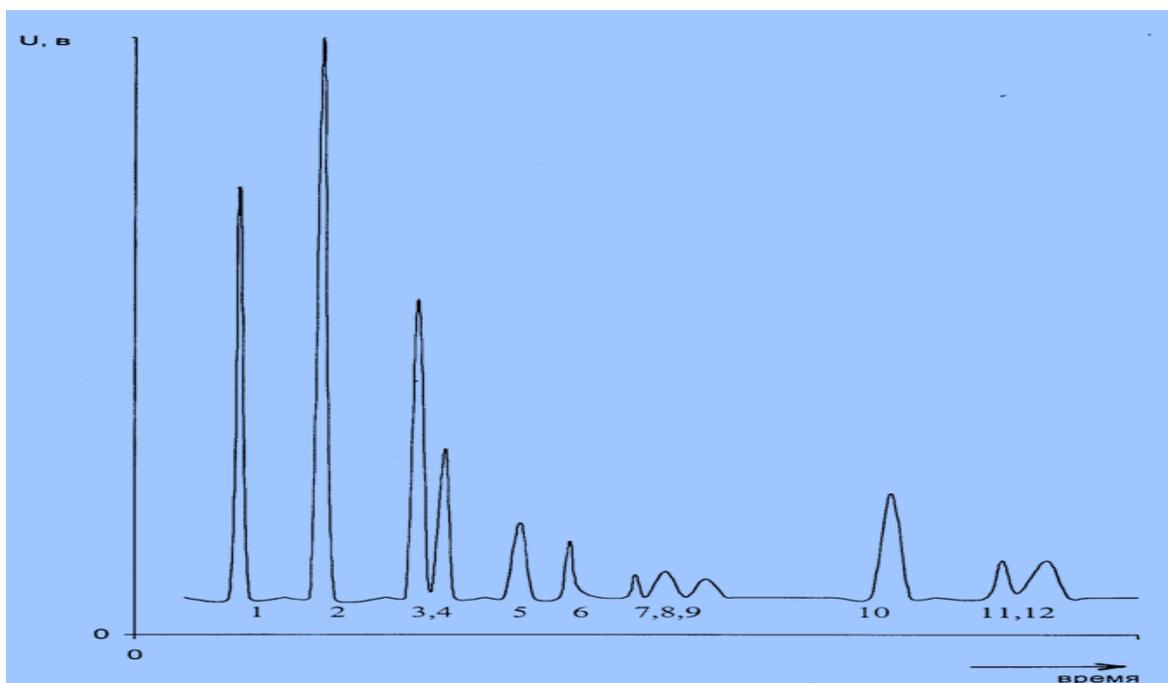

V_j = volume of liquid hydrocarbons cm^3

ρ_j = average density, g / cm^3

$\rho_j = S_{d_j} \times \rho_j$

S_{d_j} = part of a large component

ρ_j = component density g / cm^3

Figure 2.6 - S2 -S4 alkane conversion and chromatogram of liquid products

Mass fraction of gaseous products:

$$dr = m_2 / (m_r + m_{ж})$$

Mass fraction of liquid hydrocarbons: $d_j = 1 - dr$

Component concentration in the amount of hydrocarbons: $C_{-}(i) = d_{-r} C_{-}(I)$

j-component concentration of hydrocarbons: $S_j = d_j C_{-i}^{\wedge, -}$

The conversion rate (X) is calculated according to the following formula:

$$X = \frac{(M - m_{\max c})}{M} \times 100\%$$

M is the total concentration of reaction products;

product - the total concentration of propane and butane in the reaction products;

mchish - the total concentration of ethane, propane and butane in the raw material. component selection is calculated according to the formula i, j [177-179]:

$$S_{i,j} = m_{i,j} / M_{\text{олинди}}$$

$m_{-}(i, j)$ - concentration of component i, j in reaction products,

M_{olindi} is the concentration of the converted raw material

Output i, j component (A): $A = S_{-i} \times X$

CONCLUSION

1. The conversion reaction of a mixture of alkanes containing C₂H₆ = 2.2; C₃H₈ = 73.7; N-S₄N₁₀ = 24.1%. In high-silicate zeolite catalysts with the structure ZSM-5 ([SiO]₂ / [Al]₂ O₃ = 30, 50, 70 and 100) and ZSM-11 ([SiO]₂ / [Al]₂ O₃ = 100), the catalytic contacts the relationship between their structural and acidic characteristics and their activity in the formation of conversion products was studied.

2. In this process, the effect of technological parameters (reaction temperature and volumetric rate) on the activity and selectivity of zeolite catalysts was studied.

3. All used YuK zeolite catalysts are in N-form state. The results of the conversion of a mixture of low molecular weight alkanes with [SiO]₂ / [Al]₂ O₃ = 70 in ZSM-5 zeolite are given in Table 3.1.

4. With a significant yield of liquid products, the change of raw material begins at a temperature of 673 K. At this temperature, the conversion rate of low molecular weight alkanes [S]₂-S₄ is 47%. The reaction produces gaseous products: methane, ethane, ethylene, propylene, butene and liquid catalysis: benzene, toluene, xylenes (BTC fraction), alkylbenzenes, naphthalene and alkyl naphthalenes. The selectivity for the formation of aromatic hydrocarbons (S_{AY}) at a temperature of 673 K and v = 100 s⁻¹ is 25.4%, alkenes [S]₂-S₄ 19.1% by weight. An increase in the reaction temperature from 673 K to 873 K leads to an increase in the conversion rate, while at 873 K the conversion reaches 97%. An increase in the selectivity of the formation of benzene and naphthalene hydrocarbons is also observed.

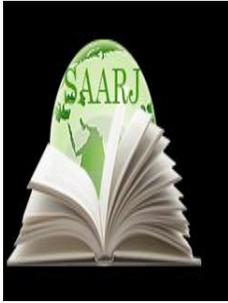

5. As a result of the work carried out, it was found that the role of the meso-porous structure of the matrix in the CSK is not limited to the function of "transport".

6. The introduction of the matrix leads to an increase in the size and volume of the zeolite pores, thereby increasing the reactive penetration of the acidic centers located inside the zeolite pores.
7. The close connection of the "zeolite-matrix" in the macropores of TSSK creates conditions for full use of the specific properties of zeolite in catalytic conversion.

ABSTRACT

An insight provided at the article reviews of some profound investigation on the scientific basis about how to create a hole drainage at a certain depth (60-80 cm) before plowing in saline soils, followed by moderate saline washing, easy removal of harmful salts from the soil by saving water. In addition, some striking data was revealed about how to utilize less water in the autumn saline wash, improved techniques for the removal of toxic salts from the soil to the maximum extent and the technology of its application.

KEYWORDS: *Drainage, Perforated Drainage, Conical Tip Cylinder With Complex Surface, Perforator, Sinker, Contour, Coverage Width.*

INTRODUCTION

Nowadays there are 4.2 million hectares of irrigated land in the country, of which 45% are saline areas of varying degrees. Annually, saline washing is carried out on more than 680,000 hectares in the country. In Bukhara region, 85.8% of the 274,612 hectares of irrigated land are saline to varying degrees, so 180,000 hectares are saline washed annually [1].

The formation of saline soils and their negative consequences are enormous. It is well known that reclamation measures and the implementation of these measures through mechanization are one of the most pressing issues of today.

In the Bukhara region, the total salinity of soils was 86%, but instead of decreasing from year to year, in some areas there is an increase.

Figure 1. Advanced perforator.

During the operation of the device, its columns have the same working depth of 70-80 cm into the soil, and the working body attached to the columns forms a perforated drain with a diameter of 70-72 mm

If the agro-technical requirement for a hole drain is long-term operation without draining the drain, the requirement for the device is to create a quality hole drain as well as minimize the resistance forces acting on the traction tractor. By using this device before the autumn saline wash, it is possible to easily leak harmful salts from the soil through the perforated drains and discharge them into the drainage pipes, open collector ditches. However, it should be borne in mind that temporary ditches must be built around the mechanically heavy soils, through which the discharge into the collector ditches gives good results. In the spring activities, of course, temporary ditches prepared for saline washing are prepared by adding contours to the soil for planting, thus bringing the land use coefficient to the previous level. The technical characteristics of the perforated drainage device created with this in mind are given in Table 4.2 below.

The main working body of the advanced hole forming device is formed at an angle of 30° - 32° with a borer geometric shape, rotating movement is provided by a hinge mounted on a steel rope and a conical end, creating a quality hole drainage that meets agro-technical requirements

for hole drainage which in turn ensures that the perforated drainage walls are strong and operate without cracking.

TABLE 4.2 TECHNICAL DESCRIPTION OF THE ADVANCED PERFORATOR

N	Name and unit of measurement	Value of indicators
1.	Type	Dangling
2.	Aggregate tractor class	3-4
3.	Coverage width, m	4,0
4.	Operating speed, km / h	4-5
5.	Basic time productivity, ha / h	2,4-3,2
6.	Mass, kg	1025 ± 50
7.	Processing depth, cm	70-80
8.	External dimensions, mm:	
	width	4000
	length	1000
	height	1450

To carry out this process, the centrifugal force generated by the rotational motion of the perforator working bodies of complex geometric shape simultaneously compresses and strengthens the walls of the perforated drain and reduces the resistance of the soil to the work-piece.

Figure 2 Holes.

The use of the improved perforated drainage device in the conditions of Bukhara region prevents salinization of arable lands, reduces the salinity of saline soils at different levels and increases productivity. The main task of the research is to increase crop yields by achieving water savings and improving land reclamation by using the proposed device to prevent salinization and re-salinization for the regional agro-clusters, farms in sufficient quantities and using it before the autumn saline wash.

Tests of the improved prototype of the perforated pit drill TIAME Bukhara branch of the training and experimental farm of the existing experimental farm with a hole drain opener TTChYu 3-70 compared to the device.

In the tests, a two-hole drainage device was used in conjunction with a New Holland T7060 tractor, with a speed of 4-5 km / h and a working depth of 70 cm. the area worked within the unit and the coefficients of fuel consumption, shift and operating time utilization were determined. Soil moisture, hardness, and density were studied prior to testing.

The results obtained during the experimental studies are presented in Table 4.3 below.

Moisture and hardness of the field soil tested

TABLE 4.3

N	Name of indicators Value of indicators	Value of indicators
1.	Soil moisture (cm) per layer,%; 0-20	14,8
	20-40	16,1
	40-70	17,8
2.	Soil stratum (cm) hardness, MPa; 0-20	1,21
	20-40	1,32
	40-70	1,94

The results of the tests are given in Table 4.4 below. Analysis of the test results showed that the improved borehole TTChYu 3-70 hole-forming device TDOQ 1-70 ensured the formation of quality holes in the soil, clearly, mechanism with it the formation of drainage holes formed on the field surface and at the bottom of the treated layer 70, respectively. The diameter of the hole increased to 70.8-71 cm and 72.8-73 cm. This can be explained mainly by the fact that the device, which creates a hole drainage by an improved perforator TTChYu 3-70, is completely layered in the soil relative to TDOQ 1-70.

Results of the developed advanced borehole tester tests

TABLE 4.4

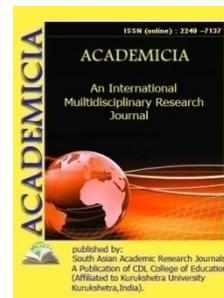

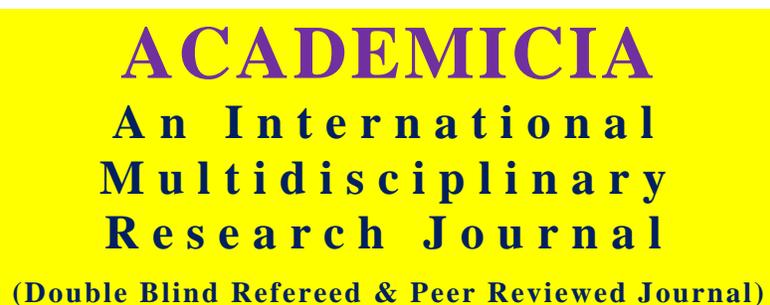

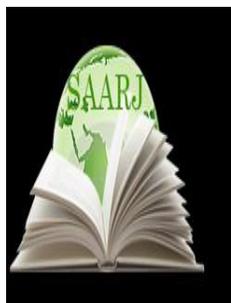

T/p	Name of Indicators	Value of indicators				
		According to the initial requirement	A device that creates a perforated drain TDHQQ 1-70.		Advanced perforator TTChYu 3-70.	
1	2	3	4	5	6	7
1.	Traffic speed, km / h	4-5	4,6	5,5	4,2	5,3
2.	Processing depth, cm: M_{av} $\pm\sigma$	12-20	51,8	51,4	70,7	70,1
		-	2,34	2,42	2,17	2,26
4.	the quality of the drainage hole formed at the bottom of the treated layer, cm	<70	60,6	71,2	72,8	74,2

ABSTRACT

This article presents the preparation of carboxymethylchitosan from a new promising source - dry dead bee chitosan. The issue of rational use of natural resources in Uzbekistan is one of the priorities of state policy. Such a statement of the task imposes tasks on many scientists involved in this object. Our country has a large number of reserves of biopolymers, the expansion of their application and in-depth study of the fundamental is of great scientific and practical importance. The physicochemical properties of carboxymethylchitosan obtained from the extinct apiary Apis Milliferra, in particular the degree of deacetylation, were studied by conductometric analysis and UV spectroscopy. In the study, for the first time on the basis of chitosan obtained from inanimate bees of local raw materials, its product carboxymethylchitosan was synthesized and its properties were studied.

KEYWORDS: *Dead Bee, Chitin, Chitosan, Carboxymethylchitosan, Conductometry, Biopolymer, Cellulose, UB Spectroscopy, Monochloroacetic Acid.*

INTRODUCTION

Currently, the practical application of natural biopolymers and their various derivatives is expanding. Cellulose and chitosan-type polysaccharides are being extensively studied in the textile, food, and medical fields. Today, they are the subject of research by many scientists.

It is known that chitosan (ChS) and its derivatives are widely used in the field of medicine, agriculture, etc. Chitosan derivatives, in particular, carboxymethyl chitosan (CMC), which has a high biological activity and pronounced antibacterial and anticoagulant properties, attract particular attention of researchers [1]. CMCS possessing minimal toxicity and stability is widely used in almost all areas, such as medicine, food industry, agriculture, nuclear energy and textile industry [2-4].

The identification of such characteristics determines the comparative study of the structural morphology of the chitosan and CMCS samples. In this regard, water-soluble samples of CMCS were synthesized and studied by conductometric analysis [5].

In terms of prevalence in nature, chitosan is second only to cellulose and is obtained from products that are completely regenerated in nature. Chitosan is widely used in medicine, agriculture, textile industry, fabric dyeing, and floral printing [6]. In the world, much attention is paid to chitosan derivatives obtained by chemical, physical or enzymatic modification of chitosan [7-9].

The main part

In connection with the widespread use of water-soluble derivatives of the chemical modification of chitin (CT), the synthesis of carboxymethylchitin (CMCT) is of great interest, a feature of which is that this polymer can be equally useful and non-toxic both for humans and for the environment. Of particular importance is the development of the most effective methods for modifying CMHT for the development of approaches and methods for the preparation of water-soluble derivatives of CT, which contain both elements of the parent structure and new functional groups [10-11].

Today, the development of experimental methods makes it possible to obtain water-soluble, hydrophilic, biologically active, environmentally friendly, harmless and other drugs with special properties. One of the most important tasks is to obtain samples of carboxymethylchitosan (CMCS) with different levels of deacetylation and water solubility based on chitosan on a global scale, as well as to expand their application and scope [9].

Recently, we obtained chitosan from the dead bees *Apis Mellifera* and determined the chemical composition of the natural dry dead bees [12].

In our study, we measured 0,25 g of chitosan synthesized from the dead *Apis Mellifera* bees collected and dried in spring. Isopropyl alcohol was mixed with water in a 1:1 ratio, measured in a volume of 20 ml, placed on chitosan, and stirred for 0.5 h in a magnetic stirrer at room temperature. Then a beaker was filled with 10 ml of 20% NaOH solution and stirred at 28 ° C for 1 hour. Measured 0,28 g of monochloroacetic acid (MCA), slowly adding to the glass and stirring at 65 ° C for 2.5–3 hours.

The mixture was left for 8-9 hours. Then it was neutralized with 1,5 ml of glacial acetic acid, washed thoroughly with absolute alcohol and filtered on a Buchner funnel. After drying at room temperature, was measured. Took 0,26 g of carboxymethylchitosan with a yield of 79%.

Carboxymethylchitosan, obtained by this method from the chitosan of the dead bees, is an odorless, yellowish powdery substance.

In the second method, 0,25 g of chitosan was measured and mixed in 12,5 ml of isopropyl alcohol (1:50). The resulting suspension was stirred in a mixer for 0.5 hours. Then add 10 ml of 30% NaOH solution to the beaker and stir for 1 h.

We added 0,28 g of MCHAA to the suspension little by little and stirred at 65°C for 3-4 hours. The reaction mixture was left for 9–10 h.

Ice was neutralized in acetic acid until pH = 7 (2ml). Absolutely washed in alcohol, filtered in a Büchner funnel and dried at room temperature, yield 65%.

0,05 g of CMCS -1 was dissolved in 25 ml of 0,02 N NaOH. It was then titrated with 0,1 N NaOH to determine electrical conductivity values every 30 s. From the graph, it is possible to determine the degree of its exchange from the volume of alkali used for the titration of the carboxyl group in the CMCS molecule.

Conclusions and feedback.

The degree of deacetylation of carboxymethylchitosan has been determined by conductometric titration. Take an analytical weighed sample of carboxymethylchitosan 0,05 g. A standard solution of 0,1 M HCl has been prepared from a fixed channel. The normality of the alkali solution has been determined using a standard solution of hydrochloric acid. The sample has been transferred to a beaker and dissolved in 0,1 N 25 ml HCl. To plot the titration curve, 100 µl of pre-titrated alkali (0,1 N NaOH) has been added every 30 seconds.

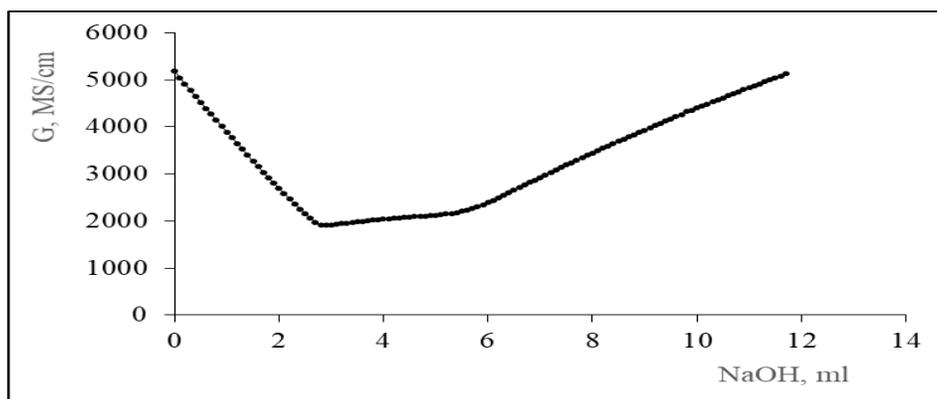

Figure 1. Conductometric titration curves

solution CMCS.

The conductometric titration curve of carboxymethylchitosan obtained at a temperature of 65 °C, a reaction time of 4 hours and a XZ / CMHZ ratio of 1: 1 is described as a dashed line corresponding to a certain range of titrant consumption (Figure).

$$x = N1 \cdot V1 - N2 \cdot V2,$$

$$CD = \frac{x}{x + \frac{m \cdot 0.9 - x \cdot 161}{203}} \cdot 100\%,$$

where V_1 is the volume of acid, ml; V_2 is the volume of alkali required for titration, ml; N_1 - acid normality, mol-eq / ml; N_2 - alkali normality, moleq / ml; m is the mass of carboxymethylchitosan, mg.

At the initial stage of titration of CMHZ with NaOH solution, the interval from 0 to V_1 corresponds to the volume of the base added to neutralize the strong acid (H_3O^+) present in the solution (Figure-1). Further, characteristic segments (V_1 - V_2) are observed, which correspond to the titration of carboxymethyl groups (CH_2COOH). Titration required for neutralization (NH_3^+ ; NH_2R ; $+ NHR_2$; where $R - CH_2COOH$) corresponds to the volume of the base (NaOH). During subsequent titration, an increase in the electrical conductivity Gsm is observed, which characterizes the excess of a strong electrolyte (NaOH) [13].

The difference in the structure of chitosan and carboxymethylchitosan polymer chains is also reflected in their UV spectroscopy values (Figure 2).

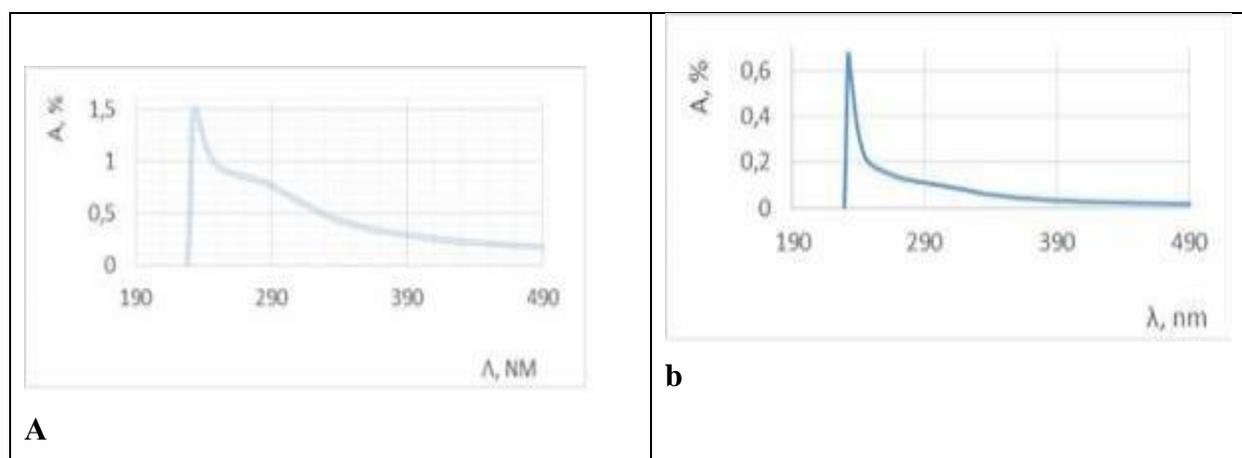

Figure 2. UV spectroscopy of chitosan and carboxymethylchitosan

a- Chitosan b -CMCS;

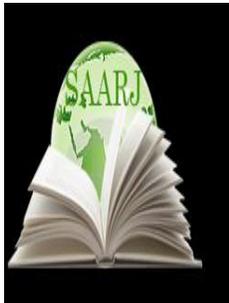

CONCLUSION

In summary, the natural biopolymer carboxymethylchitosan has synthesized from inanimate bees in a new way and it has been studied by conductometry, UV methods. During the carboxymethylation of chitosan, the concentration of the alkaline solution, the temperature, the duration of the carboxymethylation reaction and the amount of monochloroacetic acid (MHCC) have been controlled by selecting the ratio XZ: MHSK. When the NaOH concentration has been increased from 20% to 30%, the solubility of the chitosan sample obtained by alkaline treatment increased from 70-75% to 85%.

MENTAL THINKING IN A LITERARY TEXT

Jaloliddin Jamolidinovich Yodgorov*

Uzbek language, literature and folklore Institute of the Academy of Sciences,
Republic of UZBEKISTAN

ABSTRACT

From the end of the twentieth century and the beginning of the twenty-first century, there has been a growing interest and empirical research in the study of individual language in the context of speech. The manifestation of subjective reality in speech, that is, the reflection of linguistic identity in speech acts, is associated with the awareness of the language owner of the synchronous and diachronic language base, as well as associative-verbal ability. The study of the internal and external "I" as a dual phenomenon, the planning of the individual's speech and the analysis of the state of speech realization are among the urgent issues. The communicative process (creator and reader) is not only an exchange of ideas and informational contact, but also a moment directly related to human emotions, moods, feelings and total views about existence. It is precisely as a result of the psycho-emotional aura of the text that the reader creates a world free from the reality of his being.

KEYWORDS: *Literary Text, Dialogue And Monologue, Poetic Tone, Author And Reader, Mental Thinking, Lexical Character, Speech Argument, Linguopoetic Approach, Communicative-Linguistic Personality, Theory Of Speech Communication, Linguistic Pragmatics, Act Of Genetic Motivation.*

INTRODUCTION

In linguistic scattered research, dialogue and monologue are analyzed as the main form of speech communication and the most important component of the compositional-speech structure of the literary text, as well as the component that forms the character traits of the work of art. A set of international and local scattered and progressive general philological researches has been formed.

Main part

The fact that the literary text is composed of aesthetically valuable communication and the poetic tone of the work is characterized by its anthropocentricity, social significance and figurative modeling by the author is able to embody a special artistic landscape of the world. Indeed, the literary text is characterized not only by the author and the reader, but also by the total combination of lexical characters within the literary text, and as a result of views on this issue, a number of ideas have been formed. Therefore, in the linguopoetic analysis of a literary text, as a result of anthropocentric principle and linguopoetic interpretation, it is a fact that there is a linguistic person “behind the text” (V.Karaulov).

RESULTS AND DISCUSSIONS

Mental thinking as an artistic phenomenon is voiced as a textual exchange of ideas between the author and the recipient. In this regard, the formation of the image, character and types embodied in the work of art on the basis of verbal arguments, as well as its artistic expression allows to analyze the image as a linguistic entity in the set of features given in the text. At the same time, the main issues are raised in the study and research of the linguistic personality at the artistic level as a subject of textual communication. Also, a comprehensive analysis of trends in linguistic research has shown that innovative paradigms of modern linguistics (functional, communicative-pragmatic, linguoculturological, lingvopoetic and other approaches) open up prospects for further study of this phenomenon of literary genres. In general, our views will be on the priority of the functional-communicative and lingvopoetic approach in the analysis of dialogue and monologue. In this case, dialogue is manifested as a sphere of manifestation of human speech activity, and its participants are manifested in different types of activities, but primarily as communicative-linguistic individuals. At the same time, dialogue is studied in terms of the theory of speech activity, the theory of speech communication, linguistic pragmatics, the theory of speech genres that study human behavior in society, and therefore has a bright anthropocentric direction.

The creator behind the text understands the world with his own eyes and consciousness and realizes it in the text based on his inner lexicon. In particular, the ideas he wants to convey and express are expressed in different forms of the text (monologue, dialogue, polylogue). Based on its speech units, it shapes the text idioethnically and poetically actualizes it in linguistic units.

–Yes, Nihu, you’re dressed up, are you going to a party? – I said fondly.

–I was born today, – he said, blinking his dark eyes and smiling.

–Iya, you are a jubilee, but don’t hurry, now ... (U. Hoshimov. World affairs).

Indeed, its pragmatic and aesthetic influences through text are formed in dialogues, where the total totality of artistic information is concentrated. If in the text there are units of exhortation, it fully reflects the appeal of the literary text and the secondary reality formed on the basis of the creative inner world. The “*iya*” consonant is an act of genetic urge that is actively used in the Uzbek language, is a unit that fully embodies our national language and mental characteristics, and performs the full function of emotional lexicon in the literary text. If we repeat the moment of dialogue in the example and embody it on the basis of our imagination and consciousness, it is not difficult to understand the age-specific actions of communicators in the process of conversation, their propensity for phonographic adaptations in the process of using the act of

encouragement. In particular, the first speaker used the adjective “*iya*” very briefly, using it in a way that was specific to the age of the second communicator in front of him and to the specific (age of the communicant). If this aspect, that is, the sound of *ya* in the vowel *ya*, lengthens and the tone falls towards the end of the sound, we can observe that it generally turns into a secondary sema of wonder, ridicule and hatred (meaningful “atomic” particles). However, the linguistic-verbal aspects of such cases in all parts of speech cannot be shown in the text, and the phonetic potential of any language is not sufficient for this.

– *Did you hear that the dentists were lucky?*

– *What the hell happened?! – said his uncle, glad that the conversation had turned away.*

– *Iya, don't you know yet? – A new class of robbers has emerged in the city. On the tram, on the bus, on the street - when he sees a man with gold teeth, he puts a hammer in his mouth and pulls out his teeth.* (S.Ahmad. Karakoz Majnun).

Russian linguist S. Kartsevsky points out that sign and expression (meaning) cannot completely overlap. Their boundaries do not intersect at all points, and a character can have multiple functions or a single meaning can be represented using different characters. Any character has the ability to be “homonymous” and “synonymous” at the same time. Indeed, if we pay attention to the verbal expression of the act of urge (*iya*) used in the above examples elsewhere, we realize that the scholar's views are correct.

–*Well, opajon, I'll come to work tomorrow.*

–*We're leaving now.*

–*Iye, after all ...* (T. Malik. Demon streets of Satan.)

It should be noted that the main directions of dialogic research in modern linguistics are described and generalized, and there is a need for multidimensional research based on its anthropocentric, textual and linguocultural approaches. In the literary text, new views are being formed on the comprehensive structural-semantic, functional, pragmatic and lingpoetic description of dialogue. At the same time, dialogue analysis in fiction is becoming increasingly important in the study of dialogue theory, text theory, speech communication theory, modern genre studies, literary text lingvopoetics, and the peculiarities of national (mental) thinking. The specific features, tasks and types of dialogue in the literary text, as well as the specificity in the formation of the literary text along the theme plan are very important. Also, the study and analysis of the heroes of a literary work as linguistic individuals through dialogue shows the poetic perfection in the linguistic tricks of the creator. In particular, the activity of the acts of encouragement in the dialogic phases and the very intentions of the creator and the arguments he wants to show. Dialogue is a dynamic structure as the main, primary form of communication, which is primarily determined by its communicative nature. Artistic dialogue, which is an integral part of the worldview created by the writer, as a secondary form of communication, becomes an important tool for the realization of the aesthetic function, originality, based on the individuality of the author. In dialogue, artistic (secondary) communication is directly related to natural (primary) communication, which is especially reflected in the parameters of the verbalization of the communication situation in the story genre.

– *I'm not going, – said the old woman. – It's going to die. Take the corpse out of the suitcase.*

–*Iya, that's interesting! My uncle is leaving today!*

The old woman entered the house in silence ... (S.Ahmad. Karakoz Majnun).

The act of encouragement used in the text embodies the character of the literary text as an integral linguistic person in general in terms of social, psychological, age, gender characteristics and activates his verbal behavior in all respects emotionally. The idiosyncrasy of the subject is embodied as an artistic representation of national interpersonal communication.

–*Balli!* - *The testy expression in Mirzo Ulugbek's eyes was replaced by warm kindness.* (O.Yakubov. Ulugbek's treasure).

Socio-psychological types of linguistic personalities of characters are identified, their relationship with functional and semantic varieties of dialogue on the one hand, and the specific features of the situation described by the writer on the other. However, the communicative and pragmatic features of character speech behavior remain underdeveloped, as the specific features of dialogicity are largely determined by the pragmatic nature. Man is also the main object of the author's aesthetic pursuits, and his stories reflect the diversity of folk characters in different life situations. The study of dialogue in a literary text turns out to be most perfect if its analysis is carried out through the prism of a linguistic personality. As a linguistic person, character is a carrier of cultural-linguistic, communicative-activity values, knowledge, attitudes and behavioral reactions. In interspecific communication, the sign is determined by the socio-psychological type of the linguistic personality, its socio-role status.

Kozimboy tried to distract.

– *You see four years of the nineteenth century, you see ninety-two years of the twentieth century. Wow, do you want to see the twenty-first century again? Ibi, where is the honesty?* (S.Ahmad. Karakoz Majnun).

The idiosyncrasy of an artistic image is based on the type of dramatic scenes in which dialogue becomes an organic way of expressing the author's thoughts, his worldview, and becomes the subject of the image. As in drama, interspecific dialogue is multifunctional and forms a special type of text, whose functions are to collect information about characterization, action development, behavioral motives and causes of characters, and to evaluate them. An integrative approach to the study of artistic dialogue, that is, its analysis in terms of structure, functions, semantics and pragmatics in terms of communicative activity, determines the relevance of this work, taking into account the specificity of the author's linguistic personality and linguistic personality. The timeliness of the research is related to the need to compare artistic dialogue with the primary, prototypical form of communication. The communicative situation, expressed in the literary text, has its own characteristics and is mainly associated with prototypical dialogue. This defines the specific features of dialogue modeling as part of a work of art. Verbal design of communicative situation parameters helps to convey the verbal behavior of the character and its verbal and nonverbal components. Dialogue is one of the main types of human communication based on verbal interactions. The theory of dialogue is actively developing in linguistics, and its complexity at the problem level shows that linguistic and linguopoetic analyzes are evolving. The multidimensional nature of dialogue is also analyzed in the fields of art history, literature, sociology, anthropology, philosophy. Dialogue is analyzed by them as a specific form of verbal communication, a field of manifestation of verbal activity, a form of language existence, and a

form of human communication with the world. The main material for the study of dialogue is a dialogic piece that reflects the specific features of the literary hero's verbal behavior. The special significance of the dialogic passage is that it represents a literary character in the interaction with the "other" (M. Bakhtin) in the situation in which "man in man" appears.

–I wrote it by heart, – replied Diyorov.

–I wanted to warn our healthy generation about the dangerous path that the mullahs are embarking on.

–Vot molodes, – said Fatkhullin, impatient. – ... a devoted patriot joins the party! (S.Ahmad. Karakoz Majnun).

In fiction, verbal communication is represented by a piece of text. The textual parameters of constructing a communicative situation include the elements that determine the main tone of the dialogue: the identifier of the addressee and the addressee, their relationship, social roles in communication, intentions, indicators of speech-related actions, the place and time of communication. The defined parameters of the communicative situation determine the speech-behavioral scenario conveyed in the author's story, which provides textual unity. We can also highlight as a separate problem the principle of the author's choice of linguistic material to model the linguistic personality of a literary hero.

–Hey, Nazirbuvi, is this going to happen, or have we sent the chairman's sheep stuffed with empty walnuts?

–Voy, Tuxtabuvi, why not? – We put it in the meeting, didn't we? (A.Qahhor. Tales from the past).

The urgency of the problems of dialogue research suggests that there are still a number of controversial issues, in particular the question of the relationship between dialogue and monologue, dialogue and speech, that dialogue has its own characteristics as a textual type. In traditional linguistics, dialogic speech has always been contrasted with monologic speech by distinguishing their distinctive features. Dialogue was defined as a form of speech in which there is a direct exchange of speech between two persons. The monologue is viewed as a self-directed form of speech (G. Vinokur) rather than intended for the other person's verbal reaction to the speaker. Later, the terms "dialogic speech" and "monologue speech" refer to the features of the two main forms of speech, and the terms "dialogue" and "monologue" refer to the artistic expression of these forms of speech. These terms are used synonymously. Dialogue, first, is a dialogic form of speech characterized by the constant activity (role of the speaker) and passivity (role of the listener) of the communication participants. Second, in the changing direction of the messages, the dialogue consists of short statements that appear spontaneously, each of which is encouraged by the one before it (the other).

–Auntie, you have to be patient in everything, – said Arslanqul softly so as not to offend. – Let's assume that sooner or later no one will catch them...

– Ah, my son has given you the patience of an apple!" – The old woman sighed and did not open her mouth. (Oybek. Navoi).

Dialogic speech is characterized by grammatical confusion, shortcomings, reduction of grammatical forms, active and meaningful gestural approach, and communicative polarization.

One participant of monologue communication is characterized by the stability of the speech activity with the external passivity of others. It is distinguished by detailed and structured, premeditative statements that have a thematic unity. In modern linguistic research, the problem of the relationship between dialogue and monologue often does not find a single solution due to the complexity of their skills, their mutual overlap. Dialogue is primary, it ensures the dominance of being and the development of communication, and is recognized as a source of “being a means of communication” (M.Bakhtin).

The bakovul elders wore a one-ton beqasam around their waists.

– **Balli**, you're equal! – he said.

The elders did not come empty-handed.

– **Eb-ey**, what do you say, Grandpa? – said Hotam the wrestler. (T.Murod. The stars burn forever).

In modern research, dialogue is the subject of research in such areas of linguistics as communication theory, pragmalinguistics, text linguistics, syntax, stylistics, social and psycholinguistics, linguopoetics. In modern linguistics, there are three areas that study communication: actual analysis of conversation (conversation analysis), speech ethnography (speech ethnography), and speech analysis, on the basis of which the total aspects of the speech situation are studied. It is also important to note the secondary nature of the monologue over the dialogue, because, on the one hand, the monologue is the semantic origin of the dialogue, on the other hand, it is a dialogue compressed by a textual requirement. As a result, with a broad understanding of dialogue, the issue of distinguishing between dialogue and monologue is usually overshadowed. However, as the main difference between monologue and dialogue, it is necessary to recognize that monologue is a special type of communication, not an abbreviated form of communication, in order to establish and describe the parameters of monologue communication, taking communication participants as a sign of communicative equality or inequality.

The earth is washing the dishes. The pervert is accountable to his father. He was a dog! Cough again! He, let your lungs rot! (T.Malik. Demon streets of Satan).

In the reflection of the dialogue in the status of the text is explained by such factors as the constancy of the composition of the participants, space and time, situation, integrity, referential and semantic dependence of replicas and their continuity, the presence of linguistic indicators. The main difference between dialogue and monologue is that subjects change their communicative roles (speaker-addressee) and create text together. A dialogic text is an alternate chain of sentences formed by alternating the speech of two or more participants in a speech act in the role of speaker or listener. In the case of a monologue, only one of the subjects is the person performing the production of the text, the second participant in the speech act is the addressee or the recipient, either thinking or reacting immediately. Given the complex multidimensional nature of dialogue, we consider it necessary to clarify a number of concepts we use in our work.

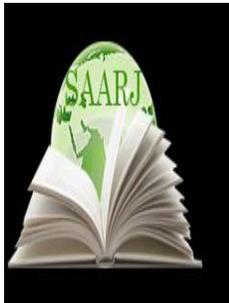

Before Tursunali's imprisonment, a man who saw the house on horseback a year later would grab him by the collar and say, “Yopiray, he was beaten by a thief last night”. (T. Malik. Demon streets of Satan).

CONCLUSION

The importance of internal speech is that it plays a uniquely important role as the basis of oral and written speech, and is sometimes referred to as passive speech. The inactivity of internal speech is that it is self-directed and does not require the presence of a second person. At first glance, this idea may seem correct, but it also has some limitations. After all, even in the inner monologue, the presence of a representative of the second pole secretly is felt on the basis of the demand of the literary text and the factors that reveal the character.

ABSTRACT

A liver biopsy was studied in 25 patients with chronic viral hepatitis B and a number of morphological changes were revealed: tissue infiltration with lymphocytes, expansion of portal tracts due to fibrosis and moderate lymphocytic infiltration, formation of port-portal septa, stepwise necrosis, hydropic infiltration of hepatocytes, detection of opaque vitreous «hepatocytes and sandy nuclei». As HBV infection progresses, the incidence of diffuse lymphocytic infiltration, the number of port-portal septa, and graded necrosis increases. After antiviral therapy, an improvement in the morphological structure of the liver is recorded. Indicators of endogenous intoxication syndrome have a direct correlation with fibro genesis in HBV infection. In patients with chronic viral hepatitis B who did not receive antiviral drugs, the toxicity index significantly increased and the albumin content decreased in comparison with patients who took antiviral therapy.

KEYWORDS: *Chronic Viral Hepatitis B, Antiviral Therapy, Endogenous Intoxication, Morphology, Index Of Histological Activity, Albumin.*

INTRODUCTION

According to WHO, today there are more than 350 million people with markers of previous HBV infection in the world [10].

Within the framework of traditional concepts adopted in pathology, toxicology, and pharmacology, cell death was considered as a passive degenerative process that occurs as a result of irreversible damage to the cell. The toxic type of cell death is usually referred to as necrosis. Cell death - apoptosis for a long time was considered inherent only in embryonic development and morphogenesis. In most cases of chronic liver damage, including infection with hepatotropic viruses, the main mechanism of cell death is apoptosis [9].

In viral hepatitis, apoptosis can be the result of direct exposure to the virus or mediated by an immune response. Being a universal biological mechanism, apoptosis in viral hepatitis can lead to excessive death of not only hepatocytes, but also other cell populations, reflecting either a systemic immune-inflammatory response to infection or extrahepatic persistence of the virus. Apoptosis of lymphocytes and granulocytes is significantly higher in patients with chronic viral hepatitis B compared with patients with other forms of chronic hepatitis [1].

Liver fibrosis is a local or diffuse increase in the amount of connective tissue, extracellular matrix (collagen fibrous tissue in the perisinusoid space) and the main pathway for the progression of chronic diffuse liver diseases. Cells directly involved in the process of fibrosis are hepatocytes, Kupffer cells, sinusoidal endothelial cells, hepatic stellate cells [2, 4].

The evolution of fibrosis in viral hepatitis is presented as primary fibrosis of the portal tracts with subsequent spread towards the central vein and adjacent portal tracts with the formation of porto-portal and port-central septa [6, 8].

The range of pathological changes in the morphological substrate in viral hepatitis is large. Evidence has been accumulated that patients with chronic hepatitis B are characterized by an increase in angiogenesis indices and a high proliferative activity of Ito cells. Antiviral therapy in patients with hepatitis B leads to positive dynamics of morphological data, accompanied by a decrease in the proliferative activity of Ito cells, a decrease in angiogenesis values and activation of anti-metalloproteinase defense mechanisms. Regression of morphological data during AVT does not depend on the degree of liver fibrosis and the presence of HBeAg before treatment [5, 7].

Endogenous intoxication syndrome is recorded in many pathological conditions of the human body, including viral hepatitis. Cytolysis of hepatocytes with HBV liver damage leads to a decrease in its detoxification and protein synthesizing function, which leads to an increase in the syndrome of endogenous intoxication. The state of the serum albumin molecule, which characterizes its binding capacity, reliably reflects the course of endogenous intoxication syndrome and can be used as a prognosis criterion, the severity of the course and outcome of the disease, as well as the effectiveness of the therapy. The albumin binding reserve index does not depend on the albumin concentration, characterizes only the state of its molecule and is regarded as a marker of intoxication that reliably reflects the status of intoxication of the body. Its dynamics is reliably associated with the morphofunctional state of the liver. Liver dysfunction leads to an increase in the toxicity index [3, 11].

There are no data in the literature that determine the relationship between the influence of morphological changes in liver tissue on the formation and degree of endogenous intoxication syndrome in chronic viral hepatitis B.

The objective: to determine the nature of histomorphological changes in the liver parenchyma and the severity of the syndrome of endogenous intoxication in patients with chronic viral hepatitis B in the dynamics of the disease and the effect of antiviral therapy on changes in the parameters of the binding capacity of serum albumin.

Materials and methods

The study included 25 patients with newly diagnosed chronic viral hepatitis B. Patients were divided into 2 groups. The first group consisted of 11 untreated patients, who underwent NPKP 3 years after the detection of hepatitis B. Patients who formed group I were initially preparing for antiviral therapy, however, for various reasons, they had to postpone therapy to a later date. The second group consisted of 14 people who underwent PFBP 2 years after antiviral therapy.

The patients received antiviral therapy (α -interferon-2a 5 million units daily and entecavir 1,0 g/day). The indications for the appointment of combination antiviral therapy were: positive PCR for HBV DNA, markers of viral hepatitis B in ELISA, increased transaminase levels. The duration of antitherapy was 6 months.

Domestic and foreign test systems were used to determine HBV and HBV DNA markers. All patients underwent percutaneous puncture liver biopsy.

Liver biopsies were obtained by aspiration liver biopsy in patients with chronic viral hepatitis B. Histological examination was performed on paraffin sections. The material was subjected to standard histological processing with the staining of serial sections with hematoxylin, eosin, picrofuchsin according to Van Gieson. We used survey morphological descriptions of structural abnormalities in the liver. In hepatobiopsy specimens, the index of histological activity (IHA) was determined according to Knodell R.G.: 0-3 points - low, 4-8 points - minimal, 9-12 points - moderate, 13-17 points - high activity of hepatitis B.

For light microscopy, the biopsy specimen was fixed with a 10% formalin solution. Paraffin sections were stained with hematoxylin and eosin, picrofuchsin according to Van Gieson. The histological criteria of chronic hepatitis B were assessed: portal tracts, lymphoid follicles in the portal and periportal zones of the hepatic lobule, hydropic and fatty degeneration of hepatocytes, proliferation of interlobular bile ducts, and the presence of port-portal septa.

Statistical analysis of the data obtained was carried out using the Statistica for Windows 6.0 software. Quantitative indicators were compared using the Mann-Whitney method, and qualitative indicators were compared using the Pearson χ^2 test or Fisher's exact method. The equality of the sample means was checked by the Student's t-test. The criterion for statistical significance was $p < 0.05$.

Results of the study

In the first group, 7 patients (63,6%) had a history of acute viral hepatitis B. Distribution by sex: men were 8 patients (72,7%), women - 3 patients (27,3%). Occasional alcohol consumption was noted by 5 patients (45,5%). Morphological changes in liver tissue during primary biopsy in patients of the first group: tissue infiltration with lymphocytes - 100% (diffuse occurred in 5

patients (45,5%), expansion of the portal tracts due to fibrosis and moderate lymphocytic infiltration - in 9 patients (81,8 %). Portal-portal septa - in 9 patients (81,2%), stepwise necrosis - in 10 patients (90,9%). In 6 patients (54,5%), Kaunsilman's little bodies were found, "sandy kernels" were described in 5 patients (45,5%). The average index of histological activity in patients with HBV infection is 8,1 points. The index of albumin tests was $62,6 \pm 2,3\%$, and the toxicity index was $0,62 \pm 0,11$ (Table 1).

TABLE 1 MORPHOLOGICAL CHARACTERISTICS AND INDICATORS OF THE SYNDROME OF ENDOGENOUS INTOXICATION IN PATIENTS WITH CHRONIC VIRAL HEPATITIS B IN THE DYNAMICS OF THE DISEASE AND TREATMENT (%)

Specifications	First Group (n = 11)	second group (n = 14)	P
Diffuse lymphocyte infiltration of tissue	45,5	21,4	< 0,05
Expansion of portalpaths	81,8	64,3	< 0,05
Stepwise necrosis	90,9	64,3	< 0,05
Portal-portalsepta	81,2	57,1	< 0,05
Tauruscouncilman	54,5	35,7	< 0,05
"Sandcores" ofhepatocytes	45,5	14,3	< 0,001
Average index of histological activity (points)	8,1	4,7	< 0,05
Albuminbindingreserve (%)	$62,6 \pm 2,3$	$81,2 \pm 3,3$	< 0,05
Toxicityindex	$0,62 \pm 0,11$	$0,23 \pm 0,10$	< 0,001

In the second group, among patients with newly diagnosed viral hepatitis B, only 6 patients (42,8%) had epidemiological data on acute viral hepatitis B. By gender, the group included 9 men and 5 women (64,3% and 35,7% respectively).

In the study of hepatobiopsy specimens obtained after antiviral therapy, the following histiostructural changes were revealed: portal tracts in 9 biopsies (64,3%) were slightly enlarged due to fibrosis and moderate lymphocytic infiltration; stepwise necrosis of hepatocytes was observed in 9 patients (64,3%). In 100% of cases (14 patients), there is a single (78,6%) or diffuse (21,4%) lymphocyte infiltration of tissue. Locally, active and inactive port-portal septa were found in 8 patients (57,1%). Nuclear-free acidophilic bodies of Kaunsilman were observed in 5 patients (35,7%). "Sand kernels" are described in 2 patients (14,3%). The average index of histological activity in patients with HBV infection is 4,7 points. The index of albumin tests was $81,2 \pm 3,3\%$, and the toxicity index was $0,23 \pm 0,10$. The indices of the syndrome of endogenous intoxication in both groups did not reach normal values (both without antiviral therapy and after it), which indicates a disruption of the compensatory capabilities of the liver after a viral lesion, as well as the formation and progression of fibrotic changes in the organ.

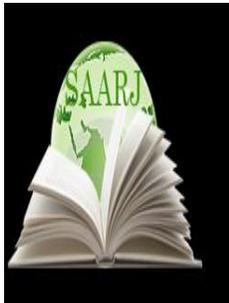

CONCLUSION

As HBV infection progresses, there is a change in histiostructural parameters of liver tissue in the form of an increase in diffuse lymphocytic infiltration, an increase in the number of port-portal septa, stepwise necrosis, which is expressed by an increase in the index of histological

activity. The use of antiviral therapy leads to a decrease in diffuse infiltration by lymphocytes, a decrease in the number of stepwise necrosis and port-portal septa, a decrease in the expansion of the portal tracts in the hepatobiopsy specimen, as well as the preservation of IGA with a tendency to decrease them. Determination of markers of endogenous intoxication syndrome in patients with chronic viral hepatitis B who have not received antiviral therapy since the detection of HBV infection records a significantly higher toxicity index and a significantly lower albumin binding reserve.

PROBLEMS OF FINANCING INVESTMENTS IN UZBEKISTAN'S ECONOMY

Lutfullo Ubaydullaev*

*Associate Professor,
 Namangan Institute of Engineering and Technology,
 UZBEKISTAN

ABSTRACT

This article describes the investments in the Republic of Uzbekistan and their distribution, financing and existing problems. The newly created value in the national economy, that is, national income, is spent for consumption and accumulation purposes. In a broad sense, consumption refers to the use of goods and services produced in the process of meeting the economic needs of society. The attraction of funds from the population's savings to finance many investment projects on the basis of privatization and liberalization in the economy of the country is also growing from year to year. In this regard, it should be noted that in the economies of developed countries, public funds are a necessary source of funding for investment projects.

KEYWORDS: *Investment, Sustainable Development, Consumption, Financial Resource, Savings, Modernization, Domestic, Foreign, Investment Commodity.*

INTRODUCTION

The further development of Uzbekistan and the world economy is mainly aimed at the targeted use of investments in sectors and industries and the attraction of investments into the economy of the republic, the development of their sources of financing, ensuring sustainable development of the industry. Clearly defining investment priorities, making science-based investment decisions, attracting internal and external financial resources, taking into account all conditions, on the basis of rational investment activities determine the future of the national economy. Finding the necessary financial resources for investment has become a condition of economic growth, which depends on the ratio of consumption and savings. The newly created value in the national economy, that is, national income, is spent for consumption and accumulation purposes. In a broad sense, consumption refers to the use of goods and services produced in the process of meeting the economic needs of society. The part of the consumer fund that falls into the hands of

the population in the form of personal income is used for consumption expenditures, which is the part of the population's current income that is used for living goods and services. In the process of spending their income, the population has a choice between increasing current (current) and future consumption.

Main part

Today, investing is one of the most important aspects of any business, especially in the context of modernizing the economy. Upgrading the existing material and technical base, upgrading production facilities, developing new activities are the reasons for the need for investment. The opportunity to increase consumption in the future is a fund for the current period, which means that the state's current income will be accumulated to meet future needs and earn income. Its size is determined by deducting consumer spending from the income of all farms. The higher the share of consumption expenditures in the income structure, the lower the amount of savings. The growth of the fund means that in economic terms, the funds will be directed from the purchase of consumer goods to the purchase of investment goods.

Investments are divided into domestic and foreign investments, according to their sources. Sources of domestic investment are the state budget, funds of enterprises and the population, bank loans and extra-budgetary funds, sources of foreign investment are funds of foreign countries and firms, as well as international financial institutions. Such grouping of investments by sources also allows to determine their structure by sources. Economic analysis differs in its structure according to the purposes and sources of investment in practice.

RESULTS AND DISCUSSION

While the sectoral (territorial) structure of investments reflects the share of a particular sector (territory) in investment expenditures in a given period, the structure by form of ownership reflects the share of state and non-state property in the total source and expenditure of investment.

The technological structure of investments reflects the share of expenditures on construction and installation work, equipment and inventory and other costs (design and survey work, management costs, etc.) in total investment costs. The structure of reproduction is defined as the share of investment in total construction, expansion, reconstruction and re-equipment. The expansion of privatization and the development of the private sector will result in a different property-based economy. As a result, investment from the state budget will decrease. In such cases, it is advisable to finance projects in the medical, health, science, culture, education and other social spheres, mainly from the state budget. Examples of this are the health facilities, academic lyceums and professional colleges, which have recently been built and commissioned in our country on a large scale. Of course, funds are allocated for such purposes from the state budget, local budgets and other sources.

As a result of the consistent implementation of economic reforms, the existing enterprises in the Republic are developing and becoming financially stable. Therefore, new means of self-financing are being formed at enterprises for modernization and technical and technological equipment of production, in particular, new means of self-financing of enterprises.

Self-financing of enterprises can consist of:

- retained earnings of the enterprise;
- depreciation allowance fund;
- funds formed through the issuance of shares;
- special funds.

The source of funds listed above can be used by enterprises to expand their production capacity, build new production, modernize or technologically upgrade, increase working capital. At present, the state allocates subsidies and other assistance to financially support many enterprises. The organization of the investment structure, increasing their efficiency largely depends on the investment policy pursued in the country. In macroeconomic theory, investment, together with household consumption expenditures, government expenditures, and net export expenditures, constitute or is considered to be total expenditure (aggregate demand).

$$\text{That is: } J_x = C + I + G + X_n \quad (1)$$

Here: J_x –total cost (total demand);

C –household consumption expenditures;

I –investment

G – government expenditures;

X_n –net export costs.

There are some differences in the closed and open economy as the main source of investment funds:

- Household funds and government funds in a closed economy are: (2)

where: - the main source of investment funds;

- Household funds;

- government funds.

In an open economy, this is compounded by the difference between domestic funds that are exported and those that come in in the form of investments and loans from abroad: (3)

where: - the difference between funds coming in the form of foreign investments and loans, and the share of this or that source in the volume of investment depends on the level of economic development, income level, social structure, economic tasks, economic policy strategy.

It is known that part of the gross income (GNP) created in the national economy is consumed in various forms, and part is accumulated in the above forms. Achieving equality between total investment expenditures in the national economy and gross savings, ie ensuring ICS identity, is one of the important conditions for achieving macroeconomic equilibrium. This identity is not achieved on its own, as households save money not only for use as an investment, but also for unexpected expenses, the purchase of more expensive items. That is, part of the funds will not be added to the investment. In this case, the government should cover part of the investment costs or ensure the above identity by attracting foreign investment, which should create a favorable

investment climate in the country. Effective fiscal, monetary, foreign exchange and foreign trade policies, guarantees and benefits for investors, as well as macroeconomic stability are the conditions that determine this environment. In particular, high inflation rates create a state of inflationary psychosis in society, leading to an increase in limited propensity to consume, a decrease in savings and, ultimately, the volume of investment.

The income of the population also plays an important role as a source of investment. The attraction of funds from the population's savings to finance many investment projects on the basis of privatization and liberalization in the economy of the country is also growing from year to year. In this regard, it should be noted that in the economies of developed countries, public funds are a necessary source of funding for investment projects. The development of the stock market in developed and developing countries serves as a basis for directing the population's funds to direct investment. The securities market is also being formed in the country, the accumulation of free funds of the population is carried out in commercial banks, and these funds are directed to more short-term lending.

CONCLUSIONS

The main indicators of investment activity at the level of the national economy are:

- Increased willingness of economic entities to participate in investment processes;
- growth of investment (foreign and national) in the economy;
- creation and continuous improvement of a favorable investment climate by the state;
- organization and active participation in various events aimed at organizing and strengthening investment activities (international and national fairs, business meetings, multilateral projects, advertising, etc.);
- qualitative improvement of the investment structure in the economy, etc.

To develop investment activity in the national economy: strengthening the organizational and technological potential of the national economy; focus on non-state investment; measures such as paving the way for farms to operate independently are required. It is important to establish specific principles for ensuring and increasing investment activity.

Given the investment activity and attractiveness of the economy, these principles should include the following areas:

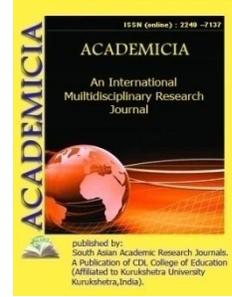

- identification of priorities for attracting investment based on real conditions;
- providing the investment process with a system of scientifically and practically based assessments;
- implementation of preferential credit, tax and depreciation policies;
- improvement of leasing relations and creation of favorable conditions for its use;
- Development of projects at the regional level, taking into account the real features of the national economy.

EVALUATION ON DEVELOPING OF NEW VARIETIES AND LINES OF BREAD WHEAT TOLERANT TO DROUGHT AND HEAT ON THE RAINFED AREAS OF UZBEKISTAN

Mamatkul Abdurahmanovich Juraev*

*Doctor of Philosophy (PhD),
 Agricultural Sciences, Scientific research Institute of rainfed Agriculture,
 UZBEKISTAN

ABSTRACT

The high correlations are studied between the productive elements of the spike and the yield on the researches. It was studied that in different years, under the influence of weather conditions, the productivity of bread wheat varieties and lines. It was found that dry weather conditions, low rainfall and lack of soil moisture lead to a decrease in wheat yields on dry lands. Due to low rainfall in autumn and winter, lack of soil moisture, seeds germinate in spring time and prolongs the growing season was heat and drought conditions.

KEYWORDS: Bread Wheat, Rainfed Lands, Rainfall, Vegetation Period, Heading, Spike, Spikelets, Drought, Heat, Heat And Drought Tolerant, Unfavorable Factor, Valuable Traits, Yield, Variety, Samples.

INTRODUCTION

The total area of arable land in Uzbekistan is 754,000 hectares. All arable lands in the country are divided into 4 zones according to altitude, soil and weather conditions: **1. Plain flat region.** This region is not provided with precipitation, and the annual rainfall is 250-300 mm. Strong weather and soil drought occur in the region in spring and summer. **2.The hill step regions.** Annual precipitation in this area is 300-350 mm.**3.Foothill region.** The annual rainfall in this region is 400-450 mm.**4. Mountainous region.** Annual precipitation in this region of dryland is 450-500 mm and more.

Today in Uzbekistan there is a low yield and grain quality of wheat varieties grown on more than 220.0 thousand hectares of dry land. Due to climate change in recent years, hot and dry weather conditions, low rainfall have a negative impact on the cultivation of grain crops on rainfed lands. Low soil moisture in the autumn is observed in the sparse germination of seeds sown in the fall

in the winter or spring, as well as the thinning of strong and dry cold wheat grasses that occur in some years during the winter months. These unfavorable factors lead to low wheat yields and poor grain quality.

Global climate change, rising air temperatures require the creation of wheat varieties for the soilclimatic conditions of rainfed lands, tolerant to biotic and abiotic stresses, and high grain quality content. The creation of bread wheat varieties with an early ripening, short grain-filling phase (25-30 days) provides an increase in grain yield on dry lands and a stable grain yield even in adverse weather conditions such as heat and drought. The duration of wheat vegetation on dry lands depends not only on the genetics of the variety, but also on soil and climatic conditions, care agrotechnology, sowing time, the time of emergence of seeds in autumn.

The duration of the germination period is important in determining early maturation. In Central Asia, the early ripening of a wheat crop is largely determined by the germination phase. Drought-resistant varieties of wheat accumulate less, late stems are not formed, the leaf surface is small, thin and twisted. The awned (spike with awn) wheat varieties are more drought and heat tolerant on rainfed lands. The generative organs of the wheat are susceptible to drought and heat. Lack of moisture in the soil during the formation of plant reproductive organs and during flowering, dry and high air temperatures during pollination lead to incomplete fertilization, and therefore the number of grains in the spike is reduced.

According to the researchers, the occurrence of high air temperatures during the grain filling period in hot weather with garmsel(dry and hot wind) reduces wheat yield by 30-50% even when the soil is sufficiently moist. Drought tolerant varieties have a shorter ripening period than drought-tolerant varieties. The greatest damage from drought is observed in the heading-ripening phase of wheat. Bread wheat samples belonging to the Central Asian Genetic Center (Uzbekistan and Kazakhstan) were found to be drought-resistant, while wheat varieties belonging to the Minor Asian Genetic Center and the Caucasus were found to be heatresistant. Drought tolerance has been proven by researchers to vary in wheat varieties.

Under drought conditions, changes in the water regime in the wheat crop disrupt the metabolism and lower yields are observed due to the number of grains, the number of grains in the grain and the weight loss of 1000 grains.

MAIN PART

The main direction of wheat selection in the development of drought-resistant varieties in Uzbekistan is the creation of early-maturing varieties, as the period from grain filling to ripening must pass in early varieties before the onset of adverse conditions such as heat and drought. However, in years with good moisture supply, the yield of early varieties was found to be lower than that of medium and late varieties. At the Lalmikor Agricultural Research Institute, research was conducted to create new varieties of bread wheat with high grain quality, resistant to unfavorable environmental conditions and disease-resistant conditions for the rainfed regions of Uzbekistan.

In the experiments conducted in 2020, favorable weather conditions, high rainfall compared to many years, led to high productivity and productivity of bread wheat varieties on dry lands.

RESULTS AND DISCUSSION

According to weather data, the amount of precipitation during the vegetation period of plants in 2020 was 391 mm, which is 29 mm more than the average perennial (362 mm). The relative humidity was also an average of 71%, which can be seen to be favorable in the ripening phases of the wheat vegetation, and the air temperature was also normal (Table 1).

Changes in weather conditions during the growing season of cereals (data from Gallaaral meteorological station in 2020).

TABLE 1

Indicators	Months									Total or average
	X	XI	XII	I	II	III	IV	V	VI	
Precipitation, mm										
Average multi-year, ±	17,1	35,0	55,0	40,4	52,0	65,0	53,6	35,4	8,4	362,0
2019-2020	5,3	32,2	16,3	57,8	61,3	39,5	91,5	87,0	0	391,0
Compared to the average multi-year, ±	-11,8	-2,8	-38,7	+17,4	+9,3	-25,5	+37,9	+51,9	-8,4	+29
Air temperature, °C										
Average multi-year, ±	12,1	5,9	0,3	1,7	0,9	6,8	14,1	19,6	22,5	9,3
2019-2020	13,2	3,7	3,5	1,4	4,6	4,6	9,4	19,6	26,8	9,6
Compared to the average multi-year, ±	+1,1	-2,2	+3,2	-0,3	+3,7	-2,2	-4,7	0	+4,3	+0,3
Relative air humidity, %										
Average multi-year, ±	32	52	69	72	66	60	48	35	23	51
2019/2020	55	78	80	88	78	70	73	67	51	71
Compared to perennials, ±	+23	+26	+11	+16	+12	+10	+25	+32	+28	+20

During the research, the length of the spike, the number of grains in the spike and the weight of the grain in the spike, as well as the 1000 kernelweight were determined in the varieties and lines, high-yielding varieties and new lines were identified. According to him, the standard early-ripening variety Tezpishar has a plant height of 109 cm, the main spike length is 9,6 cm, the

number of spikelets is 17, the number of grains in the spike is 34 and the grain weight is in the spike 1,30 g, 1000 kernel weight 38 g and the total grain yield is 2,6 t/ha.

The highest yields are observed in the new lines ICA2017 / 23, KP-2016/88, KP-2016/89, SP-2016/303 (IKARDA) and, accordingly, the grain yield are 3,26 t/ha, 2,94 t/ha, 2,93 t/ha and 2,81 t/ha, respectively. In the early-ripening variety, the number of grains in the spike and the grain weight in the spike were 33,9 pieces and 1,3 g, respectively, in the KP-2016/5 line 41,6 pieces and 1,5 g, in the KP-2016/88 line 41,4 pieces and 1,5 g, 45,7 pieces and 1,7 g on the KP-2016/89 line.

Varieties and lines of bread wheat in the RNS nursery, Gallaaral 2020.

The generative organs of the wheat plant are susceptible to drought and heat. According to A.I.Nosatovsky, the lack of moisture in the soil during the formation of plant reproductive organs and during flowering, dry and high air temperatures during pollination lead to incomplete fertilization, and therefore the number of grains in the spike is reduced. According to researchers, the drought-tolerant varieties have a shorter ripening period. The second half of the wheat growing season in Uzbekistan takes place in the context of increasing drought and heat. Under natural conditions, high temperatures slow down the accumulation of dry matter and drastically reduce grain quality. High temperatures affect the reproductive organs of the plant, leading to incomplete fertilization during flowering. When high temperatures occur during the filling period, grain failure is observed, 1000 grains lose weight, and yields are low.

In 2021, the amount of precipitation compared to other years was 133.7 mm, which is 257.3 mm less than in 2020 (391 mm). (Table 3). Extreme drought conditions in 2021 caused wheat varieties to germinate in the spring. Under such conditions, a decrease in the number of seedlings in many winter wheat varieties, a sharp decline in yield was observed due to the fact that the drought continued with high temperatures in the spring.

Changes in weather conditions during the growing season of cereals (data of Gallaaral meteorological station, 2021).

In grain crops, the growth period of the plant is divided into two: 1. Seeds germinate-heading 2. Heading-ripening(maturity). The duration of the ripening period depends on air and soil temperature and humidity conditions. When the air temperature is high, the grain filling period and grain ripening time are shortened. In Central Asia, including the dry lands of Uzbekistan, the early ripening of wheat is determined by the time of vegetation.

A 2021 study found that full germination in the early ripening template variety was detected on May 10, while in other varietal samples and lines, the maturation date was later than in the template variety.

CONCLUSIONS

During the studies, heat resistance and productivity indicators were identified in local bread wheat varieties and new lines. Heat and drought resistant lines were selected. The duration of the germination period depends on the biological characteristics of the variety, in which air temperature and day length play an important role.

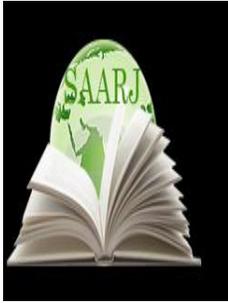

The duration of the germination period is important in determining early maturation. Studies have shown that there is a high correlation between productivity element performance in the spike and productivity. It was also found that favorable weather conditions lead to high productivity in soft wheat lines belonging to the IKARDA center. It was found that dry weather conditions, low rainfall and lack of soil moisture lead to a decrease in wheat yields on dry lands.

Low rainfall in the fall and winter months led to seed germination in the spring months as a result of a lack of moisture in the soil. It was found that this leads to a prolongation of the growing season, the passage of the ripening phases under strong thermal conditions, resulting in low yields without good filling of the grain.

ABSTRACT

The research paper investigates the vital factors leading to career breaks in women and the resurgence of women wanting to make a comeback to the organizational set up. The study adopts probability sampling with emphasis on stratified sampling technique to identify women reentry into workforce followed by convenience sampling technique under non probability sampling with $n=62$ thereby limiting itself to non-parametric data analysis of Kruskal – Wallis test. The mean rank was highest at 60.00 for outcome of (11) due to cumulative effect of marriage (1) and awaiting better prospects (5) while also (15) due to cumulative effect of child bearing (2), relocation of spouse (4), dependent care (6) and other detrimental factors (7) responsible for career break contributing to a significant difference with 0.05 ($p \leq 0.05$) in managing career work balance among women. Public policy intervention is quint essential in labour markets with the need for organizations to be more agile to support specific needs of women career reentrants.

KEYWORDS: Women, Career, Reentry, Workforce, Public Policy

INTRODUCTION

Women form an integral part of the Indian workforce. The total number of female workers in India is 149.9 million and female workers in rural and urban areas are 121.9 and 28.0 million respectively (source: census, 2011). Out of total 149.9 million female workers, 35.9 million females are working as cultivators and another 61.5 million are agricultural labourers". Of the

remaining female's workers, 8.5 million are in household Industry and 43.7 million are classified as other workers. 11.2 As per census 2011, the Work Participation Rate for women is 25.51 per cent as compared to 25.63 per cent in 2001. The Worker Population Rate (WPR) for women in rural areas is 35.1 per cent as compared to 17.5 per cent in urban areas based on 4th Annual Employment-Unemployment Survey (2013-14) and same is 30.2 per cent in rural area and 14.8 per cent in urban area under 5th Annual Employment-Unemployment Survey (2015-16) under Usual Principal & Subsidiary Status (UPSS) Approach. As per 4th and 5th Annual Employment Unemployment Survey launched by Labour Bureau in December 2013 and April 2015, the overall Female Labour Force Participation Rate under Usual Principal & Subsidiary Status (UPSS) Approach has been decreased from 31.1 per cent to 27.4 per cent. As per the results of Periodic Labour Force Survey (PLFS) conducted by National Sample Survey Office, Ministry of Statistics and programme Implementation during 2017-18, the overall Worker Population Ratio for women in the age group 15 & above was 22% and it was 23.7% in rural areas as compared to 18.2% in urban areas based on usual status (Principal status+ subsidiary status) basis. The overall female Labour Force Participation Rate for the age group 15 & above status (Principal status + subsidiary status) basis was 23.3% which was 24.6% in rural areas as compared to 20.4% in urban areas. The overall unemployment rate for the female was 5.6% and the unemployment rate of female in rural areas was 3.8% and 10.8% in urban areas. [*annual survey report – ministry of labour and employment 2019 – 20.*] However, data on women re- entry into workforce is glaringly unavailable and needs to be investigated. This research paper ponders into re-entry reasons and characteristics of women into workforce.

Research Objectives

- (1) To identify the factors responsible for women re-entering into workforce
- (2) To examine the specific needs of women re- entering into workforce.

LITERATURE REVIEW: -

At times of COVID-19, labour market has remained a concern for policymakers (Borland and Coelli 2020). In a recent study conducted it was found that the societal expectations from Indian women to work was a bare minimum of around 4% which proves the fact that Indian society doesn't have any kind of expectation from women to contribute to the expenses (Rajesh S., 2013). However, women have remained a larger part of workforce and their re-entry to work after a career break requires undaunting attention.

The term re-entry of women into workforce has been a topic of concern ever since 1960's and it was first studied in U.S.A in late 1970's (Geber, 2000). 'Re-entry women' used here is defined as women returning to work after a career break; voluntarily or involuntarily of more than six months, and now desires to once again engage in full-time employment. The women seeking re-entry are with abundance work experience, well qualified and all motivated with wanting to make a "comeback". However, the length of their career break appears to play a key role in the re-entry process. (Gwal, 2016)

The Theoretical Perspectives on Women's careers are kaleidoscope career model of Mainiero and Sullivan (2005) argue that women in early careers focus on challenge, during their mid-career, focus on balance and in the later career look for authenticity. Career scape model of

McKie et al. (2013) proposes that women's career choices are driven by willingness to have greater control on work content, time and need for autonomy.

There are literature support for reasons for women's reentry with prime being financial independence, career identity and work centrality (Singh & Vanka, 2021). However, in our study we choose to split up women re- entry into workforce as internal factors and external factors.

Women reentry into workforce: - Internal factors

Reentry women on life planning have been found to have more career indecision (Slaney, tafford, & Russell, 1981) similar to traditional college students (Slaney, 1986). The effects of career indecision (Slaney & Dickson, 1985; Slaney & Lewis, 1986) have succeeded in producing change in career-undecided women i.e reentry women have been found to be relatively career decided and use a rational career decision-making style (MacKinnon-Slaney et al., 1988; Read et al., 1988) with significantly higher expectations of their careers' providing more future life satisfaction (Read et al., 1988) alongside desirability to have a new career (Sewall, 1984) and new work (Pickering & Galvin-Schaefers, 1988; Read et al.,1988). Hence most reentry women were employed full time, had higher salaries, performed more volunteer work, were more satisfied with their jobs, and placed more emphasis on intrinsic work factors including being autonomous and experiencing a sense of accomplishment (Erdwins and Mellinger 1985). In brief reentry women chose sober jobs like social service, education, and health occupations than management and scientific occupations (Malin et al., 1980).

However, with changing times, when leaving the workforce, women are encouraged to develop a long-range plan for reentry (Greer, 2013; Ronzio, 2012; Zimmerman & Clark, 2016). They aspire for a career re-entry to engage in paid work (Harman & Sealy, 2017), with a compromised yet a better fit paid workin sync with their non-work roles (Hakim, 2000). Hence, women's decision to restart a career after a break with presumptions of the unavailability of a flexible work arrangement, part-time work and lack of training (Panteli, 2006)has been studied as re-entry irrespective of shifts in career or field (McKie et al., 2013) while women who identify strongly with their careers and possess a sense of affiliation with their profession return to the same career after the career break (Herman, 2015) (Stanley,2018).Overall, most womenreturnees feel welcomed and included, they tendto have a positive outlook towards their career and feel satisfied with their jobs(Bharathi Ravindran, Rupashree Baral,2012). But brutallysexism persists in organizationas gendered workplace culture (Herman, 2009) observes sexist behavior or formal discrimination, the interpersonal bias among employers perceptions of women employees being too emotional, less committed, being incapable of finishing tasks, and not planning to return to work after childbirth are observed (Hebl and Kleck, 2002) (Hoobler et al., 2009) (Koeber et al., 2006) (Koch et al.,2015). Further few studies have examined the desire to work after career break (Pickering & Galvin-Schaefers, 1988; Read et al., 1988) that is the liminal period between staying home and workforce re-entry (Smith, Jarman, &Osborn, 1999; Smith, Flowers, & Larkin, 2009) are usually determined by less committed or incompetent at reentry thereby persuading women to usually pursue alternative careers (Lovejoy and Stone,2012).Thus organizations need to work on cost efficiency of refreshing a re- entry compared to preparing a 'new recruit' from scratch (Roberts 2002; Quant 2001) that could have prelude tendency that career breaks result in downward mobility in salary and employment status (Gwal, 2016). This take us to focus on the notion that reentry women often underrate their actual abilities (Ekstrom et al., 1981) as they possess excellent retention rates on re- entry (Blankenship etal 2003; Williams et al 2002;

Templeman 2001; Nottingham and Foreman 2000; Alden and Carrozza 1997; Kalnins et al 1994). and that career reentry after a career break (Diekman et al., 2019) among women professionals' merits attention (Singh & Vanka, 2021).

Reentry women have been found to be more concerned with independent activity (Gough, 1975), with conflicts and emotional distress for beliefs about their roles, beliefs about self, and interpersonal dissatisfaction (Gilbert, Manning, & Ponder, 1980) exhibiting a less internalized locus of control (Erdwins & Mellinger, 1984; Mellinger & Erdwins, 1985). Therefore, reentry women may have problems in self-concept and self - perception (King & Bauer, 1988). Although women in reentry relate themselves to achievement motivation (Farmer & Fyans, 1983) (Erdwins et al., 1982; Pickering & Galvin-Schaefer, 1988) exhibit less fear of success (Freilino & Hummel, 1985) as they have found to exhibit less ambivalent attitudes toward achievement (Freilino & Hummel, 1985). Further women of re- entry have urge for increasing knowledge (Clayton & Smith, 1987; MacKinnon-Slaney et al., 1988; Sewall, 1984), self-actualization, self-improvement, and social and humanitarian motives (Clayton & Smith, 1987) in order to become self-supporting (Clayton & Smith, 1987) with extrinsic job satisfaction (Smart & Pascarella, 1987) that satiates job dissatisfaction, better employment, or changing jobs (Badenhoop & Johansen, 1980; MacKinnon-Slaney, Barber, & Slaney, 1988; Read, Elliott, Escobar, & Slaney, 1988).

To this a step further, re- entry is influenced by age or time of reentry (Healy's ,1999). women returners', have focused on women's choices and career orientations (Doorewaard et al 2004; Houston and Marks 2003) with deep love of the profession, and the enthusiasm (Durand and Randhawa 2002; Stark et al 2001; Pett 2001; Wilcock, 2000). Women returners have a perception of their own skills (Ruth Mason, 2002) as they feel out of touch and fearful of changes in new technology and methods (Hitchcock 2003; Quant 2002; Waibel 2002; Wilcock 2000). Further using career assessment tools, finding a mentor, and focusing on self-care facilitate the re-entry process (Ericksen et al., 2008) requires taking assertiveness training prior to re-entry can also help female professionals (Ericksen et al., 2008). Ronzio (2012) maintains that seeing a career counselor before reentry can help with career transitions, where employers such as consulting firms, have specific programs targeted at re-entrants (Lovejoy & Stone, 2012). This could help solve unrealistic expectations of highly qualified women who often report feeling frustrated and depressed because of their reentry experiences (Lovejoy & Stone, 2012). Thus, women workforce reentry requires some type of intervention (Ericksen et al., 2008; Greer, 2013) as women often fail to maintain professional networks or keep job skills current, and very few create any type of plan for reentry (Greer, 2013). Therefore, Zimmerman and Clark (2016, p.626) argue that "from the day that women opt-out of the workplace, they should be planning for their reentry with a specific focus on maintaining and continuing to develop their skills."

Women re-entry into workforce: - external factors

Family is a strong reason for women to re- enter workforce (Badenhoop & Johansen, 1980). However, a women's vocational role is delayed till 35 years until her family role is established (Betz & Fitzgerald, 1987) and that career versus family values conflict (Kinnier & Townley, 1986) role conflict and emotional distress (Gilbert et al., 1980) leading to a prime non motivational factor for career re- entry (Badenhoop & Johansen, 1980). Further with mounting family difficulties like availability of financial resources (Sewall, 1984) women reentering the workforce has increased the ability to contribute to the family, both financially and experientially

(Clayton & Smith, 1987). Thus, most women reenters are middle class with marriage and children at home, single heads of households, displaced homemakers, or empty-nesters. (Benokraitis, 1987; Christian & Wilson, 1985; Dabrowski, 1983; King & Bauer, 1988; Radloff, 1980). On a personal forefront, reentry women valued freedom and independence over conflicts and intimate relationships (Kinnier & Townley, 1986) which showcased that reentry women and their partners had increased confidence, reduced anxiety, and better relationships with their children and partners (Kelly, 1982). Thereby the vital role of partners (Blossfeld et al., 2001; Hoherz, 2014; Jacob & Kleinert, 2014) as a social support (Höhne, 2007) with emotional and child care support is the most efficient means of assisting women's re-entry into the work force (Brockel, 2018).

External factors such as education and access to childcare would also directly influence women's reentry ability (Nakamura and Ueda, 1999). Children and the time necessary to devote to them are viewed by reentry women as a major obstacle to finishing education (Badenhoop & Johansen, 1980). Read et al. (1988) also found that women with children believe family, as well as finances and limitations of time, are obstacles to their goals with majority time spent in appropriation of the child seen entering school or growing up (MacKinnon-Slaney et al., 1988; Pickering & Galvin-Schaefer, 1988; Sewall, 1984). In two studies (MacKinnon-Slaney et al., 1988; Read et al., 1988) married reentry women were found to be more likely to see themselves as having more family emotional support as compared with separated and divorced women. In these same studies, divorced reentry women placed a significantly higher value on better employment and financial need than did married reentry women. Reentry women with children have also been found to place a higher value on better jobs and income than have women without children (Read et al., 1988). Ericksen et al. (2008), focuses specifically on mothers' reentry experiences into the workforce through conceptual framework highlights multiple forces driving women back to work, such as financial, environmental and self-image. Motherhood unseeingly bears a penalty (Abend Roth, van der Lippe, & Maas, 2012; Aisenbrey et al., 2009) with the number and age of children playing a obnoxious role in reentry (Drasch, 2013). In short the transition from staying home with children to workforce reentry can result in personal changes such as decreased self-esteem, lack of confidence, or depression, which may require some type of intervention (Ericksen et al., 2008; Greer, 2013) with job demands (Bharathi and Baral, 2012) thus helping assure the well-being of the re-entry of women who appear are caught between being a good employee and a good mother (for exception, see Maheshwari, 2014; Ravindran and Baral, 2013). Therefore, returners should be offered flexible work arrangements and programs for women returners needs to be readily available in practice (Mishra 2016).

Methodology: -The study adopts probability sampling with emphasis on stratified sampling technique to identify women reentry into workforce followed by convenience sampling technique under non probability sampling with $n=63$ thereby limiting itself to non-parametric data analysis of Kruskal – Wallis test.

Hypothesis: -

H₀: - There is no significant difference among factors hindering women reentrants progress across different types of career breaks.

H₁: - There is significant difference among factors hindering women reentrants progress across different types of career breaks.

Data Analysis and Interpretation using Kruskal -Wallis Test: -**Descriptive Statistics: -**

Source: - Survey Data SPSS version 23

Note: - the above numerals stand for: 1- marriage, 2 – child bearing, 3- household responsibilities, 4 - relocation of spouse, 5 – awaiting better prospects, 6- dependent care, 7 – any other, 8 – (1&2), 9 – (2&3), 10 – (2&6), 11 – (1&5), 12 – (1&2&3&4), 13 – (5&7), 14 – (2&4&5), 15 – (2&4&6&7)

Inferential statistics: -

The Kruskal – Wallis test relies on mean rank which was highest at 51.00 for outcome of lower salary at reentry due to relocation of spouse (4) , 38.00 for outcome of lower position at reentry due to dependent care (6), 58.00 for outcome of lower job role at reentry(11) due to cumulative effect of marriage (1) and awaiting better prospects (5), 53.00 for outcome of lower assessment performance due to relocation of spouse (4), 35.45 for outcome of knowledge outdated at reentry due to awaiting better career prospects (5), 59.00 for outcome of lack of support from superiors at reentry due to relocation of spouse (4), 49.50 for outcome of ardent work - culture policies at reentry due to relocation of spouse (4), 49.50 for outcome of learning new skills at reentry due to relocation of spouse(4) and (15) due to cumulative effect of child bearing(2), relocation of spouse(4), dependent care(6) and other detrimental factors (7), 59.50 for outcome of talent and expertise not fully utilized at reentry(11) due cumulative effect of marriage(1) and awaiting better prospects (5), 45.00 for outcome of job dissatisfaction at reentry due to relocation of spouse(4) and (15) due to cumulative effect of child bearing (2), relocation of spouse(4), dependent care (6) and other detrimental factors (7), 48.00 for outcome of slow career growth at reentry due to relocation of spouse (4), 59.00 for outcome of lack of same status and respect at reentry due to relocation of spouse(4), 59.00 for outcome of lack of challenging task assigned at reentry (11) due cumulative effect of marriage(1) and awaiting better prospects (5), 58.00 for outcome of lack of credibility at work at reentry due to relocation of spouse (4) and (11) due to cumulative effect of marriage(1) and awaiting better prospects (5).

Overall, the mean rank was highest at 60.00 for outcome of (11) due to cumulative effect of marriage (1) and awaiting better prospects (5); also (15) due to cumulative effect of childbearing (2), relocation of spouse (4), dependent care (6) and other detrimental factors (7), responsible for

career break contributing to a significant difference with 0.05 ($p \leq 0.05$) in managing career work balance. Thus, the null hypothesis is rejected and the alternate hypothesis is accepted.

Scope and limitations: -The current study is one existential part of the pilot study, thereby not covering all aspects in the pilot study undertaken. Further the study is preliminary attempt to understand the nature and work-life aspects of women re-entrants, thus restricting itself to the data collected from Dakshin kannada only. It is a cross sectional study. Future research can be extended to more profound outlook on career breaks and re-entry by ethnic background of women and men. It can also ponder into the frivolous nature of organizations in complying to programs and essentials for women reentrants.

Conclusions: - Women reentering workforce do have varied characteristics and needs which have to be identified and more adequately addressed. Thus, the need to advance the scientific inquiry in the area of reentry women in a more coordinated with stringently controlled research effort is vital. Further labor market structures with employers and government inclusive policies, work practices and cultural traditions play an important role in combining parenthood and employment in post-industrial societies. The labour markets are not only structured by policies, practices, norms, and networks but they also reinforce gender inequality. Thus, labor markets with public policy interventions must reconsider the dearth of research on re-entry women, on which research across sectors is advocated. We hope that the findings of this study will be helpful and kindle scholarly interest in career re-entry of women professionals which is vital to enhance the current understanding of the career restart; more specifically with the aim was to understand the reasons and enablers of re-entry.

IMPROVEMENT OF INNOVATIVE MECHANISMS IN ECONOMIC DEVELOPMENT

Marifatkhon Khakimovna Ahunova*

*Assistant,
 Fergana Polytechnic Institute,
 UZBEKISTAN

ABSTRACT

This article presents the role of innovation and ways to improve innovation mechanisms in the context of crises occurring during a pandemic. Innovative clusters are defined separately, the author has developed scientific developments and prepared proposals and recommendations for implementation in practice.

KEYWORDS: *Crisis, Innovation, Innovation Mechanism, Clusters, Cooperatives, Concerns, Syndicates, Regional Economies, Innovation Cores And Poles, Transformation.*

INTRODUCTION

At a time when the effects of the crisis continue in the world, in some countries, where the pace of decline continues instead of development, the rapid development of the economy of our country testifies to the correctness of economic policy. All of the above data show the relevance of the topic, which is planned to introduce new approaches to the economy, a system of innovations through the improvement of innovation mechanisms in the economy. In the context of globalization of the economy and the requirements of market relations, there is a fierce competition for investment in the world. If we analyze the investment tendencies of the world's fastest growing economies, we can cite China as one of the first Asian countries and the United States as an overseas country. The pursuit of such high-performance investments can be observed in many developed and developing countries of the world, which are transitioning to a market economy. "Investment" is derived from the English word "investments", which means "capital investment". In the broadest sense, investment is the transfer of funds for a certain period of time to entrepreneurship or other activities in order to earn income or profit. ". According to Swedish economist Klos Eklund, "investment is tomorrow to have more consumption something left to the keun. Part of it is consumer goods that are currently left unused, and the other part is resources aimed at expanding production ". Research in this area is one of the most pressing

issues today. "Investment is a capital investment, which is a set of tangible and intangible funds spent on business and other activities for a certain period of time in order to obtain economic benefits on a risk basis".

Main part

The global financial and economic crisis observed in the world community under the influence of the COVID-19 pandemic is having a significant impact on all sectors of the economy, especially on the supply of products to the world's population. The full satisfaction of the needs of the population in quality and affordable products produced locally depends mainly on the development of the agricultural sector, which in turn requires the introduction of modern and innovative methods in the industry. Modern innovative methods are now manifested in the background of the formation of clusters.

In today's scientific literature, there are scientific developments dedicated to the activities of innovative associations, scientific organizations and enterprises associated with innovation. At the same time, innovation clusters are recognized as one of the main forms of diversified farms. The development of the regional economy consists, first of all, in the rational placement of industrial enterprises and the formation of innovative trends, in particular, innovative clusters, cooperatives, concerns, syndicates, and ensuring their rapid development.

Gradual economic reforms in Uzbekistan are being carried out with a view to achieving a rational sector, production and territorial balance, ensuring economic growth and improving the living standards of the population. The solution of these problems is inextricably linked with the implementation of appropriate investment policy, regulation of investment processes and the formation of an effective system of support. At the current stage of market reforms, the investment policy pursued in Uzbekistan is an important factor in determining the stability, structural and qualitative changes in the economy. In the context of globalization of the economy and the requirements of market relations, there is a fierce competition for investment in the world. Today, Uzbekistan is a country ready for investment. The local policy pursued here, the preservation of peace, the positive situation in macroeconomic indicators - all this serves as a key factor in actively attracting foreign investment. At present, a number of methods have been developed to regulate investment in economically developed countries. They have some experience in the development and implementation of large-scale scientific, technical, social, energy, nature protection and other programs. Also, 2 tasks play a decisive role in the organization of investment in developed countries [8]:

- the use of a system of economic and legal methods in regulating the structure of production and investment processes;
- Development of planning methods at the state and enterprise levels, ie target programs of scientific forecasts, summaries and balance sheets to overcome the negative events and crises in the regulation of investment.

It should be noted that after the introduction of planning in the regulation of investment, France, the Netherlands, Norway and Japan began to develop.

This experience later spread to Sweden, Finland, the United Kingdom, Italy, Belgium, the Federal Republic of Germany, Spain, Portugal, Greece, and Ireland. Due to the different levels of development between the countries, they have formed planning systems to regulate the following

investments. North American system (USA, Canada, Mexico). It has created the conditions for the confrontation of the European Economic Community and the established European common market, as well as had a strong impact on the efficiency of the reproduction process.

RESULTS AND DISCUSSION

Studies by Harvard Business School experts show that the share of innovation clusters in the economy is 32% in the United States, 39% in Sweden, and 44% in other developed countries [1]. In the scientific literature, cluster clustering, agglomeration factor, institutional factors, scientific and technical factors affect the placement of clusters.

In neoclassical theory, clusters are seen as a structure that provides stable interactions between economic agents, ensures economic growth, and leads to a high level of competitiveness. Much research has been done on clusters, the most notable of which are M. Porter's developments. A cluster is a group of companies and organizations that are geographically close and interact with each other. He sees his developments as advantages of geographical location and production, technological proximity. Ketels' research focused on geographical localization. In geographical localization, clusters are interconnected, interacting with each other in terms of dynamic development. According to him, if we ascend at a distance of 10 km from the earth's surface, the clusters are similar and close to each other, but if we analyze them closely, they are radically different from each other [2]. Analyzing the activities of innovative clusters, MP Vainarenko identified the efficiency of cluster activities and developed the concept of "5 I". The author summed up the research of the above scientists and developed a scientific development "3 I".

Such scientific developments have a place in the development of the region's economy. Divided into three major mechanisms, the first mechanism transforms society with the business environment, the second mechanism develops ways to develop the region's economy, while the development of regional development strategies determines the prospects of the region. The third mechanism is the process of cluster consolidation through the development of the economy, integration with information systems. Concentrations of geographical and intersectoral development and business society, market infrastructure will be developed, and these clusters will become large associations.

M. Galushkina believes that the acceleration of cluster activities, in turn, will develop an innovative economy. The competitiveness of the region's economy is largely due to the availability of innovative regions with high efficiency. In our opinion, innovation clusters should be identified as the core of innovative regions and the locomotives of development. Buyers of innovative products will be offered a wide range of new technical and technological products. On the basis of such structural changes, "innovative nuclei" are formed and their distribution is observed, and "innovative poles" begin to appear. Under the influence of strong ties and relationships between them, "innovation clusters" begin to develop.

Under the influence of the cluster approach, the region enters the stage of innovative development, as a result of economic activity, the clusters undergo processes of concentration and cooperation. Specialization and localization processes can be cited as one of the main reasons for the sustainable development of clusters. These processes are formed on the basis of the interrelationships of clusters, and it is necessary to improve the horizontal and vertical development of clusters.

At the same time against the background of active development of clusters is human capital. This is a high level of mobilization of human capital, and as a result of this process, the level of mobilization of human capital is determined. Based on the following results, clusters form highly innovative human capital;

First, the competitiveness of the labor market will develop, highly qualified specialists will be selected from among the workers, there will be competition among highly skilled workers for jobs with good conditions;

Second, there will be an increase in the number of highly skilled workers in the labor market, an increase in the number of highly skilled workers in clusters, and the same process will occur in industries;

Third, research centers will be established within the clusters, which will strengthen the process of specialization, as well as accelerate the process of economic growth.

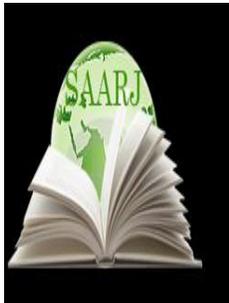

CONCLUSIONS

In conclusion, it can be said that ways to develop innovations in the development of the economy, as well as to improve innovation mechanisms have been developed. On the basis of these developments, the development of regional economies, innovation clusters as the core of innovative regions and the locomotives of development are presented. On the basis of such structural changes, "innovative nuclei" are formed and their distribution is observed, and "innovative poles" begin to appear. Under the influence of strong ties and relationships between them, "innovation clusters" begin to develop. The application of the North American policy of "fixed-purpose investment - stabilization of the competitiveness of entrepreneurs" in the country as "investment in the development of small business" meets today's requirements. In addition, for the regulation of investment processes in the Republic of Uzbekistan, in our opinion, the Italian type of regional planning provides for the regulation of investment processes in the development of individual sectors of the economy, for example, disparities between regions; It is also expedient to use in the context of Uzbekistan a method aimed at eliminating the disparities between industry and agriculture: the degree of stratification of the population and other cases.

ABSTRACT

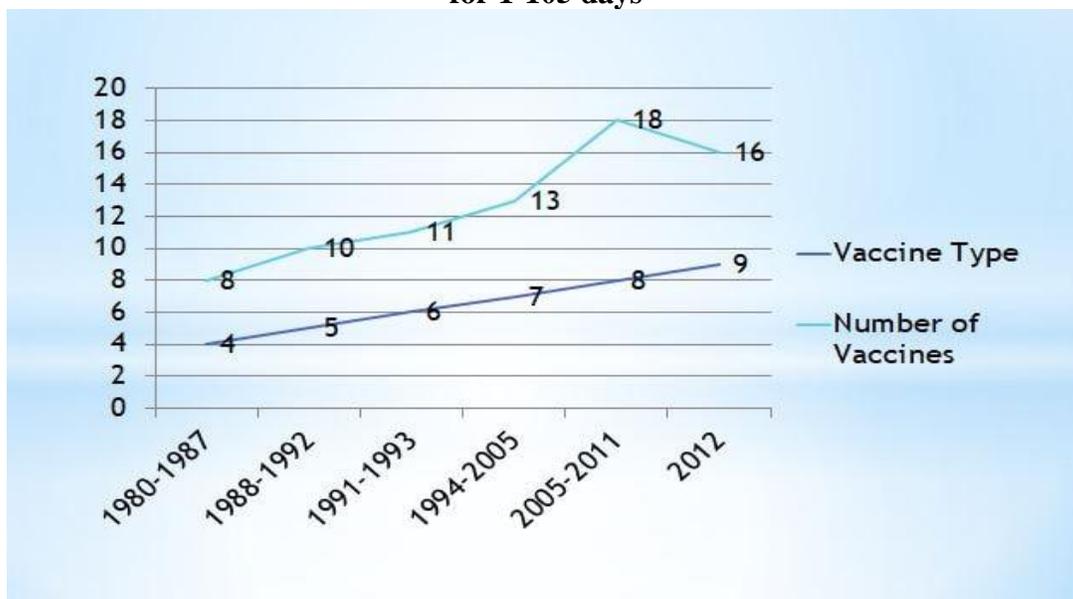

“Samarkand-Parranda” JV analyzed the frequency and effectiveness of scheduled vaccinations from 1980 to 2012 and noted that the type and number of scheduled vaccinations have doubled. JV “Ohalik-Lomannparranda” analyzed the frequency and intensity of vaccinations against Newcastle disease in 1997-1998. An increase in the number and type of vaccinations has been found to cause immunosuppressive syndrome. Immunosuppression was primarily determined by the suppression of postvaccinal immunity generated against Newcastle disease and infectious bronchitis. Immunosuppression has been reported to increase the risk of conditionally pathogenic infections. Immunosuppression has also been found to be influenced by the large population density of poultry farms and the narrow distances between poultry houses and farms. It is recommended to use the immunosuppression phenomenon and give priority to small business to prevent immunosuppressive syndrome.

KEYWORDS: *Immunosuppression, Immunoresonance, Newcastle Disease, Small Private Business.*

INTRODUCTION

Both the media and the scientific literature (4) show that since the second half of the twentieth century, the epizootiological and epidemiological situation in the world has been deteriorating again. This process is reflected in the recurrence of problems such as tuberculosis, brucellosis, salmonellosis, colibacillosis, prevention and therapy, as well as the emergence of anthropozoonotic nosological units such as acquired immunodeficiency syndrome, bovine rabies, avian influenza, swine flu. The fact that there is a state of tension in the immune system of the world's population and pets also plays a role in the emergence of this problem. We came to this conclusion based on the results of our epizootiological observations in the field of industrialized poultry and livestock (Diagram 1). This is because it is known that the virulence of infectious pathogens increases during the passage of an organism with increased susceptibility due to the weakening of the immune system. The table shows that in an industrialized poultry farm, both the type and number of vaccinations of chickens per day to 105 days have doubled in 30 years. Today, chickens are vaccinated against any pathogen every 5-6 days. Such a situation can not but strain the immune system of the chick.

Diagram 1 Dynamics of scheduled vaccinations of chickens in JV "Samarkand-Parranda" for 1-105 days

MATERIALS AND METHODS

The source of our research is the monitoring of the number and intensity of vaccinations with live virus vaccine "La-Sota" against Newcastle disease in 1995-1999 JV "Ohalik-Lomannparranda" and JV "Samarkand-Parranda" in 1980-2012, "Samarkand-Poultry" "Indicators on the effects of immunosuppression in the JV and our subsidiary farms were conducted in 2011-2012. In our research, we used epizootiological, clinical, serological and pathomorphological methods. Opportunities for bacteriological and virological research are being explored.

Results and their analysis

The Samarkand-Parranda JV raises 465,000 chickens and hens. So many chickens are being raised at the Maroqand enterprise, 500 meters away, and this is the situation. In addition, 100 thousand chickens with a diameter of 2 km, 5-6 thousand chickens are raised on 3-4 small farms. Biothermal decontamination of manure is not provided. It can be said that the air entering the ventilation system is rich in virus and bacterial particles. Our subsidiary farm is 1 km away from the settlement, the distance between 3 hens for 2 thousand chickens each is 50-60 m. Due to the fact that the vaccination regime is for 2012, the consequences of immunosuppression were noted in JV "Samarkand-Parranda" and in our subsidiary farms. The incident consisted mainly of costs associated with Newcastle disease. Although biothermal decontamination of manure has begun on our subsidiary farm, it has not been fully implemented. In Samarkand-Parranda JV, the cost of immunized chickens was 6-8%, while in our subsidiary farms it did not exceed 3%.

In 1999, when I was a fifth-year intern at Ohalik-Lomannparranda JV, I noticed that the number of vaccinations against Newcastle disease varied in different chickens. In some hens, revaccination is required every 3-4 months, while in others the immune system fluctuates within a sufficient range even for 10-16 months. The type and number of vaccinations are increasing year by year as we are able to determine the nature of this phenomenon in a timely manner (1,2,3) and not be able to introduce it into production, calling it an immunoreonance phenomenon. It has also been recognized in the scientific literature that vaccination of birds with many types of live vaccines during intensive periods can cause the problem of mixed infections (4). The features of this syndrome, which we are beginning to understand, are expressed in the fact that, first of all, the suppression of post-vaccination immunity is observed in those who have a high frequency of revaccination. First of all, the vaccine against the Newcastle disease pathogen is exposed to immunosuppressive effects. In second place are changes in infectious bronchitis. As with Acquired Immune Deficiency Syndrome, an increase in the incidence of conditionally pathogenic infectious agents has been reported. Salmonellosis in particular plays a leading role here. In particular, the hens are 150-170 days old, which has risen to the top of the egg entry. The Lomann-Brown cross of the Lomann chicken breed shows stronger immunity than the Lomann-classic and Lomann-Sandy crosses. As a result, salmonellosis vaccination has to be included in the plan. In addition, prophylactic antibiotics have to be used in pre-vaccination risk cases. Antibiotics alone are combined with furazolidone in cases where they are not effective enough.

An important role in the emergence of the phenomenon of immunodeficiency syndrome is played by the enlargement and consolidation of industrialized livestock and poultry enterprises and their proximity to residential areas. This condition leads to the opening of natural foci of intestinal infections and even internal leishmaniasis. Biothermal decontamination of manure has not been established in any of the large and small livestock and poultry farms. However, in industrialized countries where livestock and poultry are grown, the distance between not only enterprises but also their workshops is 5-6 km (5-6). In this regard, we believe that the lack of veterinary technology for the complete cleaning of chickens from the canals plays an important role in the development of immunodeficiency syndrome. Because anemia cannot fail to lower the immune system (Table 1).

TABLE 1 NUMBER OF VACCINATIONS OF CHICKENS IN FARMS 9 AND 10 AGAINST NEWCASTLE PATHOGENS IN 1997-1998 IN JV "OHALIK-LOMANNPARRANDA"

№	Row Chicken №	Duration of egg laying	Number of vaccinations
1	9	12	4
2	10	14	1

Current technologies involve filling the hen house with a population of the same age. We have found that this can also contribute to immunosuppression. We found that the number of vaccines could be reduced due to the occurrence of the phenomenon of immunosuppression in a herd formed from populations that differed in age by one month (Table 2).

TABLE 2 NUMBER OF VACCINATIONS AGAINST NEWCASTLE DISEASE IN HENS FORMED FROM EQUAL AND DIFFERENT POPULATIONS

Indicators	Same age shop (n = 8)	Two different age shops (n = 11)
1. Immune duration, days M ± m	176±33,17	239±91,98
2. Number of vaccinations M ± m	1,5±0,17	2,6±0,22

The problem is exacerbated by the lack of formal veterinary service and reporting on smallholders and farms. It is impossible to overcome this without the creation of specialized agrozoovetservis laboratories. Today, specialists from Russia, Ukraine, Turkey and Germany are involved in the use of bacteriological, especially virological, and patmaterials are sent.

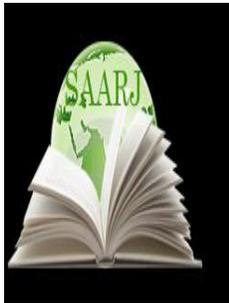

CONCLUSIONS

1. The phenomenon of immunological resonance should be tested under production conditions.
2. The vaccination schedule in chickens should be analyzed and corrected.
3. It is necessary to establish laboratories specializing in the provision of agrozoovetservis services to industrialized small livestock and poultry farms.
4. Veterinary legislation should provide for biothermal treatment of manure.

ABSTRACT

The article addresses the issues of maintaining the landscape and ecological balance of the regions, increasing land productivity, improving land cadastre in accordance with modern technologies and rapid monitoring on the basis of GIS (geographic information systems) technologies. The work also provides information on land cadastre indicators in the new century of technologies, ways of their collection, the role of GIS technologies, principles, methods of cadastral mapping and problems related to their improvement and development. In addition, the article includes an inventory of district land resources and the creation of cadastral maps, as well as a qualitative analysis of existing agricultural land.

KEYWORDS: *Landscape, Relief, Ecological Balance, Monitoring, Cadastre, Land Cadastre, GIS, Scale, Plan, Electronic Map, Digital Map, Map Creation Methodology, 3D Model.*

INTRODUCTION

Of particular importance in the world are targeted research on the activities of the economic movement, maintaining the landscape and ecological balance of regions, increasing land productivity, conducting land cadastre in accordance with modern technologies and operational monitoring. In this regard, one of the important issues in the monitoring of agricultural lands is their qualitative analysis and improvement of land cadastre on the basis of GIS (geographic information systems) technologies.

1: 10000 used in agricultural lands in our country; 1: 25000; one of the important issues is the creation of digital electronic cards instead of paper cards with a scale of 1: 50000 and their introduction into production. Therefore, one of the most pressing issues today is the correct

organization of geodetic and cartographic work and the use of modern geographic information system technologies in its implementation.

Therefore, in the efficient and rational use of agricultural land, it is important to monitor their quantity and quality, and at the same time to develop a methodology for creating electronic agricultural maps using GIS programs.

Primary data and their description

Monitoring of agricultural land in the Republic is carried out on the basis of the “Land Code” of the Republic of Uzbekistan, the Regulation “On Land Monitoring” and a number of other documents [1].

3.3 - Further improvement of the reclamation of irrigated lands in accordance with the Decree of the President of the Republic of Uzbekistan Sh.M.Mirziyoev dated February 7, 2017 No PD 4947 “On the strategy of further development of the Republic of Uzbekistan” 3.3 - Modernization and accelerated development of agriculture; development of a network of land reclamation and irrigation facilities; intensive methods in the field of agricultural production; First of all, the introduction of modern water and resource-saving agro-technologies, the use of high-yield agricultural machinery [1]. One of the important tasks is to implement these tasks, i.e. to further improve the reclamation of irrigated lands, rational and efficient use of agricultural land and on this basis to create a scientific basis for cartographic support of the state land cadastre using GIS technology.

The purpose and objectives of the study

The purpose of the study is to improve the methodology for monitoring and creation of electronic digital maps of agricultural lands of Bulungur district for cadastral purposes. For this purpose, the following tasks were identified: Development of a methodology for maintaining the land cadastre system of Bulungur district of Samarkand region using GIS technologies and the development of a methodology for creating electronic digital maps of agricultural lands of Bulungur district using GIS technologies.

The object of research is agricultural lands of Bulungur district of Samarkand region.

The subject of the study is an electronic map based on GIS technologies in the conduct of state land cadastre in Bulungur district of Samarkand region.

Research methods

The study used geographical comparison, cartographic, zoning, historical, photogrammetric, geoinformation and other methods.

The degree to which the problem has been studied. Issues of rational use of agricultural land in the country and the organization and conduct of state land cadastre and the creation of cadastral maps on the basis of modern methods I.A. Giniyatov, T.P. Magazinhchikov, A.B. Borisov, A.G. Yunusov, A.I. Ivanov, V.P. Mazalov, A.A. Korolev, S.A. Avezboev, E.Yu. Safarov, I. Musaev, S.N. Volkov, A.R. Bobojonov, J.S. Sattarov, L.T. Tursunov, X.A. Abdullaev, M.M. Muhammadjanov, X.T. Risqieva, Q.R. Rakhmonov, A.Sh. Gafurov, G.A. Tolipov, A.J. Gafirov are covered in scientific research. However, in the above-mentioned works of scientists and researchers, the development and territorial organization of land cadastre, as well as the conduct

of land cadastre in accordance with modern technologies and rapid monitoring have been studied in general.

Also, the scientific works of the above-mentioned scientists have not sufficiently studied the issues related to land cadastre indicators, ways of their collection, the role of GIS technologies, principles, and methods of cadastral mapping and their improvement and development in the new century.

THE MAIN FINDINGS AND RESULTS

It is known that land monitoring is a system of analysis of information collected on the basis of timely detection of quantitative and qualitative changes in the land fund of a particular area, assessment of their productivity and observation of the positive and negative consequences.

Based on the above, we set ourselves the goal of qualitative monitoring of agricultural land in Bulungur district of Samarkand region, ie the analysis of the productivity of existing irrigated land in the district. In our study, generally accepted standard methods were used.

Existing plan-map materials, acts of acceptance of completed works and materials of land survey were used in the monitoring of existing irrigated lands in Bulungur district.

In our research, the monitoring of the land fund of Bulungur district was carried out on the basis of specially organized regular observations, ie photography, inspection, direct measurement, comparison with data from previous years. Based on the results of the inspection, the data were evaluated.

Bulungur district is located in the north-eastern part of Samarkand region, bordered on the south by Urgut district, on the south-west by Taylak district, on the west and north-west by Jambay district, on the north and northeast by Jizzakh region.

Bulungur district belongs to the arid subtropical continental climate zone of the Central Asian province according to climatic conditions. Characteristic features of the climate of this zone are continentality, high soil and air temperatures in summer, uneven distribution of atmospheric precipitation. According to the Samarkand meteorological station, the average annual temperature in the district is + 14.1°C. The hottest month is July with an average temperature of + 25.5 °C, the coldest month is January with an average temperature of -0.3 °C. The average annual rainfall is 328 mm, and its main amount falls mainly in the autumn-winter-spring months. Typical irrigated typical gray, gray-meadow, meadow-meadow, meadow and swamp-meadow soils are distributed in the district [7].

The total land area of Bulungur district is 75197 hectares, including 53728 hectares of agricultural lands (01.01.2020). The district has opportunities to grow vegetables, horticulture, silk and a number of other agricultural products. The area of arable lands in the district is 28,135 hectares, of which 15,637 hectares are irrigated lands. There are also 8357 hectares of perennial trees in the district. Farms in Bulungur district are currently attached to 17 TFMM (Tractor Fleet of Machine Mechanization) [8].

It is known that the main factor in the formation of a database for land cadastre is the inventory of available land resources and the creation of a cadastral map of the area. These two processes are inseparable because they use common source materials, field work is performed by a single executor at the same time, and they are performed in a mutually integral state. The results of the

inventory are presented in the form of cadastral cards and inventory materials (inventory duty cards) describing the activities carried out and their description.

The connection between the spatial data contained in the cadastral inventory maps is made through the identifiers of the land plots. Inventory work is done through certain identification numbers. When compiling cadastral maps, this index is based on cadastral numbers. Such indicators are performed using special identifiers when entering data in the formation of the state land cadastre database.

Cadastral map is a set of measures for the creation of a cadastral map of a district or massif (farm) [4, 6].

The cadastral map is developed to visually reflect the results of land inventory, to determine the spatial location of land plots and their boundaries, areas [2, 3]. This will pave the way for the creation of cadastral duty cards. It is advisable to make cadastral maps and farm plans on the following district cadastral maps at a scale of 1: 10,000, and farm plans at a scale of 1: 1000 and 1: 2000.

Cadastral maps and plans should be developed using digital technology, as they cover a large area. This requires geodetic measurements and remote sensing. In some cases, for small areas, it is necessary to make plans on a scale of 1: 2000, 1: 1000 and especially 1: 500 using tachometric survey [5].

Targeted research has shown that the creation of cadastral maps and plans shows the need to develop special technology for the creation of land cadastral maps, which is not fundamentally different from the methodology of cadastral digital maps made in previous studies. The development of this technology was mainly based on aerospace methods and geodetic field measurements. However, in addition to aerial photography materials, it is necessary to use the results of field studies in the form of vector models of existing cartographic materials and object contours [9, 10.]. In the methodology of creating these cadastral maps, remote sensing materials are used as the main source. This, of course, is done through geodetic photogrammetric processing in GIS technologies. This technology of advancing the work on the creation of cadastral maps reflects the unity of cadastral map and inventory processes. It was based on the use of modern GIS principles and methods. The technology of creating cadastral maps on the basis of remote sensing materials and geodetic data is shown in Figure 1.

In the formation of cadastral maps, land cadastre maps were developed on the basis of the GIS ArcGIS program.

In addition, the created 3D model based on geodetic data was integrated with the created cadastral maps and showed the need to organize cadastral map plans on the basis of 3D models in areas with difficult terrain.

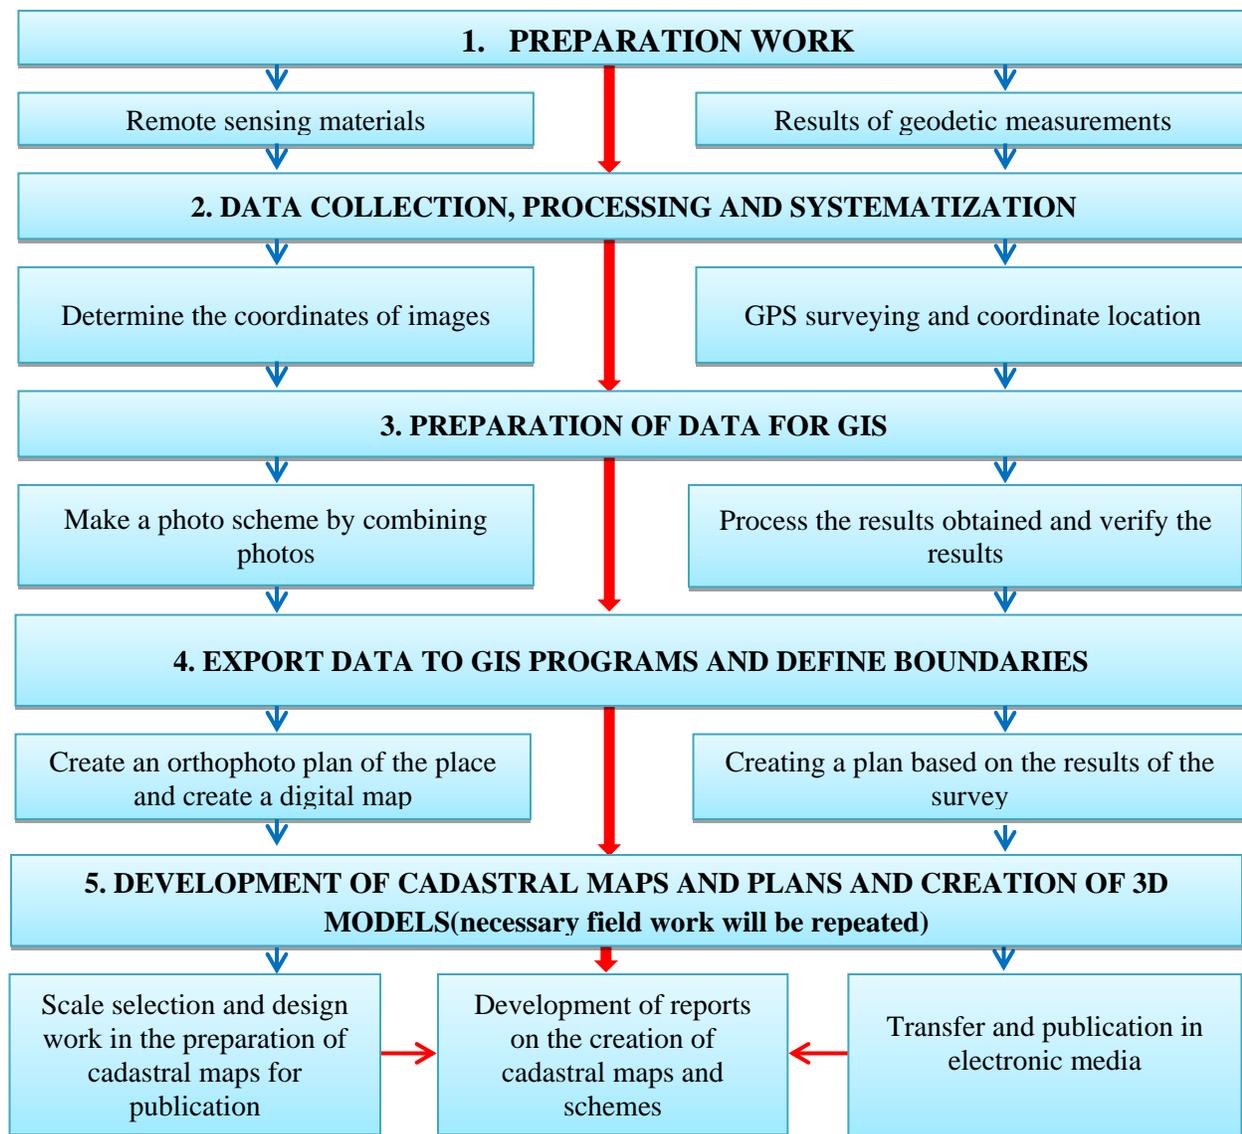

Figure 1. Technology of cadastral mapping on the basis of remote sensing materials and geodetic data.

In our research, along with the inventory of district land resources and the creation of cadastral maps, a qualitative analysis of existing agricultural lands was carried out. At the same time, the quality assessment of 24907.2 hectares of irrigated lands, including existing arable lands, perennial forests, arable lands and irrigated gray lands in the district was analyzed.

Humus plays an important role in the processes, changes and development of soil properties. This is because the organic matter in the soil has the ability to accumulate and retain large amounts of nutrients and moisture due to its ability to absorb a lot of water and its capacity.

The total amount of humus on 8458 hectares of irrigated land in the district is up to 1%, and on 16334 hectares - from 1.1 to 2%. Soils containing more than 2% of humus are 43 hectares in the district, located in the Bulungur massif.

9237 hectares or 37% of irrigated lands in the district are eroded to varying degrees. In particular, 3,810 hectares were weakly eroded, 5,134 hectares were moderately eroded and 293 hectares were severely eroded.

The average score of irrigated agricultural lands in the district is 61.2 points.

It is known that soil evaluation in the country is carried out on the basis of the “Guidelines for the evaluation of irrigated soils of the Republic of Uzbekistan”, taking into account the productivity of agricultural crops there.

Taking into account the natural fertility of soils, the productivity of irrigated lands and their potential for agricultural use, irrigated lands in the district were combined into 10 classes on productivity (on points), 5 agricultural cadastral zones (groups) on soil quality.

There are no lands of the first cadastral group in the district, ie lands of I and II classes, which are not suitable for agricultural use.

Lands of poor quality and worse are class III and IV lands and are included in the second cadastral group. The productivity of these lands is much lower. The area of lands belonging to this group in the district is 142.9 hectares, which is 0.57% of irrigated arable land. In terms of quality, these soils have a score of 21-40, and such soils are found only in the H. Olimjon massif. These lands are part of the stage of active development and cultivation in agriculture. These soils are low-yielding soils with one or two different negative character factors. The soils in this cadastral zone are subject to high humidity and irrigation erosion.

The area of lands included in classes V and VI and belonging to the third cadastral zone in terms of productivity in the district is 9927.7 hectares. In relation to the total irrigated agricultural land area of the district, the area of land belonging to this zone is 39.86%.

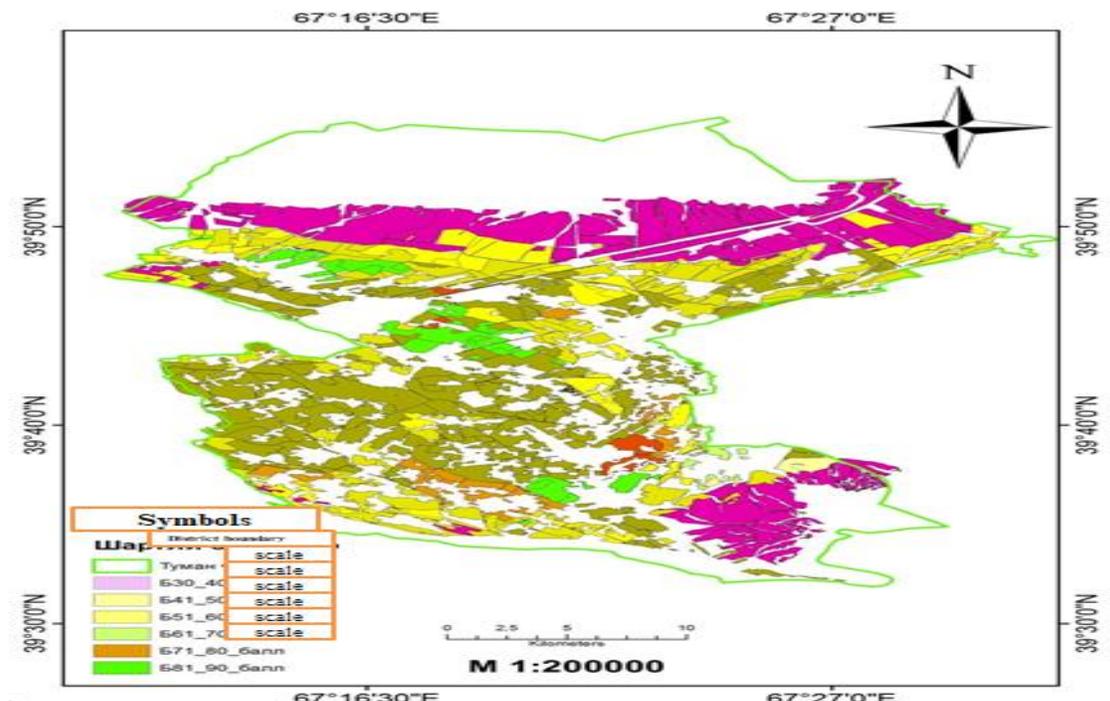

TABLE 1 QUALITY ASSESSMENT OF IRRIGATED AGRICULTURAL LANDS OF BULUNGUR DISTRICT OF SAMARKAND REGION

№	Massifs	Classification of soil by level of fertility										Total	Average score 2018 y	
		Bad lands		Low-average soils		Average lands		Яхши ерлар		The best lands

12	Beshkubi					79,6	107,2	1320					1506,8	60,3
13	Dustlik					619,0	248,6	788,3					1655,9	58,3
14	Bulungur					393,7	978,9	42,1		455,3			1870	62
15	F.Yuldosh						963,9	1034,4	81,1				2079,4	62,8
16	Gubdin					1149,2	982,7						2131,8	48,6
17	A.Navoi					131,	467,	109,	613,1	12,7			1334	63,6

7					3	8	8				,7	
Total				142,9	398,1	594,7	1174,3	1395,5	169,8		2490,7	61,2
By area class			142,9	9927,7	13138,5	1698,1						
Area in%			0,57	39,86	52,75	6,82						

Soils distributed in this zone have a 41-60 quality score and are moderately or less susceptible to irrigation erosion, salinization and other adverse effects. As a result of improper use of these lands, the slopes are washed away. As a result, there is a decrease in humus, which is one of the main elements of soil fertility, and nutrients needed for plants. The soils of this zone are found in Dustlik, Kildon, Choyantepa, A.Temur, Gobdin massifs and a number of other areas of the district.

Classes VII and VIII, which are above average in quality and have good lands, are included in the fourth cadastral zone. The soils of such areas are of good quality and are rated with a 61-80 quality score. The soils of the fourth cadastral zone are 13138.5 hectares, which is 52.75% of the total agricultural area in the district (Table 1). The soils of this region have changed during long-term irrigation and cultivation, and are characterized by their constant yield and positive properties.

The soils of the fourth zone are important for the cultivation of agricultural crops and require proper agro-technical and reclamation measures in these areas. The soils of this zone are distributed in almost all massifs of the district.

The fifth cadastral zone includes soils belonging to classes IX and X, which are very good quality and high lands. The lands included in this zone make up 1698.1 hectares in the district, which is 6.82% of the total irrigated land. On the basis of targeted research and the above data, as well as modern GIS, a 1: 200,000 scale soil map of Bulungur district was created (Figure 1).

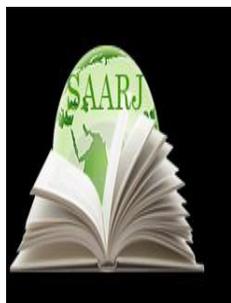

CONCLUSION

The development of methods and technological schemes for the creation of large-scale digital maps is important in the formation of land cadastre. Cadastral maps at a scale of 1: 10,000 on the basis of modern GIS programs play an important role in this. Based on the results of monitoring of agricultural lands in the district, it can be concluded that a number of reclamation and agro-technical measures are needed to increase the productivity of existing lands.

ABSTRACT

The pathology of the mammary gland is represented by such diseases as acute and chronic mastitis, fibrocystic mastopathy, gynecomastia, benign and malignant neoplasms, among which the greatest danger is cancer. Among nosological units, fibrocystic mastopathy occupies a special place, which, according to various authors, affects from 50 to 90% of women. Most often, women are sick at the age of 40-50 years. These changes in breast tissue are benign, but patients with mastopathy are at high risk of cancer [3]. A possible solution to the problem of treating patients with combined pathology of the uterus and mammary glands is the use of the domestic drug "Nodinorm" in the complex treatment of the main substance, which is indole-3-carbinol.

KEYWORDS: *Fibrocystic Mastopathy, Benign Tumor, Broccoli, Estrogens, Indole-3-Carbinol, Pharmaceutical Company Naturex, Nodinorm, Pharmaceutical Company Evalar, Indol-Forte.*

INTRODUCTION

Mastopathy is a common non-communicable disease. May occur in women of various ages. The main reasons for the formation are hormonal imbalance, neuroendocrine disorders. The neoplasm of the mammary gland is formed for a long time and may not manifest itself clinically for a long time. For treatment, medical and surgical correction is used [1,11].

Mastopathy is a fibrocystic disease characterized by a violation of the ratio of epithelial and connective tissue components, a wide range of proliferative and regressive changes in breast tissue [12].

This pathology is common in women of reproductive age. Most often, this disease occurs against the background of other gynecological diseases. The danger of mastopathy lies in the fact that this pathology belongs to precancerous diseases, against the background of which breast cancer can form. In the category of patients with mastopathy, the risk of developing malignant neoplasms is 3-5 times higher than in the general population of people [2, 8].

Factors contributing to the onset and development of breast pathology include:

- hereditary factor (presence of benign and malignant neoplasms in maternal relatives);
- neuroendocrine disorders;
- age over 40;
- Artificial termination of pregnancy;
- Obesity;
- prolonged mental stress;
- late first pregnancy;
- absence, short or long period of breastfeeding;
- age of first birth (women who have given birth to two children under 25 have a three times lower risk of developing breast diseases compared with those who had only one child);
- Early menarche and late menopause;

Combination with hyperplastic processes in other organs of the reproductive system;

- Patients with uterine fibroids who are expected to undergo hysterectomy with preservation of the uterine appendages are at an increased risk of the onset and progression of mammary dysplasia in the postoperative period[8].

Women can detect clinical signs of pathology on their own. Symptoms that should alert you:

- Soreness at the site of the neoplasm.
- Lump in the breast tissue.
- Swelling in the affected area.

- Enlargement and hardening of the lymph nodes in the armpits.
- Occurrence of nipple discharge. They are usually transparent serous. Can also be colostrum-like, greenish, yellow, brown[9].

Factors contributing to the onset and development of breast pathology include: hereditary factor (presence of benign and malignant neoplasms in maternal relatives), neuroendocrine disorders, age over 40, artificial termination of pregnancy,

obesity, prolonged mental stress, late first pregnancy, absence, short or long period of breastfeeding, age of first birth (women who have given birth to two children under 25 years of age have three times less risk of developing breast diseases compared with those who had only one child)[6].

Mastopathy is characterized by an increase in clinical symptoms in the premenstrual period. It is also important that the signs of the disease do not disappear after the end of menstruation [12].

Patients suffering from mastopathy should reduce the consumption of tea and coffee, quit smoking, include more vegetables (especially broccoli, as they contain a large amount of indole-3-carbinol) and fruits in the diet [11].

Of particular note is indole-3-Carbinol, contained in broccoli, which increases the efficiency of detoxification systems, which makes it possible to use it as a means of slowing down the aging process [1].

For the treatment of mastopathy, drug therapy is used, including the intake of non-hormonal agents (vitamins, vitamin-mineral complexes, adaptogens, galenic, diuretics, sedatives, hepatoprotectors, potassium preparations, enzymes, non-steroidal anti-inflammatory drugs, iodine preparations, etc.) [11,12] .

One of them is "Nodinorm" - a domestic herbal preparation obtained from plants of the cruciferous family, in particular broccoli, containing highly purified indole-3-carbinol.

The aim of this study was to evaluate the clinical effectiveness of the use of the domestic drug "Nodinorm" from the company "Naturex", containing indole-3-carbinol, for the treatment of diffuse fibrocystic mastopathy (DPCM) in comparison with its foreign counterparts "Indol-Forte" from the company "Evalar", produced in the Russian Federation.

Main part

The study included 45 patients aged 25–45 years, all patients were diagnosed with DPCM during a comprehensive examination of the mammary glands, including examination, palpation, mammography and ultrasound. In this clinical study, the patients were divided into two groups: 30 of them took the domestic drug "Nodinorm" at 200 mg / day, and the remaining 15 patients took "Indol-Forte" from the company "Evalar" also at 200 mg / day, within 3-6 menstrual cycles. In the course of studies conducted among women suffering from benign dysplasia of the mammary glands and taking indole-3-carbinol-containing drugs "Nodinorm" and "Indol-forte", significant improvements in the condition and well-being of patients in both groups were noted.

RESULTS AND DISCUSSION

In the course of the study, the effectiveness of the new multitarget domestic drug Nodinorm for the treatment of patients with cyclic mastalgia (mastodynia) and mastopathy was proved. Considering that the known mechanisms of action of indole-3-carbinol characterize it as a drug with an oncoprotective effect, this result is especially important in terms of preventing breast cancer in patients with cyclic mastalgia. ... The results of studies on the positive effect of indole-3-carbinol and 3,3'-diindolylmethane on clinical markers of increased risk of breast cancer (mastalgia, mastodynia and other manifestations of fibrocystic breast disease) confirm the important role of these molecules as preventive strategies for reducing risk of breast cancer.

After a 3- and 6-month course of treatment with Nodinorm, the following results were obtained during the examination of the patients. Completely completed the study (93.3%) of patients who noted the good tolerance of the drug. 1 patient (DFKM with a predominance of the fibrous component and a mixed form of DFKM) refused to take the drug for a long time and dropped out of the study due to the development of severe dyspeptic symptoms (nausea, diarrhea) during treatment with Nodinorm. Another patient with DPCM with a predominance of the glandular component stopped taking the drug due to the development of an allergic reaction. Such side effects are also possible for Indol-Forte, since these side effects are prescribed in the instructions for this drug.

After 6 months of taking Nodinorm, all 28 patients subjectively noted positive dynamics. At the same time, the disappearance of pain in the mammary glands in general was observed in 76.3% of women, a decrease in pain - in 23.7%. Among the latter, 17.5% noted mild pain in the mammary glands, and only 6.2% of women had moderate pain. Thus, no patient experienced severe pain after 6 months of taking Nodinorm.

The effect of Nodinorm develops gradually, reaching a maximum 6 months after the start of application. In the present study, the maximum clinical effect was achieved in patients with DPCM with a predominance of the cystic component.

CONCLUSION

Based on our comparison, we can say that the pharmacological effects of "Nodinorm" and "Indol-Forte" are practically similar and the domestic drug "Nodinorm" is in no way inferior to the drug "Indol-Forte". Both equally effectively coped with one of the main problems of diffuse fibrocystic mastopathy - mastalgia. It can also be noted that the drug Nodinorm has a very important - oncoprotective - property, this result is especially important in terms of preventing breast cancer, which gives us the opportunity to continue research in the future.

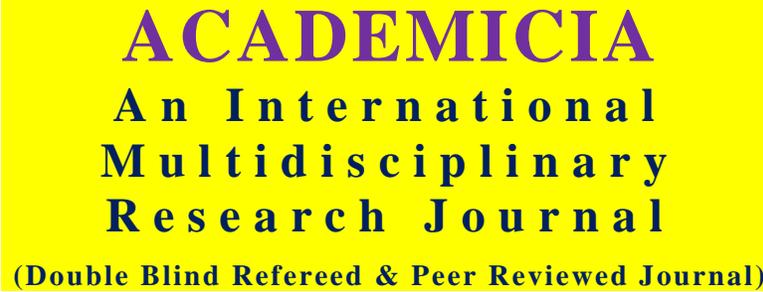

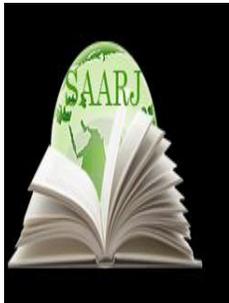

Based on the data obtained, it was concluded that the domestic drug "Nodinorm" can be recommended in the complex treatment of patients with DFKM.

DIDACTIC PRINCIPLES OF GUIDING THEORETICAL KNOWLEDGE FROM STEAM SCIENCE INTO PRACTICE

Shoxrux Razzoqovich Turdiyev*

*PhD, Associate Professor,
Karshi Engineering Economics Institute,
UZBEKISTAN

ABSTRACT

In this article, the didactic principles that help to carry out the practical orientation of theoretical acquired knowledge in the future engineers of the higher educational institution in the process of organizing training on the basis of the STEAM approach are presented, in which one by one touched on the principles of STEAM education.

KEYWORDS: *STEAM Approach, Aspect, Exact Sciences, Engineering, Principles Of Education, Didactic Principles, Fundamental, Methodological Direction, Integration, Active Techniques, Practice.*

INTRODUCTION

We can see that engineering is being taught from developed foreign countries based on the STEAM approach in the education process in America, Germany, Japan, China. The results of the analysis we will try to supplement these aspects with our own approach, taking into account the fact that the implementation of the fall into practice of theoretical knowledge, the reconciliation of new modern techniques and technologies, as well as the formation of an atmosphere of discovery – a meaningful, methodological and spiritual motivational aspect.

LITERATURE REVIEW

When you say the content of Steam: make corrections to the Necessary Steam Science Program, which is compatible with engineers; make adjustments to the practice of practical standards of the educational material; Allocation of the educational material of STEAM hardware on these specialization; contains occupational, theoretical and practical ranks.

Steam's methodological aspect is understood by the use of various methods, methods and forms of education aimed at strengthening the practical knowledge at the time of obtaining theoretical knowledge.

Scientific novelty of the article

As a result of Steam's spiritual motivational aspect, the test of motivation of motivational aspects by combining the natural knowledge of motivated by practicing motivation, the students are understood in the development of their professional activity that students must fully win their professional activity. [1,2,3].

Our opinion is an approach to the Steam approach to each other, while simultaneous approach to the practical knowledge for engineering knowledge is the One who provides practical knowledge to the practical knowledge, the theoretical knowledge derived from the subjects of Steam approach. The specialization and education of the engineering is the basis of the system and structure of the system. Other principles in the education of the university are combined around this principle and organizes integrity, and it provides the main goal of teaching steam subjects - ensuring the formation of training in the professional activities of the future engineer. We believe that the observance of a number of didactic principles, we believe that Steam Science is one of the conditions for practices of education.

Analysis and results

Didactic principles, which helps to implement theoretical diversity of theoretical knowledge in future engineers of the university, made up of:

1. Science of the content of the educational content;
2. Methodological performance of education;
3. Strengthening the fundamentality of Steam Science.
4. Coordination of methodical systems that connects the theory of education, taking into account the psychological features of students:
the logic and mental acceptance of the structure of the content of the context;
Principle of simple to complex;
the connection of clarity with abstraction;
pushing the method of induction in stating the learning material;
5. Activities in education (describing the level of participation of students in educational activities);
6. Independence describes the participation of students in the educational process;
7. Carrying out Interbank Medical Connection;

We will focus on one about the principles of the Steam Education mentioned above.

1. One of the main principles of higher education is scientific institution. Scientific, the full content of various departments of Steam in the university corresponds to the fundamental science departments, ie: the logical firmness of Steam Sciences of content, integration And others are

understood by concepts. All basic concepts should be proved based on the clear definition and practices, based on the rules of judiciary and logic.

2. The Principia for the educational direction of education must be combined with the Principia of Scientific. When called Steam Science Methodology, the doctrine of steam is the doctrine of science methods or their historical development of research techniques. Methodological direction of education is a means of modeling the connection between the material world by modeling the relevant process and objects with a material world through the material engineers It plans to form a view as.

3. Steam Sciences strengthen fundamentality in education. In higher education, these subjects should not be theoretical significance, but no engineering theory cannot be developed without fundamental knowledge and research. "When calling the fundamental educational process, we mean systematic approach to the analysis of the subject technology to the professional pedagogical issue of the subject" [4] [4]. It is the result of a fundamental knowledge that is deeply, well-based task and their ability to use them during practical activities. Adoption of some departments of Steam subjects in the educational process:

- to create a clear idea of the concepts of the basic specific sciences and the meaning of their logical structure and the meaning of practical structure;

- In its specialty, it is achieved through the formation of a skills of steam subjects.

4. Focusing on the practice of teaching methods of teaching, taking into account the spiritual unique features of students, is also one of the important conditions for practices. We believe that one of this is the logical structure of science and condition for harmony to the teaching system of the teaching material.

Only logical conclusions and comments are not easily mastered by students, especially students, and are not ready for axious method. To do this, it is necessary to teach students to provide or reject the assumptions of independent methods and techniques, to formally proof, or reject the assumptions, and in short to the theories of disciplines and engineering depending on the logical practice. Relying on the spiritual aspect of the knowledge of knowledge, then, it is necessary to adhere to the structure of Steam Science Theories. Steam Sciences It is advisable to reduce the topics not dependent on the practice in the program. It is also necessary to submit the departments later. The procedure for submitting various departments of Steam is also related to the principle of complexity from simplicity.

In the field of education, it is necessary to monitor the connection between clarity with absurdly absurdity with accuracy. "At the beginning of the knowledge process, it is necessary to focus less, always maintains applications in the exhibition and focus on determining the students' ability to understand them." [5] [5] Introduction of new concepts should be motivated and less attention should be paid less attention, as this can lead to limiting them.

An important condition for the implementation of the knowledge of students' knowledge of Steam is an important condition - describing activists and independent thinking of their participation in the educational process.

5. When the activity in education is active, the active teaching methods, the problem, the development of the development, the use of a person-oriented education, stratified teaching.

Here is a goal set for the development of students' creative activity, the development of professionalism, research aspirations. In education, the implementation of differentiation and the implementation of individual-oriented education leads to the organization of successful knowledge for students with primary knowledge.

6. Proper planning of independent learning of students is one of the important teachers of the teacher. One of the factors describing the efficiency of modern education is the application of information technology in education. The use of e-manuals and textbooks in the educational process is an important tool in education, which means active and independent education, provides an individual and stratified approach.

7. We also consider the implementation of interdisciplinary interdependence as we should be the condition for us to direct the theoretical knowledge. Teachers of specific disciplines should be imagined that the knowledge gained in mathematics, physics and chemistry should apply to general and specialty subjects, and which specialty should rely on which stealth approach.

We tried to make these steam subjects to each other to each other interdisciplinary binding on a planear model and called Steam Planetar Models.

In the Steam Playetar model, we can see interdisciplinary links (art), Art (art) and Mathematics in Figure 1 in Figure 1 Mathematics, The art, technology and natural sciences are described. Any engineering activity is based on fundamental knowledge and is based on fundamental knowledge.

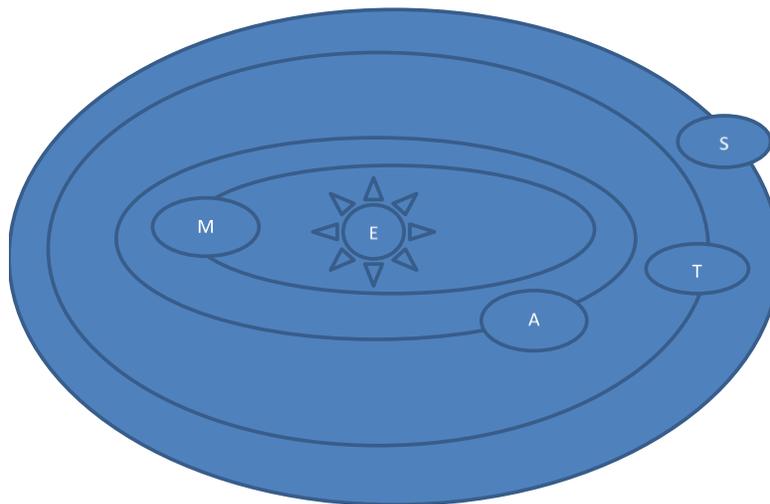

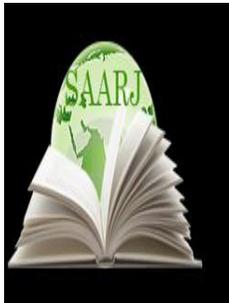

Figure 1. 1.Science (Natural Sciences), 2.Technology (Technology), 2.Et (Art) 4.Egdeau (Mathematics).

CONCLUSION

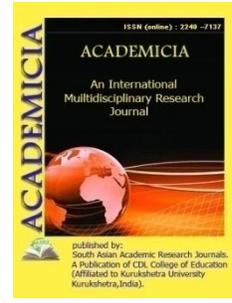

In place of the conclusion, we must say that the didactic principles that help engineers to carry out the practical orientation of theoretical acquired knowledge through STEAM Science in preparatory higher education organizations, as well as the conditions of the above-mentioned STEAM training principles, allow to apply them in the educational process, to more effectively organize the educational process.

ABSTRACT

This article discusses the need, importance and stages of implementing a smart farm in our country. This article gives information about government support to smart farms (meat and dairy processing farms, livestock processing businesses). In this case, it is recommended to determine the value of financial incentives for entities involved in the system of financial support of the livestock sector. In addition, modern technologies that can be used in the "Smart Farm" and organizational and economic stages of the organization of a Smart Farm are analyzed in the paper.

KEYWORDS: *Livestock, Smart Farm, Digital Technologies, Internet, Modern Technologies.*

INTRODUCTION

Experts predict that by 2050, the world's population would have surpassed 9.6 billion people, possibly requiring 70% more food than is currently needed for food protection. However, due to the degradation of the ecosystem, the increase in energy carriers, and the danger of decreasing soil productivity of agricultural lands, there are significant obstacles to food production (due to misuse and water scarcity).

Today, as a consequence of bio and non-technology research and development, Internet, GPS, and VRT systems, agricultural organization on the basis of new methods, modern tools, and innovative developments, in short, the sustainable development of the agricultural sector in a high-tech intelligent agricultural system security measures are being implemented.

Smart agriculture is a concept that foresees agricultural producers using innovative digital technologies to organize cost-effective activities, increase profitability, minimize the impact of influencing factors, and use resources and time wisely¹.

Smart agriculture encompasses smart farming, smart field, smart garden, smart greenhouse, smart farm (animal husbandry), smart territory, and smart land use, all of which can function independently while also complementing each other. Through smart agriculture, agricultural producers will be able to accurately select the time and amount of resource use through monitoring and evaluation of changes in crop area. Farmers in the livestock sector can better control the biological condition, needs, diet, and physiological condition of specific livestock with the help of intelligent animal husbandry technology, resulting in high productivity.

According to FAO experts, the extensive period of agricultural development in all countries around the world has passed, and the transition to a "smart" period of development is now in demand. As the world's population grows, so does the demand for modern agricultural technologies².

According to Future Market Insights' calculations, the global market value for the introduction of smart agriculture in the world in 2016 was estimated to be around 13 billion US dollars, and by 2026, this figure is expected to reach 40 billion US dollars. The average growth rate of the industry is expected to be about 11.2 percent in the coming years³.

However, this is implemented mainly in developed countries such as the United States, the European Union, Israel and China. The agricultural economy in a large portion of the least developed and developing countries is focused on traditional technologies, and the implementation of new technologies is relatively slow.

Despite the availability of material, technological, and intellectual resources for the long-term growth of the livestock sector in our country, the factors of extensive development are becoming more important. This has led to high resource consumption, low labor productivity and low livestock productivity. Unsatisfactory economic efficiency in the sector, a lack of financial resources, and non-compliance with the construction of appropriate infrastructure all stymie the mobilization of livestock farms' economic potential and the adoption of modern technologies.

In this regard, President of the Republic of Uzbekistan Sh. Mirziyoyev emphasized the importance of "developing a national concept of digital economy," which provides for the use of digital technology to modernize all sectors of the economy⁴.

Decree of the President of the Republic of Uzbekistan dated November 29, 2017 PD-5264 "On the establishment of the Ministry of Innovative Development of the Republic of Uzbekistan" to make proposals on the introduction of modern forms of agricultural production based on the concept of "smart agriculture", which will allow the rational use of land, water and other natural resources in the country, maximize automation of agricultural production in the agricultural sector, significantly increase productivity and improve financial performance, as well as the task

of promoting the introduction of innovative technologies that will ensure food security of the country⁵.

At the same time, the Ministry of Agriculture and other related agencies and ministries are subject to the President of the Republic of Uzbekistan's Decree⁶ PD-5708 "On steps to strengthen the structure of public administration in agriculture" dated April 17, 2019. The mission is to make proposals for projects and funding sources in the field of agricultural digitalization, based on the principle of "smart agriculture."

The need to create a smart farm in the country on the basis of meat and dairy farms can be explained as follows, taking into account the implementation of the above regulations and other conditions. Including:

- low labor productivity due to high manual labor in the livestock sector;
- the ineffectiveness of the prospect of increasing the economic efficiency of production based on traditional methods of management;
- the growing need for new resource-saving advanced technology to be introduced and improved in livestock farms;
- insufficient assessment of the impact of various environmental, bio-physiological, and organizational factors on technological processes that affect production efficiency;
- inadequate ability to ensure that conventional methods are compatible with the quality of dairy and meat products, as well as the quality of animal feed rations;
- the possibility of early detection of animal diseases with the help of modern remote-controlled technological equipment and their use is becoming a necessity;
- the need for daily automated management of livestock storage conditions (possibility of automatic monitoring of the necessary microclimate in storage facilities) in order to maximize the efficient use of livestock genetic potential;
- the implementation of new digital technology in the livestock sector necessitates the automated management of the livestock sector's feed base, the formation of a modern "Electro Pastux" system for driving livestock, and the need to use it to minimize livestock labor costs.

The possibility of introducing digital technologies in the livestock sector is becoming a necessity in connection with the invention of the following technological systems (Figure 1).

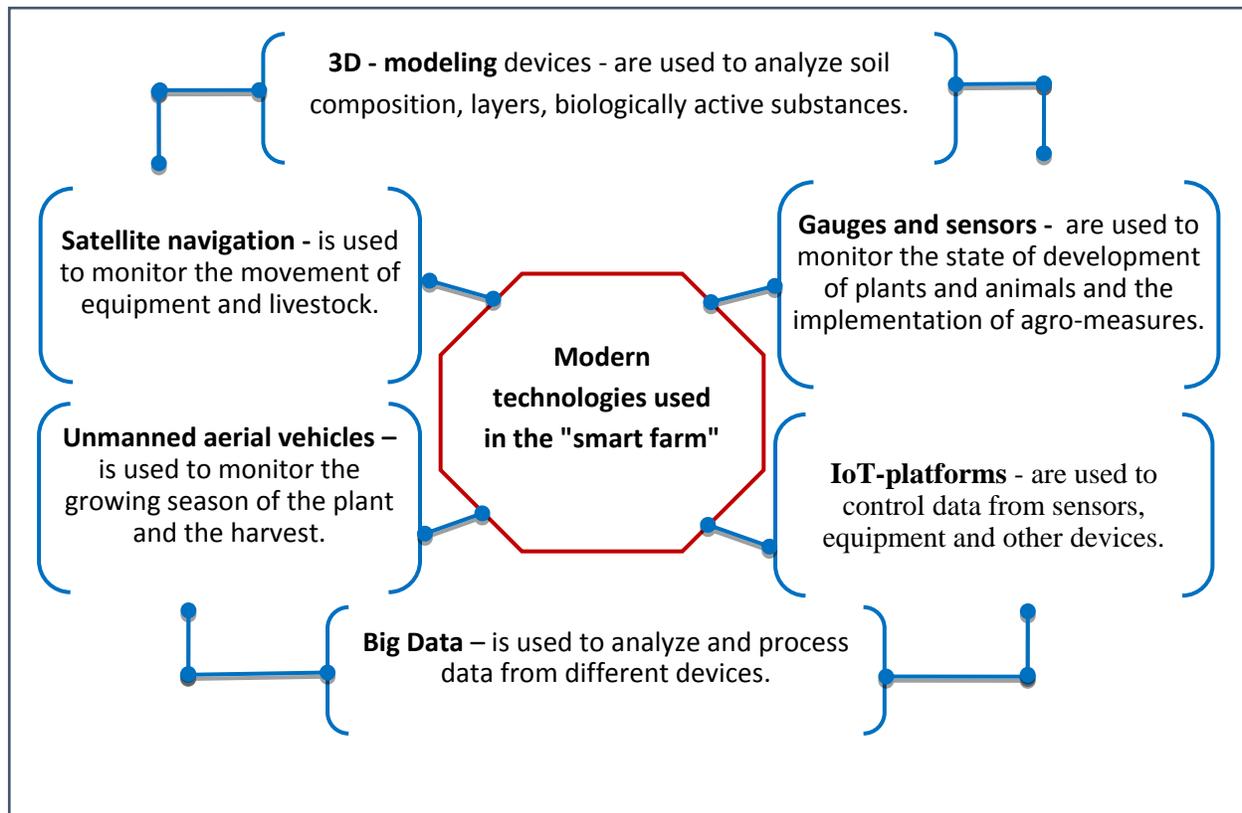

Figure 1. Modern technologies that can be used in the "smart farm"⁷

- 3D-modeling devices - these are used in the analysis and control of soil composition, layers, biologically active substances of arable lands where fodder is grown for livestock;
- satellite navigation - used in the cultivation of feed, machinery for transporting feed and livestock, dairy and meat products, and monitoring the movement of livestock on pastures;
- unmanned aerial vehicles - used for remote monitoring of vegetation, yield and harvesting of fodder crops;
- gauges and sensors - used to monitor the development of plants and animals, physiological and genetic changes, the composition and quality of dairy and meat products, the composition of feed mixtures and the implementation of agricultural measures;
- IoT-platforms - used to control data from digital sensors, equipment and other devices;
- Big Data - used to analyze data from various remote devices, develop short (seasonal), medium and long-term forecasts for business development, make management decisions and monitor.

Given the above, it is necessary to encourage the establishment of smart farms in the country. At the same time, smart livestock farms are the subjects of automated livestock production, most of which require a small amount of human intervention (operator, breeder, veterinarian, etc.)⁷.

Such a farm will rely on digital technology (artificial intelligence, Internet networks, data, and related standards) to ensure production cost-effectiveness, customer activity, and the product's negative impact on human health, among other economic indicators.

As part of the "smart farm" - a system of sensors to identify the physiological state of livestock, which allows you to monitor the number of cattle and automate the process of electronic assessment. Furthermore, the use of sensors and software for assessing and treating livestock's physiological conditions through movement and nutrition allows for automated monitoring of milk quality (protein, fat, dry matter, and so on) in milking equipment.

The automated management of feed planning, herd breeding and veterinary services, milking, animal feeding, microclimate management in barns, and boxes within the automated management framework of "Smart Farm" provides automated workplaces of leading specialists (veterinarians, zootechnicians, and engineers) is coordinated in order to control production on the basis of a digital system.

According to research, feeds prepared using automated biocatalytic technology for enzymatic feed preparation increase feed digestibility by 1.5-2 times as compared to conventional technology, and automated milking modules that track livestock condition increase the incidence of mastitis in cows by 25-30%. Increase the time of economic use of cows up to 4-5 lactation periods by reducing and separating irregular milk in the stream.

However, taking into account the country's agricultural sector's growth patterns and industrial and technological capabilities, the following factors restrict the establishment of smart farms:

Organizational and legal constraints: - the fact that small and large farms produce a substantial portion of meat and milk restricts the need for smart technology and real consumer demand. Individual elements of digital technology, on the other hand, can be used on farms.

- lack of rules for the use of smart technologies in animal husbandry and legal requirements for its harmonization with the legislation;
- the mechanism of operation of the "smart farm" is mainly connected to the Internet, the speed of the Internet in areas where livestock farms are located in the conditions of remote radio communication is lower than international standards;
- the complexity and narrow scope of regulatory documents related to the use of unmanned aerial vehicles and geographic information systems (allowed only for certain areas);
- lack of a system of training specialists for modern areas such as digital economy, smart agriculture, digital technologies in agriculture, insufficient system of their teaching methods and internships;
- a lack of trained personnel operation in the agricultural sector, particularly in the livestock sector (working conditions, distance, wages), because the range of local and foreign HEIs training specialists in IT technologies is not focused on narrow and subsystem orders;
- lack of organizational framework for quality higher education in accordance with the basic approach to the "smart farm", i.e., STEM (Science, Technology, Engineering, Mathematics);

- the necessary equipment and technology for a "smart farm" are entirely reliant on imports, and the necessary infrastructure (scientific institutions, factories, and IT parks) to localize them does not exist.
- the lack of financial resources for the import of devices with high technical and technological capabilities in most livestock farms is a socio-economic limiting factor.
- "Smart farms" necessitate the simultaneous efforts of many experts. The inability of small farms to have adequate working conditions and pay for highly skilled professionals such as zootechnicians, veterinarians, programmers, analysts, and engineers;
- lack of mechanisms for economic incentives for activities related to the creation, production and use of high-performance equipment and technologies for livestock farms;
- the involvement, support, and cooperation of social institutions in the organization and management of the "smart farm" are insufficient, due to a lack of culture associated with the use of smart technologies and the knowledge obtained via them.

Given the foregoing, one of the most pressing tasks facing the livestock sector today is to create "smart farms," develop and enforce financial and economic incentives, and ensure the development of world-class quality meat and milk.

The activities of smart farms, it was noted, necessitate the training of specialists in a variety of fields. These professionals are currently trained in various departmental systems and are not organized. There is a need to organize the activities of their planning and study in this sense.

A smart farm will completely manifest itself as part of the modernization of the livestock network if all systems operate efficiently at the same time. A breakdown of the system would result from a violation of the mixed feed supply needed for a complete ration, or a failure of the power supply or skilled personnel supply to operate the technical equipment that regulates the milk content.

Considering the above, the following logical sequence of steps should be followed when establishing a "smart farm" (Figure 2).

First of all, the stages of establishing a "smart farm" should begin with training and retraining. The reason is that the "smart farm" can import technical and technological equipment, but it will also have to import the appropriate service system. Issues of retraining (internships abroad) on the farm can negatively affect the competitiveness of the product.

And for that, universities dedicated to the training and retraining of trained specialists for the smart farm must open the required areas, open them, and equip them with professional and technological equipment. Simultaneously, particular attention must be paid to the provision of high-quality higher education in line with the new STEM (Science, Technology, Engineering, and Mathematics) approach. Furthermore, frameworks for in-depth analysis of world experience through distance learning and experience sharing in an online system must be created.

The import of technical and technological innovations, as well as attention to their localization, is needed in the second stage. The need for this stage can be explained by the risk of "enclave entrepreneurship" emerging, as well as the emergence of scientific and technological dependency as a result of the importation of equipment and technology needed for a "smart farm."

It is expedient to finance research in this area, encourage authors, expand government grants, encourage the commercialization of research results at "zero value".

In the third stage, all the links required to set up a smart farm need to be organizationally and institutionally adapted. It is advisable to pay attention to the following aspects:

- strict regulation of land-allocation and land-use policies that ensure a complete ration of livestock on a smart farm;
- development and implementation of a system for ensuring continuous resource supply (gas, electricity, water, fuels and lubricants materials, and so on);
- simplification of measures related to the introduction and connection to the high-speed Internet system;
- creating conditions for the security of the database and its free use on the farm;
- - establishing an operational and legal structure for the use of unmanned aerial vehicles (UAVs) and remote communications.

Finally, by promoting the establishment of smart farms, the creation of advocacy support, and the implementation of organizational support systems, it is beneficial to increase interest in the digital management system of farms.

The economic incentives mentioned below should be widely used to encourage the establishment of smart farms. Incentives through the tax system, in particular, are a very powerful method of production.

Since 2008, meat and milk processing businesses have been treated as a single taxpayer, and a value added tax will be implemented on January 1, 2019. We believe that allocating a portion of the value added tax charged by meat and milk processing businesses as one of the center's funding sources is a good idea.

In this regard, the state should promote the activities of organizations that support smart farms (meat and dairy processing farms, livestock processing businesses).

In this case, it is recommended to determine the value of financial incentives (VFI) for entities involved in the system of financial support of the livestock sector as follows.

$$VFI = \frac{(VDP - SOB) * VAT * SI}{100}$$

Here:

VFI - the value of financial incentives for entities involved in support, million soums.

VDP - value of processed meat and dairy products, (million soums);

SOB - value of meat and dairy products purchased from farms, million soums;

VAT - the rate of the value added tax established in the republic, (%);

SI - share of farm incentives, (%).

The economic interests of each business group concerned should be considered when assessing the share of incentives (SI). It is recommended that funds be allocated in the following ratio.

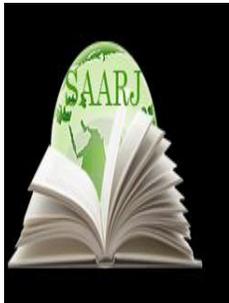

- 50% to the Smart Farm Support Innovation Center;
- 35% of farms that have introduced smart devices;
- processing enterprise can be distributed in the amount of 15 percent.

As a result of this approach, a source of funding for research and development, a financial support system for farms that have implemented smart devices, and incentives for meat and dairy processing companies to buy directly from these farms have all been developed.

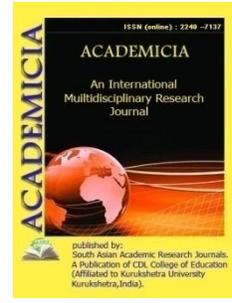

In short, the involvement of the private sector in science through the establishment and promotion of smart farms, as a result of material, technical and financial incentives through the increase of the final result of projects, the level of implementation and its commercialization for the private entrepreneur, economic (profit, market segment, capitalization) and for the state, social (food supply, science development and employment) benefits might be achieved.

METHODS OF USING INFORMATION ABOUT THE ART OF MUSIC IN THE TEACHING OF HISTORY OF UZBEKISTAN TO STUDENTS OF 6-7 GRADES OF SECONDARY SCHOOLS

Zilola Azamovna Zakirova*

*Teacher,
Faculty of National clothing and arts, music education,
Termez State University, UZBEKISTAN

ABSTRACT

This paper discusses the information used as additional materials in explaining the reality of music to students in the teaching of history lessons in grades 6-7 of general secondary schools and the didactic aspects of educating students in the aesthetic spirit on the basis of this information.

KEYWORDS: *Music, Instrument, Musician, Melody, Ensemble, Method, Teaching, Lesson, Genre, Heritage.*

INTRODUCTION

Today, the prestige of the science of history in educating the younger generation as a perfect person is growing significantly. The science of history not only forms in students the skills and abilities about our past, but also has a special place in the formation of the younger generation as a patriotic, hardworking, spiritually mature person. Especially in today's globalization, the information conveyed to students through history textbooks is also important in protecting the minds of young people from mass cultural threats.

History not only informs students about the social, political and economic life of our country, but also plays an important role in raising their cultural level. Today, every nation and state wants to be proud of how much it has contributed to human civilization in its past. Furthermore, inculcating in the younger generation the important aspects of human civilization enriched by the spiritual riches of their ancestors not only instills in them a sense of national pride, but is also an important factor in educating the younger generation in the moral and aesthetic spirit. We are convinced once again that the science of history has a special place in the spiritual education of

young people from this point of view. In the criteria of the formation of human civilization, the traditions of urbanization, architecture, religion, art and statehood play an important role.

In this article, we will try to explain the methods and recommendations for the use of music-related resources and materials in explaining topics related to cultural life in the process of teaching history lessons to secondary school students.

We know that music is one of the earliest discoveries of mankind in primitive times. For example, primitive people sent a "signal" to their relatives when something dangerous approached them, or when they called each other somewhere, hitting something and making a noise. The teacher also used certain attributes to explain to the students that in the performance of archaic rituals related to the pursuit of evil spirits, the sound of knocking on something and dancing in front of the fire in the same way as that primitive music. For example, if you can vividly demonstrate the unique sounding situations by hitting a stone, a wood, a wood, this process will be convincingly preserved in the minds of students. As humanity progresses, so do its tools of labor, its clothing, its means of subsistence. This situation can be justified by a lot of information by teaching history to 6th graders in schools [1]. In this class, students can be reminded that our ancestors have a very ancient history in the art of music by showing the statues of women playing the oud in the Ayrptom frieze and the drum statue in explaining the culture of Bactria in ancient times. In addition, it is worth noting that the oud and drum instruments were not imported to our country, but these musical instruments were the invention of our ancestors [2]. Explaining Amir Temur's centralized "founder of the state" in the history of Uzbekistan to 7th grade students, Amir Temur was informed by his priest Sayyid Baraka about the presentation of the state flag and drum in the village of Biyo, near Termez. It is possible to note that the drum is not only a musical instrument but also one of the attributes recognized as one of the state symbols, and this information can also be explained by linking this information to the statue of the instrumentalists depicted in the 6th grade Ayrptom frieze [3]. Also, when explaining the theme of cultural life in Movoraunnahr and Khorasan in the IX-XIII centuries to 7th grade students, it should be noted that during this period, the art of music in our country was very developed, holidays, weddings, folk festivals and other ceremonies. During this period, musicians made extensive use of oud, tanbur, kobiz, rubab, nay, trumpet, trumpet, neighbor, law, and many other stringed, percussion, and wind instruments. , students' interest in the subject will not only increase, but they will also be eager to play these words. While covering this topic, the teacher has to give information about "Shoshmaqom" formed on the basis of folk melodies. Then, by explaining to students that "Shoshmaqom" is a classic song of the Uzbek and Tajik peoples, it should be noted that the culture, history and traditions of these two peoples are common. He also noted that Shoshmaqom melodies are not the work of one or two musicians, but that this classical melody is a product of folk art, and that this invaluable heritage has come down to us through the traditions of teaching and learning.

MATERIALS AND METHODS

The fact that the great composer of the XX century, academician Yunus Rajabi wrote the note "Shosh maqom" also enriches the students' perception of "Shosh maqom. Also about the students' "Shosh maqom" knowledge and the melodies that formed the basis of Shosh maqom in further expanding their skills were "Rost", "Khusravoniy", "Boda", "Ushak", "Zerafkanda", "Buzruk", "Sipohon", "Navo", "Basta", "Tarona" transition plays an important role [4].

It should be noted that the art of music developed along with the science of poetry and musicology. In addition, it is useful to explain to students that Abu Nasr al-Farabi, known as the "second teacher", wrote a separate pamphlet on music called "The Book of Music" [5]. When informing 7th grade students about the history of our national culture, especially music, it is worth noting that along with "Shosh maqom" there are also Khorezm maqoms, Fergana, Bukhara and Khorezmian ways of performing maqom. In particular, the significant development of the art of maqom during the years of independence, the organization of the festival of maqom in 2018 in Samarkand on the initiative of the President of the Republic of Uzbekistan. It is also possible to enrich the students' perception of this art and increase their interest in the status and its performance [6]. The first renaissance of the Eastern Renaissance in the IX-XII centuries and the second renaissance in the XIV-XIV centuries, the third renaissance put forward by the President of the Republic of Uzbekistan Sh. Mirziyoyev. It is somewhat easier to convey the content and essence to the minds of the students. During the course, it is worth noting that in the XIV-XV centuries in the region were created new melodies and songs, musical instruments and rare works on music theory, many skilled musicians, musicians and hafiz. It is necessary to explain to the students the names of Abduqadir Nayi, Kulmuhammad Sheikh, Hasan Udi, Shahquli Gijjaki, Qasim Robbani, who lived and worked in this period [7]. It is useful to remind students that during this period, along with talented musicians, such thinkers and poets as Ulugbek, Navoi, Jami, Binoi were engaged in the art of music and contributed to its development to a certain extent. The sultan of Movoraunnahr, the great astronomer Mirzo Ulugbek wrote five pamphlets on music, as well as composed melodies "Bulujiy", "Shodiyona", "Akhloqiy", "Tabriziy", "Usuli ravon" and "Usuli otlig". expands.

RESULTS AND DISCUSSION

It should be noted that the nickname of Alisher Navoi, a great representative of classical Uzbek literature, who played an important role in the cultural life of the XIV-XV centuries, is associated with the music "Navo" or "Kuy". It should be noted that Alisher Navoi himself was a skilled musician, and the song "Isfahani" was composed by Alisher Navoi. It should be noted that the great composers of this period, Abdurahmon Jami and Kamoliddin Binoi, created a work on the theory of music, which reached a new stage of development in the organic connection with music and poetry. It should also be noted that the results of the work done during the years of independence to find, study and promote the rich spiritual heritage of our ancestors in the wider public and international arena, in particular, to study and pass on the rich musical heritage of our ancestors. , 2002 Boysun Spring Open Folklore Festival but, the fact that for some reason the festival was suspended but re-organized in 2019 has led to the revival of folklore and folk melodies, songs, lapars, sayings and poems in our country. It is also possible to dwell on the development of the art of baxshi in our country. It provides information about the activities, repertoire of epic schools such as Sherabad, Shakhrisabz, Kamashi, Bulungur, Narpay, Khorezm, the life and work of bakhshi poets, connects them to the Internet and releases video and audio recordings of bakhshi poets. it can be argued that the creator also has a unique voice. At the same time, the students will be able to listen to the melodies "Horse driving", "Kelin oy", "Ghazaloy", "Balkhuvon" and other drums, as well as charnkovuz melodies. It is much easier to embody the real reality in the minds of students by connecting history with the times. Therefore, in 1999 the 1000th anniversary of the epic "Alpomish" was celebrated, in 2000 the honorary title of "People's Bakhshi of Uzbekistan" was established. It should be noted that in 2021, the II

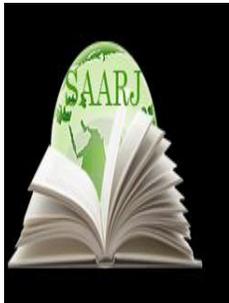

International Festival of Bakhchisarai was held in Nukus, which can further increase the interest of students in this art [8]. It should also be noted that a school of baxshichi was established in Termez, a list of those interested in this art was formed, and he studied at the school of baxshichi.

CONCLUSIONS

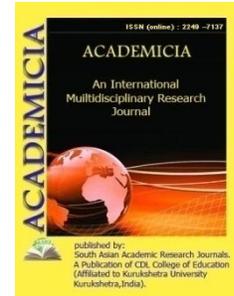

In conclusion, it is worth noting that the effectiveness of the lessons will be further enhanced by the use of crossword puzzles, cases, brainstorming, demonstrations, fish skeletons, pyramids in the history lessons for students of grades 6-7.

ABSTRACT

In the article, the further development of the educational system, the coordination of educational processes on the basis of an innovative approach, the importance of the activity of student learning and cognition, reading, the specific stage of preparation for labor activity, the calculation of the main activity of students, the development of educational and cognitive activity in students is manifested as a complex psychological phenomenon, to be socially and psychologically prepared for them the emergence of a wide range of opportunities for effective educational and cognitive activity, the activation of educational and cognitive activities of students in the organization of the educational process is carried out under the influence of a number of biological and psychophysiological factors, while parents and teachers should pay attention to the fact that there are, the essence of biological and psychophysiological factors affecting the activity of educational-cognitive activity, as well as the need to acquire modern professional knowledge, the content and important aspects of the organization of independent education, the activation of educational-cognitive activity of students in the educational system today are interpreted.

KEYWORDS: Education, Student, Process, Activity, Teacher, Influence, Necessity, Interest, Activity, Motivation, Quality, Demand, Result, Content, Approach, Essence, Formation.

INTRODUCTION

With new innovative ideas, proposals and initiatives for the development of the educational system, the formation of the necessary skills and knowledge for them to be holders of modern professions, the creation of a system of automation and comprehensive analysis of the management of education when using modern information and communication technologies, the issues of further development of electronic resources and distance education have been. In particular, the development of the methodological system and conditions for the development of educational-cognitive activity and the level of professional training of students of professional education directions plays an important role. Legal-normative and educational-didactic provision of training of pedagogical personnel in accordance with the world requirements is being improved in the higher education system. The development of effective curricula based on innovative approaches to vocational training and the use of new effective didactic opportunities of individual-oriented education in this system will serve as an important factor in achieving educational effectiveness. Today, great attention is paid to the improvement of vocational training of students of vocational education on the basis of technological development of education, the use of innovative approaches, the development of innovative models of competitive, competence training in accordance with the requirements of the labor market. The issue of the development of educational and cognitive activities of students of the directions of vocational education is of great importance in the conditions of the credit-module system of higher education. A number of scientific researches are carried out to improve the evaluation criteria of the level of professional training of graduates of the higher educational institution, improve the electronic system of clarifying the results of educational and cognitive activities. In particular, the development of professional knowledge and skills necessary for the future professional activity of students of vocational education on the basis of innovative, creative potential, acquired pedagogical and psychological knowledge is one of the priority issues. The development of professional training of students by bringing advanced foreign experience into the process of higher education, active acquisition of professional knowledge in the process of training and independent education are considered as urgent tasks to achieve with the help of innovative technologies and methods.

Main part

Further development of the educational system, coordination of educational processes on the basis of innovative approach, activation of educational-cognitive activities of students plays an important role. Study is a specific stage of preparation for labor activity and is the main activity of students. It is aimed at acquiring knowledge, as a result of which the necessary skills and skills are acquired, and the students understand the meaning and purpose of education.

Educational activity is a complex process, carried out in the didactic process from the stage of motivation, that is, after the initiation of internal action on knowledge. Acquisition of knowledge on the basis of stages of knowledge, understanding, analysis and generalization of the content of education indicates the effectiveness of educational-cognitive activity [1]. Exactly the effectiveness of education depends on the correct design of the didactic process by the educator, on the precise setting of the educational goals and the correct Organization of didactic operations in achieving them. In this situation, the correct selection of educational methods and the determination of the types of Education based on them, the harmonization of didactic goals with social goals, the development of educational activities.

In the didactic process, didactic games, problematic education, technologies of cooperation education, modeling education play a key role in the organization of effective educational and cognitive activities. In general, depending on the indicators of the results of achieving the goal of educational-cognitive activity, two groups are divided into:

- 1) effective teaching-learning activities;
- 2) inefficient learning can be divided into cognitive activities.

Effective teaching and cognition activities if we interpret the peculiarities of didactic functions, then in the didactic process on the basis of problematic educational technology, the creative assimilation, interest and need for knowledge of the content of education by students increases. Consequently, one of the main tasks of the new module of education is the formation of the qualification of the student to acquire knowledge on the eve of his labor.

The organization of educational-cognitive activities on the basis of didactic play, problematic, controversial, collaborative technologies, the content of the characteristics of students' cognitive activities, interest in science, the expansion of knowledge. In the educational-cognitive activity, the basis of the content of Education provides the basis for discussion, orientation to find the main ideas and solutions, the formation of creative, independent thinking. Free-thinking classes in educational and cognitive activities formulate the characteristics of students' scientific outlook, need for knowledge, mastering the content of independent education.

The main role in the organization of educational and cognitive activities is played by the correct definition of the toxic range of goals, the correct selection of didactic goals based on the general objectives of the project. So, from the psychological point of view of effective educational and cognitive activities, we can interpret as follows:

- 1) planning of educational and cognitive activities;
- 2) self-control, extensive knowledge, systematization in historical methods;
- 3) master the methods of self-management and find a new one;
- 4) to master the methods of self-control of attention, which governs personal interest.

Educational-cognitive activity is associated with cognition and perception. If these processes do not participate, educational activities may not be manifested.

The organization of didactic process design on an algorithmic basis, that is, the implementation of actual operations, which are carried out in stages in the mastering of educational content by students, is the basis of educational and cognitive activity. Module Program of the educational process in this direction increases the effectiveness of educational-cognitive activity, divide the elements of educational content educational-cognitive activity on the basis of the module lesson and set the objectives of the components associated with it. The effectiveness of educational and cognitive activities, cognitive characteristics in the student's personality are the following criteria.

- 1) active acceptance of the study material;
- 2) to master the methods of mastering the instructional material;
- 3) assignment and assignment of tasks in the mastering of educational content;

4) self-control and evaluation.

The formation of these criteria in the student personality is one of the main issues of educational and cognitive activity. So, based on the final results of the didactic process, we can conclude that any educational process will not be an educational activity either [2]. Consequently, the internal mental and external physical actions that a person performs on the basis of an perceived goal are called activities.

Raising the didactic process to the level of educational and cognitive activity is the main issue of innovative educational technologies. Namely, innovative educational technology is the basis for the organization of effective educational and cognitive activities. In the organization of each didactic process requires careful preparation from the educator, design on the basis of the established pedagogical system and implementation of actual operations on the basis of selected educational technologies, tools and forms. This creates the basis for effective organization of educational activities. The organization of effective educational activities is of social importance. In his contemporaries, the student's worldview is composed, the acquired knowledge, skills, qualifications are transformed into the spirituality of the individual, personality is formed, attitude to society, social system, environmental existence arises, understands the essence of education, respect for it, features of respect are found. Consequently, we see the educational role of education as a priority, however, the content of the sense of respect for education in students is still neglected. It is no secret that as a result of this, negative trends have arisen, such as a careless attitude to the educational process, reading to the name, not understanding the essence of education. Of course, the occurrence of such a negative direction is bilateral, that is, the passive attitude of the student to the educational process, as well as the didactic process by the teacher, is not designed on the basis of pedagogical requirements. Such a professional approach to the didactic process leads to ineffective educational-cognitive activity. Neglect of the results of the educational process creates a ground for the formation of a mood in which students are fed, do not appreciate time. Consequently, the control phase, which is the main component of the didactic process, that is, the realization of the assimilation of students' educational content, has an impact on the results of educational-cognitive activities. This demonstrates the effectiveness of Education, which is the basis of innovative educational technologies.

RESULTS AND DISCUSSIONS

Now the principles of teaching are known, but the law is not known. Therefore, in the direction of determining the laws of teaching and learning and mastering, first of all, the study of a person, his psychological, physiologic and other characteristics continues. The main reason for the non – assimilation of educators is the fact that their literacy (reading, writing) is bad, and the pedagogical reason for this is the lack of fast memory in them. The basis of the technology for the development of students' general educational skills is diagnostics and self-diagnostics.

The more quickly the text is read, the worse it is mastered, but the effect of 50-75% of words in the text on the meaning is less. With the speed of reading, the speed of memorization is different. Remembering is a process that takes place more slowly. In fast reading, the eye stops after both words. In this case, special exercises are performed until you can not stop until the end of the line, that is, you can see at first glance, and then walk upright in the middle of the line and see several lines at once. These are the following: let's not shake the lips, let's not read the words aloud. 250-500 words per minute, in exceptional cases, 700 and more words can be read.

The student's activity will be at more or less levels. Tiradi more than degrees actually decrease the quality of mastering, which is the excitability.

There is no direct immunity between the level of activity and mastering. Low activity, of course, low, while high activity, it can not be noted that it really provides solid knowledge.

Activity for effective reading is diverse, but it can be optimal for everyone. Motivation is of great importance for educational outcomes. Motivation is the sum of various reasons motivating a person to read or perform an action [3]. In students, such a reason is understood, so their assimilation is good. Since the students are older than the students, the motivation in them creates the right attitude towards reading. It will be known from this that the degree of memorization depends on the motivation. Also, to pass the test successfully, only memorization does not give a positive result. Reading, learning and remembering for active use of the acquired knowledge in the future is a positive motivation, and this goal itself is highly effective.

Negative motivation is a complex teaching, but the student's indifference to study negates all our efforts. Motivation factors are the reasons that motivate the student to acquire knowledge. The ability to read consists of many indicators. They change according to age. For example, children, adolescents read faster, keep in mind longer. "The knowledge learned in youth is like a pattern carved into a stone", it is not said in vain. If the motivation in the students is seriously perceived, then with increasing readiness in them, they can study very well.

The student's perception of his / her shortcomings and achievements in the educational process is a serious basis of a positive result [4]. In order to strengthen positive qualities and change their negative qualities, the student must know what is good, what is bad. It is necessary to praise his achievements, and in negative cases to reproach. In its place and the right Praise will help the student to be confident in his own strength. But if the praise is overstated, it causes negative States. Dissatisfaction also has a beneficial effect, especially on the high self-appraiser. But from regular failures the soul of the educator falls, it is necessary to take this into account.

Success in reading, the faster the good deed is stimulated, the more effective the effect [5]. The rebuke also gives the same result. As a result of delaying the rebuke, negative behavior quickly strengthens. This should be avoided. The danger of this is that the appearance of sudden negative behavior is considered to give a "positive" result. Such behavior can create negative skills in the student.

Only by praising or rebuking, it is not possible to strengthen good behavior or eliminate negative behavior. A person simply refuses a behavior that did not give a positive result to him. For example, if a student's immoral behavior is not assessed only by his peers only by laughter, and such students can not grab the attention of others by their undisciplined actions, then the desire for negative actions in them is lost.

If we open up the good qualities of the student and praise him often, then the chances of overcoming the negative qualities in him will increase. By putting a positive quality in a disciplined student in the center of attention of his classmates and group mates, the chances of turning him on the good side increase. Everyone has positive qualities, but it is often acquired negative skills that close it. That is why it is vital for every student to find out the positive aspects that existed before and to develop at the right time.

Learning to read begins with infancy. In Bunda, the interaction of parents and their relationship with children is of serious importance. The first emotional impressions leave a significant mark in the later life of a child. It can be good or bad. When preparing a child for school, parental interaction with the organization of pre-school education is necessary. The organization of preschool education provides assistance to parents in the upbringing of children. The child is brought up mainly in the family. The attitude, readiness of the child to study depends on the environment in the family. Teaching children certain games, setting their constant tasks at home, contemplating a system of age-appropriate requirements will serve to prepare them for school and determine the path to further development.

The educational requirements for a teenager, if they are accepted by the child, will give a result. Therefore, these requirements must be purposeful and have meaning for the child. Otherwise, the child will actively resist. In overcoming difficulties in reading and eliminating many repetitive mistakes, relying on a positive quality in a teenager gives a good result. The more good qualities we find and stimulate in a teenager, the faster we can eliminate the negative qualities in them.

It is necessary for a teenager to be able to share his achievements in school, that is, to be happy together with him, to help him to cope with them if it is difficult. In this situation, parents should have regular contact with the school, even if the teenager is well educated. If a teenager is happy with everything he does, it becomes customary for him to perform tasks and tasks. It is necessary not to prohibit the adolescent's questions about serious matters. This is a matter that determines his future social, biological life. Therefore, it is necessary to answer his questions clearly and satisfactorily.

It is necessary to talk with adolescents on any topic. Free communication with them increases the confidence of the teenager in you. Do not pay attention to the conversation with him under various pretexts. Because over time, your delay can convince others that the teenager has absorbed the wrong thought.

Re-reading is always more complicated than re-reading. In this situation, the following objectives are envisaged in accordance with the need:

- mastering knowledge;
- to teach some skills.

The main basis for re-reading is to make sure that it is necessary. In this it is necessary to seriously enter into the implementation of the intended goals, to believe in the correctness and necessity of the changes that caused the retraining, to have a desire and desire to learn new ones. The need for re-reading is carried out differently under different conditions. For example, studying at home, the beginning of teaching the same in another way at school to a teenager who has learned to count, will also consist in re-reading. Such a situation is a specific challenge for a teenager. Reading to a new way of work, the use of new techniques or reading to a new profession are the main forms of retraining.

The acquisition of knowledge (in education) depends not only on the characteristics of memory, but also on personal abilities, concentration of thought, purpose and diligence [6].

Goal aspiration is one of the necessary conditions, in which the average abilities acquire even more and more robust [7]. The method of cost-effective mastering is different in everyone.

It is known that memory should always be practiced, otherwise it will begin to hurt. Mental and physical abilities for reading can make a huge difference in interaction between adults of equal age. The social, family situation, education, profession, the desire to increase their professional level, lifestyle, opportunities of the person in the Bunda will be important. It is more important than biological age characteristics. Therefore, it is more correct to conditionally divide the age phases.

Each period has its own characteristic of memory, the ability to think, these periods are conditionally defined as follows:

Adolescence is from 18-20 to 25-30 years old.

The middle age is from 25-30 to 45-50 years.

The older age is from 45-50 to 65-70 years.

Old age is higher than 65-70.

2 factors of successful education: interest in learning and preparation for it are well-formed in adults compared to children [8].

In pedagogical practice, the material, objective aspect of the pedagogical process is always present with the addition of mental processes, one can not exist without the other [9]. This applies to any activity, but more relevant especially to the activities of educators, educators and educators.

The pedagogical process can not be carried out without psychological consequences [10]. The ratio of information received and developed by means of 5 intuition members, which forms knowledge in a person, is as follows::

Through the viewing member-83 %;

Through the auditory member – 11 %;

Through the smell cognition member-3,5 %;

By skin sensation-1,5 %;

Through taste knower – 1 %;

Total – 100 %.

The information received with the participation of our members of different senses will be remembered two weeks later in the following quantities:

10 percent of what we read.

20 percent of what we hear.

30 percent of what we see.

50 percent of what we see and hear.

80 percent when we talk.

90 percent when we do practice.

From this it becomes known that the ability of a person to remember depends on what methods he has mastered information and in what ways of intuition members. The most recently learned thing is forgotten sooner. So it is necessary to repeat the last learned more. This should be known, especially by young adults who are studying.

To activate the process of memorization, it is useful to read the material aloud [11]. The sound should be neither too low nor too loud. Reason: in a low voice the student can be distracted from the text, while in a loud voice he can focus on his own voice and move away from the meaning. The acoustic perception of the text in a moderately loud voice and the movement activity of the language help to remember.

So, it is necessary to read aloud, to say words moderately loud (not deliberately hard or in a low voice). Scheme (systematic) memorization will help to draw up a plan of the material read. In this it is necessary to distinguish the Basic Rules, facts. It is necessary to write the main one either in memory or in the system in which it developed itself. Very well helps to distinguish the Basic Rules in different colors. But it is necessary to distinguish the main one correctly, for this it is necessary to learn how to work correctly with the book. Then the material under study is divided into small pieces, the repetition (and not the whole section) gives a good result, saves more time, improves the quality of mastering. Step-by-step study and repetition of the read material not at once will give better results. The teaching science material should be repeated not for one day, but for several days. For example, repeating the task, consisting of 24 exercises, not on 3 day, for 12 days, will certainly give a good result.

It can be concluded that youth forgetfulness is sometimes caused by a slow (passive) fading of memory, and sometimes by an active braking due to an abundance of impressions [12]. It is necessary to control the content, volume of TV shows, which deeply excites young people. Then the imagination of young people can ensure the preservation of their spiritual strength for reading, without spending it on unnecessary things.

Any feature of the psyche requires regular exercise, only then it will be reliable enough [13]. This applies to memory, speech skills, logical thinking, concentration of attention, etc.

Special exercises for memory accumulation exercises:

- the agenda is relatively moderate (stable) - be unchangeable;
- to have a clear time to study and rest during the day;
- to teach the beginning work to the end without distractions, to ensure that the bunda teenager is not distracted by both other young people and adults;
- control over the performance of household tasks;
- strengthening any achievement with timely stimulation;
- more complicated lessons in the morning, the passage of teenage fatigue;
- give rest to the teenager when fatigue is evident.

It is necessary to carefully teach the student to self-control. To do this, the educator, the parent must be calm, give up. This is a serious condition, when they get tired of work and come in an unpleasant mood, it becomes light to press on their feelings if they want to educate the teenager well. Bunda's own behavior, with her behavior, motivates the teenager to be orderly.

CONCLUSION

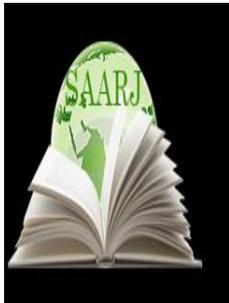

It is necessary to arm the students with important knowledge in general and specialty areas, to achieve speed in this regard. A thorough mastering of the fundamentals of general and professional disciplines by students allows them to withstand the strong competition in the labor market. The full-fledged formation of students as a specialist depends not only on the teacher and his activities, but also on the development of the student's educational and cognitive activities in the process of training. The development of educational and cognitive activity in students is a complex psychological phenomenon, which manifests its own peculiarities. Their physical, social and psychological readiness for this process creates a wide range of opportunities for them to effectively achieve educational and cognitive activity. Therefore, when organizing the educational process, attention should be paid to this aspect of the issue. In the educational process, the activation of the student's educational and cognitive activities does not take place on its own. This is achieved under the influence of a number of factors. It would be desirable for parents and teachers to pay attention to the fact that there are factors that have a positive impact on the performance of students' learning.

Reliance on psychological factors, both in improving the quality of education and in improving its effectiveness in modern conditions, guarantees a positive result of pedagogical activity [14]. Accordingly, psychological factors play an incomparable role in the development of educational and cognitive activity of students in the higher education system.

ABSTRACT

The article discusses one of the priority directions of the strategy of economic development of the Uzbekistan is the activation of the country's financial market and the formation of a global financial center on its territory in the future. At the same time, competition is considered to be the most important factor in expanding and improving business efficiency. Competition encourages constructive action in the market, offering consumers a wider range of products and services at more attractive prices and better quality, which contributes to increasing production efficiency and redistributing financial resources to the most competitive organizations. It is emphasized that competition in the production and sale of goods and services is a fundamental element of the market mechanism for regulating the economy. Banking competition is one of the types of competition in the financial market, in which banks enter into an economic competition for financial assets and customers with all its participants, including non-banking organizations.

KEYWORDS: *Competition, Financial Market, Banking Sector, Banking Services Market, Government Regulation.*

INTRODUCTION

One of the priority directions of the strategy of economic development of the Republic of Uzbekistan is the activation of the country's financial market and the formation in the future on its territory of a world financial center. The most developed sector of the Uzbekistan financial

market at the current stage is the banking services market, which could become the locomotive of the financial market.

Competition is considered to be the most important factor in expanding and improving business efficiency. It encourages constructive actions in the market, forcing them to offer consumers a wider range of products and services at more attractive prices and better quality, which contributes to an increase in production efficiency and the redistribution of financial resources in favor of the most competitive organizations.

The main findings and results

Competition in the production and sale of goods and services is a fundamental element of the market mechanism for regulating the economy. Banking competition is one of the types of competition in the financial market, in which banks enter into an economic competition for financial assets and clients with all its participants, including non-banking organizations. The creation of conditions for the development of competition in the banking market is considered a key factor in the effective implementation of the principle of the unity of the economic space and the free movement of financial services. A retrospective analysis of the nature of interaction between banks in Russia made it possible to identify three stages in the development of interbank competition since the XIX century, to the present day and describe their economic and institutional features.

The beginning of the first stage is associated with the establishment in 1861 of the State Bank and the emergence of various credit organizations: commercial banks, mutual credit societies, city public banks, mortgage credit institutions, credit cooperatives, savings banks, pawnshops. During this period, due to the specialization of their activities, there was practically no competition.

The second stage in the development of the banking system and competition in the banking services market is the Soviet one. It is characterized by a state monopoly on banking. The one-tier banking system was represented by state-owned banks serving enterprises and organizations in industry, agriculture and other sectors of the economy (State Bank), construction and the population (savings bank system). The banking system was organically integrated into the administrative-command model of management, excluding any competition.

The modern third stage in the development of competition in the banking sector of the financial market should be considered the time of the birth of civilized competitive relations. A banking oligopoly was formed in the Republic of Uzbekistan; competition is intensifying in the context of the universalization of banks, as well as the growth of capitalization and centralization of capital.

By historical standards, banks of Uzbekistan are just beginning to compete in the financial market, and this is happening in the context of financial globalization. Domestic credit institutions did not have time to master the methods of competition within the framework of the national financial market, all the more difficult it will be for them to maintain a competitive position in competition with foreign banks.

The following features of competition in the Russian banking services market can be distinguished.

1. Competitors of commercial banks are various institutional structures:

- specialized banks (savings, mortgage, investment banks, serving small and medium-sized businesses, clearing, innovative banks);
 - non-bank financial institutions and non-financial organizations (credit unions, pawnshops, leasing companies, clearing houses, financial brokers, investment companies, pension funds, postal organizations, trading houses). However, non-banking organizations do not provide competitive analogs of banking services.
2. Banking markets are markets for a differentiated oligopoly that provide ample opportunities for cooperation and coordination of market policies of various credit institutions, thus, there is both individual and group interbank competition.
 3. Competitive space is represented by a number of sectors, in some of which bank act as sellers, placing assets, in others - as buyers, attracting resources.
 4. Banking services can interchange each other, but do not have competitive substitutes, in connection with which intersectoral competition is carried out mainly through the flow of capital.
 5. A consequence of the legal registration of banking activities as an exclusive type of activity that does not allow for combination with production, trade and insurance activities is the specific nature of interbank competition, differentiated by types of banking services.
 6. Competition between banks takes place under conditions of tough (in comparison with other market sectors) regulatory influence from the state (licensing, monitoring, supervision).

Taking into account these distinctive features, as well as the theoretical concepts of scientists on this issue, interbank competition should be understood as a dynamic process of interaction (rivalry and cooperation) of commercial banks in the process of achieving corporate goals related to the expansion of the market for banking services within the framework of certain territorial boundaries or the global economic system.

The analysis of the state of competition in order to establish the dominant position of a credit institution in its banking operations is carried out in accordance with the second regulatory legal act.

The guidelines suggest calculating the following indicators:

- The capacity of the banking market;
- The share of the organization in the given market of services;
- The share of the organization in the total financial resources;
- Market concentration coefficient;
- Index of concentration of the Herfindahl-Hirschman market.

When determining the capacity of the regional market of banking services, one should take into account the volume of services provided by banks registered in the region under consideration (taking into account the volume of financial services of their branches, branches, representative offices, operating cash desks, additional offices, etc., located in this region), and the volume of services provided by branches (branches, representative offices, operational cash desks, additional offices, etc.) of organizations located in another region. To do this, it is necessary to remove from the balance sheet indicators of local banks the indicators of their structural

subdivisions in other regions and not include in the balance indicators of branches of foreign banks registered in this region, indicators of their structural subdivisions (for example, operating offices of branches in another region).

In order to avoid distorting the calculations of the capacity of the banking market and the share of each representative of the banking sector, it is necessary to calculate the “net balances” on the accounts of banking services, which are determined for each bank (branch) separately - by subtracting from the total balance on the accounts of banking services of a bank or a bank branch of the balance of its internal structural subdivisions located outside the territory under consideration.

In the absence of information, it is possible not to adjust the balances on the accounts of banking services, but to additionally analyze the dynamics of competition indicators. A more accurate estimate can be obtained by the average annual indicators of the total balances on the accounts of banking services, calculated using the chronological average.

Banking competition, obeying the general principles of economic rivalry in the market, is specific both in terms of the object (assortment of services and products) and the scale, which are determined by the globalization of the financial market. However, even perfect competition, including in the banking services market, without government intervention in the form of direct management or indirect regulation, over time is transformed into an oligopoly and even a monopoly.

State regulation should be understood as one of the functions of public administration. Its main meaning and content is the establishment and provision by the state of equal rules of behavior (activity) of the subjects of banking relations and their adjustment depending on changing conditions. However, this function of public administration is not limited to this alone. It also includes:

- Comprehensive control over the fulfillment of the requirements contained in the norms of law governing certain relations in the field of interbank competition;
- Coordination and establishment of the general direction of activities of participants in interbank competition;
- Comprehensive protection of their legal interests and rights, normative consolidation of the general principles of creating equal conditions for the functioning of all participants in the banking services market.

To determine the most significant parameters of the financial market, which must be taken into account in the process of regulating interbank competition, on the basis of correlation and regression analysis, paired linear regression equations were constructed that characterize the direct and inverse dependence of indicators of interbank competition in the Samara region on a number of micro - and macroeconomic indicators. The reliability of the regression equation was assessed by the Fisher-Snedekor criterion, the statistical significance of the model parameters - by the Students’ t-test.

The results of the correlation and regression analysis are summarized in table 1.

Thus, the growth of household incomes strengthening of interbank competition in the regional market, and the concentration of banking capital contributes to the weakening of competition.

Inflation rates have a multidirectional impact on interbank competition in the markets for attracting funds and lending to individuals.

TABLE 1 RESULTS OF CORRELATION AND REGRESSION ANALYSIS OF INDICATORS OF INTERBANK COMPETITION

Competition indicator in the regional banking market	Dependancy type	Influencing economic factor	Probable ratio of the indicator and the studied economic factors
Market concentration attracting funds from individuals	Straight	Inflation rate in the country	$\hat{y} = 829,15 + 151,15X_8$. A 1% increase in inflation will lead to an increase in market concentration by an average of 151.15 units.
	Reverse	Cash income per capita in the region	$\hat{y} = 4812,69 - 0,14X_3$. An increase in per capita income of the region by 1% will lead to a decrease in market concentration by an average of 0.14 units.
Market leader share raising funds from individuals (branch of Sberbank)	Straight	Inflation rate	$\hat{y} = 26,90 + 1,82X_5$. A 1% increase in inflation will lead to an increase in the share of the considered leader in the market for attracting funds from individuals by 1.82%
		The size of the charter capital of bank of Uzbekistan	$\hat{y} = 5,85 + 0,51X_2$. Growth of the authorized capital by 1 billion rubles. will lead to an increase in the market share of the Bank of Uzbekistan branch by 0.51%
	Reverse	Cash income per capita	$\hat{y} = 75,43 - 0,0018X_{11}$. An increase in per capita income of the region by 1% will lead to a decrease in the share of bank of Uzbekistan in the market by an average of only 0.0018 units.

Competition indicator in the regional banking market	Dependancy type	Influencing economic factor	Probable ratio of the indicator and the studied economic factors
Leader's share in the retail lending market (VTB 24 branch)	Straight	The amount of the authorized capital of VTB-24	$\hat{y} = -44,31 + 1,53X_2$. Growth of VTB-24's authorized capital by 1 billion rubles. will lead to an increase in the share of the leader in question in the regional retail lending market by 1.53%

		Net profit of VTB-24	$\hat{y} = 5,95 + 1,32X_1$. Net profit growth of VTB-24 by 1 billion rubles. will lead to an increase in the share of VTB-24 branch in the market by 1.32%
	Reverse	Inflation rate in the country	$\hat{y} = 73,22 - 5,33X_5$. A 1% rise in inflation in the country will lead to a decrease in VTB-24's share in the regional retail lending market by an average of 5.33%

CONCLUSION

In conclusion, the greatest attention in the management of interbank competition within the framework of the antimonopoly policy of the constituent entities of the Republic of Uzbekistan should be paid to the regulation of the process of bank mergers, relying on the equity capital adequacy standards and the Herfindahl-Hirschman index.

ABSTRACT

This study presents the clinical efficacy of the antiviral drug "Virostav" in patients with adenoviral keratoconjunctivitis. On the background of therapy with Virostav, complete recovery with restoration of normal vision was revealed in 69.2% of patients, and partial recovery with subsequent complete restoration of vision in 30.8% of patients. The effectiveness of the drug with complete recovery of patients with adenoviral conjunctivitis was 76.9%. The convenient and ready-to-use drug Virostav has a pronounced therapeutic effect in the complex treatment of patients with both adenoviral keratoconjunctivitis and adenoviral conjunctivitis, this is the basis that the drug Virostav is promising in the treatment of patients with viral eye lesions.

KEYWORDS: Adenoviral Keratoconjunctivitis, Visometry, Interferon, Eye Drops, Virostav, Viral Eye Damage, Antiviral Drug, Biomicroscopy, Clinical Efficacy.

INTRODUCTION

Viral lesions of the organs of vision remain the most important problem in practical ophthalmology due to their wide spread and high frequency of outbreaks. The most common viral agents of eye disease are adenoviruses - adenoviral infections. Among them, the most common are adenoviruses of serotype 8, 11, 19 (epidemic keratoconjunctivitis), adenoviruses of serotype 3, 4, 6, 7 (pharyngoconjunctival fever), as well as enteroviruses [5].

As a rule, viruses often infect the mucous membranes, and viruses in various parts of the eye are especially dangerous. The process most often involves the cornea, as a result of which keratitis

occurs, which in the future is the cause of corneal opacity, persistent decrease in vision, as well as the development of severe complications [2].

Currently, adenoviruses and herpes simplex viruses are the most common causes of corneal damage. According to the world's leading ophthalmologists, 66.8% of all cases of corneal pathology are associated with them, 55.1% - of all ulcerative lesions of the cornea, more than 60% - of blindness. A viral lesion of the eye has its own peculiarity - in most cases it proceeds with a frequent relapse of the disease. Moreover, the course of each subsequent relapse is more severe than the previous one, which requires more intensive and long-term treatment and can contribute to the development of persistent corneal opacity, as well as complicated forms of keratitis - corneal ulcers, its perforation, which requires surgical treatment - corneal transplantation. Such patients lose their ability to work for a long time or become disabled [1, 3].

Treatment of viral eye diseases is a difficult task in practical ophthalmology. Traditionally, antiviral drugs such as acyclovir and others are used for herpes viral lesions of the eyes [6].

Interferons also play an important role in the treatment of viral infections. Interferons as natural antiviral agents have been used for many years to treat viral lesions of the eyes. Due to the action of interferon around the focus of the introduction of the virus, a barrier is formed from cells uninfected with the virus, and therefore the spread of infection is limited. Interferon is also capable of modulating the activity of immunocompetent cells. Human leukocyte interferon has been widely used in the past for the treatment of viral keratoconjunctivitis, but its isolation from donor blood is currently difficult due to the epidemic situation. Recently, recombinant interferons have been used in medicine, including ophthalmology. It is believed that the safety of the spread of blood-borne infections can be fully guaranteed only if the leukocyte interferon prepared on blood cells is replaced with recombinant interferon obtained by genetic engineering [4].

Antiviral therapy for adenovirus infection is associated with certain difficulties, since today there are no drugs in the world that selectively affect the pathogens - adenoviruses. With these infections, drugs of broad antiviral action are usually used - interferons. One of them is the preparation of interferon alpha-2 - Okoferon eye drops. The active substance of Okoferon's drop is interferon alpha-2b of a recombinant person 1,000,000 IU. The drug exhibits immunomodulatory and antiviral activity. In order to avoid possible physicochemical interaction of Okoferon with other ophthalmic agents, it is advisable to apply it 30 minutes before or 30 minutes after instilling other medicines into the eyes [7].

In ophthalmological practice, a drug has recently been widely used - Virostav eye drops, the active agent of which is idoxuridine. Virostav - modern eye drops for the treatment and prevention of viral eye diseases. The main indications for the use of the drug are keratitis and keratoconjunctivitis.

Considering that the mechanism of the antiviral action of Virostav and Okoferon is the same - the drugs act on the basis of interferon alpha-2, we assumed that the use of Virostav in the complex therapy of viral keratoconjunctivitis will allow us to study the clinical efficacy in a comparative aspect.

The aim of the work was to evaluate the clinical efficacy of the antiviral drug Virostav in the complex therapy of viral conjunctivitis in comparison with other antiviral eye drops.

MATERIALS AND METHODS

We observed 23 patients with various forms of clinical course of adenoviral lesions of the eyes: adenoviral conjunctivitis (AVK) - 10 patients: 4 (40.0%) men, 6 (60.0%) women), adenoviral epidemic keratoconjunctivitis (EKC) - 13 patients, including 5 (38.5%) men and 8 (61.5%) women. Patients with adenoviral conjunctivitis made up group I, and patients with epidemic adenoviral keratoconjunctivitis made up group II (Fig. 1).

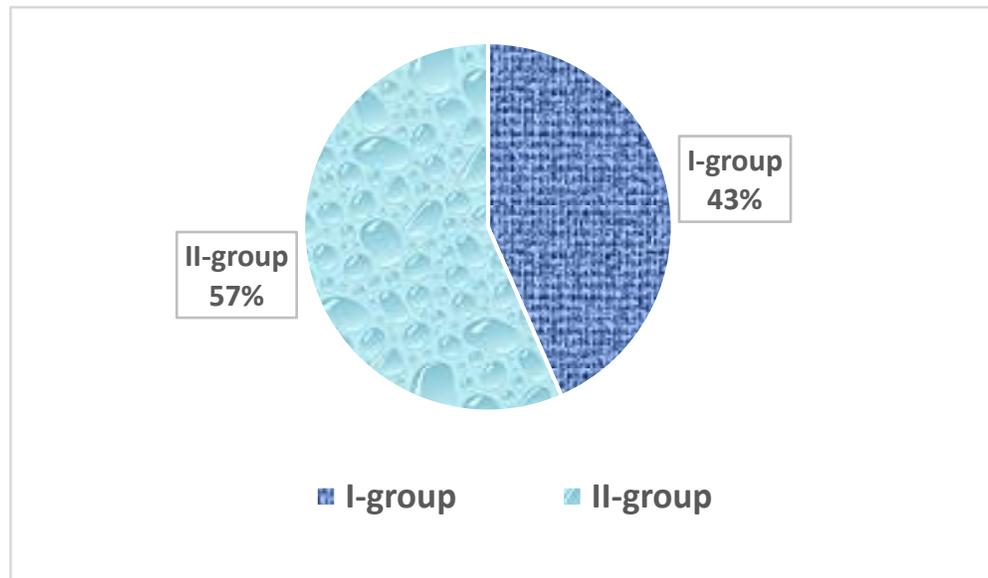

Figure 1. Distribution of examined patients by groups

The age of the examined patients varied from 18 to 55 years in the first group from 18 to 51 years), and in the second - from 19-55 years. The average age of patients in the first group was 35.4 years, and in the second - 37.0 years.

Patients of the first group received traditional therapy with the inclusion of the antiviral drug Okoferon (0.1% solution, 5.0 ml) in the form of eye drops in the treatment regimen. Patients of the second group received Virostav antiviral eye drops (0.1% solution 10.0 ml).

Eye drops Okoferon (0.1%) in patients of the first group were instilled 2 drops into the conjunctival sac of the eye every 2 hours, but not less than 6 times a day. With a decrease in the symptoms of the disease, the volume of instillations was reduced to 1 drop. The course of treatment averaged 7-10 days.

Eye drops Virostav (0.1%) in patients of the second group were instilled in the following sequence - 1 drop into the conjunctival cavity every hour during the day and every 2 hours at night. After sustained improvement, every 2 hours during the day and every 4 hours at night. The treatment was continued for another 3-5 days after complete healing, confirmed by the absence of fluorescein staining of the cornea.

According to indications, patients in both groups received additional treatment depending on the clinical form of the infectious process.

Examination of patients included: collection of anamnesis, results of clinical research, biomicroscopy of the eye, conjunctiva, cornea. General and special methods of ophthalmological

examination were used. Of the generally accepted general research methods, visometry, biomicroscopy and side illumination were used. Of the special research methods, immunological (determination of fluorescent antibodies in conjunctival scrapings), algesimetry (determination of corneal sensitivity) and virological (polymerase chain reaction) methods for determining viral eye lesions (viral conjunctivitis and keratoconjunctivitis) were used.

Statistical processing was performed using a computer program. To assess the statistical significance of differences between comparable mean values, the correctness of the answer was determined by the Student's test (t). The level of significance of this response (P) was determined according to the Student's distribution table (P-coefficient of reliability). Differences were considered significant at $P < 0.05$.

Results of the study

For patients with adenoviral conjunctivitis (group I), acute onset of the disease and bilateral eye damage were most typical. Patients often complained of pain, sensation of a foreign body in the eye, lacrimation. The eyelids of the patients were edematous, the conjunctiva was moderately or significantly hyperemic, the lower transitional fold was thickened, folded, sometimes there were punctate hemorrhages. In half of the patients, regional adenopathy of the parotid lymph nodes was found.

For patients with epidemic adenoviral keratoconjunctivitis (group II), the following clinical picture was characteristic: acute onset, usually both eyes are affected - first one, after 1-5 days - the second. Patients complain of pain, sensation of a foreign body in the eye, lacrimation, regional adenopathy is noted on day 1-2 of the disease. After 5-9 days from the onset of the disease, characteristic point infiltrates appear under the corneal epithelium (Table 1).

TABLE 1 CLINICAL CHARACTERISTICS OF ADENOVIRAL CONJUNCTIVITIS AND EPIDEMIC ADENOVIRAL KERATOCONJUNCTIVITIS IN PATIENTS WITH VIRAL EYE DISEASE

Indicators	The nature of the damage	Adenoviral conjunctivitis %	Epidemic adenoviral keratoconjunctivitis, %	P
Onset of the disease (acute)		100%	100%	$> 0,05$
Eye damage	unilateral	10,0%	7,80%	$> 0,05$
	bilateral	90%	92,3%	$> 0,05$
Eye pain		70,0%	61,5%	$> 0,05$
Sensation of a foreign body in the eye		50,0%	46,1%	$> 0,05$
Photophobia		30,0%	30,8%	$> 0,05$
Lachrymation		40,0%	38,5%	$> 0,05$
The eyelids are swollen		10,0%	15,4%	$> 0,05$
Conjunctival hyperemia	moderate	20,0%	15,4%	$> 0,05$
	significant	10,0%	23,1%	$< 0,05$
Regional adenopathy		50%	46,2%	$> 0,05$
Pinpoint hemorrhages		60,0%	69,2%	$> 0,05$
Point infiltrates under the epithelium		20,0%	30,8%	$> 0,05$
The lower transitional fold is thickened		70,0%	69,2%	$> 0,05$

As can be seen from the table, the clinical picture of adenoviral conjunctivitis and epidemic adenoviral keratoconjunctivitis were very similar, the difference between the clinical parameters was not statistically significant (the exception was significant conjunctival hyperemia in the second group, $P < 0.05$).

In the examined patients of both groups with confirmed viral eye damage, purulent discharge from the conjunctiva was not detected.

Among patients with adenoviral keratoconjunctivitis, conjunctival hemorrhages often appeared (69.2%). In this group, 4 (30.8%) patients had a severe course of the disease with a pronounced allergic inflammatory reaction, severe irritation of the mucous eyes, clearly noticeable edema of the eyelids and conjunctiva, profuse lacrimation and severe photophobia. In patients, the conjunctiva was edematous, loosened, membranes formed on the mucous membrane, the separation of which was accompanied by bleeding. In 15.4% of patients, epitheliopathy was noted on the cornea of the eye. At the first signs of subepithelial punctate keratitis or the formation of films, with epitheliopathy and tear insufficiency, appropriate symptomatic and pathogenetic drugs were added to the treatment.

When carrying out additional therapy for adenoviral conjunctivitis, the time for normalization of the conjunctiva with the disappearance of the phenomena of eye damage was reduced to 6.8 days. The results of treatment in a comparative aspect with a group of patients receiving another drug in the form of eye drops are presented in table. 2.

TABLE 2 RESULTS OF THE TREATMENT OF ADENOVIRAL CONJUNCTIVITIS AND KERATOCONJUNCTIVITIS WITH THE USE OF EYE DROPS OKOFERON AND VIROSTAV

Indicators	Viral eye damage	Okoferon (I-group)	Virostav (II-group)	P
Average duration of therapy, day	adenoviral conjunctivitis	6,8±1,10	7,1±1,32	> 0,05
	epidemic adenoviral keratoconjunctivitis	9,65±1,56	10,1±2,03	> 0,05
Disappearance of hemorrhages, day	adenoviral conjunctivitis	6,5±0,72	6,9±0,89	> 0,05
	epidemic adenoviral keratoconjunctivitis	10,9 ±2,07	11,5±2,21	> 0,05
Disappearance of hyperemia, day	adenoviral conjunctivitis	5,9±0,45	6,3±0,57	> 0,05
	epidemic adenoviral keratoconjunctivitis	6,7±0,69	7,4±0,77	> 0,05
The disappearance of photophobia, day	adenoviral conjunctivitis	8,34±1,24	9,0±1,53	> 0,05
	epidemic adenoviral keratoconjunctivitis	9,64±1,43	10,2±1,55	> 0,05
Complete recovery, %	adenoviral conjunctivitis	80,0%	76,9%	> 0,05
	epidemic adenoviral	70,0%	69,2%	> 0,05

	keratoconjunctivitis		
--	----------------------	--	--

As can be seen from the table, in case of epidemic adenoviral keratoconjunctivitis, when prescribing combination therapy with the inclusion of the drug Virostav, the duration of treatment was 10.1 days.

Conjunctival edema disappeared on day 6 in all patients, conjunctival hyperemia disappeared on day 11, and the follicular reaction completely disappeared in all patients on average on day 12 of treatment. It should be noted that as a result of complex treatment, local manifestations of the disease also disappeared.

CONCLUSION

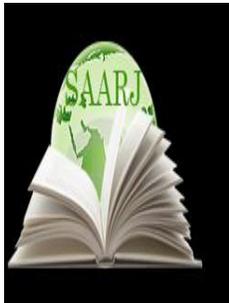

The results of these studies of the clinical efficacy of the drug - Virostav eye drops in comparison with the drug Okoferon in the treatment of adenoviral keratoconjunctivitis showed that the administration of the drug Virostav according to the proposed scheme has no less pronounced therapeutic effect in the complex therapy of adenoviral keratoconjunctivitis. Virostav does not have an irritating effect and is well tolerated by patients. There is a reduction in the duration of treatment, respectively, the number of complications and relapses decreases. The clinical efficacy and safety of patients' therapy was assessed by the reduction or disappearance of clinical symptoms of eye damage. This indicator is naturally associated with a decrease in viral load - viral replication. In the treatment of viral keratoconjunctivitis with the drug "Virostav" in 69.2% of cases, complete recovery was noted and in 30.8% of cases, a relative delay in recovery with subsequent complete recovery was revealed, the effectiveness of the drug in adenoviral conjunctivitis was 76.9% and 33.1%, respectively.

Thus, the results of the study showed that the use of eye drops of the drug "Virostav" revealed a high efficiency of therapy for both adenoviral conjunctivitis and adenoviral keratoconjunctivitis. Virostav, possessing a highly effective therapeutic effect in the complex treatment of adenoviral conjunctivitis and keratoconjunctivitis, is a highly economical drug and very convenient to use as a finished drug.

PATHOMORPHOLOGICAL CHARACTERISTICS OF THE THYMUS IN SEPSIS IN CHILDREN

Shokhrukhmirzo Abdumannopovich Ziyaev*

*Candidate of Medical Sciences,
 Andijan State Medical Institute,
 UZBEKISTAN

ABSTRACT

The formation and functional development of Gassal's bodies of the thymus normally occurs through 3 stages: construction, self-development and degeneration. Each stage of development of thymic bodies had certain morphological features in the form of cellular, glomerular, amorphous, layered, cystic and calcified formations. The qualitative and quantitative state of Gassal's bodies is of no small importance in assessing the functional activity of the thymus and developing atrophic and degenerative changes in it in sepsis.

KEYWORDS: *Thymus, Reticuloepithelium, Gassal's Little Bodies, Newborn, Sepsis.*

INTRODUCTION

Relevance: Difficulties in diagnosing and treating diseases associated with the pathology of the organs of the immune system in children, the duration and recurrent nature of their course, the impact on their entire subsequent life, put forward an urgent need for deep knowledge and disclosure of the subtle mechanisms of their pathogenesis and morphogenesis. Until now, the morphofunctional state of the immunity organs, in particular the central organ - the thymus, in sepsis in newborns, remains poorly understood. Especially, data on morphological changes in the thymus arising in various infectious diseases remain contradictory [1, p. 194; 2, pp. 36-39; 3, p. 88; 4, pp. 337-352].

THE MAIN FINDINGS AND RESULTS

It is known that the qualitative and quantitative changes in Gassal's little bodies are of no less importance in assessing the functional activity of the thymus and the pathological processes developing in it. For the medulla of the thymus, the most characteristic structures are thymic bodies or Gassal's little bodies. They are concentric clusters of elongated and fusiform cells with large nuclei and a layer of acidophilic cytoplasm [3, p. 88; 5, pp. 44-47; 6, p. 163]. The

exceptional importance of thymic bodies in the homeostasis of the body is evidenced by the fact that they quickly respond to exogenous and endogenous pathological signals, which leads to an imbalance of the entire system of differentiation and proliferation of T-lymphocytes, and, consequently, the entire immune system [3, p. 88; 7, p. 600].

Considering the above, the study of the features of the morphological and morphometric parameters of thymic bodies in normal conditions and in sepsis in children makes it possible to reveal their morphological and functional significance in the immune response during the development of a systemic vascular inflammatory process in the form of sepsis.

In this work, the **goal** was to identify the morphological and morphometric features of the thymic bodies of the thymus in health and sepsis in children.

MATERIAL AND RESEARCH METHODS

The object of the study was the thymus of 23 newborn children who died in the neonatal period from sepsis. As a control, the thymus of 16 newborns with a body weight of more than 3000 g, born at term and died from craniocerebral birth trauma, was investigated. During the autopsy, the thymus was isolated, weighed, and the thymus weight coefficient (TWC) was determined. For histological examination, pieces of thymus were fixed in 4% formalin solution in phosphate buffer and, after dehydration in alcohols, embedded in paraffin. Sections with a thickness of 5-8 μm were stained with hematoxylin and eosin, according to Van Gieson, and the PIC reaction was performed. To unify the accounting of morphological changes in the thymus in newborns and various pathologies, an algorithm for assessing morphological signs has been developed.

MATERIAL AND RESEARCH METHODS

The object of the study was the thymus of 23 newborn children who died in the neonatal period from sepsis. As a control, the thymus of 16 newborns with a body weight of more than 3000 g, born at term and died from craniocerebral birth trauma, was investigated. During the autopsy, the thymus was isolated, weighed, and the thymus weight coefficient (TWC) was determined. For histological examination, pieces of thymus were fixed in 4% formalin solution in phosphate buffer and, after dehydration in alcohols, embedded in paraffin. Sections with a thickness of 5-8 μm were stained with hematoxylin and eosin, according to Van Gieson, and the Schiff reaction was performed. To unify the accounting of morphological changes in the thymus in newborns and various pathologies, an algorithm for assessing morphological signs has been developed.

In some cases, heavy-like fields of the reticuloepithelium can be found, forming associations of thymic bodies, consisting of small cells that do not exhibit form-forming and functional activity, which once again emphasizes the connection between the specialization of the cells of Gassal's bodies and the shape of the latter.

The homogeneity and uniformity of functioning bodies, their small size and moderate number is a reliable sign of the normal activity of the thymus gland in the absence of changes in it on the part of the lymphoid tissue. On the other hand, the homogeneity of the structure of thymic bodies may indicate desynchronization of their development.

The functional activity of Gassal's bodies is primarily evidenced by the appearance of nuclear-free cells and the homogeneity of the amorphous substance (Fig. 1). As already noted, one of the signs of vigorous activity is the concentric structure of the bodies. However, this state was not

limited to the presence of only such structures. Very often it was possible to detect Gassal's little bodies in the form of microcysts (Fig. 2), the lumens of which are either filled with an amorphous mass or empty, but their outer layer consists of cells predominantly with preserved nuclei. This layer was like a capsule.

The content of the cystic cavities differed in nature, but in most cases, SHIK-positive substances were detected in it, the presence of which increased with the aging of Gassal's bodies.

Already at the stage of functional activity of Gassal's bodies, calcium salts can be deposited in them, which lead to partial or complete calcification of the cell-free masses (Fig. 3), but with the relative safety of the outer cell layer.

The final stage of histogenesis of thymic bodies is the phase of their degenerative changes. At the same time, even at this stage of development, it is far from always possible to draw a clear boundary between it and the previous stages. The degenerative nature of the changes in Gassal's bodies is evidenced by a noticeable increase in non-nuclear cells, up to the complete disappearance of cells with preserved nuclei, which is preceded by an increase in their cytoplasm from the side of the boundaries between individual cellular elements and the formation of an amorphous mass (Fig. 4). In this case, the process is not limited only to the center of the thymic bodies, but also captures their outer layer. In this phase, attention is drawn to the variety of morphological forms of Gassal's bodies, which concerns, first of all, their structure and size, and, to a lesser extent, their shape. The latter usually has rounded or oval outlines, especially when the thymic bodies are enlarged. To a lesser extent, this applies to small bodies. And this has its own explanation, which serves as an indirect confirmation of the secretory ability of these structures. By a generally accepted law, the accumulation of contents in the lumens of hollow organs or structures leads to their uniform expansion. With a further increase in the content and this is possible only when it is produced by the cells of Gassal's bodies, the shape of the structures takes on a rounded shape. Difficulty in acquiring a rounded shape may be associated with an increase in the viscosity of the contents or an uneven deposition of calcium salts.

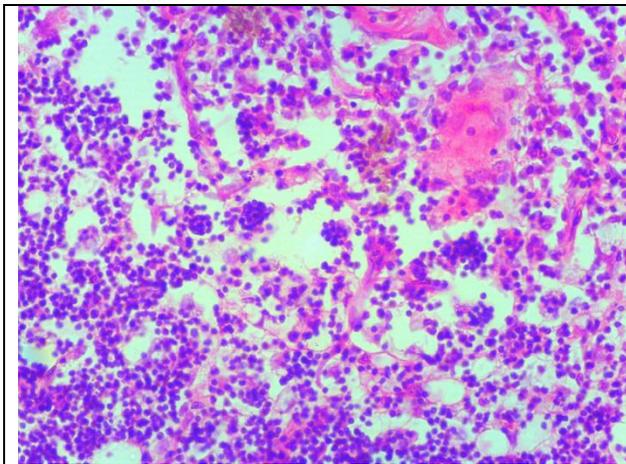

Fig 1. Formation of Gassal from pulling reticular cells. Ok: G-E. X: 10x20

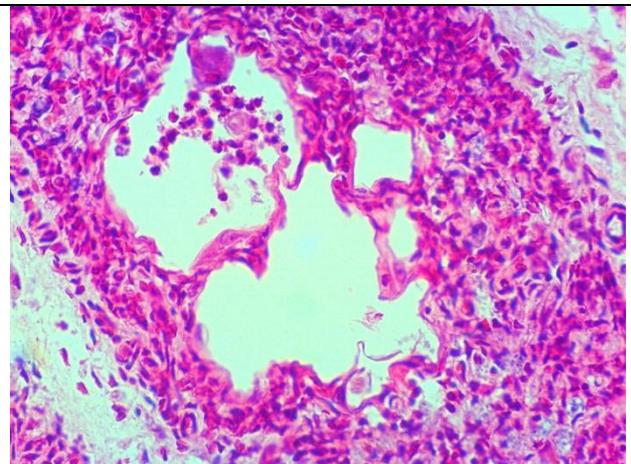

Fig 2. Formation of cysts. Ok: G-E. X: 10x20

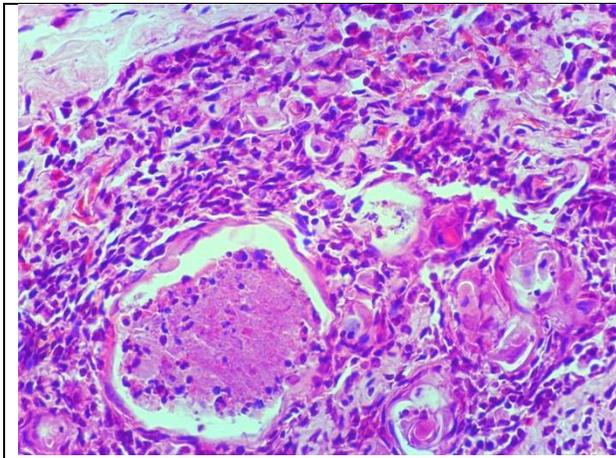

Fig 3. Filling the amorphous mass of Gassal's little body. Ok: G-E. X: 10x20

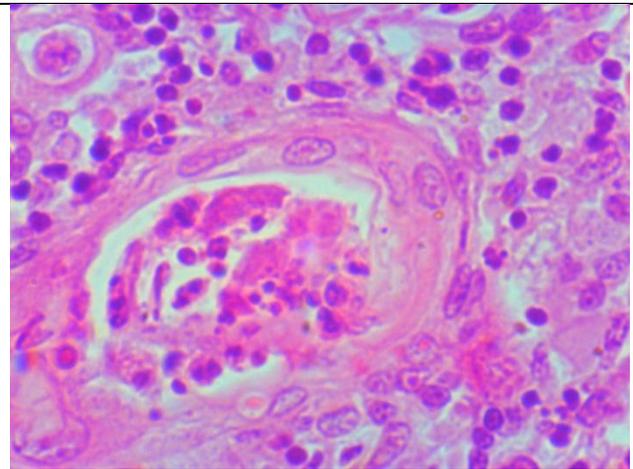

Fig 4. Dead cells and calcifications in the lumen of Gassal. Ok: G-E. X: 10x40

Thus, analyzing the morphological signs of the formation and degenerative changes of thymic bodies, it can be assumed that their active activity is largely related to the size, structure and nature of the structural composition. Taking into account all these parameters made it possible to systematize Gassal's bodies and identify their types, taking into account the phase of development; it was identified 3 stages and the nature of the structure of Gassal's bodies in the norm: 1) the stage of construction; 2) the stage of their own development and 3) the stage of degeneration. Each stage of development of thymic bodies had certain morphological features in the form of cellular, glomerular, amorphous, layered, cystic and calcified formations.

The results of studying the qualitative and quantitative characteristics of thymic bodies in sepsis showed that, along with the violation of qualitative signs, the number of thymic bodies in the stages of construction and self-development was significantly reduced, and degenerative forms were significantly increased. The size of the bodies reaches 175 microns, there are many cystic forms. The main number of bodies in the stage of degeneration is characterized by various types of structure, calcified bodies appear. The bodies lose their functional activity, the disappearance of nuclear cells is often observed, the lumen of the cysts is filled with an amorphous mass. These degenerative changes in thymic bodies are accompanied by marked delimitation of the cortical layer. In this case, stromal reticuloepithelial cells become bare and dysplastic rearrangements develop in them.

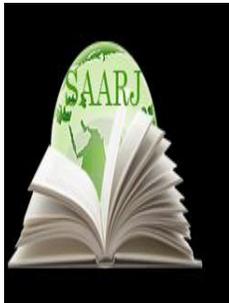

CONCLUSION

Thus, it can be noted that the qualitative and quantitative state of Gassal's bodies is of no small importance in assessing the functional activity of the thymus and developing atrophic and degenerative changes in it during sepsis.

USE OF MULTIMEDIA TOOLS IN THE DEVELOPMENT OF SPEECH COMPETENCE

Sanobar Khayotovna Kuldasheva*

*PhD Student,
 Alisher Navoi Tashkent State University of Uzbek Language and Literature,
 UZBEKISTAB

ABSTRACT

This article reveals the importance and methodology of using video materials in the development of students' speaking competence. Guidelines for achieving the specified qualification requirements are provided and the benefits are explained. Opinions of scholars and educators on the development of speech competence in native language classes are analyzed.

KEYWORDS: *Verbal Competence, Knowledge, Skills, Competencies, Video Material, Multimedia Tools, Skill Requirements, Comprehension, Assessment, Oral Presentation.*

INTRODUCTION

Although the state educational standards define two types of mother tongue teaching: speech and linguistic competencies, the current curriculum focuses on the formation of linguistic competencies in the field of modern Uzbek literary language: memorization of grammatical rules, theoretical knowledge. The draft National Program for 2020 focuses on the correct and effective use of language in different situations, i.e. the formation of practical skills. This aspect contributes to the development of speech competence, the formation of comprehension skills, oral and written speaking skills. "Within the framework of grammar knowledge, skills and competencies are formed as a specific direction in terms of meaning and content, which allows to improve the speech culture of language units" [2].

THE MAIN FINDINGS AND RESULTS

The use of multimedia tools in the development of speech competencies is relevant. When working on a person's speech, it is necessary to regularly use modern information and telecommunications tools that expand the opportunities for the effective development of information competence. It is recommended to use mobile devices (phones, tablets and other gadgets) to develop the skills of searching, analyzing scientific information from various sources

and working with the media in accordance with information security. In addition, it is a necessary tool to help develop oral skills, written speech skills, reading and comprehension skills, and listening comprehension skills. For example, we used a small experiment when we covered the topic of “Simple and Conjunctive” in the 9th grade mother tongue curriculum. First of all, what should a student in 9th grade know in terms of simple and compound sentences? What qualification requirements should be worked on to develop speaking and linguistic competence when explaining the topic of simple and compound sentences? Based on the initially defined curriculum, we have identified the following speaking and linguistic competency qualification requirements for a 9th grade student that are to be achieved through our proposed method.

Verbal competence

(Oral, written, comprehension (reading and comprehension), listening comprehension)

Qualification required code	Oral speech
9.SC.OS.1	To be able to speak fluently in formal and informal situations, following the rules of the Uzbek language;
9. SC.OS.2	To be able to prepare thoughts and ideas in the form of a presentation without deviating from the topic;
9. SC.OS.3	Be able to prepare and speak on a specific topic;
9. SC.OS.4	Verbal representation of graphic drawings and diagrams get;
9. SC.OS.5	Understand the content of language tools in the performance of poems and works, the effective use of tone, pitch, pause;
9. SC.OS.6	Consistent expression of ideas on the basis of the given text, pictures, audio and video materials;
9.HK.O SC.OS H.7	Appropriate use of arguments and quotations in speech, adherence to the norms of public speaking.

	Listening comprehension
9.SC.LC.1	To be able to hear and understand different forms of speech and debate; be able to answer questions about the monologue and conversation heard, to react to it;
9. SC.LC.2	Be able to identify the details mentioned on the general topic of live speech and audio material;
9. SC.LC.3	Be able to express the information given in audio or video material in different styles in written, graphic and pictorial form;
9. SC.LC.4	Understand the methodological tools in speech tone (irony, pitching, sarcasm, irony, exaggeration, boasting, humor);
9. SC.LC.5	To draw conclusions based on what has been heard and to substantiate the conclusion with evidence;
9.HK.A SC.LC TT.6	Understand the spirit (pathos) of the listened speech and be able to react to it.

Linguistic competence

Qualification required code	Written literacy
9.LC.SP.1	Know the spelling rules and be able to apply them correctly in written speech;

Qualification required code	Syntax
9. LC.S.1	Distinguish between parts of speech and the means of connecting them, the use of punctuation between its parts;
9. LC.S.2	Distinguish between conjunctions that are connected, followed, and without a conjunction, being able to use them correctly in speech;
9. LC.S.3	To know about quotations and assimilations, to use them in speech, to use punctuation marks correctly;
9.LC.S.4	Know and be able to differentiate specific aspects of speech styles.

The experiment showed the effectiveness of both working on the child's speech and providing theoretical information on the basis of a single video material. First, a video on "Startup created in the garage: innovation laboratory" was shown (kun.uz). When choosing the video, taking into account the age, interests, psychology of the student, attention was paid to the educational aspects that serve to expand the worldview. And another important aspect is that the issue of time allotted to the video should not be overlooked. The volume of video materials should last from 10 seconds to 3 minutes. As they watch the video, students record key words and phrases in their notebooks.

RESULTS AND DISCUSSIONS

Assignment 1. Repeat the content of the video.

Consistent, meaningful, expressive, fluent, expressive narration is required on the basis of sequence, following the norms of literary pronunciation. The student is also taught to behave freely, to pay attention to the body, hand movements when speaking, to draw the attention of his peers, in short, the art of public speaking. The arguments presented in the text can be enriched by the reader, i.e. it is allowed to fill in the ideas and make additions. "A child's speech is a reliable means of communication only if it is understandable to others. This depends on the consistent, fluent and complete expression of the idea in speech, the choice of clear words, the purity and accuracy of pronunciation. Under favorable conditions, to some extent, these features are formed by teaching the child on the basis of a clear plan, the use of various methodological methods" [1]. The teacher carefully monitors each student's speech, focusing on the shortcomings in it. Whenever possible, mistakes and shortcomings in the student's speech, ability to control others through their speech, behavior in public, etc. are discussed with the participation of their peers (classmates, groupmates). "It is well known that listening exercises develop listening comprehension skills and, at the same time, prepare students for the development of listening comprehension skills" [3]. The ability to understand what they see and hear, to think on the basis of it, and to draw conclusions is also formed. In Task 1, we used the descriptive monologue type of monologue speech. By changing the direction of the task, descriptive monologue speech, discussion monologue speeches can also be used. It is also recommended to use interactive methods and techniques, such as "Microphone", "Press Conference" for Task 1.

Assignment 2. Identify compound sentences.

A paper version of the text in the video will be distributed. Students divide the sentences in the text into simple and compound sentences. Emphasis is placed on identifying cuts in sentences and the means of connecting compound sentences. In Task 2, verbal competence is directed towards linguistic competence.

Handout

Amazon, the world's largest online store, has captured the hearts of children around the world with its animated products - Disney, Google, a search engine used by millions of people a day, and Lotus Engineering, which is innovating nanotechnology. Do you know what binds them? They all started in a simple garage and have had great success. Amazon, Disney and Google are world-renowned, but Lotus Engineering is still at the beginning of its journey, but has managed to implement useful projects.

Lotus Engineering is the name of our laboratory in Tashkent, not in any part of Europe. It's not just a simple laboratory. There, innovations will be created and applied to society using the power of nanotechnology, a direction that is still new not only for Uzbekistan but for the whole world. Interestingly, it is located in a simple garage, which once served as a car repair shop.

Amir Obidov, Lotus Engineering Project Manager, is a Doctor of Advanced Materials Science and Engineering, Professor. He studied for a master's and doctoral degree in South Korea, and the young scientist, who returned to Uzbekistan to defend his dissertation, began to think about continuing his career in a new way.

Simple sentences	Compound sentences	Means of connecting simple sentences in compound sentences

Assignment 3. Turn simple sentences in the text into compound sentences.

Students complete the task using connectors, connecting function tools, and tone. On one side of the screen, the text is displayed, and on the other side, the means of connecting simple sentences are displayed.

The reader takes a creative approach to the topic when turning simple sentences into compound sentences: inventing a continuation of a simple sentence requires the development of speech in it, the growth of vocabulary.

Evaluation

Important aspects of multimedia assessment:

1. The teacher will be able to assess 30 (32, 28) students in a class at a time.
2. Computer is a "tolerant" tool. Allows the reader to correct mistakes and shortcomings and come to a final substantiated conclusion.
3. The student will have an objective opinion; there will be no protest mood.

We used the Bingo exercise to assess students' knowledge of the topic. The student finds the sentences in the fourth column that match the content of the sentences in the second column and

writes the number in the third column. The correct answers will be entered into the computer's memory, so the computer will not accept his answer until the reader finds the correct answer. However, in assessing the student, the number of attempts earned and the time spent are taken into account.

№		№	
1	Amazon, Disney and Google are world famous		applied to society
2	They all started in a simple garage		although Lotus Engineering is still in its infancy, it has managed to implement useful projects
3	It will create innovations using the power of nanotechnology, a direction that is still new to the world		achieved great success

Homework was also given on the basis of this video material. Each group of students independently finds the meaning of the words and phrases they have written using internet search engines and electronic dictionaries.

Group 1: Disney, startup, engineering, and master's...

Group 2: Google, PhD, Nanotechnology, Amazon...

Group 3: nanopowder, innovation, materials science, project...

In this way, the student develops the skills of effective use of Internet resources, search and retrieval of sources and materials, enrichment of independent knowledge, self-study.

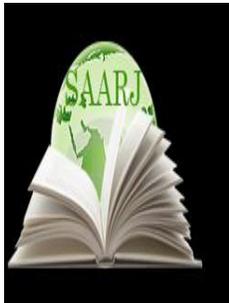

CONCLUSION

Thus, parts 9.SC.OS.1, 9.SC.OS.3, 9.SC.OS.6, 9.SC.OS.7; 9.SC.LC.1, 9.SC.LC.2, 9.SC.LC.3, 9.SC.LC.5, 9.SC.LC.6 of our speech competence qualification requirements developed on the basis of the established program, 9.LC.SC.1, 9. LC.S.1, 9.LC.S.2 parts of our linguistic competence qualification requirements is fulfilled. Along with the elements of verbal competence, the child also develops the skills of working with the media, understanding, sorting information, reacting to it, summarizing and proving.

A STUDY OF VERBAL LEARNING DISABILITY AMONG PRIMARY SCHOOL STUDENTS

Prof. Jaswinder Singh*

*Ch. Devi Lal College of Education,
 Jagadhri, Haryana, INDIA

Email id: jaswinder07hangoli@gmail.com

ABSTRACT

Learning disabilities are the problems that affect the brain's ability to receive process, analyze or store information. These problems can make it difficult for a child to learn as quickly as someone who is not affected by learning disabilities. The children with verbal learning disabilities have difficulty with words, both spoken and written. The present study has been conducted for initial or firsthand identification of verbal learning disabilities among primary school students. The main purpose of this study is early detection of cases with learning disabilities and recommends such cases for further intensive diagnosis and assessment to experts and qualified professionals. According to need and nature of the study descriptive survey method was employed. In the present study data was collected through verbal learning disability checklist developed and standardized by Dr. Vishal Sood. 80 primary school students from four schools (Two Govt. & Two Private) of Yamuna Nagar district of Haryana were selected by purposive sampling technique. Parents and teachers of these students were filled the checklist of verbal learning disabilities.

KEYWORDS: *Disabilities, Diagnosis, Descriptive*

INTRODUCTION

VERBAL LEARNING DISABILITY

Learning disability refers to learning problems which manifest in an imperfect ability to listen, think, speak, read, write or do mathematical calculations which are not primarily due to visual, hearing impairment motor handicap, mental retardation environmental or economic disadvantages, but due to a disorder in the psychological process involved in understanding or in using language. Kirk (1962) has defined: "learning disability refers to a delayed development in

one or more of the process of speech, language, reading, spelling, writing or arithmetic resulting from a possible cerebral dysfunction and emotional or behavioral disturbance and not from mental retardation, sensory deprivation, cultural or instructional factors.”

TYPES OF VERBAL LEARNING DISABILITIES

Reading disabilities:

A reading disability is a condition in which an individual displays difficulty in reading resulting primarily from neurological factors. National institute of Neurological Disorders and stroke defines reading disability or dyslexia as, “Dyslexia is a brain based type of learning disability that specifically impairs the individual’s ability to read. A specific learning disability that affects reading and related language-based processing skills. The severity can differ in each individual but can affect reading fluency, decoding, reading comprehension, recall, writing, spelling, and sometimes speech and can exist along with other related disorders. Dyslexia is sometimes referred to as a Language-Based Learning Disability.

Speech and Language Comprehension Disabilities:

Dyspraxia is a deficiency in the ability to speech and language comprehension. It can be one of the earliest types of disabilities to identify. This is because some of the symptoms are noted due to a lack of social integration, failure to reach developmental hallmarks and the palpable lack of expression in young children. This can cause regression in essential verbal expression skills and lead to low academic achievement. A speech and language disability is a deficiency in either expressive or receptive processing of language. A speech disability is characterized by difficulty in articulation of words. Examples include stuttering or problems producing particular sounds. A language disability is a specific impairment in understanding and sharing thoughts and ideas, a disorder that involves the processing of linguistic information.

Writing Disabilities:

Dysgraphia is a deficiency in the ability to write, primarily in the terms of handwriting, but perhaps also in terms of coherence. A specific learning disability that affects a person’s handwriting ability and fine motor skills. Problems may include illegible handwriting, inconsistent spacing, poor spatial planning on paper, poor spelling, and difficulty composing writing as well as thinking and writing at the same time. It occurs regardless of the ability to read and is not due to intellectual impairment.

Mathematical Disabilities:

Dyscalculia is a specific learning disability involving innate difficulty in learning or comprehending simple mathematical, arithmetical operation. A specific learning disability that affects a person’s ability to understand numbers and learn math facts. Individuals with this type of LD may also have poor comprehension of math symbols, may struggle with memorizing and organizing numbers, have difficulty telling time, or have trouble with counting. It is akin to dyslexia and includes difficulty in understanding numbers, learning how to manipulate numbers, learning mathematical facts and a number of other related symptoms.

JUSTIFICATION OF THE STUDY

Learning disability refers to learning problems in primary students like understanding, reading, speaking, remembering new things many more. Due to these disabilities the person may have difficulties in their social task. A child with these problems cannot try harder, improve their problems, could not pay full attention in their work. Learning disability is a problem that affects the brain of the child. We all human beings are born equal in this world. All are equal but some disorders arise itself.

Education plays an important role in human life. All have the right to educate. People suffering from these disabilities must not think that they don't have the right to educate. They cannot be a success person they must try their best if are guided proper. Students suffering from disabilities such as mental retardation, learning disabilities, physical handicap, backward child, juvenile delinquent can be improved if supported in best way, they need help to learn how to do these but verbal learning disabilities is a common problem at primary stage. They face the problems such as speaking, reading, spelling, writing, figuring out words, communicating, working etc. but one cannot tell properly by looking at a person that he is facing learning disabilities.

This study was conducted to gain an understanding of the learning problems of children with a learning disability which has implication on different interventional programs for children with learning disability in school and home settings.

OBJECTIVES OF THE STUDY

1. To study the concept of verbal learning disabilities.
2. To study the dimension of verbal learning disabilities.
3. To study the difference of verbal learning disabilities among primary school student in relation to their gender.
4. To study the difference of verbal learning disabilities among primary school student in relation to their residential background.
5. To study the difference of verbal learning disabilities among primary school student in relation to types of school.

HYPOTHESES OF THE STUDY

1. There exists no significant difference in the verbal learning disabilities of primary school students in relation to their gender.
2. There exists no significant difference in the verbal learning disabilities of primary school students in relation to their residential background.
3. There exists no significant difference in the verbal learning disabilities of primary school students in relation to their type of school.

RESEARCH METHODS USED

Keeping in view the nature of the present study, descriptive survey method was used to collect the data.

POPULATION & SAMPLE

The entire students studying in different primary schools were considered as populations from these population 80 students were selected by purposive sampling technique. Four schools (Two Govt. & Two Private) of district Yamuna Nagar were selected for the sample. Parents and teachers of these students were filled the checklist of verbal learning disabilities.

TOOL USED

Keeping in view the nature and need of the study, Verbal Learning Disability Check List developed and standardized by Dr. Vishal Sood was used.

STATISTICAL TECHNIQUES USED

1. In order to identify verbal learning disabilities among primary school students, *Percentage Method* was followed.
2. 't'-test was applied to find out significance of difference between different groups.

DELIMITATIONS OF THE STUDY

1. The present study was delimited only to 80 primary school students.
2. The present study was delimited only to 40 government school students affiliated to board of school education Bhiwani, Haryana and 40 students from public school affiliated to C.B.S.E.
3. The present study was delimited only to district Yamuna Nagar.

ANALYSIS OF DATA

TABLE 4.1 RESULTS RELATED TO OVERVIEW OF DATA ON VERBAL LEARNING DISABILITY

Percentage of Students of Verbal Learning Disabilities

Level Of Verbal Learning Disabilities	Scores	Number Of Students	Percentage Of Students
Extremely High Verbal Learning Disabilities	158 and above	00	--
High Verbal Learning Disabilities	139-157	04	5%
Above average Verbal Learning Disabilities	119-138	24	30%
Average Verbal Learning Disabilities	92-118	11	14%
Below Average Verbal Learning Disabilities	72-91	27	33%
Some Verbal Learning Disabilities	52-71	14	18%
Normal Child	Below 52	00	--

Total number of students= 80

Table 4.1 shows that 5% students have very high verbal learning disabilities, 30% students have average verbal learning disabilities, 14% students have average verbal learning disabilities, 33%

students have below average verbal learning disabilities and 18% students have some verbal learning disabilities.

TABLE-4.2 RESULTS RELATED TO SIGNIFICANCE DIFFERENCE IN THE MEAN SCORES OF VERBAL LEARNING DISABILITIES OF PRIMARY SCHOOL STUDENTS IN RELATION TO THEIR GENDER

Dimensions of Verbal Learning Disabilities	Gender	N	Mean	SD	t-ratio
Reading Disabilities	Male	50	28.86	8.02	0.88
	Female	30	28.60	8.01	
Speech and Language Comprehension Disabilities	Male	50	25.32	7.70	0.96
	Female	30	25.40	7.29	
Writing Disabilities	Male	50	21.96	5.99	0.72
	Female	30	21.46	6.05	
Mathematics Disabilities	Male	50	24.24	7.11	0.49
	Female	30	23.10	5.95	
Total (Verbal Learning Disabilities)	Male	50	100.38	26.72	0.77
	Female	30	98.63	24.58	

N= 80, Df= 78

Table Value= 1.99 at 0.05 level of significance

Table Value= 2.64 at 0.01 level of significance

Table 4.2 indicates that obtained 't' values for all dimensions of verbal learning disabilities viz. Reading Disabilities, Speech and Language Comprehension Disabilities, Writing Disabilities and Mathematics Disabilities are less than the table value i.e. 1.99 at 0.05 level of significance. Hence, there exists no significant difference between the male and female higher primary school students with regard to said all the dimensions of verbal learning disabilities.

It is also observed that the calculated 't' value (0.77) of the verbal learning disabilities (total) is less than the table value (1.99) at 0.05 level significance with df/78. So, there is no significant difference in the mean scores of verbal learning disabilities of higher primary school students in relation to their gender.

So, the hypothesis 1 which is stated earlier that *there exists no significant difference in the verbal learning disabilities of primary school students in relation to their gender* is accepted.

TABLE-4.3 RESULTS RELATED TO SIGNIFICANCE DIFFERENCE IN THE MEAN SCORES OF VERBAL LEARNING DISABILITIES OF PRIMARY SCHOOL STUDENTS IN RELATION TO THEIR RESIDENTIAL BACKGROUND

Dimensions of Verbal Learning Disabilities	Residential Background	N	Mean	SD	t-ratio
Reading Disabilities	Urban	45	29.28	8.45	0.50
	Rural	35	28.08	7.36	
Speech and Language Comprehension Disabilities	Urban	45	25.57	7.64	0.76
	Rural	35	25.05	7.42	
Writing Disabilities	Urban	45	22.06	6.08	0.62

	Rural	35	21.40	5.91	
Mathematics Disabilities	Urban	45	24.04	6.66	0.75
	Rural	35	23.57	6.79	
Total (Verbal Learning Disabilities)	Urban	45	100.97	26.33	0.62
	Rural	35	98.11	24.38	

N= 80, Df= 78

Table Value= 1.99 at 0.05 level of significance

Table Value= 2.64 at 0.01 level of significance

Table 4.3 indicates that obtained 't' values for all dimensions of verbal learning disabilities viz. Reading Disabilities, Speech and Language Comprehension Disabilities, Writing Disabilities and Mathematics Disabilities are less than the table value i.e. 1.99 at 0.05 level of significance. Hence, there exists no significant difference between the urban and rural higher primary school students with regard to said all the dimensions of verbal learning disabilities.

It is also observed that the calculated 't' value (0.62) of the verbal learning disabilities (total) is less than the table value (1.99) at 0.05 level significance with df/78. So, there is no significant difference in the mean scores of verbal learning disabilities of higher primary school students in relation to their residential background.

So, the hypothesis 2 which is stated earlier that *there exists no significant difference in the verbal learning disabilities of primary school students in relation to their residential background* is accepted.

TABLE-4.4 RESULTS RELATED TO SIGNIFICANCE DIFFERENCE IN THE MEAN SCORES OF VERBAL LEARNING DISABILITIES OF PRIMARY SCHOOL STUDENTS IN RELATION TO THEIR TYPE OF SCHOOL

Dimensions of Verbal Learning Disabilities	Type of School	N	Mean	SD	t-ratio
Reading Disabilities	Govt.	40	28.90	7.56	0.87
	Private	40	28.62	8.44	
Speech and Language Comprehension Disabilities	Govt.	40	25.40	7.60	0.95
	Private	40	25.30	7.50	
Writing Disabilities	Govt.	40	21.87	6.23	0.88
	Private	40	21.67	5.80	
Mathematics Disabilities	Govt.	40	24.47	7.40	0.39
	Private	40	23.20	5.89	
Total(Verbal Learning Disabilities)	Govt.	40	100.65	26.91	0.75
	Private	40	98.80	24.93	

N= 80, Df= 78

Table Value= 1.99 at 0.05 level of significance

Table Value= 2.64 at 0.01 level of significance

Table 4.4 indicates that obtained 't' values for all dimensions of verbal learning disabilities viz. Reading Disabilities, Speech and Language Comprehension Disabilities, Writing Disabilities and Mathematics Disabilities are less than the table value i.e. 1.99 at 0.05 level of significance.

Hence, there exists no significant difference between the govt. and private higher primary school students with regard to said all the dimensions of verbal learning disabilities.

It is also observed that the calculated 't' value (0.75) of the verbal learning disabilities (total) is less than the table value (1.99) at 0.05 level significance with df/78. So, there is no significant difference in the mean scores of verbal learning disabilities of higher primary school students in relation to their type of school.

So, the hypothesis 3 which is stated earlier that *there exists no significant difference in the verbal learning disabilities of primary school students in relation to their type of school* is accepted.

MAIN FINDINGS

1. It was found that out of total 80 primary school students, 04 students i.e. 5% students have found high verbal learning disabilities, 24 students i.e. 30% students have found above average verbal learning disabilities, 11 students i.e. 14% students have found average verbal learning disabilities, 27 students i.e. 33% students have found below average verbal learning disabilities and 14 students i.e. 18% students have found some verbal learning disabilities.
2. No significant difference of verbal learning disabilities was found among male and female primary school students. Hence the gender doesn't influence the verbal learning disabilities of primary school students.
3. No significant difference of verbal learning disabilities was found among urban and rural primary school students. Hence the residential background of primary school students doesn't influence their verbal learning disabilities.
4. No significant difference of verbal learning disabilities was found among Government and Private primary school students. Hence the type of school doesn't influence the verbal learning disabilities of primary secondary school students.

EDUCATIONAL IMPLICATIONS

The most outstanding characteristics of any research are that it must contribute something new in to the development of an area concerned. So, the investigator has to reveal the educational implication of the study undertaken. Finding of present study have an ample of educational implications for teachers, parents, students and administrations.

On the basis of findings of the present study, it will help the educational planners, administrators, lecturers and professors of colleges of education as well as degree colleges and also for parents in the following ways:

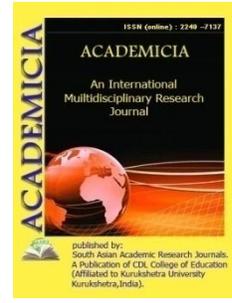

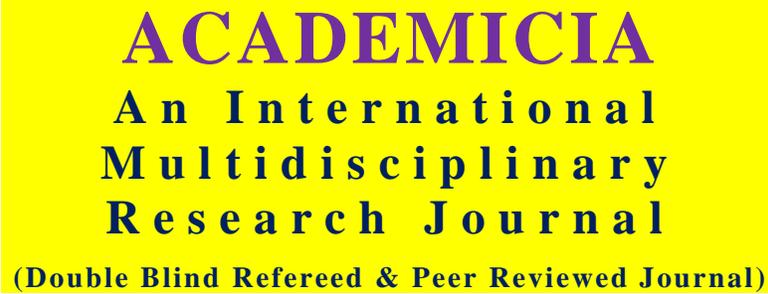

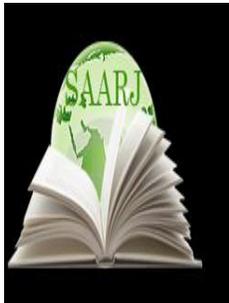

1. School should organize special programs should be organized to assess the verbal learning disabilities at primary level.
2. Students with extremely high & high verbal learning disabilities should be referred to Neuro psychologist.
3. Students with above average verbal learning disabilities should be referred to psychologist/ psycho- therapist and speech therapist.
4. Students with average/ moderate verbal learning disabilities should be referred to counselor.

5. Students with below average and some verbal learning disabilities need parental and teachers' attention. So school and family should create healthy environment for the students.
6. A resource person/expert should be appointed in the institution for identification of persons with disability and to provide them remedial teaching.
7. The teacher should use the interesting and effective teaching methods and strategies to make teaching-learning process effective.
8. Teacher should use the special equipment or instruments while teaching the disabled children.
9. The teacher should provide eco-friendly environment in the classroom.
10. The present study is helpful to know about the verbal learning-disabled students, teachers can treat them in a better way.
11. The difference of gender and residential background among the students must be ignored while teaching them.
12. Seminars, workshops and conferences should be organized in the institution for the development of self-confidence among the pupils, teachers.

ABSTRACT

Today's image of human improvement, the preservation of personality in our time, which is quickly picking up common, widespread highlights on the premise of the principles of globalization, the significance of national values, and the true esteem of national and cultural heritage is completely understood by every nation nowadays. In many cases, people address a specific sentence, situation, or individual to the general public with a variety of gestures in order to precise and supposition, increment its adequacy, or draw the recipient's attention to the same event. This process of language specifically reflects the mental image of the nation. The hypothesis of intertextuality and precedent units was also shaped on the basis of such views. The great intrigued of linguists in precedent units, particularly precedent nouns, is clarified by the linguocultural forms that take place as a result of the interaction of different languages. As a result, there is a growing body of investigation on precedent units. An analysis of precedent units in Uzbek art journalism, in particular the study of precedent names, and their role in text creation; one of the important tasks of Uzbek linguistics today is to determine which famous nouns are popular for the representatives of the Uzbek linguocultural society.

KEYWORDS: *Intertextuality, Precedent Unit, Precedent Name, National Precedent Name, Universal Precedent Name, Anthroponym, Standard.*

INTRODUCTION

It is no embellishment to say that one of the foremost imperative errands of the media is to make the message interesting to today's recipient, who lives in a constant flow of data, and not to lose interest in him directly. The author's fashion of communication plays an imperative part here. The fact that the reader acknowledges the author's own "news" when perusing the text, as well as the effectiveness of such "discoveries" within the reader's authority, is the subject of research for a number of areas of linguistics. There are two inclinations within the process of displaying information for journalistic and artistic functional methods of language: in the first method, the author himself makes "novelty" and emphasizes this novelty, attempting to express his "I" in the context of the text; in the second method it alludes to the usual methods of expression, using existing templates.

THE MAIN FINDINGS AND RESULTS

A person studying the language and culture of another country tries to get acquainted with the cultural environment by comparing it with the units of his native country, mother tongue or world culture. This is one of the reasons why the study of precedent units in the field of linguistics.

As seen on intertextuality started to take shape as a partitioned phenomenon in science, it became clear that it was based on other phenomena, units, and their properties that were not considered in linguistics. This phenomenon opened up new aspects within the linguistic literature and began to be studied extensively and in detail. At its core, the phenomenon of "precedent" was introduced into science. Y.N. Karaulov, who first introduced the term "precedent unit" to science, defined precedent units as "a very personal character of a certain person, that is, well acquainted with him and covering a wide range of him, including his past and contemporaries" the recipient is, and finally, very important in the cognitive and emotional relationships that are repeatedly referred to in the discourse of this native speaker" [Karaulov; 1987, 267] as a unit. In many cases, people address a particular sentence, situation, or individual to the general public with a variety of gestures in order to express an idea, increase its effectiveness, or draw the recipient's attention to the same event. This process of language directly reflects the mental image of the nation. The theory of intertextuality and precedent units was also formed on the basis of such views. N. Karaulov first includes in the precedent texts the names of works of art, names of characters, famous quotations and cultural symbols of oral nature. The scientist actually referred to the phenomenon under the term "text". I.V. Zakharenko, V.V. Krasnikh, D.B. Gudkov and D.B. Bagayeva talk about this phenomenon in their co-authored articles; Karaulov's definition of the "precedent text" states that the understanding of this phenomenon is close to scientific truth, that the scientist uses the concept of "text" in a broad sense, and that the term lists common features for all units. They also argue that precedent phenomena are a key (nuclear) element of the cognitive base that embodies a set of knowledge and perceptions that apply to all representatives of a particular language [Zakharenko, Krasnikh, Gudkov, Bagayeva; 1997, 82]. The concept of "precedent text" is taken after by "precedent sentence" by V.G. Kostomarov and N.D. Burvikova (1994), "pragmoreflex" by Y.P. Prokhorov (1996), "precedent name" by D.B. Gudkov (1996), "precedent phenomenon" by V.V. Krasnikh and others, and the concepts of "precedent situation" (1997) entered the science of linguistics [Gudkov; 2020, 24]. In spite of the fact that hundreds of other scientific studies have emerged from these studies, the exact definition of the phenomenon of precedent has not however been definitively set up, and

researchers contrast on this point. In subsequent logical research and writing V.V. Krasnix, D.B. Gudkov, I.V. Zakharenko, and D.B. Bagayeva indicate scientific sees on precedent units [Arbuzova; 2007, 8]. Moreover, based on the investigation of hypothetical sources, V.L. Latisheva notes that this marvel is translated differently by researchers, called by different names. According to him, in the work related to this phenomenon, researchers are studying the phenomenon at what level and to what extent, “precedent text”, “precedent sentence”, “logoepistema”, “precedent textual reminiscence”, “textual reminiscence”; they used various terms such as “lacuna”, “basic axiom of linguistic memory”, “intertext”. On the basis of these terms it is possible to understand the close phenomena and to summarize all of them on the basis of the above-mentioned definition of Y.Karaulov [Janayeva; 2008, 11]. Y. Nakhimova also noted that this phenomenon, its units are studied in grammatical, structural-semantic, methodological, rhetorical, psycholinguistic, sociolinguistic, onomastic, lingvoculturological, cognitive-discursive and other aspects, and in these works the intertext, phenomenon (precedent name, precedent-cultural sign, precedent concept), historical (social, political) or artistic (theatrical) metaphor; text reminiscence, logoepistema, vertical context element; antonomasia and allusion (as a type of rhetorical trop and figure), referring to terms such as the famous noun (onim) used to denote a cognate noun [Nakhimova; 2011, 9-10].

Precedent units are graded according to the level of awareness. According to D.B. Gudkov, these units are *auto-precedents*, *social-precedents*, *national precedent units* and *universal precedent units*. The researcher clarifies the phenomenon of autopreredence by the reflection of the individual and the universe in his mind. Certain occasions connect an individual's emotions, memory, and imagination with affiliated lines that are familiar only to him or her. Socio-precedents, on the other hand, are recognizable to members of a particular social group or class and are considered to belong to the collective cognitive level. At the same time, the scholar acknowledges that devout writings (all religious precedent events) are well known to members of the religion to which they belong (in any case of nationality, race, age, social origin). Or a similar division may be different for members of the professional community. National precedent units, on the other hand, are familiar to most members of a particular linguistic and cultural community and are part of that society's cognitive base. Universal precedent units, on the other hand, are perfect units familiar to any modern, conscious being [Gudkov; 2020, 26]. They are not limited by social boundaries such as nation, religion, and race.

The precedent unit is a steady model system that is familiar to individuals of a particular linguo-cultural community, popular among them, and serves to express similar events related to the life and history of the community. Precedent units permeate the ideology of a linguocultural society, its mental image, its way of understanding existence. Their bodies are constantly changing. These units come to life again and again in the talk, they serve as a benchmark for a specific culture and become a image of an event or situation [Janayeva; 2008, 5]. Precedent units are also energetic and changeable, adjusting to social, verifiable, and etymological contexts. The sources of precedent names are also always upgraded. Today, in expansion to traditional point of reference title sources (devout sources - the Book of scriptures, Qur'an, hadith, antiquated culture, fables, history, art, fiction, and logical literature, etc.), relatively new sources can be cited, such as media texts in different forms. Mass media, Internet resources (Internet journalism, advertising slogans, TV programs and their names, newspaper and magazine columns, etc.) today are the emergence of new precedent names, their widespread popularity, and the rapid

replacement of obsolete precedent units with new ones. One of the main sources of precedent names in modern conditions is the media. In the past, it took many years for precedent names to become popular, but today the process is very short. The foundation of precedent names of any language includes national and international names, but it reflects the specific worldview, national identity and beliefs of the nation.

Interest in precedent names is explained by the linguocultural processes that take place as a result of the interaction of different languages. A.V. Tereshchenko clarifies this situation as follows: “Communication of languages having a place to different linguistic and cultural societies is viable only when the social barrier, as well as the cultural barrier, is overcome” [Tereshchenko; 2016, 76]. Y.B. Ushakova characterizes the diverse semantization of precedent names in different dialects by the fact that the precedent names *Julius Caesar*, *Quasimodo*, *D’Artanyan* shape different affiliations between representatives of Russian and other languages [Ushakova; 2014].

In the distant past of any nation, the names of famous people, legendary folk heroes, notable places, famous historical events are preserved in the linguistic memory of this linguocultural community in connection with various associations. This may be the reason why precedent names are sometimes used as a benchmark. I.V. Zimin also pointed out that the famous horses became the standard among the stable comparative units of many nations [Zimin; 2004, 110-111].

The word “precedent” is derived from the Latin word “*praecedens*”, which means “leading”, “before”. The word is interpreted in Russian in the “Explanatory Dictionary of the Russian language” originally published in 1935-1940, and edited by D.N. Ushakov [<https://dic.academic.ru/contens.nsf/ushakov/>]. The Russian Dictionary, published by the Institute of Linguistic Research of the Russian Academy of Sciences, defines the word as follows: “1. an event that happened in the past and serves as a model or basis for similar situations. 2. A model decision of a court or other public authority to resolve similar issues in the legal system of some capitalist states. *Court precedent*”. [Precedent // Dictionary of Russian Language. 4 Volumes. 1987, p. 387]. In addition, the word is used in a number of narrow field dictionaries (dictionary of foreign words in Russian, historical dictionary of Russian Galicianism, large encyclopedic dictionary, encyclopedia of sociology, large encyclopedic dictionary, financial dictionary, dictionary of business terms, dictionary of synonyms, etc.). This word is used as a legal term in the Uzbek language in the “Encyclopedia of Laws of Uzbekistan” and is defined as follows: application of the earlier decision” [Encyclopedia of Laws of Uzbekistan; 2009, 370]. In the field of Uzbek linguistics, the term first appears as a linguistic phenomenon within the scientific articles of D. Khudoiberganova. Nowadays, there is a developing interest in studying the phenomenon of recidivism and its units. As said above, the first scientific views on precedent units in Uzbek linguistics are watched in the research of D. Khudoiberganova. In his scientific views, the researcher investigates not only universal precedent names but also the peculiarities of the Uzbek mentality in the creation of texts. As D.Khudoiberganova noted in her doctoral dissertation “Anthropocentric interpretation of scholarly texts in Uzbek language”, “precedent units appear as a means of transmitting social codes from generation to generation. At the same time, the study of texts containing analogies, text-metaphors, precedent units, standards, speech labels is the most important source in creating a scientific interpretation of the linguistic landscape of the world specific to a particular ethnic

group”[Khudoiberganova; 2015, 58]. In her doctoral dissertation, linguist D. Khudoiberganova notes that precedent names have a special place among precedent units, noting that such names are used in a work of art for various pragmatic purposes. The scientist also proves by examples that another important function of precedent names is “participation in the creation of the text as a subject of microtext”.

At the same time, in D. Khudoiberganova's pamphlet “Language, Thought, Culture” there are two important features of precedent names: the first - popularity, that is, a strong place in the linguistic memory of language owners; the second is symbolism, that is, being an example of a certain set of qualities [Khudoiberganova; 2020, 40]; cite national, Eastern, and Western linguistic names that are widely used in Uzbek linguistics today, as well as universal names [Khudoiberganova; 2020, 41].

Based on the above ideas of the scientist, it is clear that precedent names may not always reflect both highlights, that is, a few moments are characterized only by the quality of popularity, and some minutes pass through the level of popularity and become known in the minds of certain mentalities; it able to moreover see that it gets to be a unit that communicates a special and unrepeatable etymological scene - a benchmark.

D. Andaniyazova's views on prevalent onomastic units in Uzbek literary texts are also critical for research on precedent units. In his work, the researcher depicts in detail the linguopoetic highlights of point of reference onims in Uzbek exposition and verse, their capacities in the scholarly content, denotative and connotative (in turn, connotative use is divided into two - metaphorical and metonymic), cites their valuable ideas about their being an allusive name, etc. [Andaniyazova; 2016]. In particular, D. Andaniyazova's monograph “Linguopoetic study of onomastic units” notes the characteristics of point of reference units: 1) existence in the memory of language owners; 2) popularity; 3) a connection to a popular text or situation; 4) acquisition of symbolic meaning [Andaniyazova; 2016, 45].

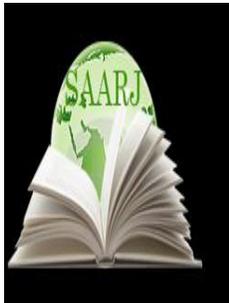

CONCLUSION

To conclude, the study of precedent names has become an object of study in Uzbek linguistics today. There are many aspects of the Uzbek language that need to be considered within the study of precedent names and precedent units in general. Focusing on the problem of investigation of the phenomenon of precedent and its units will help to decide their put in the cognitive base of members of the Uzbek linguocultural society.

DIVERGENT ASSIGNMENTS USED IN INTEGRATED TRAINING

Jahongir Tilakmurodovich Yuldashev*

*Researcher,
Karshi State University,
UZBEKISTAN

ABSTRACT

The article quotes methods and processes on how to develop and improve divergent thinking through the integration of the subjects taught in the article. The uniformity of thinking prevents the right perception of the situation and prevent other people from accepting their thoughts and makes personal communication difficult. In contrasting of convergent thinking, different thinking from each other is different thinking of many answers to the same question. Modern didactics offer a number of approaches to the integration of academic subjects, but still not created universally recognized content, forms and tools of the process. As long as it applies to any assignment, the problem, which is belonging to the problem, we can find a few solutions to the Allebat.

KEYWORDS: *Development Of Divergent Thinking, Text, Title, Analysis, Fatty Speech, Integration, Problem.*

INTRODUCTION

Under modern conditions, insecurity is not given enough attention to the teaching of disciplines. Even subjects such as physics and electrical engineering, chemistry and materials science are taught without the systematic connection in secondary special, professional education curricula. Measures to eliminate the problem are being limited to meetings of training of these subjects on the time of the relevant curricula or measures to partially harmonize the content of sciences. To resolve it, the necessary conditions for the integration of the subject disciplines, which ensure the knowledge of students, are required to develop the necessary conditions, form, content and tools of the subject.

Modern didactics offer a number of approaches to the integration of academic subjects, but still not created universally recognized content, forms and tools of the process. Many pedagogical

scientists act in the study of integration processes in education, depending on the integration of fundamental sciences.

This situation is originally explained by the fact that the integration was initially implemented in fundamental networks and later spread to the field of pedagogy. It should be noted that academic subjects are different from scientific sciences. Only this difference is not in the content, but in the form of the absorption shape, size and explanation depth.

The didactic essence of the integration of Educational Sciences is determined by the need to develop the order and legislation of pedagogical activities that allow to determine the conceptual structure and techniques of the formation of new knowledge in various educational sciences. Integration of Educational Sciences is an inalienable continuation of mutual synthesis of science fields and scientific knowledge.

The main purpose of the educational and educational disciplines is to synthesis of subjective new knowledge, the main task of integration processes - the development of pedagogical technologies ahead of the synthesis of subjective new scientific knowledge.

Purpose. The purpose, tasks, and content of education carried out at different levels of education are always determined by the present and future needs of society. Regarding global and national changes in scientific, technical, socio-cultural changes, one of the priorities of higher education is intellectually and physically developed with high levels of spiritual and moral culture, Preparation of a future specialist who has professional growth and personal development.

In recent years, students' ability to develop flexible, effective thinking skills, to make decisions under the restrictions given, is the ability to seek alternative, non-standard ideas, and the restrictions given, called divergent, there is more and more non-linear, different opinions.

Often, due to primary school teachers, linear (convergent) thinking, the correct solution to any problems has learned to use a single solution together with them to develop the mind of schoolchildren. It is possible to explain to the Conscious of the clear meditation of such thinking. The uniformity of thinking prevents the right perception of the situation and prevent other people from accepting their thoughts and makes personal communication difficult. In contrasting of convergent thinking, different thinking from each other is different thinking of many answers to the same question. Similarly, such thinking type included as divergent thinking by scientists and researchers.

Scientific novelty of the article. For many years, the problem of forming divergent thinking has been repeated several times in psychological and pedagogical literature. Specialists conducted mental psychological research, and they were engaged in the study of various thinking and the characteristics of the factors of its development.

Divergent thinking can be called a special thinking occupied by creative people. Diverish thinking is manifested in creativity and different abilities. Creating a new non-standardist, creativity - the basis of any creature.

Dividner is a type of thinking that involves the problem, which involves all the creative capabilities of a person, but meant to solve the right solution.

Many teachers rarely imagine what the students's creativity is. They mainly convey the concepts, increasing their experience and other methods to accurately fulfill professional tasks.

Research of a number of scientists shows that divergent thinking is a speed (the number of things to the time unit), elegance (circulation of flexibility), uniqueness (non-standard, non-traditional ideas) And it is a way of thinking aimed at the formation of criteria for accuracy (fullness, accuracy) of ideas. Therefore, creativity, interest, the desire to manifest the person, the other presentation of the material, are facilitated with different criteria for assessment of the results.

Among the primary school students the concept of thinking is mainly meaningful. That is, the formation of the educational task must first be done in the form of objective and game actions that ensure the emotional basis of arbitrary concepts, not in the form of oral disputes.

The primary school teacher is in need of divergent thinking in designing its professional pedagogical activities, extraction of courses and classes, and analysis of pedagogical activity. Teachers need to understand the essence of different approaches in upbringing and education.

Results and practical applications. The primary school teacher must embody the following features for divergent thinking and quality of this thinking to achieve high quality efficiency:

- to be reflected in their own eyes or on the mind and to correct the correcting deficiencies in their activities;
- Captify critical evaluation of various events in the formogene activity;
- to identify their direction and other solutions in the state of uncertainty in the solution of the camels;
- to be able to organize the knowledge and skills of the magnificent nature independently;
- Donal conditions in the event of the registration and introduction of new training issues;
- Creating alternative options when solving the absorption, and can be considered for a solution in them;
- to be able to merge and change methods in solving possible;
- Prompt methods and technologies.

As a result, various thinking helps to reveal the meaning of the educational process to primary school teachers and choose the form, according to the content of lessons, as well as their network.

Ensuring the beauty, charm, consistency, consistency and elegance of primary education, showing the beauty, charm, consistency and elegance of the lessons, showing the beauty, charm, consistency and elegance of primary education, showing the beauty, consistency of primary education, and the teacher's skill depends on the knowledge and component approach.

By dealing with issues and problems, students are developing, independence, positive qualities such as freedom, pursuit, hardship, and as a result, the child is personally brought up. They get acquainted with the life, production practice of their city, producer, people's work.

In modern teaching, the main task of the teacher is to help the reader to independently master knowledge, not to provide readiness. To do this, students need to organize the educational process to complete their ability and opportunities and to use all their efforts to learn all their efforts. In this case, we use ways to find solutions and solutions to tasks in the subjects taught in primary school.

Below we will provide examples from the introduction of primary education in the Integration of Primary Education in the example of primary education.

Read the text and find a title to it.

In the desert, various animals were in herd. They were very difficult to thirsty without finding water. They wanted to dig a well. The lion first started working. He is quickly tired. The second is the elephant work. He was also tired quickly. The turn came to the giraffe, wolf and fox. Soon, they were also exhausted. The end of the work was entered into the work. He had danged with his thin hoofs, and finally made water. All animals were happy.

By reading this text, students themselves can think of several headers with them. At the same time, each reader explains the purpose of the title he has set forthcoming this title, the reader develops the students' abilities.

Students can text the text as follows and explain it.

1. Initially, the first student tells the concept and knowledge: "We can communicate to text, water obi life, because we can understand that all animals in the desert are difficult to suffer from infirmity. If there watered the animals would not have difficulty".

In this case, we will be able to explain deeper to students based on the content of the water that all living souls in nature, the source of life in nature, and the source of natural science.

2. Then the second reader reads his understanding and writing: With this we can say that we are saving, the Savior".

Based on the title of the second reader and the comments mentioned, we can consider text in the context of the science. We can shape positive qualities of friendship, and the concept of salvation from the concept of friendship, and doing a goodness of salvation here.

3. And we can say "Texten to the text and work with wisdom. King Sher of the water lion, the most huge animal verb and all other animals were unable to do. Although it is small and weak, he can express his opinion, using his mind and hoofs".

From the mentioned points and the title, we can say that our student contributed to enriching the contents of the technology. The reason is that teaching students are taught in the field of technology, mentals of tasks, such as the rules of tasks, and safety of the case, and the correct use of tools. In the text, the text shows that in the mining of the water, using its mind and digging the land with thin hoofs and producing water.

This means that we can learn when the causes of these three titles were analyzed when we are analyzed on the content of three subjects in primary education and improve and develop existing. All students in the class understand that any assignment, the problem and the integration of the question on the integration of sciences.

After doing such exercises, assignments, and questions, will command students to conclude. Students concluded that very many questions, problems, and several solutions can be found in a variety of ways.

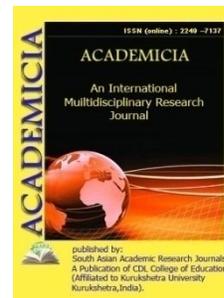

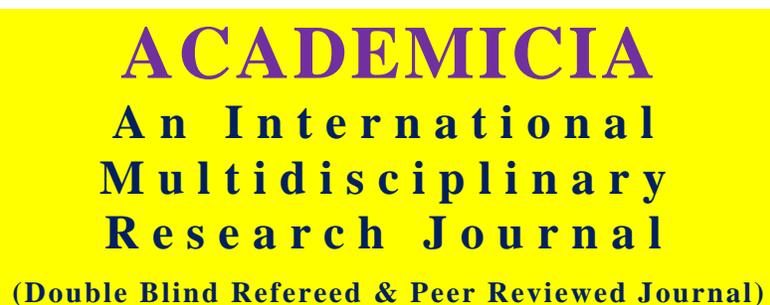

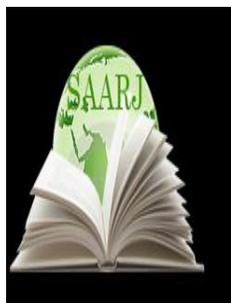

This, in turn, shows that we can improve the quality of education, improve the quality of education and develop the skills of students to observe obstruction.

CONCLUSIONS AND SUGGESTIONS

As long as it applies to any assignment, the problem, which is belonging to the problem, we can find a few solutions to the Allebat. In finding a few solutions to the problem, students can observe thought, observation, observation, and increase their knowledge and develop. From this we can come to conclus, we need to use divergent thinking in the educational process. We need to focus on independent thinking in the teaching, divorcing of ideas.

ABSTRACT

The article presents the results of improving the quality of waste paper by converting the printing ink in the MS-3 waste paper mass into a soluble state. The necessary conditions for the solubility of printing ink in the waste paper mass have been recommended.

KEYWORDS: *Waste Paper, Paper, Alkali, Degree Of Polymerization.*

INTRODUCTION

According to the report "Pulp and Paper Market Size, Share & COVID-19 Impact Analysis... and Regional Forecast, 2020-2027" provided by Fortune Business Insights, the pulp and paper market will grow by an average of 0.8% per year by 2027 reaching a volume of 368,1 billion USD. The authors of the report divide the market into three sectors, namely newsprint, printing and packaging paper, among which packaging paper has the largest share (52.9%) [1].

To produce one ton of paper, 24 trees need to be cut down. During the year, one tree produces enough oxygen for 4 people [2]. In this regard, annual plants, non-wood perennials, the rational use of fibrous waste from the main production is of particular importance.

Secondary resources in our republic - from annual plants such as cotton wool [3], cotton stalks [4], straw [5]; non-woody plants, including tapinambur [6], amaranda remnants [7], and licorice

root waste [8] have the potential to be used in the paper industry to obtain a fibrous semi-finished product.

The pulp and paper industry is the sixth largest industry in terms of water consumption, consuming 163 m³ of water per 1 ton of product, the bulk of which falls on the production of fibrous semi-finished products.

One of the main directions of reducing water consumption is the efficient use of waste paper (waste paper, recycled paper, secondary raw materials).

In the paper industry, recycling of waste paper can reduce water consumption by 40%, solid waste by 39% and air pollution by 73% [2].

Worldwide, newsprint is made from 68% of secondary raw materials. At the same time, 68% of all paper produced worldwide is a packaging paper, and its composition consists of 50% recycled paper, i.e. waste paper. However, waste paper is almost never used in the production of printing and writing paper. Even in the US, only 6% of waste paper is used for this purpose. This means that almost 90% of the primary fiber in the production of printing and writing paper, i.e. cellulose from wood, is used. And that in turn signifies that the forest will be cut down again. MS-1, MS-2 or MS-3 sort waste paper can be used in the production of printed paper. Although there is no problem in using MS-1 and MS-2 waste paper, the presence of printing ink in MS-3 waste paper limits its use for the above purposes. In particular, the problem of maximum separation of dye on the fiber surface during the processing of waste paper, its removal from the cellulose suspension, decolorization of dyed fiber and raising the whiteness of secondary fiber is currently being studied in all developed countries [10].

LITERATURE REVIEW

When the composition of paper waste generated in different enterprises was studied by NMR analysis, a researcher, it was found that a certain amount of polycyclic aromatic compounds, heavy metal, dioxin and furan compounds were present [11]. An analysis of the literature revealed that it was a multi-component system used in the preparation of typographic ink. Printing ink is supposed not to penetrate deep into the paper and to dry quickly. For this purpose, typographic inks are prepared mainly on the basis of typographic drying oils. The composition of the paint may vary depending on the purpose for which it is used. For example, when printing a newspaper, liquid paint is used, taking into account the rapid drying of the paint, and when printing books, some darker colors are used. In the preparation of all types of printing paints, wood resin and soap are added to the oil. In the literature, the composition of typographic dye is given as follows: typographic oil - 50 kg, wood resin - 10 kg, black dry - 12 kg, soap - 1 kg, color pigments 250 g. It is an olive oil that acts as a curtain. To remove the printing ink from the waste paper mass, it is first necessary to break down the component that forms the film. This means that the olive oil in the paint is an oily-waxy substance, and by converting it to a soluble state, the waste paper mass can be removed from the printing ink. When reusing all types of packaging materials, it is important to remove the dye while maintaining the physical and mechanical properties of the fibrous material. Studies have suggested 3.5% maleic anhydride and 15.8% specific polymer as the optimal content for dye extraction [12]. Another alternative method of extracting printing ink from waste paper is currently proposed by G. Tofani. To do this, to remove the dye from the paper sediment formed during the flotation cleaning process, it

is fired at 5750C and bleached with sodium ditionite, the cost-effectiveness of reuse in paper production as a filler from the resulting ash is currently being studied [13].

A number of scientists have recommended the use of biotechnology to extract laser printer ink and printing ink from the waste paper mass. Experiments have shown that cellulose from *Aspergillus oryzae* MDU-4 for the removal of ink from newsprint, and lacquer isoenzymes from *Ganoderma lucidum* MDU-7 and 2 mM HOBt for cleaning laser printer ink have shown good results. Twin-80 has also shown the best results among the enzymes studied to break down toxic toner used in laser printers and remove it from the waste paper mass [14].

The method and efficiency of extraction of non-fibrous waste from waste paper is selected depending on the shape, size, quantity, composition and surface properties of the waste as follows:

- Treatment: waste size and their shape;
- sorting: waste size, their shape and viscosity;
- Washing: waste size and their shape;
- Flotation: waste size and their surface properties.

The size of the waste as printing ink is in the range of 1-100 μm , and their density is 1.2 - 1.6 g / cm^3 [15]. Extraction of wastes with a density of about 1 g / cm^3 from the waste paper, ie adhesives, waxes, paraffins and latexes, is a more difficult and complex process than cleaning from other wastes. In terms of waste size, the removal of waste, including glue and paint particles, which is the same as the length and diameter of the waste paper fiber, requires separate processes. [16].

Methodical part

The study examined MS-3 waste paper - paper waste consisting of books, magazines and archival papers as an object. The efficiency of the printing dye extraction process from waste paper is evaluated by the degree of polymerization of cellulose [17] and the capillary values of paper castings [18].

Main part

Previous studies in this area have shown that the removal of printing ink from MS-3 waste paper is mainly based on the bleaching of the waste paper, in which a printing ink is removed from a waste paper under the influence of oxidants and reductants [19]. In the study, the printing ink was extracted from the waste paper mass, but the capillary capacity of the paper samples prepared on its basis had low values. This is due to the fact that in addition to the coloring pigment in the printing ink there are various auxiliaries, including oil-wax substances - olives, the presence of which in the waste paper mass, adversely affects the printing properties of the formed paper.

In the study, the waste paper was treated in an alkaline environment in order to make the printing ink soluble. In this case, in the first stage of the process, the paper-waste paper first swells, then absorbs the alkali, and in the next stage, a chemical reaction takes place between the abrasive alkali and the oily substance. At high temperatures, in an alkaline environment, the waste paper swells excessively, and the average size of its pores increases several times, facilitating the

diffusion of fatty substances in the printing ink. Under the influence of alkali, waxy substances hydrolyze to form sodium salts of fatty acids:

An extraction efficiency of a printing ink is evaluated by a degree of polymerization of castings and capillary properties of paper products made from it. For this purpose, MS-3 waste paper was treated at different concentrations of alkali at a temperature of 90°C for 50-60 minutes. The results of the studies are presented in

TABLE 1 INFLUENCE OF ALKALI CONCENTRATION ON WASTE PAPER QUALITY INDICATORS

#	Concentration of NaOH ,%	Polymerization level	A capillarity properties of paper castings, mm
1	1,0	850	4
2	1,5	820	6
3	2,0	800	7
4	2,5	740	9
5	3,0	710	10

Commentary: $t = 90^{\circ}\text{C}$; $\tau = 50\text{min}$

From the data given in the table, with an increase in alkali concentration, a slight decrease in the degree of polymerization of cellulose is observed, and as well as an increase in capillary properties. Repeated recycling of paper will result in lower quality of the collected paper, which will again increase the demand for primary fiber. It is also known that the quality of the paper decreases dramatically when the dye is removed [20].

Since an increase in the alkali concentration of more than 2% led to a sharp decrease in the degree of polymerization of the cellulose, its amount of 2% was accepted as the acceptable concentration. The increase in the capillary capacity of the samples can be explained by the fact that the film-forming agent in the printing ink is destroyed by alkali. The capillary rise of the liquid in the samples occurred as a result of the transfer of oligo-oily-waxy substances from the paper to the solution with increasing alkali concentration.

Although the decomposition of typographic dye was achieved with increasing alkali concentration, a sharp decrease in the degree of polymerization of cellulose was also observed. This is due to the rupture of hydrogen bonds in the cellulose macromolecule under the influence of alkali at high temperatures. Therefore, in order to reduce the alkali processing temperature, the effect of temperature on the process was studied, while maintaining the alkali concentration of 2%.

The results are shown in Figures 1 and 2.

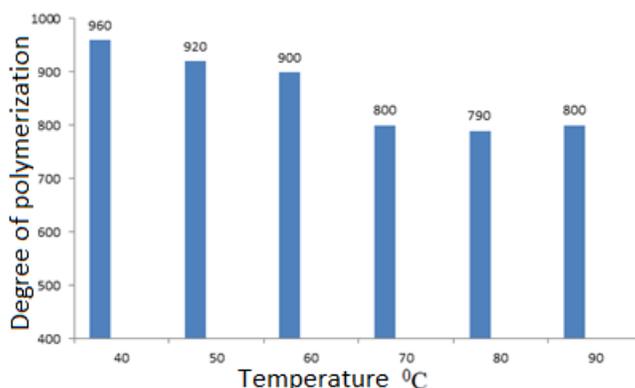

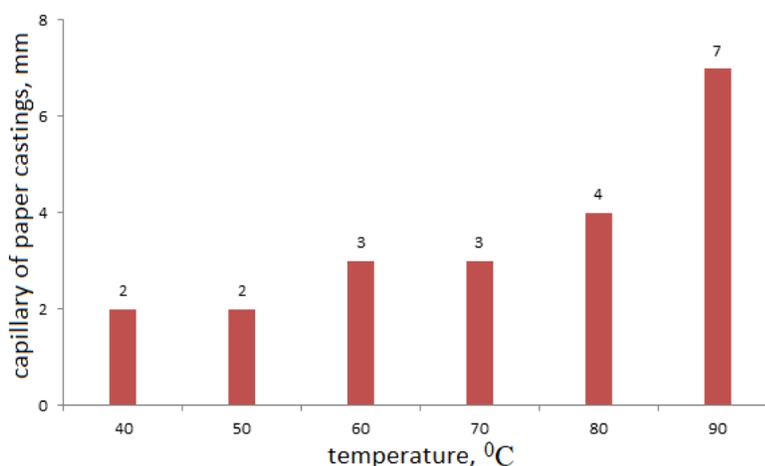

Figure 1. The effect of temperature on the degree of polymerization of waste paper

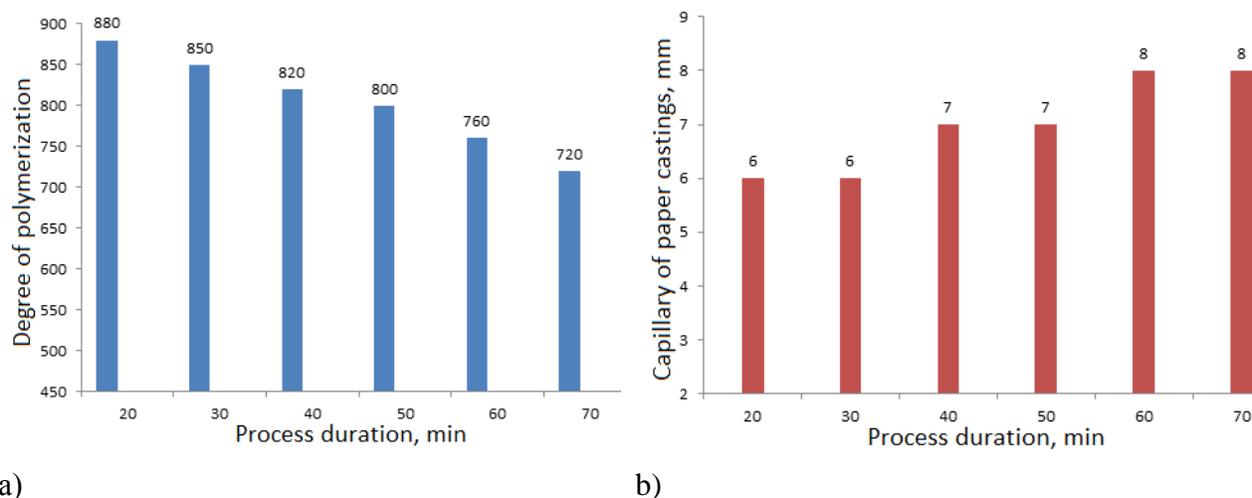

Commentary: $C_{\text{NaOH}} = 2.0\%$; $\tau = 50$ min

Figure 2. The effect of temperature on the quality of waste paper

The results given in the diagrams show that the polymerization rate of cellulose has a high value at low alkaline treatment temperatures, but the capillary rise of the liquid in the samples is observed only when the process is carried out at a temperature of 90°C.

Hence, the hydrolysis of oily-waxy substances under the influence of alkali at high temperatures has been confirmed, a temperature of 90°C was accepted as the optimum temperature. Next, the effect of process duration on the efficiency of typographic dye extraction from waste paper mass was studied. The results are shown in Figure 3.

When analyzing the graphical data, it was found that an increase in the process duration of more than 50 min leads to a further decrease in the degree of polymerization, but the capillary is almost unchanged. Due to the fact that the amount of printing ink in the paper samples did not change, the system was in equilibrium for 50 minutes during the transition of alkali-oil-waxy substances to the solution under alkaline conditions.

Commentary: $C_{\text{NaOH}} = 2.0\%$; 90°C

Figure 3. The effect of process duration on waste paper quality indicators:

a) effect on the degree of polymerization; b) effect on paper capillary capacity.

CONCLUSION

The results (Table 1) show that as a result of alkaline treatment of the waste paper mass, the degree of whiteness and capillary content of the castings decreases with increasing alkali concentration in the system by more than 2.5%. This may be due to the formation of a hydrophobic layer on the casting surface as a result of the hydrolysis of drying oil and other oils in the printing ink under the influence of alkali, as well as the re-absorption of the pigment in the solution into the fiber. Wastes are also divided into separate classes in terms of wetting, i.e., hydrophilic, hydrophobic, and wastes that are wetted in a neutral environment. The method of removing the waste from the waste paper mass and the appropriate chemical and auxiliary reagents are selected according to the wetting environment of the waste. In addition to the above, wastes known to adhere to metal parts of equipment at high temperatures are also known as paraffin, wax, and latex.

ABSTRACT

The topic corresponds to the priorities of scientific research, as it is currently actual in the republic's agriculture, after finishing the research, past crops, which increase soil productivity and winter wheat yield, will be determined in the conditions of the Republic of Karakalpakstan at the first time. Carrying out agro-ameliorative measures for reduction of soil salinity, increase of soil fertility and productivity and quality of crops, development of efficiency of past crops and mineral agro-ores in increase of winter wheat yield, application of organic and siderate fertilizers to the soil - is the way to solve the problems.

KEYWORDS: *Winter Wheat, Soil, Fertility, Mineral Agro-Ores, Celadon Green, Past, Yield.*

INTRODUCTION

Due to the biological properties of winter wheat, it must be resistant to the effects of winter frosts. However, despite the fact that the climate of our country is sharply continental (summer is hot and cold), in autumn, winter and spring the weather changes very quickly and due to improper application of certain agro-technological processes, it can not grow or develop. Therefore, the protection of winter wheat from the negative effects of winter frosts should begin with the sowing of seeds. In order to protect the crop from the negative effects of winter frosts, it is advisable to select fast-ripening varieties resistant to winter frosts, sow them at the right time and feed them properly. Winter wheat has a relative degree of frost resistance, and when agro-technological processes are used incorrectly, they can also die from the cold.

In order to eliminate the disadvantages of growing winter wheat and other crops, a computerized diagnostic program of feeding on the actual condition of farmland has been developed. Under this program, each farm will be provided with an agrochemical passport for feeding winter wheat and cotton. If it is followed we can not only reach to the planned yield but also increase soil productivity.

Grain yield produced from imported varieties such as Krasnodarskaya-99, Grom, Moskvich, Tanya, Starshina, Pamyat, Pervica, Nota, as well as from winter wheat varieties created under local conditions, such as Chillaki, Andijan-1, Andijan-2, Andijan-4, Bobur, Asr, Durдона, Matonat, Yaksart, Khazrati, Bashir, Omad in the main areas. The organization of the sowing season for this year's harvest in a cohesive way, the correct selection of varieties, ensured the achievement of high yields in the soil and climatic conditions of each region of the Republic. Timely implementation of advanced agro-technical measures has allowed to increase grain production, further improve its quality and consumer properties. The key to success was also the introduction of modern technologies in agriculture, the achievements of advanced farming techniques, the timely implementation of measures to fully establish the seed system. .

Methods of the research

Soil and climatic conditions of Khojayli district of the Central region of the Republic of Karakalpakstan, winter wheat, past crops were studied at the farm "Urazboy-ota". In our experiment, the varieties of winter wheat "Kroshka", mung bean "Durдона", soybean "Arzuv", sesame "Black Prince" are planted according to the sowing norms set in the recommendations.

Scientific research work is being carried out on the theme the selection of promising winter soft and hard wheat varieties, recommended for new plantings, creating scientific basis of agrotechnical elements of their local production taking into account the soil and climatic conditions of the country. Scientific research work is being carried out on yield of winter soft, hard wheat varieties are selected for each region based on the results of development and research of agronomic elements of cultivation of promising varieties with high grain quality indicators and their optimal sowing times and the implementation of fertilization standards.

Results of the research

After winter wheat, 12-21 quintals of root mass and plant residues remain in the soil, which has a positive effect on the increase of humus content, improvement of water and physical properties. After winter wheat, the field is empty in early July. Intermediate crops can then be planted to make better use of the land, or reclamation can be carried out with the application of organic fertilizers.¹

There are 3080-3180 thousand plants of winter wheat per 1 hectare . In order for winter wheat to overwinter well, it needs to have a thick snow cover during the winter months. The winter months in Karakalpakstan will be dry and cold without snow. Therefore, wintering of winter wheat is very important.

When determining the height of the plant stem and spike biometric parameters, the following was found. Before harvesting, the plant height is 78-7-83.1 cm, the length of the spike is 9.1-9.0 cm, the number of spikes is 19.2-18.9, the number of grains in the spike is 41.2-40.7 grains, grain weight was 1.68-1.70 g, 1000 grains weighed 38.8-37.0 g.

When mung bean was sown for grain before winter wheat intermediate crop (mung bean) + 20 t / ha of manure + 1.0 t / ha of celadon green (var. 8-10), then winter wheat, it provided a yield of 50.0-51.5 q / ha. This indicates that it was 10.0–11.5 q / ha higher than the control variant (var.1) in which winter wheat was sown after winter wheat.

When we determined the yield of winter wheat by variants, we found the following.

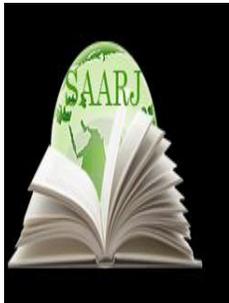

The average yield of the variants was 39.5-51.5 q / ha. The lowest rate is observed in variant 1, i.e. when winter wheat was sown after winter wheat (39.5 q / ha). In 2-4 variants when mung bean, sesame and soybean sown for grain before winter wheat it was 41.5-43.0 q / ha, in 5-7 variants when mung bean, sesame and soybean sown for grain before winter wheat, then 10 t / ha manure + 1.0 t / ha celadon green was used, it was 44.0-47.5 q / ha and in 8-10 variants when after harvesting mung bean, sesame, soybean, intermediate crop (mung bean) + 20 t / ha of manure + 1.0t / ha of celadon green was used it was 50.5-51.5 q / ha.

CONCLUSION

To scientifically substantiate the duration of sowing of past crops, the efficiency of crop structure in the system of crop rotation of local mineral agro-ores, organic fertilizers in order to obtain high yields of winter wheat and increase soil fertility in saline soil conditions of the Republic of Karakalpakstan is achieved.

ABSTRACT

The article presents the results of a study of the physico-mechanical properties of the soil in the fields after harvesting crops. The advantages and peculiarities of the method of land cultivation, the Strip-Till technology, as well as search for the possibility of using it for the cultivation of re-crops in permanent furrows and in row spacing ridges. The data obtained as a result of experimental studies to determine soil moisture and hardness, as well as the quality of soil tilling by the recommended working bodies, are presented.

KEYWORDS: *Physico-Mechanical, Experimental, Moisture*

1. INTRODUCTION

Total work on further improvement of the system of crop placement based on soil and climatic conditions of the regions of The Republic, increasing the efficiency of land and water resources, sustainable enrichment of the domestic market, maintenance and cultivation of agricultural products to expand processing and export Great attention is paid to the timely and quality conduct of the complex [1].

It is known that the main and pre-sowing tillage is the most energy-intensive process in agricultural production, accounting for 40-50% of the total energy spent on the cultivation of agricultural crops in the country. Therefore, reducing energy consumption in the main and pre-sowing tillage of lands saves a large amount of fuel and lubricants in agricultural production, reduces labor costs and other costs, and increases the durability of machines and their working

bodies. The result is a reduction in the cost of the product grown. One of the main ways to ensure energy efficiency in the cultivation of lands in the conditions of the republic is the use of combined aggregates [2].

Combined aggregates perform several technological operations on soil preparation and sowing in one pass. As a result, the negative impact of tractor motors on the soil is reduced, the quality and productivity of work is increased, the time of tillage is reduced and moisture is retained in it, and fuel and other costs are reduced. Combined aggregates used in tillage are based on the sequential installation of machines or working bodies that perform various technological processes in tillage, the use of which mainly leads to a reduction in the number of field passes of machine-tractor units.

Nowadays, after harvesting the grain crops, the land is plowed, prepared for sowing and then sown separately for the sowing of secondary crops. Most importantly, a lot of time is spent on pre-sowing preparation. As the soil moisture is low, it is necessary to irrigate the field before plowing. Then you have to wait 4-5 days until the soil matures, and only then begin to prepare the soil.

2. MATERIALS AND METHODS

Based on the scientific research, it is possible to perform several operations (land preparation, planting, etc.) in one pass by creating combined aggregates.

Minimal tillage with a combined unit, ie all technological processes of primary and pre-sowing tillage, without tillage and road tillage, and in one pass from the field, in order to prevent its over-compaction and structural damage and reduce labor, energy and fuel consumption. The development and widespread introduction of machines and aggregates [3,4,5,6,7] is a topical issue.

Field agrophony, physical and mechanical properties of the soil are of great importance in substantiating the parameters of such aggregates. With this in mind, the physical and mechanical properties of the soil in the fields where wheat was harvested, ie soil hardness according to the profile of the field (TST-Agro cluster in Lower Chirchik district of Tashkent region, Bobur femoral farm in Kamashi district of Kashkadarya region). In this case, soil hardness was measured at seven points along the slope profile (Figure 1).

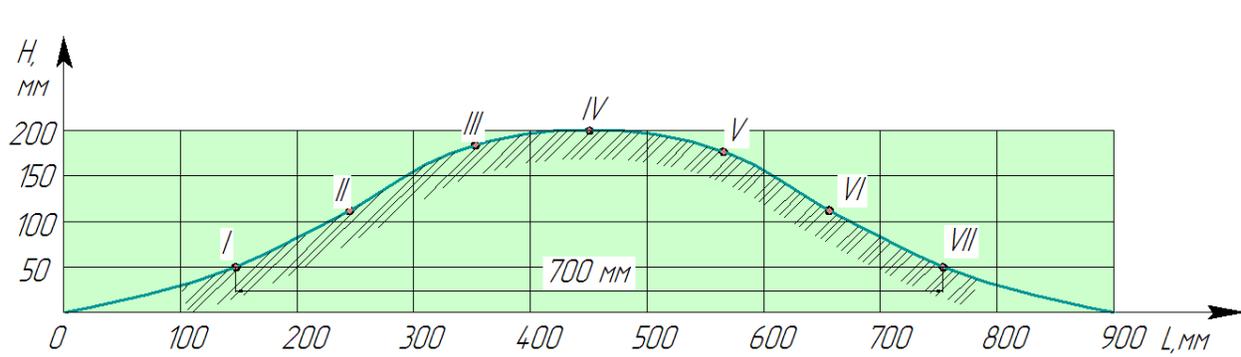

Figure-1. Furrow profiles.

Based on the results obtained, we create histograms on the profiles of the field of wheat sown in the open field and the field of wheat sown between rows of cotton (Figures 2,3,4,5).

3. RESULTS AND DISCUSSION

Based on the results obtained, we can conclude that in the wheat field planted between rows of cotton, the soil hardness of the egat profile is relatively less than in the open wheat field. As a result, a wheat field planted between rows of cotton is preferred for replanting.

Also, the results of research on energy-resource-water-saving technology of cultivation of agricultural crops in cotton and fallow lands and minimal tillage with a combined aggregate [8,9,10] bulk weight (density) and studied at depths of 0 to 10 cm, 10 to 20 cm, and 20 to 30 cm before processing (Table 1). The result showed that the volume weight value at the top of the egat profile was low.

The results obtained are given in the table 1.

TABLE 2 VOLUMETRIC WEIGHT (G/CM³) OF FIELD SOIL FREED FROM WHEAT BEFORE PLANTING AND PROCESSING.

Horizontal, cm	Indicators	Sample location		
		Marza	Side of furrow	Rut
0-10	M _{av.} , g/cm ³	1,07	1,02	1,11
	σ, g/cm ³	0,03	0,02	0,04
	V, %	2,8	2,0	3,6
10-20	M _{av.} , g/cm ³	1,13	1,15	1,19
	σ, g/cm ³	0,08	0,05	0,03
	V, %	6,6	4,3	2,5
20-30	M _{av.} , g/cm ³	1,17	1,20	1,21
	σ, g/cm ³	0,03	0,03	0,02
	V, %	2,8	2,8	2,0

Soil moisture and hardness were also banned at depths of 0 to 10 cm, 10 to 20 cm, and 20 to 30 cm (Table 3). According to the experimental results, the soil moisture in the upper part of the slope profile (0-10 cm) was 5.4-6.1%. This indicator is not sufficient for seed germination. At the bottom of the Egat profile we can see that the soil moisture is 11.7-12.5%. Soil hardness was 3.8-4.02 MPa at the top of the egat profile and 5.32-5.45 MPa at the bottom.

TABLE 3 SOIL MOISTURE AND HARDNESS AT THE EXPERIMENTAL SITE

Horizontal, cm	Sample location		
	Marza	Side of furrow	Rut
0-10	5,4/3,80	6,0/3,93	6,1/4,02
10-20	9,8/5,10	10,2/5,14	10,5/5,19
20-30	11,7/5,32	12,2/5,39	12,5/5,45

Note. In the figure-soil moisture is at%

in the denominator - soil hardness is atMPa

4. CONCLUSION

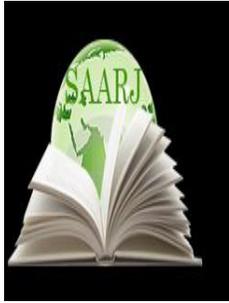

To determine the mass of straw in the experimental plot, 1m² of straw residue was collected from each suitable site. Calculations showed that the mass of straw on the experimental plot was 4.2 t / ha and the coefficient of variation was 15.6%.

In addition, research on resource-efficient agrotechnologies of perennial tillage [11] shows that the impact of resource-efficient agrotechnologies on the agrophysical and agrochemical properties of the soil, changes in its mechanical composition, evaporation of soil moisture and water permeability properties require the development of new tillage aggregates in the cultivation of secondary crops.

The above scientific research also shows that the planting of secondary crops requires the development of energy-saving aggregates for field preparation.

INFLUENCE OF THE HEATING TEMPERATURE ON THE PROPERTIES OF STEEL

D.M. Berdiev*; A.A. Yusupov*; A.Kh. Abdullaev*; B.K. Abdullaev*

*The Tashkent State Technical University,
Tashkent, UZBEKISTAN

ABSTRACT

The article analyzes the methods of heat treatment of iron-carbon alloys. In particular, the modes of heat treatment of steel grade 45 and 40X were studied. The essence of unconventional modes is that by means of preliminary high-temperature HT, a high level of defectiveness of the crystal structure of steel is achieved. Thus, it has been shown that with significant heating of steel, extreme temperatures are observed at which, after cooling, structures with an increased (after normalization) dislocation density or with a high level (after quenching) are formed.

KEYWORDS: *Austenitic Steel, Iron, Steel 40X, Melting, Low-Carbon Martensitic Steels*

INTRODUCTION

An important problem of modern mechanical engineering and repair enterprises is to reduce the cost of metal and energy resources. Since the main parts of machines are made of carbon and low-alloy steels, the service life of which is mainly determined by mechanical properties, they are hardened by heat treatment (TO) - quenching and tempering. The accepted standard modes of maintenance of metal products, as a rule, provide high mechanical properties, but in some cases this turns out to be insufficient. In particular, this concerns the toughness of metals [1], which ensures high product reliability.

In recent years, in order to exclude large grains in blanks, considerable attention has been paid to structural heredity [2]. Dependence of the mechanical properties of low-carbon martensitic steels on the structural heredity during HT [3]. In articles [4] heredity is considered during phase transformations.

MATERIALS AND METHODS

Based on the studies carried out, it was established that all unconventional modes of steel HT are based on the fundamental laws of phase transformations [5]. The essence of unconventional

modes is that by means of preliminary high-temperature HT, a high level of defectiveness of the crystal structure of steel is achieved. This allows, upon repeated heating, depending on the completeness of repeated structural transformations, to significantly refine the steel grain [4]. However, in the studies carried out, there were unresolved theoretical and practical issues related to phase transformations of steels:

- the effect of the heating time on the temperature and the value of the extremum of the dislocation density after $\gamma - \alpha$ - transformation upon cooling in air and after annealing of steel upon cooling together with the furnace.

In this work, not only the mechanism of $\alpha - \gamma - \alpha$ - transformations is considered, but also it is noted that with high heating there is an extreme temperature at which atoms of refractory impurity phases pass into a solid solution (austenite). In this case, upon cooling ($\gamma - \alpha$ transformation), the dislocation density in the α - phase increases. During repeated phase recrystallization, some of these dislocations are retained, which significantly increases the performance of steel products.

Investigated samples of steels 45 and 40X industrial smelting. Armco iron samples were used as a reference material. Steel grades are regulated by STSD 3541-79. The chemical composition of the investigated heats is shown in Table 1.

TABLE 1 CHEMICAL COMPOSITION OF STEEL SAMPLES FOR RESEARCH

№	Steel grades	Element content,% wt.						
		<i>C</i>	<i>Mn</i>	<i>Si</i>	<i>S</i>	<i>P</i>	<i>Cr</i>	<i>Ti</i>
1.	Армко-Fe	0,04	0,04	0,03	0,02	0,015	-	-
2.	45	0,42	0,65	0,26	0,02	0,02	-	-
3.	40X	0,41	0,74	0,35	0,025	0,022	0,92	-

The samples were thermally treated at different temperatures: the initial temperature for each steel was chosen from the calculation above the critical point of heating temperatures $A_{c3} + 30 \div 50$ °C, and then at temperatures of about 900, 1000, 1100, 1150, and 1200 °C. The holding time at each of the above temperatures was different: 5 minutes, 20 minutes, 2 hours, and 5 hours. Depending on the holding time, heating was carried out in a salt bath or in an oven. The samples were cooled in air, in water or oil, as well as while cooling together with the oven. Thus, the thermal prehistory of steel was created. The repeated phase recrystallization was always carried out with heating to $A_{c3} + 30 \div 50$ °C for each steel.

Analyzes were carried out: metallographic - on microscopes MIM-8M [6]; X-ray diffraction - on the DRON-2.0 installation. The state of the fine structure of steel (dislocation density), the amount of retained austenite, the period of the crystal lattice, and the amount of carbon in the phases of hardened steel were determined [7].

Metallographic and X-ray studies showed an intensive growth of austenite grain with an increase in the heating temperature, and the dislocation density was very low, although an extreme temperature is clearly observed for steels 45 and 40X, when the dislocation density is increased (Table 2), and the austenite grain grows (Fig. 1).

TABLE 2 THE AMOUNT OF AUSTENITIC STEEL GRAIN DEPENDS ON THE HEATING TEMPERATURE

Heating temperature, °C	Steel grades					
	45			40X		
	d_{av} , mm	N ball	ρ , 10^8cm^{-2}	d_{av} , mm	N ball	ρ , 10^8cm^{-2}
850	0,017	9	ЭТАЛОН	-	-	-
870-880	-	-	-	0,0193	8	etalon
1000	0,106	3	1,7	0,021	8	1,73
1100	0,168	2	3,5	0,032	7	5,57
1200	0,214	1	1,5	0,102	3	1,75
1260	-	-	1,5	0,107	3	4,37

Note: d_{av} – average grain diameter; N – ball number according to STSD 8639-92

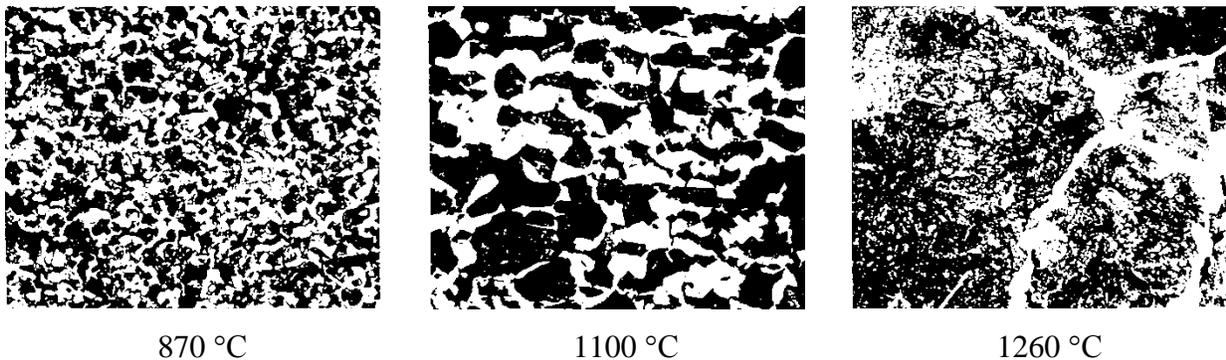

Fig. 1. Microstructure of steel 40X after annealing at heating temperatures: 870, 1100, 1260 °C ($\times 100$).

The difference in the density of dislocations between the maximum and minimum in percentage terms is significant, but in absolute terms it is very small: $\Delta\rho \approx 1,64$ or $3,84 \cdot 10^8 \text{cm}^{-2}$. Naturally after the repeated phase of crystallization and crimping, when the density of dislocations grows by three orders of magnitude up to 10^{11}cm^{-2} under the influence of the low density.

With an increase in the heating temperature, a certain growth of austenite grain is observed. However, in all cases, there is an extreme heating temperature of 1100 °C with an austenitization time of 20 min, when, after cooling, the maximum level of dislocation density can be recorded (Table 3). From the tabular data, a relatively large increase in ρ is seen, but the absolute difference is not large.

When normalizing large-sized parts, the holding time in the austenitic region during the heating process can be calculated in hours. In this case, the effect of the influence of extreme temperature on the state of the fine structure of steel has not been determined [8].

Studies have shown that with an increase in the holding time during heating of the steel after the γ - α transformation, the density of dislocations of the α - phase decreases, and the peak of the maximum shifts to lower heating temperatures (Fig. 2).

TABLE 3 DISLOCATION DENSITY OF STEELS AFTER NORMALIZATION AT DIFFERENT HEATING TEMPERATURES (AUSTENITIZATION 20 MIN)

Normalization temperature T , °C	Armco-iron		Steel 45		Steel 40X	
	$\rho, 10^9 \text{ cm}^{-2}$	ρ/ρ_{900}	$\rho, 10^9 \text{ cm}^{-2}$	ρ/ρ_{850}	$\rho, 10^{10} \text{ cm}^{-2}$	ρ/ρ_{870}
$A_{c3} + 30 \div 50$	–	–	1,0	–	1,13	–
900	0,37	–	–	–	1,13	1,0
1000	0,88	2,38	1,73	1,73	2,31	2,0
1100	1,40	3,78	4,5	4,5	4,54	4,0
1200	0,73	1,97	2,99	2,99	1,26	1,08

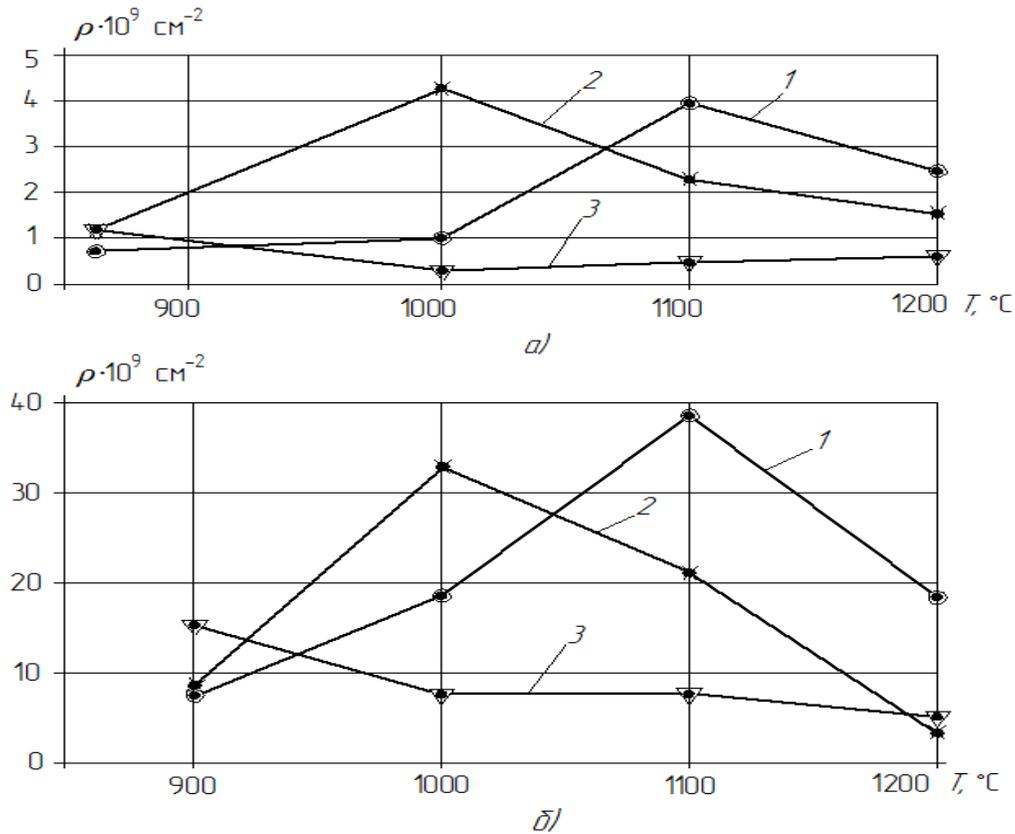

Fig. 2. Influence of temperature T of heating and holding time 20 min (1), 2 h (2), 5 h (3) on the density ρ of dislocations of normalized steels 40 (a) and 40X (b)

Quenched steel samples are the most convenient for studying the structure parameters, since their main structure is martensite and a certain amount of retained austenite. Of particular importance is the density of dislocations in steels quenched from a temperature (1100 °C) of heating in comparison with quenching in an environment from the usually accepted temperatures (above the heating temperatures of $A_{c3} + 30 \div 50$ °C). This difference is large at low carbon content, for example, 288% for armco iron. For samples made of steels 45 and 40X, it is 37 and 69%, respectively. It is possible to assume that the effect of the growth of the density of dislocations in the hardened and low-tempered steel in the case of the hardening with an extreme temperature (1100 °C) at the speed of In this case, in the process of quenching cooling and at low tempering,

a redistribution of carbon atoms between phases was observed: carbon atoms pass into dislocations and into residual austenite.

The influence of the holding time on the dislocation density at different heating temperatures after quenching cooling is shown in Fig. 3. The nature of the change in the density of dislocations with an increase in the holding time is similar to the change in density during normalization. The same results were obtained in the study of steel 40X.

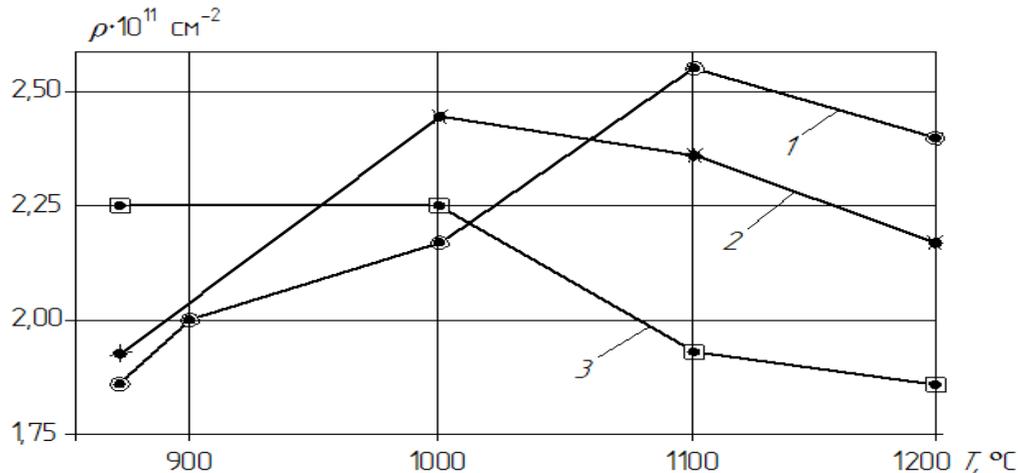

Fig. 3. Influence of temperature T and holding time 20 min (1), 2 h (2), 5 h (3) on the density ρ of dislocations in hardened steel 45: tempering at heating 200°C

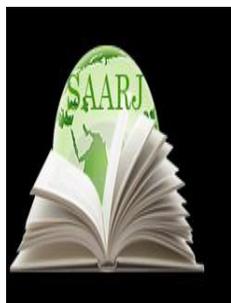

CONCLUSION

Thus, it has been shown that with significant heating of steel, extreme temperatures are observed at which, after cooling, structures with an increased (after normalization) dislocation density or with a high level (after quenching) are formed. The extrema of the dislocation density occur at temperatures of 1100, 1000, and 900°C with holding times of 20÷30 min, 2 h, and 5 h, respectively. The increase in the dislocation density depends on the content of carbon and alloying elements in steels.

ABSTRACT

The article provides information on the determination of the iodine content of in species of Diospyros kaki (PCh) persimmon chocolate, Diospyros kaki (KH) Korolyok-Hyakume persimmons, the extracts of Cucurbita pepo L – pumpkin fruits and Exocarpium Citri L-lemon peel, which are grown in the conditions of Andijan region, through potentiometric and iodometric titration methods.

KEYWORDS: *Persimmon, The Extracts Of Lemon Peel And Pumpkin Fruit, Potentiometric And Iodometric Titration, Electromotive Force – EF, Increase Of Potential After Equivalence Point, Starch Indicator Solution, Titration Graph, Approximate Titration, Exact Titration.*

INTRODUCTION

Although synthetic drugs containing iodine are used in thyroid disease, they can adversely affect certain systems in the human body, such as the gastrointestinal tract in patients with pathology of the gastrointestinal tract. As a result, iodine deficiency, which leads to thyroid dysfunction due to poor absorption of iodine in the body, is not eliminated [1; p. 19-23].

Given the side effects of synthetic drugs on the human body, we recommend that patients with thyroid disease use drugs made from various medicinal plants or iodine-containing food supplements. Such medicinal food supplements are used in practice in the treatment of thyroid disease and are highly effective [1; p. 19-23].

Iodine medicinal food additives are prepared from iodine-containing medicinal plants, or enriched with natural biodiesel, depending on the beneficial properties of the plant for the human body. In order to prepare medicinal food compounds containing iodine, the amount of iodine in

medicinal plants is first checked. Potentiometric and iodometric titration methods can be used to determine the amount of iodine in solutions of these plant extracts [2; p. 24-26].

The potentiometric analysis includes methods for determining the concentration of ions in a solution based on the measurement of the potential difference (electromotive force - EF) between the electrodes immersed in the test solution.

Their oxidometric capacity was used for the potentiometric determination of iodine in the analyzed solutions. Since the iodine ion is electroactive in an aqueous solution under given conditions, the oxidation-reduction pair is formed by titrant in order to determine the endpoint, ie 1 drop of 0,1 N KI solution is added to the solution to form IO_3^- / I^- pair.

In doing so, I_2 falls into precipitate. The solubility of the resulting precipitate is small (0.28 g / l).

When the titration of I_2 in the solution was completed, the last added 1 drop of $Na_2S_2O_3$ led to an increase in the electrode potential. The rise of the potential after the equivalence point can be explained using the formula [3; p. 10-20].

$$E = 1,33 + \frac{0,059}{6} \lg \frac{[IO_3^-][H^+]^{14}}{[I^-]^2}$$

To assess the accuracy of the results of potentiometric determinations, we also directly determined the amount of iodine in persimmons, pumpkins and lemon peel by iodometric titration.

The method is based on the interaction of potassium iodate with potassium iodide in an acidic environment (1) and titration of the released iodine with sodium thiosulfate (2) [3; p. 10-20].

The amount of iodine in mg in the solutions obtained for analysis was calculated according to the following formula:

$$X = \frac{N_t * V_t * E_a * V_{er}}{1000 V_{ek}}$$

Here, N_t – titrant normality;

V_t – total volume of titrant consumed, ml;

E_a – equivalent molar mass of iodine compound in the test solution;

V_{er} – the mass of the sample to be tested, mg;

V_{ek} – the volume of titrant solution consumed at equivalent point, ml.

EXPERIMENTAL PART

Samples of Diospyros kaki (PCh) palm chocolate, Diospyros kaki (KH) Korolyok-Hiakume palm varieties, Cucurbita pepo L - pumpkin fruits and Exocarpium Citri L-lemon peel solution of lemon peel grown in the Andijan region as the object of analysis for the research work.

2 grams of persimmons, lemons and pumpkins weighing to the nearest 0,01 g were placed in three separate porcelain crucibles, each containing 3 ml of 20% potassium carbonate and 2 ml of distilled water, moistened, the crucible lids closed and left at room temperature for 16 h. The crucibles were then placed in a sand bath with the lid open and heated to 150–250 °C until the smoke stopped. The muffles were then placed in the muffle furnace with the lid closed and kept at 250 °C for 30 min. The temperature in the crucible samples was gradually raised to 500–550 °C until complete combustion. The firing process was continued until a white residue remained in the crucibles. A solution of 2 N sulfuric acid was added to the obtained white ash until pH = 2, and distilled water was added to them so that the volume of the solution was 100 ml. Due to the slight turbidity in the resulting solutions, the solutions were centrifuged for 10 min and separated from the precipitate [4; p. 30-33].

Potentiometric determination of iodine. Iodine in solutions of palm, lemon, and pumpkin samples prepared for analysis was separated from 50 ml of the solutions obtained for potentiometric testing. Potentiometric titration of I-ions in the obtained solutions determined the amount of iodine in the solution. I-130 ionometer was used before potentiometric determination of iodine was initiated. Initially, the filtrate from the palm sample was separated from 10 ml using a 10 ml graduated pipette and placed in a 50 ml titration beaker. To the solution was added 1 ml of 2 n H₂SO₄ solution, stirred by adding 10 ml of 0,1 N KI solution, then cover the container with a stopper and place in a dark place for 10 minutes. Add 0,01 N Na₂S₂O₃ from the burette to the mixture, stirring until the colour turns light yellow to the orange test solution. Approximately 2 ml of starch indicator solution was added to detect free iodine in the test solution. As a result, the mixture turned brown and the titration was continued with 0,01 N Na₂S₂O₃ solution until the final colour of the solution disappeared. The Pt indicator and silver chloride comparison electrodes, as well as the steel piece sterile coated completely with polyethene, were washed and dissolved in distilled water. The solution in the beaker was placed in an MM-3M magnetic mixer with electrodes and a magnetic stirrer rod. A constant rotation speed of the magnetic stirrer was set to keep the solution stirring continuously during the titration. The main attention was paid to the fact that the solution does not scatter and no gaps are formed around the electrode. The titration process was continued until the brownish colour of the solution disappeared [4; p. 30-33].

In this process, the ionomer potential was measured and the titration was performed by adding titrant fractions every 40-60 seconds from a standard solution of Na₂S₂O₃ in a micro burette with a volume of 25 ml. Since the amount of iodine in the test filtrate was very low, the titration was carried out by adding the titrant fractions dropwise.

40-60 seconds after the addition of each fraction (drop) of titrant, the ionomer index was expected to remain constant, and these potential values were recorded in the titration protocol. The titrant volume up to the drop corresponding to the largest potential-jump was taken as the volume corresponding to the equivalence point. The amount of iodine was calculated based on

the results of 6-7 repetitive experiments conducted in parallel. After each titration, the used vessels and electrodes were washed with distilled water.

The volume of sodium thiosulfate corresponding to the potential jump in the initial titration was approximated, and in subsequent parallel titrations, the titrant was added dropwise in the jump area. In the approximate titration, 1 ml of titrant was added [4; p. 30-33].

The point of slow jump of the potential corresponds to the equivalent point. To find the volume of titrant used for titration, the volume of titrant added during the drop titration was added to the volume of titrant (e.g., 4 ml) that went to the potential jump in the approximate titration. To find the volume of titrant used for droplet titration, the number of drops was multiplied by the volume of one drop.

To find the volume of one drop, the number of drops in 1 or 2 ml of solution was determined and the corresponding volume was divided by the number of drops.

Potentiometric titration of iodine in solutions of lemon and pumpkin fruits was carried out in the same way.

The iodometric titration method was used to estimate the potentiometrically determined amount of iodine in persimmon, lemon, and pumpkin fruit extracts.

Dissolve 10 ml of the test sample obtained for analysis in a conical flask with a volume of 250 ml in 100 ml of distilled water to the measured volume. As the resulting solution was turbid, it was filtered. To the resulting solution was added 1 ml of 2 N H_2SO_4 solution, stirred by adding 5 ml of 10% KI solution, cover the container with a stopper and leave in a dark place for 10 minutes. Because before titration, an additional process under the influence of light in the reaction mixture, oxidation of iodide ions to iodine can occur [5; p. 102-105].

$Na_2S_2O_3$ with 0,01 N from the burette was added to the test solution, stirring until the orange solution turned light yellow. When approximately 2 ml of starch indicator solution was added to the test solution, the mixture turned brownish blue. The titration was continued until the final colour of the solution disappeared.

Given the decrease in the accuracy of the analysis when using a completely uncooled starch solution, the solution was titrated while cooled. An iodine starch complex is formed which reacts very slowly when the indicator solution is added too early, which leads to high results of the analysis.

The reaction was carried out at a moderate room temperature of 25 °C so that the indicator solution did not lose its sensitivity when heated due to the increased volatility of iodine [5; p. 102-105].

RESULTS AND THEIR DISCUSSION

A potentiometric titration method was used to determine the amount of iodine in solutions made from dates, lemon peel and pumpkin fruits. The results of the exact and approximate titrations are presented in Table 1.

As can be seen from the results in the table, the abrupt jump in EF corresponded to a titrant area of approximately 5 ml in the approximate titration and 7 ml in the exact titration. After adding 4

ml of titrant in the approximate titration and 6 ml in the exact titration, we started dripping titration to find the exact equivalent point.

In the potentiometric titration process, the titrant consumption at the equivalence point was 5 ml and the total titrant consumption was 14 ml when titrated with sodium thiosulfate with the addition of 15 ml of distilled water to 10 ml of the persimmon extract solution.

The following equation for the amount of iodine in persimmon extract was determined on the basis of the following formula, taking into account that the iodine content of the persimmon solution tested for normality of the titrant used in the experiment was 0,01 n and the equivalent of potassium iodate was 214

$$\chi = \frac{N_{Na_2S_2O_3} V_{Na_2S_2O_3} \vartheta_{KIO_3} V_{er}}{1000 V_{ek}} = \frac{0,01 \cdot 14 \cdot 214 \cdot 10}{1000 \cdot 5} = 0,0599 \text{ mg} = 59,9 \text{ mkg was obtained.}$$

To carry out potentiometric titration with the addition of 15 ml of distilled water to a volume of 10 ml of a solution of lemon peel extract, 15 ml of a 0,0001 N solution of sodium thiosulfate obtained as a titrant was used.

The volume of titrant consumed at the equivalent point was 6 ml, and if we determine the amount of iodine in it, $\chi = \frac{N_{Na_2S_2O_3} V_{Na_2S_2O_3} \vartheta_{KIO_3} V_{er}}{1000 V_{ek}} = \frac{0,0001 \cdot 15 \cdot 214 \cdot 10}{1000 \cdot 6} = 0,00053 \text{ mg} = 0,53 \text{ mkg was obtained.}$

When 15 ml of distilled water was added to 10 ml of pumpkin extract solution, 20 ml of 0,0001 N titrant solution was used for potentiometric titration. Taking into account that the volume of titrant consumed at the equivalent point is 5 ml, the amount of iodine in the solution was determined to be

$$\chi = \frac{N_{Na_2S_2O_3} V_{Na_2S_2O_3} \mathcal{E}_{KIO_3} V_{er}}{1000 V_{ek}} = \frac{0,0001 * 20 * 214 * 10}{1000 * 5} = 0,00085 \text{ mg} = 0,85 \text{ mkg} \text{ was}$$

obtained.

16 ml of titrant ($Na_2S_2O_3$) was used to determine the iodine content by iodometric titration by taking 10 ml of a solution obtained by burning a mixture of palm fruit extract and potassium carbonate for analysis. The volume of titrant consumed at the equivalence point was 6 ml. Based on these data, the results of the analysis were calculated using the following formula.

$$\chi = \frac{N_t * V_t * E_a * m}{1000 V_{ek}} = \frac{0,01 * 16 * 214 * 10}{1000 * 6} = 0,057 \text{ mg} = 57 \text{ mkg}$$

Based on the values entered in the titration account, titration curves were constructed.

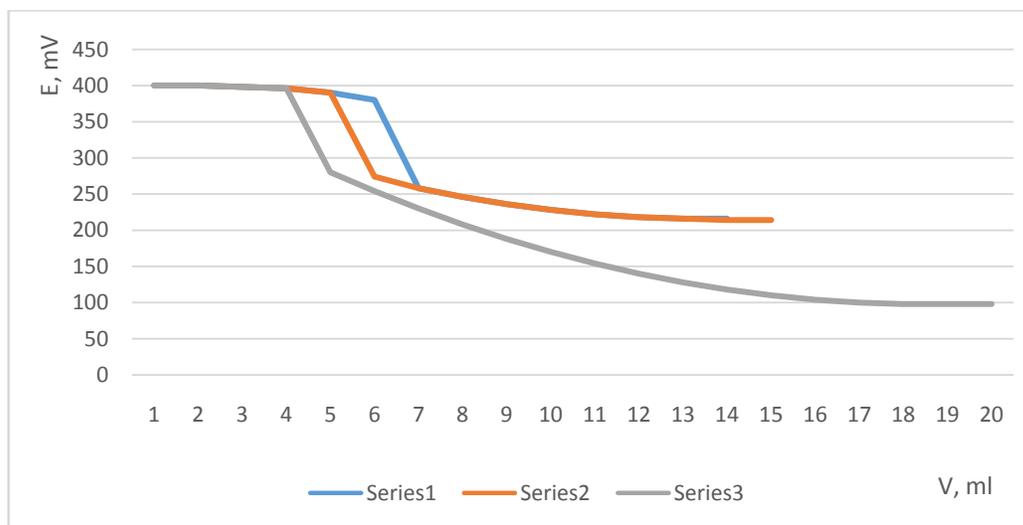

Figure 1. Graph of potentiometric titration of iodine content in persimmon, lemon peel and pumpkin fruit solutions.

When the iodine content of lemon peel extract of the same mass was determined by iodometric titration, the volume of titrant consumed at the equivalence point was 12 ml, and the total volume of titrant consumed was 28 ml. As a result of titration, the amount of iodine in the sample was found to be

$$\chi = \frac{0,0001 * 28 * 214 * 10}{1000 * 12} = 0,00049 \text{ mg} = 0,49 \text{ mkg} .$$

In the same order, 18 ml of titrant was used for pumpkin fruit extract. The volume of titrant consumed at the equivalence point was 5 ml. The amount of iodine as a result of titration was found to be

$$\chi = \frac{0,0001 * 18 * 214 * 10}{1000 * 5} = 0,00077 \text{ mg} = 0,77 \text{ mkg} .$$

The results of potentiometric determination of iodine content in solutions of persimmons, lemons and pumpkins are given in Table 2.

TABLE 2 RESULTS OF POTENTIOMETRIC AND IODOMETRIC DETERMINATION OF IODINE IONS IN PERSIMMON, LEMON PEEL AND PUMPKIN FRUIT SOLUTIONS

№	Objects to be analyzed	Theoretical amount mkg	<i>The results of the analysis, relative to 100 g of sample (χ, mkg)</i>	
			<i>Potentiometric titration</i>	<i>Iodometric titration</i>
1	<i>Persimmon</i>	60	59,9	57
2	<i>Lemon</i>	0,6	0,53	0,49
3	<i>Pumpkin</i>	1,0	0,85	0,77

If we compare the results of potentiometric and iodometric titration, we can see that the results of potentiometric titration are closer to the theoretical data.

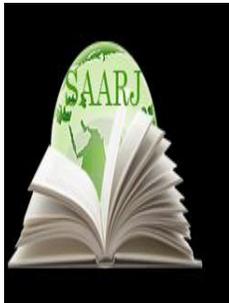

CONCLUSIONS

The following conclusions were drawn from the experiments to determine the content of iodine in the aqueous extracts of persimmons, lemon peel and pumpkin fruits obtained as the object of study and the analysis of the results obtained in them:

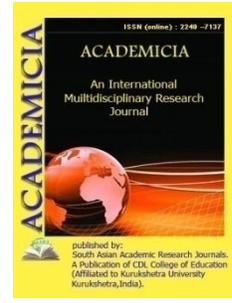

1. Diospyros kaki (PCh) persimmon chocolate, Diospyros kaki (KH) Korolyok-Hyakume persimmon species, Cucurbita pepo L - pumpkin fruits and Exocarpium Citri L-lemon peel sample grown in the Andijan region as the object of analysis for the research work.
2. Aqueous extracts of the obtained samples were isolated, and analytical solutions at concentrations of 10%, 25%, 50%, 75% and 100% were prepared using bidistillate water from the initially concentrated solutions to be tested, and analytical methods were selected to study the chemical composition of these solutions.
3. Potentiometric titration was performed to determine the amount of iodine in the extracts of persimmon, pumpkin and lemon peel. The iodometric titration method was used to assess the level of accuracy of the results obtained in potentiometric titration.
4. When the content of iodine in persimmon, lemon peel and pumpkin fruits was analyzed by potentiometric and iodometric titration methods, it was found that iodine exists 59,9 mkg in 100 g in the content of persimmon, 0,53 mkg in lemon peel, 0,85 mkg in pumpkin.

ABSTRACT

The article examines the principles of literary influence and poetic renewal in the development of world literature. There is illustrated the role of Anton Pavlovich Chekhov's works in world storytelling. The influence of the author's work on the works of the English writer Catherine Mansfield and the well-known writer of the Uzbek nation Abdulla Kakhar is studied on the example of their storytelling, the stages of development are studied. The system of ideological and artistic growth in stories is scientifically proven.

KEYWORDS: *National Mentality, Literary Influence, Artistic Renewal, Innovation, Logo, Contrast, Ideological Commonality, Socio-Psychological Determinism, Creative School.*

INTRODUCTION

As we know, there are many nations and people in the world. Every nation has its traditions, mentality and worldview. If we want to get acquainted with the worldview or mentality of a nation, we must refer to the literature created by the writers of that nation. Because writers write their works accordingly to their nations' worldview. Therefore, the literature of every nation has its uniqueness. However, we can find proportionality in the works created by representatives of different nationalities. Let us approach the works of the English writer Catherine Mansfield, the Russian writer A. Chekhov and the Uzbek writer Abdulla Kakharin this perspective.

Main part

Catherine Mansfield is a New Zealand writer who had made a huge contribution to the development of the story genre in her time. While working in this genre, she studied the traditions of different folk writers, perfected and continued them. The literary influence of Chekhov's work on Catherine Mansfield deserves special mention: "It is important that

Mansfield paid attention to the shortness of this story, which can be written long according to the tradition of English literature. Anyway, the works of this event were very close and valuable to her, it didn't happen without Chekhov's literary influence". [Л. Володарская, 1989, 13].

Catherine Mansfield was called "English Chekhov" by her contemporaries. In some of her stories, Chekhov's literary influence is evident. The proportionality in the writer's work can be seen differently. This can sometimes be seen in terms of the theme, sometimes in terms of the idea and the essence of the work. For instance, her story is named "The Little Governess", begins with a young girl going alone on a night train from England to Germany for working as a nurse. Moreover, this story also skillfully expresses the girl's worries, thoughts and feelings about going alone, without relatives. An old man accompanies the lady, who is walking in such fear and anxiety. At first, the lady is afraid of him and looks at him with suspicion. Later, because of her childish innocence, she began to respect the old man as if he were her grandfather, and unfortunately she trusted him. When she arrives in Munich, the old man takes the girl around the city and takes her home to carry out his nefarious plan. The girl ran away from the old man's house, but the young girl's confidence was broken. She realizes that she has made a big mistake by trusting the old man. The story is a convincing and appealing portrayal of the horrors of life, the ugliness of human morality, the shattering of a young girl's childish innocence.

In the play, the writer contrasted the innocence, purity, and sincerity of life with the opposite of lies and deception. This contrast plays an essential role in achieving the literary goal of the writer. In life, light and shadow are intertwined. As long as there is a shadow, we feel the light, its value, its superiority.

The author's goal of depicting the two poles of life - the positive and the negative - in the opposite way, is reflected in the same place. She would like to teach the reader the value of life and the need to spend one's life in the pursuit of good. Because the good in the face of evil, the light in the face of darkness (horror) is more clearly reflected in the imagination of the reader. Catherine Mansfield doesn't conclude the story, she doesn't talk about what "horror" is. It is up to the reader to decide.

Chekhov's story "Страх" is radically different from the above story in its plot and course of events. But these two works also have proportional aspects. This is reflected in the common meaning and ideas of the creators. Chekhov's story "Страх" also expresses the horrors of life, the shortcomings in human morality through the image of the protagonist Dmitry Petrovich Silin. The fear in this play serves to express how cowardly the protagonist is. Furthermore, dishonesty and betrayal are committed against the protagonist by close people, such as his friend and wife. But Silin behaves as if he expects the same thing to happen throughout the play. Because he tells his friend how much he is afraid of living, of people, that his wife doesn't love him, that life itself is horrible. His friend abuses his trust by using Dmitry Silin's weakness and betrays him with his wife. At the end of the story, it is clear that Dmitry Silin understands everything, as can be seen from the last words he said to his friend: "A misunderstanding is likely written in my destiny. If you understand something, then... congratulations to you. My eyes are dark" [А.П. Чехов, 1992, 357].

The tragic side of the protagonist of the story is that it depicts how weak, blind, reluctant the hero is in the face of life's difficulties, to turn a blind eye to the problems he encounters, to give up. And the extent to which people are capable of meanness is reflected. When Chekhov wrote this

story, it was, definitely, based on the mentality of his people. The balance between “Страх” and “The Little Governess” is that in both, the protagonists' trust is shattered. They were afraid of it.

Uzbek writer AbdullaKakhar also called one of his stories "Dahshat(Horror) “ AbdullaKakhar also writes about fear in “Dahshat”. But he takes a completely different approach to the subject. M. Sulonova studied the works of A. Kakhar a lot, according to her scientific research which was investigated in the mid-1960s, she mentioned that “When the author worked on the theme of the past in "Dahshat", the main goal was to reveal the oppression of the past, the violation of human rights; to inspire a deep hatred for the writer's classes and thus a greater appreciation of our free time" [D.Quronov, 2007, 35].

He illustrated the plight of women in the past with the story of the protagonist Unsin. Unsin was the youngest, eighth wife of Olimbekdodhoh, and she was ready to do anything to get rid of her fate, and she agreed with the dodhoh:

Unsin had to go to the cemetery at night and make tea. Only then does the plaintiff promise to let her go home. It's scary to go to the cemetery at night, but Unsin prefers this horror to live in dependence and captivity.

Well-known literary scholar Ozod Sharafiddinov said that Abdulla Kakhar wrote the story based on a popular legend. According to the legend, a young man had to go to the cemetery and stab the grave. But he stabs the hem of his robe, and he got scared and right away died.

The author was able to write a very impressive and meaningful story based on this legend. The most impressive feature of the story is that the protagonist is not afraid to sacrifice her life for freedom. Yes, she will perish physically, but she will be free spiritually.

Comparing the story “Dahshat”(horror) with Chekhov's “Страх”, Chekhov expresses that the protagonist did not fight fear, weakness and unwillingness in the face of life's hardships, on the contrary, Unsin had great courage and she was able to overcome fear, he even skillfully described her willingness to sacrifice her life.

Here are some thoughts of G. T. Garipova, Candidate of Philological Sciences, on "Dahshat" and "Страх ":“Chekhov used the following order of socio-psychological determinism: "grievance - misunderstanding - fear –dependance ."

“A. Kakhar, in contrast to A. Chekhov, created a slightly different system of philosophical and socio-psychological determinism: "dependance- the fear of captivity - the fear of death - death."A. Kakhar’s protagonist was able to overcome fear, physically she died, however she could achieve freedom spiritually” [Г. Гарипова,2012, 40].

CONCLUSION

Every writer can write a story for a different purpose. For example, some writers write to teach their readers to learn from the actions of the heroes in their work, to be able to behave like them in life, while others, on the contrary, draw conclusions from the mistakes of their protagonists, not to repeat their shortcomings in their lives.

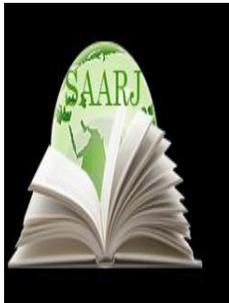

Catherine Mansfield and A. Chekhov wrote the above-mentioned stories with the aim that readers would read them, draw conclusions from the mistakes of the protagonists and not repeat

them in their lives. On the other hand, AbdullaKakhar created “Dahshat” to illustrate the heroine's devotion and actually, he would like to teach us that we should learn from her.

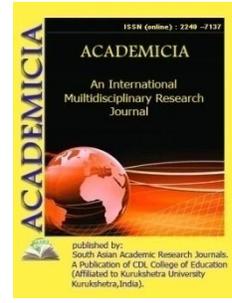

In conclusion, all three writers were able to write their shortstories skillfully and effectively. For this reason, surely we can say that these stories are still loved and read by literary lovers today.

ABSTRACT

The article shows the current economic situation in the Western Balkans, gives an assessment of the economic development of the countries at the present time, the development prospects. The “shadow” component that emerged in the 1990s plays a major role in the country's economic life. The unemployment rate in Albania is relatively low for the region. The role of SMEs in economies remains relatively small. In the countries of the third group there is a high level of social protection for society, but the social dialogue between entrepreneurs and their employees is poorly developed. Despite these improvements, per capita income levels are expected to remain 6.5% below pre-pandemic projections through 2022. Tourism-dependent economies, particularly Albania and Montenegro, will continue to struggle with restrictions on international travel.

KEYWORDS: *Western Balkans, Pandemic, Integration, Macroeconomic Indicators*

INTRODUCTION

The Balkan sub-region of Southeastern Europe (SEE) is a permanently complex ethno-confessional and territorial conflict area with a high value of an external factor that can exacerbate “frozen” conflicts at any time. This factor is in the interest of actors like the EU (in an institutional function), the USA, Germany, Great Britain (to a lesser extent a number of other European countries - Italy, Greece, Austria, CEE countries, France), China, Turkey, a Range of Middle Eastern countries (Saudi Arabia, United Arab Emirates, Qatar, Kuwait).

METHODOLOGY

In terms of socio-economic development, the countries of the Western Balkans are inferior to the EU members. According to the UN typology, the states in the region are still countries with transition economies. The process of creating market relationships is still ongoing. One of the

most important prerequisites for joining the EU is the completion of the socio-economic transformation process and the development of a market economy. Four of the five Western Balkans began these processes under very similar conditions, since all but Albania were part of a common state.

DISCUSSION

To date, three types of economic models are being followed that are emerging in the countries of the region.

The first group of countries includes North Macedonia, where the privatization of state property took place earlier than in the other countries examined. Through market-oriented reforms, the government has helped to significantly increase the share of small and medium-sized enterprises (SMEs) in the economy. It is characterized by a high level of protection of the sphere of work and legislation by the state.

Although the picture is ambiguous, the socio-economic model of North Macedonia can be expected to evolve towards building a continental European form, sometimes referred to as the socio-market economy. The weaknesses of the Macedonian model are high levels of corruption and organized crime.

Albania belongs to the second group of countries. It has made rapid progress in privatization, which makes the private sector's share of the Albanian economy the highest of all Western Balkan countries. The "shadow" component that emerged in the 1990s plays a major role in the country's economic life. The unemployment rate in Albania is relatively low for the region. This is because the majority of the population who could not find employment at home emigrated: According to various estimates (Albanian Statistical Agency, World Bank), 1.08 to 1.44 million 37 to 50 left Albania between 1990 and 2010 alone % of the total population of the country. The level of social protection in society is low.

Despite a number of institutional features that are not characteristic of industrialized countries, it can be argued that Albania is on the way to building a liberal market economy with its own peculiarities. Contrary to the classical model, the role of the country's financial sector, including the stock market, is insignificant, very high levels of informal relationships persist in society, public administration is ineffective, and organized crime is thriving.

The third group of countries includes Bosnia and Herzegovina, Serbia and Montenegro. Privatization processes were the slowest in this group of countries and therefore private entrepreneurship is lowest in the Western Balkans. A characteristic feature of all countries in this group is a high level of informal economy and crime. The role of SMEs in economies remains relatively small. In the countries of the third group there is a high level of social protection for society, but the social dialogue between entrepreneurs and their employees is poorly developed. The level of social benefits to the population as well as expenditure on health and education are at a low level. With regard to the "level of carelessness", this country category shows many similarities with the Mediterranean model. Although the differences between the classical Mediterranean model and the group analyzed are so great that they could be ascribed to a particular variety - the Balkan model.

RESULTS

In 2001-2019, the countries in the region managed to slightly narrow the income gap (by 14%) with the EU, but the gap is still very large. In 2019, GDP per capita in PPP for the Western Balkans was only 39% of the EU-27 level. The highest GDP per capita is in Montenegro - 23 thousand US dollars, the lowest in Albania - 11.8 thousand US dollars.

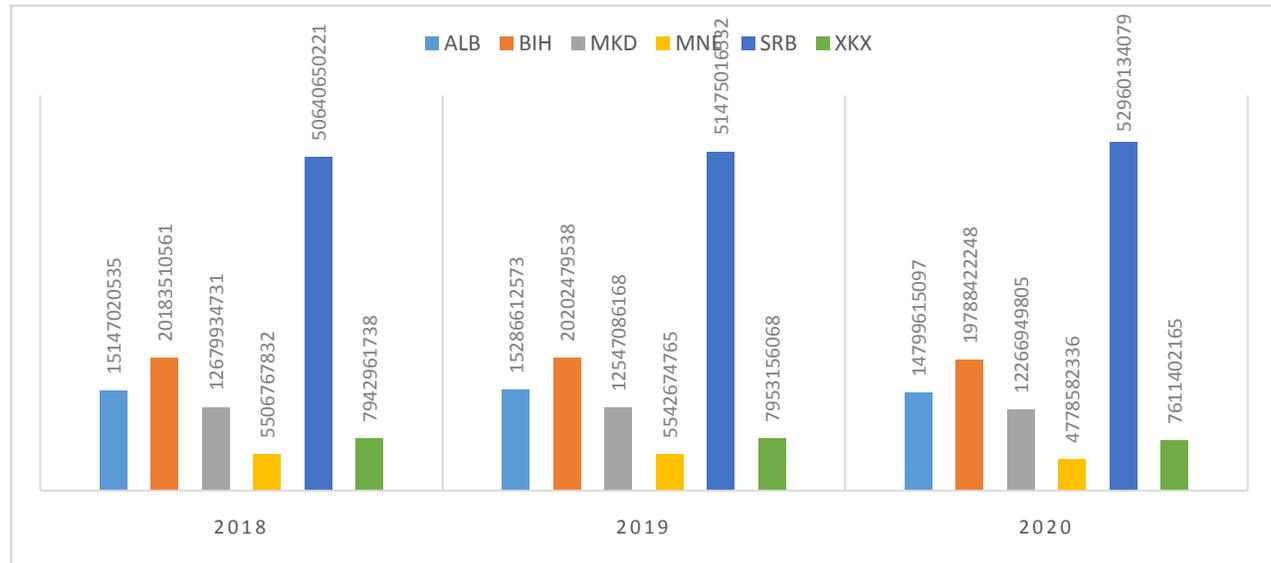

Figure 1. GDP USD¹

The structure of foreign trade between countries in the region is similar. The majority of exports are industrial goods - more than 60%, while the share of high-tech products does not exceed 5%. The exception is Montenegro, where more than 50% of exports are fuel and mining products. In other countries, the combined share of these positions is around 12%. Another important export product of the Western Balkans is agricultural products - more than 15% in the export structure. In the structure of imports of the countries of the region, industrial goods dominate - 64%.

The most important trading partner of all countries in the region is the EU, which supplies over 70% of the export volume of the Western Balkans. Regional trade plays an important role, with the countries of the region accounting for at least 15%. Russia is only one of the five largest export destinations in Serbia (approx. 5% of Serbian exports). The main importer into the countries of the region is also the EU - it accounts for more than 60% of the regional imports. In terms of regional imports, China ranks second with 7.7%, and Turkey ranks third (7.7%). Russia is one of the five most important import partners for three countries in the region: Serbia (7.9%), Bosnia and Herzegovina (4.7%) and Albania (2%) 3.

All countries in the region have trade deficits financed by foreign capital inflows and migrant remittances. The latter play an important role in the economies of the Western Balkans. Due to the high double-digit unemployment rate, the region is an exporter of labor. Remittances from migrants from the Western Balkans are the main source of capital inflow into the economy and even exceed the volume of foreign direct investment (FDI) attracted (with the exception of Albania).

Foreign capital plays an important role in the socio-economic development of the Western Balkans. In 2019, the region received \$ 6.9 billion in FDI, which is 0.4% of the global level. Serbia is the largest capital importer among the countries in the region. They account for over 60% of the inflows of foreign direct investment into the region. Albania is in second place by a large margin - just under 20%.

According to UNCTAD data, in 2019 Serbia became the second among the transition countries to have managed to attract the most foreign direct investment - 4.3 billion US dollars. The main industries that received FDI were: construction (28%), transport (16%), wholesale and retail (8%), information and communication technologies (5%). Serbia continued to develop export-oriented projects in the automobile cluster, which was the subject of foreign capital investment. Most foreign direct investment came from the EU in 2019. China has started to play an increasing role by investing in infrastructure and energy projects. The countries of the region have accumulated FDI of US \$ 73.5 billion (0.2% of the world volume), of which 60% in Serbia, 12% in Albania and Bosnia and Herzegovina. Due to the end of the privatization process of state property and the small size of the national economies, the volume of foreign capital inflow into the real economic sectors is insignificant.

Amid the COVID-19 pandemic, which plunged the global economy into one of the deepest recessions in 100 years, emerging and developing countries in the Europe and Central Asia (ECA) region experienced an economic downturn of 2% in 2020. According to forecasts, the pace of economic recovery in 2021 will be 3.6% slower than previously expected due to the new wave of coronavirus infections. Governments play an equally important role in shaping labor markets in this region: 86 million people work in the public sector, or 25% of the total workforce, well above the global average of 16%.

In the Western Balkans in particular, the proportion of people with higher education in the public sector is more than twice the average for the population as a whole.

The economies of the Western Balkans were hit by one of the worst coronavirus outbreaks in the ECA region in early 2021, with daily peak increases well above the regional average. Similar to Central Europe, the three economies of the Western Balkans (Bosnia and Herzegovina, Montenegro and North Macedonia) are among the top 10 EMDE countries with the highest COVID-19 deaths per capita, further adding to the burden on health systems. In most Western Balkans economies, widespread vaccine rollouts are not expected until the second quarter of 2021 (later than originally expected) as countries wait for vaccines to be delivered through the World Health Organization's COVAX mechanism. The supply of vaccines is hampered by delays in production and imports.

An exception is Serbia, where vaccination started at the end of December and 24 doses per 100 inhabitants were administered until mid-March, which is well above the average for the region and the world.

Economic growth in the Western Balkans is expected to accelerate to 4.4% in 2021 and then slow to 3.7% in 2022, provided that consumer and business confidence rebounds as the COVID-19 pandemic takes control and levels of political instability decrease. Despite these improvements, per capita income levels are expected to remain 6.5% below pre-pandemic projections through 2022. Tourism-dependent economies, particularly Albania and Montenegro, will continue to struggle with restrictions on international travel. Rising fiscal obligations in the

countries of the sub-region have reduced the scope for fiscal support and contributed to the development of macroeconomic imbalances. At the same time, state budget tensions will mount as additional spending will be required to counter the negative economic effects of the COVID-19 outbreak.

Despite these challenges, economic growth and productivity gains in Albania and North Macedonia will be supported in the medium term by accelerated structural reforms in the run-up to EU accession - provided that accession negotiations are not postponed again. The sub-region is also expected to benefit from the recently adopted EU Economic Support and Investment Plan, which calls for funds to be mobilized

Support the development of sustainable connectivity, the development of human capital, the improvement of competitiveness and inclusive growth, the transition to a green economy and digitization.

The COVID-19 crisis underscores the critical importance of investing in digital skills and technology to ensure continuity of the learning process, as well as the need to devote resources to modernizing information and communication infrastructure to enable distance learning for learners, especially children social classes, support vulnerable households. Die Einbeziehung der Ziele der grünen Wirtschaft in das Konjunkturpaket nach der Pandemie wird die Widerstandsfähigkeit gegenüber zukünftigen Schocks erhöhen und die Risiken verringern. Maßnahmen zur Förderung der Einführung grüner Technologien, einschließlich Bemühungen zur Verbesserung der Energieeffizienz durch Nachrüstung von Gebäuden, können hohe steuerliche Multiplikatoren haben, da sie arbeitsintensiv sind und zu Produktivitätssteigerungen beitragen.

In the long term, measures to create an environmentally friendly physical infrastructure, energy modernization, investments in education and training will be effective,

Investing in natural capital, green research and development and in low and middle income countries, spending on rural support (Hepburn et al. 2020). Improving energy efficiency, nature conservation, use of clean energy sources, sustainable development of the transport sector are also among the priority areas for investments that promote green development.

Bridging the gap between current spending and the level required to achieve the Sustainable Development Goals can contribute to sustainable growth in per capita income. Prioritizing investments in high-yield green infrastructure projects and promoting the widespread introduction of environmentally friendly technologies can support higher growth in the long term and at the same time help curb climate change.

Strengthening resilience to the risks of climate change, including the increasing frequency of severe cyclones and droughts, rising sea levels and falling crop yields, is crucial.

For the ECA region, especially since the region has many agricultural exporters and a large part of the population lives on the coast (World Bank 2019a). It is expected that in the coming decades more than 80% of the agricultural area will be exhausted due to lower rainfall (European Environment Agency 2019). Spending on investments in sustainable infrastructure can be offset through targeted rapid job creation measures, including the introduction of drought management technologies, landscape and water catchment management, ecosystem restoration and sustainable forest management.

Bridging the gap between current spending and the levels required to achieve the Sustainable Development Goals can contribute to sustainable growth in per capita income. Prioritizing investments in high-yield green infrastructure projects and promoting the widespread adoption of environmentally friendly technologies can support higher growth in the long term while helping to mitigate climate change.

Strengthening resilience to the risks of climate change, including the increasing frequency of severe cyclones and droughts, rising sea levels and falling crop yields, is crucial.

For many emerging and developing countries, investments in renewable energies can help improve energy security and at the same time reduce dependence on imported electricity. These investments could also ease the burden on energy subsidy budgets, which are quite high in the ECA countries and averaged more than 3% of GDP in 2019. The tax incentives provided so far in the G20 countries in response to the pandemic are intended to support both carbon-intensive and environmentally friendly activities. In the G20 countries, including the ECA region, support for the electricity sector has focused on CO₂-intensive activities. In the absence of reforms in energy consumption and tariff policies, the transition to low-carbon energy is likely to result in lower household revenues.

For the ECA region, especially since the region has many agricultural exporters and a large part of the population lives on the coast (World Bank 2019). It is expected that in the coming decades more than 80% of the agricultural area will be exhausted due to lower rainfall (European Environment Agency 2019). Spending on investments in sustainable infrastructure can be offset through targeted rapid job creation measures, including the introduction of drought management technologies, landscape and water catchment management, ecosystem restoration and sustainable forest management.

The recession in the Western Balkans region is being driven by a sharp drop in domestic and foreign demand during the pandemic. Traffic restrictions and social distancing measures have a particularly profound impact on the tourism and service industries, with the latter accounting for up to 50 percent of employment in the region (75 percent in Montenegro). Supply-side disruptions and falling demand are affecting many manufacturing industries; Investments are severely affected by liquidity bottlenecks and a high degree of uncertainty.

The main risk for the Western Balkans arises from the fact that the onset of the economic crisis will be difficult to cope with due to the ongoing pandemic in connection with a deep recession in the European Union.

All six governments in the region have announced fiscal and social measures to support communities and businesses in this emergency; its implementation is allocated between 1 and 6.7 percent of GDP. Countries that entered the crisis with larger fiscal and external reserves are better placed to fund larger aid programs.

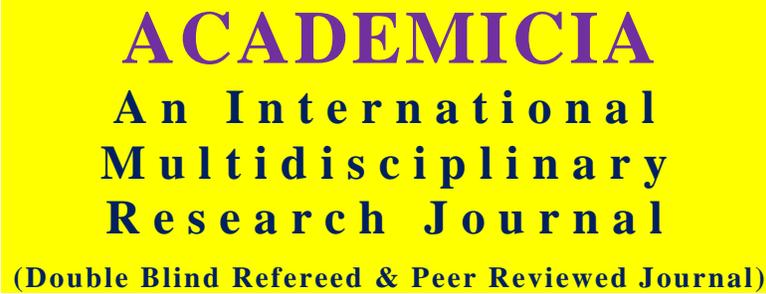

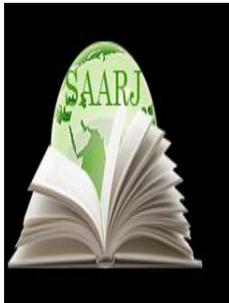

In the Western Balkans, the proportion of those who are dependent on self-employment, part-time employment and income from informal activities is higher. These categories are vulnerable to crises, but more difficult to support with traditional mechanisms.

Socio-economic models of the countries of the Western Balkans were formed in the 1990s - 2000s. According to a scenario similar to the Eastern Europe scenario, which led to a high degree of dependence of the national economies on the global economic and external economic

situation. This underlines the importance of the almost undisputed European election for the states in the region.

THE IMPORTANCE OF PERSONAL VALUES OF ELEMENTARY SCHOOL STUDENTS IN LEARNING

Shabbazova Dilfuza Ruzikulovna*

*Senior Lecturer at Termez State University,
UZBEKISTAN

ABSTRACT

Educational activities enable an elementary school student not only to develop a high level of cognitive processes, but also to develop personal qualities. In addition, the student's success in school will become an absolutely positive basis for his or her subsequent mental development and personality formation. This article is also devoted to a complete coverage of this very topic.

KEYWORDS: *Junior Schoolchild, Education, Value, Cognitive Processes, Learning Activities.*

INTRODUCTION

The changes taking place in society have a great influence on the formation of the human qualities of students, who are the object and subject of the educational process. Given this, in our country, special attention is paid to ensuring that students grow up as versatile people in the educational process. In particular, the Concept of "Continuous Spiritual Education" of the Republic of Uzbekistan provides for a change in the prevailing views in society. In particular, there is an opinion in the public mind that "the fruits of a child's upbringing are visible later, when he finishes school and grows up." One cannot agree with this opinion. Because no matter how old a child is in life, implicit behavior appropriate for that age is expected. If the expectation is justified, praise is given, if not justified, criticism is expressed.

Independence raised issues related to human dignity, its interests and the needs of human dignity. Human dignity also manifests itself in his social characteristics, his activities in society, his relationship to others and the environment, his maturity, his possession of social characteristics and his ability to express them in a spiritual way. Philosopher K. Nazarov said: "The process of becoming a person, realizing one's own value and the value of others takes a lot of time. In general, in the third millennium all over the world there is a growing need for the application in practice of the universal criteria of the philosophy of appreciation. Unfortunately, when humanity, from the early days of its existence on the planet, prioritized dignity and value, the

modern landscape of the Earth would be completely different, and humanity would not be faced with universal problems such as environmental storms, the threat of war and spiritual decline. " [4]

Of course, the spirituality and behavior of an elementary school student cannot suddenly become good or bad. The behavior of a child of any age reflects the level of strength or weakness at that age. Every day a child unknowingly either pleases or grieves the parents or teacher. Otherwise, adults would not rate children as "polite child", "correct your behavior", "loving girl", "naughty child", "stubborn child", "fearless child". This proves that the level of parenting of a child manifests itself every day in online relationships, in behavior, and not later.

Value orientations are a complex structure in which 3 main components can be distinguished: cognitive, emotional and behavioral. Cognitive is an element of knowledge, emotional is an emotional component that arises as a result of assessment; behavior is associated with the implementation of value orientations in human behavior.

In the success of the educational process in primary grades, the internal needs of the student, motives, acquisition of knowledge, knowledge and skills, attitude to values are of particular importance.

The problems of motivation and value of peers in activity and behavior was the subject of research by famous psychologists V.G.Aseev, L.A.Blokhina, A.N.Leontieva, V.N.Myasishche, A.N.Piyanzin, S.L.Rubinstein. In their study, a number of mechanisms for the formation of values in students were considered.

From play activity to the transition to educational-play activity, more noticeable personal updates are formed, associated with the development of awareness in this activity. Younger school age is the age of intensive intellectual development. Intelligence ensures the development of all other mental processes during this period, the intellectualization of mental processes, their understanding and arbitrariness. During this period, educational activity makes high demands on all aspects of the psyche of students, and as a result, the content of the students' value system is improving.

Two factors influence the formation of the value system of primary schoolchildren: objective and subjective. Objective factors include the material and technical base of an educational institution, the state of the surrounding world, and subjective factors include the psychophysiological characteristics of children, the specifics of their motives and characteristics. Subjective factors develop in direct connection with the individual characteristics, interests, orientation of the student's personality. [8]

Pedagogical observations show that positive attitudes towards reading decline slightly towards the end of the primary school period. Interest in learning activities increases in grades 1–2 and decreases in grades 3–4. With a decrease in interest in educational activities, the teacher's narration of the finished material and the institution of memorization of students prevail, the activities of students are imitative in nature. Students in grades 3-4 usually do not like to retell what they read, copy exercises written on the blackboard, memorize rules and verses, and instead like to independently solve examples and problems, observe natural phenomena, draw and sculpt things from plasticine and clay. In other words, younger students are more interested in work that has the potential for initiative and independence. V.A. Sukhomlinsky believes that one of the

reasons for the decline in interest in reading at early school age is a high low assessment by the teacher, which leads to a decrease in the child's interest in reading and a decrease in self-confidence.

Psychologist N.I.Murachkovsky found that the origin of inadequacy is influenced by two different categories of personality traits:

- First, the peculiarities of the student's thinking;
- Secondly, the attitude towards learning, which is reflected in the orientation of the student's personality, is the "inner position of the student". [5]

Based on the analysis of the described situation, the formation of a system of values among younger students will largely depend on the values of primary school teachers. It is the teacher, as a person and a specialist, who introduces children to the world of social relations, culture, connects them with spiritual riches and new achievements created by mankind. Valuable goals of the teacher's activity are reflected in the results of students' educational activities. This is another aspect of the problem under study. An empirical experimental study of the value system of a primary school teacher makes it possible to form a clear idea of the modern primary school teacher, to determine the values of the highest and lowest significance.

V.A. Yadov considers independent values in pedagogical activity as the basis of human consciousness as a hierarchical structure consisting of thoughts and feelings capable of expanding their vital interests around themselves. Therefore, the development of the teacher's personal and professional values is considered as an indicator of pedagogical activity that affects the teacher's self-esteem, the satisfaction of his higher social needs, such as self-development and self-expression. In addition, values in the work of a teacher are viewed as factors of social maturity, civic responsibility, professional ideals and humanity.

E.A.Rudenko writes that the highest value in upbringing is the personality of the child. In order for this value to be absorbed into the consciousness of the teacher, his system of values, it is necessary to coordinate the teacher himself, his way of thinking and behavior. This is not connected with the improvement of qualifications and competencies, the introduction of the most modern technical means and a new experimental program into the educational process, but with the emergence of new thinking.

Indeed, the vocabulary of primary school students is of particular importance in the organization of educational activities and the application of the personal-value approach in the development of literacy. On the eve of entering school, the child's vocabulary increases to the point that he can express himself. A 6-year-old normally developing child uses 3-7,000 words in his speech. Their school educational activities play a particularly large role in the development of children's speech. Before going to school, the child uses his or her speech only as a means of communication and cognition, without thinking about how he or she speaks. However, at school, the language spoken by the child remains the subject of instruction and study.

As a result of studying the grammar of his native language, a child at school learns to consciously structure his speech in accordance with the rules of grammar. In the process of studying grammar, the phonetic side of the child's speech is determined, the morphological side of speech is clarified, the structure of the syntax is significantly improved. [10] These qualities, characteristic of certain aspects of speech, develop not only as a result of reading grammar, but

also under the influence of other subjects taught in school. In the process of studying and solving all the subjects taught at school, the student's vocabulary is enriched.

Researcher G. Mamatova in the methodological manual "Methods of forming literary ideas in younger schoolchildren" not only acquaints schoolchildren with literary ideas, but also focuses on the study of the language of fiction. In his opinion, the study of the language of a work of art means enriching the speech of students with literary terms, visual aids, elements of the literary language. [3]

Educational activities provide an opportunity for a student of elementary grades not only to develop a high level of cognitive processes, but also to develop personal qualities. At the primary school age, the formation of the child's personality continues. A student's success in school will be an absolutely positive foundation for his or her subsequent mental development and personality formation. As a result, it can be seen that the child spontaneously begins to understand his or her place in the family, the class in which he or she is studying, and in other communities.

The transition to a new type of activity creates a new attitude of the student to his main activity. A sense of duty begins to grow in him. He understands that reading is compulsory and it is his duty to follow the established rules and requirements. Feeling like a real reader, he needs to read well. [9]

The moral consciousness of primary school students undergoes significant changes when reading grades 1-4, moral qualities, knowledge, imagination are significantly enriched, the child begins to understand himself. If he does not know his inherent good and bad qualities, the motives for learning will change as follows: the interest of elementary school students will turn from an interest in a specific fact to an interest in laws and principles. Psychological research in recent years has shown that there may be interest in ways of acquiring knowledge, moving to the middle grades of primary school. Motives for self-study also arise during primary school, but they appear in the simplest form - interest in additional sources of knowledge and from time to time reading additional books. When social motives move into first grade, it shifts from a nondifferential general understanding to a deeper understanding of the reasons for reading and learning, "to an awareness of the content of reading for oneself and to socialization. social motives. Situational social motives at this age are the need to seek support from a teacher.

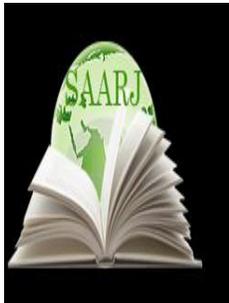

Learning activities provide an opportunity for children of primary school age to meet certain educational needs, as well as take a place among their peers. It is in this place or position that the child seeks to learn well. Children at this age constantly compare their own successes with the successes of other peers. It is extremely important for them to always be the first. [7] Motivation to participate in competitions among children in primary school is a natural psychological need that gives them strong emotional stress. These features actually begin to show in kindergarten and are most evident in primary school as well as adolescence.

Primary school students evaluate themselves based on what adults think and evaluate. The student's self-esteem will also depend on his or her success in various activities. Self-esteem among elementary school students can be different - high, adequate, appropriate or low. Traits such as confidence, openness, susceptibility to external influences, obedience, which are present in children of this age, provide a good opportunity to shape them as individuals. The transition from government to self-government during the small school period is extremely important.

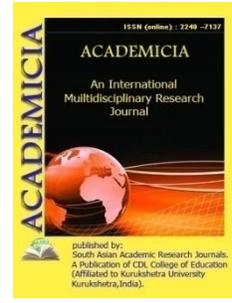

Revealing hidden talents in children in the educational process, showing them their activities from an early age, creating opportunities for the development of their creative abilities is the key to the development of competitive personnel who will show high potential, social activity, intelligence and intelligence into the future. This corresponds to one of the priorities of our state - the upbringing of a comprehensively developed person. [6]

THEORETICAL BASES OF PROFESSIONAL DEVELOPMENT OF FUTURE PEDAGOGICAL PERSONNEL

Normuminov Bahodir Umarovich*

Teacher,
 Department of Pedagogy and Psychology of SamSU,
 UZBEKISTAN

ABSTRACT

This paper discusses issues related to the study of the complex process of professional competence of future teachers in the educational process, the use of the laws of pedagogical communication technologies on the basis of a systematic approach

KEYWORDS: *Education, Economics, Future Pedagogue, Professionalism, Professional Competence, National Model, Mentality, Pedagogical Technologies, Efficiency, Mobility, Flexibility*

INTRODUCTION

Today, in the context of the interconnected development of social, economic and political relations as a system, it is becoming increasingly clear that the human factor, its intelligence, knowledge, skills, abilities and values are the main coordinating factor and tool.

A new type of person, a perfect person is formed by educators-specialists who carry out new labor activities. This huge and responsible task is enshrined in the Law of the Republic of Uzbekistan "On Education" and the "National Training Program". Its implementation in practice requires an innovative approach from the educational institutions that train teachers - to ensure the professional competence of future teachers in the educational process, using a systematic approach. In today's market economy, the main requirements for teachers are:

- high level of qualification and professionalism;
- have the knowledge, skills, abilities and basic qualities necessary for a professional career;
- professional mobility, flexibility;
- ability to adapt quickly to changing life situations;

- Qualities of a competitive specialist
- the ability to think independently and critically, the ability to detect contradictions in real life and find ways to overcome them, the ability to use modern technology, the ability to apply the acquired knowledge, creative new ideas ability to give, creative thinking, ability to use information correctly, ability to work in a team, etc.

In order to achieve these goals, educational institutions must, first of all, improve the professional qualities of their specialists. The quality of knowledge of competent teachers must meet the following requirements:

- completeness - the amount of knowledge about the object, process, event to be studied;
- depth - comprehension and interconnection of knowledge from different disciplines;
- Systematization - the organization of the sequence of knowledge, step-by-step mastering;
- Reality, specificity - the ability to apply knowledge to the elements in specific situations;
- generality - the ability to express real knowledge in a general way, using concepts.

The following indicators of knowledge play an important role in professional training: efficiency, mobility, flexibility, comprehension. These characteristics are one of the foundations that form the functional competence of each professional. Necessary components for this profession are included in the training program of the Republic and among the main qualities of the national model. It takes time to consider the content of today's continuing education, the basics of organization, its management as a subject of a new paradigm-social renewal, a force that creates a new social way of life.

In the current context, the spiritualization of the educational process, as a method and mechanism for the realization of the intellectual and spiritual potential of the learner, performs its function, fulfills its function, understands and comprehends students, works on itself, encourages them to look for ways to develop their capabilities independently.

The professional competence of the future teacher consists of the following qualities:

1. Social qualities;
2. Features of adaptation to the conditions of the labor market;
3. Necessary features of the profession.

These qualities can ensure that every educator is competitive in the job market. The following changes may occur in educational institutions in the training of competitive teachers: First, if the educational process is not organized on the basis of cultural and intellectual development, the student will find answers to the questions that are necessary for him, aimed at crying out the vital necessity. He answered the following questions: - Why is the activity carried out? What methods and ways is it used? How is it achieved?

Second, does the student acquire such knowledge in the process of learning, which helps the student to find answers to the following questions: what is it?, what does it do?, how can it do it? and so on. Third, the student develops the skills he or she needs to do effectively. Fourth, the student will have communication and teamwork skills. Fifth, the student will have the ability to

anticipate and predict. Sixth, the student develops an active life position and high motivation to work.

These personal qualities, attributes, knowledge, skills ensure the professional suitability of the future pedagogical staff, which are based on the following psychological processes and situations:

- Contemplation (ability to perform thinking operations)
- Emotional-volitional qualities - emotions, volitional acts, ways of their expression;
- People, in relation to people, work, self;
- Knowledge, evidence, laws;
- Experience universal, professional, new, local;
- Traditions, norms.

Activities in pedagogical colleges and universities are part of the educational service for the state, society and the individual as a whole. This is a long process. According to the Russian researcher V. Markova, educational services differ from the process of production of goods (objects) by the following qualities, signs: durability, durability of production and consumption, inconvenience to storage, etc. This means that the results of the educational service are not felt, are not captured, can not be transferred from one place to another, can not be preserved.

The following pedagogical technologies are used to develop the professional competence of future teachers:

- Explanatory educational technologies;
- Person-oriented educational technologies;
- Developing educational technologies.

At present, the use of the laws of pedagogical communication technologies in the development of pedagogical competence can give the planned result. Pedagogical communication is organized and directed by the teacher. Pedagogical communication is a creative process. It is held in the following stages:

1. Planning, design of communication with students by the teacher;
2. It takes into account the individual qualities of students, the choice of optimal methods;
3. Communicative attack - in which students are quickly involved in the learning process and the modeled communication is further clarified;
4. At this stage, manages the measures to strengthen the psychological connection with students, implements educational goals in practice.

From modern technologies to developmental professional competencies of educators, developmental educational technologies give effective results. This technology allows future professional educators to develop the following socially important qualities, to develop general and professional, professional erudition; development of creative abilities; demand and systemic

growth. This technology will equip future professionals with methods of correcting the personal professional institutions of students.

The technology that optimally develops professional competence in the system of new pedagogical technologies is the technology of targeted intensive training of specialists. The production of this technology, closely related to practice, performs its function together and is based on the following principles:

- the ability to independently develop in their field what is needed in a quality, world-class, accessible way, and to conduct research on what is needed;
- the ability of a modern specialist to create and use automated information bank, knowledge bank and other information resources;
- A modern specialist must be able to fully understand the whole technological process, from the beginning to the end of the product, to have the knowledge and skills to automate this process as much as possible.

The following rules should be followed in the training of a specialist with such professional competence:

- complex of training (education - practice together with upbringing);
- Carry out real course work and graduate work related to individual or group practice;
- use of modular legislation in the employment of a group of graduates;
- involvement of university teachers, specialists, production staff in the management of students;

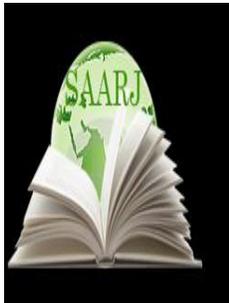

Flexibility, mobility of the training system, operative social and economic changes of special courses, programs, plans, methodologies, non-contradictory changes, updates on the basis of requirements;

- Focus on computerization, programming of the training system, the development of independent knowledge, skills and abilities;
- Continuous training;

Differentiation of specialists depending on the quality of training. Based on the above, a comprehensive approach, the analyzed new laws of education in the development of professional competence of future professionals optimally perform their function as a system. Improving the professional competence of a specialist is a modern requirement, and this psychological, social structure develops on the basis of targeted education. Today's education is such a sphere of social activity that it should create the necessary conditions for the development of a new type of person. Modern education is the development of individual knowledge and learning activities of students, upbringing and self-education, as a synthesis of socialization. Its goal is to create the conditions for the development of a new-minded, independent and democratic person, a highly professional person, a citizen, a citizen of his country.

APPROACHES TO LEXICAL CONNOTATIONS

Navruzova Nigina Xamidovna*

*Teacher of the English linguistics department,
 Bukhara State University, UZBEKISTAN
 Email id: niginavruzova25267@gmail.com

ABSTRACT

This article deals with the research of lexical connotation in English and Uzbek languages. The article also discusses logical-philosophical concept of connotation, semantic connotations, connotations with an emotional basis. A more extended definition of connotation is presented in the Great Russian Encyclopedia, published in 30 volumes, edited by A.M. Prokhorov, which complements the previous definition: the connotation includes semantic and stylistic elements, in a certain way associated with the main meaning and superimposed on it. In particular, they talked about the difference between concrete and abstract words. Specific words were determined not only by what qualities they possess, but also by whether the carrier of these qualities also possesses the same qualities.

KEYWORDS: *Denotative, Connotation, Pragmatic Features, Semiotics.*

INTRODUCTION

There are many approaches to the definition of lexical connotation, the concept of connotation is vague, this term is interpreted ambiguously, has many synonyms. An attempt to define connotation from the standpoint of one or two or three aspects is incomplete. Each direction individually is not able to fully comprehend the essence of the connotation.

In our opinion, the lack of terminological unity in the definition of a given concept is due to its complexity and multidimensionality, it presupposes the structuring of this phenomenon, therefore, in the structure of the lexical meaning of a word, several types of it are distinguished: 1) denotative meaning: the object denoted by the word (in a broad sense) in linguistics is called a denotation, therefore denotative meaning is a meaning that characterizes the correlation of a word with a designated subject (situation); 2) the significant meaning, which is the main one for lexicologists, which is often called simply the meaning; 3) emotive (or connotative) meaning is a meaning associated with an emotionally expressive and evaluative reflection of objects and

phenomena of the external world, which is known to all native speakers, although it is not recorded in dictionaries (compare the connotations of the word pig in English language - "commonly used to **insult a person as dirty, fat, greedy, gluttonous,**" or the word hare "**sensitive and artistic**"); 4) structural meaning is a correlative meaning indicating the relation of a word to other words of the language.

DISCUSSION

The meaning of the word includes, in addition to the denominational, the connotative aspect. The term "connotation" is used in different areas of philological knowledge and covers various aspects of the word: "additional or marginal semantic components", "emotional and expressive", "modal" and "evaluative", "pragmatic features" , "Semantic associations" and "stylistic nuances", etc.

The word "connotation", having appeared in about 1200 from Lat. con - notare "together - to designate" and having arisen in scholastic logic, was used in philosophical and theological discussions about the meaning of words, in philosophy about the language of the 14th century, the term connotation began to be used quite specifically with the goal of distinguishing words in image and action , depending on what they indicate. In particular, they talked about the difference between concrete and abstract words. Specific words were determined not only by what qualities they possess, but also by whether the carrier of these qualities also possesses the same qualities. In structural semantics, the concept has undergone significant expansion and change. The semantic scope of the concept of connotation was further expanded in semiotics, which led to different uses of this term: the concept gradually spread to sign systems of thought, such as image, matter, and sound.

In the linguistics of the 19th century, the term "connotation" began to denote all the emotively colored elements of the content of expressions, correlated with the pragmatic aspect of speech.

Nevertheless, despite the long history of using this term, its definition in linguistics is still ambiguous. The term "connotation" entered linguistics in the 17th century through the Port-Royal grammar to denote properties as opposed to substances. The Russian Encyclopedic Dictionary edited by A.M. Prokhorov and The Big Encyclopedic Dictionary give the following definition of connotation: Connotation (Middle Ages. note, designate), in linguistics, additionally, the concomitant meaning of a linguistic unit or category.

A more extended definition of connotation is presented in the Great Russian Encyclopedia, published in 30 volumes, edited by A.M. Prokhorov, which complements the previous definition: the connotation includes semantic and stylistic elements, in a certain way associated with the main meaning and superimposed on it. The connotation serves to express the expressive-emotional and evaluative shades of the statement. For example, the word "winter", denoting Despair and Hope. References to winter in literature may refer to **death, old age, pain, loneliness, despair or an end**. The season provides the setting for painful messages, as well as messages of renewal, rebirth and hope, according to Annie Fitch in an article on the Poetry Foundation

The logical-philosophical concept of connotation goes back to J. Mill and his works in the 19th century, where connotation is based on the opposition of connotation and denotation. Connotation according to J.S. Mill is the signs communicated by a word, his ideas about

connotation correspond to modern ideas about the essential features of a concept and is based on a three-part understanding of a sign (sign-object, referent and signified): denotation - the extensional meaning of the sign, connotation - its intentional meaning. In 1934 K. Buhler continued J.S. Mill's arguments by developing in his works in the book "Theory of language".

This can be formulated in a different way, namely, that words of a certain class open around them one or several vacancies, which must be filled with words of certain other classes. In reporting "The city is built of marble", we may be giving completely different information, and this is due to the very meaning of the complex connotative name "built of marble". The word "white" denotes all white objects - snow, paper, sea foam, etc. - and includes, or co-means (connotes), the attribute of whiteness.

L. Yelmslev presented the arguments that to describe the semantic content of a word to the designated objects (expansion) and signs (design) of the designated objects also include judgements and assessment, connected in a single linguistic community.

In 1962 T. Pavel for the first time expresses the idea of research with the help of connotations of the semantic structure of metaphor, in which the denotative meaning is replaced by the contextual, figurative, connotative. Since that time, in linguistics, the view of connotation as an integral part of the language system, which cannot be limited only by stylistic framework, has been increasingly strengthened. Referring to the opinion of L. Yelmslev, R. Barth defined connotation as a stimulator of the meaning of a symbolic, evaluative or feeling-dependent image.

Connotations, despite the fact that they are conditioned by culture, are arranged strictly according to the rules, moreover, they are not limited to individual signs, and are closely related in a row with each other by signs, as in a single text. A connotation is a content for which a denotative system serves as an expression, and this content itself can be determined as a result of "subtracting" the denotation from the text, and "a connotative system is the expression plan of which is itself a sign system". Connotation according to R. Barth varies between expressive, stylistic variants and emotional-expressive coloring of the object of denotation and the content of the word.

For the first time the socio-cultural component was introduced into connotation by Bloomfield, who singled out purely semantic connotations related directly to the sphere of consciousness and connotations with an emotional basis. In the connotations of group L. Bloomfield saw a certain level of speech, conditioned by social, regional and cultural factors. To this group, he attributed the connotations that arise in borrowed words. The inclusion of extralinguistic factors in the concept of connotation caused some linguists to try to attribute connotation not to the field of linguistics studies, but to the sphere of pragmatics and semiotics.

S. Bullon, in turn, also considers and uses connotation in relation to all socio-cultural associations arising from native speakers in connection with a particular word, and which a native speaker may not know about, since these associations are related to culture and cannot be conveyed by traditional dictionary definition or one-word lexical equivalent in translation. As one of the examples, S. Bullon analyzes the associations associated with the word "шампанское" champagne. This expensive wine is in Great Britain a social marker of belonging to the upper strata of society, and is also associated with weddings and other special occasions.

V.N. Telia considers the connotation as a special macrocomponent of meaning (halo), since the ability to signal the value attitude of the speaking subject to the world, and thereby the ability of the utterance containing the given name, to produce a pragmatic effect and constitutes the specificity of the connotation, including the way of expression estimates. The main function of connotation is the function of influence, directly and inextricably linked with the pragmatics of speech. A.N. Leontiev considers connotation in connection with the peculiarities of speech perception and refers the definition of connotation to psycholinguistics.

D.N. Shmelev, following K.A. Dolinin, examines the connotation from a stylistic point of view. He considers the core of the word not some separate meaning of the word, but those semantic elements that are common to all meanings of the word. In the research of D.N. Shmelev, expressive elements of language appear: 1) those that characterize the emotional state of the speaker or his attitude to the subject of the message (or are aimed at emotionally influencing the interlocutor); 2) those that characterize the speaker himself from a linguistic point of view.

N.G.Komlev does not endow connotation with explicit content, connotation is a semantic modification of meaning, which includes a set of semantic layers, feelings, ideas about a sign, a logical concept or some properties and qualities of objects, for the designations of which the given word-meaning is used. Otherwise, the connotation is the sum of the components included in the semantic structure of the sign, and is not formally contained in the word-sign.

CONCLUSION

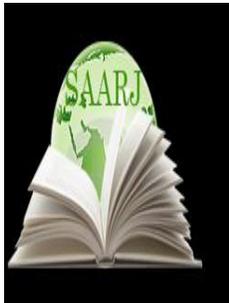

Thus, there are many approaches to the definition of connotation, the concept of connotation is indistinct and vague, this term is interpreted ambiguously, has many synonyms. Researchers consider stylistic, emotional, cultural, pragmatic, associative and other aspects of connotation; it appears before us as a kind of "heap-small", and not as a structured whole. From our point of view, this is because the attempt to define connotation from the standpoint of one or two or three aspects is incomplete. Each direction individually is not able to fully comprehend the essence of the connotation. In our opinion, the lack of terminological unity in the definition of this concept is due to its complexity and multidimensionality, it presupposes the structuring of this phenomenon, therefore, to give a definition of connotation is to describe its structural elements.

ABSTRACT

The translated works published in the journal of "Education and Teachers" between 1925 and 1927 are examined in this article. The intellectual value of the translated texts is explored, as well as their role in current writing. There is a brief overview of translators' and authors' work. The art of translating has progressed over time. Translation has been proved to be the most essential mode of interethnic communication. Not only was the literature and art of other countries studied through translated works, but also their way of life, history, economy, and daily life. More than that, I really can't do it. All I could do was translate some of the blessed man's poems into Russian through prose. That's a big deal"6. Apparently, Cholpon is a proponent of innovation in literature.

INTRODUCTION

The book is one of the most important discoveries in human history. Of course, life would be unimaginable without literature. Today, a book encompasses a wide range of newspapers, periodicals, and other media in addition to books. In a nutshell, they encourage individuals to open their eyes, learn about the world, understand themselves, grow spiritually, and discover the truth. Only through books do we learn about our country's ancient past and the tremendous scientific and cultural treasures of our forefathers.

The magazine "Education and Teacher", published between 1925 and 1933 and housed in the Republic's libraries' Rare Publications Collection, is one of our spiritual treasures. The journal is a great source for the study of our country's early and mid-twentieth-century history, literature, and the oppressed lives of our people during the Soviet colonial period as a literary and historical source. This publication depicts the country's most affluent period of intellectuals and modern literature representatives.

Education and Teacher is a natural follow-up to "Maorif," a magazine that ran from 1918 to 1919.¹ Despite the fact that it claims to be a monthly political, educational, literary, scientific, and scientific publication, literary materials predominate. The publication's name also suggests that it is a scientific and methodological journal for educators. The columns in the journal are as follows: "Official section", "General section", "Education", "Society", "Explore the country", "Literature", "Dictionary and terms", "Science and technology", "Criticism and literature", "Western literature", "Literary reviews", "Biography", "Language and terminology", "Fine arts", "Education news", "Political enlightenment", "Economics", "Agriculture", "Professional movement", "Children's literature", "Local news", "Questions and answers", "Messages", "Responses and advice from the office", "Announcements". It is known from this index that the sections "Literature", "Western literature", "Literary reviews", "Children's literature" cover the whole literature, while the sections "Criticism and literature", "Biography" are partially given literary articles.

In the sections "Western Literature" and "Literature," the journal "Education and Teacher" publishes current poetry, stories on diverse topics, critical pieces, and translated works on a regular basis. There are examples from fraternal peoples and foreign literature. In the 4th issue of 1925, in the translation of A.Niyazi, the article "Examples of lessons from the history of Turkish literature" translated from Azerbaijani (The similarities in form and meaning in the works of Fuzuli and Navoi are also about their differences), in issue 5-6 of 1925, Mahmud Suboy's story "Life and Death" from Russian, in issue 7-8, 1925, an analysis of the stories of Robindranath Thokur in Cholpon's article "Great Indian", R. Tokhur's story "Subha" translated by Cholpon; issue 9-10, 1925, issues 11-12, 1925, Turgenev's short stories "Bosaga", "Tilanchi" translated by Makhmud Suboy, Lermontov's poem "Debate", translated by Erkin in the same issue, in issues 1-2-3 of 1926, Gogol's story "Shinel" translated by S.A. Siddikui, in the 3rd issue of 1926, Arthur Arnu's story "Paris Commune" translated by Makhmud Suboy, in issues 3-4-5 of 1926, Kubikuf's critical article "Great writers of Russia" translated by Kh. Nuri, in the 4th issue of this year, Farichi's story "Galila" translated by M.Suboy, In the 5th issue of this year, the story "Stipan Razin" translated by M. Suboy, in the 9th issue of 1926, Lunacharsky's "Days of February", "At the time of change" translated by M. Suboy, in the 10th-11th issue of 1926, Bayish translated the story of Y.Zart "Miob", The story "Xun-chi-fu" from Chinese life, translated by Z.Usmani in 3-4 issues of 1927, in the issue 7-8, 1927, the story "Duoxon" based on the Russian translation by M. Suboy, in the same issue M. Gorky's works "Interests" translated by Y. Omon.

Artists such as Makhmud Suboy, Cholpon, Erkin, Kh. Nuri were active in the field of literature in translating samples of foreign literature into our native language. Especially in Cholpon's translation of R.Thokur's story "Suba"², Lermontov's poem "Debate", translated by Erkin³, the story "Stipan Razin" translated by M. Suboy⁴ and the protagonists of the "Xun-chi-fu" stories

from Chinese life translated by Z.Osmani did not leave the readers indifferent with their textual will, worldview and patience in the trials of difficult times⁵.

The first research on Robindranath Thokur was conducted by Abdulkhamid Cholpon and Abdurauf Fitrat in the early twentieth century. His eight-volume work (1958-1965) was later published in Uzbek. Robindranath Thokur's novels and short stories by Sharif Talib, Odil Rakhimi, Tokhtasin Jalolov, Amina Rajabova, Kodir Mirmukhamedov, S. Khudaiberganov, S. Abdukakhorov, A. Isroilov, poems by Mirtemir, Maksud Shaykhzoda, Shukhrat, Shukrullo, Jumaniyaz Jabborov. It is known that it was translated by artists such as Erkin Vakhidov and Yusuf Shomansur and presented to students.

In particular, Cholpon's research on Thokur's work is important in the development of twentieth-century literature. Cholpon had a great respect for the work of this Indian writer. In an article dedicated to him, The "Great Indian" writes: "I will tell about my pathless: Navoi, Lutfi, Boykaro, Mashrab, Umarchan, Fuzuli, Furkat, Mukimi: same, same, same! The mind is something else - looking for something new; Botu, Gayrati, Altai, Elbek, Jolkinboy: It's just fun! They are false lights for me, but for my tomorrow! I don't read Avloni, Tavallo, Siddiqi and Hakimzoda, I don't read them: they are the ones who put me in this situation!... It was in this situation that the great man came to me. After that, I really bled! Although my hands were shaking, my heart was pounding, and I was not strong enough, I wanted to introduce to my people that "golden bridge between east and west. More than that, I really can't do it. All I could do was translate some of the blessed man's poems into Russian through prose. That's a big deal"⁶. Apparently, Cholpon is a proponent of innovation in literature. The poet was inspired by the works of modern intellectuals and tried to acquaint students with the works of foreign writers. In Cholpon's issue 11-12, 1925, he published an article entitled "Tagur and Tagurology". The article notes that Thokur read the first information about his Nobel Prize victory in 1913 in the magazine "Shura" and brings to the readers' attention a translation of Thokur's poem "Hey, passenger girl"⁷.

In Suba's story, "In Chandipur, Bonikatno had three daughters, the youngest of whom was Subashini (sweetheart)". In short, he was called Suba. She was a beautiful girl, but she couldn't talk. The girl's sisters have already got married. Father understood his daughter well and was kind to her, but the mother considered her an insult to herself. The girl was sitting under a Tamar tree on the banks of the Bengal River, talking to a mute nature like her. Khussain's son Pratap also used to come here to fish. Suba helped him catch fish and cook from the vegetables he brought. Both get used to each other. Unable to bear their neighbours' gossip about Suba, Bonikatno and his wife take their daughter Suba to their home in Calicutta. At their last meeting, Pratap said: "Your parents have found you a husband. You're going to Calicutta. You wouldn't forget me", -said and was upset from Suba. Despite her weeping, they made her marry to Calicutta. Because of Suba's dumbness in the husband's house, no one talks to him. After some time her husband brought a new wife.

Robindranath Thokur's story "Suba" describes the tragic fate of women. His stories such as "Account", "Mokhamaya", "Notebook", "Judge", "Sister" are also on this topic. A similar theme of women has been mentioned in Uzbek literature by many writers⁸. In particular, Cholpon's story "Tulip in the Snow" describes the fate of Sharofatkhan, who is only seventeen years old. In addition, Zebi, the characters of Cholpon in the novel "Night and Day", the baker girl, in the stories "Baker Girl", Unsin in Abdullah Qahhor's story "Horror" are similar to Thokur's

characters Uma, Subashini, Khiroda and Shoshikola. Problems such as early marriage, wedding customs, mother-in-law relationships, and illiteracy are still relevant today.

Robindranath Thokur's stories deal with many of the social, moral, and Indian traditions of the Indian people. If they openly express their hatred of the evils of human nature, such as hypocrisy, cowardice, cruelty, greed, immoral customs in society, violence, injustice, the age-old divisions among the people, feelings of sympathy, pity, kindness to ordinary, simple, honest people, their worries and problems.

Lermontov's poem "Debate", translated by Erkin, describes the debate between the two mountains, Kazbek and Elburs. The old man looked at Elburs Kazbek and said, "People are coming and climbing on you and building a house. Do you know what they mean? You must not build a house for them, they must not strike your valleys with axes, they must not stab you in the chest in search of gold, they must not build roads, they must not let caravans pass through them. You know, they're cunning, especially the people of the East. " In response, Kazbek said: "Do not be afraid of the East, because for 900 years it has been quiet, a drunken Gurju pouring alcohol on his clothes, Tekhran leaning on his pillow with the pleasure of a colony, the god-burned (hot) land Jerusalem is silent, the Nile River in the distance, pyramid stones were mined. They are counting the stars, reminiscing and enjoying the quiet times of their ancestors. The old East is over, it can't be compared to me." Elburs, on the other hand, told him he was very proud. Suddenly there was a commotion, a commotion in the Urals, an explosion of the Dun River, and an army of white crowns. Fire broke out and drums began to attack the East. Kazbek was upset and looked to the east. He put his cap on his head and kept calm forever.

The Caucasus Mountains are a mountain range at the crossroads of Europe and Asia. The most famous peaks - Mount Elbrus (5642 m) and Mount Kazbek⁹ (5033 m) are covered with permafrost and glaciers. The highest mountain in the Caucasus is Elbrus. Mount Elbrus, with two crater peaks, was formed millions of years ago. Mount Kazbek is located on the border of the Kazbegi district of Georgia and the Republic of North Ossetia in Russia. There are many stories and legends about these two inseparable friends - Elbrus and Kazbek - in the folklore of Russia and other countries. In one of them they were always on the battlefield and in a merry feast, that Elbrus was strong and wise, and that Kazbek was a handsome young man, that no one could defeat them and allow them to attack their prey, but the enemies found a way to do so, telling the curious and young Kazbek that his friend Elbrus had slandered him and was laughing at him. Then the confident Kazbek began to distance himself from his loyal friend¹⁰ and their relationship has been torn apart, and in the second it is said that Elbrus and Kazbek were father and son, and everyone envies their greatness and grandeur, that they were in love with a girl named Mashuni, Elbrus sent his son Kazbek to war and forced him to marry Mashuni, curious Kazbek killed his father, then stabbed himself in the chest with a guilty conscience, Mashuni is said to have suffered greatly from these events.

Of course, this theme is not left out of Lermantov's view, and the poem "Debate" is created. In the play, the language of the Kazbek Mountains shows that the eastern countries have been in turmoil for many years, lagging behind in development, spending time in drunkenness instead of moving forward, and even the mighty Nile, where the pyramid stones were mined, is silent, peace and prosperity, novelty and that no one is fighting for progress, that the east is old, that the war is still going on, is illuminated with a peculiar sad passion. In the poem, the poet, who always lives with the pain of the people, is clearly expressed.

As a poet, prose writer and artist, Lermontov made a significant contribution to the development of Russian culture and literature. In his works, he sang the ideas of freedom and patriotism. In this sense, Lermantov's works have always fascinated Uzbek translators.

Among the translated works in the magazine "Education and Teacher", the story "Stipan Razin" translated by M. Suboy attracts the reader with its interest and relevance. Translator Makhmud Suboy has appeared in almost all issues of the magazine with excellent translations. Without this creator, the translation in the magazine would be meaningless. In the 6th issue of the magazine in 1927, the editors gave a biography of this artist under the title "The true friend of our magazine", noting that the editor of the magazine was pleased with the translator and concluded: "Makhmud Suboy is a real fan who has been actively working since the founding of our magazine"¹¹.

For some reason, very little is known about this artist. Makhmud Suboy co-authored with the representatives of Jadid literature and contributed to the development of our literature with his translated works and scientific articles. Because he studied in Turkey, his articles imitate the works of Turkish artists. He used the nickname "Semurg" in his articles. He was not among the victims of repression. If he had, his life and work would have been studied.¹²

In Russia, the situation of peasants and the urban population deteriorated en masse as a result of the increase in taxes caused by the wars with Poland (1654-1657) and Sweden (1656-1658). As a result, the story of "Stepan Razin" describes the tragic situation and uprising of Russian peasants during the reign of the Ramonovs in Russia in 1670-1671. The peasant uprising is led by Stepan Razin. Razin defeated the king's army and captured the cities of Astarkhan, Saratov and Samara. Land title deeds will be destroyed. Razin's army was defeated near the city of Simbirsk and he fled to Don. He is captured by his friends and handed over to the government. Hundreds of thousands of peasants will be executed to quell the rebellion and take revenge. In public, Razin was first punished and then beheaded.

Makhmud Suboy does not specify the author of the story. "Russia has played a significant role in the history of the revolution, and since then it has been part of folk literature and music. There is a lot in Russian folklore about this event and Razin. We moved one of them here."¹³ he said.

The protagonist of the story is Razin Stepan Timofievich (1630-1671), leader of the Peasants' War against landlords and serfdom in Russia, Don Cossack. He was betrayed by the Cossack chieftain (aksakal) to the tsarist government. He was executed in Moscow¹⁴. Stepan Razin's uprising shows the causes and consequences of the disintegration of Russian society at that time, and the need for reform in Russia.

Among the translated works, the story of "Xun-chi-fu" from Chinese life, translated by Z.Osmani, has a special relevance. He can't help but feel sad for Xun-chi-fu, the old Chinese man and his complicated life as he reads the account. We are confident that such individuals exist.

The story is about the miserable life of an old Chinese man named Xun-chi-fu. From morning till night, Xun-chi-fu pulls a chariot of wild Europeans for a loaf of bread and half a bowl of soup. After his beloved son Li was executed by European tyrants, the old Hong-chi-fu has to be put in a chariot. As a gesture of sadness for his son who was slain at the time, he places a circular white object on top of his cap. He gave his son to an Englishman named Mr. Astik from an early age. He was a tyrant who caused a lot of problems for Lee. Lee cried out at first that he won't work

here, but when his father ignored him, Lee eventually became a silent child. His mother passed away one day. His father rushed to Astik's residence and informed him of the situation. Astik beat Hun-chi-fun in spite of pleas that he entered his house without allowance. Lee used an ax to hit his master Astik in the head and cut off one of his ears, unable to withstand his father's harsh beating. Astik then accused Lee of cannibalism, tortured him to death, intervened with the government, and had him murdered by executioners. Astik gets into his automobile one day while standing next to a European club. It's raining, and walking is difficult. Astik pushes him with his cane and beats him when he is tired and wants to relax for a while. Hun then became enraged and proceeds to walk down the street to the river. Then he went upstairs and down to the river with his cart. The cart swiftly plunges into the river, and Astik is knocked unconscious. Astik has fully left China.

Imperial powers (the United Kingdom, Germany, Austria-Hungary, France, Japan, the United States, Russia, and Italy) intervened in China and captured Beijing in August 1900. The "Final Protocol" between foreign countries and China was signed on September 7, 1901, transforming the Sin Empire into a semi-colonial state.¹⁵ The Chinese people had many problems during this time, which lasted until 1912. The narrative of "Xun-chi-fu" exemplifies this point.

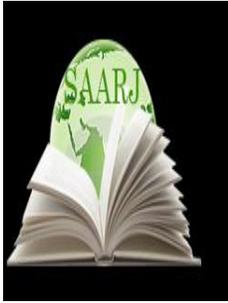

Ziyo Osmani, the story's translator, co-edited at the "Bukhara Akhbori" newspaper with A. Fitrat, Cholpon, and Said Akhrori, which was a tribune of the Jadids and fought for national independence and bourgeois-democratic changes in the country, and was repressed on charges of nationalism between 1920 and 1923¹⁶. Ziyo Osmani, a thoughtful son of his day, was engaged in the press with his translated works like "The New Uzbek Alphabet Was Welcome"¹⁷ (No. 6, 1926, p. 39). The author, whose name is unknown, does not appear to be uninterested in the author's work.

In the late XIX and early XX centuries, the socio-political, spiritual, and enlightenment literary developments in Uzbekistan were crucial times in the history of Uzbek literature. The country's and people's biggest tragedy - the loss of their freedom as a nation and a state - had a tremendous effect on the intelligentsia's psyche, yet true artists' spirits were not broken during this period of depression. There was a growing interest in the literature and art of brotherly and foreign countries as fresh, timeless works appeared around the world. The art of translating has progressed over time. Translation has been proved to be the most essential mode of interethnic communication. Not only was the literature and art of other countries studied through translated works, but also their way of life, history, economy, and daily life. There has been an increase in interethnic friendship. Of course, the publication "Education and Teacher" plays an important role. The "Western Literary" and "Literature" sections of this magazine published works and articles translated from Russian, English, Chinese, Turkish, Azerbaijani, Tatar, and Tajik languages, which played a vital role in the development of Uzbek literature in the 1920s and 1930s. The above-mentioned and examined translated works are clear evidence of our point of view. In general, this publication is one of the most important sources for early twentieth-century Uzbek periodicals, history, literature, education, and culture.

**‘LISTEN TO ME PLEASE!’ –A CLARION CALL OF NATURE FOR
 RESCUE: AN ECOCRITICAL STUDY ON DR. INDIRA GOSWAMI’S THE
 MAN FROM CHINNAMASTA**

Dr. Daisy Gohain*

ABSTRACT

From time immemorial the affinity between man and nature was inextricable. Man and nature protected and nurtured each other to safeguard and nourish mankind. The ecological and the cultural dominance the Whites had over the third world countries are referred to as ‘Eco – colonization’ of the natural world. The Man From Chinnamasta explores the issues of ecological malpractice and questions mankind on the issues related to rituals and devotion at the detriment of ecology. It also reveals the Whiteman’s dominance over nature and the resources. The study focuses on the concept of the ‘Other’, the cruel strategies the whites employed to ‘other’ man power, poor peasants, ecology and the natural resources alike. The protagonist, the Jatadhari, holds a pragmatic opinion on the subject of sacrifice and offering. From an ecological perspective, the novel lends occasion to explore the bond that nature and this hermit shared. The clarion call to save ecology gives birth to a new canon which discards the centuries-old practice of butchering animals. His perspective towards offering acts as a catalyst that welcomes new modifications. The Jatadhari is bestowed with the sense of living in harmony with our ecosystem. The environmental crisis happening around us is a result of man’s detachment from the natural world. The present study employs an Ecocritical approach that strives hard to bind the scholars and critics, to show the significance of nature to the human world. It is an investigation of the relationship between each other.

KEYWORDS: Anthropocene, Voice, The ‘Other’ Ecocriticism, Green Studies, Eco Colonisation, Postcolonialism

INTRODUCTION

In the prehistoric period, the affinity between man and nature was inextricable. Man protected and nurtured nature so that nature might guard and nourish the human race. But with the arrival of new philosophies and expeditions, both man and nature took their own path. With the advent of colonization, the ecological resources were exhausted for gain. European civilization grew more and more anthropocentric and bolstered their egotism believing that they were not only the best of God's creation but are the monarchs of the whole world. The present study aims to emphasize on the environmental crisis and global issues arising from the exploitation of the natural world from a post-colonial perspective.

The voyages of Columbus and Vasco da Gama emphasize the merging of commercial and financial interests, (religious) ideology and belief, military force and political cunning. "... already during his first voyage, we may discern in Columbus the germs of the idea for violently subduing the native populations to grab their riches: the horrific genocide of the "Indians" is quick to follow". (Prasad 4)

It can be concluded thus that the means by which the colonists became supreme were through expansion of territory, coercive violence, and ruthless exploitation be it the colony, man-power or natural resources. The work *The Beginnings: Ecology and Eco-Criticism* discuss the relationship that living and the non-living beings owe to their environment. The ecological and the cultural dominance the Whites had over the third world countries are referred to as 'Eco – colonization' of the natural world. As a result, ecocriticism arrives with the promise of offering a unique combination of literary and natural scientific discourses.

In Dr. Indira Goswami's novel, *The Man from Chinnamasta* the interconnection between nature and culture is analysed. Ecocriticism believes in 'constructedness' which includes the idea that "everything is socially and linguistically constructed" (Barry 243). The "outdoor environment" overlaps and gradually moves from nature to culture." (Barry 243) Religious and cultural obligations should maintain this interconnectedness. Goswami tries to bring both nature and culture face to face to eliminate hindrances that try to distort this connection. Ecocriticism mainly concentrates on how literature interacts with and participates in the entire ecosphere.

Thomas K. Dean in his paper "What is eco-criticism" asserts that, the ecological crisis are a result of humanity's cessation from the "natural world, brought about not only by increasing technology but also by particularization; that is, a mentality of specialization that fails to recognize the interconnectedness of all things." (Dean 5)

The Man from Chinnamasta deals with the issue of animal sacrifice. The novel was written in the yesteryears where white imperialists ruled Assam with their headquarters in Gauhati, the capital of Assam. The study focuses on the concept of the 'Other', the cruel strategies the whites employed to 'other' man power, poor peasants, ecology and the natural resources alike. However, the present study focuses only on ecological 'Othering'.

The independence movement was fast gaining ground. The white men were growing cautious. Volunteers were prepared to lay down their lives for the motherland. Mahatma Gandhi had launched a war of emotions where moral issues took the place of bullets. (TMC 146)

Assam was populated with white sahibs enjoying the pleasure of hunting birds and rehearsing their shooting skills. Plummeted cartridges, stray bullets fallen here and there, trees with holes

made from pleasure shooting and hunting was a common sight. “The path was littered with empty cartridges. They were clear indications that more and more white men were coming here for rifle practice”... “Another aimed his rifle at a grapefruit...” (TMC 46) Herons and cranes falling by the target of the White shooters during the rifle practice was not something amusing to the local people living there, “... Just then a large crane fell from the sky at the jatadhari’s feet. It had been hit by a stray bullet. The students shouted, “We *must* ask the White men to move their shooting range. Gently the Jatadhari lifted the dying crane and cradled it to his chest ...” (TMC 53) John Simon’s visit to Assam created excitement among the people. “The Gandhi topi was becoming popular around that time” (TMC 144). The cry for *Swaraj* was at its crest. The novel is sandwiched between the demand for *Swaraj*, the growing capitalist consumerism and banning of animal sacrifice. However, the present study deals only with Ecocritical perspectives in this novel.

“The Orient is an integral part of European *material* civilization and culture.” (Ashcroft 24) Taking ‘Culture’ as its stance, the study extends to support the ecological crisis prevailing at rampant based on cultural and religious background. An illustrious account of the mighty river Brahmaputra is delineated whose tide rises and falls with the sharp tenor of the novel. The breath taking imagery of the mighty sea ‘draped dappled white’ (TMC 64) acts as a spectator, at times roaring with tumult or at times tranquil and sedate. Dr. Goswami’s deliberate use of the botanical terminologies for plants, flowers, birds, reptiles, creepers, and trees makes it an authentic ecological survey which not only studies the theme but also teaches the reader new terms of the flora and fauna of Assam.

Hunting had been a popular sport among the whites. Shakespeare’s evergreen quote best fits with the white’s mentality: “Like flies are to wanton boys, are we th’ gods/ they kill us for their sport”. (Shakespeare 136) Seeing the severed marks on the trees Dorothy exclaims, “What are these marks on the trees? ...Targets for the white man’s shooting sessions. Here are the empty cartridges ... The wood apple tree has been wounded!” (TMC 172) Many officers along with the officials “of the East Bengal Company and the government of Assam were hunting here”. (TMC 28) The frequent visitation of the Sahibs from “the Steamer Company cycled up at dawn for target practice’ and eventually ‘Many trees had been felled”. (TMC 28) While practicing, “the bullets often missed their targets and hit the nests of tokoras or barhoitokas. Sometimes they got a flapping dhanesh. On occasion a bird dropped from the sky, landing in the midst of the jatadhari’s congregation”. (TMC 29) Apart from these, the flora and fauna of the land are not left untold.

Dr. Goswami’s frequent reference to moss, vines, flowers, creepers and varieties of grass makes it a real display of assorted species of shrubbery. “... tender sprigs of durba grass, blood red hibiscus flower, Sandalwood ”. (TMC 6) Images of the “chirping bulbuls, the chattering monkeys and the first flickers of dawn in the eastern sky” (TMC 7) fill her pages. She describes the monsoons with brevity as,

... the trees had closed in. the sculpted crowns of the bheleu trees were heavy with green blossoms. Gulmohar and moroi were in full bloom. The stalks of the bhatghila, were pregnant with seeds – like eggs in a lizard’s belly shown up by the sun. the round gandhosoroi leaves shone like coins stamped with the queen’s seal. (TMC 135)

The most important character, the humble hermit Jatadhari becomes the redeemer and liberator of animals. Nature trusted him as her savior. His matted dreadlocks were a safe haven for snakes and reptiles. “A strange poisonous snake twisted happily around his matted locks”. (TMC 30) Intricately coupled with postcolonial issues and religious sacraments the present research studies the same novel with an ecocritical perspective. The step taken by the hermit is a noble attempt to preserve the ecosystem which is ‘Othered’ at various levels. Here orthodoxy and religious practices ‘others’ the ecosystem.

Unlike the fanatic hermits, the Jatadhari though a passionate devotee of Ma Chinnamasta is aware of the flimsy line that demarcates devotion from fanaticism. Keeping himself within the yardsticks of religious taboos, the Jatadhari holds a pragmatic opinion on the subject of sacrifice and offering. The novel narrates an incident where a woman came with her child “fearful that some inauspicious star would cast its evil spell on her son who had played football with the skull”, (TMC 25) The Jatadhari consoles the troubled mother by giving a logical solution, “... there is nothing to fear. What proof have you that it was a skull from a sacrifice that was accepted by the goddess?” (TMC 27) His interpretation is reasonable and justifiable. He adds saying that the days of ancient writings and beliefs have changed and it is ridiculous to follow them blindly.

Can anyone today stand for a whole day and night before the Mother, holding an oil lamp in the severed head of a sacrificed buffalo? The sacred bowls in which blood and lotus flowers were offered to the mother have all disappeared. (TMC 26)

Deep ecology has stressed on the link between listening to the nonhuman world and reversing the environmentally destructive practices modern society pursues. There is a need to establish communication between human subjects and the natural world. Gary Snyder in her work *The Practice of the Wild* rightly opines that leading an ethical life with our surroundings will reduce contentions. (Snyder 22)

Pertinent to the above concept the deep ecologist in Goswami strikingly narrates the bond that nature and this hermit inextricably shared. Nature is projected as confiding in the ascetic’s idealistic belief and devotion. They cry out for redemption from this cruel practice forever. His pragmatic perspective itself is a call for ‘change’. The narration speeds vigorously with the surging flow of the river Brahmaputra.

On seeing the trees wounded with bullets the Jatadhari exclaims with grief, “The wood apple tree has been wounded”. (TMC 172) In the words of Gary Snyder in her work *The Practice of the Wild*, “The world is not only watching, it is listening too”. (Snyder 22) The greatest flaw in human nature is to neglect mother-nature and its boundless service to mankind. The attitude they have towards nature and “... its treatment is literally sickening, unethical, and a source of boundless bad luck for this society”. (Snyder 22) In relevance to the above context, as Christopher Manes in “Nature and Silence” from *The Ecocriticism Reader* opines that — “In addition to human language, there is also the language of birds, the wind, earthworms, wolves, and waterfalls—a world of autonomous speakers whose intents (especially for hunter-gatherer peoples) one ignores at one’s peril” (Manes15), similarly the novel records various narrations where nature seems weeping at times with the poor animals that are kept ready to be hacked. River Brahmaputra is witnessed roaring with surging waves hitting the shore. When Bidhibala’s

buffalo was made ready to be butchered, “The Brahmaputra roared ... Without warning a large owl hooted in the mango tree.” (TMC 103)

The Jatadhari brings a new canon which discards the centuries-old practice of butchering animals. His perspective towards offering acts as a catalyst that welcomes new modifications. The main subject of the novel lies in the process in which animal sacrifice was banned in the Kamakhya temple. The ascetic devices a movement, fixes the “date, time and the auspicious moment ...” shouting “Ma ... Ma ... Ma! Cast off your blood stained robes ... adorn yourself in garments of flower ...” (TMC 53) A memorandum against animal sacrifice being submitted to the high priest creates a raucous situation in the vicinity. A strong union of students from Cotton college, Tol ... all assembled to fight tooth and nail against this practice.

W.M. Adams in the work *Green Development Environment and Sustainability in the Third World in Countercurrents in Sustainable Development* talks about the “impacts of environmental degradation that are socially and spatially differentiated: they may end up affecting the global environment, but first, they damage small parts of it”. (185) The Jatadhari is bestowed with the sense of living in harmony with our ecosystem. Both the creator and its creation lie in one accord which cannot be divided. God being the absolute creator of this cosmos will be hurt seeing His own creation in the form of animals being mercilessly butchered. With ample quotes from the ancient scriptures, University journals and government documents the Jatadhari gives an enlightening insight into this thought: “Listen. O faithful, just as our mothers want us to live and be happy- so does the Goddess Kamakhya want her children to live and be happy”. (TMC 151) The Jatadhari claims:

The mother has never said that she would reduce the earth’s abundance to ashes if she were not offered blood’ ... Everyone joined in,

A House of flowers. The finest offering!” ...

He continues:

... The status of flowers is higher than blood. The sacred texts state that the goddess is satiated for a hundred years with the blood of a single buffalo. The same writings also claim that an offering of one Karabi flower can earn the devotee the virtues of the most arduous Yagna, the Ashwamedha or horse sacrifice. (TMC 128 – 129)

The devotees chorused:

Throw out the blood. Worship the goddess with flowers. Ma ... Ma ... Ma! (TMC 129) The disciple’s joined them: “you can earn greater blessings by offering flowers than by offering blood”. (TMC 130)

The subject in this novel is not about hindering one’s devotion in worshipping the goddess. It is only the gruesome practice of shedding animal blood that is put to question. Extending various alternatives, the students from Tol including youths and scholars explain to the priests about, “the scriptures offer alternatives to sacrifice. We can also please the Mother with honey, milk, and yogurt. It doesn’t say anywhere that the rituals cannot be performed without blood”. Despite the tremendous effort, the opposition was headstrong. “O Ma Durga! O Ma Durga! We cannot change what has been practiced for thousands of years”. (TMC 57) and threatened the students about the Mother’s wrath.

Deep Ecologist Lawrence Buell in *The Environmental Imagination* says that “human behavior is not an empty vessel whose only input will be that provided by culture, but is strongly influenced by genetic orientations that underlie and modify, or are modified by cultural influences” (Buell 3). Religious rituals are an inextricable part of the culture. Animal Sacrifice is a religious act offered by the devotee to Ma Chinnamasta. As Lawrence Buell opines, human behavior is dependent on cultural modifications as only such changes will lead to the harmonious existence of the society; likewise, the Jatadhari’s deep ecologicistic zeal tries to create harmony with nature by discarding all hindrances that intimidate or cause threat to the ecosystem.

The term “Gift Economy” used by Gary Snyder in work *The Best Buddhist Writing* pronounces the words of Gandhi who says that, “For greed, all of the nature is insufficient”. (Synder 39) It is high time that something should be rendered back to nature for all her benefits bestowed on mankind. According to her, a gift economy is that which “saves the world instead of depleting and devouring it”. In this context, the role of a writer is of paramount importance: “Art takes nothing from the world: it is a gift and an exchange. It leaves the world nourished”. (Synder39) Dr. Goswami’s acute sensitivity and empathy for mother-nature are a “Gift Economy” in its real sense. She tries to ‘save’ the depleting cosmos from perdition by reconciling both the human and the non-human world. Like a crusader, she comes to nature’s rescue with her compelling narrative and infinite vision.

As the collection of signatures grew higher, the Jatadhari who was ‘Othered’ by the other priests for accomplishing this mission along with his followers were taken into custody. Stones were pelted at the doors and windows leading to injury. Few students were admitted to the hospital. The procession commences with the Jatadhari at the lead demonstrating, “... respectful of all creatures... Man is God’s creation. Man has many things to learn from animals. Only when men and animals live in harmony will the world become a paradise.” (TMC 180)

God is personified in nature and also resides in them. The wood apple tree that has been wounded appears to him as, “the embodiment of Shiva’s matted tresses ... And the three leaves of the wood apple tree are the three Vedas – Rig, Yajur and Sama.” (TMC 172) Nature itself manifests its cooperation in this protest. Snakes and birds ‘encourage’ the hermit not to give up the quest. As the procession progresses, “a venomous serpent riding in his dreadlocks (TMC 181) had rested in his matted locks. Wild birds had perched on his arms”. (TMC 181) It appeared as though nature too had come with the same petition imploring humanity to be more loving and sensible to sustain Mother earth. Being ‘othered’ for this noble purpose, Chinnamasta Jatadhari was yet steadfast in his command crying “carry on”... “Move along, move along” (TMC 182) reverberating across the nook and corner of the shrine. It would be worth adding the opinion of Gary Synder who in *The Practice of the Wild* asserts that, “It would be a mistake to think that human beings got “smarter” ... and invented the first language. Language and culture emerge from our biological-social natural existence...” (Synder 18)

The adamant tantric demanded blood from the ascetic’s flesh ordering him to exactly make the incision, “from below the navel or from the back. Blood from the arms or the stomach is also acceptable”. (TMC 185) They insisted hard to cut a part of “your own body” and offer a lotus leaf cup filled with your blood ... a razor, a machete, a sharp knife – you can use any of these. Remember, that the larger the blade, the more auspicious it is” (TMC 185) randomly shouting ‘Now prove it’ (TMC 185).

The sacrificial altar “was drenched in the blood of young men”. (TMC 186) The novel ends with a heavy downpour which, “carried away the raw blood with all the other rubbish and swept it into the bosom of the Brahmaputra. In the light of day, no one could see a trace of blood. Not a single wiper bloodstain remained”. (TMC 186) Dr. Goswami tries to explain the tremendous effort and unity one needs to bring a change in the socio-cultural practices. Nevertheless, after the blood drained from the hermit’s body the novel emphasizes that “Not a single bloodstain remained”. (TMC 186) The hermit’s jeopardized attempt to ban animal sacrifice signifies the dawn of modernity and transition. Therefore, while Goswami exposes the cruel and evil side of the colonialists, she also portrays how certain positive elements percolated even in such an atmosphere of indignity, injustice, and unconcern.

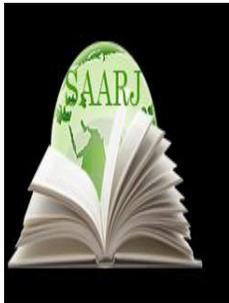

The phenomenon of ‘Change’ can be brought by removing, breaking, and discarding the old and existing ones. ‘Breaking the rule’ being Goswami’s hallmark, she faces tremendous opposition in the issue of animal Sacrifice in this novel. As Greg Garrard in his seminal work *Ecocriticism* estimates about the responsibility of ecocritics that “they must nevertheless transgress disciplinary boundaries and develop their own ‘ecological literacy’ as far as possible” (Garrard 5), Goswami too breaks (deconstructs) certain sensitive boundaries for the greater welfare of the ecosystem.

Ecocriticism explores and critiques the relationship between the humans and the ecology which is severed due to eco colonization. “natural” world has intrinsic value: that we should care for it not simply because this may be of benefit to us” (Adams 49) As man has been continually failing in fulfilling his moral obligation towards the natural environment, the harmony between mankind and nature is disturbed. The fundamental concept of ecology is that everything is interrelated. It is this unified concept that the ecocritics and environmentalists survey. They assert that nature exists as “an entity which affects us, and which can affect, perhaps fatally, if we mistreat it”. (Barry 243)

VERBALIZATION OF THE CONCEPT OF FRIENDSHIP IN ENGLISH AND UZBEK

Zatulloyeva Fariza Xikmatillojevna*

*2 – course of Master's Degree,
SamSIFL, UZBEKISTAN

ABSTRACT

This research examines the semantic and linguocultural characteristics of various English and Uzbek proverbs regarding friendship. The equivalents of some proverbs in a target language are offered for understanding them in the other language in order to discover numerous essential new translation methods and compare and contrast their peculiarities in the English and Uzbek languages. The findings and examples presented in this study can assist in identifying certain differences in the meanings of English and Uzbek proverbs about friendship, as well as learning about their linguocultural uniqueness.

KEYWORDS: Proverb, Verbalization, Friendship In English And Uzbek, Linguoculturology, Cultureme, Pragmatics, Synonymy, Antonymy, Equivalent, Context.

INTRODUCTION

Linguoculturology is one of the most important elements of linguistic research; it deals with a variety of concerns relating to a nation's language spirit and cultural variance, as well as many national-cultural conceptions and conversational structure theories. This branch looks at how a language reflects a country's spirit. It is linked to various fields of study such as philosophy, logics, sociology, anthropology, and semantics, and it encompasses national-cultural knowledge via voice communication.

The focus of this article is on the contrastive examination of proverbs that fall into the third category of this classification. It is self-evident that the emergence and formation of proverbs, as well as their acceptance into real dialogues by the nation, takes a significant amount of time. The languages of English and Uzbek are said to have a long history. The Uzbek language has a rich history as well. True, it was only lately that this language was given the label "Uzbek language," although it has existed since the X-XI century. A large number of proverbs, sayings, and aphorisms are considered to constitute a significant part of Uzbek culture. The main sources can

be divided into the following categories: religious characters and borrowed translations (mainly from the Arab, Tadjik, Persian and Russian languages). Furthermore, some proverbs are derived from sayings made by the media (TV, radio, or social media), film and song phrases, and even commercial slogans in all languages, including English and Uzbek. They do, however, require some time to develop or construct new proverbs.

Concepts and methods

With the use of examples concerning friendship, this article tries to examine the linguo-cultural characteristics of proverbs in these two languages. The concept of "friendship" is an abstract term that is valuable in human life and falls into the same category as "family," "health," "wealth," and "labor." Because of the culturemes that exist in the content of a target language, translating proverbs word-for-word is insufficient to represent the meaning of a proverb in other languages. It may lead to a misunderstanding of a proverb's essential meaning.

To explore the peculiarities of proverbs regarding friendship in different languages, the approach of discovering analogues of proverbs in English and Uzbek was utilized. - Like birds of a feather, they flock together. O'xshatmasdanuchratmaso'xshatmasdanuchratmaso'xshat (They do not meet who do not look like each other). In the English proverb, bird behavior is compared to human friendship, however in the Uzbek proverb, a short sentence form with an unknown subject is employed. It is acknowledged that practically all proverbs belonging to the Uzbek nation have a sentence form with an elliptical subject. In addition, according to the interesting fact that both proverbs, which are given above have Arabic origin (XVI century).

In a language, there are many synonym words and phrases, and proverbs might be interchangeable.

Their meanings are sometimes similar, and they might be used interchangeably in some situations. However, despite their lexical similarity, many synonym proverbs cannot be considered absolute synonyms. Because their expressiveness in their meanings varies to some extent, they are used in different cases and situations – and thus have different pragmatic and sociolinguistic characteristics: some are mostly used in formal (official) situations, while others are frequently used in informal (oral) conversations. Despite the fact that the proverbs listed above have various synonyms, they cannot be substituted in a context because the semantic or stylistic balance would be disrupted. A man is known by the company he keeps. – Do'stingkimliginiyayt, seningkimligingniyaytaman (Tell me your friend, I shall tell who you are).

According to these proverbs, a man's attributes are defined by the type of friends he has. These two proverbs appear to be semantically identical, but their pragmatic aspects differ: the English proverb is typically employed in more official and literary forms, whilst the Uzbek proverb is typically used in informal speech.. There is no better looking-glass than an old friend. / The eye of a friend is a good mirror. –Do'stachimtibgapirar, dushmankuldirib (A friend tells bitter truth, an enemy sweet lie).

According to these proverbs, a true friend gives you the truth even if you don't like it, and they should warn you about your faults or bad character, but adversaries deceive you with beautiful words in order to be liked or find your flaw. The lexeme mirror (= looking-glass) is used in both of these English proverbs. The artistic trick of oxymoron is used in the Uzbek translation of these proverbs (friend – enemy, bitter – sweet). A friend in court is better than a penny in purse. –

Boylikboylikemas, birlikboylik (Wealth is not wealth, solidarity is wealth). The main meaning of these proverbs represents that friendship is more valuable or necessary than money, it is real wealth. The existence of the cultureme "penny" proves that it belongs to the English nation.

Compare and analysis

In the English culture, friendship is compared to money, and it is said that friends are better than pennies; in the Uzbek society, friendship is equated to genuine wealth. It is beneficial to have friends in both heaven and hell. – *ishingosonbitadi, do'stingyoningdabo'lsa.* (You fix your difficulty quickly while your friend is with you.) Because of the culturemes "heaven" and "hell," which are both religious words and semantic opposites, the English proverb has a powerful expressiveness and impressiveness (antonyms). The occurrence of these words exemplifies the proverb's linguocultural and pragmatic idiosyncrasies. The proverb in Uzbek has more simple structure and literal meaning in comparison with the English one that owns figurative meaning. Be a friend to thyself and others will befriend thee. – *O'zigaboqmagan, o'zgagayoqmas* (If one does not pay attention to himself (his character or behaviour), others do not like him).

To summarize, proverbs have become an important component of the English and Uzbek languages. They differ from one another in terms of semantics, structure, style, and even pragmatics. Many flaws in a nation's culture are addressed in Proverbs. The purpose of proverbs is to characterize, identify, and reflect the culture of the language in which they are found. National concepts, items, attitudes, traditions, well-known forebears, and even place names — cultural points – can all be found in a language's paremiologic fund. Proverbs in English and Uzbek connected with the theme of "friendship" represent a nation's attitude, culture, and customs, and play a significant role in the language of the country. In both languages, proverbs about friends are various, besides synonymous or antonymous proverbs can be found among them. Friendship proverbs can be found in both languages, and they include both synonymous and antonymous proverbs. However, because they are chosen according to a context, their synonymic and antonymic relationships are not considered absolute, and their meanings may be slightly altered as a result. As a result, using a proverb in the right context makes a speech clear and fluent. Because, as previously said, proverbs are frequently employed in speeches and are chosen based on time, place, circumstance, and other pragmatic aspects. Furthermore, society and social processes have a direct impact on proverb usage, semantic expressiveness, and other characteristics.

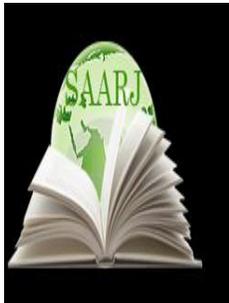

CONCLUSION

The process of translating proverbs from one language to another necessitates more than a componential or structural approach; it is vital to convey the target proverb's fundamental meaning precisely in the translation. The paper's principal finding is that there are significant semantic, structural, and stylistic parallels between English and Uzbek proverbs about friendship, as well as many variances. However, there is no similarity between the linguocultural features of these proverbs in these languages. Because, according to the genetic classification of global languages, they are not relative languages. Furthermore, every nation has its own culture, tradition, and, of course, culturemes that represent aspects of that culture in the language of that nation. These culturemes supply proverbs with unique semantic and linguocultural characteristics. In light of the foregoing, it's worth noting that proverbs contain social behaviors that can be seen in a real or hypothetical society. Furthermore, because a language develops from

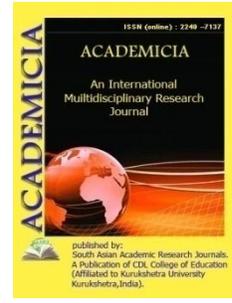

day to day, the number of proverbs in it changes as well; certain proverbs may fade away, and people may begin to employ new proverbs in their talks.

THE ROLE OF VENTURE CAPITAL IN THE INNOVATIVE DEVELOPMENT OF A TRANSFORMED ECONOMY

Chulliyev Suhrob Rabbonaqlovich*

*Senior Lecturer at the Department of Geography and Economics,
 Navoi State Pedagogical Institute,
 UZBEKISTAN
 Email id: suhrobchulliyev@gmail.com

ABSTRACT

The article examines the research of a number of scientists on the role of venture capital and innovation in the innovative development of a transforming economy. The innovation activity of enterprises and organizations of Uzbekistan is analyzed. The advantages of venture financing are highlighted.

KEYWORDS: *Innovation, Transformation, Venture Capital, Technology, Venture Financing.*

INTRODUCTION

Uzbekistan's entry into the group of leading countries in terms of GDP, per capita income and many other parameters is impossible without transforming the economy and requires a constant shift in the vector of investors to better use of human knowledge and skills to improve technology, economic outcomes and life in general. does. The Address of the President of the Republic of Uzbekistan to the Oliy Majlis recognizes that our country has entered the stage of innovative development in order to achieve modern progress. "Innovation is the future. We need to start building our great future ... based on innovative ideas. It is no coincidence that we are moving towards innovative development and the digital economy. Because who will win in today's fast-paced world? A state based on new ideas, new ideas and innovations will win. " [1]

In recent years, in the development of economic policy of Uzbekistan, more and more attention is paid to the strategic direction of innovative development, according to which only effective and systematic use of scientific and technological potential of the country can ensure its sustainable economic development. Accelerating the innovative development of the economy is the most important priority of socio-economic development of the country in the long run.

One of the most important and serious problems in Uzbekistan is the implementation of the results of scientific and technical activities. The paradox is that a significant amount of unfulfilled scientific achievements and discoveries have accumulated, and as a result of the physical and spiritual obsolescence of technology in many sectors of the economy, there is ample room for the use of these achievements and discoveries. At present, Uzbekistan does not have a chain of fundamental science - applied research - the real sector. New technologies and discoveries are slowly being introduced into the manufacturing sector, which leads to a decrease in the competitiveness of Uzbek products in domestic and foreign markets. This could have serious consequences, such as the country becoming an outsider in science and technology.

The implementation of innovations, innovations, as well as scientific and technical achievements in the production of new or existing goods, technologies and services is important for the development of the country's economy and improving the living standards of the population; increase labor productivity, create new industries, services and jobs, improve the quality of services and increase the competitiveness of domestic goods in the world market. [2]

The level of innovation activity of organizations in Uzbekistan is not yet high (Table 1), so in modern conditions there is an objective need to transform the economy of Uzbekistan, its transition to an innovative scenario of development.

TABLE 1 INNOVATIVE ACTIVITY OF ENTERPRISES AND ORGANIZATIONS IN UZBEKISTAN, 2018-2019 [3]

Innovations	Number of enterprises and organizations that have introduced innovations, together *		Number of innovations introduced, unit	
	2018 year	2019 year	2018 year	2019 year
Total	1024	1587	2558	4567
Technological innovations	982	1514	2482	4427
Marketing innovations	17	28	42	128
Organizational innovations	25	45	34	13

* Organizations implementing several types of innovations are listed once in the "total" category

At present, a number of state initiatives aimed at the development of science and technology in Uzbekistan have been developed: “2017-2021 йилларда Ўзбекистон Республикасини ривожлантиришнинг бешта устувор йўналиши бўйича Ҳаракатлар стратегияси”(Action Strategy for the five priority areas of development of the Republic of Uzbekistan in 2017-2021), “2019-2021 йилларда Ўзбекистон Республикасини инновацион ривожлантириш стратегияси” (Strategy for Innovative Development of the Republic of Uzbekistan in 2019-2021), Innovative Development and The Fund for Support of Innovative Ideas was formed, the concept of complex socio-economic development of the Republic of Uzbekistan until 2030 was developed.

The main thing here is the demand for knowledge, the restoration of the country's innovative potential through the development of modern innovative projects, not only the creation of

individual examples of technically complex developments, followed by the development and sale of innovative products for domestic and global markets.

At present, the main transformation processes are mainly associated with the development of technological innovations that act as a catalyst for the adaptation of economies to the conditions of formation of the latest technological order. The peculiarity of today's world economy is that it has a high level of competition in the field of technology and a wide range of opportunities for their rapid transfer. Under such conditions, the formation of national innovation systems as the main mechanism of development has become a key factor in the long-term growth of the world economy. Countries can no longer be passive in ensuring the required level of innovative development; otherwise an unhappy prospect awaits them: dependence on external financial and technological resources makes them the only suppliers of raw materials.

The importance of an innovative approach to economic development is emphasized by many economists.

The concept of "innovation" itself is associated with the name of the Austrian economist J. Schumpeter, who was one of the first to study the impact of scientific and technological progress on the level of economic development in the first half of the twentieth century.

Schumpeter said, "Production is a combination of things and forces that exist in our sphere. The manufacturer believes that it is something else, or in other words, to create other combinations of these things and forces"[5].

In Schumpeter's Theory of Economic Development, the content of innovations is revealed:

1. "Creating new, that is, goods that are not yet known to consumers, or developing a new quality of this or that blessing.
2. The application of a new method (method) of production that is not based on a new scientific discovery, as well as a new method of commercial use of the relevant commodity, which may not exist at all in this industry.
3. Development of a new market for sale, ie a market in which this industry has not yet been demonstrated. It does not matter whether this market has existed before or not.
4. Assimilation of a new source of raw materials or semi-finished products: regardless of whether this source previously existed or was not, or simply ignored or considered unattainable, or whether it should now be created.
5. Appropriate reorganization, for example, by securing a monopoly position (through the establishment of a trust) or by destroying the monopoly position of another enterprise."[5]

Russian economist Nikolai Kondratev developed the theory of long waves in the 20s and 30s of the twentieth century. According to him, the state of the economic system is subject to periodic fluctuations lasting at least 50 years. At the same time, scientific and technical innovations serve as a factor in the transition of the economic system from one period to another.

Most researchers prefer to divide innovations into technological, management, and product innovations.

It is pointless to argue which of a product or technological innovation is more important from an economic point of view, but it is safe to say that product innovation plays a key role in times of

economic boom or strong demand for a new look for a product. Technological innovations play an important role in the relative saturation of the market, which uses new technological production processes to reduce the cost of production of existing products. [6]

Unlike an existing product or technological process, any major innovation that affects not only the micro but also the macro level has an important feature as a scientific and technical innovation. Different innovations have different levels of innovation, so it is so important to look for its reliable indicators from a scientific, technical and economic point of view. For example, a sharp increase in aircraft speed is possible, but this leads to serious economic losses in return for increased fuel consumption. The true novelty of a product or process must be related to the growth of the economic benefits derived from their use. [6]

Another important feature of innovation is that it represents not a rare one-time event, but a more or less continuous process, a continuous chain from the emergence of a technical idea or discovery to their application to a new technological process, or a qualitatively new product. Between these two perspectives are the interrelated stages of research, development, invention, design, demand analysis, production decision making, and more, culminating in the commercialization of a new product in the market or the economical use of a new technological process in production. [6]

The fact that innovation is a leading role that can be described as a process aimed at creating the best and / or previously non-existent goods (services) and technologies in terms of economic growth is beyond doubt today. As mentioned earlier, the innovation process itself must end with the sale of a product that the market demands.

It is known that large companies receive about half of their income from the sale of new types of products with a shelf life of no more than five years. Industrial companies want to increase spending on research, but are constantly faced with a number of challenges.

The paradox of innovative business is that it is much easier for small businesses to implement new technologies due to high mobility, sensitivity to technological innovations and willingness to take risks; they are not afraid that, unlike large companies, the introduction of a new product may affect the current situation in the market. Large companies often face problems in introducing new ideas and technologies, so in practice they use small innovative enterprises for this purpose.

Thus, effective innovative reproduction is formed on the basis of integration of small and large enterprises, where small enterprises operate in the field of innovation, and large enterprises in the field of investment.

The so-called "corporate venture" model of innovative business is widespread. Under it, enterprises solve their problems of innovative development independently, while the major parent company, which directs resources to the implementation of innovative projects, remains the main investor. If the innovative project is not organized by the parent company, funding is usually provided through a venture fund that is corporately dependent (captive).

Another important factor supporting the establishment and development of small innovative businesses was a significant increase in scientific discoveries and inventions of various research centers. Many scientists and engineers in such institutions began to emerge as entrepreneurs by

setting up small firms to implement their inventions, and this became widespread in foreign practice.

Financing of such small innovative enterprises is carried out mainly at the expense of venture investment technologies. Venture capital is an important source of extra-budgetary funding for research, development and innovation. The share of venture capital in the total investment resources of the world economy is not relatively high, but it is very important for the successful development of individual countries. This is confirmed by the fact that many large internationally renowned companies have succeeded precisely because of venture capital. As T. Perkins, the founder of the Venture Movement, put it, "...the money we make is, in fact, a by-product, ... driven by the desire to create amazing technologies that are at the tip of the spear and have to change the world."

The importance of venture capital for small high-tech firms is explained as follows. Young high-tech firms often fail to succeed in the competitive struggle that takes place through development based on self-financing. Bank loans also cannot be considered as a source of financing for small innovative enterprises due to the credit history of such companies and the lack of sufficient collateral. Moreover, the organizers of such enterprises sometimes do not have sufficient management skills. The function of venture capital is to solve such problems in the development of small innovative enterprises.

The venture investor's funds are used by the company as a unique financial lever that helps small innovative businesses grow and develop rapidly. The company's organizers and venture investors strive not only to achieve high returns, but also to become leaders in these markets by influencing the development of the innovative sector of the economy, creating new directions of scientific and technological processes, creating new markets and achieving innovative monopolies. The growth potential of the company's value depends on the level of innovation, ie the novelty of the project.

Venture capital allows you to commercialize advanced ideas, create new innovative companies and an entire industry, and support existing ones. It plays a huge motivating role by encouraging enterprises to redirect the type of development and stimulate the growth of their scientific, technical and innovative activities. Emerging innovation firms often act as generators in the creation of new technology manufacturers, new types of products and innovative development sources for large enterprises, reorienting their investment and innovation policies, creating the conditions for achieving high competitiveness as quickly as possible.

A number of studies reveal the essence of individual methods using venture capital innovations and new high technologies to encourage the establishment of companies. S. Kortum and D. Lerner analyzed the activities of 20 industries in the United States in 1960-1990 and found that the participation of venture capital leads to an increase in patent activity by 5-18%. Using data on 173 newly formed companies in Silicon Valley, T. Hellmann and M. Puri showed a significant reduction in product launch times for companies using venture financing. [7]

M.Aoki noted another important factor in the participation of venture capital in the popularization of technological innovations. Young high-tech companies in Silicon Valley specialize in developing innovative products that provide the conditions for the emergence of a new chain of value creation. In the context of high levels of uncertainty and competition inherent in modern technology and market development, innovative firms will need to

continuously create and distribute data among contractors that constantly affect all emerging value chains. However, companies need to combine and protect specific data that is critical to their products at the same time, because that alone guarantees them a competitive advantage. This bias leads to an increase in the exchange and distribution of technological knowledge between firms gathered in the Silicon Valley. Venture capitalists play a key mediating role in these processes. [7]

A similar conclusion was reached by P. Robertson and R. Langlue. They argue that financial innovators help accelerate the development of individual companies and disseminate the innovations they implement by building and maintaining broad connections within areas where innovation activity has increased. In addition, the development period of groups of innovative firms from the "established" state to the transformation of large technology clusters before the emergence of venture capital is more than 20 years. [7]

The advantages of using venture financing mechanisms include:

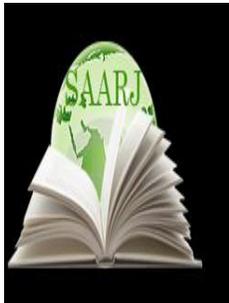

- intensification of the establishment and development of high-prospects innovative enterprises;
- support for high-tech sectors of the economy, especially dynamically developing ones;
- application of innovations in the economy and increase the speed of their spread;
- increase the level of commercialization of scientific developments;
- development of the social sphere (education, health, culture, etc.);
- improving the quality of life;
- Creating new competitive jobs through the development of innovative companies.

Thus, the innovative development of venture capital is manifested as a factor in the structural transformation of the economy. It helps to create a unique investment mechanism of innovative activity that increases the efficiency of the economy as a whole by ensuring the interaction of all links of the "science-production-market" chain. Venture capital is the driving force behind the innovative renewal of the economy, the factor that accelerates its growth.

THE ART OF POETRY IN "GULSHANI DILAFGOR"

Sobir Mansurov*

*Senior lecturer,
Tashkent State University of Uzbek Language and,
Literature named after Alisher Navoi,
UZBEKISTAN

ABSTRACT

This article classifies some of the poems in the "Gulshani Dilafgor" collection. The study of lyrical works in the collection of the poet "Gulshani Dilafgor" shows that Dilafgor could not avoid the themes that accompanied the poets in Uzbek classical poetry.

KEYWORDS: "Gulshani Dilafgor", "kalomi jomi'", gazelle, devon, nat, poem, literary criticism, "tavshih", verbal, spiritual.

INTRODUCTION

The influence of the works of Ahmad Yassavi, Sulayman Boqirg' oniy, Fuzuli, Huvaydo, Hazini are felt in Dilafgor's work. Also, most of the poet's poems are in sync with the lyrical works of poets such as Furqat, Muqimi, Hamza, Khislat, Kami, imbued with the ideas of nationalism and enlightenment. He, too, relied on the progressive ideas of his time in continuing the traditions of his predecessors, who had shaken the pen before him. While composing "Gulshani Dilafgor", the poet Dilafgor, like his predecessors, traditionally begins the collection with praise to Allah and praise to the Prophet. The first verse of the verse dedicated to Muhammad (peace and blessings of Allah be upon him) begins with artistically powerful lines such as:

It should be noted that the supreme universe Muhammad (s.a.v) had at first had great difficulty in spreading Islam in his homeland, but later enlightened the Arab world with the light of Islam. Then that pure light illuminated the foreign lands. The above verse also praises the fact that our Prophet ruled Islam in the Arab world like a king, that he was enlightened in other lands, not by himself, and that such a king and such a monk would be blessed. Even one line shows how much potential the poet has.

In the East, lyrical works are important because they are rich in wisdom. Even in poetry bouquets such as "Gulshani Dilafgor", the work of "Be adorned with something like admonition,

wisdom, and time to complain to the brethren” (Badoyi us-sanoyi) is a natural process. Poems like this, which are dominated by advice, wisdom, and the motive of complaining about the brethren of the time, give rise to the art of the “word-of-mouth” art. Dilafgor's:

*Guys, we still can't strive for the nation,
Lying in a bed of ignorance, we still can't open our eyes.*

Or:

*Your life is over, O heart, do not go to bed, wake up,
If you are a king, go to bed early in the morning.*

Or:

*You are a gangster, O tongue, seek the consent of the Lord,
If the Ummah dies, look for the true Mustafa.*

His gazelles, which begin with the mats, are frozen from head to toe with the art of the "kalomi jomi".

The "Mazhabi kalomiy" is one of the spiritual arts, and in prose and poetry it consists of subtle arguments to prove one's point. Evidence can be clear as well as hypothetical. From Navoi's poetry, especially in his gazelles, proof of thought has been used in a variety of forms as a special art.

In the gazelle, the sectarian word is often used within a byte. Evidence is made through various auxiliary words and conjunctions (why, why, because, morning, not strange, not strange, not strange, who, etc.).¹

Dilafgor's gazelle also contain the art of the "Mazhabi kalomiy":

***It is strange** that a sick slave dies when his soul dies.
If you dream, I'll be in my head.*

Or:

*But Dilafgor relationship hopes that he will not cut,
One day, **strangely** enough, he lost his friend.*

Or:

*My labor is on my head, my interlocutor is in pain,
My wonder is my misfortune, my happiness is ink, O God.*

Or:

*My mind is always on you,
Surprisingly, you are hurting the mountain without a blessing.*

In the science of art, “when a poet uses various images or phrases to express his thoughts and experiences, he abandons his previous ideas (phrases, images) in the process of painting, rejects them and replaces them with new images and phrases. The art of “rujo” is born out of the desire

to express new thoughts and experiences in a more powerful way, replacing phrases and images that seem to be incapable of fully expressing their purpose.² It is noteworthy that the art of "rujo" can be found not only in the poems of the poet Dilafgor, but also in his "muhammas".

The use of the words or in the poet's work served to expand the possibilities and further strengthen the artistic love:

*When you cry like a madman, your heart bleeds,
When you cry, your tears flood,
Or like a nightingale in the morning,
Please pray for the fairies,
If unkind, the effect of prayer will be rare.*

According to the data, the essence of the art of union is that the poet uses his name or nickname in the poem in such a beautiful way that the lexical and terminological meaning of the word comes to the reader's mind at the same time.³

Given the fact that the word "Dilafgor" means a sick heart, a broken heart, an overly sad person, the poet in the process of using the nickname also tries to express those destructive heartaches:⁴

*Dilafgor osiyemen, oh rabbano, have mercy on me,
I beseech thee, O God.*

Or:

*Posted by Dilafgor sadly, if the mistake is forgiven,
Old and young still can't respect each other.*

Or:

*Dilafgor is not happy, although he is having a party.
It doesn't matter, you idiot.*

According to the Dictionary of Literary Criticism, "tavshih" (Arabic - "tavshih" - embellishment) is a poetic art in classical literature, the derivation of a word (noun) from a set of letters at the beginning of a verse or byte (sometimes at the border of the tablets). A poem based on this art is called muwashshah.⁵

The poems in the collection "Gulshani Dilafgor" belong to a unique genre in terms of expression and content, and the poet has created works in such genres as gazelle, "muhammas, muwashshah, musaddas, tarje'band, chiston and fard", which are widely used in our classical poetry. It is known that every artist creates in harmony with the period, so the signs of the existing system in his works are in some sense subdued. This can also be seen in the work of Dilafgor. The collection "Gulshani Dilafgor" contains 51 poems of the poet, 23 of which are gazelles. It is obvious that the role of the gazelle genre in the work of the writer is great.

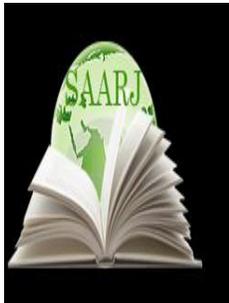

In addition to the above-mentioned arts, the art of talmeh was also used effectively in these gazelles. The arts used in the ghazals, in turn, reveal the inner spiritual world of the artist. This is especially true of lyrical works on religious and philosophical themes.

In conclusion, it is also clear from the above observations how high the poet's artistic skill was. Dilafgor was able to create unique lyrical patterns using the verbal, spiritual, common forms of art used in our traditional poetry. In his lyrics, the poet made extensive and appropriate use of many of the arts typical of our classical literature.

There are a number of types of art in Dilafgor's work. In particular, the "darj" type of art of "quotation" in art adorned the works of the poet. In the poet's work, one of the oldest poetic methods of rhyme, "radd ul-matla" or "iyto", is used, for example, one of the two types of iyta, iytoyi hafiy (closed, hidden repetition).

ABSTRACT

In this article, you will have a complete knowledge of the origin of horses, the history of evolution, snake networks, consultations on the stench of horses, training, proper assessment of the ester of body parts, orientation in the right direction according to the position of horses.

KEYWORDS: *Evolution Of Horses, Snake, Training, Equine Ecstasy, Body Parts, Index, Horse Feathers, Phonandus, Brain.*

INTRODUCTION

In order to develop horse breeding, breeding and horse sports in our country, to increase the number of domestic breeds of horses, to popularize modern sports beshkurash and polo, to attract a wide range of foreign investments directly to the sphere, as well as to strengthen the material and technical base:

The following are the main directions of further development of horse — riding and horse-riding in Uzbekistan (in subsequent places-horse-riding), as well as modern beshkurash and polo sports: in the country, the system of turning horse sports, as well as modern five-track and polo sports into one of the most popular sports among the population, selection of talented young people, selection (selection) and training of them as professional athletes is established;

The formation of the necessary material and technical base and infrastructure for horse sports and polo sports, including the development of the activities of horse sports clubs, effective organization of the training process for national teams; Step-by-step introduction of horse sports, as well as modern five-track and polo sports to the physical training of the Armed Forces and law enforcement bodies; equestrian sports, as well as modern beshkurash and polo sports to a level that can compete with developed countries, training specialists on the basis of international requirements and standards, holding world and continental championships among major international competitions, including the youth and women's teams of adolescents;

Agriculture is the most important branch of livestock farming. In the following years, this network has been given wide opportunities. To this day, this sphere was the field of animal husbandry, which remained unnoticed. Horses are fed in the national economy for manpower, sports, product acquisition, breeding and other purposes. The study of the origin of horses, knowledge of horse consults, ecstasy will help them to correctly identify the location of organs, distinguish them into species depending on the breed of horse breeds and appearance, qualified personnel in the same field, otchopars, Equestrian Club and horse sport. Failure to properly orient the horses to the species causes a change in them, losing their natural state of kop, without being able to properly distribute their power, can reduce productivity.

Relevance of the topic

Students, hawkers and other specialists who are now familiar with horses have a great importance in collecting information, equipping horses with the mountain, dividing their appearance, weight and other characteristics into groups with a high assessment of the ecster, moving to the right direction. It is known that horse sports today is one of the most developed areas. As a result, the demand for classic sports horses increases. Horse sports are characterized by beauty, pleasure and curiosity from other sports. To participate in the same horse sport, it is necessary to have information about the training, consulting with him, so that the horses are also obedient, beautiful, healthy.

According to the Zoological classification, a horse, donkey, zebra, a slave and many other ungulates belong to the class of mammals, the category of ungulates, the family of otsimons, the ancestor of horses. the evolution of horses tiny animals originated 50mln years ago from this.

12 has experienced a period. Horse ancestors were animals that looked like a fox or a dog. One of these is the phonandus, which has a body structure similar to a horse, a smaller animal. The horse came from the Wild Horse-tarpan, who lived in Europe, Asia, Africa. Tarpans were first cultivated in the three thousand years before milloan in the Danube and in the territory from the Balkans to the Urals.

The fact that horses can move quickly and walk on hard land was the reason for the formation of hoofs in them. The hooves were first shaped on the hind leg and then on the front leg. Feet uzayishi depends on their rich hanging. At the same time, their brain weight also increased. The horse was domesticated after the donkey, the dog, the sheep. Spread from North America to the continents of Asia, Europe, Africa. Horse sports, horse clubs, farms have been established on all continents in day.

Training, Consultation

Training improves the health of horses, increases endurance, facilitates their adaptation to the environment. Training in general is understood to engage in horse riding, training them, feeding, grooming, walking and other classes. Training begins with a small level, without suddenly starting from a large one on a new toy. From day to day its speed, condition, health is high and levels of anticipation are impressed. Constantly consulted, the breed of horses engaged in training is well and tolerant. The period of their preservation of these qualities was many. The higher the level of training of horses, the more tender it is, the more work capacity is relaxed, the less energy is required than before to fulfill the given norm. In addition, regular training on horses has a good effect on their health, the work of the cardiovascular, respiratory, digestive systems of the heart. Metabolism is accelerated, the central nervous system develops well. The training is not only in distinguishing good horse breeds, but also in increasing productivity in a snake.

There are the following ways of testing horses: a quick chop on four legs, a quick chop on four legs, crossing each homogeneous barrier, with a load on it or with a cart attached. the maximum load increase is to take it to the distance. Training is carried out according to certain rules, depending on the type of horses and the work they perform, age.

Horse consults and excerpts. The sum of the anatomical and physiological characteristics that cause the degeneration and individual development of the organism is called consultation. These characteristics determine the animal's body structure, along with the development of organs, as well as the productivity of its work. Or the first time the concept of consulting in science was introduced by the scientist Hippocrates, who lived in 377-460 years. In 1939, professor V.O.Viit and Sh.n.Zamyatin recommends that rural animals be divided into broad-body (eyrosomli) and narrow-body (leptosomli) types of consultation.

In the evaluation of pedigree horses, body parts cannot be bonitirovka without knowing the dimensions. He must be able to think and know the names of the body parts as if they were visible on the X-ray screen.

Capsule consultation-the bones of the animal are covered with flat ,thick and coarse wool, the fat layer under its skin is stagnant, the trunk and head are disproportionately located on the body
hin consultation-the bones of the animal are thin, the head is small, the neck is thin, the skin and wool are thin. The hooves are thin.

Empty consultation - the animal's beak is large, the bones are bruised, the muscles are strained, but the joints are conspicuous .fluid can be found in the joint

Dense consultation-the animal shakes its feet and developed a solid, skin stroke connective tissue stagnant. The muscles are dense and the temperament is high.

- The types of cover and dense consultation are clearly thrown into the cocoon. They are adapted to the conditions of Sagittarius.

Head, cover and fine-consulted types are mostly common in heavy-duty horse breeds.

- for horses (pure-blooded, arab, akhaltaka), a dense consultation is a harvest. The animal ecster is the designation of animal consultation on the outside.

And the external structure determines its pedigree, ability.

When monitoring the growth and development of young horses, during the bonitirovka, 4 dimensions are obtained in the animal: height, length of the trunk, circumference of the cockroach, and width of the palm. In order to fully haract the structure of the horse's body, one size is subtracted from the other, and this is called the index.

he following indexes are used:

- 1.length.
- 2.fun of cockroach cage.
- 3.strife.
- 4.bone building.
- 5.efficiency.
- 6 feet.
- 7.the strength of the palm.
- 8.depth of the cockroach.
9. height.
10. Magnanimity and others., aloobesity. bunda horse body looks fuller, the bristles seem to lick, but the work efficiency is reduced.

Factory or good obesity, sexual activity in such horses is high Working obese, such horses do not accumulate fat between the muscles,ixchsam was considered the most acceptable for working horses. Unsatisfactory obesity is observed when the conditions of animal storage are unsatisfactory, poorly nourished, sick or old.

Father's assessment of the ecster begins with the fact that he begins to eat, stand in his stables, eatfood,eat appetite.

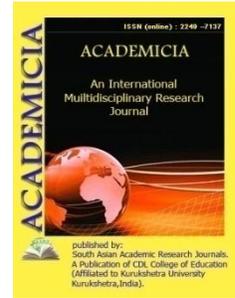

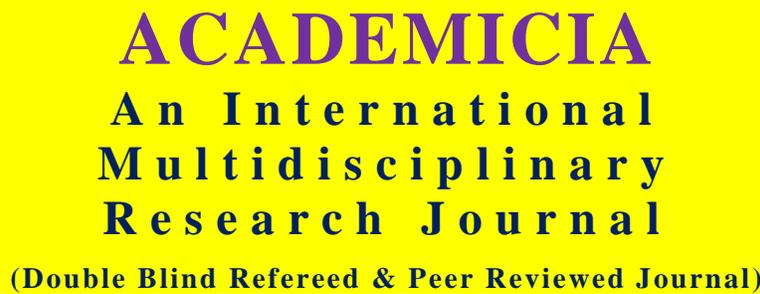

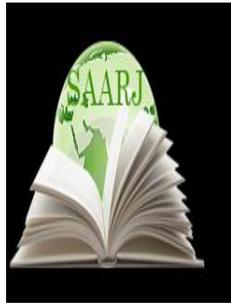

Then it is taken out and checked for nasal folds, eyes, breathing, convulsions.5 or 6 steps away from it can be summarized depending on the total.

CONCLUSION

1. In order to properly Group horses in a snake, it is important to bypass and fully study them all. It is necessary to start the study from the intake of nutrients, to monitor appetite, to monitor breathing and all other small processes.
2. It is the second issue to apply the correct consults to them after studying horses. It is necessary to perform the exercises that the horse organism raises, stratifying them by degrees. Putting hard training on young horses leads them to fatigue of their organism.
3. Correct assessment of the ecster's location than the external Corinth on horses will help the horses in the direction of the task. For example: it would be a mistake to expect the efficiency of a horse entering a dense consultation from an external Corinthian to an empty consultation. Diseases caused by various physiological changes may arise when the error is studied.

ABSTRACT

Spiritual and moral education of the younger generation is of great importance in the formation and development of a modern personality, whose activities are carried out in a multipolar socio-cultural space. Spiritual and moral education in the process should take one of the leading places in teaching Russian as a non-native (foreign) language. The article includes recommendations for teachers of Russian as a non-native (foreign) language, which can be used when writing teaching aids.

KEYWORDS: *Morality, Spirituality, Teaching, Education, Personality, Society, Activities, The Younger Generation, Classics*

INTRODUCTION

Each era, in accordance with its specific tasks, dictates the need for spiritual and moral education and personality formation.

In the 21st century, when there is a transition from the reproductive-pedagogical to the creative-pedagogical paradigm of education, there is an urgent need to search for new technologies of moral education aimed at developing a person's spiritual abilities (1.73). Moral education is one

of the most pressing and complex problems that must be solved today by everyone who is related to the upbringing and education of the younger generation. Morality in the learning process should take one of the leading places in teaching Russian as a foreign language. This is very important for the development of a highly moral, harmonious, physically developed and spiritually healthy personality, capable of creativity and self-determination. Morality, by the definition of S.I. Ozhegov, is the rules that determine behavior, spiritual and mental qualities necessary for a person in society, as well as the implementation of these rules (2).

Moral education is the educational impact of the school, family, community, with the goal of forming stable moral qualities, feelings, behavioral skills based on the assimilation of ideals, norms and principles of morality in practical activities (3). It is not difficult to formulate, set an educational goal of the lesson, but it is much more difficult, with what methods and techniques and on what material to carry it out. Teachers, when planning their classes and writing teaching aids for students studying Russian as a foreign language, can use material with a pronounced moral connotation with a great emphasis on texts that talk about kindness, humanity, mercy, conscience, love for the Motherland. For example, when planning independent work, you can use text material which encourages students not only to think, but also to form moral attitudes, activate creative thinking. For better memorization, use the techniques "Cluster", "Flight Diary", "Water Circles", etc. In our opinion, tasks that characterize a person by his actions and qualities, which encourage students to think about life, relationships between people, about the connection between the past, present and future, about their place in life, are of great educational value. In classes on the topics "Personality and society", "Spirituality and culture will save the world", provided for by the calendar-thematic plan of the practical lesson in the Russian language, we include texts about the life and work of the classics of Russian literature: A.S. Pushkin, L. Tolstoy, M. Lermotova. Faced with a book every day, we have the richest material for educating our youth, therefore it is advisable to include and memorize the verses of Russian classics in the independent work of students, which are also of great educational value. They should have a detailed conversation about hard work, truthfulness, courage, perseverance.

These stories encourage an excited conversation about the difficult problems of our life, about the difficult fate of the heroes of the work, about good and evil. Taking into account the above fact, we included in the independent work of students the story of Y. Bondarev "Forgive us!", K. Paustovsky "Steel ring", "Old cook", "Telegram". Plots of morality are reflected in fairy tales, aphorisms, proverbs and sayings. They are a source of an inexhaustible supply of moral experience, they are distinguished by deep content, which reflects the most essential aspects of morality and ethics, a metaphorical assessment of personal qualities, and folk wisdom. We recommend to include A.P. Chekhov, a remarkable Russian writer, who attached great importance to the fact that people have a sincere delicacy, which is deeper than just the external politeness of a person. When completing assignments, we recommend using the words: educated, polite, correct, delicate, tactful, educated, cultured.

Task 1. Explain the meaning of these words, translate them into your native language. Where possible, form short forms of adjectives. Cheerful, energetic, active, enthusiastic, hardworking, businesslike, educated, intelligent, witty, resourceful, noble, humble, tireless, sociable, caring, hospitable, generous, tactful, decent, naive, arrogant, flattering, cruel, vindictive, good-natured, intelligent, loyal, kind, sympathetic.

Task 2. Express your opinion about the following judgments: 1) An intelligent person is, first of all, one who knows how to feel someone else's pain. 2) Respecting the culture of another people means being an intelligent person. 3) Good manners are one of the most important signs of intelligence. 4) Do you think a person's character depends on the upbringing and self-education of the individual or is it inherited? It is impossible to educate a highly moral person without instilling in him moral values that are closely related to moral qualities: benevolence, the desire to do good deeds; tolerance for the shortcomings and mistakes of others, the ability to ask for forgiveness and forgiveness, the desire to reconcile the quarreling, not to answer evil for evil; philanthropy, respect for the individual and the opinions of others; honesty, the ability to see your shortcomings, to admit mistakes; solicitude, responsibility; hard work, respect for the work of another, the desire to please others with their work. It is necessary to pay great attention to tasks of a creative nature, which are of great educational value and characterize a person by his actions.

Task 3. Describe a person by his actions and qualities listed below. When answering, use the constructions that were studied earlier: I think that .. ", " I want to say that ... ", " If I'm not mistaken ... ", " This is not entirely true ", " It's a pity. By the way, ... "Sample: I think that a polite person is the kind of person who never forgets to say hello, say goodbye, and thank for the service. 1) Never forgets to say hello, to say goodbye, to thank for the service. 2) Apologizes for being late for a meeting, meeting, class. 3) Sits in the presence of elderly people. 4) Knows how to spare the pride and dignity of people. 5) Always, in any critical or unpleasant situation, patient, restrained. 6) Slams the door when the angry one leaves. 7) During a play, film or lecture, talks to a neighbor. 8) Greeting elders by age or position, calls them by name and patronymic. 9) Coming home late, when everyone is asleep, he tries not to make noise so as not to wake up his loved ones. 10) In a scientific discussion, he shows great and deep knowledge in various fields of science and culture. Working with the whole group, the teacher should not lose sight of individual students, therefore it is important to include in the classroom assignments of a game nature, where the teacher asks students to give examples: an act of principle, an evil that others have done to them, a good deed, which they have witnessed, a just deed, which was committed by a familiar person. Students love this type of assignment, where they are happy to argue, sometimes they argue with each other.

Task 5. Listen carefully to a few statements. Please tell me how much you agree with them. 1) I am often kind to my classmates and classmates. 2) It is important for me to help a classmate when he is in trouble. 3) I believe that you can not be restrained with some adults. 4) Probably there is nothing wrong with being rude to a person who is unpleasant to me. 5) I believe that being polite helps me feel good around people. 6) I think that you can afford to swear in response to an unfair remark addressed to me. 7) I am pleased to bring joy to people.

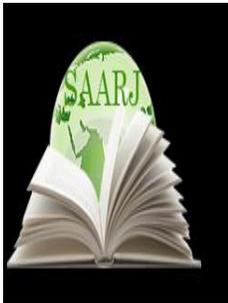

Task 4. Think and add the following sentences: 1) When I see someone in a ridiculous situation, then I 2) If someone laughs at me, then I 3) If I want to be respected, then I 4) When they interrupt me, then I 5) When I don't want to communicate with a classmate, then I

The texts and assignments in many textbooks on the Russian language for students of Uzbek groups of non-linguistic universities are devoted to the themes of patriotism. When studying the topic "Uzbekistan - a state with a great future", teachers use materials from the Constitution of the Republic of Uzbekistan. After reading texts about the basic law of the republic, students

answer questions about the rights and obligations of citizens of Uzbekistan, about protecting the Motherland as a sacred duty, about the right to work, education, individual freedoms. "They memorize proverbs: "Mother is a symbol of the Motherland", "To love the Motherland means to love people, the earth, nature", "Those who have lost their families cry for seven years, those who have lost their homeland have been crying for the whole century", "I glorify the Fatherland that is, but three times that will be", "For the good of the Motherland, do not spare your life", "A man without a Motherland is a bird without freedom. "Students expressively talk about the coat of arms, flag, anthem of our country, using in their speech the words peace, freedom, friendship, cooperation, brotherhood, stability, determine their meanings, make proposals and write essays. For example: "Homeland. Nothing sounds more proud than this short but extraordinarily succinct word. Homeland. This is our common home, the place where we were born and live, the land on which we walk." For better memorization, when working on texts and other educational materials, we recommend using technologies for the development of critical thinking, in particular, the method of graphic research "Intellect-map", the method of TIPS(theory of inventive problem solving), "Circles on the water" (search for key concepts and disclosure their essential features), POPS - formula, method of KWF (we know, we want to know, we found out). During the learning process, it is necessary to constantly activate words and expressions: hello, thank you, please, good morning (afternoon)! All the best! Good luck! See you! Thus, the process of forming spiritual values is long and therefore there can be no quick result, but the work that is carried out by teachers in the classroom in Russian as a foreign language will help to plant a precious seed in the soul of our students.

ABSTRACT

Increasing the speed of digital systems and ensuring electromagnetic compatibility in the design of printed circuit boards. One of the main directions in the design of the electromagnetic compatibility of digital systems is the use of CAD. The emergence of new materials, the development of technology mikroperehodov, increased resolution and other technical factors contribute to the production of more advanced e sun dress design. Thus, the developer of the board must decide whether the use of a mathematical method in each case and then make a rational choice of a software environment that allows an analysis based on the selected method.

KEYWORDS: *Printed Circuit Board, Electronic Equipment, Automatic Design, Electromagnetic Compatibility.*

1. INTRODUCTION

In the design of electronic equipment (CEA) is mandatory accounting requirements for electromagnetic compatibility (EMC), ever escalating with increasing density and the upper frequency range of useful and interfering signals in the line, as well as a decrease in the levels of mineral and rising levels of interfering signals. Full-scale tests CEA EMC and its re-design due to dissatisfaction with increasingly stringent requirements of EMC substantial rise and slow design, creating serious obstacles to the production of finished products to market. Therefore, it is urgent modeling EMC problems at the design stage of CEA.

2. The purpose of the task

A very important step in the design of the equipment shall be the means of the automatic design (CAD) to predict the emission of radio frequency interference and susceptibility with sufficient

accuracy for the goals, based on the design parameters of the product. This will apply the appropriate technology EMC and avoid costly rework later.

Designed equipment requires a minimum number of errors, or that their absence. The solution lies in the proper organization of the development and addressing these issues early in the design. When designing high-speed electronic equipment has become virtually mandatory provision neiskazh e n tion signal, and therefore, no circuit board can be manufactured without the use of specialized software to facilitate the analysis of signal integrity and EMC.

Any problem of EMC can be represented in terms of the interference source and receptor path interference. The structure of the communication path may include as a mechanism of radiation and conductive, and it is often to be analyzed, such as voltage and current at the interface equipment is the result of communication equipment with an external field.

Analysis of EMC electronics assemblies for a comprehensive assessment of the quality of the design development, confirming the correctness of design and technological solutions for the operation of RES in the given conditions and with the required quality. EMC analysis is based on computer modeling. Initial data for the performance of the EMC analysis: a circuit diagram; List of electronic components; PCB design; a complete set of design documentation; technical project, which will include EMC requirements.

For modeling the electronic system on a virtual prototyping stage mainly used software packages. In these stages of circuit simulation and PCB layout design of integrated circuits or separated. First performed simulations of electronic circuits without parasitic effects inherent in the actual topology, and then after repeated simulation of designs with their account. This procedure is covered with a particular task to ensure the completeness of signal integrity and EMC. Below is a brief overview of the most well-known programs design and analysis of printed circuit boards with a view to illustrate the possibilities of CAD in this area.

Prospective CAD systems

CAD Company MENTOR GRAPHICS

CAD Mentor Graphics allows a full cycle of the verification fee. It uses the following subsystems:

- HyperLynx, ICX / Tau, Quiet Expert - analysis of signal integrity and electromagnetic compatibility;
- BetaSoft Board - analysis of the thermal regime of the printing unit;
- IDF Interface - bi-directional interface to CAM / CAD
- Fablink XE / Pro - post-processing to enhance manufacturability.

Package HyperLynx - the most powerful in the analysis of signal integrity. It has modules predtopologicheskogo (HyperLinks LineSim) and posttopologicheskogo (HyperLinks BoardSim) analysis (see. Above), works closely with the monitoring system limitations.

Package ICX performs verification signal integrity analysis of high accuracy, including the worst case. Analysis can be done for multcard systems in interactive and batch modes. An important feature is the ability to analyze component placement and routing of the electrical requirements.

Tau performs a comprehensive package of verification before and after tracing board.

The Mentor Graphics Design Kit are ready library blocks and component models, which are used for signal integrity analysis. This model Spice, IBIS, VHDL-AMS and others supplied by the manufacturers of chips.

CAD firm CADENCE

Another power of the proposed solutions is the company CADENCE. For top-level design of the proposed package PCB Design Studio. As an editor of printed circuit boards are used program Allegro, allows the development of multi-layer and high-speed, high-density components. As a full-time module auto placement and auto routing are using a program SPECCTRA, operates an extensive set of design rules and technology limitations. Analysis of signal integrity and EMC PCB layout is done using a special module SPECCTRA Quest SI Expert, and for a preliminary analysis of the project and preparation of sets of design rules used module Sig Explorer.

CAD firms ZUKEN

The third most popular in the world is quite powerful product - Visula company ZUKEN. The products the company provides through the design cycle and offer an effective means of simulation and synthesis of programmable logic with the subsequent development of the PCB. There is a standard set of tools, as well as its own funds autoplacement and autorouting. It should be noted that the company ZUKEN also offers users integrated tools tr e hmernyh solid modeling developed devices.

CAD firms ALTIUM

In 2002 the company released a ALTIUM package Protel DXP, which is a continuation of their own original product line Protel. This package provides a through-cycle design of mixed analog-digital circuit boards. All the tools implemented on the basis of an integrated design environment Design Explorer, running the operating system Windows XP. By means of the previously existing posttopologicheskogo signal integrity analysis added the ability to perform predtopologicheskyy analysis (Fig. 2). But the main innovation of Protel DXP was supposed to be a topological auto router Situs, designed to implement a new approach to the automatic wiring boards.

CAD Quantic EMC

Compliance - System posttopologicheskogo electromagnetic compatibility analysis on printed circuit boards. Compliance Package allows you to assess the impact of structural features of printed circuit boards on their electrical characteristics (Fig. 3), as well as simulate the electromagnetic compatibility of devices esch e to the actual manufacture of structures, thereby reducing the time and cost of designing with a significant increase in quality.

Designing high-speed circuit boards requires the construction of adequate models for the analysis of signal integrity and EMC. Levels of performance achieved increase the sensitivity of the design to various variations of materials, dimensions of structural elements and characteristics of the components. The emergence of new materials, the development of technology mikroperehodov, increased resolution and other technical factors contribute to the production of more advanced e sun dress design. Thus there is a refinement of models to be analyzed. For example, if a relatively low-frequency circuit board calculation capacity between conductors can

be carried out under the simplified expressions, which do not take into account the thickness of the wire, then the convergence of the values of the gaps between the conductors and the thickness of the account of the last parameter is mandatory.

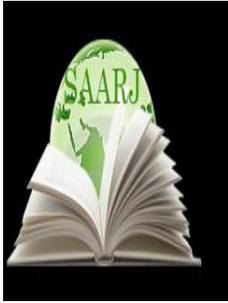

3. CONCLUSION

EMC problem is complex, requiring provision of the necessary requirements at all levels of modularity in the design of equipment. Increasing the level of modularity leads to increasing costs and reduced EMC measures available. EMC achieved by different design and technological measures, including the choice of the element base, rational layout elements, shielding individual circuit elements, modeling of the interference field elements, etc. The absence of algorithms for the optimal placement of ERE on the board with which ensure that their EMC unwieldiness and complexity of the mathematical description of the use of different CAD systems require for a quick and high-quality design of electronic digital devices.

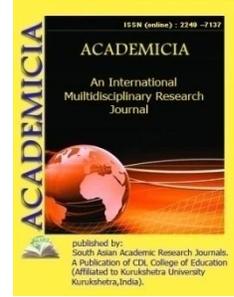

As seen from the survey, unfortunately, there is no universal product for analyzing signal integrity and EMC estimates of the parameters. Thus, the developer of the board must decide whether the use of a mathematical method in each case and then make a rational choice of a software environment that allows an analysis based on the selected method. The most optimal solution is still a combined method of using multiple software products in the design board.

ABSTRACT

This article describes the political activities of Abulhairkhan, a skilled politician and commander, based on information from historical written sources. The city of Tura and its environs were also under the control of Adabbek and Kepakbek, the chiefs of the eagle tribes. The right tributary of the Ishim River, the left tributary of the Otbosar, was ruled independently by another nomadic Uzbek khan, Mustafa Khan. In short, the Uzbeks, who established their rule in modern Uzbekistan and Central Asia in the late 15th and early 16th centuries, played an important role in the formation of not only the Uzbek people, but also the Kazakh people.

KEYWORDS: *Abulhairkhan, Shaybani Dynasty, Turkestan, Movarounnahr, Science Of Hadith, Fiqh, Safavids, Mysticism, Teachings, Poetry.*

INTRODUCTION

Since independence the studies of the revival of our rich ancient history, including all spheres of our society, many aspects of our national spirituality has been researched. In this regard, President Shavkat Mirziyoyev noted in his address to the OliyMajlis: "... It is necessary to understand our national identity, study the ancient and rich history of our country, strengthen research in this area, fully support the work of scientists in the humanities." [1]. This article is based on written sources from the rise to power and military campaigns of Abulhairkhan, the founder of the Uzbek Nation.

MATERIALS AND METHODS

It is known that the Shayban ulus (southwestern Siberia and the Syrdarya basin) was ruled by several independent khans in the 12th-13th centuries. In particular, according to the events of 1425, one of

these khans, the rule of Jumadukhan (1425-1428) was established in the area adjacent to the Mangit ulus, north of the Aral Sea, between the Sarisuv and Emba rivers.. At the same time, Muhammad Yusuf Munshi writes that after the death of the Sheikh Oglon, the struggle for power in this nation intensified and as a result, his youngest son Abulhair Khan abdicated [2,49]. According to Mahmud ibn Wali: "Since the blessed prince (Abulhayr khan) was immature and his lucky star was still a few days away, Jumadukhan ibn Sufi, known in the sources of the Shayban sultans as Yumaduq, rolled up his sleeves. , by plotting, made the work of the heir to the throne (Abulhair khan) difficult, and thus captured the hearts of all the nomadic tribes and soldiers by throwing nets of lies in his path "[3,34-35]. Seeing that Abul-Khair Khan had lost power, Jumadukhan ibn Sufi, among others, recognized the oglon's rule.

Another khan who ruled the Shayban nation independently was Mahmudhoja ibn Koonbek. The city of Tura and its environs were also under the control of Adabbek and Kepakbek, the chiefs of the eagle tribes. The right tributary of the Ishim River, the left tributary of the Otbosar, was ruled independently by another nomadic Uzbek khan, Mustafa Khan. In the Mangit ulus, Idiku (Edigey) was ruled by Gozibi, the son of an Uzbek. Sources do not have enough information about the internal life of these countries and their interaction. According to Mahmud ibn Wali, the quarrels between all the Shaybani tribes, which began soon after Jumadukhan came to power, continued in the Manghit nation. It was this nation that marched to punish the rebels. They were executed according to the decisions of 'Ja Bahadir, Sarig' Uthman and others) [4,45-48].

At that time, a young man named Abulhair, who was in charge of Jumadukhan's army, was also taken prisoner. However, not only was his life saved, but with the help of elders such as Sarig 'Uthman and OlashaBahodir, the young Abulhair later gathered a number of fighting troops and returned to his nation in the spring of 1428. There are several tribes of Abulhair here, including Qiyat, Mangit, Dormon, Koshchi, Otoji, Nayman, Uqarash-Nayman, Tubai, Taymas, Jot, Chinese, Uyghur, Qarluq. , usun, qarlaut, tuman-ming, tangut, chiefs of bells and representatives of the clergy: SayyidKulmuhammad, supported by the Black Sayyids, proclaimed him khan. According to Mahmud ibn Wali, Abu al-Khair Khan was supported by about two hundred representatives of the tribes and clans at that time [3,38]. The reason for this support was that the aristocracy, which at the time feared that the tribes and nations would continue to plunder each other and that the nomads might cause popular uprisings, united around the khan, who had the power to centralize the country. , was forced to build a state system capable of keeping the working people in obedience. These factors led to the formation of a state of nomadic Uzbeks under the leadership of Abulhairkhan, and this state was not the first state of nomads, but similar to the states of the Huns, Turks and other nomadic peoples of Central Asia, only it was a new look that had been restored.

According to Muhammadyar ibn Arab Qatagan'sMusahhir al-Bilad, who lived and worked in the middle of the 16th century, "... After the martyrdom of Khoja Mahmudkhan, the DashtiKipchak kingdom, that is, Turkestan, from the border of Signak, passed into his hands. At the age of twenty-four, ShahrukhMirzo ibn Amir Temur freed Khorezm region from the clutches of Koragon and relied on the heights of the khanate and the sky of secularism "[8, pp. 23-24].

In short, when the fame of his royal heroism and the sound of his glorious glory spread everywhere, those around him turned to the Ka'bah of the needy. Each returned with the desired amount of survival and the needs of both worlds. In particular, Sultan Abusa'id Mirza (1451-1469) and his younger brother Manuchehr Mirza and Muhammad Joki Mirza and Sultan Hussein

Mirza, descendants of Amir TemurKoragon, came to the service of Hazrat and became a state official of Humayun.and they achieved their desires because of his grace and protection.

Abul-Khairkhan, who was planning to establish a centralized state, set himself the goal not only of uniting the Shayban nation, but also of subjugating the territories that were once part of the Golden Horde, that is, the lands east of the Ural River. had done. Initially, he made a military expedition to Tura in 1428-1429. The mayors of the city (beks) Adabbek, Kepakhoja and the nobles of the city submitted to Abulhairkhan without resistance. After a sermon was delivered in his name and coins were minted here, Tura remained the capital of the Shaybanid (i.e., Uzbek nation) state until 1446.

Thus, according to the narration of Mas'ud ibn 'Uthman al-Kuhistani, a number of beys and sultans who were famous at that time, including Bakhtiar sultan, a descendant of Arabshah, the son of Khidr Khan, who was a loyal soldier until the end of his life).

In a very short time (between 1428-1431), Abul-Khair Khan managed to unite the Shayban nation and establish his rule.

In other words, the author of Bahrul-Asror, Mahmud ibn Wali, also wrote that Abul-Khairkhan did not submit to the descendants of TuqayTemur, who ruled in the Golden Horde at that time, and declared the independence of his state. Abulhairkhan, like the governors of all nations, will be invited to the congress after Muhammad Khan ascends the throne of his ancestors in Saraychik in Tukay-Temurid. The withdrawal of Abulhairkhan and other Shaybanis, who did not want to obey the decision to gather troops at this congress, led to the breakdown of the alliance between the TukayTemurs and the Shaybanis after this event (5, 76-77).

However, the last rulers of the Shayban ulus (Davlat Sheikh, Jumaduq, Mahmudhoja) were to some extent mute to the TukayTemurids.

During the subsequent marches, in 1431-32,Khorezm (Hafiz Tanish Bukhari, 1999. pp. 53-54) and his brothers Ahmadkhan and Mahmudkhan, his fathersKichik Muhammad, Javak Sultan and Bashak, he defeated the combined forces of the sultans in Egritepa (prof. Semyonov called this place Iqri-tur, according to "TarihiAbulhairkhani", Iqritub. Prof. Semyonov assumed that its location was in the steppes along the Syrdarya) which occupied the Orda bazaar (once Sainkhan, i.e., the residence of Botukhan) (Ahmedov, 1992. pp. 44-45) and thus strengthened its position in the western part of DashtiKipchak. As a result of Abulhairkhan's 15-year (1431-1446) military campaigns to expand his possessions, a patriarchal state was established, although not centralized in the Syrdarya and Kazakh steppes.

There were forces on the borders of Abul-Khairkhan's state that threatened his state. That is, on the one hand, the fact that sultans such as Ibakhan, Burka Sultan, Janibek and Garoy were fighting against him, and one of his active rivals, the Uzbek khan Mustafa Khan, turned a large part of the mangits to his side. , on the other hand, were the Tuqay-Temurids, who were migrating to the south-west, especially waiting for a convenient opportunity to obtain the blood of defeat in Egritepa.

Nevertheless, Abul-Khairkhan resumed his march in the 1840s. In particular, in 1446, Shahrukh ibn Amir Temur skillfully took advantage of the difficult situation and political disintegration in Mongolia to build fortresses on both banks of the middle reaches of the Syrdarya, namely,

Akkurgan, Arquq. Conquers fortresses such as Signak and Suzak (6, p. 53). Archaeological maps show the location of these fortresses on the left bank of the Syrdarya (3, p. 47-48).

The vast area is rich in cities and a culture of irrigation based on artificial irrigation. In other words, Zagryazhsky, who conducted research in 1874, noted that the lands between the Syrdarya, Aris, Karatag and Turkestan were well irrigated by the rivers Today, Chayon, Borjar and Ikan, which flow from Karatag. . In later centuries (i.e., the twentieth century), Kallaur and Richkov proved that these areas were indeed prosperous and irrigated (7, 70).

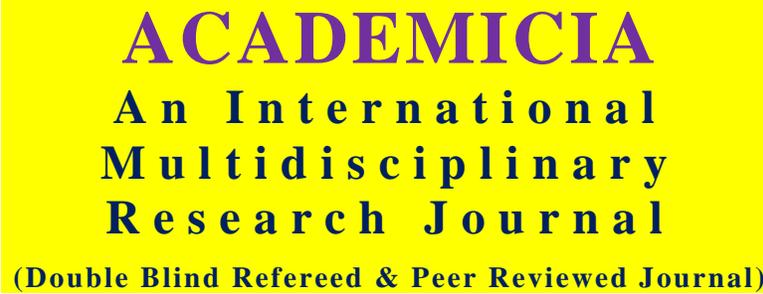

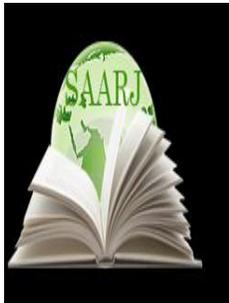

In short, the Uzbeks, who established their rule in modern Uzbekistan and Central Asia in the late 15th and early 16th centuries, played an important role in the formation of not only the Uzbek people, but also the Kazakh people. They were also considered an ethnic component of the Uzbek people and soon became part of the Turkic community of Movarounnahr, giving it only its own name. Therefore, the opinion of some scholars that the Uzbek people are known only after the XV century is completely wrong.

CONCLUSION

In conclusion we can note that some historians such as Ivanov and Semyonov believe that the state of Abulhairkhan was a temporary state union. However, the existing state courts, devons, government officials, tax regimes, and the fact that coins were minted in the name of the head of state, the khan, and intercultural relations with other states, especially the Timurids, were signs of his temporary state union indicates that it was a patriarchal state, though not centralized.

ABSTRACT

This article uses the interpretation and lexical meanings of ideas about social and political terms in Yusuf Hos Hajib's Qutadghu Bilig to study words as a system and to classify words into specific groups. The interpretation of the terms is explained.

KEYWORDS: *Socio-Political Vocabulary, Community, Social Life, Image-Synchronous Direction, Historical-Diachronic Direction, Comparative-Typological Direction, Lexical Layer, Lexical Field, Genetic Group.*

INTRODUCTION

The lexicon of the language "Qutadghu bilig" is colorful, it contains lexical units specific to different areas of the ancient and old Uzbek language. In particular, it contains lexical knowledge and lexical-semantic groups specific to socio-political lexicon, which, if studied linguistically, will naturally play a special role in determining the historical development of socio-political lexicon of the Uzbek language.

Before thinking about the topic of socio-political lexicon in Qutadghu Bilig, it is important to cover social and political concepts and the study of this field, as well as the interpretation of terms (terms such as layer, field) used to classify words as lexical systems. At the present time in modern linguistics there are different views on the analysis of the socio-political lexical system, the use of "social" and "political" lexemes as terms, as well as the study and definition of lexical units. Interpreting the views in this area, we analyze the socio-political vocabulary and lexical units in the work "Kutadgu bilig" on the basis of the proverbial direction.

The term social is lexical, in general, in all dictionaries, including H.K. Baranov's "Arabic-Russian" dictionary, as follows: society serves to convey concepts. In general, the lexical scope of the social term is defined by the following relations.

1. The main differences between classes, their place in social production and their relation to the means of production;
2. Human activity in society, social movement, development of social thought, social attitude, social life, political, professional, cultural, etc., related to collective services;
3. Relationships related to common, common areas;
4. Relationships in non-individual, public, accessible institutions;
5. Organized by the collective, issues related to non-personal meanings were considered socially specific.

But in the process of analyzing the research, it becomes clear that there is no clear idea about the terms "social" and "political", including the socio-political lexicon, which are interpreted differently by scholars. According to some sources, the terms "social" and "political" can be interpreted as follows.

1. The terms "social" and "political" are a set of closely related fields in social studies, the object of its study, various spheres of social life;
2. Social sciences such as philosophy, sociology, social psychology, law, economics, political science as academic subjects;
3. Socialism, based on specialized knowledge, studies the social, economic, political and religious aspects of life;

In linguistics, however, there are different views on socio-political lexicon. These views can be divided into 3 groups:

1. Socio-political vocabulary in the descriptive-synchronous direction;
2. Socio-political vocabulary in the historical-diachronic direction;
3. As a socio-political lexicon in a comparative-typological direction.

Most of the research was done in the first direction.

It is known that the study of the socio-political lexeme in the historical-diachronic direction is left out of the view of our linguists. There is almost no special work in this area. In the present case, however, it is limited to the interpretation of the history of some words.

In the course of the analysis of the research, it became clear that there is no unity in the opinions of scholars on socio-political vocabulary and the terms "social" and "political", and no definite conclusion has been reached on this issue. However, summarizing the views expressed, they can be divided into three groups:

The first group of scholars add some of their political knowledge to the social structure.

The second group of scholars clearly distinguishes between social lexicon and social terminology and does not include political terms in the structure of social lexicon.

The third category of scholars use the term and the word as synonyms. Uzbek researcher A.Kh. Turakhodjaeva says that in her research, a lexeme and a term contradict each other in terms of generality (being understandable to the general public) and specificity (being understandable to a certain social circle). At the same time, he considers that units with the sign of specificity can be divided into terms (conference, diplomat), and units with the sign of common can be divided into lexemes (meeting, minister, reform).

Some linguists, including P.K.Milshin, I.F. According to Protchenko, much of the socio-political lexicon is known, understood by all, and refers to the relationship between the past and present of life processes. In some similar studies, socio-political lexicon does not refer to a system in a particular shell, it is considered to be specific to other categories of lexicon as well. Therefore, they do not include political terms in the socio-political lexicon. Finally, a third group of scholars does not add political science terms to the socio-political term.

A.A. Buryachok sees socio-political lexicon as a broader phenomenon than socio-political terminology.

Yu.Belchikov also added the terms of social sciences to the socio-political lexicon. This has broadened the scope of the socio-political lexicon. Such socio-political lexicons include some philosophical, legal, and literary terms, as well as some similar linguistic terms. The term socio-political lexicon is used in the scientific literature. From what has been said, it is clear that a lexicographic analysis of words in this context has not been carried out and they have not been studied on the basis of a certain terminological rule.

It can be concluded from the above. The question of defining the socio-political lexicon or defining its content has not been resolved. There is no clear distinction between social and political terms. Nevertheless, the views of some scholars are noteworthy. For example, according to L.A. Zhdanova, some political terms are also included in the social lexicon. Political reality gives us discrete just like any other reality. Linguistic analogues are manifested through existing structures. It is this linguistic process that shapes the linguistic system through its relationship to language, its internal connections, and its laws. Social lexicon is a lexical system that reflects the political structure and political life of a society.

Similar views have been interpreted in the research of scholars such as AH Turakhodjaeva. In defining the concept of socio-political lexicon, he first refers to the social essence, content and features of the concept of "politics". In the explanatory dictionary of the Uzbek language, the lexical meaning of the word "politics" is "Implementation and management of forms of state power; the path of state power in governing the country and in international relations. For example, the concept of "politics" is used in a narrow and broad sense. In the narrow sense, it represents the changes that take place in a particular sphere of society, that is, in its political sphere, and is applied to the sphere itself. In a broad sense, it reflects the events and changes that take place in various spheres of society.

On this basis, A.Kh. Turakhodjaeva expresses the following views: Both the essence of the concept of "events" and the diversity of thematic classifications can be explained by the above-mentioned meanings of the term "politics". In particular, the inclusion of lexemes related to economic processes in the socio-political lexicon in various studies is, without exception, related to the broader meaning of the term politics. However, the fact that hundreds of branches are developing in a particular field or science, and many new concepts and events are now operating

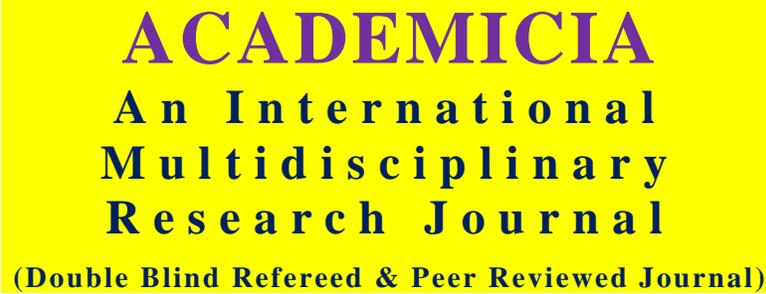

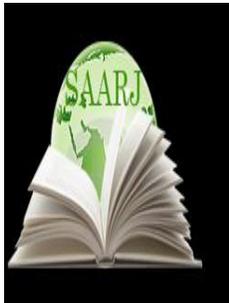

as independent fields, suggests that the narrow definition of the term "politics" leads to the most accurate conclusions in defining the sum of socio-political vocabulary. In this case, it is appropriate to connect the essence of the word social in the lexicon of the term "socio-political" with the social phenomenal nature of politics. Therefore, Z. Isakova admits that "it is impossible to study the lexical units of the socio-political sphere separately, that is, by separating them into social and political lexicon."

Thus, based on the above ideas, A.Kh. Turakhodjaeva defines the socio-political lexicon as follows: It is a changing layer formed on the basis of economic, spiritual, enlightenment, cultural and religious factors.

We have also come to the conclusion from the interpretation of the above literature that the question of how to look at and define socio-political lexicon separately in social and political form, or whether the question of defining its content has not been resolved, is still debated in this area. There is no clear distinction between social and political terms. Therefore, it is clearly stated that the above-mentioned opinions are mostly interrelated socio-political lexicon, as L.A. Zhdanova said, social lexicon is a lexical system that reflects the political structure and political life of society. Hence, it is necessary to interpret the socio-political lexicon as a whole.

ABSTRACT

Induction of superovulation in the body of donors is the main task in embryo transplantation. If superovulation is successful and a large number of egg cells are released, we will get good results in transplantation. Folliculostimulating hormone (FSH) can also be used to induce multiple ovulations. Many researchers and scientists recommend selecting animals for embryo transplantation taking into account additional criteria reflecting hormonal status and metabolic activity potential. Gonadotropins can adversely affect the development of the fertilized egg after ovulation in animals. In some cases, the chances of developing follicular cysts in the ovary are also high.

KEYWORDS: Donor Animal, Recipient Animal, Superovulation, Transplantation, Metabolic Homeostasis, Folliculostimulant, Metabolic.

INTRODUCTION

Since the 1970s, research and applications in the field of transplantation have grown rapidly. In cattle, the calf was first frozen in 1973 and then obtained by transplanting thawed beef.

The analysis shows that 5,413 head of transplanted calves were received in Canada between 1973 and 1982, and by 1990, the number of transplanted calves in the United States (34th member of the International Society for Transplantation in 1984) had reached 500,000 and 12,000 in Russia.

In the last 12 years of the 21st century, record-breaking results have been achieved in breeding: 136 calves from one donor cow in the United States, 80 in France, 57 in Germany, and 216 calves from 44 donor cows at the Russian Livestock Research Institute.

The use of modern methods of induction of superovulation in livestock has been proven in practice and production to increase the maturation of ovaries in the ovaries by 10-20 times, ensuring simultaneous maturation of 25 eggs in cows and sheep, 40-45 in pigs, 5 in bees and 90 in rodents. From the best donors it is possible to get 5-8 times a year.

In animal husbandry, breeding animals are selected that have the ability to induce superovulation (maturation of multiple follicles) and obtain a viable ovary for long-term transplantation. In order to induce superovulation in donor animals, they are treated with various hormonal drugs (GSJK, follegon, pregmagon, etc.) - bovine bile blood serum is taken on days 60-90 of calving, FSH, etc.) according to a certain plan.

The Main Findings and Results

Many researchers and scientists recommend selecting animals for embryo transplantation taking into account additional criteria reflecting hormonal status and metabolic activity potential. These criteria, the ability of the donor to ovulate multiple times and the washing of viable embryos from him are of practical importance. It is believed that in order to obtain at least 8 ovulations and 7 embryos from the best donor, the amount of estradiol in the blood of cows at the beginning of the sexual cycle should be 15.3. Testosterone - 0.18 ng / ml, LH - 1, 46 IV / l in cows, progesterone levels ranged from 2.0 to 5.0 ng / ml (mean 3,150) and LH was 1.52 IU / l on day 10 of the reproductive cycle. Induction of superovulation in cattle Induction of superovulation when the level of cholesterol in the blood is not less than 3.55 mmol / l, b - carotene - 8.80 μ mol / l, vitamin A - 4.40 μ mol / l and alanine aminotransferase activity not less than 0.25 μ m gives an effective result.

In cattle, the use of GSJK (follegon) - gonadotropins in donor animals in the middle of the reproductive cycle (from 8 to 16 days) is a guarantee of good results. These drugs are administered once in a dose of 2-3 thousand XB, and after 48 hours prostaglandin F2-alpha analogues (estrofan, magestrofan, cloprostamol, superfan, clatraprostin, etc.) or one of its other synthetic analogues of these drugs are used. In donor cows, after 2 days, the sexual arousal phase of the sexual cycle begins, in which the phenomena of ejaculation, general arousal, sexual arousal and ovulation are clearly visible. Once these signs are observed, the donor animals are artificially inseminated.

In agriculture, follicle-stimulating hormone (FSH) can also be used to induce multiple ovulations. These hormones also have similar effects as GSJK. But doing this practice, getting

them, is a very complicated process. In farms, FSH prepared from the pituitary gland of sheep and pigs can be used to induce superovulation, and its inactivation in the body takes only a short time (5 hours). This drug is administered in a reduced dose twice a day for 5 days (5 mg in the morning and evening on the first and second days, 4 mg on the third day, 3 mg on the fourth day and 2 mg on the fifth day), resulting in a total of 10 doses of FSH good results can usually be obtained when sent from the 9th to the 11th day of the sexual cycle.

At present, standard gonadotropic hormones are used in the form of high-purity drugs: sergon (Czech Republic), folligon (Netherlands), premgagon (Germany). These drugs are administered to donors according to the guidelines, once every 11-12 days of the sexual cycle, at a dose of 2000-3000 TB. corresponds to a live weight of 600 kg of the animal. The use of these gonadotropins ensures multi-grain ovulation in 75–80% of animals and an indexation of an average of 4.0–4.5 embryos per donor.

The advantage of GSJK is that it is easy to find biologically (if there are 60-90-day-old buffaloes, you can take blood from them and prepare a good specialist whey in any farm), and the disadvantage of this drug is that it takes a long time to inactivate the animal, the inactivation of gonadotropins in the body in which this drug is used takes an average of 6 days, but in experiments, drug residues can be detected in the blood even 10 days after drug administration. Gonadotropins can adversely affect the development of the fertilized egg after ovulation in animals. In some cases, the chances of developing follicular cysts in the ovary are also high. After observation of superovulation in livestock, it is recommended that a donor animal be given an anti-GSJKG serum.

CONCLUSION

GSJK (follegon) - good application of gonadotropins to donor animals (cows) in the middle of the sexual cycle (from 8 to 16 days). The drug is given to cows once in a dose of 2-3 thousand XB. After 48 hours, prostaglandin F2 (estrofan, magestrofan, cloprostenol, superfan, clatraprostin, etc.) or one of its other synthetic analogues is administered.

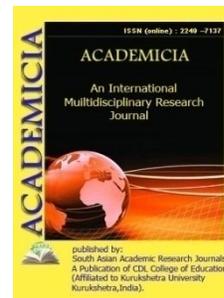

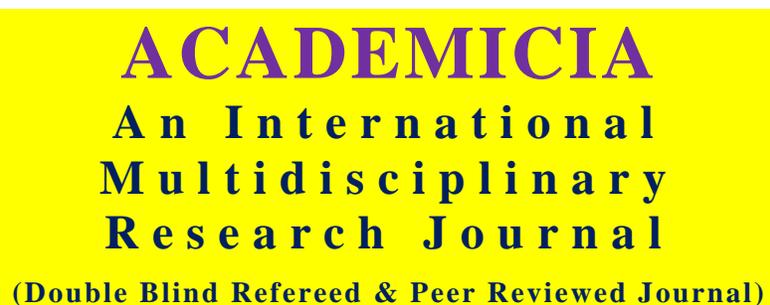

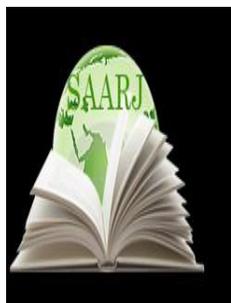

If the yellow body diameter in the cow's ovary at the time of gonadotropin injection is 1.5 cm, it is possible to expect effective results from superovulation. Poliomyelitis is reduced in bovine ovaries. In addition to a well-developed corpus luteum in the ovary at the time of drug administration, the intensity of multiple ovulation is also reduced if there is a developed follicle, follicular or luteal cyst. The effectiveness of superovulation is mainly determined by the physiological condition of the ovaries, and these indicators are taken into account.

The results of theoretical research and production experiments show that superovulation is considered effective when donor animals are given gonadotropic hormones that promote the growth and development of several follicles simultaneously in the middle of the reproductive cycle if at least 6 eggs are released. The main purpose of hormonal treatment in livestock is to ensure the separation of 10-20 eggs from the ovary by inducing superovulation.

Animals sent to GSJK are required to be fed a complete diet (protein, carbohydrates, vitamins, etc.) because starvation of animals can lead to a decrease in the number of ovulations.

ABSTRACT

The article presents the optimal methods for the synthesis of vinyl ethynyltriethoxysilane in a solvent medium and the maximum reaction yield in a diethyl ether medium is reached. The synthesized polymer was also analyzed using UV spectroscopy to determine the shift of the absorption lines of the chromatophore group.

KEYWORDS: *Acetylene, Vinylacetylene, Tetraethoxylane, Ethyl Ether, Benzene, Tetrahydrofuran, Adsorption, Solution, Monomer, Polymer, Emulsifier, Organ silicon Compound, Stabilizer, Thermo polymerization, Viscosity, Density, Light Refractive Index, UV Spectrum, Absorption.*

INTRODUCTION

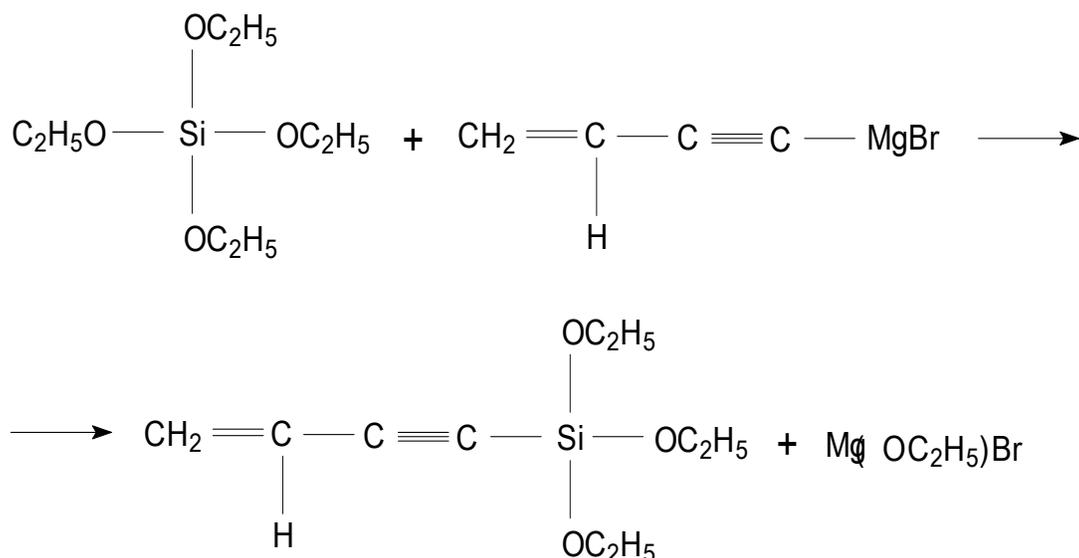

Since the 1940s, inorganic silicon materials have been produced commercially. Over the past period, the production of inorganic silicon materials has increased and began to be used in many areas, including mechanical engineering, construction, electricity, transport, aviation, defense, medicine, textile and cosmetic industries.

The world pays great attention to the production of moisture protection products based on modern technologies and their use to increase the moisture resistance of building materials and structures. The creation of chemical materials that increase hydrophobicity and their inclusion in the composition of building materials is an urgent problem in all respects [2,3].

Therefore, it is important to create a new generation of complex chemicals based on innovative technologies in the creation of moisture resistant hydrophobic materials and their use in various fields.

The discussion of the results

In view of the above, it is possible to obtain a new type of polymer compounds based on tetraethoxysilane to expand the range of currently most widely used organosilicon compounds. Vinylethynyl magnesium bromide and tetraethoxysilane were used according to this procedure for the synthesis of vinyl ethynyltriethoxysilane[1,4]. The interaction of tetraethoxysilane and vinylethynyl magnesium bromide in equimolecular ratios is accompanied by the formation of vinyl ethynyl triethoxysilane according to the following scheme:

Unlike dry ether and benzene, the reaction yield is low in reactions carried out in toluene, dioxane, and other solvents.

Synthesized vinyl ethynyltriethoxysilane, light yellow, soluble in liquid, ethers, benzene, chloroform, tetrahydrofuran, dioxane, hexane, poorly soluble in acetone, pyridine, dimethylformamide, dimethyl sulfoxide, completely insoluble in water and alcohols.

At 30 °C and a reaction time of 6 h, the effect of the ratio of the starting materials and the nature of the solvents on the formation of vinyl ethynyltriethoxysilane was studied. The data obtained are presented in table 1.

As can be seen from Table 1, the starting reagents react up to 69.7% depending on temperature, the ratio of solvents and substances, and the rest do not react. The influence of the nature of solvents on the reaction kinetics was studied in solutions of ethers, benzene, chloroform, tetrahydrofuran, and dioxane. It has been observed that the reaction rate increases with increasing polarity of the solvents. The highest reaction rate and the highest yield of the final product are observed in ether and benzene. In addition, the viscosity values were determined, which are very typical for product samples [5,6].

TABLE 1 INFLUENCE OF THE RATIO OF SUBSTANCES ON THE REACTION YIELD

Molar ratio "Tetraethoxysilane: vinyl ethynyl magnesium bromide"	Molar ratio "Solvent: tetraethoxysilane + vinyltinyl magnesium bromide", 0.5: 0.5	Yield, wt%
10:90	Ethyl ether	62,5
	Benzene	57,6
	Tetrahydrofuran	52,8
30:70	Ethyl ether	63,5
	Benzene	56,3
	Tetrahydrofuran	58,9
50:50	Ethyl ether	69,7
	Benzene	62,4
	Tetrahydrofuran	60,3
70:30	Ethyl ether	66,9
	Benzene	63,4
	Tetrahydrofuran	60,5
90:10	Ethyl ether	62,3
	Benzene	61,5
	Tetrahydrofuran	60,0

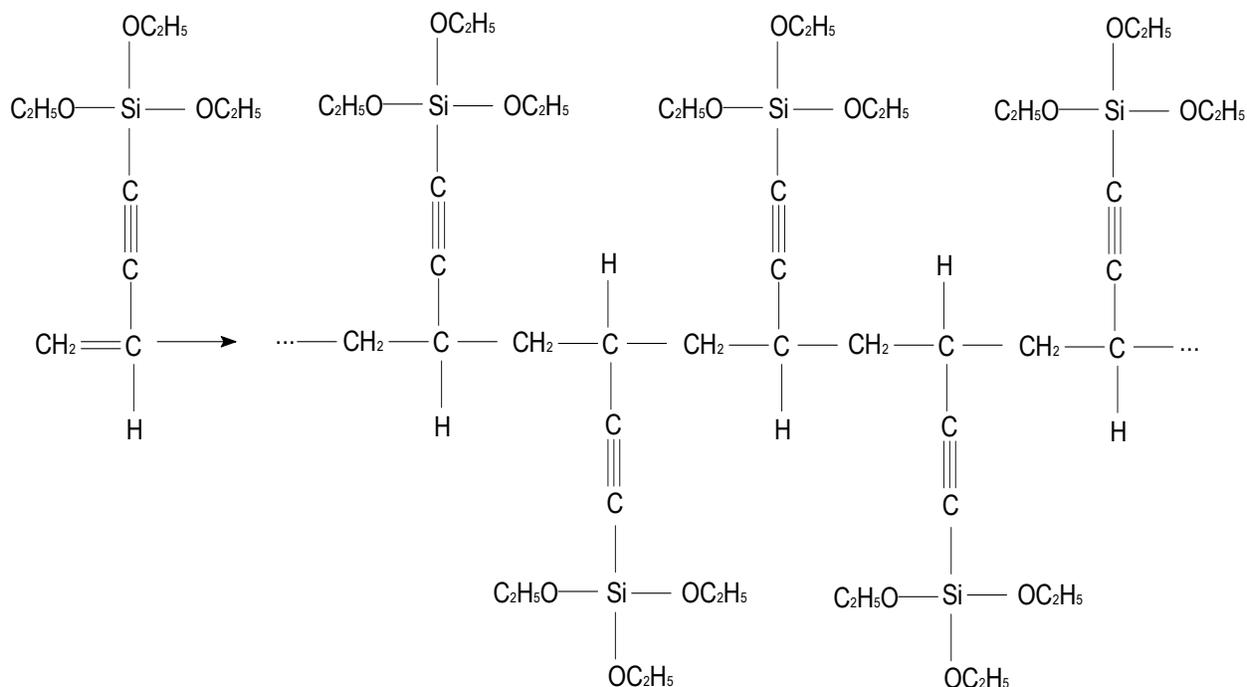

With increasing temperature, the reaction rate and the yield of the resulting semi-finished product increase.

In the solvents discussed above, the reactions of interaction of tetraethoxysilane with vinyl ethynyl magnesium bromide proceed almost continuously, without an induction cycle. The experimental results show that a change in the initial equimolar ratio of tetraethoxysilane and vinyl ethynyl magnesium bromide also leads to an increase in the rate of the process.

The reaction yield in ether solution is high when the substances are prepared in a 1: 1 ratio at a temperature of 30 °C.

The most common method for the polymerization of organosilicon monomers is the method of thermopolymerization of these monomers.

The scheme of thermal polymerization of vinyl ethynyltriethoxysilane monomer at a temperature of 30-40°C can be represented as follows:

The resulting product is rectified for the presence of water, ethyl alcohol and unreacted monomer in polyvinylethynyltriethoxysilane, resulting in a product with polyvinylethynyltriethoxysilane in 150 ml (50%) or benzene in 140 ml (48%), n^{20}_D 1.456 1.0183. n^{20}_D 1.4560; d 420 [7].

Viscous polyvinylethynyltriethoxysilane - colorless, non-toxic - odorless, non-volatile substance, insoluble in water. Insoluble in lower alcohols, but soluble in many organic solvents and has high hydrophobic properties, heat-resistant, characterized by a slight change in viscosity with increasing temperature. Table 2 lists some of the main physical properties of the obtained products [8].

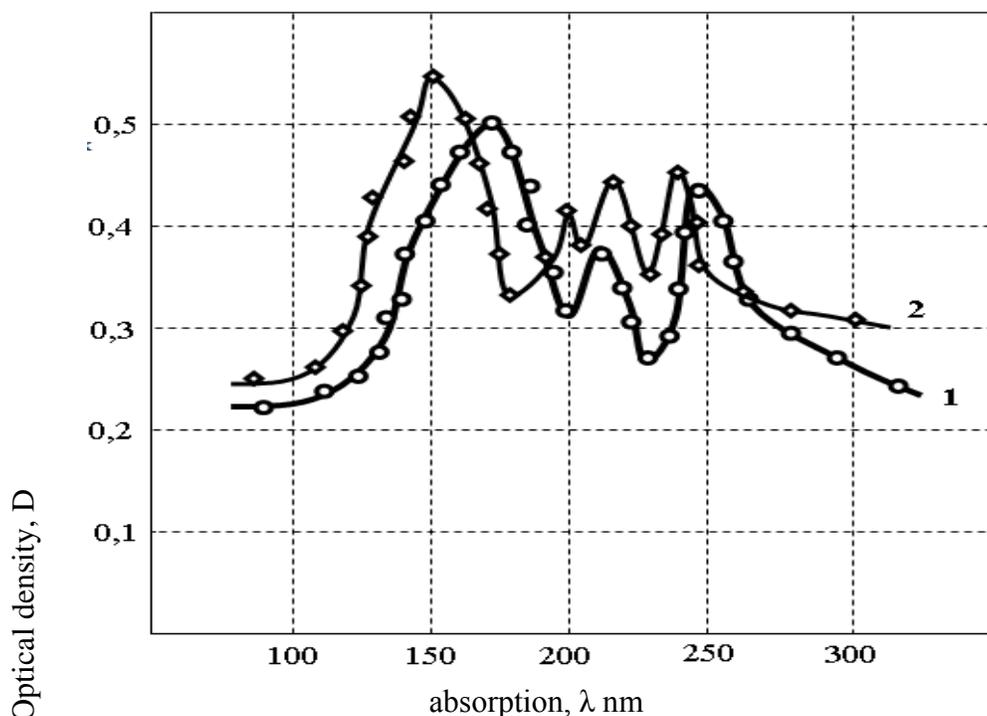

TABLE 2 BASIC PHYSICAL PROPERTIES OF ELEMENTARY INORGANIC MONO(POLY)MERS BASED ON SILICON

Products	Density at 25°C, g/sm ³	Refractive index of light, n^{25}_D	Viscosity at 25°C, mm/s ²
Vinylethynyltriethoxysilane	1,1154	1,13526	120
Polyvinylethynyltriethoxysilane	1,3372	1,3862	410

We also analyzed the UV spectra of the synthesized substances.

Chromofoms are often groups of unsaturated bonded atoms. However, vinyl ethynyltriethoxysilane and polyvinylethynyltriethoxysilane containing unsaturated C = C bonds are only 200 shows the spectrum in the absorption region above nm. The samples with the ethynyl group -C≡C- have broad absorption lines up to 240 nm, and it should be noted that this is due to the possibility of particle transition.

Rice. 1. UV spectrum of vinyl ethynyltriethoxysilane and polyvinylethynyltriethoxysilane

There are also two systems, the 180-165 nm series and the Rydberg series, a wide fuzzy network in the 152-105 nm region. In addition, the presence of two pairs of bonds between carbon atoms is detected, which leads to strong decay in the region of 225 nm.

It is known that the C-C bond between carbon atoms is usually absorbed only in the far ultraviolet region. In this regard, when the length of the hydrocarbon chain increases, that is, the conversion of vinyl ethynyltriethoxysilane to polyvinylethynyltriethoxysilane $\text{CH}_2 = \text{CH}$. It was found that the excitation effect requires significantly less energy due to the interaction of the groups.

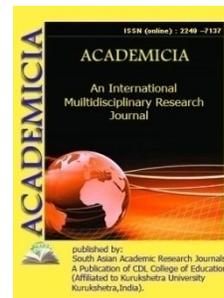

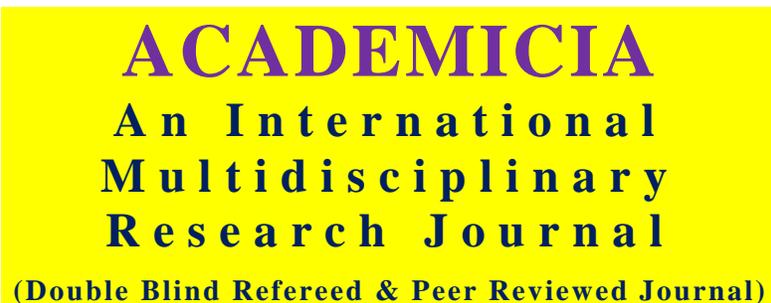

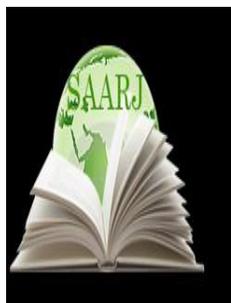

CONCLUSIONS

In this regard, it can be concluded that an increase in electromagnetism from left to right causes a stronger bond of electrons, so that (λ_{max}) the wavelength shifts towards shorter waves. $\text{CH}_2 = \text{CH}$ - 200-205 nm.

In addition, depending on the conditions in which the chromoform is located, the absorption line of the chromophore group (neighboring atoms, solvent, etc.) can shift within certain limits. Thus, for the first time, a vinyl ethynyltriethoxysilane monomer based on tetraethoxysilane and vinyl ethynyl magnesium bromide was synthesized.

ABSTRACT

In this article are described an interpretation of some of the terms used to classify words into specific groups in the study of lexicon as a system in Yusuf Hos Hajib's Qutadg'u Bilig, as well as an interpretation of opinions on social and political terms and lexical analysis. The above-mentioned cases on the use of the concept and term of the layer in linguistics are also present in Russian linguistics. In Russian linguistics (as well as in Turkology), different terms are used when thinking about the concept of layer. In this case, lexical units are divided into two layers according to their specific speech patterns: general speech layer and specific layer. H. Doniyorov uses the term layer in the description of methods.

KEYWORDS: *Descriptive-Synchronic Direction, Historical-Diachronic Direction, Comparative-Typological Direction, Lexical Layer, Lexical Field, Genetic Group, Socio-Political Lexicon, Community, Social Life.*

INTRODUCTION

The correct way to study vocabulary as a system is to analyze words by grouping them into specific groups. Just as the introduction of system linguistics into the science of linguistics played an important role in this, the formation and development of the field of lexicology as a science laid the foundation for the development of system-structural linguistics.

Linguistic units, including its lexical groups, also emerged on the basis of a dialectical relationship of system, structure, and norm or norm. In this case, the system consists of an integral set of elements, and the structure consists of the internal structure of this complex. Therefore, the study of linguistic phenomena in system-structural ethics requires, firstly, the

definition of the set of elements that make up the system and, secondly, the definition of internal relations and connections between these elements, their hierarchical arrangement and ways of forming one element from another. . This can be observed in the study of words in the lexicon of the language by dividing them into certain groups.

It should be noted that in linguistic lexicon, various concepts and terms are used in linguistics in the study of words into certain groups. Among these, the most widely used terms are lexical layer and lexical field. There are also cases when different terms are used instead of these terms. It is therefore appropriate to make some comments on this issue.

In linguistics, the concept and term of the lexical layer have a wide place in the division of words into certain groups. In Uzbek linguistics, the lexical layer, including terminological systems, is studied not only in terms of spiritual content, but also in terms of thematic grouping. Some sectoral terminological systems are also explored. But in linguistics, on the one hand, there is no uniformity in the clear and coherent understanding of the layer phenomenon, and on the other hand, in the systematic use of the term layer, which expresses this concept.

Linguist E. Begmatov in his work pays special attention to the lexical layers of the language, and in many studies expressed important ideas about the attitude to the phenomenon of layers and the use of the term layer. For example:

1. Some scholars in linguistics analyze lexical phenomena as a lexical layer, but do not call it only a layer or a lexical layer, but also use another term in a number of works. This situation, i.e. the use of different terms instead of the term lexical layer in the analysis of words into certain groups, exists not only in the Uzbek language, but also in the field of general linguistics.
2. Many linguists make extensive use of the concept and term lexical layer or lexical layer. But different terms are named at the same time with this term.

The views of Russian linguists on this issue played an important role in the emergence of the scientific concept of lexical layers in Uzbek linguistics. The above-mentioned cases on the use of the concept and term of the layer in linguistics are also present in Russian linguistics. In Russian linguistics (as well as in Turkology), different terms are used when thinking about the concept of layer. M.I. Fomina calls the concepts belonging to different lexical layers "genetic group of words". It can be observed that the concept of layering in Russian was used to group words in the lexicon of Turkic and other languages in general. In most works written in Russian, the word assimilation is referred to in various terms. Plast (layer), sloy (layer), Turkish lexicon, Turkism, Turkic names, element, Turkic lexical elements, Turkic element, Turkic borrowed words, fund (ancient fund, social fund). In using these terms, each author has acted from his own point of view.

In general, the understanding of the concept of layer in different senses and non-verbal use is widespread in Russian linguistics. In some works, the concept of layer term is also used with the terms discharge, group, active reserve. It is noteworthy that sometimes in the stylistic analysis of the Russian lexicon was used the term layer, and an attempt was made to define the concept of layer in detail.

For the first time in Uzbek linguistics the concept of layer was introduced by V.V. Reshetov and A. K Used in Borovkov's research. .

In works on Uzbek linguistics, such as Fakhri Kamal's work on Uzbek lexicon, he avoided using the term lexical layer for groups, which were considered to be the lexical richness of the language. Sometimes he used the term lexical element. However, it can be observed that in his research he also used the term layer, reflecting on changes in lexical layers, Persian and Arabic word layer, Arabic word layer, international word layer, basic lexical layers.

Observations show that the term layer, lexical layer, is widely used in Uzbek linguistics. But the concept of stratification also applies to meanings specific to certain social or speech groups of words. Ya.Pinkhasov describes the social-dialectal groups of words with the term layer, while Sh.Rakhmatullaev used the term layer to name the groups of words specific to social networks. Words are also divided into certain layers according to their methodological branching characteristics. In this case, lexical units are divided into two layers according to their specific speech patterns: general speech layer and specific layer. H. Doniyorov uses the term layer in the description of methods. It analyzes lexical and stylistic layers. Academician A. Khojiev used the term layer when thinking about his own layer and assimilated layers in the Uzbek lexicon and specific lexical layers of the Uzbek language, and also uses this term to divide words into historical-functional groups.

In the works of Sh. Shoabdurahmanov, the term layer was used to divide words into groups of activity and passivity. In general, Sh. Shoabdurahmanov in his research divided the words in the Uzbek language into three layers: 1) the lexical layer, which is common to the literary language and dialects; 2) a lexical layer unique to a dialect; 3) traditional lexical layer in Uzbek language.

In some works, the term layering has been used to describe words related to the military and various branches of the profession. While I. Rasulov uses the term layer in the sense of words specific to the military sphere, N. Mirzaev and T. In Tursunova's works, the layer of ethnographic lexicon is used in the analysis of the ancient traditional layers of ethnographic lexicon.

A.D. Urazbaev used the term lexical layer in the definition of thematic-semantic groups of socio-political lexicon in the dissertation "Socio-political vocabulary in Agahi's work "Riyazud-davla". The third chapter of the study is entitled "Structural analysis of socio-political vocabulary in the work" and includes "Structural analysis of socio-political lexicon of the Turkish lexical layer" and "Structural analysis of socio-political lexicon of the Iranian lexical layer" and "Socio-political lexicon of the Arabic lexical layer". structural analysis of vocabulary ”.

Although G.Muhammadjanova did not consistently use the term layer in her work and did not focus on the concept of layer and the essence of the term layer, which expresses it, she thought about the all-Turkish lexical layer and other layers. In some works, the concept of layer is also removed from the headings.

K. Yusupov also used the term layering in his book "Lexical, semantic and stylistic features of the Uzbek literary language", but some of the historical and etymological groups of words in the language dictionary are "Azerbaijani-Turkish words", "Arabicism", "Persian-Tajik words". grouped in forms.

In the first chapter of the dissertation, A.Kh.Turahojaeva, along with the use of the term layer (such as "the emergence of new structures belonging to the socio-political stratum"), widely used the term field.

Hence, in linguistics, the concept of layer is interpreted differently and accordingly the term layer is used in different senses. In this case, E. Begmatov concludes:

“1. The social differential groups of words are called layers: social-dialectal layers, like the layer of dialectal words.

2. Diachronic and synchronously functional groups of words are called layers: modern layer; old and modern layer; like a layer of old words and a layer of new words.

3. Groups of words that are active or passive according to their use are also called layers: active word layer, passive word layer.

4. The methodological differential groups of words are also called layers: such as the general layer and the custom layer.

5. Groups of words within a literary language and dialects, as well as inter-dialects or groups specific to one dialect are also called layers: literary language layer, lexical layer common to Uzbek literary language and dialects, layer common to all Uzbek dialects, single dialect like a specific lexical layer.

6. According to the normative, i.e. historical, groups of words are also called layers: traditional lexical layer, like the ancient traditional layer.

7. Groups of words related to specific areas, such as occupations, are also referred to as strata: military strata, ethnographic lexical strata or ethnographic strata, such as lexical strata related to occupational sectors.

8. Groups of words belonging to a particular style or different styles are also called layers: stylistic layers, lexical-stylistic layers, expressive-stylistic layers of lexicon, stylistic colored layers, stylistic layers of language.

9. Historical and etymological groups of words in the language dictionary are also called layers: layers of Persian and Arabic words, layers of Arabic words, layers of Russian-international words, primitive Turkic lexical layer, Turkish lexical layer, assimilated lexical layer, own layer, assimilation layer, The groups of words defined by the period of their appearance are also called layers: the oldest layer, like the layer that appeared later.

According to the scientist, not all such lexical phenomena can be considered as a single lexical layer. Because lexical layers are a group of words that have a certain position in the lexicon of the Uzbek language, forming a significant volume. Lexical layers mean that words belonging to different genetic sources, with a certain amount, are layered in the lexical system of the language in different historical periods. It is possible to agree with this conclusion. But the scholar argues that the amount of words in it should be taken into account when determining the lexical layer. For example, in the Uzbek language there are some words typical of ancient Sughd, ancient Sanskrit, ancient Greek. But they are not so numerous in number. Can these words also be called an independent lexical layer? In our opinion, it is expedient to call such lexical phenomena lexical elements, not a lexical layer. The scientist also considers the group of words that have entered the lexicon of the Uzbek language at different times as a lexical layer.

In our opinion, all the words present in the Uzbek lexicon form a lexical layer. This can also be understood from the lexical meaning of the term layer. For example, let us draw attention to the

lexical meaning of the term layer. In fact, this concept and term came into Uzbek on the basis of a translation from Russian linguistics. For example, the word layer used in the Uzbek language in the sense of a linguistic term is the Uzbek translation of the Russian words *plast* or *sloy*. In fact, in the Russian-Uzbek Dictionary, the word *plast* in Uzbek is mainly: 1. layer, translated as layer, and *plastpochvy-soil* (earth) layer; *ugolnyyplast-coal* layer; 2. *Plast-layer, gang, group*; *plastnovykh slovarnykh zaimstvovaniy* - like a layer of new assimilation words. The term *Sloy* is also translated into Uzbek mainly in the sense of layer, however; The forms used in the form of *sloygliny*, *sloylda*, *tolstyysloykraski*, *verxniesloiatmosfery*, *shirokiesloinaseleniya* are also interpreted in the sense of a layer of clay, a layer of ice, a layer of thick paint, the upper layers of the atmosphere, the general population.

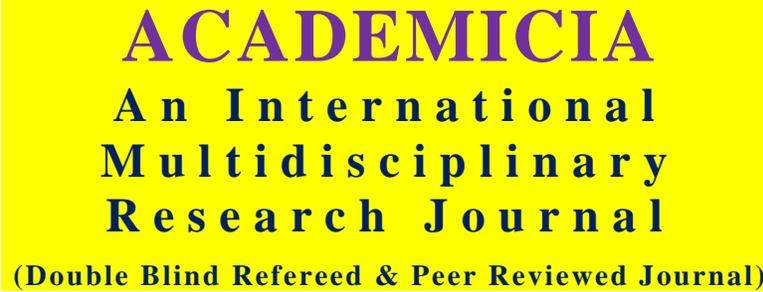

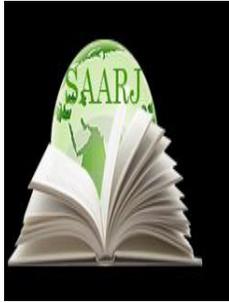

The term layer refers to the products that make up certain layers. In the Uzbek Soviet Encyclopedia, layer is defined as a geological term: Layer (in geology) is the basic form of sedimentary rock placement. The composition of the layer is the same and is bounded by surfaces that are almost parallel to each other. Hence, the term layer (*plast* or *layer*) literally refers to products in which the surface of one is parallel to the other (overlapping or overlapping), layered (layered).

This means that regardless of the amount of words in the language lexicon, they are all located in parallel in the lexical layer of the language and form a common layer, but they form lexical units according to their semantic meanings. According to E. Begmatov, words in the lexicon of the Uzbek language can be applied to historical and etymological groups. The concept of layer is mainly specific to the lexical layer phenomenon. Although this concept and term does not express the essence of other areas of linguistics, it can be applied conditionally to them as well. In general, there is still no consistency in the use of this term in linguistics. Therefore, in linguistics, the concept of field is used in conjunction with lexical layers in the study of areas in the system of language lexicon in groups.

CYTOKINE DIAGNOSTICS IN THE PROGNOSIS OF CRITICAL CONDITIONS IN NEWBORNS BORN TO MOTHERS INFECTED WITH COVID-19

Navruzova Shakar Istamovna*; Baratov Sunnat Samiyevich**

^{1,2}Bukhara State Medical Institute,
UZBEKISTAN

ABSTRACT

The authors conducted a study of cytokines of newborns born to mothers with coronavirus infection. SARS-CoV-2 infection causes a sharp decrease in the number of lymphocytes, especially a decrease in CD4 T cells, accompanied by uncontrolled release of inflammatory cytokines, which leads to a second stroke and exacerbates pathological changes in the respiratory system. Clinical symptoms vary among the infected population, suggesting that individual immune status is associated with susceptibility to COVID-19 and that immune dysfunction may play a significant role in the development of critical diseases.

KEYWORDS: COVID-19, SARS-Cov-2, Newborns, Critical Conditions, Coronavirus Disease, Cytokines

INTRODUCTION

The 2019 coronavirus disease (COVID-19) has spread rapidly around the world. With a sharp increase in the number of infections, the number of pregnant women and children with COVID-19 is also growing [6,23,24].

Since the first reported case of neonatal COVID-19 in February 2020 [20], concerns have been expressed about the possible vertical transmission of SARS-CoV-2 [9,10,12,23].

Early Chinese reports suggested that vertical transmission of SARS-CoV-2 does not occur because amniotic fluid, vaginal mucus, placenta, umbilical cord, umbilical cord blood and neonatal stool samples tested negative for the virus [6,7,11,15,17,19,21,24]. In addition, smears from the nasopharynx of these newborns immediately after delivery were negative. Moreover, there have been no reports of vertical transmission during outbreaks of Severe Acute Respiratory

Syndrome (SARS) and Middle East Respiratory Syndrome (MERS) due to genetically similar coronaviruses [4,16].

In other series of cases, serological testing of seven newborns with limited postpartum exposure (mothers born by caesarean section wore masks, and newborns quickly separated from their mothers) showed the presence of virus-specific antibodies, including three with high IgM levels, despite negative virological testing [9,10]. This may indicate the transplacental passage of SARS-CoV-2, since IgM does not cross the placenta, although IgM assays are difficult to interpret due to frequent false positive results [12]. While postnatal transmission of infection to newborns is most likely, current data are inconclusive regarding intrauterine transmission [5].

It is known that critical conditions of newborns are characterized by organ dysfunction and multiple organ failure, the treatment of which requires urgent aggressive therapeutic measures. Changes in clinical, laboratory and physiological parameters in critical conditions are often considered and interpreted in isolation from each other. Timely adoption of clinical and organizational decisions in the treatment of patients in critical conditions is very important [1-3].

The frequency of critical diseases caused by COVID-19 is about 19%, of which in most cases progress to acute respiratory distress syndrome and respiratory failure, accompanied by acute immune dysfunction. SARS-CoV-2 infection causes a sharp decrease in the number of lymphocytes, especially a decrease in CD4 T cells, accompanied by uncontrolled release of inflammatory cytokines, which leads to a second stroke and exacerbates pathological changes in the respiratory system. Clinical symptoms vary among the infected population, suggesting that individual immune status is associated with susceptibility to COVID-19 and that immune dysfunction may play a significant role in the development of critical diseases. Due to the special immunological status of pregnant women, the inflammatory reaction of the mother to a coronavirus infection can affect the structural and functional development of the fetus and newborn [13,19].

In children, COVID-19 is weak or asymptomatic.¹²; however, the virus can remain in the body for a long time, and viral nucleic acids can persist in faeces, which suggests the possibility of non-respiratory transmission in children. Immaturity of immunological function in children and newborns leads to their increased susceptibility to viral infections, while immaturity of adaptive immunological development can make their clinical symptoms different from those in adults [8,13].

Together, these aspects raise serious questions about why the clinical manifestations of infected children and newborns differ from those of adults with immunosuppression and what effect the inflammatory response caused by maternal infection has on the immunological function of the fetus [14].

The aim of the study was to study blood and urine cytokines of newborns born to mothers infected with COVID-19 to predict the outcome of critical conditions.

Materials and methods of research:

Under observation were 120 newborns with critical conditions hospitalized in the BODMPMC in the period 2020-2021. A clinical and laboratory examination of 64 newborns was conducted: 33 newborns born to mothers with COVID-19 (group 1), 30 newborns with perinatal CNS lesion (CNS) (2nd group) and 31 healthy newborns. The exclusion criteria were congenital

malformations, prematurity, traumatic lesions of the central nervous system. All newborns underwent conventional clinical and laboratory methods of examination. To determine the molecular markers in the urine, the morning, first portion of urine was collected in special sterile plastic urine collectors with lids. Determination of the content of the main pro- and anti-inflammatory cytokines (IFN γ , IL-17A, MCP-1, IFN α , VEGF) in urine and serum (IFN γ , IL-17A, MCP-1, IFN α , VEGF) on the 5th day of life was carried out by solid-phase enzyme immunoassay using sets of reagents from Vector-Best (Novosibirsk, RF). The results were expressed in pg/ml. Statistical processing of the obtained results was carried out by methods of variational statistics using the Statistica for Windows application software package. Digital data was processed on an IB MPC personal computer using the memory of Microsoft Exell-97 application programs. The information was considered reliable under the condition that $t \geq 2$ and $P < 0.05$.

Research results and their discussion: To compare the immunological parameters of blood and urine, as well as to determine the dynamics of cytokines and reduce invasive procedures, the study of pro and anti-inflammatory cytokines in blood serum and urine in newborns was carried out. Modern literature says that the immune system in the neonatal period and in the postnatal period is in a state of physiological suppression. The biological meaning of suppressing immune reactions in newborns and in the postnatal period is to prevent the risk of developing severe immunopathological reactions with massive contact of the child with environmental antigens [8]. It has been established that the human immune system is inextricably linked with the interferon system. Interferons- α and - γ affect the activity of natural killers. Also, one of the important properties of interferons is the ability to interfere with intracellular replication of viruses, activating the cell's response to viral infection. Interferon triggers a cascade of biochemical reactions in cells that lead to suppression of the synthesis of viral proteins, as well as to suppression of the assembly and release of viral particles and activation of the process of apoptosis of an infected cell [3,22].

Prognostically unfavorable for the development of infectious and inflammatory diseases of the pulmonary system in premature infants is a decrease in the indicators of alpha and gamma interferons in the blood [4].

As a result of the analysis, it was found that the concentration of IFN γ increases in newborns of the 1st group to 23.64 ± 0.83 pkg/ml ($p < 0.05$), and in the 2nd group to 29.20 ± 1.28 pkg/ml ($p < 0.05$), in relation to the control 20.96 ± 0.66 pkg/ml (Table 1).

At the same time, an increase in the concentration of IFN α was also noted in newborns born to mothers with COVID-19 (group 1) to 33.71 ± 1.22 pkg/ml in relation to the control indicators 26.49 ± 1.20 pkg/ml ($p < 0.05$), and children of group 2 with PPCNS had a statistically insignificant decrease to 24.43 ± 1.36 pkg/ml.

TABLE 1 THE CONTENT OF CYTOKINES IN THE BLOOD OF NEWBORNS

Cytokines pg/ ml	Control groupn=31		1-groupn=33		2-groupn=30	
	min-max	Average	min-max	Average	min-max	Average
IFN γ	14,48- 27,35	20,96 \pm 0,66	15,27- 32,25	23,64 \pm 0,83*	17,05-39,63	29,20 \pm 1,28*
IFN α	15,83- 38,21	26,49 \pm 1,20	21,79- 47,37	33,71 \pm 1,22*	16,92-35,49	24,43 \pm 1,36
IL-17A	29,93- 64,97	46,99 \pm 1,70	55,34- 92,06	70,63 \pm 1,70*	24,22-56,17	38,74 \pm 2,07*
MCP-1	98,29- 305,71	196,69 \pm 9,9 2	422,15- 1058,15	765,66 \pm 33,07 *	74,22- 166,43	116,47 \pm 7,86*
VEGF	19,21- 59,93	38,47 \pm 2,23	25,17- 54,67	40,05 \pm 1,49	30,12-54,45	42,15 \pm 1,82

Note: *-significantly relative to the control ($p < 0.05$)

Consequently, the obtained results of studying the interferon status of observed newborns on the first 5th day of life show activation of interferon formation in full-term newborns born to mothers with COVID-19. Interleukin-17 belongs to proinflammatory cytokines and is involved in many stages of the immune response. It stimulates the production of chemokines and, as a result, stimulates the migration of neutrophils to the site of inflammation. IL-17 triggers an extensive tissue reaction leading to the migration of neutrophils into the inflammatory zone [7]. IL17A is a dimeric glycoprotein (15 kDa) consisting of 155 amino acids. Its biological function is aimed at ensuring the interaction between innate and acquired immunity [18,36].

The study of IL-17A levels in the serum of observed newborns showed a statistically significant increase in group 1 children to -70.63 ± 1.70 pg/ml ($p < 0.05$), and in group 2 a decrease to 38.74 ± 2.07 pg/ml ($p < 0.05$) versus control- 46.99 ± 1.70 pg/ml. The results obtained indicate the presence of an inflammatory process and activation of the phagocytosis system in the first 5 days of life in full-term newborns born to mothers with COVID-19. And a significant decrease in its level in newborns with PCNS confirms an increase in INF γ and the absence of inflammation. Thus, full-term newborns born to mothers with COVID-19 are characterized by an increase in the synthesis of INF γ and IFN α against the background of an increase in IL-17A, which confirms the activation of phagocytosis and interferon synthesis in response to viral load for the first time 5 days of life.

It is known that monocytic chemotactic protein (MCP-1) is widely involved in physiological (teething, nociception, angiogenesis, etc.) and pathophysiological processes in the body, participates in the pathogenesis of a number of diseases. MCP-1 is mainly expressed by macrophages in response to the action of a wide range of cytokines, such as IL-6, TNF- α and IL-1b. Due to its targeted cell specificity, it has been postulated that MCP-1 plays a pathogenic role in a variety of different diseases characterized by infiltration of mononuclear cells. Elevated levels of MCP-1 were also detected in connection with bone inflammation, as well as in myocardial ischemia and viral infection [5].

In our studies, when studying the concentration of MCP-1 in the blood serum of observed healthy and sick newborns with critical conditions, a statistically significant increase was found

in group 1 children to -765.66 ± 33.07 pg/ml ($p < 0.05$), and in group 2 a decrease to 116.47 ± 7.86 pg/ml ($p < 0.05$) versus control- 196.69 ± 9.92 pg/ml.

Consequently, the established increase in the level of MCP-1 in group 1 newborns confirms the development of inflammation at the endothelial level and indicates the onset of systemic inflammatory response syndrome (SIRS).

Currently, seven different CoV strains have been found to infect humans, including HCoV-229E, HCoV-NL63, HCoV-OC43 and HCoV-HKU1, which usually cause self-resolving symptoms. In addition, coronavirus can cause severe acute respiratory syndrome (SARS), Middle Eastern respiratory syndrome (MERS-CoV) and lethal acute respiratory syndrome, which causes the recently identified SARS-CoV-2. Four types of HCoV, including HCoV-229E (α -CoV), HCoV-NL63 (α -CoV), HCoV-OC43 (β -CoV) and HCoV-HKU1 (β -CoV), are endemic to humans and usually cause mild respiratory infection with self-resolving symptoms, which accounts for 15-30% of acute respiratory diseases (ARI). As a rule, this type of infection occurs in young people, but in older age, especially in patients with cardiovascular and bronchopulmonary pathology, it can cause hospitalization, including emergency [30]. Vascular Endothelial Growth Factor (VEGF)-activator of angiogenesis, responsible for restoring oxygen supply to tissues in a situation where blood circulation is insufficient. In physiological concentrations, endothelin (ET) acts on endothelial receptors, causing the release of relaxation factors, in higher concentrations it activates receptors on smooth muscle cells, stimulating persistent vasoconstriction primarily at the level of microcirculation [19]. The constrictor activity of endothelin-1 may be a factor of vasospasm enhancement, closing the vicious circle of pathobiochemical reactions and aggravating cerebral ischemia [9].

In our studies, the study of VEGF concentration showed a tendency to increase, regardless of nosology, to 40.05 ± 1.49 and 42.15 ± 1.82 in relation to control- 38.47 ± 2.23 in newborns with critical conditions of the 1st and 2nd groups, respectively (Table 1). The established phenomenon indicates the involvement in the development of CVD during the first 5 days in newborns of the observed group both with coronavirus infection and with PDCNS in the absence of COVID-19.

To reduce invasive manipulations and compare blood serum and urine values in newborns of the observed group, urocytokinodiagnostics was performed.

The studied indicators in urine allowed us to conclude that during the first 5 days of life of full-term newborns with perinatal pathologies, reliable results of urocytokinodiagnostics can be obtained. Thus, in full-term newborns with perinatal pathologies, the concentrations of INF γ , IFN α and IL-17A significantly increase in urine both during infection and in the absence of COVID-19 in the mother. The studies revealed a statistically significant 3-fold increase in the level of INF γ to 16.84 ± 0.66 pg/ml in children of group 1, and a 2-fold increase (10.21 ± 0.41 pg/ml) in children of group 2, against the control- 5.94 ± 0.23 pg/ml ($p < 0.05$). This tendency to increase was noted in relation to the level of IFN α in urine: up to 7.60 ± 0.39 pg/ml and 9.49 ± 0.43 pg/ml against the control- 5.78 ± 0.23 pg/ml, in newborns of the 1st and 2nd groups, respectively (Table 2).

TABLE 2 THE CONTENT OF CYTOKINES IN THE URINE OF NEWBORNS

Immunologic parameters of urine	Control group n=31		1-group n=33		2-group n=30	
	min-max	Average	min-max	min-max	Average	min-max
IFN γ	4,25-8,75	5,94 \pm 0,23	10,08-24,11	16,84 \pm 0,66*	6,94-15,42	10,21 \pm 0,41*
IFN α	3,68-8,06	5,78 \pm 0,23	4,33-11,87	7,60 \pm 0,39*	5,48-14,33	9,49 \pm 0,43*
IL-17A	20,05-38,48	30,75 \pm 0,93	41,15-92,50	65,48 \pm 2,30*	23,55-54,67	37,07 \pm 1,43*
MCP-1	74,51-130,2	99,25 \pm 2,63	16,72-33,10	23,36 \pm 0,75*	39,45-71,27	54,75 \pm 1,80*
VEGF	18,36-34,97	26,99 \pm 0,87	10,26-30,15	19,79 \pm 1,02*	14,48-33,05	22,72 \pm 0,96*

Note: *-significantly relative to the control ($p < 0.05$)

The study of the concentration of MSR-1 in urine revealed a 4-fold decrease to 23.36 \pm 0.75 pg/ml in COVID-19 and a 2-fold decrease to 54.75 \pm 1.80 pg/ml in full-term neonates against control-99.25 \pm 2.63 pg/ml. And the concentration of VEGF in urine also had a significant tendency to decrease to 19.79 \pm 1.02 pg/ml and 22.72 \pm 0.96 pg/ml against the control -26.99 \pm 0.87 pg/ml, which indicates the absence of an activator for oxygen delivery to tissues and inadequate renal circulation during the first 5 days of life of full-term newborns both in the presence of COVID-19 and in its absence in newborns with PDCNS, respectively.

CONCLUSION

The obtained results of cytokinodiagnostics allowed early diagnosis and prediction of the health status of newborns for the development of critical conditions.

Newborns born from a mother with COVID-19 develop CVD during the first 5 days of life. In critical conditions in newborns with a coronavirus load, an increase in the synthesis of INF γ and IFN α was found against the background of an increase in the level of IL-17A, which confirms the activation of phagocytosis and interferon synthesis for the first time 5 days of life.

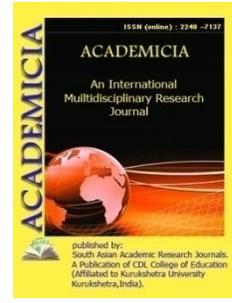

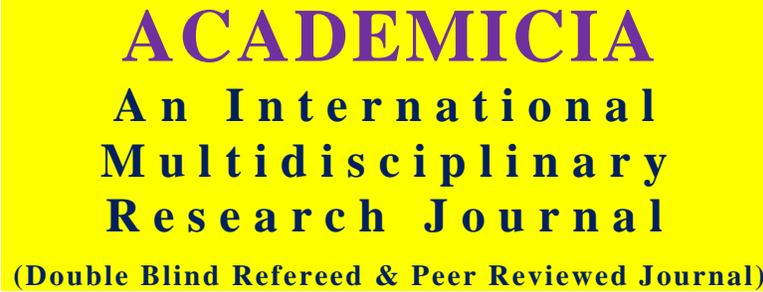

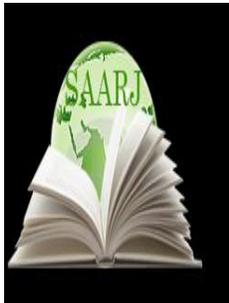

The established processes are accompanied by an increase in the level of MCP-1 in the blood by 3.89 times, with a decrease in its urine by 4.25 times in newborns born from a mother with COVID-19, which indicates the severity of the course of CVD. Both with COVID-19 infection and with PDCNS in newborns without COVID-19 infection, there is a tendency to increase VEGF in the blood, against the background of a statistically significant decrease in its urine. Consequently, the observed dynamics of cytokines in the blood and urine of newborns with CVD indicates the activation of phagocytosis, interferon formation and inadequate renal circulation during the first 5 days of life.

UZBEKISTAN

ABSTRACT

This review presents data revealing the pathogenesis of uterine bleeding during puberty, examines neuro-endocrine and immune mechanisms of regulation of the menstrual cycle in adolescent girls. The authors have formulated a conclusion summarizing modern research devoted to the study of the regulatory mechanisms of the reproductive system.

KEYWORDS: *Uterine Bleeding, Puberty, Adolescent Girls, Reproductive System.*

INTRODUCTION

In modern society, improving the reproductive health of women of all age groups is an important task for the formation of future generations of healthy, capable of full-fledged, social functioning and creative self-expression of people. Gynecological pathology of the puberty period, in particular, uterine bleeding, has a noticeable effect on reproductive health. Women who had uterine bleeding during puberty, subsequently represent a risk group for menstrual cycle disorders and generative function, hormone-related diseases [1,2].

Puberty is a critical period in the formation of the reproductive system. The main difference in the endocrine status in this age period is the immaturity of the hypothalamic-pituitary-ovarian system and inadequate sensitivity of target organs to the effects of gonadotropins. Therefore, it is during this period, under the influence of various both endo- and exogenous influences, various disturbances of the hormonal regulation process are possible, and as a consequence of this, a violation of menstrual function occurs. This is most often manifested by uterine bleeding of the pubertal period (UBPP), the share of which in the structure of gynecological pathology is 20-30% on average [3].

In the pubertal period, abnormal uterine bleeding (AUB) is usually considered to be associated with hormonal dysfunction and changes in the structure of the endometrium. Their frequency in the structure of gynecological morbidity ranges from 10% to 37.5%. However, in more than 50%

of cases, the pathogenesis of the disease remains unclear, which makes it impossible to use a unified treatment regimen. Known mechanisms of uterine bleeding include a violation of contractile activity of the uterus, a decrease in the tone of the uterine arteries due to a violation of the balance of vasoconstrictor and vasodilator prostaglandins, a violation of endometrial regeneration and pathology of thrombosis, especially in the platelet-vascular link, as well as as a result of activation of the fibrinolytic system. Regardless of the mechanisms that initiate abnormal bleeding, the significance of hemostatic reactions that provide thrombosis at the endometrial level is unanimously recognized, since their adequacy prevents the pathological consequences of blood loss and secondary organic changes in the endometrium [4].

One of the most important and clinically manifest forms of menstrual function disorders are UBPP, previously known as juvenile. The more familiar term has been changed recently in accordance with the recommendations of the International Classification of Diseases of the Xth revision. Due to the variety of conditions and causes for the occurrence of uterine bleeding, the term "abnormal uterine bleeding" is more often used in foreign literature to designate them [5].

The first clinical manifestations of UBPP manifest themselves during the formation of the menstrual cycle. The main causes of bleeding caused by changes in blood clotting are associated with impaired platelet function and, most often, Willebrand factor pathology. The functional activity of platelets and the level of the Willebrand factor depend on the general condition of the body, taking medications, physical activity, past illnesses, as well as the patient's blood type. The level of activity of the Willebrand factor in girls can also be influenced by the phase of the menstrual cycle. Hormonal disorders and related changes in prostaglandin levels, endometrial conditions and uterine contractility can also cause hyperpolymenorrhea. After a single study of blood clotting, it is almost never possible to identify the cause of uterine bleeding [6].

AUB in puberty is bleeding from the uterus, excessive in duration (more than 8 days), volume of blood loss (more than 80 ml) and/or frequency (less than 24 days), which has an adverse effect on physical, social and emotional well-being, the ability to verbal learning and memory in adolescent girls aged from menarche to 17 years inclusive. The frequency of AUB is 25-30% of all adolescent girls aged from menarche to 17 years inclusive who have sought medical help. In 33-69%, the disease has a tendency to chronic course and relapses. AUB in the pubertal period, Ovulatory dysfunction ("O") is the most common cause of AUB in adolescent girls aged from menarche to 17 years inclusive. Coagulopathy ("C") is determined in 20% of adolescent girls aged from menarche to 17 years inclusive. Willebrand's disease is found in 36% of teenage girls with regular menstruation. Organic pathology (polyp-P/adenomyosis-A/leiomyoma-L/malignancy and atypical hyperplasia-M) are collectively detected with a frequency of up to 10% in the structure of the causes of AUB in adolescent girls aged from menarche to 17 years inclusive [7].

The etiology of UBPP is diverse: infections of various nature, metabolic disorders, psycho emotional state, significant physical exertion occupy an important place. According to the literature, the pathogenesis of UBPP is mainly associated with changes in the central nervous and endocrine regulation of the menstrual cycle in adolescent girls, which is accompanied by a change in the concentration of gonadotropin, leads to a violation of folliculogenesis and anovulation. Iron deficiency anemia of varying severity due to chronic iron loss is often a complication of UBPP [8].

The functional state of the higher nervous activity controlling the regulatory mechanisms of the reproductive system is unstable during puberty; the development of differentiations in the cerebral cortex and, especially, the hypothalamic-pituitary centers is insufficient. The uterus has not yet completed its final development, its receptors are imperfect, the potential for the uterus to perceive irritations and conduct them into the central nervous system is poorly expressed. At the same time, the pituitary gland receives perverted impulses and the synthesis of gonadotropins is not coordinated in it; follitropin production prevails, and lutropin and prolactin are not produced sufficiently. Various external and internal stimuli acting against this background can easily disrupt the regulatory mechanisms of the reproductive system, preventing the establishment of its stereotype and accompanied by uterine bleeding. The hormonal function of the ovaries during this period in girls is insufficiently expressed due to the imperfection of the receptor apparatus, as a result of which follicular and steroidogenesis is disrupted, and bleeding is most often of a hypoestrogenic nature. Prolonged monotonous exposure to low estrogen levels causes necrobiotic processes in the endometrium, which is accompanied by the appearance of bleeding. Taking into account that the mechanism of bleeding is not associated with a sharp drop in hormones, as it happens during normal menstruation, therefore, the endometrium is not rejected simultaneously, but in separate areas, therefore bleeding is more often not abundant. Since the level of estradiol is not high enough for rapid regeneration of the endometrium, bleeding is prolonged. Along with this, the question of the role of the endometrium itself in the occurrence of bleeding is discussed. It is assumed that endocrine, hemostasiological, as well as immunological mechanisms are important in the development of bleeding at the endometrial level [9].

Relative hyperestrogenism in puberty is due to the insufficiency or absence of the luteal phase of the cycle, which leads to disruption of secretory transformation processes and the development of endometrial hyperplasia [10].

The study of uterine bleeding is impossible without taking into account the peculiarities of the state of the blood coagulation system. Blood clotting is an important protective mechanism, the violation of which can lead to serious conditions, even to death. The maintenance of the liquid state of the blood is provided by the principle of self-regulation with the formation of an appropriate functional system. The main reaction apparatuses of this functional system are the coagulation and anticoagulation systems. In the study of the blood clotting system, the greatest attention is paid to thrombocytopoiesis due to the fact that platelets are the main supplier of thromboplastin, from which the blood clotting process begins [11].

The main modulators of cell growth with pronounced mitogenic properties in the tissues of the uterus and ovaries are insulin-like growth factor (IGF) -1, endothelial growth factor (EGF) and vascular-endothelial growth factor (VEGF). Angiogenesis is considered as a key factor in the development of tumor processes, but normally cyclic changes and the development of new microvessels from existing ones occur monthly in the ovaries and eutopic endometrium – cyclic angiogenesis. In other intact tissues of an adult, angiogenesis is not detected. The main inducers of the angiogenesis process are VEGF, angiogenin and the main fibroblast growth factor (FGF-2). VEGF expression is detected only in well-vascularized tissues: ovarian cysts, "mature" follicles, yellow bodies in the vascularization phase, in the epithelium of the fallopian tubes, in smooth muscle cells and ovarian gates. Changing the processes of cyclic angiogenesis leads to inadequate vascularization of follicles, which disrupts their growth and can contribute to both

atresia and persistence at various stages of maturity, up to cystic formation. VEGF expression is not observed in atretic follicles and degenerating corpus luteum [12-14].

With inadequate vascularization of the corpus luteum, luteal phase insufficiency develops, leading to various obstetric and gynecological pathology associated with progesterone deficiency.

R. Barbieri's studies have confirmed the role of insulin and insulin-like growth factors in the regulation of ovarian function. Both substances have a mitogenic effect, stimulating the proliferation of granulosa cells, which, by potentiating the effect of gonadotropins, leads to increased steroidogenesis in the ovaries. Insulin and IGF-1 stimulate the synthesis of estradiol and progesterone induced by follicle-stimulating hormone (FSH) in granulosa cells and luteinizing hormone (LH)-induced androstenedione synthesis in theca and stroma cells. A direct inducing and activating effect of insulin and IGF-1 on aromatase was noted [15,16].

Reviews have shown that hyperplastic processes in the uterine mucosa occur against the background of neuro-endocrine disorders and a progressive decrease in the ability of cells to apoptosis, which leads to a decrease in the degree of degradation of deoxyribonucleic acid (DNA) and an increase in the number of proliferating cells. Apoptosis is the natural end of the life cycle of any cell, the mechanisms of its regulation are universal, do not have tissue specificity and can act at various levels. The development of tumors, pathology of the cardiovascular system, neurodegenerative diseases, acute and chronic inflammatory processes is associated with a violation of the processes of regulation and implementation of apoptosis in the form of its premature induction or pathological suppression.

Currently, the uniformity of the premorbid background has been established in patients with various combinations of hyperplastic processes in hormone-dependent organs of the reproductive system, which suggests a similarity of the pathogenetic mechanisms of their development. Cytokines, growth factors and other proteins included in the cell microenvironment participate in the regulation of apoptosis. Tumor necrosis factor- α (TNF- α) is a cytokine that exhibits cytotoxicity by activating the corresponding receptors — p55 (TNFRI) and p75 (TNFRII) [17].

According to modern views, UBPP is associated with a violation of the function of the regulatory centers of the brain, namely the hypothalamic-pituitary system, which is a reflection of the age characteristics of the adolescent organism - the physiological immaturity of the regulatory centers and their unsteady connections with the ovaries. The functional state of the higher nervous activity controlling the regulatory mechanisms of the reproductive system is unstable during puberty, the development of differentiations in the cerebral cortex and, especially, in the hypothalamic-pituitary centers is insufficient. The uterus has not yet completed its final development, its receptors are imperfect, the potential for the uterus to perceive irritations and conduct them into the central nervous system is poorly expressed. At the same time, the pituitary gland receives perverted impulses and the synthesis of gonadotropins is not coordinated in it – the production of follitropin prevails, lutropin and prolactin are not produced in sufficient quantities. Various external and internal stimuli acting against this background can easily disrupt the regulatory mechanisms of the reproductive system, preventing the establishment of its stereotype and accompanied by uterine bleeding [18].

Polymorphism of phenotypic manifestations of hereditary disorders, and often connective tissue dysplasia, is associated today with an increased risk of the formation of vascular intracranial

abnormalities. Violation of the development of connective tissue involves not only somatic, but also all parts of the reproductive system. The formation of the function of the latter in adolescence is interrelated with the collagen formation of the reproductive organs and the functioning of vascular-platelet and coagulation hemostasis. The mutual influence of these links determines the preservation of not only the reproductive, but also the general somatic health of a teenage girl [19].

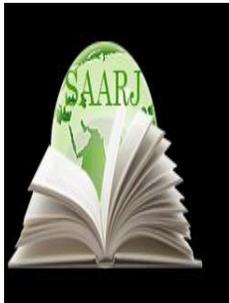

CONCLUSION

1. The pathogenesis of UBPP is caused by a complex of neuroendocrine, metabolic and immune disorders, among which the main place was previously given to the phenomenon of relative or absolute hyperestrogenism.
2. Endocrine, hemostasiological, as well as immunological mechanisms are important in the development of bleeding at the endometrial level.
3. The main modulators of cell growth with pronounced mitogenic properties in the tissues of the uterus and ovaries are insulin-like growth factor (IGF) -1, endothelial growth factor (EGF) and vascular-endothelial growth factor (VEGF).
4. The functional state of the higher nervous activity and its receptors are imperfect, the potential for the uterus to perceive irritations and conduct them into the central nervous system is poorly expressed. At the same time, the pituitary gland receives perverted impulses and the synthesis of gonadotropins is not coordinated in it, preventing the establishment of a normal menstrual cycle and accompanied by uterine bleeding.

 Rohtak, INDIA

ABSTRACT

This study examined the academic achievement of senior secondary school students in relation to their creativity. The study adopted a descriptive survey method of research. Participants were 800 senior secondary school students randomly selected from sixteen schools in Gurgaon and Rewari districts of Haryana state (400 boys & 400 girls) belongs from urban and rural areas. The research instruments used for data collection were: Divergent Production Ability Test by Dr. K.N. Sharma and matric examination marks/ grades were taken for academic achievement, tested at the 0.05 & 0.01 level of significance. The findings indicated that there exist a significant difference in academic achievement of senior secondary school students in relation to their High and Low Creativity. There is a significant difference in academic achievement of male and female senior secondary school students in relation to their High and Low Creativity. There is a significant difference in academic achievement of urban and rural senior secondary school students in relation to their High and Low Creativity.

KEYWORDS: *Divergent, Randomly, Examined*

INTRODUCTION

Creativity, we usually understand an activity resulting in some new product of a definite social value. Creativity is also a very important process for progress and major advances in every field. Research indicates the importance of creativity in student's achievement, career success, personal well being to improve student's achievement and success. It is the basis of all social development and new inventions and discoveries in the field of science and technology.

Academic achievement is the accomplishment or acquired proficiency in the performance of an individual in a given skill or a body of knowledge. In other words it means the pupil's needs or drive towards the achievement of success in academic work. Educators have therefore been interested in those factors which influence or associated with academic achievement. Academic achievement is influenced by a multitude of factors. In the beginning, psychologists focused only on cognitive aspects like intelligence but research has shown that social and emotional factors like emotional intelligence, creativity, anxiety, personality, family relationship etc. affect the achievement of students. So, the variables Academic Achievement and Creativity of the students need inquiry for proper understanding of a student. Hence the present study is a humble attempt to search an empirical database with certain hypothesis.

Objectives of the study

1. To study the academic achievement of senior secondary school students in relation to their High and low Creativity.
2. To study the Academic Achievement of male senior secondary school students in relation to their high and low creativity.
3. To study the Academic Achievement of female senior secondary school students in relation to their high and low creativity.
4. To study the Academic Achievement of urban senior secondary school students in relation to their high and low creativity.
5. To study the Academic Achievement of rural senior secondary school students in relation to their high and low creativity.

Hypotheses of the study

1. There is no significant difference in academic achievement of senior secondary school students in relation to their High and Low Creativity.
2. There is no significant difference in academic achievement of male senior secondary school students in relation to their High and Low Creativity.
3. There is no significant difference in academic achievement of female senior secondary school students in relation to their High and Low Creativity.
4. There is no significant difference in academic achievement of urban senior secondary school students in relation to their High and Low Creativity.
5. There is no significant difference in academic achievement of rural senior secondary school students in relation to their High and Low Creativity.

Need of the Study

School education is an important segment of the total educational system contributing significantly to the individual as well as to national development. A good school provides environment conducive for development of cognitive, affective and psychomotor domains for all round development of individuals. The primary function of the school is the imparting of academic skills. Early research on the predictors of academic achievement focused primarily on intellectual and ability factors. There is considerable evidence that intelligence alone does not

account for all the variance in academic achievement (Lavin, 1967, Cattell Butcher, 1968, Vernon, 1950). Although intelligence is perhaps the still most effective predictors of academic achievement research has shown that social and emotional factors like emotional intelligence, creativity, anxiety, personality, family relationship etc. affect the achievement of students.

Hence, it was thought worthwhile to understand the complete abilities and potentialities of the child before giving him/her education. Creativity is also a very important process for progress and major advances in every field. Research indicates the importance of creativity in student's achievement, career success, personal well being to improve student's achievement and success. It is the basis of all social development and new inventions and discoveries in the field of science and technology. So, the variables Academic Achievement and Creativity of the students need inquiry for proper understanding of a student. Moreover, no such coherent endeavor has been undertaken on senior secondary school students of Gurgaon and Rewari District and hence the present study is a humble attempt to search an empirical database with certain hypothesis.

Research Design

Methodology

The present study was conducted through descriptive survey Method. This method is one of the important methods in education, because it describes the current position of the present research.

Sample

Random sampling was used in the present study, where every individual has equal chance of being selected in the final sample. Eight hundred (800) male and female, urban and rural, government and private senior secondary school students were included in the present study as subjects. Sixteen (16) senior secondary schools affiliated to the Board of School Education, Haryana, Bhiwani were taken in the study. The study included two districts of Haryana i.e. Gurgaon and Rewari.

Research Tools

The following tools were selected and used in the study:

1. Divergent Production Ability Test by Dr. K.N. Sharma (2006).
2. Marks/Grades obtained by the students in 10th class examination conducted by Board of School Education, Bhiwani (Haryana) taken as indicator of academic achievement of the students.

Statistical Techniques used:

Mean, Standard Deviation and t-test was used.

Testing Hypotheses

1. ACADEMIC ACHIEVEMENT OF SENIOR SECONDARY SCHOOL STUDENTS IN RELATION TO LOW AND HIGH CREATIVITY

The mean and 't' score of senior secondary school students having low and high creativity is given in table 1.

TABLE 1 ‘T’ VALUE FOR THE ACADEMIC ACHIEVEMENT SCORES OF SENIOR SECONDARY SCHOOL STUDENTS HAVING LOW AND HIGH CREATIVITY

Group	N	Mean	S.D.	‘t’ value
Low creativity	216	54.79	7.76	19.970**
High creativity	216	74.20	5.50	

**Significant at 0.01 level of significance.

Table 1 reveals that ‘t’ value between senior secondary school students having low and high creativity (‘t’ = 19.970) is significant at 0.01 level. In the context of mean scores, it was found that mean score of senior secondary school students having high creativity is higher than mean scores of senior secondary school students having low creativity. Hence, the null hypothesis framed earlier, “There is no significant difference in academic achievement of senior secondary school students in relation to their high and low creativity” is not retained. This shows that students having high creativity have better academic achievement than students having low creativity.

2. ACADEMIC ACHIEVEMENT OF MALE SENIOR SECONDARY SCHOOL STUDENTS IN RELATION TO LOW AND HIGH CREATIVITY

The mean and ‘t’ score of male senior secondary school students having low and high creativity is given in table 2.

TABLE 2 ‘T’ VALUE FOR THE ACADEMIC ACHIEVEMENT SCORES OF MALE SENIOR SECONDARY SCHOOL STUDENTS HAVING LOW AND HIGH CREATIVITY

Group	N	Mean	S.D.	‘t’ value
Low creativity	108	51.19	5.83	21.824**
High creativity	108	73.01	6.58	

**Significant at 0.01 level of significance.

Table 2 reveals that ‘t’ value between male senior secondary school students having low and high creativity (‘t’ = 21.824) is significant at 0.01 level. In the context of mean scores, it was found that mean score of male senior secondary school students having high creativity is higher than mean scores of male senior secondary school students having low creativity. Hence, the null hypothesis framed earlier, “There is no significant difference in academic achievement of male senior secondary school students in relation to their high and low creativity” is not retained. This shows that male students having high creativity have better academic achievement than male students having low creativity.

3. ACADEMIC ACHIEVEMENT OF FEMALE SENIOR SECONDARY SCHOOL STUDENTS IN RELATION TO LOW AND HIGH CREATIVITY

The mean and ‘t’ score of female senior secondary school students having low and high creativity is given in table 3.

TABLE 3 'T' VALUE FOR THE ACADEMIC ACHIEVEMENT SCORES OF FEMALE SENIOR SECONDARY SCHOOL STUDENTS HAVING LOW AND HIGH CREATIVITY

Group	N	Mean	S.D.	't' value
Low creativity	108	50.81	5.66	20.133**
High creativity	108	70.18	8.24	

**Significant at 0.01 level of significance.

Table 3 reveals that 't' value between female senior secondary school students having low and high creativity ('t' = 20.133) is significant at 0.01 level. In the context of mean scores, it was found that mean score of female senior secondary school students having high creativity is higher than mean scores of female senior secondary school students having low creativity. Hence, the null hypothesis framed earlier, "There is no significant difference in academic achievement of female senior secondary school students in relation to their high and low creativity" is not retained. This shows that female students having high creativity have better academic achievement than female students having low creativity.

4. ACADEMIC ACHIEVEMENT OF URBAN SENIOR SECONDARY SCHOOL STUDENTS IN RELATION TO LOW AND HIGH CREATIVITY

The mean and 't' score of urban senior secondary school students having low and high creativity is given in table 4.

TABLE 4 'T' VALUE FOR THE ACADEMIC ACHIEVEMENT SCORES OF URBAN SENIOR SECONDARY SCHOOL STUDENTS HAVING LOW AND HIGH CREATIVITY

Group	N	Mean	S.D.	't' value
Low creativity	108	49.31	5.87	19.671**
High creativity	108	69.37	8.82	

**Significant at 0.01 level of significance.

Table 4 reveals that 't' value between urban senior secondary school students having low and high creativity ('t' = 19.671) is significant at 0.01 level. In the context of mean scores, it was found that mean score of urban senior secondary school students having high creativity is higher than mean scores of urban senior secondary school students having low creativity. Hence, the null hypothesis framed earlier, "There is no significant difference in academic achievement of urban senior secondary school students in relation to their high and low creativity" is not retained. This shows that urban students having high creativity have better academic achievement than urban students having low creativity.

5. ACADEMIC ACHIEVEMENT OF URBAN SENIOR SECONDARY SCHOOL STUDENTS IN RELATION TO LOW AND HIGH CREATIVITY

The mean and 't' score of rural senior secondary school students having low and high creativity is given in table 5.

TABLE 5 ‘T’ VALUE FOR THE ACADEMIC ACHIEVEMENT SCORES OF RURAL SENIOR SECONDARY SCHOOL STUDENTS HAVING LOW AND HIGH CREATIVITY

Group	N	Mean	S.D.	‘t’ value
Low creativity	108	53.93	5.60	16.094**
High creativity	108	73.64	5.49	

**Significant at 0.01 level of significance.

Table 5 reveals that ‘t’ value between rural senior secondary school students having low and high creativity (‘t’ = 16.094) is significant at 0.01 level. In the context of mean scores, it was found that mean score of rural senior secondary school students having high creativity is higher than mean scores of rural senior secondary school students having low creativity. Hence, the null hypothesis framed earlier, “There is no significant difference in academic achievement of rural senior secondary school students in relation to their high and low creativity” is not retained. This shows that rural students having high creativity have better academic achievement than rural students having low creativity.

Main Findings:

1. There is a significant difference in academic achievement of senior secondary school students in relation to their High and Low Creativity. This shows that students having high creativity have better academic achievement than students having low creativity.
2. There is a significant difference in academic achievement of male senior secondary school students in relation to their High and Low Creativity. This shows that male students having high creativity have better academic achievement than male students having low creativity.
3. There is a significant difference in academic achievement of female senior secondary school students in relation to their High and Low Creativity. This shows that female students having high creativity have better academic achievement than female students having low creativity.
4. There is a significant difference in academic achievement of urban senior secondary school students in relation to their High and Low Creativity. This shows that urban students having high creativity have better academic achievement than urban students having low creativity.
5. There is a significant difference in academic achievement of rural senior secondary school students in relation to their High and Low Creativity. This shows that rural students having high creativity have better academic achievement than rural students having low creativity.

CONCLUSION

The study revealed that significant difference was found in academic achievement of senior secondary school students in relation to their High and Low Creativity. This shows that students having high creativity have better academic achievement than students having low creativity. **Chauhan and Sharma (2017)** investigated the relationship of student’s creativity and academic achievement and found the creativity is important in predicating the students’ academic achievement.

There was a significant difference found in the academic achievement of male and female senior secondary school students in relation to their high and low creativity. This shows that male and female students were having high creativity have better academic achievement than male and

female students having low creativity and data also shows that the male students were more creative than the female students. Data also revealed that rural area students showed more creativity compared to urban area students. **Ai (1999)** studied the relation between creativity and academic achievement and found that creativity was related to academic achievement for both boys and girls.

Suggestions for further Research

- Similar study can be done on a large sample.
- Similar study may be conducted on college students.
- The present study was restricted to class XI. Other classes of school can also be included in the sample.
- The statistical techniques, which were used in the present study, are mean, standard deviation and t-test. More statistical techniques may be used in the same study.
- This type of study can be done to other cities of Haryana State.

THE NATIONAL NATURE OF THE IMAGE IN ABDULLA ARIPOV'S POEMS CREATED ABROAD

Gulrux Khudoyorova*

*Tashkent State Uzbek Language and Literature universities,
 UZBEKISTAN

Email id: gulruxkhudoyorova@mail.com

ABSTRACT

The article analyzes the national features of the poetic image in the poems of the People's Poet of Uzbekistan Abdulla Aripov, created abroad. The interpretation of universal ideas in the poet's work has been studied comparatively with the masterpieces of Uzbek and world literature. The interpretation of the national psyche at the heart of universal ideas is revealed through detailed images. As a result, new scientific and theoretical generalizations about the poet's artistic and aesthetic world were published.

KEYWORDS: *National Character, Detailed Image, Artistic Discovery, Comparative Analysis, Tradition, Universal Idea, Poetic Interpretation.*

INTRODUCTION

In Abdulla Aripov's lyrics, the first thing that every student can feel in the process of studying the issue of images is that the images have a universal and national character. There are such images in the poet's work that the author absorbs universal issues into the essence of these images. In fact, the more extensive and global the concept of image in literature, the more comprehensive and lifelong the work created by the author. At the same time, it should not be forgotten that the image does not reflect the dreams and aspirations of the people of the world, but also reflects the aspects of the society in which the author grew up, the elements of the mentality in which the writer lived. For example, Martin Eden, who is familiar to readers all over the world in prose, and lyrical heroes created by Pushkin in poetry, no matter how much they reflect the universal character and aspirations, are completely devoid of national characteristics of the nation from which he was born. Laylo Osarova, commenting on the images and expression of the national spirit in the work of Abdulla Aripov, writes: "Apart from the artistic image, neither literature nor poetry, which is its most active form, can exist. After all, image is a

condition of the existence of fiction, and figurative thinking is a key factor in the creative process. The role of the artistic image in the expression of the national spirit is especially special "[6.62]. Based on these ideas, it can be said that every image created by Abdulla Aripov drank water from the source of national values. But there are also images in the poet's work, in which the author fully absorbs the national spirit and mood. As soon as the reader reads, he realizes that these images belong to the Uzbek nation. In Abdulla Aripov's poems created abroad, the national nature of the images is reflected in Uzbek objects, Uzbek customs, traditions and features, Uzbek folk proverbs and wise sayings.

The artist's creativity is seen in his ability to update the poetic images that exist in literature. According to Professor Nurboy Jabborov: "Innovating in an image is more complicated than in the form. But the true rise of poetry depends more on this poetic phenomenon "[2.33]. The analysis of the poet's poems created abroad shows that Abdulla Aripov is an innovative poet in the creation of images, and the images created by the poet never lag behind the images found in the masterpieces of world literature. Content, form, philosophical views, theoretically exceed them, but not less. But there is one aspect of his poems that is superior to all literary specimens that it is impossible not to grasp. No matter where and on what subject the poet works, in the essence of his poetry there is a real Uzbek psyche, worldview, that is, the national spirit. The poet himself says about this situation: "Let there be a desire for greatness, let there be acquaintance with the most advanced ideas of the world, humanity, let them think at the level of the West, Europe, America, Latin America, the Moon, Mars ..., but let the Uzbek think, think in Uzbek! If this "small" condition is met, we will definitely achieve the rest "[3.178]. As the poet himself said, it is possible to read in his poetry that a real Uzbek child thinks. Especially in Abdulla Aripov's poem about the Motherland, the Uzbek national spirit prevails. The poet infuses the national spirit into his poetry through various details typical of the Uzbek people. From literary theory it can be said that on the basis of the national nature in the images it is possible to understand which nation the author represents. For example, if we look at the poems of Russian poet Sergei Esenin written as a result of his travels to the East and Abdulla Aripov's poems written during his travels abroad, we can see that the national spirit is at the forefront in the poetry of both artists (especially in their lyrics on the Motherland). In the works of poets, the sense of patriotism is reflected in almost the same way. None of them will forget their homeland wherever they are. This is evident in the process of their skillful assimilation into the poetry of the customs and traditions, objects, concepts of their mentality associated with their homeland. While Abdulla Aripov's travels often use objects and situations such as doppi, belts, tea, teahouses, teapots, Esen's work repeatedly refers to concepts and objects reminiscent of the Russian environment, such as birch, harmonium, kingdom, cap, potato. Undoubtedly, the love of the Motherland and the memory of the Motherland will be hidden.

In Esen's poem "Letter to my sister":

Yodimdadir bayram,
O'sha so'lim may,
Sabzalar bezangan,
Gullagan siren,
Oppoq qayinzorni

Quchoqlab tinmay,
Sho'x-xandon maydon ham
Mastroq edim men.

Abdulla Aripov yearns for his homeland, especially for tea and tea drinking, and proudly writes that the concept of a teahouse on Uzbek soil is actually compatible with concepts such as kindness, kindness, sincere conversation and mutual respect in a teahouse. wonderful value that is not found in any other country.

Goho oddiy muloqotdan yashnagay dillar,
Uchrashganday yiroq ellar, olis manzillar.
Sayohatda turfa gaplar bo'ladi, jo'ra,
Choyxo'rlik soz, jonjallashib yurgandan ko'ra.

Abdulla Aripov's poems written abroad are dominated by the use of Uzbek objects and traditions in instilling the national spirit in the images. In particular, the poet's poem, written in binary form with the title "Japanese" from the series "Japanese melodies", contains the following features:

Boshimda do'ppi-yu, egnimda chopon,
Mehmon bo'lib keldim, men senga, yapon.

Knowing that he is Uzbek through the robe on his head and the skullcap on his head, the poet looks at the Japanese people with ancient history and traditions with admiration and envy and asks the reason for their universal success:

So'rayman O'rta qo'yib vijdonni:
– Sen qanday zabt qilding butun jahonni?

While giving such a savoir-faire, the poet continues his thoughts with a slight smile on the reader's face:

She'r yozib, gap sotib turibman shu on,
Yapon-chi, ish bilan mashg'uldir yapon.

With these two verses, the poet himself answers his questions, illuminating the image of the Japanese and Uzbeks based on their own customs. While acknowledging the diligence and hard work of the Japanese people as a factor in their main achievements, the Uzbeks see the waste of time as a major enemy of their people. To the poet, everything has its own norm. Of course, as noted in the poem "Tea in California", the gathering of friends and relatives leads to an increase in love, but the excess of this thing leads to a waste of time, a waste of life. While creating the Uzbek image with the help of Uzbek traditions, the poet takes an objective approach to everything. After all, there are two sides to everything. Which side to choose depends on the person himself. For example, the poem "Uzbek Teahouse in Osaka" proves our point. This poem seems to be a logical continuation of the poet's above-mentioned poems. While proudly writing about an Uzbek teahouse in the heart of Osaka, the poem notes that it is dedicated to an Uzbek businessman. In fact, he is proud of the work of an Uzbek young man who used everything effectively and did not waste his life:

Tandir gurullasa, o't yoqqan oni,
 Axir qo'zg'atmaydi kimning havasin.
 Kichkina quyoshdek o'zbekning noni
 Qizdirib turibdi yapon havosin.

The poet is proud of the work of a young man who is doing business in faraway Japan, of Uzbek bread like a little sun. He teaches his reader that the pleasure of life is in honest labor.

In his poems, Abdulla Aripov depicts life and people as they are. Just as life does not go smoothly, so do the people in it. In the poem "Uzbek Teahouse in Osaka", a hard-working, honest businessman portrays a young Uzbek man in such a way as a teahouse, an oven, a loaf of bread, and in the poem "Osh" from "Inspirations of Ummonorti" he portrays a completely opposite image. We know that Osh is a process in the Uzbek mentality that embodies the traditions of people meeting each other and growing in love:

Kattakon qozonda pishirdik palov,
 Tun buyi tinmadi o'choqda olov.
 Tong otay deganda damlandi-ku osh,
 Qozonni qurshab biz bo'ldik ko'z-qosh.

Among the people gathered around the cauldron, unfortunately, there are also those who spoil this harmony and good mood:

Va lekin bir kimsa, dilimiz g'ashlab,
 Qochdi qurboqani qozonga tashlab.

In a slightly exaggerated way, the poet shows that people are different in life, that there are bad people next to the good, evil next to the good, and sorrow next to the happy. In order to shed light on this situation, he makes effective use of the Uzbek people's tradition of making soup and gathering relatives and neighbors in the process. As we have witnessed, the poet makes effective use of traditions and customs, national objects in revealing the nature of images. Through them, they not only instill the national spirit in the images, but also highlight the shortcomings and shortcomings in people. Given that Abdulla Aripov's poetry is the poetry of the time, it is not difficult to understand that using national means to expose the shortcomings of people alone is not enough for his work.

A. Hamdamov's dissertation on nationalism and its significance in Abdulla Aripov's poetry states: "Abdulla Aripov's poetry is a bright manifestation of the fiery love for the motherland and the Motherland. In this process, international poetic thinking, the spirit of nationalism emerges as an artistic and aesthetic pathos. At the heart of this is a love for humanity - a sense of humanity." [7.92]. In the poetry of the poet, nationalism is reflected through international events, objects, which, as noted above, reflect the boundless love for the Motherland. In some cases, a slightly muted, playful tone gives the poet more vivid spirit to the poetry. In particular, the same situation can be seen in his poem "Cream". The uniqueness of our people is reflected in a simple way:

Texasdek iqlimi

Qaynoq yoʻq ekan,
Shundanmi, ayiq yoʻq –
Maymoq yoʻq ekan.
Jannatga oʻxshaydi
Manzilim, lekin
Sigir koʻp ekan-u
Qaymoq yoʻq ekan.

In fact, when a person travels to another country, he begins to miss the blessings of his own country. The poet tries to express this same expression of nostalgia through a light metaphor.

“Abdulla Aripov, as a thinker and poet, knows the hearts of the people, the Uzbek people who have gone through thousands of years of life experience, and who know the morally formed proverbs, sayings, stories and legends. The poet does not simply follow the diltortar tones of the people's heart to the spiritual treasure created by our people; He fully masters its essence and connects it with the criteria of his artistic thinking, the problems of the time in which he lives, the hearts of his compatriots and compatriots. [5.83]. In particular, in the poet's poem "Astana" he skillfully uses the proverb of the people "The homeland begins on the threshold", using the content of this proverb to create a completely new idea:

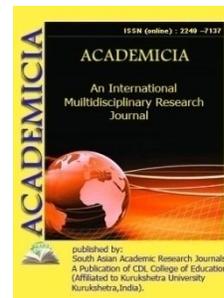

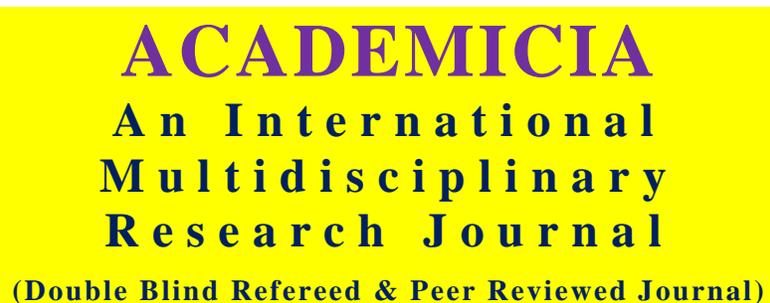

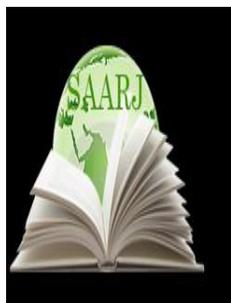

Ватан остонадан бошланар, болам,
Буни рад этолмас бирорга одам.
Бироқ билмасдирсан, шул остонадан
Гоҳо бошланади мусофирлик ҳам.
Vatan ostonadan boshlanar, bolam,
Buni rad etolmas birorta odam.
Biroq bilmasdiansan, shul ostonadan
Goho boshlanadi musofirlik ham.

This quartet, created as a product of alienation and moments of separation in the poet's life, can be considered as a product of the poet's innovation. It is a well-known notion that the homeland begins on the threshold, but the beginning of exile on the threshold is one of the artistic expressions found by the poet. In fact, this finding is a lyrical reflection of the poet's arduous life.

In short, there is ample reason to say that Abdulla Aripov's poetry has risen to the world stage in terms of the nationalism of the image and character, the poetic synthesis of important features of the Uzbek mentality. Achieving the expression of universal essence at the heart of national images are important factors that have ensured the artistic perfection and international fame of the creative works.

ABSTRACT

In this article, the author discusses the innovative approach used in conducting classes in the Department of Optics of Physics and its practical significance. It is proved that the technological development of modern physics and the use of advanced pedagogical and innovative technologies are highly effective in the implementation of laboratory work.

KEYWORDS: *Innovative Teacher, Skill, Method, Problem-Based Learning, Non-Traditional Learning, Debriefing, Formation Of Professional Competence In Students, Innovation, Technology, Approaches, Principles, Tools*

INTRODUCTION

In the world sciences of physics and pedagogy, a number of studies are being carried out aimed at developing innovative methods of teaching optical quantum generators, fiber optics, laser technology, photonics, medicine and nanotechnology. This plays an important scientific and practical role in strengthening the integration of science-education-production. In particular, there is a need to study the pedagogical, psychological, didactic and methodological possibilities of teaching physics on the basis of technological, systemic, activity-based, competence-based and integrated approaches.

In our country, the relevance of the modernization of the education system, the organization of the educational process aimed at training competitive personnel who meet the requirements of world standards, is consistently gaining relevance. Therefore, for the development of the exact sciences, such priority tasks have been identified as “further improving the system of continuing education, improving the quality of educational services and opportunities, continuing the policy of training highly qualified personnel in accordance with the modern needs of the labor market”, as well as “creating effective mechanisms for the implementation of scientific and innovative achievements into practice”. This, in turn, requires improving the teaching methods of optics

topics using innovative methods, ensuring the compliance of educational and regulatory documents with international standards. At the same time, a special place is given to targeted research, taking into account the expansion of the possibilities of educational and methodological support of physics, the improvement of the didactic capabilities of innovative methods and technologies.

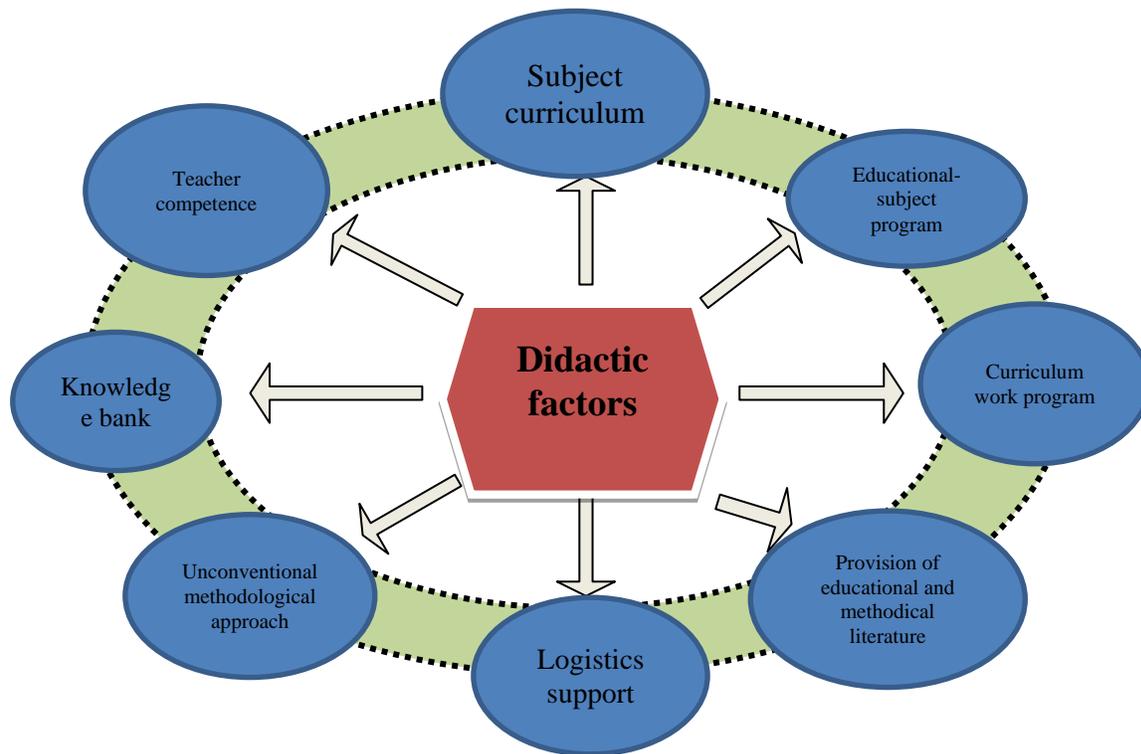

The article provides scientific and methodological works on the theoretical foundations of non-traditional teaching "Optics" of the physics section, outlines the organization, control and management of methodological planning in teaching it, improving the quality of education in order to ensure the effectiveness of this process, pedagogical and psychological foundations and didactic factors of teaching the optics section based on the use of interactive methods in education based on non-traditional learning technologies.

Research papers and literature are analyzed, an analysis of the development of mechanisms for improving non-traditional teaching methods "Optics" of the physics section is given on the basis of modern trends in innovative development, the formation of thinking through the widespread introduction of experimental methods of teaching and educating students, the presentation of optical processes, the problem of the formation of mental activity and qualifications in the course of laboratory exercises.

The psychological factors influencing the relationship between the student and the teacher are revealed, the organization of the educational process by the teacher based on the study of pedagogical and psychological characteristics of students and the development of students' assimilation abilities are theoretically substantiated through non-traditional methods of teaching optics in the physics section based on pedagogical and psychological laws.

Improving non-traditional teaching methods is an activity related to the learning process, didactic factors for the development of individual psychological characteristics of a person, motivation for learning and intellectual abilities have been developed. The didactic factor is an unconventional methodological approach that requires the formation of teaching methods based on the fundamental knowledge of the student. According to scientists-psychologists, every twenty minutes of an eighty-minute lesson, the student's attention (listening and mastering the lesson) begins to pass into a passive mode. Thus, it was found that the popularization of the use of at least four innovative methods during an eighty-minute lesson is important as an important didactic factor for improving the quality and effectiveness of education, the formation and development of the educational and cognitive process among students. Among the didactic factors, the teacher's competence is of particular importance, since the enrichment with new ideas, the constant improvement of teaching methods, control, replenishment and strengthening of students' assimilation, improving their qualifications in the process of teaching the optics section requires pedagogical skill.

The main participant in the educational process is the student, whose important task will be to independently study the innovative paradigms of the optics section in the process of research in real educational practice. The teacher must study the assignment himself and demonstrate ways to solve educational problems. Students learn to analyze and evaluate their personal actions based on the information provided, examples, can notice their own mistakes and shortcomings. The teacher establishes joint activities of the participants and motivates them for research (Fig. 1).

Rice. 1. Didactic factors influencing the improvement of non-traditional teaching methods

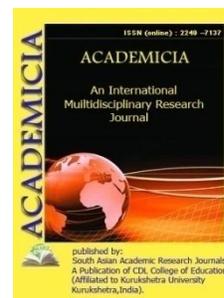

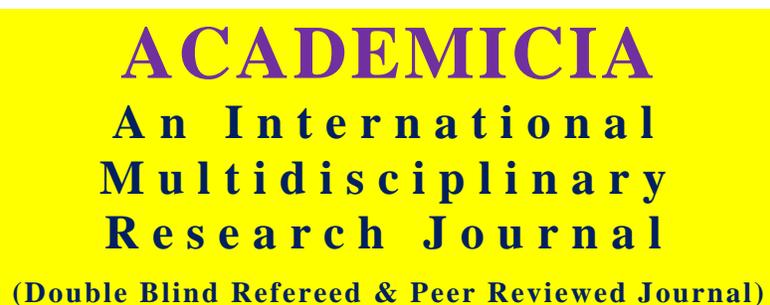

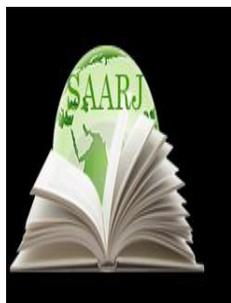

The results of the study of paradigms associated with the section of optics, theoretical rules and conclusions are generalized and, accordingly, reflects the content of teaching the subject to students. The process of acquiring physical knowledge by students is considered in connection with the level of development of thinking, imagination and other cognitive processes, the development of motivational-volitional and sensual (emotional) activities. Improvement of non-traditional teaching of the optics section based on the choice of forms, methods and means of teaching the subject of physics is determined based on educational goals. Consequently, the improvement of non-traditional teaching of physics lessons develops by generalizing the essence of the interaction and interdependence of physical phenomena, laws and formulas, through didactic factors of life reflection of the processes of reality in the minds of students. When improving the methodology of non-traditional teaching of the optics section, attention was paid to the following aspects: correct understanding of optical phenomena and laws, analysis of formulas and theoretical ideas appropriate for this phenomenon; determination of each optical quantity; identifying the formulas associated with this phenomenon and their relationship, that is, the desire to understand the optical formulas that reflect each law; awareness of the characteristics of the process of the course of all physical phenomena; presentation of a clear manifestation of physical laws; ensuring the uniqueness of creative development reflected in each physical phenomenon.

As a result of the study, the formation of experimental skills of future teachers of physics and astronomy of students in pedagogical higher educational institutions was studied in conjunction with the problems of developing non-traditional methods of teaching the organization of theoretical, practical and laboratory training in the field of improving the teaching of optics and

training competitive personnel. It was studied and concluded that the knowledge of didactic factors influencing the improvement of non-traditional teaching of the optics section in physics lessons and the ability to assess the level of their impact is a complex process that requires special competence.

ABSTRACT

The experiments were carried out on 50 white rats of a mixed population with an initial weight of 150-220 grams, kept in a vivarium on a standard laboratory diet. The state of the microvasculature of the liver has been studied, and a quantitative assessment of the changes occurring during experimental hypoxic hypoxia has been given. A comprehensive analysis of the state of the rheological properties of blood in close relationship with the properties of the erythrocyte membrane in the dynamics of the development of experimental hypoxia is presented.

KEYWORDS: *Hypoxia, Microcirculation, Hemorheology, Liver.*

INTRODUCTION

The problem of oxygen starvation of biological systems continues to be the focus of attention of researchers. This is due to the fact that hypoxia is a leading factor in the occurrence and development of many pathological processes associated mainly with dysfunctions of the blood, circulatory and respiratory systems [1,8].

Modern ideas about the mechanisms of pathological changes in hypoxic conditions are based on experimental and clinical data. In this aspect, the study of the hypoxia of critical states, which is a complex multifaceted biological phenomenon arising as a result of disorders in the activity of various organs and systems of the body, is of great importance.

In recent decades, the problem of hypoxia has been intensively developed in various directions [2,3,4]. At the same time, along with the indisputable successes, a number of issues of fundamental nature and requiring in-depth methodological analysis were clearly identified.

Various aspects of the hypoxic state were studied with a predominant study of the function of external respiration, respiratory failure and the state of arterial oxygenation [5].

However, in most cases, hypoxia is formed at practically all stages of the body's vital activity and at all stages of oxygen transport from the alveoli to the cell, i.e. represents changes in essentially all bodily functions. That is why the assessment of hypoxia as a clinical phenomenon requires the study of many body functions.

Modern methods of studying the manifestations of hypoxia, unfortunately, do not allow us to obtain comprehensive information about the essence of physiological events occurring in the body. Understanding hypoxia, its pathogenesis and clinical essence is impossible without simultaneously studying the processes occurring in the liver, blood, the microcirculatory component of oxygen transport and the state of tissue metabolism.

The development of hypoxia is accompanied not only by an increase in energy imbalance, but also by structural and functional damage to cells and tissues, changes in the reactivity of blood vessels, a violation of their nutrition, and sharp violations of the rheological properties of blood [6,7]. These disorders lead to altered functions of vital organs with high metabolic activity, characterized by abundant blood supply and sensitive to oxygen starvation. Therefore, a comprehensive study of the rheological properties of blood and the state of microcirculation of internal organs (liver, kidneys, pancreas) is of great scientific interest in order to deepen the understanding of the pathogenesis of hypoxia.

According to some authors, during the first hours of hypoxic hypoxia, the alkaline reserve changes little, there is only a decrease in pCO₂ due to hyperventilation, followed by an increase in blood pH. After a few hours, the alkaline reserve begins to decrease, and the degree of its decrease depends on the severity of the hypoxic state [8,11]. The authors found in the terminal stage of hypoxic hypoxia a decrease in the alkaline reserve to 8.8 vol%. The accumulation of carbon dioxide leads to the expansion of arterioles and capillaries, however, Shvets D.A. [9], express doubts that carbon dioxide really increases blood flow, since, in this case, respiration is stimulated.

Studies to study the effect of hypoxia on the cardiovascular system were undertaken with the aim of accumulating factual material and elucidating the mechanisms of hemodynamic reactions. The main results of these studies can be summarized as follows. A short stay at high altitude is accompanied by an increase in heart rate and slight changes in systolic blood pressure. Enhanced

blood circulation due to increased heart rate begins at an altitude of 2000 m, slowly increases to 7000 m, and then develops faster, and it is usually pronounced in untrained individuals, while in trained individuals, adaptation is carried out mainly due to an increase in the stroke volume of the heart. At an altitude of about 5000 m and above, disorganization in the activity of the cardiovascular system is observed, the strength of the heart contraction decreases, but the increase in the heart rate can continue. With the ineffectiveness of compensatory reactions providing an increase in the activity of the circulatory apparatus, the redistribution of blood and the centralization of blood circulation, i.e. maintaining normal blood flow in vital organs such as the brain and heart [4,10].

The Purpose of the Study: The aim of this work was to assess the relationship between vascular liver lesions and changes in the rheological properties of blood in experimental hypoxic conditions.

Materials and Methods of Research: The experiments were carried out on 50 white rats of a mixed population with an initial weight of 150-220 grams, kept in vivarium conditions on a normal laboratory diet.

Hypoxic hypoxia was induced by placing rats in a pressure chamber SPT-200 Vaccum-DRIER. The animals were kept in a pressure chamber at an altitude of 9000 m for 3 hours.

The studies were carried out at 1, 3, 24, 96 hours after the reproduction of hypoxia.

Study of the Viscosity And Shear Rate Of Blood: One of the main indicators of the rheological properties of blood, viscosity (or fluidity) was determined by the Copeley method modified by V.M. Udovichenko. For this purpose, a system consisting of a measuring capillary preostat and a thermostatic installation was assembled at the Department of Basic Medical Disciplines of the Fergana branch of the Tashkent Medical Academy. Viscosity indices were determined in the following shear stresses 2, 4, 8, 12, 16 mm of water. Art. The results were calculated using the following formula:

$$Z = \frac{100 \text{ gz}}{8\gamma \cdot 1 \cdot L} P \cdot t \text{ (cP)}$$

where, γ is the radius of the capillary in the wide part.

z - radius of the narrow part.

L - wide part length.

t - blood flow time.

P - pressure supplied from the capillaries from the preostat.

g - acceleration of gravity equal to 980 cm/s

The shear rate of blood at a given viscosity was also calculated using the following formula:

$$4R2L$$

$$V = \frac{\quad}{z t} \text{ sec}^{-1}$$

$z t$

Based on the obtained values, a dynamic viscosity curve was constructed.

Intravital biomicroscopy was performed under general anesthesia (the animals were injected intraperitoneally with Na etaminal at a dose of 8 mg / 100 g of body weight).

In order to optimize the study and improve the quality of the results obtained, we used an interactive system for monitor digital analysis of microcirculation parameters with computer data processing. The system consists of a luminescent microscope "Lumam IZ", a monitor camera, a monitor capillaroscope, a digital memory device with an adjustable recording interval, a video monitoring device and a Pentium-IV type personal computer.

Biomicroscopy was performed with contact objectives 10x0.40 and 25x0.40.

Such parameters of microcirculation as the diameter of microvessels and the linear velocity of blood flow were assessed.

The digital data were processed by the method of variation statistics. Numerical differences were considered significant under the condition when $t \geq 2$, and $P < 0.05$.

RESULTS AND ITS DISCUSSION: Metabolic processes in internal organs depend on the preservation of the structure and function of erythrocytes, the most important of which is the transport of oxygen to organs and tissues.

The blood viscosity in animals was determined after 1, 3, 24, 96 hours, as well as at the pressure values applied to the blood flow: 2,4,8,12,16 mm. water Art. The results of changes in blood viscosity in white rats during hypoxic hypoxia, depending on the duration of the experiment and blood pressure, are shown in Table 1.

In the intact group of animals, it was found that the viscosity of blood at a pressure of 2 mm cP. is 5.0 ± 0.42 cP, and at 16 mm cP. 3.81 ± 0.26 cP. In experimental animals, in the dynamics of the development of a hypoxic state, there is a significant increase in blood viscosity and a significant decrease in the shear rate during the study period at various values of hydrostatic pressure.

TABLE 1 INDICATORS OF BLOOD VISCOSITY AND SHEAR RATE DEPENDING ON THE PERIOD DURING HYPOXIC HYPOXIA.

Study groups	2 mm water column		16 mm water column	
	Viscosity	shear rate	viscosity	shear rate
Intact	5,0±0,42	7,63±0,08	3,8±0,25	76,5±0,27
1 hour	6,2±0,13*	4,55±0,18*	4,3±0,14*	73,6±2,9
3 hours	9,3±0,26*	3,97±0,13*	6,5±0,27*	50,7±2,2*
24 hours	7,5±0,16*	6,84±0,18*	5,1±0,12*	69,4±1,2*
96 hours	5,8±0,31	7,35±0,35	4,2±0,37	75,6±2,8

Note: * - The results are reliable in relation to intact gr. ($P < 0.05$)

With hypoxic hypoxia, the blood viscosity indices after 1 hour at the minimum pressure increased by 24%, and at the maximum one exceed the value of intact animals by 13.1%.

It was found that after 3 hours after hypoxic exposure, the severity of these processes increases and the studied parameters at minimum and maximum applied pressures increase by 86 and 71.5% compared to the intact group, and by 50 and 51.1% compared to the previous period, respectively.

After 24 hours, the severity of changes in comparison with the previous period decreases somewhat: the increase in viscosity at the minimum and maximum applied pressures is 19.4 and 21.6%, but at the same time, in relation to the intact group of animals at the minimum pressure, the blood viscosity remains high 50 %, and at the maximum by 34.2%.

In the subsequent period - after 96 hours, the tendency to a decrease in viscosity at the minimum and maximum applied pressures continues. So, in relation to the intact group of animals, at the minimum pressure, the blood viscosity remains increased by 16% and at the maximum pressure by 10.5%, which indicates the preservation of blood hypercoagulation.

The blood shift rate in the intact group of animals at the minimum pressure was $7.65 \pm 0.08 \text{ C}^{-1}$, and at the maximum pressure $76.5 \pm 0.27 \text{ C}^{-1}$.

It is noted that already 1 hour after hypoxic exposure at a minimum pressure, the blood shear rate decreases by 32.5%, and at a maximum pressure by 35.7%. 3 hours after the experiment, the severity of these changes increases with the minimum and maximum applied pressures; by 48.0 and 43.8% in relation to the intact group of animals. One day after hypoxic exposure, an increase in the shear rate is observed - at a minimum pressure compared to the previous period by 72.2%, and at a maximum pressure by 36.8%, respectively. 96 hours after the hypoxic state, the shear rate at minimum and maximum pressures continues to increase in comparison with the previous period and almost returns to the initial level.

Thus, the results obtained indicate that in hypobaric hypoxia, the most pronounced changes are observed after 3 hours, and by the end of the experiment they tend to recover.

The viscosity of the blood at the minimum pressure was found to be higher than the values at the maximum pressure and high shear rates.

A decrease in the shear rate of blood and an increase in its viscosity will certainly affect the state of the vessels of various organs, the functional failure of which can lead to stagnation of blood and the development of organ hypoxia. Taking this into account, we subsequently investigated the state of microcirculation of internal organs.

The State Of Liver Microcirculation In Experimental Hypoxic Hypoxia: The most important physiological parameter of microcirculation is the blood flow velocity in microvessels and their diameter, which determine, in particular, the conditions for oxygen transport to the liver tissues [3,6,8].

Proceeding from this, the task of our work was to study possible disorders of the microcirculatory bed of the liver, determine its static and dynamic parameters, fluctuations in these values in the norm and their changes in some forms of experimental hypoxia.

When observing the surface layer of the liver of intact rats using a contact lens, it was found that at a depth of 20-30 microns there are a large number of hepatic venules with sinusoids flowing into them. Portal terminals, from which the sinusoids originate, are located at great depths and therefore were available to our observation much less frequently. They had a length of about

200-400 μm and a diameter of $9.5 \pm 1 \mu\text{m}$ on average. The diameter of the portal venules was $32.1 \pm 0.4 \mu\text{m}$, the blood flow velocity was $0.345 \pm 0.01 \text{ mm/sec}$. The diameter of the sinusoids was $9.5 \pm 0.2 \mu\text{m}$, with a blood flow rate of $0.290 \pm 0.002 \text{ mm / sec}$. In the central collecting venule, the diameter was $45.1 \pm 0.8 \mu\text{m}$, and the blood flow velocity was $0.206 \pm 0.002 \text{ mm / sec}$. In the sinusoids in the center of the lobules, the blood flow velocity is faster than in the sinusoids located to the periphery. The results of morphometric studies are shown in Table 2.

As can be seen from the table, 1 hour after hypoxic hypoxia, the diameter of the portal venules increased by 23.6%, sinusoids by 50.5%, central collecting venules by 13.7% and a slowdown in the blood flow velocity in them by 43.2, 36.3 and 26.9% compared to the intact group. In the microcirculatory bed of the liver, there is a decrease in the number of functioning portal, collecting venules and sinusoids. In the vessels of the liver, empty sinusoids alternate with dilated ones, filled with blood. There was a significant decrease in the rate of hepatic blood flow. Hepatic venules became full-blooded, somewhat dilated, with areas of microaneurysms.

TABLE 2 MORPHOMETRIC ANALYSES OF THE VESSELS OF THE MICROVASCULATURE OF THE LIVER DURING HYPOXIC HYPOXIA

Research objects	Portal venules		Sinusoids		Central collecting venules	
	diameter (μm)	blood flow velocity (mm/s)	diameter (μm)	blood flow velocity (mm/s)	diameter (μm)	blood flow velocity (mm/s)
Intact	32,1 \pm 1,16	0,345 \pm 0,002	9,5 \pm 0,18	0,290 \pm 0,002	45,1 \pm 0,59	0,206 \pm 0,002
1 hour	39,7 \pm 0,23*	0,196 \pm 0,008*	14,3 \pm 0,09*	0,185 \pm 0,002*	51,3 \pm 1,95*	0,130 \pm 0,001*
3 hours	45,3 \pm 2,25*	0,114 \pm 0,004*	18,5 \pm 0,94*	0,136 \pm 0,001*	57,2 \pm 1,36*	0,104 \pm 0,003*
24 hours	36,4 \pm 1,43*	0,245 \pm 0,01*	12,7 \pm 1,23*	0,213 \pm 0,001*	48,1 \pm 1,82	0,168 \pm 0,002*
96 hours	33,5 \pm 1,42	0,278 \pm 0,002*	10,8 \pm 0,064	0,256 \pm 0,003*	46,7 \pm 0,89	0,186 \pm 0,003

Note: * - The results are reliable in relation to intact gr. (P <0.05)

An hour after the experiment, microcirculatory disorders in the liver are aggravated. There is a statistically significant increase in the diameter of the portal venules, sinusoids and central collecting venules by 41.1, 94.7 and 26.8%, with a slowdown in the blood flow velocity in them by 67, 53.2 and 49.6% compared to the intact group of animals, in some areas there is a presinusoidal edema, especially in the center of the lobules, and along the periphery of the lobules there is an increase in the number of "plasma" sinusoids. The tendency to aggregation of blood corpuscles is intensified and areas of the so-called "dumb zones" appear in which signs of diapedesis are noted. In this case, the vessels are sharply dilated, tortuous, filled with aggregates of blood corpuscles. And the blood flow is sharply slowed down, in some places even

completely stopped (stasis). Arteriovenular anastomoses function, shunt blood flow is observed.

After 24 hours of the experiment, plethora and expansion of the sinusoids are still observed. Thus, the diameter of the portal venules, sinusoids and central collecting venules was significantly increased by 13.3, 33.6, and 6.6% in comparison with the intact group, and the blood flow velocity in them decreased by 29, 26.6 and 18.5%, respectively. In this period, areas of petechial hemorrhages are noted in the liver parenchyma, at the same time there is a separation of plasma in the capillaries and the functioning of arterio-venular anastomoses. In all visible terminal hepatic venules and sinusoids, the blood flow is slowed down, intermittent, plasma gaps are clearly traced, which indicates a pronounced aggregation of blood corpuscles, which are caused by a change in the aggregation of erythrocytes and the rheological properties of blood.

We have found that by 96 hours of the experiment in rats with hypoxic hypoxia, the above-described mosaicity of changes is somewhat preserved in the microcirculatory picture, but in some areas there is a tendency to recovery. This is confirmed by changes in morphometric data. Thus, the diameter of the portal venules, sinusoids and central collecting venules, in comparison with the previous period, decreased by 8.15 and 3%, and the blood flow velocity increased by 13.4, 20.1 and 10.7%. But, at the same time, in relation to the intact groups, the diameter increased by 4.3, 13.6 and 3.5%, and the blood flow velocity decreased by 19.5, 11.8 and 9.8%, respectively. The number of functioning sinusoids is noticeably increased mainly along the periphery of the lobules, mainly due to the inclusion of previously non-functioning sinusoids. The perisinusoidal edema is somewhat reduced compared to the previous period, but the vessel walls remain blurred.

It is known that vasoactive substances that come from foci of tissue hypoxia and affect microcirculation play an important role in the development of primary microcirculatory and hemorheological disorders. Experiments have shown that the linear velocity of blood flow in the vessels of the liver after 3 hours with hypoxic hypoxia decreases by more than 2 times. In venules, due to pronounced rheological disorders, the blood flow rate decreases, vasodilatation is observed. Aggregates of shaped elements begin to appear, while there is a decrease in the speed of blood flow. Plasma separation from erythrocytes, multiple micro thrombosis, stasis phenomena in venules, capillaries and sinusoids lead to the development of tissue hypoxia.

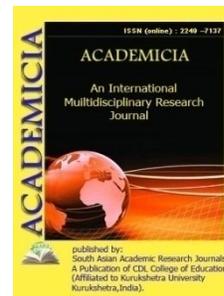

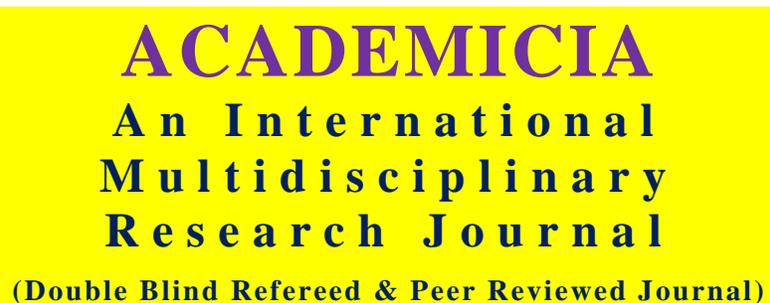

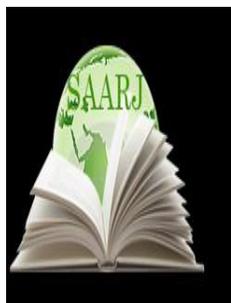

CONCLUSIONS

1. Acute hypoxic hypoxia is accompanied by pronounced disturbances in the rheological properties of blood.
2. Disorders in the liver microcirculation during hypoxic hypoxia are unidirectional and depend on its genesis: at 98 hours of hypoxic hypoxia, normalization of the diameters of the liver vessels is observed, against the background of a reduced blood flow rate in them.

PSYCHOPHYSIOLOGICAL CHARACTERISTICS OF PUPILS OF PRIMARY SCHOOL AGE WITH LEARNING DIFFICULTIES

Davurova Guzal Akbarovna*

Jizzakh State Pedagogical Institute,
UZBEKISTAN

ABSTRACT

The main goal of primary education is to preserve and support the individuality of the child, his physical and mental development, the formation of the ability to learn. It is in elementary school that children begin to master a variety of activities and forms of activity, which later determine the style of behavior in the learning process. The school should build its influence on the child so that this style effectively helps each student to know the world and himself. To be able to learn means to be able to carry out learning activities independently and effectively. To be able to learn means to be able to choose types and forms of your own learning, calculate your strength, and use modern means and ways of getting information.

KEYWORDS: *Teacher, School, Psycho physiological, Pupil, Characteristic, Primary Education, Different.*

INTRODUCTION

What is a young pupil who has a difficult journey of learning under the guidance of a teacher, whose interest in learning has awakened by a teacher? The early elementary school age is a stage of a child's development that corresponds to the period of elementary schooling. Chronological boundaries of this age vary in different countries and in different historical conditions. These boundaries can be conventionally defined in the interval from 6-7 to 10-11 years, their specification depends on the officially accepted terms of primary education [4, 74]. The child's enrollment in school poses a number of tasks to the institution during the period of work with younger students: to identify the level of his/her readiness for schooling and individual features of his/her activity, communication, behavior, mental processes. Which will have to be taken into account during the training; to compensate possible gaps and increase school readiness, thereby

preventing school disadaptation; to plan strategies and tactics for the training of a future schoolchild taking into account his/her individual capabilities [5, 27]. The solution of these tasks requires in-depth study of the psychological features of modern schoolchildren who come to school with different “baggage” representing a set of psychological new formations of the previous age stage – preschool childhood. Each age stage characterized by the child’s special position in the system of socially accepted relations. Accordingly, children of different ages fill their lives with specific content – special relations with peers and a special, leading activity for a given stage of development. We would like to note that L.S. Vigotsky allocated the following types of the leading activity:

Infants– direct emotional communication;

Early childhood – manipulative activity;

Preschool children – game activity;

Younger schoolchildren – educational activity;

Teenagers– socially recognized and socially approved activity;

Senior schoolchildren – educational and professional activity [1, 328]. Entering school radically changes the character of the child's life. From the first days of school, there is a major contradiction – between the constantly growing demands that imposed on the child's personality, his attention, memory, thinking, speech, and the present level of development. This contradiction is the driving force of development in the younger pupil. As the requirements increase, the level of mental development pulls up to their level. Junior school age is a qualitatively peculiar stage of development of the child. Development of higher mental functions and the personality as a whole occurs within the framework of the leading activity at this stage (educational - according to D.B. Elkonin’s periodization), replacing play activity which was leading in preschool age. The inclusion of the child into educational activity marks the beginning of reorganization of all mental processes and functions [5, 48].

Certainly, not at once younger schoolchildren form the correct attitude to learning. They do not yet understand why they need to learn. Soon it turns out that learning is work that requires volitional effort, mobilization of attention, intellectual activity, and self-restraint. If the child is not used to it, then he gets disappointed, there is a negative attitude towards learning. To avoid this, the teacher should instill in the child the idea that learning is not a holiday, not a game, but serious, hard work, but very interesting, because it allows you to learn a lot of new, entertaining, important, and necessary. It is important that the organization of the educational work itself reinforce the teacher's words. In the beginning, he gets interested in the very process of learning activity without realizing its meaning. Only after the emergence of interest in the results of his learning work interest formed in the content of the learning activity, in the acquisition of knowledge. This is the basis and is a favorable ground for the formation of motives of learning of high social order, associated with a truly responsible attitude to learning activities. Formation of interest in the content of learning activities, acquisition of knowledge is associated with the experience of schoolchildren feeling satisfied with their achievements. In addition, this feeling supported by approval, praise of the teacher, who emphasizes each, even the smallest success, and the smallest progress. Younger students feel a sense of pride, a special lift of strength when the teacher praises them. The great educational impact of the teacher on the youngest students is

because the teacher becomes an unquestionable authority for them from the very beginning of their stay in school. The teacher's authority is the most important prerequisite for learning and education in the early grades [9, 151].

There is a functional improvement of the brain – the analytic-systematic function of the cortex develops; the ratio of excitation and inhibition processes gradually changes: the process of inhibition becomes increasingly stronger, although the excitation process still prevails, and elementary school students are highly excitable and impulsive [4, 70]. Learning activities in the early grades stimulates, first, the development of mental processes of direct knowledge of the world around – sensations and perceptions. Younger schoolchildren distinguished by sharpness and freshness of perception, a kind of contemplative curiosity [6, 152]. The most characteristic feature of the perception of these students is its low differentiation, where they make inaccuracies and errors in differentiation in the perception of similar objects. The next feature of students' perception at the beginning of primary school age is its close connection with the actions of the schoolchild. Perception at this level of mental development connected with the child's practical activity. To perceive an object for a child means to do something with it, to change something in it, to do something with it, to take it, to touch it. A characteristic feature of pupils is a pronounced emotionality of perception. With training, perception restructured; it rises to a higher level of development and takes on the character of purposeful and controlled activity. During training, perception deepens, becomes more analytical, differentiating, and takes on the nature of organized observation.

Some age specific features are inherent in the attention of elementary school students. The main one is weakness of voluntary attention. Possibilities of volitional regulation of attention, its control at the beginning of primary school age are limited. The voluntary attention of the younger schoolchild requires so-called close motivation. Whereas older students maintain voluntary attention even in the presence of distant motivation. They can force themselves to concentrate on uninteresting and difficult work for the sake of the result expected in the future, younger students can usually force themselves to concentrate only in the presence of close motivation: prospects to get an excellent mark, to earn praise from the teacher, to do the task best [8, 200]. Involuntary attention much better developed in younger school age. Everything new, unexpected, bright, interesting attracts pupils' attention by itself, without any effort on their part. Age-specific features of memory in the younger school age develop under the influence of training. The role and specific weight of verbal-logical, semantic memorization strengthens and the ability to consciously control your memory and regulate its manifestations develops. In connection with age-related relative predominance of activity of the first signal system, younger students have more developed visual-logical memory than verbal-logical. They remember specific information, events, persons, objects, facts better, faster and more firmly than definitions, descriptions, explanations. Younger students tend to remember things mechanically, without grasping the meaningful connections within the material they are remembering [3, 518].

The basic tendency of development of imagination in younger school age perfection of procreative imagination. It is connected to the representation of previously perceived or creation of images according to the given description, scheme, drawing, etc. The procreative imagination perfected by reflecting reality more and more correctly and completely. Creative imagination as the creation of new images associated with the transformation, processing of impressions of past experience, combining them into new combinations, combinations, also develops [4,82].

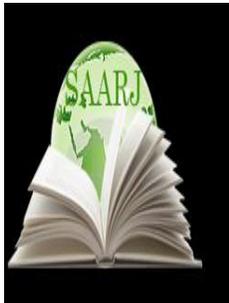

Under the influence of training, there is a gradual transition from the knowledge of the external side of phenomena to the knowledge of their essence. Thinking begins to reflect the essential properties and features of objects and phenomena, which makes it possible to make the first generalizations, the first conclusions, to make the first analogies, to build elementary conclusions. On this basis, the child gradually begins to form elementary scientific concepts. Analytic-synthetic activity at the beginning of primary school age is still very elementary and is mainly at the stage of visual-actual analysis based on direct perception of objects [9, 198]. Junior school age is the age of sufficiently noticeable formation of the personality. It is characterized by new relationships with adults and peers, inclusion in a whole system of collectives, inclusion in a new type of activity – learning, which imposes a number of serious requirements on the student. All this decisively affects the formation and consolidation of a new system of relationships to people, the team, to learning and related responsibilities, forms the character, will, expands the range of interests, and develops abilities. In junior school age the foundation of moral behavior laid, there is an assimilation of moral norms and rules of behavior; the social orientation of the personality begins to form. The character of younger schoolchildren has some features. First, they are impulsive, inclined to act immediately under the influence of immediate impulses, motives, without thinking and without weighing all the circumstances, for random reasons. The reason is the need for an active external discharge with an age-related weakness of volitional regulation of behavior [7, 288].

Age peculiarity is also a general lack of will: the younger schoolchild does not yet have a great experience of long struggle for the intended purpose, overcoming of difficulties and obstacles. He or she can give up in case of failure; lose faith in his or her strength and impossibility. Capriciousness and stubbornness often observed. The usual reason for them is a lack of family upbringing. The child was used to the fact that all his desires and demands were satisfied and he never saw anything rejected. Capriciousness and stubbornness are a peculiar form of the child's protest against those firm demands, which the school imposes on him, against the need to sacrifice what he wants in the name of what is necessary. Younger schoolchildren are very emotional. Their emotionality reflected, first, in the fact that their mental activity usually colored by emotions. Everything that children observe, think about, and do evokes in them an emotionally colored attitude. Secondly, younger schoolchildren cannot restrain their feelings, or control their outward manifestation; they are very direct and frank in expressing their joy. Grief, sadness, fear, pleasure or displeasure. Thirdly, emotionality expressed in their great emotional instability, frequent change of moods, a tendency to affect, short-term and stormy displays of joy, grief, anger, fear. As the years go by, the ability to regulate ones feelings, to restrain their undesirable manifestations develops more and more [2, 14]. The elementary school age provides great opportunities for fostering collectivistic relations. In a few years, a junior high school student accumulates an important for his further development experience of collective activity – activity in the team and for the team. Fostering collectivism helps children participate in public, collective activities. It is here that a child acquires the basic experience of collective public activity.

STATE OF MILITARY TERMS IN GERMAN LANGUAGE

Rahmonkulova Dilshoda Murodkozievna*

*Senior Teacher,
 Chirchik Higher Tank Command Engineering School,
 UZBEKISTAN

ABSTRACT

This article describes the formation and application of military terms in German. The image of the world language and its role in human society, its influence on language development are also shown. The conceptual image of the world is a characteristic of all human beings. Because man is in constant contact with the world around him, his brain is constantly receiving new information about this world.

KEYWORDS: *World Image, World Language Image, Semantic Words in German, Words Formed From Many Units, -keit Affix in German and Its Meaning in Uzbek.*

INTRODUCTION

A person, as a subject of science, is an object that carries certain information. Therefore, in today's world of science, scientific or secular views have their own system in different fields and have different views. While this system in different disciplines has its own name, it is expressed in different ways, that is, they have secular views in the field of science, the conceptual system of the world, the secular model or the image of the world.

The concept of "secular image" has a long history, as does the concept of man. In general, the problem of the "image of the world" is still attracting the attention of many scientists, because the concept of science is one of the basic concepts that reflect the relationship of man to the reality around him. In the study of this concept, L. Wittgenstein, M. Heidiger, Ch. Fillmore, Yu.S. Yakovleevna, B.A. Serebrennikov and other scientists contributed.

In general, the conceptual concept of the world refers to the initial state of global thinking, which consists of a person's direct understanding of the world, the formation of his thinking ability through perception, and a combination of other important knowledge or ideas [1. B.160].

The conceptual image of the world is a characteristic of all human beings. Because man is in constant contact with the world around him, his brain is constantly receiving new information about this world.

In order to solve certain problems, man, by his nature, organizes and summarizes information about the world. It follows that empirical experience provides knowledge, and knowledge creates a conceptual image of the world [2].

In order to form the image of the world, man first of all has a great emphasis on language, that is, speech. In general, language is an important tool that helps to consolidate and standardize the knowledge of an objective society [3].

The concept of secular linguistic imagery refers to the relationship between language and reality, that is, through language a person expresses a situation through speech. In general, language serves to convey the secular image to the other person as much as possible through speech, just as a person expresses the world in his mind.

Today, in modern linguistics, the concept of "world language image" focuses on the study of scientific and linguistic culture problems, including the study of linguistic facts and linguistic problems. The "World Language Image" is a great help in organizing, sorting, and categorizing the world around a person according to their spelling meanings [4].

The term is a word with these features, which distinguishes it in a special category of language symbols. Unlike ordinary words, a term can be associated with only one object of reality, which can be a single concept, a single symbol, or a group of identical objects. One and the same term cannot be associated with different semantic levels; in this sense the term does not always have the same meaning. However, this ambiguity can be observed only in one field of knowledge, because in another field the same sign can mean a completely different concept or a completely different object of reality. However, in one area of human activity and knowledge, the term tends to remain ambiguous.

If the lexical meaning of a word is determined by the context, then the meaning of the term in the same field of knowledge is not determined by the context, that is, in any context within a single field of knowledge, the term always depends on only one object. If we are limited to military affairs, we must recognize that there are many areas in this vast area that can be considered as independent fields of knowledge or activities. Therefore, we cannot talk about the concept of "military term", but we must distinguish between tactical, organizational, military-technical terms, terms related to different types of troops and armed forces. All of these are different areas of military knowledge and activity, each with its own terminology.

Military terms are basically just a concept, and they are used only by people in the field, and they differ in that they are self-explanatory. This is due to the origin of the terms. We know that terms are formed in two different ways.

That is, the first is that the meaning of a word that has many meanings in the vernacular is narrowed and becomes a single word that expresses the concept of science, while the second is that it refers only to the field of science and technology. is the transformation of words into terms. Of course, Type 1 terms are often the most widely used terms. Type 2 terms are mostly borrowed from other languages.

Language and speech not only reflect the being in the world, but also interpret it. In general, the "world language image" is assessed anthropocentrically by scientists. However, the "world language image" does not reflect all the objects, events and their signs in the universe, but only those that are interesting and important to him from a human point of view.

In addition, the concept of "image of the world" is ethnocentric, and this concept may have its own characteristics in a particular ethnos. This means that each ethnos has its own linguistic features in the features of perception and understanding. All possible interrelations of the term can be imagined using this term in various speech works. However, for a translator, such an approach is unacceptable due to inefficiency, so it is useful to refer to a military bilingual dictionary.

It follows that the military dictionary is a part of the world language image, which contains a special layer of the language dictionary. In general, a military dictionary has several features, the comprehension and comprehension of which involves reading or understanding special texts. The military dictionary consists of terminological and non-terminological words (dictionary). A military dictionary is a collection of military terms that describe different concepts of military service.

In addition to military terms, science and technology terms are widely used in the military lexicon. Today, military terms can be divided into general-military and specialized lexical meanings. Common German military terms:

Atomwaffe - nuclear weapon; Atomic energy - nuclear war; Abrüstung - disarmament.

Due to the narrow range of specialized terms, these terms are known only to specialists.

Bergepanzer - armored, special conveyor (tank) for repair or evacuation; Brückenkegepanzer - a special tank that breaks the bridge; Faltstraße is a special corridor.

It should be noted that each military lexical term must represent an object, but experience shows that in German there are also synonymous terms for the expression of an object. These synonymous terms can also confuse the linguist. Gefechtsfahrzeug and Einsatzfahrzeug are synonymous terms and mean "war machine". Older terms, as well as terms from another language, can be used to denote the name of an object in German. For example: Motor - (from English) motor or engine, in German the term Antrieb is also used; Fahrzeugkran or Hebezeug - truck crane (heavy lifting device); Brückenlegepanzer or Brückenschieber - a special tank that breaks the bridge; Minenräumpanzer Keiler or Wühl-schwein - a special transporter (special tank) that digs the ground; There are also regional variants of the term in German for the same objects. For example, a grenade launcher is a special grenade launcher, also known as the Minenwerfer in southern Germany.

Expansion of military dictionary terms in German is carried out in different ways, that is, by changing the semantic structure of the word, by forming new words (affixation), by learning words from other languages, and by abbreviation. For example, the term Kette means tank chain, but now it also means aviation units. If in German the meanings of terms formed by a phrase are determined by the meaning of the components, the affixive meaning is determined by the affixes. For example:

Turmwaffe - a tower (bashnya) throwing device, Kleinkalibergewehr - a small-caliber weapon (pistol). These military terms are made up of phrases, Prison (tower) + Waffe (weapon); Klein (small) + Caliber (caliber) + Gewehr (pistol).

Brennbarkeit - flammability; Kletterfähigkeit is the ability to climb. In this case, the words are formed by affixes. This affixoid in Uzbek means ability to perform, to have a certain ability. In German military terminology, in addition to two-component words, there are also multi-component lexical words: Grundwehrdienst - military service; Luftlandetruppen - airborne forces.

There is also the influence of other languages on German military terms. English is especially influential today. This is because German words are now widely used in German military terms: Allrounder - a multi-purpose vehicle; Teamarbeit - combat training in the team.

Abbreviations are widely used in German today. In German military terms, all abbreviations can only be used in writing: SPz - Schützenpanzer - landing combat tank (that is, the landing forces move behind this tank, and the tank acts as a bullet protection); PS - Pferdestärke - horse power; TMG - Turmmaschinengewehr - tower machine gun; MKF - Militärkraftfahrer - military driver; MSA - Modulare Schutzausstattung - modular protection devices; NMWA - Nebelmittelwurfanlage - smoke extraction tool; Rh - Rheinmetall - German company Reynmetal (This company specializes in the production of military equipment in Germany and Europe) [5]; TAF - Taktische Forderungen - tactical requirements; WBG - Wärmebildgerät - a device that describes heat, ie thermo temperature; LKW - Lastkraftwagen - truck; FLA - Fliegerabwehr - Air Defense Forces; MK - Maschinenkanone - automated gun; EloKa - Elektronische Kampfführung - forces against enemy radio-electronic forces; MAN - Maschinenfabrik Augsburg-Nuremberg - Augsburg-Nuremberg Machine-Building Plant; SEM - Sender / Empfänger mobile radio station. SLT - Schwerlasttransporter - heavy truck and others.

In German, some acronyms are spoken orally, just like ordinary horses, and have their own plural forms. The word labor can be abbreviated in German because it creates complex military terms in German: Laborzug is a laboratory group. The same is true for horses with the suffix -er: Brückenleger oder Brückenlegepanzer is a special tank-breaking vehicle.

Semi-abbreviated abbreviations are widely used in the German military lexicon today, with one or more complex components of the term being abbreviated and the rest being used in an expanded form: ABC-Waffe - a weapon of mass destruction; FLA-Maschinengewehr - anti-aircraft machine gun (anti-aircraft machine gun); FLA-Lenkrakete - anti-aircraft guided missiles.

Thus, the German language uses a wide range of methods to express key terms in the field of military service. In the formation of a certain vocabulary and the further development of the level of knowledge, the thinking of this or that specialist is closely connected with the secular linguistic image, and it has its own characteristics in each nation.

An important component of military terms in German is the widespread use of complex (compound) words. Most of the military terms in German - complex words - have a semantically pure structure. For example: Luftangriff - air attack. Luft - air, Griff - attack.

However, there are terms in the German language that are mistranslated during the translation process, and the exact meaning of these terms can be found through their semantic properties.

For example, Gratismaterial in German means the free delivery of combat equipment to another country, while Gefechtpistole means torpedo barbie, not a combat pistol.

It is known from linguistic lexicology that the terms expand as the development of science in society accelerates. Military texts of any genre are also saturated with different terms. The rapid development of military science, and especially military technology, is leading to the emergence of new terms, terminological expressions.

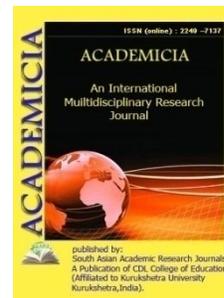

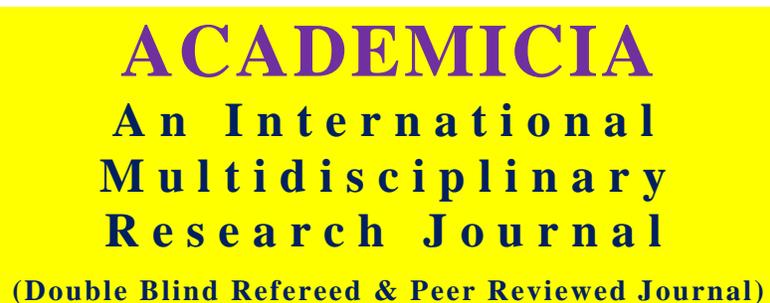

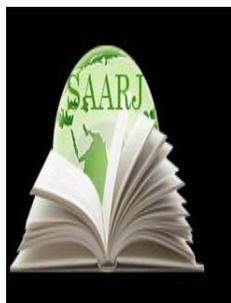

An important component of military terms in German is the widespread use of complex (compound) words. Most of the military terms in German - complex words - have a semantically pure structure. For example: Luftangriff - air attack. Luft - air, Griff - attack.

THE WAYS OF IMPLEMENTING VOCABULARY ACTIVITIES IN TEACHING PROCESS

Shakhnoza Musurmanova*

Chirchik Higher Tank Command Engineering School,
UZBEKISTAN

ABSTRACT

This article is devoted to the ways of implementing vocabulary activities and principles for developing vocabulary abilities. Vocabulary is obviously a very important element within a language as the overwhelming majority of meaning is carried lexically; and, therefore, something to be taken into consideration both in Second and Foreign Language Teaching - although not the only one that conveys meaning. There are certainly other elements such as grammar, stress, rhythm, and intonation, tone of voice, pauses, hesitations or silences.

KEYWORDS: *Context, True-False, Cluster, Mind Mapping, Content Words, Communicative Approach.*

INTRODUCTION

Nowadays to learn foreign languages is very important in the world. One of the important issues in educational sphere in Uzbekistan is to raise the quality of teaching education. To reach the required standards the Republic of Uzbekistan accepted presidential decree in December, 2012.

The first president of the Republic of Uzbekistan, Islam Karimov said that “When our people have acquired independence after a very long period of time Uzbek people began determining their own way of development there existed lots of inner and outer threat aimed at overturning the newly born state, to disturb the peaceful life established in Uzbekistan. The Uzbek people understood that they must strengthen the independence gained and what hard obstacles were waiting us in further steps of the development. (Karimov I.A. Yuksak ma`naviyat – yengilmas kuch)

Many people learn English because they think it will be useful in some way for international communication. Such students of general English often do not have particular reason for going

to English classes, but simply wish to learn to speak (read and write) the language effectively for wherever and might be useful for them.

The purpose of people for learning will have an effect on what they want and need to learn – and as a result will influence what are taught. Business

English students, for example, want to spend a lot of time concentrating on the language needed for specific business transactions and situations. Students living in target – language community need to use English to achieve their immediate practical and social needs.

For example, in our military school teaching English is very up to date and it requires all the cadets to improve their all skills actually vocabulary.

Vocabulary is obviously a very important element within a language as the overwhelming majority of meaning is carried lexically; and, therefore, something to be taken into consideration both in Second and Foreign Language Teaching - although not the only one that conveys meaning. There are certainly other elements such as grammar, stress, rhythm, intonation, tone of voice, pauses, hesitations or silences. Learning a language cannot be reduced, of course, to only learning vocabulary, but it is also true that even though the students learn grammar successfully, they need to use vocabulary in meaningful way(McCarthy 1990:VIII).

Nevertheless, in spite of the importance of this element, vocabulary is often the least systematized and the most neglected of all the aspects of learning a second language, not only in EGP but in ESP as well This lack of attention is not only characteristic of older grammatical syllabuses but of more recent communicative approaches (Kennedy & Bolitho 1984).

In my opinion, our students need to be made aware of the importance of this element because we have observed that, in general, there is a tendency to concentrate on grammar, paying little attention to vocabulary.

When making decisions about content, one of the first questions the language teacher will have to address is what vocabulary to teach. For many of them this will be determined by the choice of the course book, the syllabus designers, or other factors.

Even so, the teacher should be concerned about the different criteria used when designing their syllabuses and materials, the ones followed in making decisions about vocabulary content in language courses, and what the objectives of these particular decisions are. Otherwise, it becomes difficult to evaluate syllabuses and materials, to understand why particular vocabulary is to be taught as well as to explain to learners why they must learn particular words (McCarthy 1990:79).

If we want to organize our vocabulary teaching on a subject basis it may be a good idea to work out what the most frequent words are in that subject area either intuitively, with the aid of teachers of other subject matters (ESP), through the study of a limited set of related texts or with the help of a dictionary, e.g. topic dictionaries (see McArthur 1981, Pheby (ed.) 1985, Walter 1995).

Furthermore, teachers try to teach a foreign language through synonyms, antonyms and different kind of exercises. As for students it is very easy to remember more often used words. They are simple to catch by contexts.

Teachers who take their own texts into the classroom will often have to decide from experience, intuition or even the use of a dictionary, which words are likely to have the most useful range, a job which has already been done to a great extent in good course books. (Gaims & Redman 1989: 59).

The classroom will also often dictate the need for certain vocabulary without which the SS may fail to understand their teacher, classmates or the activity they are engaged in. One of these areas is grammatical terminology. Many teachers do not wish to burden their SS with too many grammatical labels, but it is also true that understanding such items can be very helpful.

On the one hand, the explanations given can be shorter and, on the other hand, the student can make a more profitable use of dictionaries and grammar books. It is the teacher who, taking into account factors such as age, course duration, etc., must weigh up the possible benefits or harm of using such terminology. The same would apply to phonological terminology.

Another area of classroom language has to do with the items which often appear in language activity instructions. Although constant exposure alone usually guarantees that these items will eventually be assimilated, it is possible to speed up the process by designing classroom activities containing many of these items and so avoid confusion or misunderstanding. (Gaims and Redman 1989: 57)

The importance of vocabulary in four evidences is emphasized. All exams, tests are based on mostly vocabulary, future workers will be considered the best if they have a large vocabulary, vocabulary is the source for trading and so on. Building and activating learners' background knowledge, motivating them are some of the main goals in teaching vocabulary skills.

If students develop their vocabulary skills, if they read with a clear purpose in mind and learn to apply various strategies, like guessing from the context, using context clues, using keyword technique and using dictionaries and so on, they will engage in reading with greater understanding and effectiveness will learn to solve problems, be creative and will become independent learners.

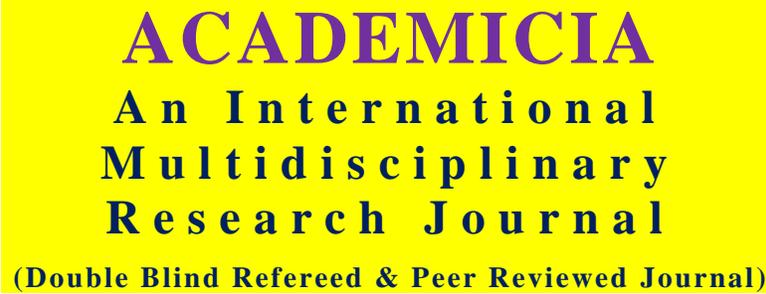

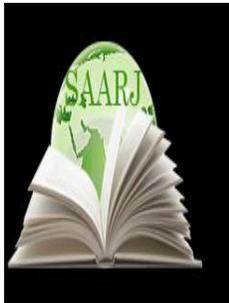

From the observations, I noticed that those groups of cadets who practiced grammar activity with games felt more motivated and interested in what they were doing. However the time they spent working on the words was usually slightly longer than when other techniques were used with different groups. This may suggest that more time devoted to activities leads to better results.

The marks cadets received suggested that the fun and relaxed atmosphere accompanying the activities facilitated their learning. But this is not the only possible explanation of such an outcome. The use of games during the lessons might have motivated cadets to work on the vocabulary items on their own, so the game might have only been a good stimulus for extra work.

ABSTRACT

It is proposed to create a knowledge base in automated variant architectural and construction design. Logical-linguistic models of variant design of industrial buildings, which are a complex set of groups of evaluation criteria for the quality of design solutions, can be taken as a basis.

KEYWORDS: *Expert System "VARIANT", Knowledge Base, Subject Image, Logical Model.*

INTRODUCTION

The development of automated variant design is closely connected with the application of artificial intelligence achievements, the development of expert systems based on the knowledge of highly qualified specialists in a specific subject area.

This requires the definition of principles and the development of methods for presenting weakly structured tasks of automated variant design in the form of a knowledge base.

Automated variant design can be improved on the basis of achievements in the field of artificial intelligence by developing, for example, an expert system "Variant".

One of the ways to further improve the automated variant design is the intellectualization of the automated design system of construction objects based on advances in artificial intelligence. This

process is carried out by developing expert systems at the initial design stage - the expert system "OPTION", which has the ability to qualitatively and quantitatively evaluate a limited set of options, followed by the selection of the most effective design solutions for further development.

The Expert system OPTION contains the following main components: interface - Expert system, meta-knowledge base, logical-linguistic models of qualitative evaluation of the effectiveness of design solutions, information-logical models of quantitative evaluation of the effectiveness of design solutions, knowledge base, database, communication, linguistic processor, linguistic knowledge base, and user menu of the Expert System OPTION.

The core of the expert system is the Knowledge Base. It is a set of knowledge of highly qualified specialists in a specific subject area in a formalized form and a logical inference mechanism that, when asked by the user, is able to explain the results of solving the problem.

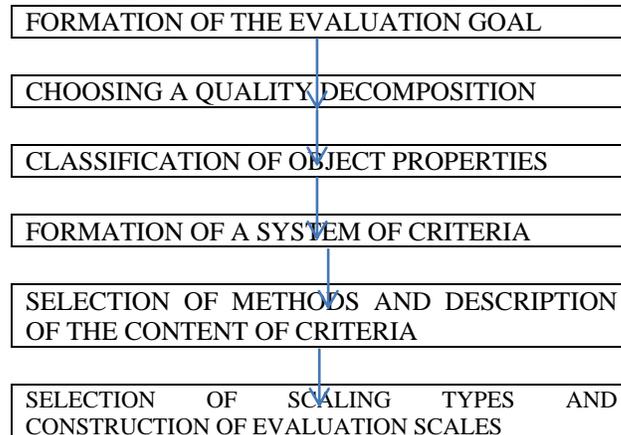

Research on the creation of a knowledge base in subject areas shows the possibility and effectiveness of creating a knowledge base in architectural and construction design, in particular automated variant design. The main feature here is the weak structuring of the objects and processes under consideration.

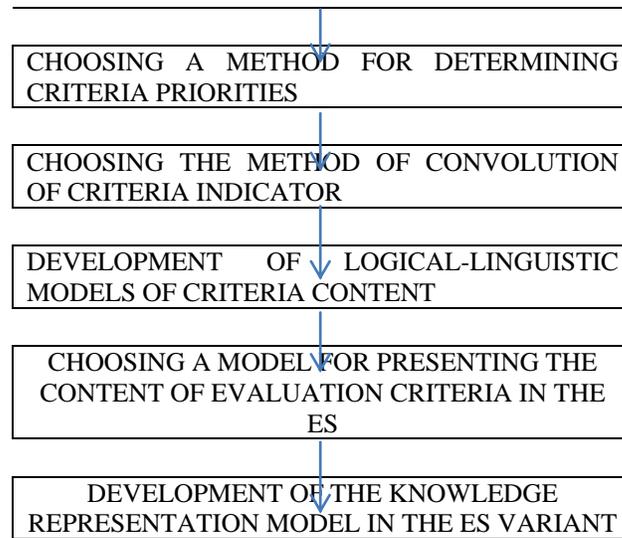

When creating a knowledge base, the logical-linguistic models of variant design of industrial buildings developed by us can be taken as a basis.

To formalize and present knowledge, it is necessary to solve the following tasks:

- To distinguish the distinctive features of knowledge from data in automated variant design;
- To substantiate linguistic criteria for assessing the quality of design solutions for presentation in the knowledge base in the form of knowledge of highly qualified specialists;
- To develop the structural components of the knowledge base in the variant design;
- Develop meaningful knowledge base structures;
- Develop the principles of creating a knowledge base;
- Develop a methodology for creating a knowledge base;
- Develop knowledge representation models.

THE PROCEDURE FOR ASSESSING THE QUALITY OF OBJECTS AND PROCESSES IN THE EXPERT SYSTEM OPTION

Evaluation of the effectiveness of design solutions can be structured in the form of decomposition from general to particular. For example, "operating conditions of production - flow - human flow - orientation", etc.

Formally, the fuzzy set A of the universal set of elements U is defined by the membership function $\mu_A: U \rightarrow [0, 1]$ which corresponds to each element $u \in U$ the number from the interval $[0, 1]$, characterizing the degree of membership of the element u to the set A .

Linguistic variables are the concepts: COMPLETED, PARTIALLY COMPLETED, NOT COMPLETED. They make up a set of fuzzy variables X , which can be interpreted in the interval $[0, 1]$. The function of belonging is the task of the theory of psychological measurements in psychometric methods, which are actively being developed at the present time. In practice, it is possible to set an approximate representation of the form of the function μ_A , which is as follows: the error will not increase when combining fuzzy sets both using operations and using methods of the theory of possibility, since in this case, for the most part, only the operations of finding the minimum and maximum are used.

CONCLUSION AND RECOMMENDATIONS

1. The study of knowledge representation models "Expert System" shows the expediency of using logical models to represent the content of evaluation criteria for the quality of design solutions, since the formal axiomatic system of predicate logic of the first order, which is used to describe the content of criteria, has well-understood mathematical properties and a powerful inference mechanism can be directly programmed. With the software implementation of this Knowledge Base in the automated variant design of industrial buildings, the use of the representation of knowledge of the PROLOGUE language as a tool is provided.

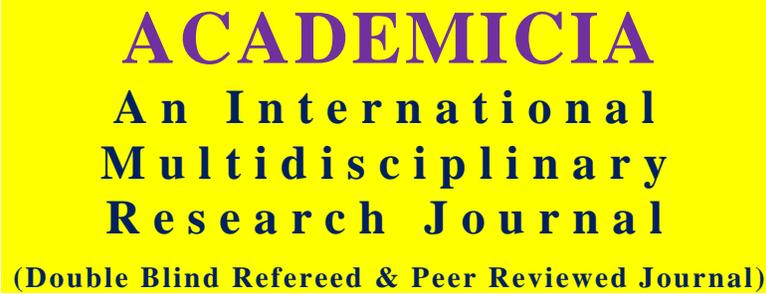

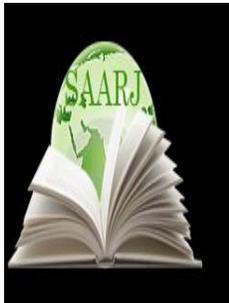

2. The study of the content of the evaluation criteria of quality gives grounds to classify them as the knowledge of highly qualified specialists in this subject image, since their development was carried out with the participation of a group of experts on the design of industrial buildings of food industry enterprises.

Logical models of knowledge representation in the expert system of automated variant design of industrial buildings VARIANT have been developed. The developed logical models can be divided into groups: operating conditions of production, working conditions, layout, composition and flexibility, etc. In general, the developed logical models represent a complex set of groups of evaluation criteria for the quality of design solutions of industrial buildings in relation to the food industry.

The developed approach of presenting qualitative knowledge contributes to the intellectualization of the computer-aided design system of construction objects, and, in particular, the procedure for conducting automated variant design at the initial stage of development.

ABSTRACT

The organization of the educational process using Multimedia technologies opens up new opportunities for the development of students' creative abilities. With the joint efforts of employees of the educational sphere, scientists, programmers, multimedia educational devices manufacturers and teachers-practitioners, a new information and educational environment is created, in which the integration of educational and information approaches to the content, methods and technologies of teaching is crucial. In this article, Laser Physics is an application in the form of interactive Java applets; the concept of designers and its implementation are considered. The electronic designers and models created with their help allow simple operation both on personal computers and in network mode, including remote access through the Internet.

KEYWORDS: *Laser Physics; Multimedia Technologies; Teaching Methods; Digital Modeling; Individualized Education; Adobe Flash CS3 Professional Portable; 3ds-Max; Java Programs.*

1. INTRODUCTION

A new level of quality has emerged in the opportunities offered to a wide range of users by modern computer technologies, and new, very attractive prospects for the use of information and communication technologies in education have opened up. Information, digital and multimedia technologies can be used in its teaching in the most natural way [1,2].

New technologies that are of interest in the study of laser physics include computers and multimedia projectors, high-quality audio and video editing software, image editing and animation, remote access technology, and video conferencing support. As a result of the

introduction of these technologies in the educational process, there is a need to develop new approaches to the creation of e-learning products based on them.

The development of methods for the introduction of multimedia technologies in education, the use of which in education can make a significant contribution to the effectiveness of knowledge has become relevant [3,4].

One of the most interesting and demanding tasks at the current stage of computerization of physical education is the transition to maximum individualization of education, which is not possible in the mass version. It encourages learners to offer individual learning trajectories that are characterized by a high level of preparation, skills, and motivation, as well as a degree of complexity, speed of development, and a share of independent creative work. In the future, students or their small groups will have the opportunity to choose the teacher who best suits their personal characteristics and intentions.

The task that has been formed today is no longer imaginary, because many of the problems that make it up today have their own technical and organizational solutions. Many of the professionally designed systems for e-learning that have already been proposed [5] are primarily aimed at mass individualized learning and include the ability to create individual lesson plans, formulate individual tasks, and account for their performance. The main challenge in realizing these opportunities is to change the way teachers work and to produce large amounts of person-centered learning materials.

2. MAIN PART

Teaching methods are the most important components of the pedagogical process, which include the goals and objectives of teaching, the content, the forms of organization of training and its results. The role of methods in teaching is determined by their types and functions, so the main didactic problem is the classification of teaching methods. There is no single classification of teaching methods, but the consideration of different approaches to differentiating teaching methods is the basis for systematizing them as didactic tools.

The use of multimedia technologies means that graduates of pedagogical and higher education institutions have special information training, skills in the mechanisms of information retrieval, collection and analysis, visual perception of the expression of ideas, concepts, processes and implies that they can implement their ideas through the use of a variety of information.

The introduction of multimedia technologies requires constant updating of the idea and content of university education and the training of new teachers capable of studying and implementing these technologies [3,4].

Features of multimedia technologies serves as a basis for the development of information direction. By introducing and using new technologies, this field means creating a product that informs the audience of a set of images, texts and data, along with sound, video, animation and other visual effects.

Multimedia technologies include interactive interfaces and other controls. To better understand what types of multimedia technologies are available, it is necessary to identify and highlight the main directions of their use. This is really important.

Today, multimedia technology is one of the most promising areas of informatization of the educational process. We see the prospects for the successful use of modern information technologies in education in improving the software, material base, as well as mandatory training of teachers.

Digital modeling is one of the most popular uses of computers in the teaching of laser physics. This type of learning material serves to develop individual forms of learning: independent research of virtual physical systems, development of new models and demonstrations, analysis of complex systems and their evolution is a logical continuation of traditional processes for studying laser physics [6-9]. These types of e-learning products should not be seen as an alternative to actual demonstration experiments and laboratory practices. Computer modeling, on the other hand, is an adjunct to the teaching techniques of the theoretical part of the course, and the creation and analysis of models significantly expands traditional teaching methods. The possibility of creating interactive modeling programs in terms of solving the problems of individualized learning and the development of its forms, aimed at the active mastering of the material, varies.

A distinctive feature of the approach considered in this study provides maximum ease of working with designers;

- 2) Provide the ability to build, model, and visualize its results for three-dimensional systems;
- 3) Any that can be done from a CD or remote server access to applet-Designer functions at a time.

3. RESULTS AND DISCUSSIONS

Despite the popularity of Internet video packages, it is very difficult for a wide audience to access these types of resources without problems, due to the relatively large flow of transmitted data. For example, in the context of self-study (connecting a computer to a network via a mobile phone), it is not possible to view almost any of these resources without pre-loading. However, in the latter, the presentation is usually accompanied by slides of presentations. The proposed alternative is to use audio recordings that are used as electronic analogues of traditional speeches. The Adobe Flash CS3 Professional Portable [11] environment is recognized as the most suitable environment for developing the proposed resource type, which is represented by drawings and formulas with a high quality audio line. A useful feature of the suggested resource is to draw the audience's attention to the material presented by the teacher. A very short format (10-20 minutes) was chosen for the electronic analogues of each of the 80-minute lectures. The focus of the resource development was not only on the selection of materials and the preparation of meaningful texts, but also on their audio recordings and the formation of the attached video layout. Graphic images with traditional calculations and drawings for video conferencing have been replaced by high-quality electronic analogues created by computer graphics methods.

Modern technology for creating very high quality short videos on a computer is well developed and today requires almost no significant changes and optimizations. The combination of 3d animations developed on the platform of the 3ds-Max [12] collection with real-time video recordings on real equipment was a major innovation in the creation of the new video library. The use of such videos with elements of technology allows to solve many interesting new educational and methodological problems. These include the ability to demonstrate a step-by-

step transition from a simplified idea of experiment to real experimental equipment and the phenomenon under study (Figure 1). The practice of creating hybrid video images described shows that using modern software packages allows you to create them without resorting to the services of video creation specialists.

Since modern Java versions of electronic constructors used in multimedia packages are based on the original development ideology created for the DOS operating system, it is appropriate to briefly discuss the main ideas and technical solutions used in them.

Figure 1. Application of 3D models (example: experiment with lasers and laser systems).

The Windows interface and design of the Java version of the designer were close to the standard available in the Windows environment (Figure 2). The features of 3D animated windows are complemented by three-dimensional scrolling capabilities and the placement of a graphic background from an external file. Added the ability to assign any graphic image, including animated images, to _particle-type objects. required expansion.

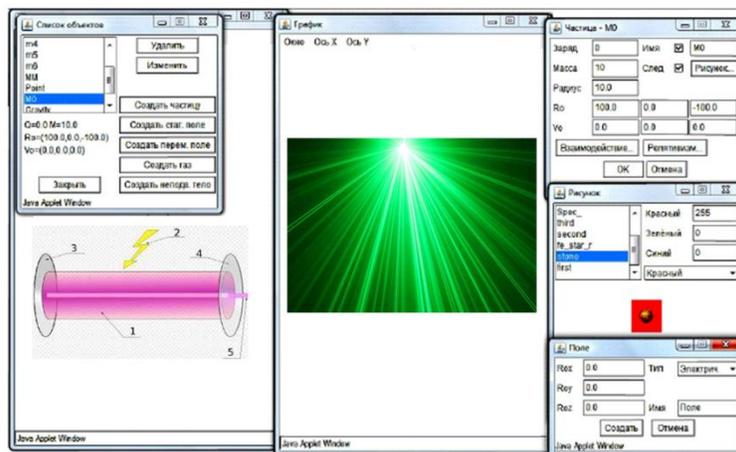

Figure 2 The interface and design of the main designer's animation and dialog windows, implemented in the form of a Java applet

We know that particle motion is very important in laser physics. Since the standard multi-window Windows standard did not yet exist during the creation of the first version of the designer, the DOS version of the designer program was implemented in a multi-window interface to simulate the motion of particles in constant fields (Figure 3 a, b). It provides access to a package of 50 ready-made models, and has the service of adjusting the work screen according to the specifics of the task.

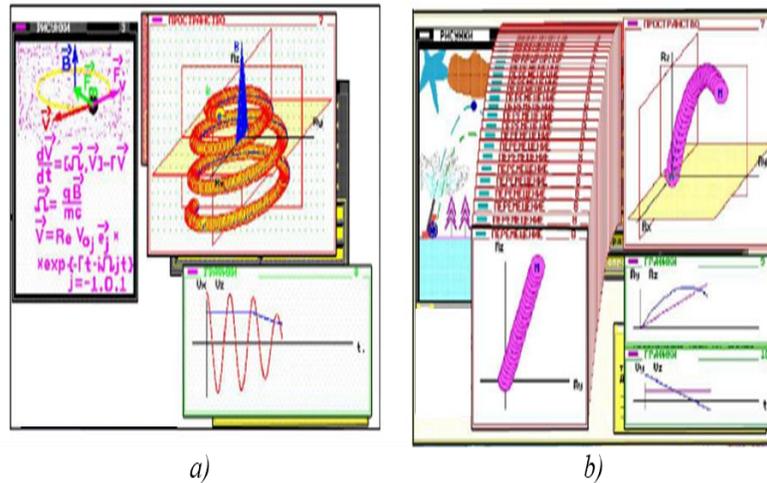

Figure 3. The interface of the first version of the interactive program is the designers of particle motion models in power fields (there is a non-traditional object designed to demonstrate the effects of switching between moving reference systems between windows for different purposes).

The algorithm of the created program objects (Figure 4) is based on the `_something` class, which is a moving area of the screen workspace containing a specific graphic image and stores information about the image in the closed part of the screen. At its base were built the main branches of the virtual designer: `_particle`, `_field` and `_window`.

Based on the program, `_window` has built many branches of text and dialog boxes that perform many types of service functions: (`_phys_text`) output and (`_picture`), physics and application interface (`_help`), user interaction (`_menu`) and others `_space3` three-dimensional graphs (representing a modeled system in three-dimensional coordinate space, velocities, accelerations, etc.) and two-dimensional graphs `_space2` (interdependence of different kinematic and dynamic properties at different times).

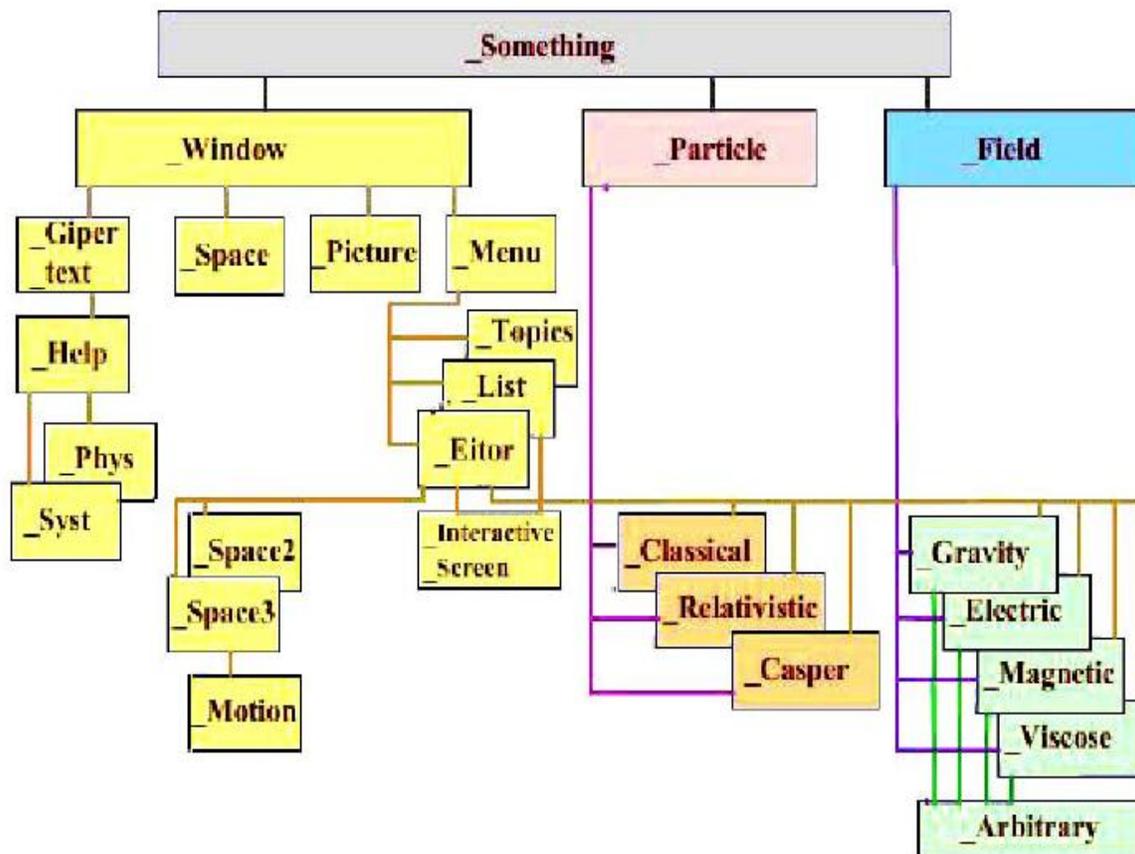

Figure 4. Classes algorithm of the first version of the program.

The program `_particle` is used to describe particles with initial properties (mass, charge, initial state, graphic image) and variable kinematic properties. Programming methods allow you to retrieve data from fields (objects in the `_field` class) and deliver their kinematic properties to the animation windows upon their request.

Our approach to the creation of test original versions of interactive simulators of laser physics laboratory complexes is a simpler multimedia explanation of laboratory rooms equipped with very sophisticated equipment. Take, for example, the work on the reconstruction and control of femtosecond lasers. As part of this, a technology for the development of electronic simulators based on the creation of a copier or a 3D model of the device was proposed and implemented. This model can be used to create static and dynamic images in different operating modes (regular and non-standard). These images form the basis for creating an interactive animated model in the Macromedia Flash environment (Figure 5), which is controlled by the user by “clicking with the mouse” across the screen areas containing the controls.

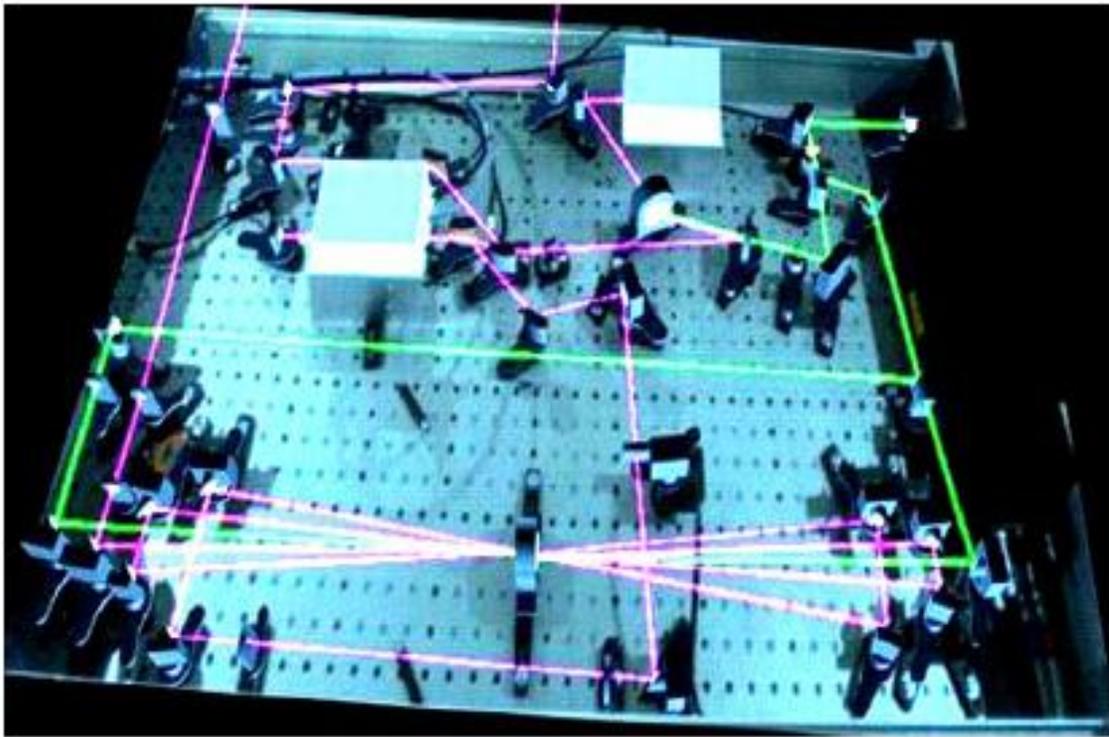

Figure 5. Interface and design of interactive computer simulators used to organize the preparation of students for laboratory work "Fem to second laser use and device."

The decision to respond to the user's actions in the model is made on the basis of digital modeling of physical processes that determine the state of the device. These simulators used the built-in Macromedia Flash programming language [13], the capabilities of which were sufficient to provide accurate digital simulation that met the requirements for proper operation of the simulator. Sophisticated equipment models developed in the 3ds Max environment are also used to create multimedia descriptions of laboratory work. The second is in the form of virtual tours of the device under study, and the main methods of working with them on a regular basis include video recordings.

Includes multimedia descriptions of laboratory work, interactive computer simulators, and reworked audio instructions for working with equipment, as well as a set of video graphics demonstrating the basic methods of working with equipment with very little textual description;

4. CONCLUSION

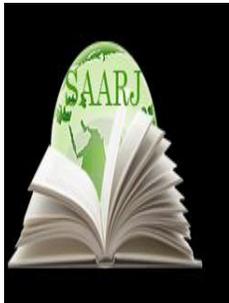

The above practice of creating video images shows that creating video using modern software packages allows you to create them without resorting to the services of specialists.

Many interactive demonstrations and computer problems are being developed based on a series of physical system model designers described in the form of Java applets. This was an important part of the collection of multimedia resources for the study of laser physics. These are the characteristics of the technical solutions used to create the original sources, and the descriptions of the laser physical ideas described by them.

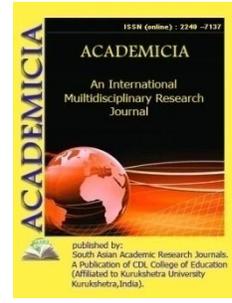

The considered technical solutions have been successfully used in the creation of a number of electronic packages of multimedia resources to support the teaching of general physics block sciences for undergraduate students of physics departments of classical universities. This will make it possible to acquire a lot of knowledge in a simple and understandable way through e-learning, and at the same time make great strides in the future.

UZBEKISTAN

ABSTRACT

The article A 7-year-old child will have experience in managing his / her emotions, all of which are acceptable to the principles of that the child is ready in terms of school psychology, one of the important conditions in the preparation for school education is all that he/she said above. In the organization of pedagogical work in primary classes, it is necessary to take into account the level of social development of anatomical physiological characteristics of children of small school age.

KEYWORDS: *Fulfill The Various Requirements, Junior School Age Of Children, Physically And Psychologically.*

INTRODUCTION

The period of junior school age of children is from the age of 7 to 11 years of study in primary classes. The childhood period in the kindergarten age is over. Before coming to school, the child will be physically and psychologically ready to receive education, in other words, to fulfill the various requirements imposed on the side of the most important period of his life, that is, the school period, according to the following. The child will have a clear in drawing lessons, in the work of making something from plasticine, and in the simplest drawing lessons. Dressing the experience for a while will have the child make independent organization of their attention in the management of their attention. The vocabulary room of the 7 young children is also rich enough and the amount of concepts is much higher. The child understands what he hears, wide enough. As it turned out from the research of specialists, well-organized education develops the thinking of children from the age of 6 to the age of 7 years. They will be able to draw up and eat simple

exercises and issues. The feeling of duty and responsibility in them begins to wane. A 7-year-old child will have experience in managing his / her emotions, all of which are acceptable to the principles of that the child is ready in terms of school psychology, one of the important conditions in the preparation for school education is all that he/she said above. In the organization of pedagogical work in primary classes, it is necessary to take into account the level of social development of anatomical physiological characteristics of children of small school age.

MATERIALS AND METHODS

D.N. As Levitov correctly noted, at the age of one school does not depend on the state of Health and social development of the junior school age Max. The child develops from the age of 7 to 11 years in a relatively calm and uniform way physically. Height and weight the vital volume of the lungs of the body's clarity develops much more flat and smooth Psychologist L.S.Slavina shows that in the beginner class, children with insufficient cognitive activity can meet.

Such children become normally developed in terms of aspiration. This development is wetting in their game and practical activities. Active thinking is for them. Such pupils should be carefully looked at by the teacher. It is necessary to associate the performance of educational tasks with the game and practical activities in the early days, so that they have a comprehensive support of their achievements, adapting them to the activities of their thinking.

All the reading activities of junior school age students have been specifically targeted. First of all, students should be able to master the skills of reading, writing, and counting, improve their knowledge in arithmetic, native-language, history, geography and Natural Science, much larger than the elementary foundations of geometry. Secondly, the child's level of knowledge and interest in cognition develop well. The third is the development of cognitive processes, the development of reason. For active independent creative activity, the ability to find content and a productive attitude towards reading, the direction of reading should find high Factors in reading. We cognitive processes of junior school age students and their progress in their activities.

Understanding

Children of small school age differ in the purity of their perception. The perception of the students differs from the fact that they are given specific knowledge as a spectator.

Attention

The main characteristics of the attention of students of junior school age are in their voluntary weakness. At a small school age, attention will be limited to the ability to adapt and manage it with willpower.

Although the period of junior school age is not a period of silencing, which is fraught with the development of the individual, in our opinion, such a period is a period of adolescence, nevertheless, the content of the individual in this period is noticeable enough. As already mentioned above, entering the school is a turning moment in the life of the child. A new relationship with adults (teachers) and peers (classmates) comes to the field. The child is attached to a whole system of communions (general school, class). The inclusion of a new type of activity in the study, in which the teacher put before him a number of serious requirements, forces the student to categorically organize his life, obey the rules and the regime. All of them

have a decisive influence on the content and consolidation of the new system of relations in relation to the surrounding reality, education to other people, the collective, and the obligations associated with it. We find the content of the will of the circle of interests, determines the progress of abilities.

Memory

It develops in two directions with the effect of memory education in junior school age students. Word logic is the role of understanding and remembering the memory and its connotation, to the possibilities of regulation.

Due to the relative predominance of the activity of the first alarm system, in small school-age students, the visual-figurative memory becomes more developed than the memory called the word logic memory. Small school-age students look at the rules and explanations that make up concrete information, realities, images that make things and objects better quickly remembered and stored firmly in their memories.

It's a dream. Fantasy is one of the important psychic cognition processes. Without the fantasy that an inactive teacher is talking about and not knowing how to make an impression of what is written in the lessons, as well as working with visual images, We cannot really master what kind of educational subject.

The dream of a junior school age student is compounded by the impact and demands of his / her teaching activities. Along with this, direct taxis go and see, see the cinema, go to the exorcisms, work on the school land plot, etc.) Also develop the imagination.

Will be able to tell other people and absorb the thoughts of other people, will know the feelings and desires of other people. People communicate with each other in this way in their activities and everyday lives.

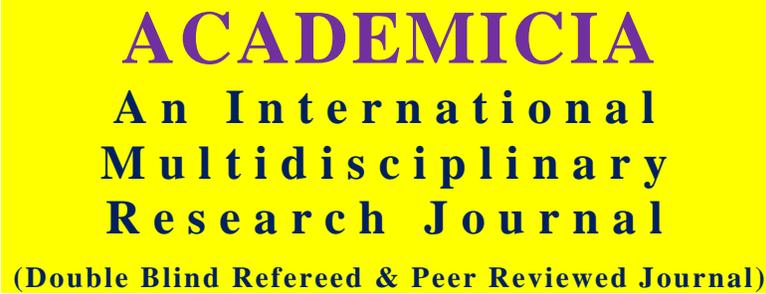

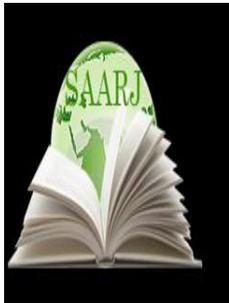

In the process of communicating with the means of speech, each person receives most of the knowledge from other people. Communication with the means of speech is a constant need of a person, and this communication serves to gain ideas.

A person cannot live without being treated by speech with other people. When a person is left alone, they often talk "in themselves" with the interlocutors in their dreams. If a person falls into the middle of one or more people who are unfamiliar to him, then the need to say something or hear something from those people will definitely arise. When this need is not met, a feeling of "unevenness" is born that makes a person sad. Such a need arises even when a person has "nothing to say". In such cases, he does not know "what to do". In such cases it appears that what should I talk about?", "as long as I'm talking about something", when the search for the topic begins. Depending on the age, knowledge, general level of research of each person, his speech will have its own characteristics. Characteristics of the profession of some people, what these people are interested in, their client and similar characteristics are manifested in their own speeches. Everyone speaks on their own, using one or more languages. each person has his own speech. Speech, which is a special function of the human mind, is studied by the science of psychology. And language is a social phenomenon. Language exists independently in some person. And the creator of the language is the people's own, the nation's own, historically composed.

With speech, the language is different, but at the same time it is impossible to distinguish them from each other; both speech and language are interconnected, they exist in unity. This unity is an expression that every language has emerged and grown in the course of historical progress in the process of connecting people with the means of speech communication. The way each language lives depends on what people speak in that language. If people do not speak a language, then this language also disappears: it becomes a "dead language". We know from written monuments that there are "dead" languages, where this language is reflected. For example, ancient Greek (Greek), Latin, here are such "dead" languages. The unity of speech with language is further manifested by the fact that each person uses a language in his speech, while some use several languages. In the interaction of people, their speech is manifested in different meanings or functions.

ABSTRACT

The results showed that 688 respondents (43.16%) did not do sport outside school or university. 272 people (17.06%) reported jogging and playing sports games on their own. 634 respondents (39.78%) attended sports clubs and sections on a regular basis. The survey demonstrated that physically inactive students and schoolchildren violated daily routine. Such schoolchildren spent significantly more leisure time on television viewing (52.78%) compared to their peers attending sports clubs (41.36%). The percentage of schoolchildren spending much time on the computer among those not doing sport was also higher (58.59% vs 41.47%). The same trend was observed in the students: 36.24% of the students not practicing sport spent most of their leisure time on the computer. Physically active students spent enough time outdoors as compared to those not doing sport (23.40% vs 11.15%).

INTRODUCTION

The attitude of comparison is reflected in almost all levels of linguistics.

Although some aspects of the comparative attitude to this day have been studied, the attitude towards comparison in Uzbek linguistics has not yet been sufficiently studied.

The manifestation of linguistic means at different levels of language, which creates a comparative attitude, has not been studied in detail. The meaning side of the word is with its objects, phenomena, etc.

It follows from the binding. It is without direct contact it occurs through reflection of existence in the mind of a person.

H.Ne'matov and R. Rasulovs revealed: "members of society a ready-made, general, binding, consisting of a stable combination of form and content , something in reality, character , feature and relationship the formative is a morpheme-type lexeme that can attach grammatic morphemes in speech and dictionary to itself."

Lexical composition of the language from Dictionary units-independent meaningful words will organize.

Participate in the speech process with the meanings of words, express the thought in addition, the main task in the delivery of specific information to the listener it does.

The function of words in the composition of the sentence is quite extensive. Because they are involved in the formation of human speech as the main unit .Comparison in the process of speech participates in the expression of content. To what extent does a person know about existence it is reflected in his word? Because to know the existence is to have an understanding of things, events. And these are common and important signs of something and phenomena means separation from something else and events. Human experiences this concept, which is the result of the Universal declension, forms the basis of the word meaning, and makes up the core.

For example, the shape, function, characteristic of a human cloud taking into account its features, it is likened to another predicate it was a comparison.

Morphological means

The attitude of comparison in the current Uzbek language of literature also occurs with the help of morphological means. Some ointments as such morphological means and

We can indicate the words in the task of the assistant:

- A) According assistant.
- B) This assistant with the words of the exit agreement

When it comes to the predicate or circumstance in which the word in the exit agreement is expressed to another

It is compared, compared.

According to, despite the suitability, mainly concerning, co-workers ca like suitably- it is added to the names in the agreement.

An assistant is actually more applicable in the departure agreement than an assistant- despite being a make-up, the output agreement was not requires names to come up with.

- B) Assistant than. This is the highlight, highlight, show the assistant subtracted, it also means comparison, comparison.

When the comparative meaning is expressed through the genitive assistant, the word representing the sign is often observed to come in comparative syllables.

- C) Relative. This lexeme refers to the original word category. When the comparative, genitive meanings are reflected when used in the task of the assistant.

Analogy usually occurs with the participation of at least two subjects. But speech if from the process or logically the cultivation is understood, then by analogy the object that can be the basis is dropped, - the itself of the added element can take part in the sentence and represent a comparative meaning: I breathe, take it to a cold place.

Comparative degree, which is considered a kind of qualitative degree, among the morphological means involved in the expression of the comparative relationship

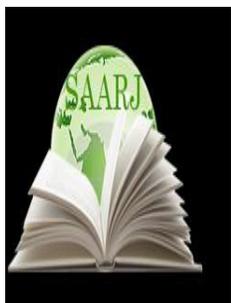

- The reflected through. One of the most important tools that form a comparative degree one is. - forms of quality, formed by, are powerless from the normal state of the co-sign along with the emergence of the meaning of comparisons specifies the window.

This six is something-phenomena, sometimes work-a sign of a concept in which an adjective is meant when a person is engaged in actions a little more than the same sign in another concept over means that.

ABSTRACT

In the dictionary work, the pronunciation and spelling of the meaning of the word are paid attention. All the main objective of the study is to achieve the students ' use in speech when the need arises, it is to ensure that others understand their speech. For this, the teacher used in the lessons of his native language of each word, in educational processes: exorcism, mutual conversation, at various events, used a look at the meaning of the words with attention, which of them requires special performance must be identified.

KEYWORDS: *Fulfill The Various Requirements, Junior School Age Of Children, Physically And Psychologically.*

INTRODUCTION

Enrich the vocabulary of native speakers, reading children in the curriculum of primary classes.

Development of coherent speech, perfection of literary-aesthetic thinking, and culture of speech the formative is called the critical factor of ensuring the effectiveness of speech. These tasks study of mathematical topics, observation and analysis of exercise texts, special vocabulary - it is performed through grammatical exercises.

The main purpose of teaching mother tongue is also the role of language in society, with its function determined. Language is a means of communication-the speaker explains his thoughts through language, while the listener means the thought that comes to mind through language tools.

The native language science prepares teachers for the activities of explaining ideas and getting him to read. Idea

When going out into a dream through the language, everyone must know and its use.

knowledge is rich not only in mastering its – law rules, definition, but also in the native language it is to be able to make practical use of their capabilities, that is, to correctly express their opinion verbally and in writing, it is to be able to express clearly and competently. To achieve this, the native language on the dictionary particular attention should be paid to performance.

In the dictionary work, the pronunciation and spelling of the meaning of the word are paid attention. All the main objective of the study is to achieve the students ' use in speech when the need arises, it is to ensure that others understand their speech. For this, the teacher used in the lessons of his native language of each word, in educational processes: exorcism, mutual conversation, at various events, used a look at the meaning of the words with attention, which of them requires special performance must be identified.

In the lessons of native language for the assimilation of the dictionary wealth of the language by students it is introduced by the following meanings of words.

1. Introduce students to unfamiliar words and phrases.

It may be the first time that students encounter words and phrases in the textbook.

Although this word is not a newly appeared word, it means that the reader does not know its meaning,

It is a new word for the reader. For example, in the textbook of the 1st Class “mother tongue”.

(window curtains glued to transparent paper instead of Windows), (proud (stuttering, proud-humble), Kemal (comprehensively mature, establish, find Kemal-Khazan Hab), ruin (left unattended ruin), brother (friend, brother, relative-seed), comrade (together in military service, in the organization together), Basin (a picture of rivers or a set that is laid on rivers and lakes, forming it show), commander (Commander, soldier), zeb (decoration, fur.), ornaments (for beauty the serving item), the castle (Palace) are faced with such words. Such comment with meaningful words against by expanding the synonyms of the meaning of words.

It is possible to form an understanding through pictures, to solve the meaning by creating a sentence, to give. Such performance creates sensitivity in students towards word meanings.

2. To acquaint readers with the new meanings of the word. Students are many meaningful

If one understands the meaning of words, they cannot express the meaning of another. Children's words they cannot absorb all their meanings at once. Step to master their meaning phase is carried out. If in 1-2 class you get acquainted with one or two meanings of a multi-meaning word, then 3-4- in the classes you will learn more other meanings. Translate all levels of language: phonetics, lexis, vocabulary composition, morphology, syntax (in the elementary class these sections are called "Sounds and letters", " word",

In the process of studying (which is called" sentence“,” connecting speech") fine expressions, phrases, meanings of words with meaning, formative, anti-dependent meaning are based on different types of work understanding. In the textbook of the native language of the 1st Class hours it is given a thought disorder-portable meaning phrase compare with the combination of

the disorder. Which combination is used in a different sense? (Clock broken) which does the combination apply in another sense? (The idea is broken). How the idea meant a combination of disorder expresses? Children are explained that they think and say that the idea of the evil ones with the intention is a violation.

It turns out that the method of comparison is considered an effective method in interpreting the meaning of words. Throwing buns,

The lazy ate, the Blind played, the heart was fire, the tongue was found, and the pleasure was also on the meaning of the phrases tasted

It is processed in this way.

MATERIALS AND METHODS

All the reading activities of junior school age students have been specifically targeted. First of all, students should be able to master the skills of reading, writing, and counting, improve their knowledge in arithmetic, native-language, history, geography and Natural Science, much larger than the elementary foundations of geometry. Secondly, the child's level of knowledge and interest in cognition develop well. The third is the development of cognitive processes, the development of reason. For active independent creative activity, the ability to find content and a productive attitude towards reading, the direction of reading should find high Factors in reading. We cognitive processes of junior school age students and their progress in their activities.

Although the period of junior school age is not a period of silencing, which is fraught with the development of the individual, in our opinion, such a period is a period of adolescence, nevertheless, the content of the individual in this period is noticeable enough. As already mentioned above, entering the school is a turning moment in the life of the child. A new relationship with adults (teachers) and peers (classmates) comes to the field. The child is attached to a whole system of communions (general school, class). The inclusion of a new type of activity in the study, in which the teacher put before him a number of serious requirements, forces the student to categorically organize his life, obey the rules and the regime. All of them have a decisive influence on the content and consolidation of the new system of relations in relation to the surrounding reality, education to other people, the collective, and the obligations associated with it. We find the content of the will of the circle of interests, determines the progress of abilities.

Memory

It develops in two directions with the effect of memory education in junior school age students. Word logic is the role of understanding and remembering the memory and its connotation, to the possibilities of regulation.

Due to the relative predominance of the activity of the first alarm system, in small school-age students, the visual-figurative memory becomes more developed than the memory called the word logic memory. Small school-age students look at the rules and explanations that make up concrete information, realities, images that make things and objects better quickly remembered and stored firmly in their memories.

It's a dream. Fantasy is one of the important psychic cognition processes. Without the fantasy that an inactive teacher is talking about and not knowing how to make an impression of what is

written in the lessons, as well as working with visual images, We can not really master what kind of educational subject.

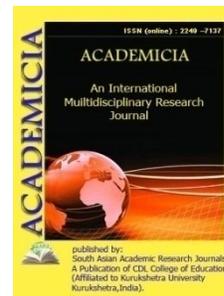

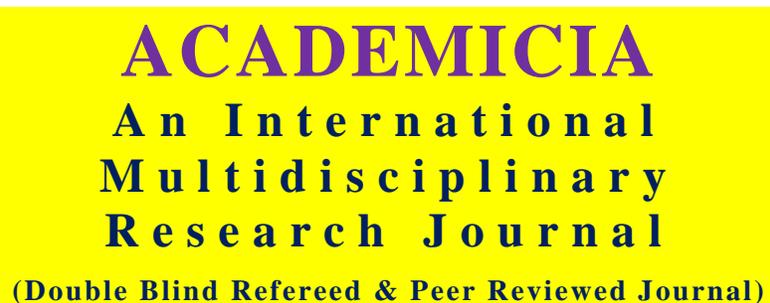

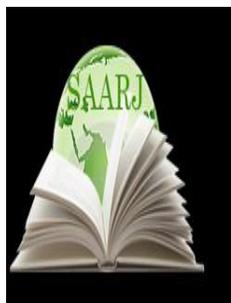

The dream of a junior school age student is compounded by the impact and demands of his / her teaching activities. Along with this, direct taxis go and see, see the cinema, go to the exorcisms, work on the school land plot, etc.) Also develop the imagination.

Will be able to tell other people and absorb the thoughts of other people, will know the feelings and desires of other people. People communicate with each other in this way in their activities and everyday lives.

In the process of communicating with the means of speech, each person receives most of the knowledge from other people. Communication with the means of speech is a constant need of a person, and this communication serves to gain ideas.

DEVELOPMENT OF PRACTICAL ACTIVITY SKILLS OF STUDENTS IN MATHEMATICS IN E-LEARNING ENVIRONMENT

Mamadiyorov Jamol Bahodirovich*

*Basic Doctoral Student,
Research Institute of Pedagogical Sciences,
UZBEKISTAN

ABSTRACT

This article shows the ways of developing and forming practical activity skills of schoolchildren in the e-learning environment. In the development of practical activity skills of students in the field of mathematics, the organization of training taking into account their individual characteristics, requires the design of electronic educational resources as a basis. In this regard, the use of mathematics in educational and cognitive activities allows the teacher to create an individual educational trainee for the students, and the students can choose an individual educational direction for learning and evaluating their results in the conditions of developing practical skills in science with the use of different methods.

KEYWORDS: ICT, practical activity skills, multimedia, visual education.

INTRODUCTION

Due to the increase in the flow of information and the application of ICT in all spheres of human activity, the need for the development of practical activities skills of students in this subject arises by improving the requirements of general secondary schools for the teaching of mathematics.

In the development of practical activity skills of students in the field of mathematics, the organization of training taking into account their individual characteristics, requires the design of electronic educational resources as a basis. In this regard, the use of mathematics in educational and cognitive activities allows the teacher to create an individual educational trainee for the students, and the students can choose an individual educational direction for learning and evaluating their results in the conditions of developing practical skills in science with the use of different methods.

A distinctive feature of the development of practical skills of students in mathematics in the e-learning environment is the creation of an individual training course on its basis and the selection of the direction of education by each student taking into account individual cognitive methods of coding of information.

The role of e-learning resources in the teaching of mathematics is of particular interest, since their use can only increase the effectiveness of teaching due to the visual presentation of information that positively affects the formation and development of flexible mathematical thinking, thereby creating the idea of kenyingi activities related to the design, construction and processing of visual data. The importance of practice depends on the possibility of increasing the effectiveness of mathematics lessons, as well as the fact that the use of electronic educational resources in teaching is an important aspect of modern education, increases the interest of students in the study of mathematics, which contributes to the development of his practical activity skills.

U.N.Taylokov noted that the introduction of the e-learning environment is primarily related to the social potential of society, including the informatization of the educational sphere, and that the issues of the content and quality of education should be considered as a priority direction in society. In his opinion, the e-learning environment serves as an important tool in the development of practical skills of Secondary School students in the field of science.

I.V. According to kuznesova, the desire to use computer technology in mathematics lessons is caused by the following for social, pedagogical and technological reasons::

- Increases the requirements for the introduction of innovative technologies into the educational system;
- Increases the need for new tools izlash to improve the effectiveness of pedagogical education;
- The computer enables the transfer of educational information to a significant extent kengaytiradi, to increase educational motivation Kuchay and to actively engage students in the learning process.

Computerization of education is concerned with the prospects of increasing the effectiveness of the educational process, reducing the gap between the demands of the society on the younger generation and the practical school preparation.

If it is acceptable for students to harmonize the teaching methods used in school in the process of teaching mathematics with the use of information technology, then the effectiveness of the learning process will increase, because in this case the principles of visualizing the differentiation of Education will be most fully implemented, the motivation of the students will be underestimated.

Today, the main goal of the teacher is to train specialists who can enter the educational, information, economic space and know how to work. The task of the teacher is to provide the student with the correct use of resources, remember and apply the information, understand the purpose of the study, identify the link between real life and seeing the world from a different perspective, contribute to the awakening of the creative principleillarni in the student.

It has a variety of capabilities for use in modern information technology and their educational process. On the other hand, there are many problems in this area.

First, Information Technology is developing so rapidly that pedagogical research and methodological developments in their application in the educational process are also quickly outdated.

Secondly, the possibilities of using technical means in the professional activity of the teacher are very diverse and multifaceted, new ways of using them in the educational process will arise, and new tasks, problems associated with the competent use of computer technologies in the educational process will arise before the teachers.

Kengaytiradi the possibilities of using a variety of methods, taking into account the age, level of development and preparation of students in the use of modern information technology and technical equipment. Modern instructional technology has become an active participant in the joint work of both teachers and students .tiradi Because modern teaching tools allow to demonstrate independence and creative activity in the development and improvement of new didactic materials projects.

The methodology for the use of information technology involves the combined use of various additional teaching aids in mathematical lessons, not only with the use of traditional parts of instructional materials, but also with the ability to effectively solve didactic tasks. In our opinion, the use of Information Technology for teaching, which ensures the unity of the content of educational materials presented with their help, seems to be pedagogically purposeful. At the same time, the content of the lesson is better opened with the help of multimedia through visualized learning data.

In the process of teaching mathematics in the 11th grades, the methodology for the application of computer technology can not be reduced only, depending on the technical side of its implementation, although their application is sufficiently provided with computer equipment, it is also possible that the failure of the software will affect its success.

In the lessons of mathematics, the organizational side of the application of computer technology seems to be important. To determine the place and time of use of instructional materials as a component, to introduce ICT into traditional teaching manual into the learning process either sequentially or parallel. The use of computer capabilities of traditional textbooks and the content of instructional material can vary depending on the time they are used in the learning process. A similar situation is possible in the lessons of repetition, systematization and generalization of knowledge.

The use of ICT in mathematical lessons allows the teacher to::

- make the learning process more interesting and lively due to the richness of multimedia features;
- Effective solution to the problem of Visual Education;
- To expand the visualization of instructional materials so that it is understandable to the students.

Computer technology can be used at any stage of the lesson:

- Presentation of the subject of the lesson;

- At the beginning of the lesson, using the questions on the topic under study, to create a problematic situation;
- in addition to the teacher's explanation (presentations, formulas, diagrams, drawings, video clips, etc.);
- control of knowledge.

The main educational importance of information technology is that it allows you to create a more active interactive learning environment, which has opportunities at the disposal of both the teacher and the student.[1-2]

The advantages of computer technology over traditional technology are multifaceted. Along with opportunities such as more visual, visual presentation of the material, cognitive development, they include various organizational forms in the activities of students, teaching methods in the activities of the teacher. Classes using computer technology not only revitalize the learning process, but also increase the learning motivation.

Innovative technologies are considered important in the professional activity of the teacher so that he can always monitor the shortcomings of the student and take corrective measures. The pace of development of the present time requires teachers to build creativity in research areas in a new way. Therefore, XXI century is considered to be the age of innovation and educational process related to computer and Information Technology and form the thinking ability of the student. In the information society, the effectiveness of pedagogical technologies that shape the thinking abilities of students and enhance computer literacy is high, as a result of which the way to the formation of professional capacity is opened.

The methodology of teaching mathematics is closely related to pedagogy, in particular didactics. The main attitude that characterizes teaching in didactics is "teaching – learning", in methodology – "teaching - learning materials – teaching". Pedagogy determines the methods of teaching, educational goals, methods of scientific research. Taking these methods and goals from pedagogy as a basis, the methodology introduces its specific mathematical composition both in the educational process and in the scientific research work.

The methodology of teaching mathematics is aimed at the characteristics of students of a certain age group, taking advantage of the laws of individual characteristics of students of a certain age group. The effect of psychology in the methodology of teaching mathematics is explained by the attitude towards the introduction of personality-oriented education, which is characterized by the education of the student to the extent that he / she is capable of self-development, self-knowledge, research and finding.

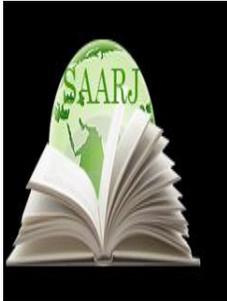

The teaching of mathematics to students is aimed at the following:

- Mastering the system of mathematical knowledge, the skills necessary for further study of mathematics and related subjects in order to solve practical problems;
- Development of spatial imagination, logical thinking of oral and written mathematical speech;
- formation of computational skills, algebraic transformations, solving equations and inequalities, as well as formation of instrumental and graphic skills.

Mathematics differs not only in size, system and depth of presentation, but also in the practical direction of the questions being studied.

ABSTRACT

The article describes the games related to the military activities of the great commander Amir Temur, their royal life, their role in the physical and moral development of the younger generation, the fighting potential of the army and its role in raising confidence in victory.

KEYWORDS: State, Army, Combat Training, "War Theater", Navkar's Physical And Mental Maturity, Folk Games, Military Games, "War-War" Game, Horseback Riding, Fencing, Archery, Javelin Throwing, Solo Singles Wrestling, National Wrestling, Horseback Riding.

INTRODUCTION

One of the priorities today is to study in depth the folk games created by our ancestors and passed down from generation to generation, in particular, games related to military activities, their history, development and significance today. Because in different periods of the history of our country, such games have been one of the important factors determining the beauty and appearance, physical, mental and intellectual maturity of our people. We can see this in the activities of the great statesman and invincible commander Amir Temur.

It is known that many sources describe the childhood of Amir Temur in a legendary way. In particular, under the protection of Timur's father Taragay Bahodir, he enjoyed all kinds of mental and physical education typical of the nobility at that time, and was trained both mentally and physically. From the time his tongue came out and recognized his mind until he was twelve years old, he enjoyed going to school, being literate, listening to fairy tales, then historical stories and legends, and playing various action games with his peers. Over time, the

games became more complex. These include horseback riding, racing, one-on-one wrestling, and "war-of-war" games. "I used to play with children on the street," Amir Temur wrote, - playing wars with the kids, appointing myself a commander, directing the game, and practicing fighting one group of kids with another group"¹.

It should be noted that the book "Temurnoma" by Mullo Salohiddin Tashkendi also mentions the game of "war-war", as well as illustrates the fact that Amir Temur grew physically strong and brave from childhood. Amir Temur argued, shot the butcher's six days with one finger, lifted the cart full of loads with one hand, bit the dragon's head with his teeth, and pulled the mesh out of the well by himself forty times alone. Amir Choku, who contributed to his upbringing, and Mirzo Sayfiddin, who was later appointed his minister, and his tribesmen and peers witnessed and watched such an extraordinary demonstration of Amir Temur's power.

According to the sources, Taragay Bahodir oglu Temurbek always said the same thing: that we are the descendants of ancestors famous for martial arts, so I was obliged to study martial arts from childhood. As much as Temurbek was eager to learn, whether under the influence of such invitations or because he was in his blood, his interest in military work was no less. In the areas bordering Kesh there were very large pastures, where herds of yearlings and wild donkeys grazed. Among them was a small herd that belonged to my father. Temurbek used to come here after school eager to learn to ride a horse. At first he was taught how to subdue these semi-savage horses, which no adult had ever ridden. He mastered all the rules of the job. He was later much more qualified in this regard. "When I was twelve years old," writes Amir Temur, "I began to play childish games"². Amir Temur now began to love horseback riding, horseback riding and hunting.

"When I was fifteen, I fell in love with horse hunting, and my skills in this field have matured," he says³. But even then, he did not give up the "war-war" game. Only now the game is played in a serious way with real horses, not with stray horses as before. There is such information in the sources about this.

It was not enough to ride a horse in the Sahibkiran pasture. He practiced fencing, archery, and self-defense on horseback. Of course, his teacher, who received the hadith of this art, would help him. I shot while running on horseback, but the arrow did not hit the target, and the sword did not give the expected result. Then his teacher rubbed him and said, "You are still young, your muscles are not strong. As you grow older, your body will become stronger - and you will be able to shoot long distances by mistake"⁴.

At the age of sixteen, Amir Temur mastered the martial arts to such an extent that none of his peers could compete with him in wrestling and shooting. His muscles were so strong that if he fired a shot into the sky, he would disappear into the clouds, returning a long time later. He was also distinguished by his agility from many heavyweight wrestlers. He tried to be superior to others in everything, to do exercises that were difficult for them to do. One such exercise was riding three horses side by side and jumping from one to the other.

"When I was in my twenties, I often went to war exercises with my peers: I divided them into two groups and trained one to fight the other"⁵. In this way a simple fun game becomes a real combat exercise.

Another of our great-grandfather's hobbies was grabbing the saddle of a horse that was running at high speed, jumping to and fro, and straightening his saddle without touching the ground. This exercise was later used in battles to give left to the arrows of the beast.

In addition to riding, the great commander Amir Temur also had great skills in swimming. The Jaihun River flows along the Movarounnahr. In the spring, it overflows and does not fit into the river. Swimming from one shore to another becomes difficult, and even the current becomes dangerous. Even in this situation, Temurbek swam to the opposite shore. To do this, he surrendered himself to the current as soon as he fell into the water. As he walked along the stream, he was in a slow motion to get closer to the other shore, a situation that lasted until he reached the shore.

It is known that according to the tradition of the XIV-XV centuries, battles and military marches were carried out to the sound of trumpets, drums and bolobons. The notion of "war theater" that has emerged in Western Europe and Russia in recent centuries can be applied to that period as well. After all, the fighting was also reminiscent of a big show. Amir Temur's marches and battles are no exception. One of Timur's rules is called "The big drum and flag-giving system". That is, the drum is held in place like a flag. "I have ordered," Amir Temur writes, "that each of the twelve great emirs be given a flag and a drum." Let them present to Amir ul-Umar with a flag and a drum, a district flag and a chart. And let them give the commander a flag and a trumpet. As for the rulers of the provinces, they should present one drill. Give each of my four princes a flag, a drum, a flute, and a trumpet"⁶.

Emirs, captains, centurions, and corporals were promoted with additional flags, flags, and drums, increasing their ranks according to their services in battle.

In the army of Amir Temur from time to time held various competitions, performances, demonstrations to awaken the necessary fighting spirit, the spirit of confidence in victory. At such meetings, the physical and mental readiness of the navkars was tested. After all, the Navkars regularly mastered the techniques of combat. Hundreds of special sticks, clubs, chains, rope fights, wrestling on the field and on horses, boxing, jumping, chilling, hitting the head, twisting the hands were used. The winners of such contests and competitions were awarded the title of hero and high ranks. Therefore, every navkari of Amir Temur, trained through trainings and public competitions, with his strength, skill, entrepreneurship, confidence in victory, mental freshness, stood up to a thousand soldiers.

Sahibkiran even used the dhikr of the Sufis, in which many hafiz and sages participated. According to the Temurnoma, before fighting against the Greek army, Amir Temur inspected his 40,000-strong army in ranks and formations. According to his judgment, they will bring forty thousand trumpets, drums, and bolobons. He orders the hunters to catch forty thousand swallows. They put them in cages and prepare the grain with water. After that, they start "four thousand hafiz khushkhan". In the evening, the soldiers, led by the vigilant hafiz, begin to recite dhikr. The swallows are released from the cages, they cover the blue face. Thousands of torches are lit. "By waving the flags on all four sides and chanting the takbir, the hafiz will sing the anthem and start marching against the Romans"⁷. The earth trembled and shook the hearts of the Greek people. Opposition soldiers in the square begin to flee.

As we study the life and work of the great master in depth, we see that he was very physically strong. In particular, "Temurnoma" contains information that Amir Temur fought with a number

of heroes. Here are two of them. One is that after the conquest of Herat, the merchants came to him and complained to the Emir of Kandahar, Bahodurkhan. Amir Temur dressed five hundred young warriors in the guise of a merchant and rode a herd of horses near Kandahar. Bahodurkhan invited them to his presence, lifted the elephant and walked around the square to show his strength. The owner goes around the field seven times as he lifts the elephant. Annoyed by Bahodurkhan, he called on Amir Temur to fight one by one. They fight from morning till night, and finally they beat their opponent on the ground, asking for help from the masters⁸. The second example is Amir Temur's fight with a hero named Sword Lion. The incident took place near the city of Tus. They fight first with a spear and then with a sword. The Sword Lion's horse fell and broke his neck. Then they get the waist. Amir Temur will win. After that, the master Sword puts a sarpo on the Lion and adds him to the ranks of his heroes.

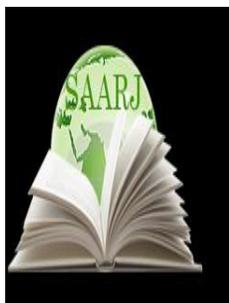

It is known that during the reign of Amir Temur special attention was paid to the national struggle. Special wrestling grounds have been built in different parts of the country. For example, in the presence of Amir Temur's grandson Pirmuhammad from India, two wrestlers wrestled. "Two men in short-sleeved leather jackets struggled," Clavijo wrote, "and couldn't knock each other down". Pirmuhammad said one of the two men in the fight must definitely fall. Eventually, one of them knocks down the other and presses for a long time without letting it stand"⁹.

The national wrestling, which was a picture in the time of Amir Temur, is divided into three types according to its practical application, task, order and form: combat, competition and spectacle wrestling. Among them, combat was of special importance. This type of wrestling was introduced mainly among military soldiers, specific troops. The commanders regularly trained their navkars for future battles. In this type of wrestling, fighters are first and foremost taught the secrets of bending, twisting, breaking, jumping with an unarmed foot, and hand-to-hand combat on the field. He also improved his skills in complex trades such as the use of special sticks, hammers, chains and ropes, horse and foot battles, strangulation, head hitting, and stabbing.

So, it is important to use the system of games related to the highly developed military activity during the reign of Amir Temur to bring up the younger generation as physically strong and spiritually mature people, to form in them a true love for our national values, selflessness, courage and determination. is important.

ABSTRACT

Betalain are natural pigments and highly water soluble nitrogenous compounds which are commonly found in the order Caryophyllales and in some fungi species. Considering the significance of natural colourants in the food industry, the present study aimed to bring the benefits and potentiality of Gompherna globosa into limelight as a food dye. The pigment has been extracted using aqueous solution as a solvent and they are quantified by Spectroscopic method and HPLC method and the extracts were characterized for higher Anti-oxidant, Anti-microbial. The storage effects of different temperature and light intensities on the Gompherna extract were measured where maximum degradation was observed when the pigment was stored under room temperature and under light on 14th and 7th day of storage. On concerning the stability of Gompherna extract, the lyophilized extract was used as a dye by incorporating in Ice-cream and the dried flower was used for making tea. The betalain flavoured ice-cream and Gompherna tea were preferred more by the active respondents compared to the plain vanilla Ice-cream and black tea for the appealing colour, Texture, Taste and palatability.

KEYWORDS: Gompherna Globosa, Quantification, Anti-Oxidant, Anti-Microbial, Stability and Food Dye.

1. INTRODUCTION

Colour is a major character of flowers which not only add attraction, elegance and beauty but also serve as a source for natural pigments which in turn used in colouring of food products and textiles.

Synthetic dyes and pigments are the major pollutants affecting the environment, soil and water resources and thereby cause health issues to the humans. To overcome the harmfulness caused by the synthetic dyes to humans and environment, researchers have involved in the development of natural dyes and pigment (Kumar *et al.*, 2017).

Natural pigments are less stable due to different factors and are higher in cost of extraction compared to synthetic dyes and hence more attention is needed in their utilization and development. (Sabarudin *et al.*, 2016).

Betalains were one of the natural pigment found in Plants which is a potential food dye giving a wide range of colour from red to Violet. Betalains are highly water soluble nitrogenous compounds, commonly found in the order Caryophyllales and in some fungi species. Betalains are predominantly found in Beetroot, Opuntia, Bougainvillea, Gomphrena, Celosia etc.

Previous studies had stated that betacyanin was extracted from fruits of cactus (*Opuntia ficus-indica*), dragon fruit (*Hylocereus polyrhizus*) and red beet (*Beta vulgaris L. ssp. Vulgaris*) which is widely used as a food colourant in many dairy products, beverages, candies and cattle products that give vivid red colour. Apart from the use as a colourant, betalains have a wide range of biological activities with potential health benefits like they counter inflammation, protect the liver and have anticancer, antitumor and antioxidant properties.

Gomphrena species is an edible, Ornamental and medicinal plant commonly known as Globe Amaranth or Bachelor Button, belongs to the family Amaranthaceae. Though extraction procedures for betalains have been reported in crops like, red beet, and *Opuntia*, research on extraction of betalain pigments from flowers is meager and needs to be exploited. Considering the importance of flowers as sources of natural betalain pigments, the present paper aimed to extract, quantify and expose the antioxidant, antimicrobial properties and stability of betalains from *Gomphrena globosa* and their potential usage as a food dye.

2. MATERIALS AND METHODS

2.1 Sample preparation

One gram of shade dried Gomphrena petals were macerated with 100ml of solvent (HPLC grade distilled water) and kept in a shaker overnight for incubation. Then the pigments were extracted by filtering the solution in a Whatman no.30 filter paper and the filtrate was stored under -20°C for further analysis.

2.2 Estimation of total betalain content

The aqueous extracted pigment was diluted using McIlvaine buffer (pH 6.5, citrate-phosphate buffer). The absorption was measured at different OD values at 538, 480, and 600nm for the quantification of betacyanin, betaxanthin, and total betalains respectively using UV-VIS spectrophotometer (Eppendorf bio spectrometer) (Moßhammer *et al.*, 2005)

The betalain content (BC) was analyzed by the following formula,

$$\text{Betain Content}(mg/l) = \frac{A * DF * MW * 1000}{\epsilon * l}$$

Here,

A -Absorption value at 600 nm

DF - dilution factor

l -Path length (1 cm) of the cuvette

For quantification of betacyanins and total betalain- the molecular weights (MW) = 550 g/mol and molar extinction coefficients (ϵ) = 60 000 L/ (mol cm) in H₂O; λ =538 nm for betacyanin and λ =600 for total betalain.

For quantification of betaxanthins -the molecular weights (MW) = 308 g/mol; and molar extinction coefficients (ϵ) = 48 000 L/ (mol cm) in H₂O; λ =480 nm

2.3 Lyophilization

The aqueous extracted sample was concentrated for betalain pigments using lyophilizer (Lark, Penguin classic). Freeze drying at -80°C temperature and 0.1mPa pressure yielded freeze dried powder of the Gompherna betalain extract and were stored in vials at deep freezer(-80°C) to prevent from degradation.

2.4 Quantification by HPLC

Betanin was quantified by water modular liquid chromatographic system (Shimadzu LC- 88 A) equipped with two M510 pumps, a M996 photodiode array detector and a rheodyne model 7125 injector and a sample loop of 20 μ l was used, along with a Millennium 2010 chromatography data management system. A kromasil 100 C₁₈, 5 μ M, 25 cmx 4.6 mm I.D column was used and elution was carried out following a modification of the chromatographic program proposed by (Fernández-López *et al.*, 2002). The program consisted of two mobile phase solvent A (1% acetic acid in water) and solvent B (1% acetic acid in acetonitrile) with a flow rate of 1ml/min.

2.4.1 Preparation of betanin standard

The betanin standard was diluted with HPLC grade distilled water since betalain is highly soluble in water. Freshly prepared standard was used for analysis. The concentration of the standard used for HPLC was 100ppm.

2.4.2 Preparation of Gompherna extracts for HPLC quantification

The Gompherna extract was prepared by dissolving the freeze dried sample in HPLC grade distilled water. For each analysis, 20 μ l of the filtered extract was directly injected into the chromatographic column. The identities of the different chromatographic peaks were confirmed by their visible spectral characteristics in comparison with the standards and their retention times.

2.5 Assessment of antioxidant activity of Gompherna betalain extract

The antioxidant activity of Gompherna extract was analyzed by two major methods namely, Free radical scavenging activity and TotalReducing power assay. For the estimation of

antioxidant, the Gompherna extract was prepared at different concentrations using distilled water viz., 1250, 1000, 750, 500, 250 µg/ml.

2.5.1 Free radical scavenging activity

2.5.1.1 DPPH (2, 2-diphenyl-1-picrylhydrazyl) method

DPPH is a stable free radical which do not dimerize as other free radicals. Occurrence of purple colour indicates the delocalization of DPPH molecule, with an absorption of around 517nm. The betalain extract was measured for antioxidant activity by its ability to scavenge the stable DPPH (1,1-diphenyl-2-picrylhydrazyl) (Wong *et al.*, 2006). Hundred micro litre of the prepared extract was treated with three ml of a DPPH reagent having absorbance of 0.980 ± 0.02 in methanol initially and incubated at normal ambient temperature. After 20 min of incubation, the absorbance was measured at 517nm using UV/Vis spectrophotometer.

2.5.1.2 ABTS (2, 2'-azino-bis (3- ethylbenzthiazoline-6-sulphonic acid) method:

The oxidation of ABTS cation radical is determined by the loss of electron in a nitrogen atom which is physically indicated by the presence of bluish green color. 300 µl of the extract was mixed with 3 ml of 7mM ABTS and 2.45mM potassium persulphatereagent having absorbance of 0.7 ± 0.05 in methanol at 743 nm and incubated at normal ambient temperature. After 6 min of incubation, the absorbance was measured at 743 nm using UV/Vis spectrophotometer.

Ascorbic acid at different concentrations (1 mg/ml to 5 mg/ml) was used as standard for both the methods. The percentage of inhibition was calculated by the below formula,

$$\% \text{ inhibition} = \frac{(\text{Initial absorbance} - \text{final absorbance})}{\text{Initial absorbance}} * 100$$

The concentration required for 50% reduction of ABTS (IC₅₀) and DPPH (IC₅₀) was used to express the antioxidant capacity of the samples (Yıldız *et al.*, 2008)

2.5.2 Total reducing power assay

2.5.2.1 FRAP (Ferric ion reducing antioxidant power) method

The FRAP reagent was prepared by adding 25ml of 300 mM Acetate buffer maintained at a pH of 3.6 to which 2.5 ml of 10mM TPTZ (2, 4, 6- tri (2-pyridyl)-s-triazine) was dissolved in 40 mM HCL and added with 2.5 ml of 2.mM FeCl₃. 100µl of the extract was added to 1.9ml of FRAP reagent and the reaction mixture was incubated for 30 minutes under water bath and maintained at 36°C. The ferric ions get reduced after adding the extract indicating the antioxidant potential of the extract which was measured after incubation under UV/Vis spectrophotometer at 593nm. The Ferric reducing antioxidant potential of the flower extracts was expressed as µM Ascorbic acid equivalent (Brand-Williams *et al.*, 1995)

2.5.2.2 CUPRAC (Cupric reducing antioxidant power) method

CUPRAC reagent was prepared by mixing together 1mL of 1.0×10^{-2} M copper (II) chloride with 1mL of 1M ammonium acetate buffer maintained at pH 7.0, at which the reaction mixture was added with 1mL of 7.5×10^{-3} M neocuproine solution. Hundred microlitre of the flower extract was added to 1ml of CUPRAC reagent. The reaction mixture was then incubated at room

temperature for 30 minutes and their absorbance was recorded at 450nm using UV/Vis spectrophotometer. (Sahreen *et al.*, 2010) A standard calibration curve was developed using ascorbic acid and CUPRAC reagent. The cupric ion reducing antioxidant capacity of the flower extract was expressed as μM Ascorbic acid equivalent.

2.5.2.3 Chelating potential

The extracts were dissolved in water to prepare various sample solutions at 1250, 1000, 750, 500, 250 $\mu\text{g/ml}$. To 200 μl of the sample prepared, 100 μl of $\text{FeCl}_2 \cdot 2\text{H}_2\text{O}$ (2.0 mM) and 900 μl of methanol were added. After 5 min of incubation under room temperature, 5.0 mM of 400 μl of ferrozine is added. The absorbance was measured after 10 min at 562 nm using UV/Vis spectrophotometer

The chelating activity (%) was calculated using the following equation,

$$\% \text{ inhibition} = \frac{(\text{Initial absorbance} - \text{final absorbance})}{\text{Initial absorbance}} * 100$$

Ascorbic acid was used as a standard. The concentration required for the 50% reduction of the chelates (IC_{50}) was used to express the antioxidant capacity of the samples. (Karawita *et al.*, 2005).

2.6 Assessment of antimicrobial properties of betalain extracts

2.6.1 Preparation of betalain extract

Lyophilized *Gomphrena globosa* extract was dissolved in distilled water to get different concentrations as follows,

Treatments	Concentration of samples for inoculation
T ₁	100 mg/ml
T ₂	200 mg/ml
T ₃	300 mg/ml
T ₄	400 mg/ml
T ₅	500 mg/ml

2.6.2 Preparation of culture media

Common food borne species of bacteria and fungi (obtained from the Department of Microbiology, TNAU) were cultured and maintained on nutrient agar (NA) medium (Allen, 1953) and Potato dextrose agar (PDA) medium (Sabouraud, 1892). For the analysis of antimicrobial activity by, a loop of the organism *viz.*, bacteria and fungi was inoculated into 100 ml of the nutrient broth and potato dextrose broth respectively. The conical flasks were incubated at a temperature of 37°C for 24-48 h for bacteria and 3-6 days for fungi.

The antimicrobial activity of the *Gompherna* extract was analyzed by Agar well diffusion method with a Each well was loaded with 20 μl of the prepared flower extract at different concentration using sterilized pipette with two replications maintained with a positive control

(antibacterial agent Ampicillin and antifungal agent cyclohexamide at a concentration of 10 mg/ml) and negative control as distilled water.

After an incubation period of 24 hours for bacteria and 3 days for fungi, the observations were recorded by measuring the inhibition zone (clearing zone), which indicate the absence of microbial growth around the well. The diameter of inhibition zone (Yıldız *et al.*) was measured and the mean DIZ was calculated. The antimicrobial activity was assessed by calculating the relative inhibition zone diameter (RIZD).

$$\text{RIZD (per cent)} = \frac{\text{DIZ of sample} - \text{DIZ of negative control}}{\text{DIZ of positive control}} \times 100$$

2.6.3 Microorganisms tested

	Bacteria	
1.	<i>Escherichia coli</i> (O157 strain)	Gram - ve
2.	<i>Pseudomonas aeruginosa</i>	Gram - ve
3.	<i>Bacillus subtilis</i>	Gram - ve
	Fungi	
1.	<i>Rhizopus spp</i>	
2.	<i>Aspergillus niger</i>	

2.7 Stability of betalain extract of Gompherna at different temperatures

The effect of different storage temperature on betalain stability was analyzed. The concentrated extracts were taken in screw-capped vials and stored at different temperatures as follows,

Treatments	Temperature levels
T ₁	- 80°C (deep freezer)
T ₂	-20°C
T ₃	0°C
T ₄	4°C
T ₅	30°C(room temperature)

The betalain content was measured on alternate days for first 7 days and at weekly intervals up to 28 days. The betalain content was measured using citrate phosphate buffer and expressed as mg/l.

2.8 Stability of betalain extract of Gompherna at different light intensity

Concentrated betalain extracts were taken in screw-capped vials and stored under ambient conditions at different light intensity as follows,

Treatments	Light levels
T ₁	Dark
T ₂	565 lux
T ₃	1140 lux

The above light intensity ranges were fixed based on earlier reports. White incandescent light was used as light source. The betalain content was measured on alternate days for first 7 days and at weekly intervals up to 28 days. The betalain content was measured using citrate phosphate buffer and expressed as mg/l.

2.9 Sensory Scoring of Gompherna tea and Ice cream

5g of dried Gompherna petals were used for the making tea at 100ml of water. Since the pigment is highly soluble in water, they readily dissolved in water by giving a Purple to violet colour. The Gompherna tea is compared to the Normal Black Tea. And for Ice cream, 30mg of the lyophilized extract of Gompherna is added to the 100g plain vanilla Ice cream to impart colour in it and it is compared to the plain non coloured Vanilla Ice cream. Scoring of the products was done by a panel of members consisting of educated professors, assistant professors and students of Floriculture and Landscape architecture department at Tamil Nadu Agricultural University (India) based on the Taste, Texture, Flavor, Appearance, Palatability and overall acceptability over the control using five point hedonic scale (1:Extremely good, 5: bad).

2.10 Statistical analysis - The statistical analysis was carried out using IBM SPSS Statistics 20, DSTAT and Graph pad prism 5 software.

3. Results

3.1 Total Betalain Content with respect to Spectroscopy method and HPLC method

The Gompherna showed a higher total betalain content, betacyanin and betaxanthin content of 30.51mg/l, 33.35mg/l and 22.76 mg/l using aqueous solution as a solvent respectively. The HPLC quantification of Gompherna extract for betanin (Betanidin 5-o-glucoside) standard showed several major peaks and minor peaks. The elution was monitored at 535 nm. The major peak detected at the retention time of 8.3 minute was readily identified as betanin (Betanidin 5-o-glucoside). Elution of the flower extract coincided with that of the standard. Based on the Rt and elution of standard and peak, the betanin content was quantified 88.41ppm.

3.2 Anti -oxidant activity of Gompherna globosa

3.2.1 Free radical scavenging activity

Significant results were obtained with regard to antioxidant activity of betalain extract. It was revealed that the flower extract scavenged the DPPH and ABTS free radicals depending upon their dosage level.

Antioxidant potential is observed in Gompherna flower extracts with an IC₅₀ value of 181.24mg/ml when compared to ascorbic acid standard (54.23 mg/ml) by DPPH method. The standard ascorbic acid showed IC₅₀ at 81.26µg/ml concentration whereas the IC₅₀ of Gompherna flower extract is 27.2mg/ml by ABTS method.

3.2.2 Total reducing power assay

Significant results were obtained with regard to antioxidant activity of betalain extract by Total reducing power assay. By Chelating potential, the chelates get reduced systematically at higher concentration of betalain extract and results found that Gompherna has 50% inhibition at 2.229mg/ml whereas, the IC₅₀ value of ascorbic acid standard is 7.17µg/ml respectively.

By CUPRAC (Cupric reducing antioxidant power) method and FRAP (Ferric ion reducing antioxidant power) method, irrespective of IC₅₀ value, the antioxidant potential is given in terms of µg equivalence to standard (*i.e.*) ascorbic acid by CUPRAC method. Gomphrena showed the anti-oxidant potential as 49.05µg equivalence to that of ascorbic acid by CUPRAC. FRAP method exhibited 106.17µg equivalence to that of standard in Gomphrena flower extract.

3.3 Anti -Microbial activity

The data on antimicrobial activity of *Gomphrena globosa* against three bacteria *Escherichia coli*, *Pseudomonas aeruginosa*, *Bacillus subtilis* and two fungi (*Rhizopus spp* and *Aspergillus niger*) recorded significant results. Among the bacterial cultures highest inhibition zone of 2.98cm RIZD was observed against *Bacillus subtilis*. With regard to fungal cultures higher antimicrobial potential was registered against *Aspergillus niger* (3.52cm RIZD) at 500mg/ml concentration. Lowest inhibition zone was observed against *Rhizopus spp* with 1.78 cm of RIZD. No inhibition was observed at the concentration of betalain extracts from 100-300mg/ml against *Escherichia coli*.

3.4 Stability to different light and Temperature

Betalain extract of *Gomphrena globosa* exhibited significant results with regard to storage stability at different light intensities after a week of storage period.

Among the different light intensities, betalain extract stored under dark (T₃) condition showed the highest stability on 1st, 3rd, 5th and 7th day (25.92, 25.31, 24.89mg/l of betalain content respectively) followed by pigments stored at 565lux (T₂) intensity (25.3, 24.98, 24.01 mg/ml of betalain content respectively). Least stability of betalain extract was observed in case of pigments stored at 1140lux (T₁) light intensity as the degradation was faster (25.15, 24.01, 22.90mg/l of betalain content).

The stability of betalain extracts from *Gomphrena globosa* was significantly influenced by different storage temperatures. The lowest stability was observed in case of pigments stored at 30°C (17.7, 17.1, and 16.2, 15.02 mg/l of betalain content on 1st, 3rd, 5th and 7th day of storage. Higher stability was observed when pigments were stored at -80°C (21.89, 21.7, 21.57, 21.37 and 21.32mg/l of betalain content) on 5th, 7th, 14th, 21st and 28th day of storage followed by storage at -20°C (21.62, 21.58, 21.32, 21.28, 20.92mg/l of betalain content) after 5th, 7th, 14th, 21st and 28th day of storage. Degradation was less when pigments were stored at 8°C even up to 28 days.

3.5 Sensory evaluation of Gomphrena Tea and Ice cream

The Results was confirmed based on the acceptance of 80% respondent of the overall respondent. On comparing the Gomphrena tea and Black tea, the acceptability for the colour, Texture and taste was higher to Gomphrena tea. The overall acceptability was higher to Gomphrena tea due to its taste.

On comparing the plain Vanilla Ice-cream with beautifully coloured Gomphrena flavoured Ice-cream was preferred more due to its pleasing and colourful appearance, taste, texture and Palatability by 80% respondent.

DISCUSSION

Gomphrena is reported to have Gomphrenin-I (Minale *et al.*, 1966). Betanin is a sub group of betacyanins which are further classified as amaranthin, gomphrenin and decarboxy-betanin group (Strack *et al.*, 1980). So on comparing the Spectroscopy and HPLC method Gompherna extract holds more Betacyanin content.

The betacyanin and betaxanthin content were reported for the scavenging activity thereby inhibiting oxidation. Various methods are reported for the analysis of antioxidant potential of Gompherna pigments. The antioxidant potential of a compound is confirmed by analyzing the free radical scavenging activity and total reducing power using ABTS, DPPH, Chelating potential, FRAP, PFRAP and CUPRAC methods. Betalains were reported to have higher antioxidant property as illustrated (Escribano *et al.*, 1998). Betalains contain a cyclic amine which is similar in chemical structure of the antioxidant ethoxyquine (Luisa Tesoriere *et al.*, 2004).

The Gompherna extracts showed a higher anti-microbial activity against different food pathogens. The inhibition zone formed against *Pseudomonas aeruginosa* in the present study corroborates with the work of previous workers Hamiduzzaman *et al.*, (2012) in *Gomphrena globosa* which inhibited to a diameter of 14mm. Therefore, betalain extract from *Gomphrena globosa* is a potential food dye with good properties.

Betalain pigment from Gompherna when stored at different temperature and light conditions they show a greater degradation at room temperature and high light intensity. Hence betalains very highly sensitive to light and temperature and are required to be stored under refrigeration and in dark. This was in accordance with Reshm *et al.* (2012) which was reported in betalain extracts of *Basella alba* fruit and (Castellar *et al.*, 2003) in *Opuntia stricta*. This difference in stability might be due to the breakage caused by light in the double bond of the electron in the betacyanin molecule which is in the excited stage resulting in the destruction of the betacyanin and that pigment degradation was influenced by many factors like pH, light and heat and not only by the temperature.

CONCLUSION

Gompherna globosa a potential plant for betacyanin and to be used as food dye for their health benefits and aesthetic property that creates an appealing visual especially in the frozen products like Yogurt, Candies, Ice-cream, Squash etc., Further studies can be forwarded in terms of different extraction method and analyzing other different potential benefits.

ANALYSIS OF DIGITAL BANKING SERVICES IN UZBEKISTAN AND WAYS OF ITS DEVELOPMENT

Otabek Maxmadaminovich Melikov*

*Trainee Researcher,
 Denau Institute of Entrepreneurship and Pedagogy,
 UZBEKISTAN
 Email id: info_dtpi2020@mail.ru

ABSTRACT

This article describes the process of providing digital banking services in Uzbekistan through banking platforms and develops its mechanism. The trends of interbank payment system transactions and the dynamics of global online commerce are also studied. A comparative analysis of the services provided by mobile applications of banks and payment providers was conducted. In addition, a mechanism for further development of banking services provided through digital banking platforms has been proposed.

KEYWORDS: Banking, Digital Ban Services, Banking Platform, Transaction, IT-Technologies, Payment System, Payment Providers, Mobile Banking, Internet Banking.

INTRODUCTION

In the context of globalization and cross-sectoral integration, new modern innovative forms of services and digital platforms are expanding. With their help, the representatives of the service sector have the opportunity to bring their services to the world stage, to increase the number of customers indefinitely. In particular, the role of innovative digital platforms in socio-economic processes and relationships is growing. Including, Google, Yandex, Amazon, Gov.uz, Olx and including other platforms.

All this is achieved through the achievements of modern information technology (IT) and their scientific and technological progress in the field of software.

In today's era of development, the role of digital banking services in the online communication of the population is also growing. This is because the population uses digital banking services directly to meet their daily needs (payments for goods and services, utility bills, other payments, international and local money transfers, currency exchange, keeping money in bank accounts or

using bank loans, etc.). This can be clearly seen in the example of digital banking platforms, which are organized on the basis of today's traditional banking systems and are constantly evolving.

Mobile banking applications are the most popular and successful system in the use of digital banking platform. The main reason for this is that a single mobile phone (tablet) is enough to use Mobile banking applications. The mobile phone (tablet) is the most common IT device today and it is convenient and inexpensive to connect it to the Internet.

ANALYSIS AND MAIN RESULTS

Integration of electronic payments, bank cards, credit cards, electronic money transfers, online loans, online deposits, Internet banking services, electronic payment providers and other related tools in the provision of services through digital banking platforms and the mechanism of this process is as follows (Figure 1).

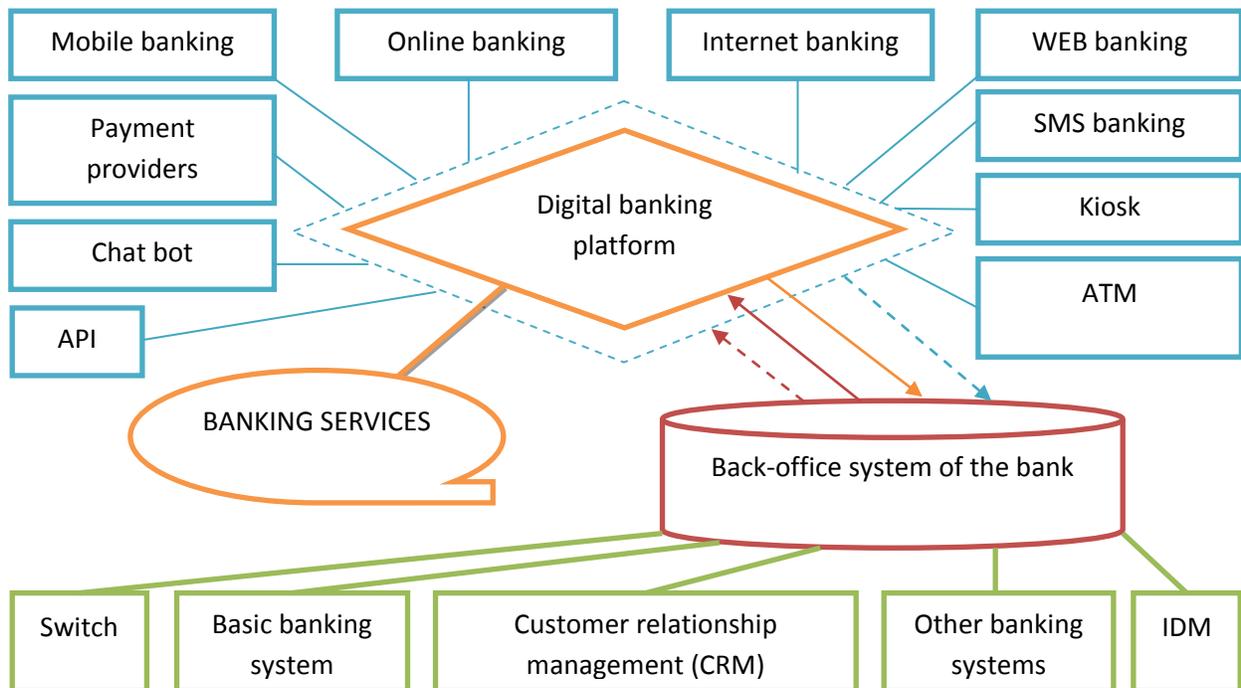

Figure 1. Mechanism of digital banking services.

Source: Author development.

At present, various payment providers are operating as a rapidly growing electronic system, competing with mobile banking applications in the field of electronic payments and other digital banking services.

However, it is more difficult and time consuming for users of mobile banking apps than both payment provider apps to learn how to use cross-border payment tools and set up processes to make optimal use of them.

It should be noted that one of the tasks of the Central Bank of the Republic of Uzbekistan in ensuring the stability of the payment system is to create a convenient, reliable and secure infrastructure of payment services that meet international standards.

As of June 1, 2020, there are 5 payment systems in the Republic of Uzbekistan, 3 of which are payment systems of the Central Bank (Interbank payment system, clearing system and express payment system) and the remaining 2 UZCARD ("Single Republican Processing Center" LLC) and HUMO (National Interbank Processing Center LLC) payment systems) are business entities licensed by the Central Bank in the prescribed manner.

Also, as of July 1, 2020, the Central Bank issued licenses to 27 legal entities to carry out the activities of payment organizations: Slick LLC, Brio Group LLC, Inspired LLC, National Innovative Payment Technologies. LLC, "Paybox" LLC, "Maroqand" LLC, "Milliy pochta paylari" LLC, "International Eco Pay" LLC, "Payment Aggregation Systems" LLC, "Alif Tech" LLC HK, "Wooppay uz" LLC, "Genesis Innovation "LLC," Plum technologies "LLC," Global solutions "LLC," Automated transport payment system operator "LLC," Mayasoft "LLC," E-services house "LLC," Yurt Pay "LLC," Tea House " LLC, "Zplat" LLC, "Center for digital technology and innovation" LLC, "Tezpay" LLC, "Payload" LLC JV, "Interpay Sys" LLC, "Panda internet technology" LLC JV, "Multicard payment" LLC and "PAY -WAY "LLC.

In addition, there are systems that have an "electronic wallet" service and are registered with the central bank as an electronic money system. Including, "BRIO GROUP" LLC, "INSPIRED" LLC, "CLICK" LLC, "WOOPPAY UZ" LLC and "ALIF TECH" LLC (Table 1).

TABLE 1ELECTRONIC MONEY SYSTEM REGISTRY [1]

No	The name of the electronic money system	Operator name	Issuer name	Date of commencement of activities for the issuance of electronic money
1	OSON	"BRIO GROUP" LLC	"Turkiston" XATB	16.06.2020 й.
2	E-CARD	"INSPIRED" LLC	"Universal" ATB	21.08.2020 й.
3	CLICK	"CLICK" LLC	"Agrobank" ATB	21.08.2020 й.
4	WOOPPAY	"WOOPPAY UZ" LLC	"Kapitalbank" ATB	02.11.2020 й.
5	alif.mobi	"ALIF TECH" LLC	"Aloqabank" ATB	02.11.2020 й.

The interbank payment system of the Central Bank, as the most important electronic payment system in the country, is the basis for the functioning of all payment systems.

In order to make interbank payments to the Interbank Payment System of the Central Bank, all 31 commercial banks in the country are connected as participants in the payment system.

According to the analysis, in January-May 2020, the number of transactions made through the interbank payment system decreased by 16% compared to the same period last year, and the amount of transactions increased by 38%.

According to the analysis of this process by commercial banks, a total of 31 commercial banks in July this year received more than 1.1 million payments, of which 28709.39 billion soums. soums.

According to the analysis, in July alone, the National Bank made the largest number of payment transactions - 119844 payments (5426.11 billion soums), Uzpromstroybank - 120606 (5807.94 billion soums), Microcredit Bank - 86149. (796.49 billion soums), People's Bank 128540 (1324.86 billion soums), Qishloq Qurilish Bank 111090 (1085.93 billion soums) and Hamkor Bank 111863 (2314.89 billion soums) payment operations. performed.

These are payments made only through bank tellers, mobile banking applications and online banking platforms. In addition, many individuals also make payments through payment providers such as "Payme", "Click", "Click Evolution", "Oson" and "Woy-wo"

This shows that today the population's need for payment services is growing day by day.

Payment systems are one of the most important sectors of the economy. Because the country's economy cannot be imagined without payment systems based on modern technologies. Payment systems are an area where money is available. Payment systems are the basis for the stability of public finances, reduce operating costs in the economy, increase the efficient use of financial and other resources, increase the liquidity of financial markets and contribute to the conduct of monetary policy. For this reason, it is important to study the development of payment systems.

A payment instrument is any payment instrument that allows a user to transfer funds. In other words, a payment instrument can be called a means of payment. A bank card or other electronic object that contains information and allows the payer to make a payment, as well as perform other operations provided for in the contract between the payer and the issuer of electronic payment instruments [2].

Currently, the most common payment instruments are studied in five categories: digital payments, payments by bank payment cards, cashback; payments through mobile apps, fintex startups [3].

In the context of the digital economy, in order to make it easier for the population to provide payment services, "e-wallets" have been created on various Internet platforms. In particular, the general view of regional and global e-wallets covers the MENA system in India, China and Latin America, including Google Pay, Apple Pay, Yandex. company information. Also Money, Fitbit, Samsung Pay, Alipay.

According to the data, in 2019, 2.1 billion consumers worldwide used their mobile wallets to pay or send money. As it turns out, mobile wallets are handy[4].

With the expansion of online commerce and cross-sectoral integration processes, there is a growing demand for remote, real-time implementation. In particular, the volume of e-commerce in 2020 will reach 5855 billion. USD, the volume of mobile retail sales amounted to 1120 bln. USD and digital goods 139 bln. USD (Figure 3).

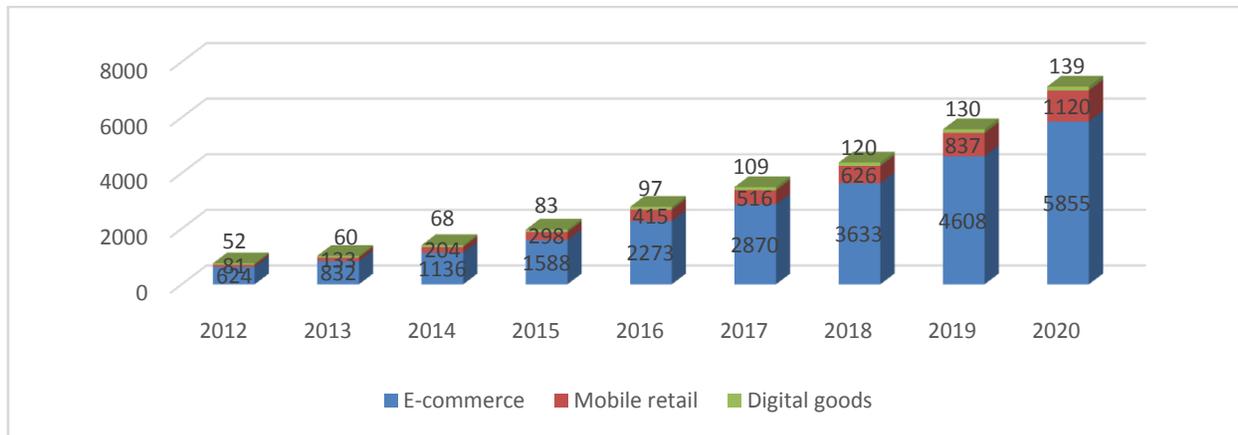

Figure 3. Global online commerce dynamics (billion USD) [8]

According to the analysis, in 2020, e-commerce increased by 2.6 times compared to 2016, 9.4 times compared to 2012, mobile retail sales increased by 2.7 times compared to 2016, 13.8 times compared to 2012, and digital goods increased compared to 2016. 1.4 times, an increase of 2.7 times compared to 2012.

Digital goods are an important element of the e-commerce market, including any non-physical goods and services purchased online. The first digital goods were digital forms of the usual physical goods, including music (from vinyl discs to MP3 files), movies (from celluloid reels to digital), software (from punch cards or wired boards to CDs), and books (from print to e-books) [5].

The technology and technical means used in the field of payments today are constantly evolving and expanding. These include devices that make payments based on NFC (contactless) and QR-code (Quick Response Code).

It should be noted that NFC is one of the brightest and most promising technological developments in the latest IT market [6].

In accordance with the "Concept for the development of digital banking in the Republic of Uzbekistan", the Central Bank launched a standardized and universal system of rapid payments QR-online (QR-online) in March this year.

Within the framework of this system, trade and service outlets (business entities) generate and register QR-codes through commercial banks serving them. Payments are made by buyers by scanning ("reading") QR-codes of sales and service outlets through mobile applications of banks.

At present, as part of the implementation of this system in Tashkent, commercial banks have provided sales and service outlets of more than 3,400 businesses with stickers of the QR-online system.

At the same time, the QR-online system allows you to quickly make payments from bank cards and electronic wallets of payment systems available in the mobile applications of all commercial banks and several payment organizations.

It should be noted that the QR-online stickers issued to businesses, in addition to the existing POS-terminals, allow you to make quick purchases and provide quality customer service. For

example, organizations operating in the field of delivery of products to the customer, passenger transport, will be able to quickly receive payments from customers via QR-code without the use of payment terminals.

The full launch of the QR-online system in the payment services market will serve to improve the quality of services provided, further expand the scope of cashless payments, as well as ensure the stability of the payment system, which is one of the main strategic goals of the Central Bank.

The results of the analysis of the content of mobile applications of banks and payment providers show that in the "transfers" section of the application there is an opportunity to make various bank card and e-wallet money transfers. However, payment providers have the advantage of having a "scan" or "NFC" function when entering a card number, as well as almost 2-3 times more options in the "payments" section, and a wider range of risk management capabilities in the "security" section.

The advantages of banking applications include electronic deposit, electronic credit, virtual card, electronic conversion, exchange rate data and some other banking products and services.

In general, the results of a comparative analysis of the services provided by banks and payment providers on mobile applications can be seen in the following table (Table 2).

TABLE 2 THE RESULTS OF A COMPARATIVE ANALYSIS OF THE SERVICES PROVIDED BY MOBILE APPLICATIONS OF BANKS AND PAYMENT PROVIDERS

Source: Developed by the Author. **Note:** * this service is suspended.

Today, there is no industry that has not entered the digital transformation. Digitalization has accelerated, especially in the context of the COVID-19 pandemic. Due to quarantine restrictions, network and industry enterprises were forced to switch to digitization of their resources. As a result, in the new digital world, amazing and unique experiences of successful service have been formed and are evolving.

According to Efma and Infosys Finacle's Retail Banking Innovations report, 75 percent of financial institutions have identified digital banking transformation as a priority for 2021, with a particular focus on improving the customer experience [9].

However, while there is an understanding of the importance of digital transformation, most financial institutions consider their actions to be insufficient. According to a survey conducted by Efma and Infosys Finacle, only 7% of participating banks have shown that digital change initiatives are achieving the expected results.

CONCLUSIONS AND SUGGESTIONS

It should be noted that in the process of digital transformation, when the main focus is on the product, what management technology should be used is becoming a major problem for many bank managers.

The ever-evolving digital landscape, modern competition, and customer expectations have become the general rule for adaptation in almost all industries, including banking and financial institutions. That is why many banks need to monitor and adapt their customer experience.

It is important to analyze, study, and develop a development strategy based on customer experience and customer needs over time. Because today, the bank and its customers communicate through several electronic channels and platforms. Therefore, the customer experience is more social in nature [7].

As a solution to this problem and in the further development of digital banking services, it is advisable to use the following mechanism (Figure 4).

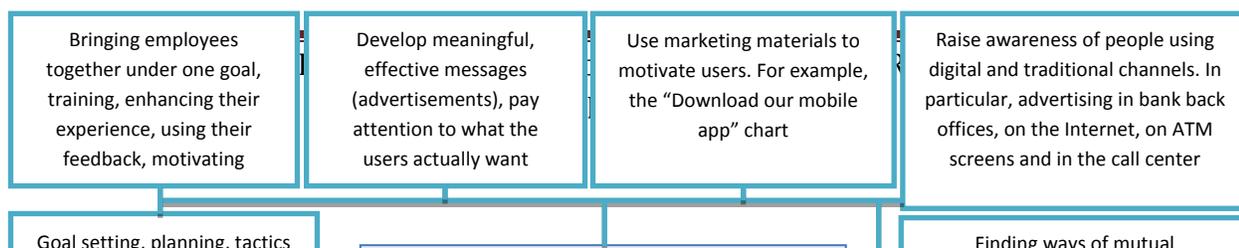

Figure 4. Mechanism for further development of banking services provided through digital banking platforms.

Source: Author development.

Customer experience in the banking sector is an important aspect of any strategic approach to meeting customer requirements. Banks and financial institutions, whether online or retail, need to be digitally transformed to provide a consistent banking experience.

The world's leading digital banking experience shows that in the sustainable development of the digital banking market, banks should not only expand the range of their customers, but also maintain the loyalty of their customers while sharing their experience. This will require easy access to banking services provided by users through digital banking platforms, real-time performance, individual services, data security and other conveniences and benefits.

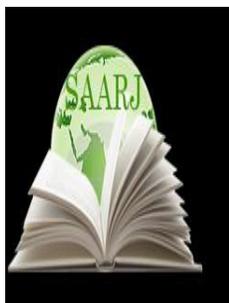

Many banks offer a digital banking experience, but it is important for customers to have a digital banking strategy that guides the process of creating the best online banking services. Customers

are not happy with being “good enough” in a world of so many options. Here’s how to improve online banking services and improve the digital banking experience in general.

While there are many ways for banks today to improve their customers’ digital and online experiences, there are a number of ways that these have been gaining popularity and continue to gain popularity in recent times. In particular, it helps to convince customers that their data is secure and that their experience is always of the highest quality, an institution that cares about every customer.

ABSTRACT

In this article, the norms, terms of planting and the amount of mineral fertilizers in the conditions of irrigated hungry and hungry soils of Kashkadarya region are related to the quality indicators of Autumn soft wheat grain of Yaksart, Gazgon, Bunyadkar and Krasnodarskaya-99 varieties. According to the results of the experiment, it was observed that with a delay in planting times and an increase in the number of planting Meyers, the content of protein and gluten in the grain decreased. The increase in fertilizer yield has led to an increase in the quality of grain, on the contrary.

KEYWORDS: Term, Norm, Fertilizer, Protein, Gluten, Grain, Soil, Fertilizer, Intensive, Natura.

INTRODUCTION

At present, increasing the efficiency of the network of grain cultivation in agriculture is an urgent issue, while the need for food, grain and grain products of the world population is growing without interruption and the energy resources are shrinking. In such conditions, changes in the development of grain cultivation systems should not only increase its yield, but also ensure the quality, stability of grain.

The ever-changing global weather and climate in the world is leading to a reduction in the yield from agricultural crops, including grain-bearing crops, both high and high-quality. Taking this into account, taking into account the diversity of soil and climatic conditions of the Republic, it is necessary to create varieties that are suitable for soil-climatic conditions of each region, fertile,

morning, drought and heat-resistant, high grain quality, and improve The Agrotechnology of their cultivation in different soil-climatic conditions of the Republic [5;4].

Taking into account the soil-climatic conditions of the irrigated lands of the Republic, a number of research works have been carried out by researchers on the implementation of the most optimal planting periods and norms, fertilization standards of autumn soft Willow varieties. [3].

Field experiments in 2014-2016 and 2016-2017 in the conditions of hungry soils of the kashkadarya branch of the scientific research institute of grain and leguminous crops in the field of experimental fields were conducted production test experiments.

New "Yaksart", "bunker", "Gezgon" varieties of softwood, which are recommended to be planted in the southern regions to study the yield of autumn softwood varieties and the duration of planting on the yield components, the effect of planting and fertilization standards, as well as "Krasnodarskaya-99" varieties that are cultivated in large areas, were obtained.

The area of the pike perch, where each option is located, is 100 m² (the length of the rut is 41,7 m, eni 2,4 m), of which 50 m² is taken into account. The number of options was 36 units, the experience was placed in 3 returns, the options were placed in 3 Yaros. Our research was conducted on generally accepted recommendations and methodological guidelines.

Taking into account the biological characteristics of autumn softwood varieties in the conditions of hungry soils of kashkadarya region, optimal planting times, norms and norms of mineral fertilizer have been determined. Autumn soft Willow varieties in these conditions: " Yaksart", " bunker", " Goose " are planted in the early term (1.10.), the norm of planting is 4.0 million hectares. the number of fertile seeds and mineral fertilizers increased by N180 p108k54 kg/ha, by 5,0 ml per hectare at an acceptable time period (20.10). grain yield norm of fertilized seeds and Fertilizers amounted to N210P147K105 kg/ha, planting norm at late period (10.11) was 6,0 million. it was found that higher grain yield and economic efficiency were achieved from autumn soft varieties when the grains were increased to the sprouted seeds and fertilizers were used in the norms of N210P147K105 kg/ha.

In the early (1.10) period, autumn soft Willow varieties were planted in the fields of 4.0 million fertile seeds Krasnodarskaya-99 varieties of Dogi, 13.7% of the protein content in Yaksart varieties, 13.4% in the creative varieties and 13.5% in the goose varieties, these indicators were calculated in accordance with the varieties in 5-6 million fertilized 13,9-13,8%, 13,5-13,9; 13,6-13,7 and it was determined that it was 13,8-14,1%.

Autumn soft Willow varieties in the medium term (20.10) it was determined that the amount of protein in the planted control (without fertilizer) variants was 13.7-14.0% in Krasnodarskaya-99 varieties, 13.8-14.3% in Yaksart varieties, 14.2-14.4% in the builder varieties and 14.3-14.5% in the goose varieties. In the field of experiment, the norms of mineral fertilizers were used on the account of n180p108k54 kg/ha, the protein content of bug'doy Dogi in the pike perch is high, that is, in Krasnodarskaya-99 varieties 14,3-15,1%, in Yaksart varieties 14,5-15,3; In accordance with the norms of varieties and planting, the amount of protein in the grain grown in the stalls is increased (up to N210P147K105 kg/ha), while in the creative varieties it is 14,6-15,4 and in the goose varieties it is 14,7-15,6%. the norm of fertilizers is increased (up to N210P147K105 kg / ha). 15,2-15,8%, 15,3-16,1; 15,6-16,3 and it was noted that it was 15,7-16,8%.

Autumn varieties in the evening (10.11) are planted in 4,0, 5,0 and 6,0 million hectares of sprouted seeds, the amount of protein in cereals grown in fertilizer unused (controlled) stalls Krasnodarskaya-99 varieties 13,5-13,4 %, Yaksart varieties 13,5-15,6%; in the builder varieties 13,7-13,5 and in Goose varieties 13,8-13,9%, in the when applied to/from krasnodarskaya-99 varieties, the protein content in the cereal is 13,6-14,4%, in yaksart varieties 13,5-14,5%, in accordance with the above; 14,0-14,5 and 14,2-14,7% in the wild varieties, mineral fertilizers in these conditions n210p147k105 kg/kg of the amount of protein in the grain grown in the stalls in proportion to the varieties 14,6-15,6%, 14,6-16,1; 14,8-16,3 and it was 14,9-16,8%.

In our experiments, on the effect of sowing periods and norms on the amount of gluten contained in cereals, the same legality observed in protein was demonstrated. In the Krasnodarskaya-99, Yaksart, creative and Goose varieties of autumn soft Willow studied, the amount of gluten in the grain has changed significantly, depending on the duration and norms of planting.

For example, in the early term (1.10) and 4,0; 5,0; 6,0 million units of control (without fertilizer) planted in seedling, the amount of gluten in pike-perch, in Krasnodarskaya-99 varieties 21,9-22,3%, in Yaksart varieties 20,7-22,6; in the builder varieties 20,9 -22,4 and in Goose varieties 22,4-23,7%, when these 23,5-25,2%, 24,0-25,6 in yaksart variety; 24,6 -26,1 in bunyadkar variety and 25,2-26,4% in the goose Variety, the amount of gluten in the grain content obtained in the pike perch given the fertilizer norm N210P147K105 kg / in proportion to the varieties 26,3-28,0; 27,2-28,3; 27,5-28,6 and it was determined that it was 27,9-29,2%.

Autumn soft Willow varieties were planted in 4,0, 5,0 and 6,0 million hectares of fertile seeds for optimal periods (20.10), the amount of gluten in non –fed-controlled variants was 21,2-23,5 %, in accordance with the norms of planting in Krasnodarskaya-99 varieties, 21,7-23,8% in Yaksart varieties, 22,0-23,4% in creative varieties and Within this period and norms, the amount of gluten in the grain grown on the pike perch, which was planted and fed to N180P108K54 kg/ha, was high, which was 24,8-27,0% in Krasnodarskaya-99 varieties, 25,1-26,8 in Yaksart varieties, 26,1-26,9 in creative varieties and 26,8-28,0% in Goose varieties. Increasing the dietary norm (N210P147K105 kg/ha) ensured that the amount of gluten in all variants was relatively higher. The amount of gluten in cereals grown under these conditions was 26,5-29,2% in Krasnodarskaya-99 varieties, 27,4-29,5% in Yaksart varieties, 27,7-29,8% in creative varieties and 28,6-30,2% in Goose varieties.

In our experiments, the sowing periods and norms for the amount of gluten contained in the grains of autumn soft Willow varieties grown together affected. For example, the seeds of autumn soft varieties were planted in late periods (10.11), 4,0; 5,0 and 6,0 million unvchan seeds, the amount of gluten in non-fertilizer control options was determined to be 20,7-20,5% in accordance with the norms of planting, 21,6-21,2% in Yaksart varieties, 21,8-21,6% in the builder and there was a decrease with an increase in the standards.

1-TABLE THE DURATION OF PLANTING, THE NORM AND THE EFFECT OF FERTILIZERS ON THE TECHNOLOGICAL QUALITY INDICATORS OF AUTUMN SOFT WILLOW VARIETIES GRAIN (PLANTING TIME 20 OCTOBER, AVERAGE 2014-2016 YY.)

№	Fertilizer norm	Planting norm, million pieces	Name of the varieties	In composition of the cereals		Glass of grain-Simon league level, %	Don natura-si, g/l

But, when the feeding was carried out, on the contrary, it was noted that the amount of gluten contained in the grain increased not depending on the norms of planting. That is, when the feeding was carried out with N210P147K105 kg/ha, the amount of gluten was 25,0-27,1% in Krasnodarskaya-99 varieties, 25,4-27,0 in Yaksart varieties, 26,6-27,4 in the builder varieties and 26,5-27,5% in the goose varieties. It is known that since the swelling of the grain is inextricably linked with the amount of protein and gluten contained in it, it is also one of the important quality indicators. In our research, in the autumn acceptable terms (20.10) and in the norm, the swelling of the grain grown on the feedstock with n210p147k105 kg/ha, sown in the fertile seed of 5.0 million units, amounted to 69% in Krasnodarskaya-99 varieties, 72 in Yaksart varieties, 75 in the creative varieties and 77% in the goose varieties.

When analyzing the IDK indicators of the autumn soft Willow Krasnodarskaya-99, Yaksart, creative and Goose varieties studied in our research, it is determined that when planted on October 1 and November 10, Class III, that is, from 0 to 15, Hard unsatisfactory and from 105 to 125 weak unsatisfactory, as well as solid satisfactory quality indicators belonging to Class II (from 20 to 40). In our experiments, autumn soft Willow varieties Krasnodarskaya-99, Yaksart, bunker, Goose in the early term (1.10), 4,0; It was observed that the grain quality indicators were met with the demand of Grade II (from 80 to 100) in the options planted in 5,0 and 6,0 million seeds. It should also be noted that against the background of N210p147k105kg/ha Yaksart, geese in this term. It was found that the quality of grain in the variants planted in the cultivar varieties 5,0-6,0 million sprouts responded to the demand ("good") for Grade I (from 40 to 75).

It was shown that these varieties can be planted in early terms. When the autumn soft Willow varieties shown were sown in the above norms in late (10.11) terms, grain was obtained, whose

quality indicators meet the demand of Grade II. Bunda, when these varieties are sown in early terms, it is possible to observe a decrease in grain quality indicators.

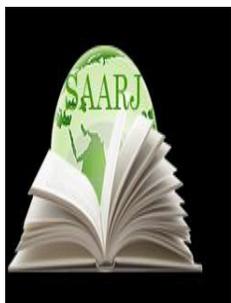

It was observed that autumn soft Willow varieties Krasnodarskaya-99, Yaksart, bunker and Goose were planted in the medium term (20.10), 4,0; 5,0 and 6,0 million seeds, fertilizer was not used (control), and quality indicators of cereals grown on the pedigrees applied to N180P108K54 kg/II grade (from 80 to 100) Meet the requirements of weak satisfactory. It was observed that autumn varieties were planted in the period indicated 5,0 million units of sprouted seeds, and grain quality indicators grown on feeders fed with N210P147K105 kg/ha were observed to meet the "good" demand of I-grade (40 to 75), IE gluten quality. It was found that it is important to properly conduct the nav agrotechnics in cases where the biological characteristics of each variety are due, and at the same time, to correctly specify the dates of their planting, the norms and feeding.

One of the most important indicators determining the quality of autumn soft wheat varieties, which are grown in different soil-climatic conditions of the Republic, is its nature, which determines the fullness of the grain and the value of the mill. Accordingly, grain nature is included in the list of state standards as one of the indicators that determines its quality. Fertilizer of our experiments is not used, planting 4,0; In accordance with the norms of planting in Krasnodarskaya-99 varieties 766-773 g/l, 769-777 in Yaksart varieties, 771-779 in creative varieties and 775-782 g/l in Goose varieties, N180P108K54 kg for feeding plants in the period and norms of this planting was established. when applied to/in accordance with the varieties, these indicators are used 784-787 G/L, 787-790 , 786-791 and 790-795 G/L, when the fertilizer norm is increased (to n210p147k105 kg/in) grain nature Krasnodarskaya-99 varieties 795-797 G/L, yaksart varieties 798-802, It was 801-806 G/l in the creative variety and 805-811 g / L in the goose variety. As a result of the research carried out in the field of experiment, it was observed that in the medium term (20.10), the indicators of autumn soft Willow varieties in the fertilizer unused (control) variant planted were lower than those of the variants in which the feeding was carried out. Bunda, the nature of the grown cereals Krasnodarskaya-99 variety 759-764 g/l, in Yaksart 762-766, in the builder 765-769 and Goose navidv 770-771 g/l, in the specified planting time and norms, the nature of the grain grown in the fields fed with plants N180P108K54 kg/l Krasnodarskaya-99 variety 776-783g/l. When used in Yaksart varieties 776-784, in the builder varieties 780-786, and in Goose varieties 784-790 g/l, the norm of fertilizers is increased (to N210P147K105 kg/l), these indicators are higher, in Krasnodarskaya-99 varieties 789-800 g/l. 790-794 in Yaksart varieties, 793-798 in creative varieties and 797-800 g/l in Goose varieties, it was determined that.

In conclusion, in the conditions of irrigated acreous soils of Kashkadarya region, the most favorable planting period for the Krasnodarskaya-99, Yaksart, creative and Goose varieties of autumn soft Willow is October 20, the norm is 5,0 million fertile seeds, when mineral fertilizers are used in the norms N210P147K105 kg/ha, the highest and highest quality grain yield (protein 15,4-16,2 it was found that the vitreous content was 69-77%, the grain nature was 744-805 G/L, the unit of IDK was 78-75, which provided cultivation to the 1st Class, that is, "good"). When autumn soft Willow varieties were planted early (1.10) or late (10.11) from the acceptable planting time and standards, it was taken into account that the quality indicators shown in the grain decreased.

ABSTRACT

The present article provides information on the importance of antioxidants in the human body, a number of natural and synthetic antioxidants widely used in the food and chemical industries. There is also information on the evaluation of the antioxidant properties of Cucurbita pepo L - variety pumpkin fruit extracts grown in Andijan region by comparing them with standard antioxidants quercetin and glyclazides.

KEYWORDS: oxygen oxygenase, oxidative stress, free radicals, antioxidants, ferment and vitamins, glyclazide, quercetin, pumpkin fruit extract.

INTRODUCTION

The exchange of oxygen in the human body is constantly monitored by physicians and biochemists. This is because oxidative stress in the human body occurs when the balance between the biochemical mechanisms of oxygen oxygenase utilization is disturbed. Reducing oxidative stress is accomplished using biologically active substances (BAS), particularly antioxidants. Antioxidants inhibit rapidly growing oxidative processes, forming inactive radicals and expelling them from the body [1,2].

Because free radical molecules lack one or more electrons, they attack healthy molecules aggressively and cause chain reactions. Free radicals usually accumulate in cell membranes and begin to break down them, resulting in the cells of our body gradually disintegrating and dying [3,4,5].

Antioxidants act as specific donors for free radicals, stopping the formation of free radicals by sacrificing their electrons and not turning them into free radicals. As a result, the oxidation of cells in the body is slowed down or even completely stopped [3,4,5]. Enzymes are the primary antioxidant protection that destroys active oxygen species. They convert reactive oxygen species

into hydrogen peroxide and less aggressive radicals, which are then converted to water and simple useful oxygen [6]. Vitamins and substances of vitamin nature, as secondary anti-oxidant protection, destroy aggressive radicals and prevent the development of a chain reaction that leads to the formation of new radicals that eliminate excess energy. These vitamins or vitamin-rich substances include water-soluble vitamins - C, R-vitamins (bioflavonoids - rutin, cercetin, citrine, hesperidin, ascorbutin), fat-soluble vitamins - vitamin A, beta-carotene, E, K, amino acids containing sulfur (gluta-thione, cysteine, methionine), C-cytochrome, chelates, microelements such as alcohol, selenium and zinc in micro doses [6].

Antioxidants are substances that prevent food from oxidizing under the influence of atmospheric oxygen. In this process, the antioxidants are expended in the oxidation process i.e. they are decomposed under the influence of oxygen in the air. Therefore, the more antioxidants a product contains, the longer its shelf life. However, the addition of large amounts of antioxidants can adversely affect food intake [7,8,9].

Today, there are a number of natural and synthetic antioxidants that are widely used in the food and chemical industries. These include ascorbic acid (E 300), sodium salt of ascorbic acid (E 301), butyloxyanisole (E 320), butyloxytoluene (E 321), sodium lactate (E 325), orthophosphate acid (E 339), citric acid and its salts (E 330 - 333) and other antioxidants can be added. Although these types of antioxidants increase the shelf life of food, they can also exhibit harmful properties [7,8,9].

EXPERIMENTAL PART

Aqueous extracts of localized Cucurbita pepo L variety pumpkin fruits were obtained for the experiment in Andijan region.

Using bidistillate water from the initial concentrated solution to be tested, ie 10% (900 ml of bidistillate water per 100 mg / ml test solution), 25% (750 ml of bidistillate water to 250 mg / ml test solution), 50% (500 mg / ml test solution to 500 ml). bidistillate water), 75% (250 ml of bidistillate water to 750 mg / ml test solution) and 100% (1000 mg / ml test solution) of 5 different concentrations.

The solubility and analysis conditions of the samples to be tested are given in Table 1.

TABLE 1. SAMPLES BEING TESTED

No	Samples	Solvent	Concentrations of solutions in vitro conditions mg / ml
1	Cucurbita pepo L	water	100/250/500/750/1000
2	Quercetin	30% alcohol	100/250/500/750/1000
3	Glyclazide	water	100/250/500/750/1000

The amount of the extract under study (concentration 1 mg in 1 ml) was used as standard. 0.2 M 2.0 ml buffer, 0.18% 56 mg / ml (5.46 mM) adrenaline was used as a control sample.

To check the optical densities of the test samples, 2.0 ml of 0.2 M sodium carbonate (Na₂CO₃-NaHCO₃) buffer with pH = 10.65, 56 mg / ml of 0.18% solution of adrenaline (epinephrine) hydrochloride and 30 mg / ml were added. the mixture was prepared by adding an antioxidant sample and the optical densities of the solutions were checked on a Cary 60 UV-Vis Agilet

Technologies spectrophotometer in a 10 mm cuvette with a wavelength of 347 nm for 30 seconds to 10 minutes by rapid stirring.

For comparative analysis, in addition to the samples examined, the optical densities of glyclazide and quercetin were also determined. Based on the values of the determined optical densities, the AA (%) activity of the samples was calculated based on the following formula:

$$AA = \frac{(D_1 - D_2) \cdot 100}{D_1}, \%$$

D_1 -optical density of adrenaline hydrochloride solution added to the buffer;

D_2 -the optical density of the extract under study and adrenaline hydrochloride added to the buffer.

The statistics were verified with the t-student criterion and the Original 6.1 U.S. program.

The antioxidant activity of the samples obtained for the study was carried out by inhibiting the autooxidation reaction of adrenaline under "in vitro" conditions, as well as by inhibiting the formation of the free form of oxygen. The method is based on the inhibition of the autooxidation reaction of adrenaline, in which the formation of adrenaline over time in "in vitro" conditions is expressed as a percentage of the formation of KFSH (active form of oxygen) and autooxidation (%).

RESULTS AND THEIR DISCUSSION

Optical density of 5 different concentrations of adrenaline hydrochloride solution added to a buffer solution of 0.2 M sodium carbonate ($\text{Na}_2\text{CO}_3\text{-NaHCO}_3$) pH = 10.65 as a control of the solutions of the tested samples, as well as the optical densities of the extract under study and adrenaline hydrochloride mixture were measured on a Cary 60 UV-Vis Agilet Technologies spectrophotometer in a 10 mm cuvette at a wavelength of 347 nm. The results of spectrophotometric analyzes are given in Table 2.

TABLE 2. INDICATORS OF SPECTROPHOTOMETRIC AND ANTIOXIDANT ACTIVENESS (AA%) OF PUMPKIN EXTRACT

№	Solutions to be analyzed	Control (D_1)	Experiment (D_2)	AA%
1	Cucurbita pepo L - (10%) 100 mg/ml	0,23611	0,1970	16,56
2	Cucurbita pepo L - (25%) 250 mg/ml	0,27326	0,2247	17,77
3	Cucurbita pepo L - (50%) 500 mg/ml	0,29455	0,2384	19,06
4	Cucurbita pepo L - (75%) 750 mg/ml	0,36258	0,2918	19,52
5	Cucurbita pepo L - (100%) 1000 mg/ml	0,36806	0,2927	20,47
6	Glyclazide - (10%) 100 mg/ml	0,02782	0,0235	2,0
7	Glyclazide - (25%) 250 mg/ml	0,03895	0,0329	2,8
8	Glyclazide - (50%) 500 mg/ml	0,06955	0,0587	5,0
9	Glyclazide - (75%) 750 mg/ml	0,11823	0,0998	8,5

10	Glyclazide - (100%) 1000 mg/ml	0,13909	0,1174	10,0
11	Quercetin - (10%) 100 mg/ml	0,11128	0,0940	8,0
12	Quercetin - (25%) 250 mg/ml	0,18778	0,1586	13,5
13	Quercetin - (50%) 500 mg/ml	0,27819	0,2396	20,0
14	Quercetin - (75%) 750 mg/ml	0,38251	0,3294	27,5
15	Quercetin - (100%) 1000 mg/ml	0,67247	0,5348	34,7

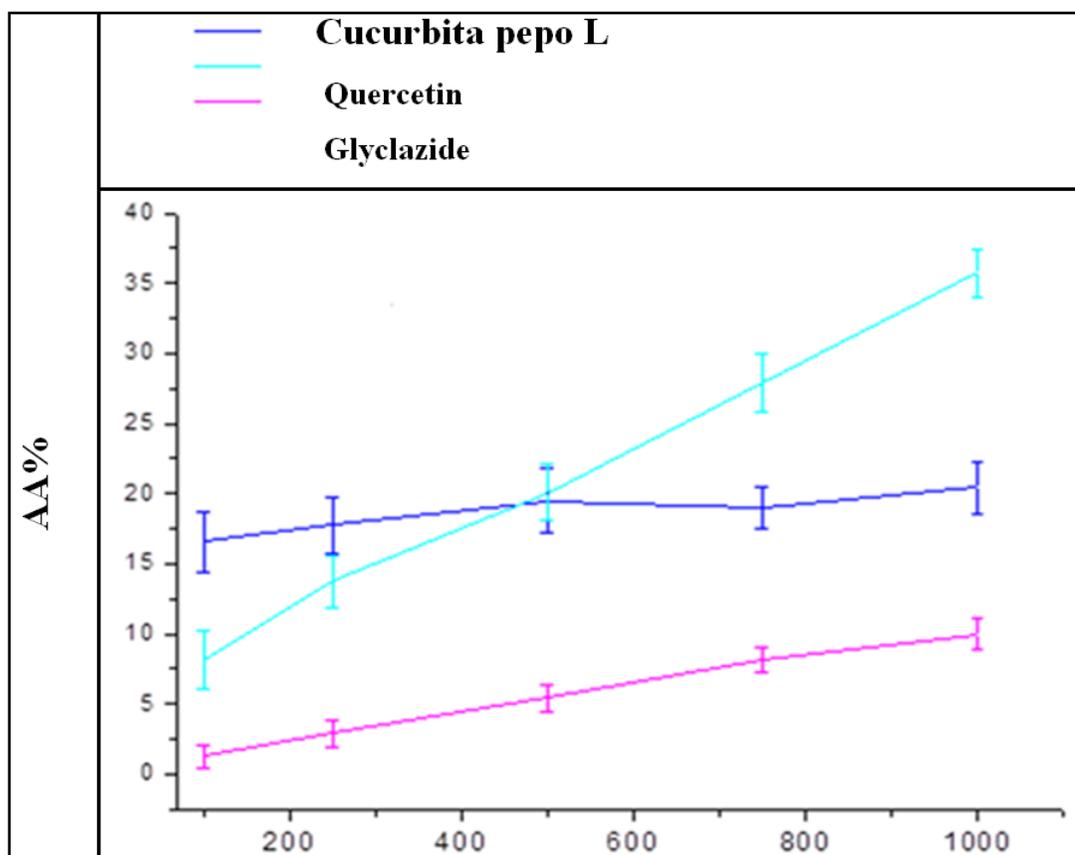

Figure 2.4. Dependence of the antioxidant properties of Cucurbita pepo L sample on concentration

The antioxidant activity of the test samples was calculated based on the values of their optical densities by preparing samples of 5 different concentrations from the test solution with bidistillate water:

$$AA = \frac{(D_1 - D_2) * 100}{D_1} = \frac{(0,23611 - 0,1970) * 100}{0,23611} = 16,56 \%$$

The results of the identified calculations are given in Table 2.

For a comparative analysis of the antioxidant activity of the samples tested, the optical densities of glyclazide used in pharmaceuticals and medicine, as well as quercetin substances used as BFQ in the food industry, and antioxidant activity based on these values were also determined.

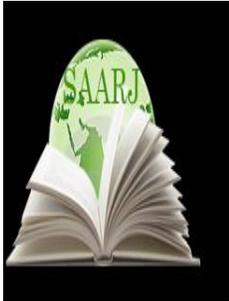

A graph of the concentration dependence of the AA activity of 5 different concentrated solutions of the Cucurbita pepo L-pumpkin fruit sample examined is shown in Figure 2.4.

CONCLUSIONS

1. The AA activity of the test samples was explained by the inhibition of the autooxidation reaction of adrenaline in vitro and the formation of a free form of oxygen.
2. The antioxidant properties of Cucurbita pepo L pumpkin fruit extract samples were evaluated by comparison with quercetin and glyclazide antioxidants as standard antioxidants.
3. It was found that the AA activity of low-concentration solutions of all tested samples was higher than that of glyclazide, and the AA activity of high-concentration solutions was closer to that of quercetin.
4. Local Cucurbita pepo L pumpkin fruit extracts were found to have high antioxidant properties and were recommended for use in the food industry as a natural antioxidant.

 Research Institute of Named After T.N. Qori Niyazi,
 Pedagogical Sciences Of UZBEKISTAN

ABSTRACT

This article describes the role and importance of national education in the essence of Uzbek pop music, the views and opinions of representatives of the Middle Ages, as well as the recognition of pop songs as the main means of education. The issue of training in pop singing has become one of the most important and urgent tasks today. Because it is appropriate to connect the urgency of this issue with the threat of "mass culture" in today's globalization. Because the main means of propaganda of popular culture is undoubtedly the art of music. Therefore, in this case, the variety is explained by some of its essential aspects.

KEYWORDS: *Basic Phrases: National Variety, Song, Tradition, Rap, Pop, Popular Culture, Musical Variety, Pop Singer.*

INTRODUCTION

Decree of the President of the Republic of Uzbekistan No. PP-1533 of May 20, 2011 "On measures to strengthen the material and technical base of higher education institutions and radically improve the quality of training of highly qualified specialists"; Resolution of the Government of the Republic of Uzbekistan dated April 20, 2017 No. PQ-2909 "On additional measures for the implementation of state policy", "On measures for further development of the higher education system", November 17, 2017 No. PP-3391 Resolution "On measures for further development", November 21, 2019 №940 "On the establishment of boarding schools specializing in the art of status", May 26, 2020 PF-6000 "On the role and impact of culture and art in society" The establishment of the Uzbek National Institute of Musical Arts named after Yunus Rajabi in accordance with the Decree "On measures to further enhance the ng, like other genres, laid a solid foundation for the further development of pop songs and its further promotion and propaganda among the population.

In the country, pop music has reached a qualitative stage of its development. It should be noted that this is due to the development of pop art. In this sense, the provision of pop vocal art with professional staff has become one of the important issues. It is known that pop art has not been in the Republic of Uzbekistan for a long time. However, today's music performance cannot be imagined without pop songs. Pop music has developed in our country so fast that it is difficult to find a home or a soul that does not belong to it [1].

The issue of training in pop singing has become one of the most important and urgent tasks today. Because it is appropriate to connect the urgency of this issue with the threat of "mass culture" in today's globalization. Because the main means of propaganda of popular culture is undoubtedly the art of music. Therefore, in this case, the variety is explained by some of its essential aspects.

Over the centuries, music has been able to show its new facets, evolve, improve and reflect the characteristics of different genres. One such genre of music is pop. Variety entered our social life so quickly that it developed rapidly and became somewhat popular, especially among young people.

The concept of variety is a Latin ascended specifically for show, meaning place. By the end of the nineteenth century, this concept began to mean performance in a single, small form. A playwright creates an image of a play, a director, a play, an actor. The three processes are embodied in one person, and if he creates a spectacle in a small form, it is called a number. Spectacle - the art of creating numbers has been called pop since the twentieth century. The person who created the number and performed it at the art level began to be hailed as a pop actor.

It is known that the XX century was a period of radical renewal in the Uzbek musical art, the emergence of "unconventional" compositions and new forms of concerts. In this regard, the concept of "variety" has entered the musical culture.

Initially, it was characterized by an extremely wide range of applications. In this regard, the following comments of O. Bekov are noteworthy: "The variety concert, which was formed on the basis of bright, colorful, dramatic changes, but not interconnected, demonstrated the" ability "to absorb virtually all types of art, from poetry and music to the circus. . And finally, in contrast to philharmonic concerts and theatrical performances, pop art has become the basis of the performing nature, such as a distinctive dialogue between the audience and artists, a light connection. In particular, the constant, direct contact with the audience during the show has led to the emergence of a variety genre, such as a conference. The author interprets the term "variety" in the field of performing arts, emphasizing its defining qualities as "lively, original simple musical forms, sometimes the authors' bright, well-directed intonation and approach to the" popular "dance methods." These ideas apply to the Uzbek musical culture, mainly in the 1920s and 1950s. It should be noted that in the reality of modern Uzbekistan, the term "variety" is used not only in connection with the stage, but also to describe a specific direction in music. Thus, in music culture, the term "variety" in the "narrow" sense refers to samples of music based on a certain unity of performance and artistic elements. The term "variety" is emerging as a private concept. Therefore, it is expedient to use the concept of "musical variety" in this section to understand the whole set of genres of stage music based on the "dynamic method".

From the lexical meaning of the word variety, as a broad concept of "stage art" and in the narrow sense, "musical variety" is a simple, quick-to-remember melody and mainly in the form and

content that serves the purpose of entertainment without special training, which combines dance methods (a bit of a "bit" on the ground), the rhythm is mainly the rhythm - the method gives the main content, and it is expedient to understand the musical samples in which the work is performed mainly on electronic instruments.

The use of the term pop music in a narrow sense ultimately means that it has the same meaning and the same pattern as the term "pop music". However, with the recent changes and developments, the rapid introduction of information and communication technologies in our lives, attitudes to the concept of music variety have changed radically. In particular, the concepts of variety, national variety began to be widely used in Uzbekistan.

It should be noted that the process of formation of Uzbek musical variety was an important basis for folklore. The dancing of songs, lapars and especially cheerful yallas, light melodies and polyphonic rhythms on electronic musical instruments were useful. At the same time, this has become one of the means of providing the national basis of "Uzbek music". Uzbek pop music, which began to take shape in the early twentieth century as a socio-political situation, can be divided into two periods:

- The first is the period of development of traditional genres - song, lapar, yalla, terma;
- In the second period, the genre of folklore began to develop stylistically on the basis of the requirements of the musical variety.

Songs about the Motherland, independence, freedom and the nation have been among the works of art created since the independence of Uzbekistan. Among other types of art, the most popular art form - a new system for the development of music, a new system has been introduced.

Most of us know a nation or a social stratum and group through a writer or poet who is one of its members. Fiction is a great idea in itself, along with elegance it also provides information about the social stratum to which the writer belongs. Unlike art, fiction has a wider range of possibilities. But art expresses that fiction in images, in visible and perceptible, impressive forms. "Literature is stronger than the atom," says Abdullah Qahhor. Fully agreeing with this idea, it can be admitted that art, which is the revival of literature, increases its power tenfold.

A lot of scientific research has been conducted on the role of pop music in the life of the Uzbek nation, people, tribes and clans, its development. There are many definitions of the concept of art by many thinkers. For example, Leo Tolstoy described art as a method of indirect communication between people, while Konstantin Sergeevich Stanislavsky described art as "the beautiful life of the human soul at one time and place." Just as gymnastics elastically corrects the human body, so art restores the human mind and spirit. Along with understanding the value of art, he realizes humanity in people, raises himself to the level of perfect beauty, rests. He says there is no greater happiness. Several other philosophers have also expressed a number of their very valuable, complementary ideas on the subject. It is natural to ask how to distinguish a true work of art from other products of creation, or what the main function of art is, and how people benefit from it. Perhaps another means can be found for entertainment and various other pleasures. What role does art play in it. In our opinion, the greatest task of art is to call these people to goodness and kindness. Art, including music, embodies only good wishes and good deeds. He never preaches evil. In any society where art is glorified, there are more and more people who promote beauty and goodness in this society. From this point of view, it can be

concluded that art means beauty. Art is a means of beautifying life.

The art of singing, which is an integral part of the Uzbek national musical culture, has been developing for a long time, embodying the role and place of people in public life. Singing alone and in groups has been associated with the whole life of almost all peoples since ancient times. It is known that traditional ceremonial folk songs were performed as a group of songs woven by the people on the occasion of this or that ceremony, and they have been performed to this day.

The art of singing, including pop, has a special place in the life of our people today. His voices are heard on radio and television, in theaters and concert halls, in schools and stadiums. In our country, large-scale events and celebrations with pop songs have become a tradition. As mentioned above, the basis of pop songs lies folklore sayings. Probably for this reason, the pop song is closely connected with all the events of our lives and demonstrates a commonality.

Our national-musical heritage, in particular, folk songs and their methods, have a special place in the upbringing of the younger generation on the basis of the traditions, values and culture of our ancestors, in the formation of their spiritual and moral qualities. As the President of the Republic of Uzbekistan Sh. Mirziyoyev said: "Education of high spiritual qualities in society, formation of national ideology, respect for our rich cultural heritage, historical traditions, universal national values, love for the Motherland is one of the key goals of all reforms in our country." . Good results can be achieved as a result of wide enjoyment of the scientific and spiritual heritage of our great ancestors, who lived and worked in the past, and the connection of advanced ideas and views to education today. Also, the theoretical foundations of music, its educational power, the musical heritage of the great poet and philosopher of the East Abdurahmon Jami, Alisher Navoi, music theorist Darvesh Ali Changi serve as a unique source for solving problems of musical and aesthetic education [9].

In the life and activity of a person through the art of music, all the sensory (emotional), intellectual (mental), motivating conditions are a very important and necessary type of activity to increase his work efficiency [8, 9]. In the process of educating students to improve their musical culture, it is important that the teacher takes into account the psychological and physiological characteristics of students. The psyche of the student plays a very important role in conducting music lessons. For this reason, we set ourselves the goal of analyzing the psychological characteristics one by one. In particular, attention is the focus of an activity on something at a particular time. It is mainly divided into two types. One is involuntary attention and the other is voluntary attention. However, it is worth mentioning another peculiar form of it. He is the main and long-lasting character of voluntary attention. It is a much more intense and productive mental activity, giving high efficiency to all kinds of labor.

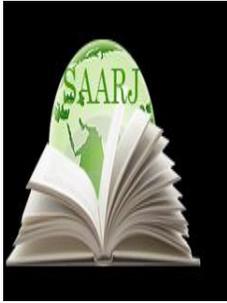

In the art of music, all types of musical activity are related to human attention. Special attention is paid to this concept, especially in pop performance. In fact, attention is a psychological concept. It should be noted that in modern psychology, the study of its qualitative features in the structure of attention. This includes attentional stability, displacement, distribution, and volume. Attention is one of the most important components of the learning process. All the great musicians had an extraordinary focus. For example, Mozart was able to write music calmly in a crowded room and in the presence of strange voices [6, 8].

In conclusion, it should be noted that in the context of the Uzbek national musical traditions, there are spiritual and moral views that serve to ensure the development of the individual, which

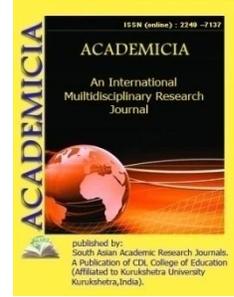

has an important educational value. Young people should pay attention not only to modern pop music, but also to singing and listening to national and traditional, classical songs. To do this, music lessons, media, Internet sites and other means of listening to music on CDs of songs offered to young people, the literature on the work of teachers and composers have found their own meaning, the melodies contain elements of national melodies. It will be necessary to establish efficient use. Because it is impossible to understand the essence of the true national tone of art without knowing the history of our art, the history of our teachers.

 UZBEKISTAN

ABSTRACT

Fiction is a product of the human mind and emotions. At the heart of fiction is the so-called miracle of human nature, the most intelligent, the most perfect being on earth, so we are not mistaken in calling this kind of art anthropology. Fiction reflects the human spiritual world, his thoughts and experiences. These experiences are embodied through vivid images.

KEYWORDS: Dictionary, Literature, Development, Language, Subject.

INTRODUCTION

When we talk about the concept of temporality in a literary text, the first question that arises is what the literary text itself is. There are several tariffs for text. The term "text" is interpreted differently in the scientific literature. The Uzbek Explanatory Dictionary points out that the word text is borrowed from Arabic, is an outdated biblical word, and is equivalent to the meaning of the word text. Exactly

The dictionary defines the word text as follows:

- 1 A written, copied, or printed work of art, scientific work, speech, document, etc., or part thereof, is text. For example: the text of the article.
- 2 A poem or word that is the basis of a piece of music, such as a song, opera, romance, and so on.
- 3 The name of one of the large fonts in polygraphy.

This means that only the written form should be considered when referring to the text. The annotated dictionary in the new edition also contains the following emphasis: text [Arabic - shoulder; written expression of speech, text].

- 1 An author's work or document formed in writing or in print.

2 The main part of the printed edition without pictures, drawings and comments.

L. Loseva, one of the textual scholars, points out the following three features of the text:

1 Text is information in written form;

2 The text is semantically and structurally complete;

3 The text reflects the author's attitude to the information provided (the author's approach).

A text is a unit with linguistic communicative, semantic features. The text has features of completeness and integrity. It is coherence, communicative, which provides logical-semantic relations

It is based on categorical indicators such as goal statement and informativeness (importance of information or level of novelty). Text is a unit of information exchange and it mainly serves to perform this function. In addition, the term "dikurs" is often used in many works on the study of textual problems in world linguistics. Although the term is widely used in text linguistics as well as in the fields of literature, sociology, political science, philosophy, logic, and psychology, it is also used in text linguistics.

Nor is there a single, widely accepted interpretation, meaningless. Initially, the terms "discourse" and "text" were used for the same concept, then "text" was used for written communication and "discourse" was used for oral communication. The word means "discours" in French.

In short, a text is a unit at the highest level of the syntactic level of a language, a structural, semantic, and communicative whole that occurs orally and in writing on the basis of the connection of a sequence of sentences.

According to the functional methodological essence of the text is a scientific text (thesis, article, lecture, reviews), literary text (prose, poetry), official text (reference, decision, order, description, recommendations), popular text (article, conversation, greeting, and speech texts).

It is necessary to distinguish between two opposing types of texts, the literary text and the non-fictional text, based on which of the two important functions of language, the communicative function or the aesthetic function, leads in the purpose of the text. It is better to call a text that is led by a communicative task in the main purpose as a non-fiction text, and a text that is led by an aesthetic task in the main purpose and essence. "The literary text reflects the diversity of all genres of fiction. It is dominated by emotion and aesthetic taste, and the form of expression is of great importance. In literature, artistic and emotional perceptions are stronger than logical perceptions of reality. Depending on the form and manner in which the content is presented, the emotional impact and aesthetic value of the work will be high. "

[30] In a literary text, the author conveys artistic pleasure to the reader through a variety of linguistic means. In a literary text, the writer chooses words and phrases depending on the theme, content and character of the work, makes effective use of syntactic construction, lexical, grammatical and semantic methods. In the text, along with the norms of literary language, the possibilities of live (spoken) language are used equally. Even slang phrases are used to individualize the language of the character.

The text is multifaceted and complex. Like any whole, a text is made up of the elements that make it up, the specific units.

In linguistics, which units form a text or which units are divided into parts of a text?

There is a lot of debate about the calculation. At first glance, defining text units does not seem to be such a complicated problem. But this is not the case, which is why there are so many different and controversial views among textual linguists. For example, I. R. Galperin states that a sentence cannot be a unit of text. According to the linguist, a large whole that combines several sentences - a whole larger than a phrase - can be a unit of text. The phrase, which is an integral part of the whole, says that a text cannot be a unit at the same time.

Most linguists, on the other hand, argue that the sentence is the main formative element of the text.

In fact, it is difficult to imagine the content of the text, its relation to the objective world, and, consequently, its correct understanding. Therefore, the place of the sentence in the text system, especially its ability to form text, cannot be denied. In the text, sentences are connected by various syntactic means. These include various lexical and grammatical units, such as repetitive parts, rhymes, xiasmatic constructions, units representing time and space, tense forms of cuts, and modal words.

Real life dominates the world around us. To the reader who reads a work of art, the work of art is taken from human life and is an objective, real-time expression, born of such observation. Yes, a work of art depicts human life, but when one studies the theoretical nature of the artistic age in which one lives, one realizes how wrong the above observation is. Below we will try to explore the difference between real and artistic times.

The relationship between the units of time and space in any text is inextricably linked, because any event takes place in a specific time and space.

The logical relationship between events in time and space can be divided into the following types:

- 1) Temporal semantic group;
- 2) Local semantic group.

Temporal relations have been studied in linguistics at different levels of lexical, morphological, and syntactic units. The semantic temporal relationship between the two sentences is interrelated.

Local relationships are also divided into the following types:

- a) The relation of action, the place of origin of the property:

She had stopped at a shop, over which was written, Krook, Rag and Warehouse [21; 57];

- b) The relation of action, the place of origin of the property;

- d) The relationship of the direction of motion, the direction of the property:

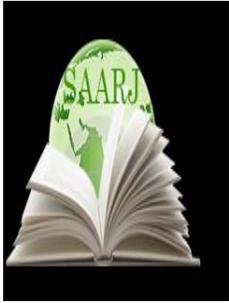

Jack went to his corner walking that funny jerky way and we got him down through the ropes and through the reporters' tables and out down the aisle [27; 145b].

The category of temporality plays an important role in shaping the content of a literary text. One of the most important parts of text referential modality is temporal semantics. The problem of analyzing the content and structure of the text, of course, requires the discussion of the question

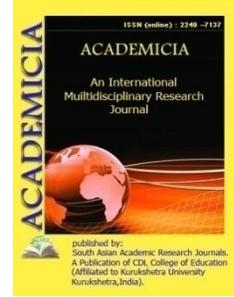

of determining the place of the category of temporality or time in the content of the text. Researchers have already focused on this issue, noting that temporal integrity is one of the most important indicators of text structure. However, information on the temporal structure of the text is currently scarce and they are not sufficient to fully comprehend the role of time indicators in the formation of the textual content. The formation of the text and the connection of its components with the help of units representing time and space stems from the temporal properties and functions of the text. Integrity of time is one of the indicators of the text, because the content of the text requires the manifestation of temporal indicators, and without these indicators it is impossible to imagine a clear expression of any communicative purpose. In this regard, the category of time should be recognized as one of the main categories that shape the communicative content of communication units. Events in a work of art take place over a period of time. Only the time in a work of art differs from the regularity of time in real life. "Time lexemes are used to connect distant (distance, indirect) and contact (remote, indirect) parts of text. Some temporal words serve as lexical grammatical connectors, reflecting the chronological sequence in the text [9; 24b] ". L. A. Nozdrina discusses the concept of "text actualizers". According to the linguist, the main actualizers of the text are the motives for the interaction of the literary text with the reality behind the text: temporality, localism, personality, referentiality, and so on. At the heart of these categories are the interrelationships of morphological, lexical, syntactic, and word-formers, which are the means of language that serve to construct the typological characteristics of a text. These basic actualizers of the text are the text.

**COMPARATIVE ANALYSIS OF RISK PERCEPTION AND RISK
 MANAGEMENT STRATEGIES AMONG VEGETABLE GROWERS IN
 PUNJAB STATE, INDIA AND NAKURU COUNTY, KENYA**

CarolyneCherotich*; Dr. Manmeet Kaur**

ABSTRACT

Vegetable growers are faced with wide range of risks that have to be managed, especially in developing nations. The risks are on a trajectory due to rise in trading of agricultural produce globally, ravages of climate change and emerging pandemics that jeopardise vegetable production enterprises. This study presents results of an investigation into risk perception by vegetable growers in two regions; Punjab State, India and Nakuru County, Kenya. Few studies have carried out a comparative investigation across two regions touching on risk perception among vegetable growers, risk management strategies adopted and barriers that prevent successful mitigation of the risks. Using descriptive and inferential statistics, data from 200 respondents was analysed and market risks was ranked as the leading source of risks. Improved agricultural practices was the main risk management strategy employed by (77%) of the growers in Punjab and (79%) in Nakuru. (63%) of growers in Punjab and (62%) in Nakuru also used market survey as a strategy. Lack of information on pests and diseases (53%), marketing challenges (50%) and lack of access to extension services (31%) were the major barriers to risk management strategies among vegetable growers in Punjab; compared to lack of access to capital (57%), lack of information on plants and diseases (47%) and lack of access to extension services (27%) in Nakuru. This study seeks to provide an understanding to existing risk challenges and suggest areas of improvement to support efforts for risk management and reduction.

1. INTRODUCTION

Vegetable cultivation among small scale farmers has a key role in agricultural productivity. It has the potential to improve the social and economic condition of small scale and marginal farmers compared to other crops since its cultivation is considered to result in higher yields and higher economic returns within a short period of time (Mohammad et al., 2020). Vegetable production however occurs in highly variable biological, physical and economic conditions, mostly characterised by lots of uncertainty misfortune and loss (Harwood *et al* 1999; Huirne, 2003). This results from natural calamities and catastrophic events (Veber 2014); biotic factors such as diseases and pests (Anastacia *et al* 2011; Toroitich *et al* 2014; Wright *et al* 2016); technological changes, regulations and social concerns and also human factors (Belaineh& Lars, 2005). It is therefore necessary that growers recognize the risks involved in the vegetable cultivation so as to easily plan for their prevention and management (Drollette 2009).

Farmers generally make decisions on the basis of expectations, projections, and even on the basis of what they fear or hope is possible (Patt, 2001). Risk sources for vegetable growers should be understood in order to develop action plans towards crop management and adaptive systems. To understand how vegetable growers make decisions in risky and uncertain conditions, an analysis of their perception and reaction in risky situations is of utmost importance. Farmer perception on risk source and the subsequent response have bearings on the type of intervention strategies that would be considered across households and ecosystems (Sjoberg, Moen, and Rundmo, 2004; Váchal et al. 2013; Veber 2014).

India is ranked as the second highest vegetable producer in the world after China (Nasim, Sinha *et al* 2018). It has witnessed a rise of 59-61percent in the overall horticultural production sector and an annual 2-3 percent increase in demand (Govil, 2013; Sinha *et al* 2018). The ripple effect of the expansion in vegetable production has brought about an ensuing increase in vegetable cultivation in Punjab State; from an initial area of 100 thousand to over 208 thousand hectares, and a production of 168502.90 thousand metric tonnes per hectare (Anonymous 2016; Nair and Barche, 2014).

Vegetable production in Kenya has also continued to grow at an average annual rate of 5.11 percent (KENDAT, 2015), with over 90% production by small scale farmers and with a 96% local consumption (KNBS, 2019, FPEAK, 2021). The impressive growth has witnessed a consequent increase in vegetable production performance in Nakuru County, mostly for export farmers, while leaving out a vast majority of small scale growers (Francesco and Hanne, 2019).

The increase in vegetable production in the two regions can be attributed to changing habits and need for a diversified nutrition, use of the latest technology, availability of technical training and easier access to markets (Hazell et al 2007; Kadenyi, 2017; FPEAK, 2020).Despite the apparent remarkable achievement in production of vegetables, the increase in supply has not met the ever-increasing demand due to several challenges in cultivation (Aseto et al., 2020; Sunny & Sanjay, 2019). Vegetable production is at a point of stagnation in Punjab due to depleted water levels, decreasing land holdings, multiplication of insects and diseases (Singh, 2017); while in Nakuru, high dependence on rainfall patterns for production and harvesting cycles; small landholdings; a lack of the necessary knowledge and skills among most smallholder farmers, poorly organised marketing system has introduced an aspect of unreliability in production (AGRA, 2017; WFP, 2015; Aseto et al., 2020). There is need therefore to address these challenges in order continue exploiting the ever increasing rise in demand.

2.0 REVIEW OF LITERATURE

Vegetable growers generally experience and cope with risks from different sources (Huirne, 2003). The risks can lead to adverse effects on production such as decrease in yield and income, financial ruin, famine and even farmer health challenges (Komarek et al., 2020). The dependence on rain fed agriculture, small sizes of land and lack of access to financial aid and technical information makes them highly vulnerable to risks from different sources including; weather and climate change risk (Greiner et al., 2008; Rejesus et al., 2013; Harvey et al., 2014; Schreinemachers et al., 2017; Harvey et al., 2018); market risk (Musser and Patrick 2002; Manek& Ghosh, 2019); institutional risk (Lien et al., 2003; Flaten et al., 2005); financial risk (Palinkas and Székely, 2008; Musser and Patrick 2002; Jain and Parshad 2006; Pelka, 2015); production risk (Goodwin and Mishra 2000; Holt &Chavas 2002; Anju, 2017); human risk (Dercon et al., 2005) and bio-security threats (Heymann 2005; [FAO, 2013](#)). These risks can simultaneously affect a farmer, thus showing a need for in-depth efforts to address them because risks can be a barrier or a trigger for growth and expansion in vegetable production (Marraet al 2003).

Risk perception is the subjective evaluation of the chances of a specific type of misfortune occurring; and the level of preparedness for the outcome (Sjoberg, Moen, and Rundmo, 2004). Risk source perception aids in quantification of the negative and positive variations from planned outcomes (Váchal et al. 2013; Veber 2014); and also aids in prevention and management of potential risk (Harwood, Heifner, Coble, Perry &Somwaru, 1999). It is critical to understand how vegetable growers perceive risk in order to develop and implement programs and policies that support their management (Greiner et al. 2009). Research has shown that there is often a disconnect between risks which are perceived and the actual risks (Botterill and Mazur 2004); that the aim to change behaviour does not always lead to actual change in behaviour regardless of an individual's risk assessment and risk perception (Niles *et al* 2016). Menapaceet al (2015) also shows that the mental acceptance of existence of a risk factor; such as a first-hand experience with crop loss gives an explanation as to why some farmers perceive risks more than others. Some farmers are also risk averse and perceive risks differently from those who are neutral (Sulewski and Kłoczko-Gajewska, 2014). It is therefore imperative that the two categories are considered when assistance in decision making is being provided. Farmers from different countries live within different agro-ecological and institutional conditions, which can have an influence on risk perception. There is therefore need to establish whether risk perception differs based on vegetable growers' domicile.

Strategies related to risk reduction and risk transfer can significantly augment vegetable farmers' capacities to with stand shock. This therefore makes early detection of risks and their effective management paramount (Jankelova, Masar, Moricova 2017). Choice of risk management strategies is often influenced by farmer socio-economic characteristics (Velandiaet al 2009; Careret al 2018; Ullahet al 2015; Tudor et al 2014); hence affecting the decision making on ways of mitigation (Palinkas and Szekely, 2008). Vegetable growers employ different management strategies ranging from simple practices at the farm level to legally bound ones such as insurance and contracting (Lin, 2011; Gillespie and Mishra, 2011; Kisaka-Lwayo, and Obi, 2012). The suitability of the different coping mechanisms is at times of doubtful authenticity mostly due challenges of contextualisation. The current study therefore attempts to

establish the suitability and authenticity of some of the risk management strategies among vegetable growers in two different regions.

There are a range of barriers to successful management of risks among vegetable growers. Literature shows that barriers differ based on whether the agri-enterprises are in developed or in developing nations (Legesse and Drake, 2005; Ilbery et al., 2013). Small scale vegetable growers can experience difficulty in their productive process due to lack of access to information and technical knowledge, financial challenges, and poor production technologies (Legesse and Drake, 2005; Mannon, S.E. 2005); hence limit their productive capacity.

SIGNIFICANCE OF STUDY

While the existing literature has discussed different sources of agricultural risks for individual crops in different countries, those that cover individual crops in different countries in the context of agricultural risks, risk perception, risk management strategies and the barriers to the different strategies are few, if any. This study therefore seeks to fill this gap.

OBJECTIVES/HYPOTHESIS

The aims of this study are, therefore, to (1) assess risk perception, risk management strategies and barriers among vegetable growers, (2) identify the socio-economic factors that affect vegetable growers' perceptions and management strategies. The hypotheses guiding the study are (1) there is a difference in risk perception; risk management strategies and barriers to management (2) socio-economic factors have no effect on perception among vegetable growers.

RESEARCH METHODOLOGY

STUDY AREA

The study was conducted in two different countries, Punjab State in India (Fig. 1) and Nakuru County in Kenya (Fig. 2). The selected sites are among the leading areas for agricultural production both in India and Kenya and have embraced diversification into vegetable production (Singh et al 2009; Sharma et al 2014). They are areas with high vulnerability to weather shocks, large poor and vulnerable populations, and high dependence on rain-fed agriculture for Nakuru and high dependence on irrigation for Punjab.

Fig.1 Punjab State (source 2020 Government of Punjab)

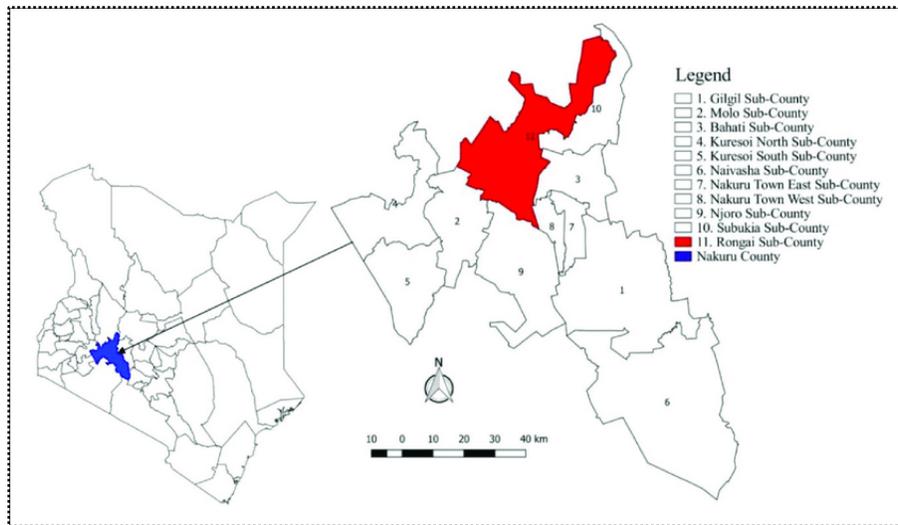

Fig. 2: Nakuru County (Source; Kiplagat et al, 2020)

DATA COLLECTION AND DATA ANALYSIS

Semi-structured questionnaires were used to elicit vegetable growers' socio-economic characteristics, their risk perceptions, risk management strategies and barriers to management. The schedule had statements which were categorized into market risk, financial risk, production risk, institutional risk, human risk, weather and climate change risk and bio-security threats. Respondents' perceptions of the risks were expressed in terms of a three-point continuum of critical, major and minor. Risk perception was categorized into critical, major and minor with a score of 3 for critical risks, 2 for major risks and 1 for minor risks. To calculate the scores, total points and maximum points were used. Friedman's test was used to find differences in rankings of the risk as perceived by the vegetable growers after it was established that the data met all requirements.

In order to document different strategies adopted by the farmers, thematic analysis of data was used to develop a list of eight strategies from qualitative data. These were then dichotomized into a score of 1 if the respondent followed the strategy and 0 if the respondent did not follow the strategy. Multiple Response in SPSS was then used to calculate percentage number of cases for each choice. To calculate barriers to the different strategies, thematic analysis of data was used to develop a list of ten barriers from qualitative data. These were dichotomized into a score of 1 if the respondent faced the barrier and 0 if the respondent did not face the barrier. Comparative analysis of socio-economic characteristics of the vegetable growers' in Punjab and Nakuru was done using Mann-Whitney u test. Multiple regression analysis of risk perception on socio-economic characteristics was also carried out after the data was found to have met the multiple regression assumptions.

RESULTS AND DISCUSSIONS

SOCIO-ECONOMIC CHARACTERISTICS

The sample population consisted of 200 farmers: 100 from Punjab and 100 from Nakuru. The findings were as shown in Table 1 below. Majority of the farmers were middle age in Punjab

(75%) as well as in Nakuru (61%). (100 %) were males in Punjab compared to (77%) in Nakuru. As regards education, (47%) of the respondents in Punjab had secondary education compared to (37%) in Nakuru; matric level was (19%) in Punjab and (24%) in Nakuru; and, graduate level at (18%) in Punjab and (11%) in Nakuru. The highest percentage of the sample (66%) and (64%) in Punjab and Nakuru respectively had 10-20 years farming experience; while (72 %) in Punjab and (61%) in Nakuru had less than 10 years vegetable growing experience in farming. (64%) of the farmers in Punjab and (99%) of those in Nakuru operated farm sizes of less than 2.5 acres. (83%) of the growers in Punjab leased land for vegetable cultivation compared to (99%) in Nakuru. The income from vegetable sales was high in Punjab (82%) with farmers earning above 7 lakhs than in Nakuru where the majority (47%) earned below 4 lakhs. Majority of the vegetable growers in Punjab sold their produce to wholesalers compared to in Nakuru; while majority (44%) of the farmers in Nakuru sold their produce to retailers.

TABLE 1. VEGETABLE GROWERS' SOCIO-ECONOMIC CHARACTERISTICS

S. No	Parameters	Category	Punjab (n=100)		Nakuru (n=100)	
			<i>f</i>	%	<i>f</i>	%

COMPARISON OF SOCIO-PERSONAL PROFILES OF VEGETABLE GROWERS IN PUNJAB AND NAKURU

A comparative analysis of the socio-personal profiles of the vegetable growers was done to determine any there differences between the two regions. The results are shown in Table 2

TABLE 2: COMPARISON OF VEGETABLE GROWERS IN PUNJAB AND NAKURU BASED ON THEIR SOCIO-PERSONAL PROFILES

S. No.	Socio-personal profile	U	Z
1	Age (years)	4855.50	-.354

*Mann-Whitney *u* test Note.* $p < .05$, ** $p < .001$

Age scores of vegetable growers in Punjab ($Mdn = 38$) were equal to that of vegetable growers in Nakuru ($Mdn = 35$). This shows that majority of the vegetable growers in the two regions fell into a category which was almost equal, which from Table 1 was found to be middle age group. Singh et al., (2006) and Mohammad et al., (2020) have also reported findings that majority of farmers in their studies fell into the middle age groups. The gender scores in Punjab ($Mdn = 1$) were less than those for Nakuru ($Mdn = 1$). A Mann-Whitney test indicated that this difference was statistically significant, ($U_{n_1=n_2=100} = 3850.00, z = -5.085, p < .001$). This is because there were no female respondents; thus collaborating previous observations by Munshi, (2020), Singh & Vinay (2013), Munmun & Arindam (2014), Bala, (2010) and Amekawa et al., (2021) that though several women are engaged in agricultural activities in Asia, a large number of them have remained "invisible" and are mostly not considered during decision making in farm activities. Comparatively, female vegetable growers in Nakuru was (23%), a figure which is quite low but supports reports by Anonymous (2014) that women in Kenya make up 46% to 65% in agriculture, but often play a subordinate role (Muriithi and Matz, 2014) mostly underpinned by customary laws (Otieno, 2019).

Education level for vegetable growers in Punjab ($Mdn = 5$) differed significantly from that of vegetable growers in Nakuru ($Mdn = 4$). A Mann-Whitney test indicated that this difference was statistically significant, ($U = 3920.00, n_1 = n_2 = 100, z = -2.764, p < .001$). This shows that a higher percentage of vegetable growers in Punjab (66%) had secondary education and above compared to (48%) in Nakuru. The reasons for the lower percentage in Nakuru could be due to most people who have post-primary education moving out to other occupations (Lewin, 2007). The works of Adebayo (2012) and Mohammad et al (2020) have also found similar results that most of the small scale farmers possess higher education level. Vegetable farming experience did not differ significantly, among vegetable growers in Punjab ($Mdn = 1$) and Nakuru ($Mdn = 1$), ($U = 4427.00, n_1 = n_2 = 100, z = -1.705, p > .05$); however, several respondents had low vegetable growing experience. This can be attributed in Punjab to recent changes in farming patterns towards vegetable production as farmers diversify (Singh, 2017); while in Nakuru, it could be attributed to a negative perception of unprofitability in vegetable cultivation due to low farm gate prices; hence fewer farmers diversifying to vegetable production (Abdulai, Nimoh, Darko-Koomson, & Kassoh, 2017).

Operational land holding scores of vegetable growers in Punjab ($Mdn = 2$) differed significantly to that of vegetable growers in Nakuru ($Mdn = 2$), ($U = 3348.50, n_1 = n_2 = 100, z = -5.877, p < .00$); compared to the distribution for land leased, of which there was no significant difference; Punjab ($Mdn = 0$) and Nakuru ($Mdn = 0$), ($U = 4476.50, n_1 = n_2 = 100, z = -1.511, p > .05$). This could be attributed to pressure on land and shrinking land sizes which pushes most to hold marginal farms; a condition far more prevalent in Nakuru than in Punjab. Lack of difference on the farm leased shows that majority of the farmers could be diversifying into vegetable production given their potential as a source of higher income (Mohammad et al., 2020; Joshi et al., 2003; Bashangwa et al., 2020, Mahajan, 2016). Farmers therefore resort to leasing more land to boost productivity.

Annual Income among vegetable growers in Punjab ($Mdn=12$) differed significantly from that in Nakuru ($Mdn=6$) ($U= 1613.00$, $n_1 = n_2 = 100$, $z = -8.529$, $p<.001$)., where majority of the vegetable growers had an income of over 7 lakh compared to Nakuru where the majority earned an income below 4lakh from the vegetable sales. Navjot& Poonam (2014) have reported similar findings of higher income from vegetables in Punjab; while Kealeboga et al., (2017), and Muyanga & Jayne, (2014) reported similar in Kenya. Marketing of vegetables differed between the two countries. Vegetable growers in Punjab ($Mdn=0$) sale of produce to direct consumers, differed significantly compared to that of Nakuru ($Mdn=0$), ($U= 3844.00$, $n_1 = n_2 = 100$, $z = -4.625$, $p<.001$); compared to sale to retailers, ($U= 4232.00$, $n_1 = n_2 = 100$, $z = -2.188$, $p<.05$).Sales to wholesales also differed significantly for Punjab ($Mdn=1$), and Nakuru ($Mdn=0$), ($U= 2742.00$, $n_1 = n_2 = 100$, $z = -6.505$, $p<.001$); compared to sale to exporters in Punjab ($Mdn=0$), and Nakuru ($Mdn=0$), ($U= 4841.00$, $n_1 = n_2 = 100$, $z = -1.082$, $p>.05$); processors in Punjab ($Mdn=0$), and Nakuru ($Mdn=0$), ($U = 4350.00$, $n_1 = n_2 = 100$, $z = -3.717$, $p<.001$); government corporations in Punjab ($Mdn=0$), and Nakuru ($Mdn=0$), ($U = 4650.00$, $n_1 = n_2 = 100$, $z = -2.686$, $p<.001$); and cooperative societies in Punjab ($Mdn=0$), and Nakuru ($Mdn=0$), ($U = 4650.00$, $n_1 = n_2 = 100$, $z = -2.686$, $p<.001$). This shows that there is potential for market expansion to embrace processors and even export.

VEGETABLE GROWERS' PERCEPTIONS OF RISK PERCEPTION

A summary of vegetable growers' perceptions of risks is presented below;

TABLE 3: VEGETABLE GROWERS' PERCEPTIONS OF RISKS

S.NO	Punjab Category	Risk perceived	Ranking	Nakuru Category	Risk Perceived	Ranking
1	Market risks	6.17	1	Market risks	5.41	1
2	Institutional Risks	5.89	2	Weather/ climate change risks	5.12	2
3	Weather/ climate change risks	4.10	3	Production risks	3.85	3
4	Financial risks	3.80	4	Financial risks	3.58	4
5	Production risks	3.65	5	Institutional Risks	3.55	5
6	Human Risks	2.68	6	Human Risks	3.34	6
7	Bio- security threats	1.72	7	Bio- security threats	3.17	7
	$\chi^2_{(6)}=338.733$ $p<.05$			$\chi^2_{(6)}=102.850$ $p<.05$		

Results of the Friedman's analysis indicated that there was a differential rank ordered perception for the seven sources of risks, $\chi^2_{(6)} =338.733$, $p<.05$ in Punjab and in Nakuru $\chi^2_{(6)} =102.850$,

$p < .05$. The respondents perceived the most important risk factor both in Punjab and Nakuru as market risk (mean value 6.17 and 5.41 respectively), while the least was bio-security threats (mean value 1.72 and 3.17 respectively). The mean values for the other five risk factors were as follows; 5.89 (institutional risks) in Punjab and 5.12 (weather/climate change risks), in Nakuru; 2.2 (hail) and 2.6 (poor overwintering and spring frosts)

The results indicated that there were significantly more favourable rankings for market risks over all other risks in the two regions, similar to findings by Hardaker et al., (2015) and those from a global review on risk perception study by Duong et al., (2019) which revealed that 55% of the articles frequently mentioned market risks. There was also a highly significant difference in how participants evaluated sources of risks. Bio- security threats, though an emerging risks in agriculture is ranked last, a divergent view from findings by Waage& Mumford (2008) and Duong et al., (2019).

4.4 Influence of demographic characteristics on vegetable growers' risk perception

Results of multiple regression analysis on Table 4 revealed that the variables statistically significantly predicted market risk, $F(9, 90) = 3.358, p < .05, R^2 = .251$ with one variable (operational landholdings) statistically adding significantly to the prediction, $p < .05$ in Punjab. For Nakuru, the variables also statistically significantly predicted market risk, ($F(10, 89) = 5.362, p < .05, R^2 = .376, p < .05$), with two variables (age and land leased) adding statistically significantly to the prediction. The socio personal variables in Punjab did not statistically significantly predict financial risk ($F(9, 90) = 0.625, p 0.773, R^2 = 0.059$), whereas in Nakuru, the variables statistically significantly predicted financial risk ($F(10, 89) = 2.139, p .029, R^2 = .194, p < .05$), with two variables (age, land leased) adding statistically significantly to the prediction.

The variables also did not statistically significantly predict production risk $F(9, 90) = 0.331, p 0.963, R^2 = 0.032$ in Punjab, while in Nakuru the variables statistically significantly predicted production risk ($F(10, 89) = 3.963, p .000, R^2 = .230, p < .05$) with two variables (age and land leased) adding statistically significantly to the prediction. The socio-economic characteristics did not statistically significantly predict institutional risk ($F(9, 90) = 1.070, p 0.392, R^2 = 0.097$) compared to Nakuru where the variables statistically significantly predicted institutional risk ($F(10, 89) = 4.150, p .000, R^2 = .318, p < .05$). Only two variables (age and land leased) added statistically significantly to the prediction.

The socio-economic variables statistically significantly predicted human risk in Punjab ($F(9, 90) = 2.482, p .014, R^2 = .199$) and Nakuru ($F(10, 89) = 2.508, p .011, R^2 = .220, p < .05$) with one variable (age) adding statistically significantly to the prediction in Punjab and two variables (family size and operational land) adding statistically significantly to the prediction in Nakuru. The variables did not statistically significantly predict climate risk ($F(9, 90) = 541, p .841, R^2 = 0.051$) in Punjab whereas they significantly predicted climate risk ($F(10, 89) = 2.711, p .006, R^2 = .234, p < .05$) in Nakuru, with only one variable (land leased for vegetables) adding statistically significantly to the prediction. The socio personal variables did not statistically significantly predict biosecurity risk both in Punjab ($F(9, 90) = .541, p .841, R^2 = 0.051$) and in Nakuru ($F(9, 90) = 1.596, p .121, R^2 = 0.152$).

Similar findings on age and land significantly predicting perceived risks have been made by Kisaka-Lwayo & Obi (2012) and Nmadu et al., (2012); which significantly differs from those of Borges & Machado (2012) who found that age did not significantly affect farmers' risk perceptions in Brazil.

TABLE 4: RISK PERCEPTION-MULTIPLE REGRESSION ON SOCIO-PERSONAL VARIABLES OF VEGETABLE GROWERS

S. No.	Source of Risk	Punjab			Nakuru		
		R^2	<i>d.f.</i>	F, α	R^2	<i>d.f.</i>	F, α
1	Market Risks	0.251	(9,90)	3.358, <.05	.376	(10,89)	5.362, <.05
2	Financial risks	0.059	(9,90)	0.625, 0.773	.194	(10,89)	2.139, 0.029
3	Production risks	0.032	(9,90)	0.331, 0.963	.308	(10,89)	3.963, <.05
4	Institutional risks	.097	(9,90)	1.070, 0.392	.318	(10,89)	4.150, <.05
5	Human risks	.199	(9,90)	2.482, 0.014	.220	(10,89)	2.508, .011
6	Climate risks	.051	(9,90)	0.541, 0.841	.234	(10,89)	2.711, .006
7	Biosecurity risks	.098	(9,90)	1.088, .380	.152	(10,89)	1.596, .121

**Multiple Regression*

Comparison Of Vegetable Growers Based On Risk Management Strategies

From the results, majority of vegetable growers in Punjab (77%) and Nakuru (79%) used improved agricultural practices as their risk management strategies, similar to findings by Jin et al., (2015) and Chang & Tsai (2015). Market survey was used by (63%) in Punjab and (62%) vegetable growers in Nakuru. Search for information on diseases, pests and new agricultural technologies proved to be another popular strategy with (17%) vegetable growers in Punjab and Nakuru (27%) engaging in it. Crop diversification, credit facilities as well as crop insurance turned out to be the least used strategies with (4%), (3%) farmers using the first two respectively; while (4%), 15% and (3%) used these strategies in Nakuru.

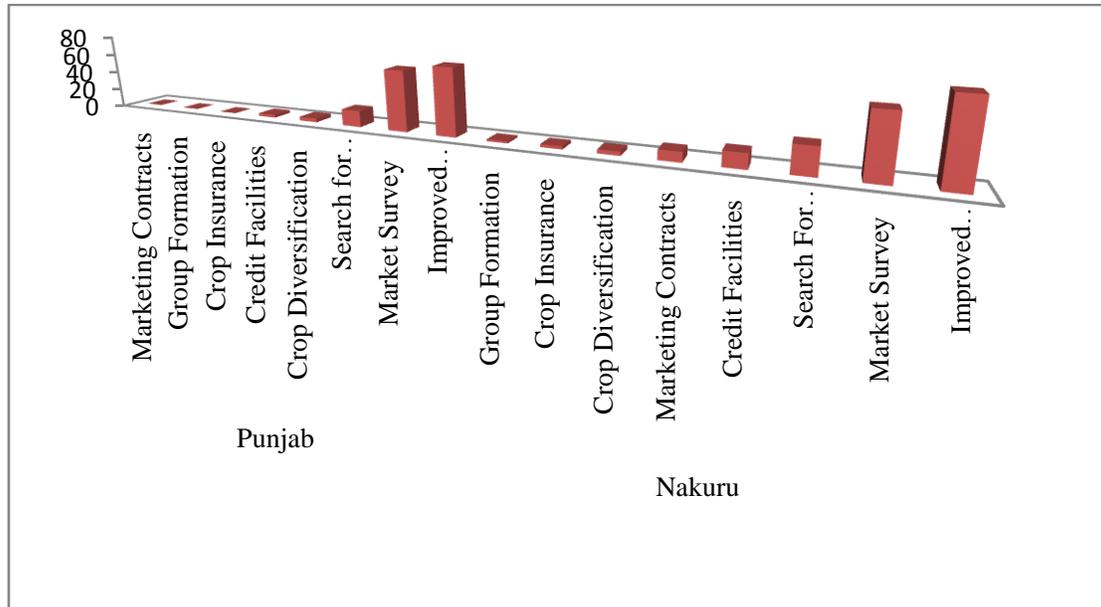

Fig. 1 Distribution of vegetable growers on basis of risk management strategies

BARRIERS TO PERCEIVED RISK MANAGEMENT STRATEGIES

Lack of information on pests and diseases (53%) was the major barrier in Punjab followed, by marketing challenges (50%), lack of access to extension services (31%), lack of access to capital (4%), land fragmentation (1%) and post-harvest challenges (1%). In Nakuru, the majority of vegetable growers experienced barriers from lack of access to capital (57%), lack of information on plants and diseases (47%), lack of access to extension services (27%), marketing challenges (26%), use of conventional farming practices (18%), high production costs (14%), harsh weather (5%), land fragmentation (3%), post-harvest challenges (3%) and labour (2%). Studies which have identified almost similar barriers include Baruwa et al., (2015); Panneerselvam et al., (2011); Harvey et al., (2014), and Ullah, Shivakoti & Ali (2015).

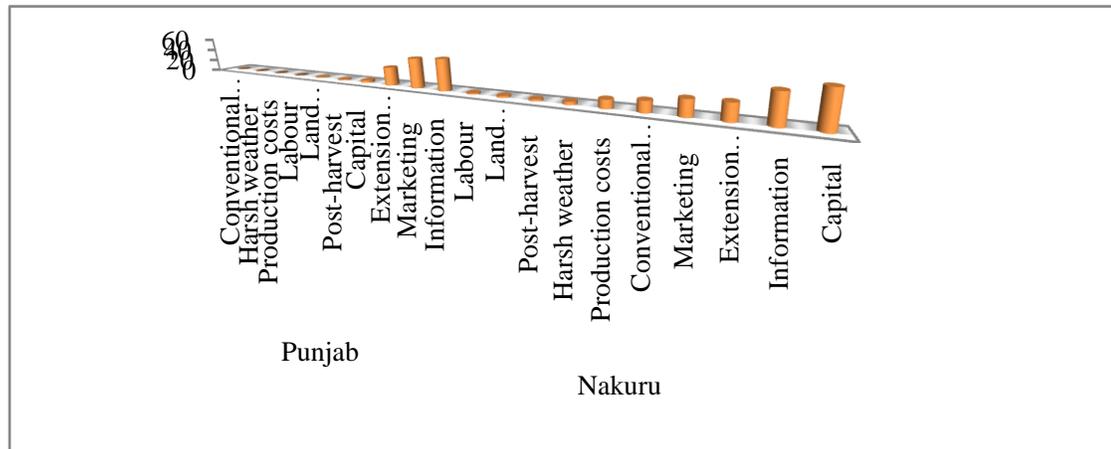

Fig. 2 Distribution of vegetable growers on basis of barriers to risk management

FINDINGS AND RECOMMENDATIONS

Results obtained in this paper have established that vegetable growers from the two regions have almost similar socio-economic characteristics, risk perception and approach to risk management. Vegetable growers still face immense marketing challenges and mostly rely on improved agricultural practices to counter the risks faced. The findings have important implications to policy makers because they reveal the need for new technological innovations to improve agricultural practices; strengthening of marketing services and greater access to extension services. New ideas in risk management strategies such as crop insurance, crop diversification, and marketing contracts are yet to take hold among the vegetable growers. On the basis of this study, it is suggested that it is important to continue supporting current smallholder vegetable growers' ways of managing risk even as the novel ideas through crop insurance, crop diversification and use of market contracts are explored. One way of support could be through strengthening of extension services and access to more information on vegetable cultivation.

ACKNOWLEDGEMENTS

The authors wish to thank the vegetable growers, personnel of the Ministry of Agriculture in the two countries and the enumerators who were actively involved in the research process.

THE EDUCATIONAL DESIGN OF THE MULTIMEDIA LESSON

Inagamova Nargis Abdullaevna*

*Teacher of English Department,
University of World Economy and Diplomacy (UWED),
UZBEKISTAN

ABSTRACT

Pedagogical design-the use of knowledge (principles) about effective educational work (teaching and learning) in the process of design, development, evaluation and use of educational materials. The preparation of such lessons requires even more careful preparation than in the normal mode. Concepts such as the script of the lesson, directing the lesson - in this case, not just newfangled terms, and an important part of the preparation for the training session. Designing a future multimedia lesson, the teacher must consider the sequence of technological operations, forms and ways of presenting information on the big screen.

KEYWORDS: Lesson, Development, Language, Subject, Pedagogical, Design, Technologic, Multimedia.

INTRODUCTION

The lesson, as a direct tool for the implementation of the basic ideas of information and communication technologies, requires the most careful development. It is the lessons that are the litmus test that show the effectiveness of a particular development. This is both the final result and the last stage of design, implementation of ideas laid down by the developers of certain technologies.

The preparation of such lessons requires even more careful preparation than in the normal mode. Concepts such as the script of the lesson, directing the lesson - in this case, not just newfangled terms, and an important part of the preparation for the training session. Designing a future multimedia lesson, the teacher must consider the sequence of technological operations, forms and ways of presenting information on the big screen. It is worth immediately thinking about how the teacher will manage the educational process, how pedagogical communication will be provided at the lesson, constant feedback from students, developing the effect of learning.

Relevance and current status of the topic: A multimedia lesson is a lesson that uses multimedia representation of information using technical means, primarily a computer. In numerous articles devoted to this topic, the expression "lesson with multimedia support" is often found. It is quite obvious that this is the name of a lesson where multimedia is used to enhance the learning effect. In this lesson, the teacher remains one of the main participants in the educational process, and often the main source of information. At any time, the teacher can use hyperlinks to go to the details of the information, "revive" the studied material with the help of animation and so on.

It is obvious that the degree and time of multimedia support for the lesson can be different: from a few minutes to a full cycle. However, a multimedia lesson can also act as a "mini-technology", that is, as a teacher-prepared development with specified educational goals and objectives, focused on quite specific learning outcomes. This lesson has a sufficient set of information component, didactic tools. The role of the teacher who in this case is, first of all, the organizer, the coordinator of cognitive activity of pupils significantly changes at its carrying out. Conducting a lesson in the mode of mini-technology does not mean that the teacher is deprived of the possibility of maneuver and improvisation. It will not be surprising that such a lesson can play with new faces, pass more attractive, interesting, and dynamic. But the lesson is a mini-technology implies a significant reduction of "pedagogical marriage".

When designing a future multimedia lesson, the developer should think about what goals he pursues, what role this lesson plays in the system of lessons on the studied topic or the entire training course. What is the multimedia lesson for?

- To study new material, presentation of new information;
- To consolidate the passed, working out educational skills;
- For repetition, practical application of the acquired knowledge, skills;
- For generalization, systematization of knowledge.

It is necessary to determine at once: thanks to what the training and educating effect of a lesson will be strengthened that carrying out a multimedia lesson did not become just a tribute to newfangled Hobbies. Based on this, the teacher must choose the forms and methods of the lesson, educational technology, teaching techniques.

Experimental Part: In the study of new material. It allows you to illustrate a variety of visual AIDS. The application is particularly beneficial in cases where it is necessary to show the dynamics of any process.

When checking the front independent work. Provides along with oral visual control of the results. When solving problems of educational nature. Helps to execute the drawing, to make the decision plan and to control intermediate and final results of independent work on this plan

A means of emotional relief. During the block lessons or long consultations before exams-it is necessary to include video sequences of experiments or cartoons at the same time the students disappear fatigue, there is interest, they are looking for answers, turn to the teacher with questions, charged with new energy. Multimedia programs look like a video, but with the ability to intervene in the course of action and dialogue.

Analysis of the Results: As a means to making distributing didactic material, codogram and cards. Personal computer in the hands of teachers, in addition to the scanner and printer is a mini-printing office of a teacher.

In educational activities, the use of the computer is possible in three forms, 1) the machine as a simulator, 2) the machine as a tutor, performing certain functions for the teacher, and such that the machine can perform better than a person. 3) a Device that simulates a certain environment and the actions of specialists in it.

Training systems are most appropriate to apply to consolidate previously acquired skills. Tutoring systems are best used provided that the goals and objectives of training are clearly defined. Simulation training modeling is most suitable when the training material is not systematic and its boundaries are not clearly defined.

When using a multimedia presentation, it can be used in a classroom system or use new models of its application.

It is possible to note a method of projects as the most perspective pedagogical technology which allows to open most fully creative abilities of trained, to form ability to be guided in the huge sea of information, focusing attention on the main thing, to take responsibility and to make decisions.

Of course, the method of projects requires the highest qualification of the teacher, creative approach to the school curriculum, and the ability to aggregate knowledge in several subjects and, of course, organizational skills. The use of information technology in the project at school and, of course, in the development of materials for it, was decisive, breathed new life into the well-known design methodology for a long time. The main components of the project method are the research work of schoolchildren and the evaluation of this activity

Of all the tools of cognition, multimedia is the best way to represent knowledge in a variety of ways, including all the modalities of perception. Working with multimedia tools, students have at their disposal a rich Arsenal for self-expression of the studied material. Multimedia implements a more creative approach to the process of assimilation and presentation of knowledge.

The system of training, in which students acquire knowledge and skills in the process of planning and implementation of gradually increasing complexity of practical tasks-projects. One of the personality-oriented technologies, a way of organizing independent activities of students, aimed at solving the problem of the educational project, integrating the problem approach, group methods, reflexive and other techniques.

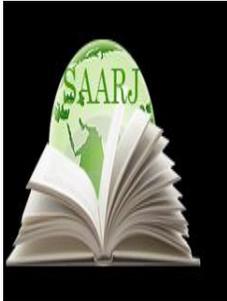

CONCLUSIONS

In our opinion, the most progressive possibilities of multimedia are to use them in the educational process as an interactive multi-channel learning tool. Research, project approach in the system of education, development of their own multimedia / hypermedia projects, constant use of multimedia for educational purposes in all blocks of disciplines of General cultural and subject training, allow to transform the traditional learning process into developing and creative. Information technology allows students to give a unique opportunity to learn a new concept independently of the teacher, to notice a pattern, to put forward their own hypothesis, to feel how

mathematical questions arise. The ability to use the method of projects-an indicator of high qualification of the teacher, his progressive methods of teaching and development of students.

THE CONCEPT AND APPLICATION OF "ABBREVIATION" IN ENGLISH AND UZBEK

Khudaykulova Sevara Saidakbarovna*

*Teacher of English Department,
 University of World Economy and Diplomacy (UWED),
 UZBEKISTAN

ABSTRACT

An abbreviation (from Latin brevis, meaning short) is a shortened form of a word or phrase. Usually, but not always, it consists of a letter or group of letters taken from the word or phrase. For example, the word abbreviation can itself be represented by the abbreviation abbr., abbrev. or abbrev. Abbreviations can be simple or complex. Simple abbreviations are formed by dropping the ending or starting syllables of the stem. For example: caps (capital letters), demo (demonstration), intro (introductory sentence) is the first sentence of a newspaper article that should immediately interest the reader ad (advertisement).

KEYWORDS: *Abbreviation, Much Information, Phrase, Initial Abbreviations, Graphic Abbreviations.*

INTRODUCTION

Abbreviations can be simple or complex. Simple abbreviations are formed by dropping the ending or starting syllables of the stem. For example: caps (capital letters), demo (demonstration), intro (introductory sentence) is the first sentence of a newspaper article that should immediately interest the reader ad (advertisement).

Compound abbreviations (compound abbreviations) are formed by the action of abbreviation and base composition and consist of the initial letters or syllables of words and stems or from a combination of them with full stems. For example: CND (Campaign for Nuclear Disarmament); PA system (public address system); Interpol (International police); hi-fi (high fidelity); sci-fic (science fiction); V-Day (Victory Day).

Russian linguist E.M. Dubenets distinguishes two main types of abbreviations: graphic abbreviations and lexical abbreviations.

Graphic abbreviations are the result of abbreviating words and phrases only in written speech, while in oral speech, the corresponding full forms are used. They are used to save space and enhance writing.

The oldest group of graphic abbreviations in English is of Latin origin. Here, contraction occurs when writing Latin words. While orally relevant English equivalents are pronounced in full: e.g. - for example (Latin *exempli gratia*), a.m. -in the morning (*ante meridiem*), No - number (*numero*). In some cases, the initial letters are pronounced, for example, a.m. [ei 'em]. p.m. [pi: 'em] etc.

Some graphic abbreviations of Latin origin have different English equivalents in different contexts, for example p.m. can be pronounced as in the afternoon (*post meridiem*) and after death (*post mortem*).

There are also graphic abbreviations of words and phrases and corresponding English equivalents in full form. There are several such semantic groups of them:

- a) Days of the week, for example, Mon - Monday, Tue - Tuesday, etc.
- b) The names of the months, for example, Apr - April, Aug-August, Sep - September, etc.
- c) County names in the UK, eg Yorks - Yorkshire, Berks - Berkshire, etc.
- d) names of states in the USA, for example, Ala - Alabama, Alas - Alaska, Calif-California, etc .;addresses such as Mr, Mrs, Ms [miz], Dr, etc .;
- e) Military ranks, for example capt - captain, col -colonel, sgt - sergeant, etc .;
- f) Scientific degrees, for example. BA - Bachelor of Arts, DM - Doctor of Medicine. (Sometimes in scientific degrees there are abbreviations of Latin origin, eg MB - *Medicinae Baccalaurus*);
- g) Units of time, length, weight, for example f./ft -foot / feet, sec. - second, in. - inch, mg. - milligram, etc.

The reading of some graphic abbreviations depends on the context, for example m. can be read as: male, married, masculine, meter, mile, and million, minute; l.p. can be read as long-playing, low pressure.

Initial abbreviations stand between graphic and lexical abbreviations.

The initial abbreviations are pronounced differently. Very often they are pronounced as in their language of origin, for example. ANZUS (Australia, New Zealand, United States) are pronounced in Russian as ANZUS; (UFO - UFO).

There are three types of initial abbreviations in English:

- a) letter-reading initials such as UK (United Kingdom), B UP (British United Press), etc .:
- b) Initial abbreviations that read like words, for example, UNESCO (United Nations Economic, Scientific, Cultural Organization), OPEC (Oil Producing European Countries), etc .:
- c) Initial abbreviations that match English words in their sound form. Such initial abbreviations are called acronyms, for example NOW (National Organization of Women), AIDS (Acquired Immunity Deficiency Syndrome).

In English abbreviations, the last letters can be both consonants (math, chimp) and vowels (divi, demo).

English abbreviations may undergo spelling and phonographic changes (mike - microphone, telly - television).

Individual abbreviations may show the ability to further word formation: telephone - phone - phony

Abbreviations can act as components of complex words, for example, labware - laboratory ware.

Abbreviated words can take on grammatical changes, such as plural: dems - democrats.

Abbreviations are widely used in many areas of our life. These are science, technology, technology, bibliography, units of measurement, messages by phone and e-mail. But it is necessary to take into account certain features of the use of abbreviations.

The rapid development of the media in the United States and England at the turn of the XX - XXI centuries. have left their mark on the language structure of headings, making it more flexible and modernized. Quality newspaper headlines reflect the law of saving space.

Newspaper headlines are another great source of English acronyms. The prevalence of abbreviations in newspaper headlines is apparently due to several reasons: economy of space, the desire to influence the reader with the unusual and expressive headlines, the desire to interest and sometimes intrigue the reader. It is interesting that very often the word used in the title in an abbreviated version is given in full in the text. For example, the headline reads: Lift ads ban - ex-Minister. In the text under this heading we find: The Government should lift its ban on advertising in the Morning Star, former Minister told a meeting.

The acronyms most frequently encountered in the English press can be divided into several main groups. The first and largest group includes abbreviations for the names of parties, trade unions, various kinds of organizations and positions: NLRB = National Labor Relations Board = National Labor Relations Board);

In the headlines of English newspapers, in addition to abbreviations of the names of domestic organizations, abbreviations of the names of international organizations are often used, such as, for example: U.N. - United Nations; NATO - North Atlantic Treaty Organization; WFTU - World Federation of Trade Unions.

It should be remembered that many abbreviations often have two or more meanings. For example, OAS can mean the Organization of American States - the Organization of American States - the OAS or the terrorist organization of the French ultra OAS. The abbreviation MP can mean Member of Parliament - a member of the House of Commons; RM - Prime Minister - Prime Minister or Police Magistrate - judge of a police court, etc. translation.

The second group of abbreviations most often found in the headlines of English newspapers are abbreviations of surnames or familiar nicknames of famous political or public figures. Such abbreviations significantly complicate the understanding of headings and, with rare exceptions (FDR - Franklin Delano Roosevelt; GBS - George Bernard Shaw; RLS - Robert Louis Stevenson), are hardly registered in dictionaries.

The third group of abbreviations that are very common in headings are abbreviations for geographic names. They are especially common in American newspapers. Abbreviations of this group in a number of cases make it difficult to understand the title, in particular, when it is difficult to establish whether we are dealing in this case with an abbreviation of a geographical name or with an abbreviation of, say, the name of an organization.

A distinctive feature of abbreviations of geographical names is that in most cases the letters in them are separated by periods, or after the entire abbreviation, a period is put, which, as a rule, is not observed in abbreviated names of organizations. Here are some examples: S. P. - South Pacific, Ga. - Georgia, Conn. - Connecticut, L. A. - Los Angeles, SF - San Francisco.

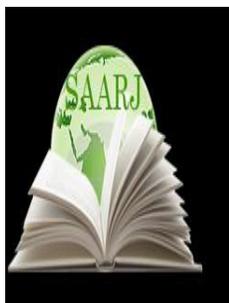

The three main groups discussed above do not exhaust the whole variety of abbreviations found in the headlines of English and American newspapers. In fact, they can also be abbreviated to any words or phrases, sometimes quite unexpected. Such abbreviations can be very difficult to understand and translate the title, since there is practically nothing to be guided by when decoding them and it remains entirely and completely to rely on the fact that the context either contains the decoding, or makes it possible to guess which word could be abbreviated.

Thus, the law of space saving and information compression in modern English and American newspapers leads to the frequent use of abbreviations.

This means that English abbreviations have become firmly established in our life, we actively use them in our speech, but we do not always understand their meaning.

GRAMMAR AND STYLISTIC CHARACTERISTICS OF PAIR WORDS IN MODERN GERMAN AND UZBEK LANGUAGES

Imyaminova Shukhratkhon*; **Shaxnoza Bekmurotova****

ABSTRACT

The present work provides a quick insight into the problem of phraseology in its theoretical part, briefly dealing with its definition, its main features and the classification of phraseologisms. I pay more attention to the characteristics of the considered word pairs, where I mainly follow the terminology, partial classification and the syntactic and semantic structure.

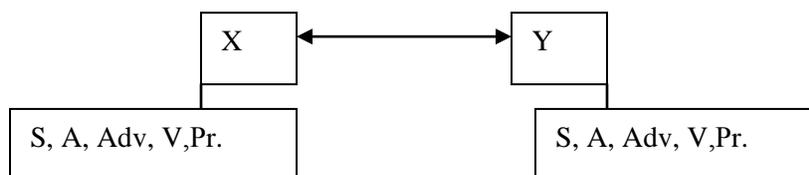

KEYWORDS: *Word Pairs, Phraseology, Linguists, Twin Formulas, Dictionary.*

INTRODUCTION

When classifying a word grammatically, it is important to note first of all the importance of its component, which word group-specific word-forming and modifier suffixes and prepositions it can accept, as well as its function in the sentence. In German, nouns are formed from nouns, adjectives, verbs, adverbs, and rhymes. Although a pair of words belongs to a particular word group, it has grammatical norms specific to that group and comes as a part of speech.

Accordingly, when it comes to the grammatical structure of a pair of words, it is understood that the affixes that are common to both components of a pair of words are not primitive or artificial, but the addition of one or both components of the pair of word components. It is advisable to classify the pairs of words in order to analyze them more accurately. For example: Freund und Feind We define the first component as Freund (X), the second component as Feind (Y). The

conjunction that connects the two words is given by the words und, oder, weder... noch, von... bis. The result is a schematic. It is known that, as mentioned above, a pair of words is formed in a horse word group, and they consist of two horses. Pairs of nouns in general - Substantive (S), adjectives in pairs - Adjective (A), pairs of words in pairs - Adverb (Adv), verbs in pairs - Verb (C). From this comes the following formula for a pair of words.

Word groups play an important role in the grammatical classification of pairs of words in German. Pairs of words are related to words that belong to the same noun phrase.

The word Feuer und Flamme is translated into Uzbek as завқ – шавқ, ўт – олов. Both the word “das Feuer” and the word “die Flamme” mean “ўт”, “олов”, “гулхан”, “оташ” and they differ in a single genus, but both words belong to the horse family.

Pairs consisting of nouns are not only used with a few prepositions, but there are pairs of words that come with all prepositions. For example: with Haut and Harr, with Stock and Stein, with Dach and Fach, with Strich and Faden, with Gift and Galle, with Tau and Tag, with Nacht and Nebel, with Ort and Stelle.

Prepositions always precede a pair of words belonging to the noun phrase. However, in German, the occurrence of prepositions in adjectives, adverbs, and rhymes is rare.

In the Uzbek language, pairs of adjectives consist of antonyms. Many pairs of adjectives are formed through additions. For example: азоб-уқубатли, сабр-тоқатли. – ик, - иқ,- ук, -with the addition of such adjectives as аччиқ-чучук, иссиқ-совуқ, эгри-бугри. In some pairs of adjectives, the pair is added to an additional second component that is common to both components of the word.

If we analyze the content of pairs of words in depth, prepositions and conjunctions play an important role in the formation of pairs of words in German, but in Uzbek there is no preposition, so the formation of pairs of words with the addition of affixes determines the differences between pairs of words.

In German, a pair of words grammatically forms a pair of words from all categories, but this aspect is the same in Uzbek. But now that science and technology are advancing all over the world, the development of languages is no exception. Even some languages are being shortened on the basis of computer language. In the process, both the language and the vocabulary, as well as the pair of words that are part of it, are enriched and expanded.

Even in modern German, because double words are considered expressive language units, they all have a clear meaning and perform a certain stylistic function. They serve to reinforce meaning. For example: zittern und zagen - қалт-қалт титрамоқ, to be in a very frightened state or situation. fix und fertig маст бўлиб таппа-тайёр бўлмоқ. This pair of words describes the condition of a person who is drunk. null und nichtig means to try in vain, in vain, to try to do

something but to no avail, to try in vain. This pair of words also performs a certain stylistic function in the sentence because they are stylistically expressive.

It is also possible that a pair of words comes within its own meaning in a sentence and does not acquire a portable meaning. But not all pairs of words have a figurative meaning. For example: *Leben und Tod* we do not see an amplified and exaggerated meaning in the word life-death pair, because the phraseological meaning is not hidden behind this pair of words. The same phenomenon can be seen in the word *arm und reich* rich-poor couple. These include double words such as *Himmel und Erde*, *Haus und Hof*, *einzig und allein*, *frisch und munter*, *gut und böse*.

It is known that in the Uzbek language, in the colloquial language, in the folklore there are many lapars, terms and olans. A pair of words can be found in each lapa or olan verse. For example:

Ҳай-ҳай ўлан, жон ўлан,

Ўлан айтинг ёр-ёр.

Келин-куёв пойларига,

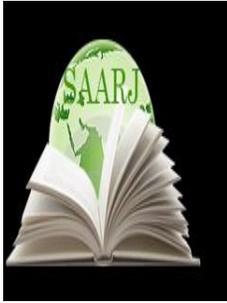

Тилло сочинг ёр-ёр.

The pair of words began to be used in German prose as early as the 15th century. From this period onwards, the emergence of double words was a topical issue. This process in the middle Ages led to the emergence of various phraseologies in German. Many pairs of words are considered ancient. Their origin dates back to the middle Ages, for example: *Hülle und Fülle* in Uzbek means “тўкин-сочин”, “мўл-кўл”. This pair of words existed in the 16th century. At the same time, in this century, the *Kleidung und Nahrung* form of this pair of words appeared, expressing similar meanings of “мўл-кўл”, “икки-биққи”. But there is a big difference between the two pairs of words above, one is expressed in a positive sense and the other in a negative sense. For example, the word *Hülle und Fülle* has a positive meaning. Because this double meaning is used to describe qualities such as more fertility, abundance, a prosperous life, a symbol of life.

The word *Kleidung und Nahrung* has a somewhat negative connotation. This pair of words combines meanings such as eating and drinking only for the greedy, and dressing modestly even though it does not fit their body. The word *Krethi und Plethi* is also ancient. In Uzbek it means *қаланги-қасанги*. More precisely, the history of the origin of this double word dates back to the I century AD. But today this pair of words is rarely used. It has been speculated that the negative connotation of the word *Krethi und Plethi* occurred centuries later. In fact, in the west, the king's peculiar guards were called *Krether und Plether*. The word *gand und gäbe*, which means “расм-русм”, “урф-одат” in Uzbek, was first used in the 13th century by Rerkhov Ayke's *Sashsenspiegel* and later by Martin Luther. In fact, these two adjectives are derived from the vocabulary used in the daily lives of traders. The meaning of the word *gang* is the price of a commodity in a coin account, i.e. a sign of a constant price. The phrase *Gabe* is derived from the verb *geben*, meaning “нимабераолишимумкин”. But since the original meaning of these two words depends on the price, and so that it does not change, these two words have become "tradition", "habit". In modern German, these two words form a pair of words.

METHODOLOGY OF ORGANIZATIONAL CAPACITY DEVELOPMENT IN GIFTED CHILDREN

Abdullaeva Zuxro Ismoilovna*

*Lecturer at the Department of Psychology,
Termez State University,
UZBEKISTAN

ABSTRACT

The article describes methods for the development of organizational skills in gifted children, the structure of organizational skills, ways of forming organizational skills. A tendency to organizational activities as a property, on the one hand the need for psychological readiness and group activity, on the other hand, prosperity in the process of its implementation. These changes have affected the learning process. Because it is impossible to develop a society in all its aspects without setting up an educational process.

KEYWORDS: *Assimilate The Task, Ability, Ability, Organization, Physically And Mentally, Organizational Ability.*

INTRODUCTION

In the strategy of actions on five priority directions of development of the Republic of Uzbekistan in the item "Priorities of development of the social sphere", the fifth - "Improvement of the state youth policy": support and development of creative and intellectual potential of the young generation to promote the formation of a healthy lifestyle among children and youth, their widespread involvement in physical culture and sports; to support and realize the creative and intellectual potential of the younger generation, to form a healthy lifestyle among children and youth, to involve them in physical culture and sports, to develop the talents and aspirations of children in our country. provides for the implementation of comprehensive work aimed at raising the standard.

After the independence of our republic, many radical changes have taken place in the life of our people. These changes have affected the learning process. Because it is impossible to develop a society in all its aspects without setting up an educational process. Because the development of

society in many respects depends on the level of education, consciousness and upbringing in terms of morality.

A child's success in school depends in many ways on his or her level of preparation for school. The child must first be physically and mentally ready for school. That is, a child's successful schooling depends not only on his mental and physical preparation, but also on his personal and socio-psychological preparation.

Without developing students' talents and thinking, it is impossible to develop their communicative and organizational skills and abilities. Talent is a system of mental development throughout life. Talent is observed in the successful completion of this or that activity. Talent is a specific form of ability that ensures the successful completion of an activity, ensures the compatibility of abilities, and serves to fill gaps in other abilities.

Organizational ability is a set of qualities that help manage group activities as a special ability. Gifted children show significant social activism, responsiveness, organizational skills.

Well-known psychologist LIUmansky (1921-1983) during his many years of experimental research on the development of problems of organizational activity and organizational skills found that identified and described psychological features.

LI Umansky included the following components in the structure of organizational (special) skills:

Psychological selectivity is the ability to reflect psychology most fully and deeply in an organized group in the process of solving a common group problem that includes interpersonal relationships and the psychological characteristics of the group as a whole. The practical psychological direction of the mind, that is, the acquisition of practical psychology, the readiness to apply information about psychological phenomena to the practice of solving group problems.

Psychological tact is the ability to maintain a sense of proportion in relationships with others, to act in accordance with them and their psychological characteristics. To this must be added sensitivity, a sense of objectivity, compassion for others.

Social energy is the ability of an organizer to infect and charge his energy to the stewards, to create in them feelings and willful actions.

Strictness and criticism is the ability to identify and express the conditions established by the task of the group, as well as the established norms (including the norms of the group) that are important for joint activities. A tendency to organizational activities as a property, on the one hand the need for psychological readiness and group activity, on the other hand, prosperity in the process of its implementation.

Each of the above features is a specific syndrome, manifested in a number of symptoms.

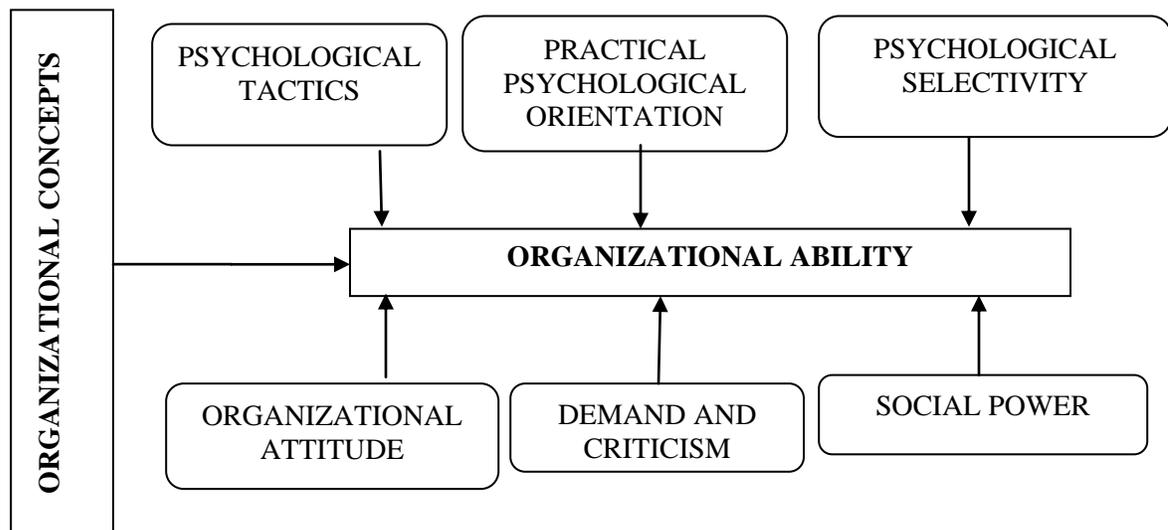

It is important to distinguish between the concepts of "manager" and "organizer" in defining the organizational skills of gifted children, because according to L.I. Umansky, every organizer is a leader, but not every leader is an organizer. The object of the organizer's work is to influence a particular social community - to influence a small group that he or she is motivated to unite to solve a specific group task in a particular social situation in a collaborative setting.

Structure of organizational activity:

1. Assimilate the task
2. Selection of small organizers and organizers
3. Introduce the organization to the task. Group decision making
4. Identify material resources, time and space conditions.
5. Planning based on optimal data.
6. Distribution of responsibilities. Determining the form of organization.
8. Internal coordination and communication.
9. Work with small organizers.
10. Final analysis of the task and performance evaluation (individual and collective)

2.2.1. picture

Structure of organizational skills

Gifted children are characterized by higher organizational skills than normal children. Educators and psychologists need to identify gifted children in school and carry out developmental work with them. Organizational features to be formed in gifted children - the ability to organize activities; communication skills, practical intelligence, ability to infect and activate others, critical thinking, politeness, initiative, assertiveness towards oneself and others, self-control, perseverance. There are a variety of methods for developing organizational skills in gifted children, the best of which are psychological trainings.

Exercises to develop organizational skills in gifted children:

Organizational skills are not a separate thing, they include advanced general skills and are necessary for a particular type of activity. Therefore, the following general exercises can be suggested to develop them.

Be confident

We recommend doing this exercise with someone and in front of an audience. The bottom line is that you and your partner are hiding some shapes (toys, anything) behind you. The challenge is to convince your audience that you have a clear goal and that you will achieve it. The winner is the one who can convince the audience.

Time distribution

Make a to-do list for the evening in the evening, learn to get up early, make a schedule, and stick to it. Teach yourself to be tidy at work, at your computer desk, in your closet at home. Configure and save this mode.

Factors affecting the organizational ability of gifted children.

1. Authority. This is a key quality that an organizer should have. It is necessary to ensure that the tasks are performed without hesitation. Typically, other members of the group follow the example of more organizers. A trustworthy person who can behave in dealing with teammates is the best motivator.

2. Conflict resolution. Properly selected methods of influencing different partners in the structure of organizational skills alleviate acute situations, have a positive effect on the psychological climate and communication culture.

3. Perseverance. Organizational skills cannot be imagined without control and determination. Partners, it is very important to immediately suppress the laziness in the group, and the talented, organized student himself is simply obliged to set an example for them. Peers should be politely explained that disobedience to their teammates can lead to punishment.

4. Incentives. Often the services of different activity partners are not taken into account. Either way, no matter how you celebrate your success in person or in public, you should also pay attention to the success of your partners. Otherwise, those in the group lose motivation to work at full capacity. By praising the team members, the whole team strives to excel, perform tasks better, and not break discipline. Incentives don't have to be material, some value personal praise and a diploma more.

5. Delegation of powers. It is not effective for one person to take full responsibility. In this case, confusion occurs and the quality of the tasks performed is not as expected. The smartest option is group activity.

6. Response to criticism. A person who is calm about criticism does not take everything personally. Listen to others, evaluate their thoughts, ideas, possible corrections. According to experts, this can lead the group to great success.

7. Get rid of excess. The skills of the organizers include the ability to clean up the excess. It is important to keep the situation under control while avoiding excessive freedoms. The organizer should also value the time of himself and others.

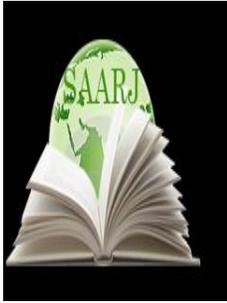

The following recommendations are suggested for the development of organizational skills in gifted children:

- practicing emotions in front of a mirror - helps to properly convey or hide emotions - depending on the specific situation;

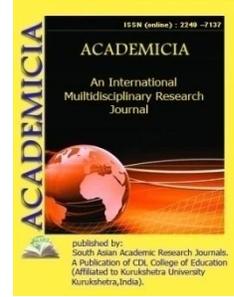

- written work planning - time allocation allows you to develop the habit of implementing plans, as well as eliminates delays;
- Singing - an exercise to adequately convey emotions, when a person asks himself questions and answers them, says words;
- Improving communication skills by initiating personal conversations with acquaintances.

A REVIEW ON NETWORKING AND INNOVATION

Dr. Manjula Jain*

*Teerthanker Mahaveer Institute of Management and Technology,
 Teerthanker Mahaveer University, Moradabad,
 Uttar Pradesh, INDIA
 Email id: jainmanjula76@gmail.com

ABSTRACT

The significance of corporate networking for innovativeness has been highlighted in recent competitiveness research. Until recently, there was a lack of understanding of the mechanics of this connection. This article provides a comprehensive assessment of evidence that links a firm's networking behavior to its ability to innovate. Risk sharing, gaining access to new markets and technologies, speeding products to market, pooling complementary skills, safeguarding property rights when complete or contingent contracts are not possible, and acting as a key vehicle for obtaining access to external knowledge are among the main benefits of networking identified in the literature. The data also shows that companies that do not collaborate and do not officially or informally share information restrict their knowledge base in the long run, reducing their capacity to engage into exchange partnerships. National innovation systems, in terms of the way they influence networking activity, play a significant role in the spread of innovations on an institutional level. The data presented in the article suggests that network connections between suppliers, consumers, and intermediaries such as professional and trade organizations have a significant impact on innovation and productivity. Inter-firm conflict, displacement, lack of scale, external disruption, and a lack of infrastructure are all reasons why networks fail. There are many gaps in the literature that need to be addressed, according to the study. For example, further research on the link between networking and other types of innovation, such as process and organizational innovation, is required. In the same way, we need a deeper knowledge of network dynamics and configurations, as well as the involvement of third parties like professional and trade organizations. Our research emphasizes the importance of multidisciplinary research in these fields.

KEYWORDS: Innovation, Networking, Business Networking

1. INTRODUCTION

The systematic study that yielded the results reported in this article was driven by a desire to determine the degree to which UK businesses participate in networking activities in order to improve their creative potential. The review's specific goals are to:

- Determine the nature of the connection between networking and innovation.
- Compare and contrast the extent and effect of networking activity in the UK with that of competitor nations' companies.
- Examine instances and research on business-to-business network failure.
- Develop insights that will guide policies targeted at promoting business-to-business networking, which will lead to increased creative capacity and productivity.
- For the Economic and Social Research Council's (ESRC) study priorities board, identify topics for future research.

Inter-organizational networking is essential for the development of creative capacity in companies, according to the Porter Report. The study is less clear on the degree to which UK businesses participate in networking and how this engagement translates into creative results. Porter's research, for example, finds that the UK underperforms major rivals in this area but offers no data to back up the assertion. The review's goal is to thoroughly examine the facts in light of the Department of Trade and Industry's (DTI) mandate: Is it possible for UK companies to effectively network with other businesses in order to promote innovation? Following consultation, it was decided that the study should focus on business-to-business networking; the degree to which networking leads to creative results; and include some instances of network failure in the construction and maintenance. The authors provide a subset of the systematic review's results in this article, as well as the overall research base that has looked at the connection between innovation and networking across nations and industries. The approach we use to perform this particular review is outlined in the next section[1]–[4].

1.1. The Evidence Base

A subset of the systematic review findings on the connection between networking and companies' tendency to innovate is provided in this article. The nature of the entire evidence base utilized for the research is described in detail here. The technique provided was used to conduct the systematic review. Using the search strings generated, 628 articles were discovered in the first stage of the review by scanning the citation indexes of ABI Proquest, Science Direct, and Web of Science.

The findings indicate that networking and creativity are researched in a variety of social science disciplines. Economic and regional geography, organizational behavior, sociology, operations management, political economy, entrepreneurship and small company, technology management, marketing, and strategic management are some of the topics covered. The major journals that contributed to the review show which areas of research have the most to say about the topic. Research Policy, Journal of Business Venturing, Regional Studies, Technovation, and International Journal of Technology Management were the top five journals in terms of coverage of this subject in the review. Aside from these publications, the review included papers from

additional 47. It's worth noting that major US management publications were underrepresented among the 325 papers identified before the articles were graded.

The American Journal of Management, for example, only published one article, the American Management Review only published one, and the Administrative Science Quarterly only published two. It's probably not a good idea to speculate on why this happens. One explanation for the under-representation is that the bulk of management studies have focused on organizational behavior, entrepreneurship, or supply chain management. Organization Studies contains nine papers, the Journal of Business Venturing has 33, and Management Science has five, while the mainstream British Journal of Management has just one.

The character of the articles examined for this research is shown by doing a keyword analysis. Innovations, Research and Development, Small Business, Alliances, Regions, Technology Change, Statistical Analysis, Business Networking, Organization Theory, and Product Development are the top 10 terms in the study (in order of significance).

The papers that are evaluated are also analyzed in terms of the nations that are mentioned in the research. According to this study, 36 articles contain empirical data based on the United Kingdom, 35 on the United States, 42 on other European nations (Germany has the most other European countries included in the review, with 14 studies), 11 on Asian countries (Japan 11), and three on other countries (Australia, Brazil and Israel). The number of research focused on the United Kingdom is very high, indicating that UK scholars have contributed significantly to the field. However, despite being filtered to a lower number using quality criteria, the overall amount of articles focused on the UK remains rather low in terms of total numbers (36 out of 127 papers).

A thematic analysis was created after the NVIVO analysis of the A-list citations (stage 8). Table 3 summarizes the findings of the theme analysis. A significant percentage of the papers examined in the thematic review focused on company level (micro) variables, such as how networks are managed and function in reality (57.7 percent). The macro or networking architecture that may support networking activity is examined in a lesser percentage of the evidence (42.3 percent). When the year of publication is taken into account, it becomes apparent that this research topic and evidence base are relatively new. For example, our search identified 93 articles on the topic from 1999 to 2003, but just four papers from 1981 to 1986. The number of citations on networking and innovation increased between 1981 and 2003, according to the study. The low number of papers published between 1981 and 1986 may be attributed to a lack of coverage in citation databases. However, the statistics may also indicate that this is a relatively young field of study, with little published work over this time span.

In conclusion, a few important conclusions may be stated about the total sample of evidence utilized in this study. To begin with, the study's evidence base is dominated by a focus on technology and emerging technology sectors. Second, the evidence is mostly focused on the United Kingdom, the United States, and Germany, with a little bias toward the years 1995–2003. Finally, due to the small number of studies that have been conducted, the study to date lacks considerable depth. The study is also fragmented since it spans a vast number of authors, publications, and social science fields. The primary conclusion derived from the sample utilized in this systematic literature analysis is that if the evidence base is to be enhanced and extended,

the topic area may need some priority by a 'critical mass' of academics over a lengthy period of time.

The following is our analysis of the general connection between innovation and networking, which is based on a subset of empirical data obtained from the systematic literature review. This connection is discussed in more detail in the next section. We then show a diagram that depicts this connection. This diagram serves as a framework for the study that follows, in which we look at the roles of the many parties that make up the networking interface and infrastructure. We wrap off our investigation by looking at evidence of network limits in innovation processes and network breakdown. To wrap up the article, we discuss several key topics for future research and briefly discuss policy implications based on the current evidence base[5]–[8].

1.2. Overview of the Innovation and Networking Relationship:

The work in this research takes into account the DTI's focus on effective exploitation of innovative ideas. Product, process, and organizational innovations all have a role in the successful commercialization of a novel concept. As a result, the research uses the DTI's wide definition: Innovation is defined as the effective conversion of ideas into new goods, processes, services, or business practices. It is a key process for attaining the two complimentary corporate objectives of performance and growth, which will help narrow the productivity gap.

As a result, the research believes that innovation encompasses both the creation and use of new goods, processes, services, and business practices. Companies see a growing need to cooperate with other firms, both officially and informally, as products become more modular and information is dispersed across organizations. Indeed, the center of innovation is increasingly the network in which a business is embedded, rather than the person or the organization. Many scientific and technical achievements are the result of many contributions from many players operating in networks, and the standards required for a technology to operate across marketplaces are becoming more reliant on networks of companies.

The biotechnology industry in the United Kingdom is an excellent example of the beneficial connection between networking and innovation. Collaboration is generally recognized as a crucial element of the biotechnology sector when it comes to invention. The sector is supported by a constantly developing, complex knowledge base, and the skills and capabilities required to bring a scientific discovery in biotechnology to market are dispersed among a variety of big and small companies. While the biotech business exemplifies the significance of networking for innovation, the study emphasizes the need to network as a precondition for innovation across the majority of industries. Firms in a wide variety of sectors have been shown to benefit substantially from networking behavior in terms of innovation output and competitiveness. Service industries¹, primary industries², manufacturing industries³, and high-tech industries⁴ are examples of industries where networking has had an effect on innovation.

1.3. Network Formation and Configuration Overview:

The first is concerned with companies' resource needs, and how they are encouraged to establish network connections with other firms in order to get access to technical and/or commercial resources that they lack. The availability of chances to establish connections is not seen as a restriction from this viewpoint. The second contends that chances to establish connections likely to mirror previous inter-firm relationship patterns. As a result, a company's capacity to form

network connections with other companies is determined by its current relationships and network capability.

Social institutions have an impact on the relative ease with which business-to-business networks develop. These institutions may create the cultural circumstances and infrastructure for networking, as well as serve as brokers and intermediates in network creation, according to empirical data. The development of the infrastructure needed to support the creation of business-to-business networks is shaped by institutions such as the legal system, banking and finance system, labor market structure, education system, and political system.

In terms of which kinds of companies benefit from networking, it has been discovered that networking is helpful not just to established firms but also to entrepreneurs. Because interpersonal and inter-organizational connections allow actors to get access to a range of resources owned by other players, networking may improve the success rate of entrepreneurial efforts. Network relationships, for example, are believed to offer emotional support for entrepreneurs who take risks, and this, in turn, is expected to increase the desire to stay in company.

Several additional studies have shown that successful entrepreneurs utilize networks to acquire ideas and collect information and advice on a regular basis. Other ways to get into important talent and market knowledge include connections with venture capitalists and professional service groups. Alliances allow businesses to get access to resources, which is especially useful when time is of the importance. Small company owners may use networks to connect to R&D that is contracted out by bigger companies, to participate in collaborative R&D ventures, and to establish marketing and manufacturing connections[9], [10].

1.4. Networking Infrastructure and Networking Interface Interrelationships:

Recent research on 'innovation systems' has shown that when there is a knowledge flow across systems, innovation happens more effectively (for example, between different industries, between regions or between science and industry). The significance of variety of connections in networks has been demonstrated to have an effect on innovativeness based on this research. The importance of varied partners for empirical research on innovation, as well as the findings of this study, are reinforced by technology networks in the Spanish automotive industry and work on tiny high-tech companies in the United Kingdom. These studies indicate that numerous players both within and outside the company impact innovation, and that the most significant partners are from the business sector - consumers come first (33.5 percent of companies), followed by suppliers (21.9 percent of firms). Firms' willingness to collaborate outside of these "direct" connections is similarly restricted, according to studies on partnering. Only 8.9% of businesses, for example, collaborate with colleges. Research in Germany, on the other hand, reveals substantial national variations in terms of engagement with research institutions and universities, as well as the significance of scientific partners in certain industries.

According to studies, tying marketing and technical efforts together early in the innovation process allows goods to be created with a complete understanding of the customer's requirements. Furthermore, putting too much focus on technical quality or marketing may lead to over-engineered or over-priced inventions. Customers' network connections are considered essential because:

- Dialogue between important business customers and suppliers enables companies to not only learn about current requirements, but also to identify future ones ahead of the competition.
- Customers who are involved in the early phases of product development will help to create ideas.
- Involving customers in the innovation process lowers the chance of failure.
- The inventor learns from the consumer about the product's probable commercial potential.

2. DISCUSSION

The overwhelming majority of the data examined is very favorable in terms of the usefulness of B2B networks and their effect on the innovation process. However, no comprehensive study of this topic would be complete without a focus on why networks fail or the reasons that hinder successful networking behavior. Networks seem to have issues for a number of reasons. These issues may emerge as a result of relocation, or they could be caused by inter-firm dispute, a lack of size, external disturbance, or a lack of infrastructure.

Networks may last a long time and continue to develop. As a result, they go through times of disagreement amongst partners, which may and often does lead to the network's collapse. Although networks may face internal conflict, they can also face displacement and conflict from other networks. For example, investigates how small and medium-sized businesses in a Japanese area of traditional ceramics manufacture have adapted to high-technology uses. He shows how, in new Japanese sectors, external connections to networks have put the survival of creative networks in an old industrial area in jeopardy.

Every network has rules of engagement that limit the behavior of the participants. The network's governance mechanisms and the infrastructure (especially industrial culture) in which the network is embedded control these regulations. For example, the pharmaceutical business has an industrial culture that encourages more open and networked innovation, while the defense industry has moved toward tighter and more concentrated networks due to the sensitivity of the technology. Although the influence of networking on innovation performance seems to be clear, some research indicate that big companies can innovate more successfully. Shows that failure in Silicon Valley is related to networks of small businesses failing to capitalize on the revenues that may be earned when ideas reach maturity. After the original invention has been created, networks of small businesses have been proven to be unable to get the resources and scale to properly market the innovation. As a result, they are unable to maximize profits from the opportunity. A study of high-tech firms in the deep south of the United States found that clustering of related industries is facilitated by a lack of appropriately configured laboratory and office space at the intermediate stage of business growth, which necessitates information sharing and cooperative behavior. The study's businesses' growth was severely hampered by a lack of essential networking mediation entities.

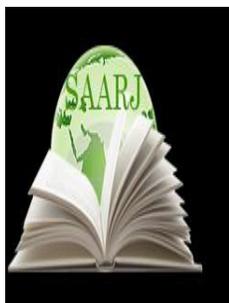

3. CONCLUSION

This assessment of the evidence base on the connection between networking and innovation identifies many areas in which further study is needed. The connection between networking and various kinds of creativity is the first apparent gap in the research (e.g. process and organizational innovation). Too far, product innovations have been the primary focus of research

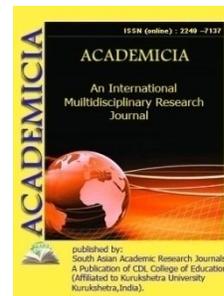

across disciplines. While process and organizational innovation are more challenging to analyze by their very nature, the kinds of networking activity that occurs throughout the creation, dissemination, and implementation of process and organizational innovation need significant consideration. Then it may be able to compare networking activity and configurations across these various kinds of innovation and draw meaningful conclusions about the differences. More broadly, network dynamics and network configurations are likely to be the most important topic for future study. According to the data, there is a lot of uncertainty and dispute in the literature about the best network topologies for effective innovation. While networking configurations are obviously influenced by variables such as industry and kind of innovation (radical vs. gradual; product vs. process), much more study is needed in this area. Recognizing that networks are fundamentally dynamic, a longitudinal approach to study may be beneficial.

ENVIRONMENTAL POLLUTION BY CHEMICAL SUBSTANCES USED IN THE SHALE GAS EXTRACTION: A REVIEW

Dr. Amit Sharma*

*Faculty of Engineering, Teerthanker Mahaveer University,
 Moradabad, Uttar Pradesh, INDIA
 Email id: dramit.engineering@tmu.ac.in

ABSTRACT

Various fluids for hydraulic fracturing are used to obtain shale gas. Several hundred distinct chemical compounds may be found in them. Many of them may be harmful to the environment and human health. Despite the fact that chemical additives make up just 2% of the fluid volume, the huge quantity of fluid utilized and the fact that the majority of these chemicals are extremely toxic make them a potentially significant environmental hazard. To minimize their negative environmental impact, product safety data sheets must be used to identify all chemicals and specify their toxicity levels. Their usage should likewise be minimized to the greatest extent feasible, or they should be replaced with less hazardous alternatives. The following research looks at the most common chemical additions used in shale gas extraction fracturing fluids. It focuses on their characteristics and toxicity, as well as the difficulties in determining the presence of microelements and microelements in samples with such complex matrices. There are other hazards associated with their application and movement to soils, surface water, ground water, and creatures.

KEYWORDS: *Fracturing fluid; Shale gas; Chemical substances; Environmental threats*

1. INTRODUCTION

The globe is in the midst of an energy crisis. As a result, new energy sources are being actively explored. Shale gas is one possibility that has been considered all around the globe, including in Europe. According to the US Energy Information Administration, Europe's unconfirmed theoretically recoverable shale gas quantities total 13.3 10¹² m³, with Poland and France accounting for the majority (4.19 10¹² and 3.87 10¹² m³, respectively). Ukraine (3.62 10¹² m³), Romania (1.44 10¹² m³), Denmark (0.91 10¹² m³), and the Netherlands and the United

Kingdom (both 0.73 1012 m³) are believed to hold the next biggest deposits. The European Commission issued a nonbinding proposal in January 2014 entitled "Minimum guidelines for the exploration and production of hydrocarbons (such as shale gas) utilizing high volume hydraulic fracturing." The member states have been asked to put these proposals into action within six months after their publication, and the commission will assess their efficacy in July 2015[1]. This declaration focuses on three specific issues that need attention from a European standpoint.

The first is the issue of the EU's high population density in comparison to many of the places examined so far, including the United States, Canada, and Australia. European nations' average population density varies from just under 100 to over 600 persons per square kilometer, compared to little over 3 in Canada and Australia and 32 in the United States, respectively. As a result, fracking operations will inevitably interact more intimately with other activities. Furthermore, since the EU has the world's most extensive and legally enforceable greenhouse gas reduction and climate change mitigation measures, the net impacts of fracking on achieving Europe's climate change goals are significant. Finally, since the European public has previously demonstrated a high level of sensitivity to the subject of fracking, the impact on the public and communities is also a major concern[2].

In terms of financial benefits, the environmental risks associated with shale gas must be considered, since it necessitates the new gas extraction technique. For fracturing fluids, the applied technique requires huge quantities of water and chemical substances. One borehole is expected to use 20,000 m³ of water, 850 tons of proppants, and 210 tons of chemical solutions. A total of 100 kilograms of sand and 2 tons of water are required to extract 1,000 m³ of shale gas. As a result, a large portion of the debate is dedicated not just to economic, political, and technical problems, but also to environmental concerns. Shale gas has been utilized in the United States for 40 years, with 50,000 boreholes drilled. However, Europe is far from starting from scratch when it comes to fracking. Since the 1950s and the 1980s, hydraulic fracturing and horizontal drilling have been used throughout Europe. Horizontal drilling and multitrack stimulations were successfully carried out in northern Germany in the early 1990s[3]. Throughout recent decades, more over 1,000 horizontal wells have been drilled in Europe, including thousands of hydraulic fracturing operations. So far, no severe events related to shale gas extraction have been reported in the literature. However, one must consider the long-term consequences of this technique of extraction, as well as the fast rise in its use in recent years.

Approximately 90% of Poland's energy originates from the burning of hard and brown coal, which is in violation of EU environmental regulations. The EU recommendations on the risks posed by shale gas production were released in 2011. According to the agreement, all interested parties must be provided with information on the chemical compositions of the additives used in fracturing fluids. It's also crucial to figure out how hazardous they are and keep track of the pollution they create[4]. Furthermore, the environmental risk posed by the use of hydraulic fracturing must be evaluated. As a result, the issue is viewed as one of properly controlling current regulations rather than creating new ones. New regulations for shale gas production are presently being established in Europe and Poland.

They should go into effect shortly. Hydraulic fracturing is a technique for improving borehole efficiency. Fracturing fluid is injected into the borehole at high pressure to create, maintain, or expand cracks in the rock. To extract shale gas, petroleum, or uranium, this method is utilized[5]. In 1947, the technique was used for the first time in gas extraction in the United States. The fluid

is evacuated from the borehole once the procedure is finished to allow for gas extraction. After the hydraulic cracks are created, the fluid is evacuated by lowering the pressure in the borehole. During the flow back phase, a portion of the fluid is returned to the system. to the surface. It is collected and either recycled or disposed of as industrial trash. Regrettably, only 40% of the fracture fluid is returned to the surface. The remaining portion is buried[6].

The use of hydraulic fracturing is fraught with controversy. Shale gas production requires huge quantities of water, chemicals, and proppants for hydraulic fracturing, in addition to land for well pads and associated infrastructure to exploit the resource. The use of hydraulic fracturing in oil and gas operations resulted in a huge rise in sand mining (the United States used some 28.7 million tons in 2011). Sand requires a high quartz content (98%) and round grains with a comparable size range (100–500 m) in significant numbers, which can only be obtained from quarries or nearshore or coastal sources in Europe[7]. It's also worth noting that the mining and extraction lobby continues to exert control on study into the method's potential dangers, despite the fact that the entire composition of the applied fluids remains unknown. In 2011, France became the first country to enact a law prohibiting the use of hydraulic fracturing for gas and petroleum production.

There are two methods to make the fracturing fluid. During the fracturing process, the components are chosen and combined in continuous mixing. The components are chosen ahead of time in batch mixing, and the ready-made combination is utilized for the process[8]. At each step of preparation, the fluid should be carefully secured and kept in tight tanks to avoid leaks or secondary contamination. After fracturing, the fluid that returns to the ground surface is routed into the treatment system, where it is treated to a high degree of treatment (up to 98 percent) before being put in the tanks[9]. The fluid that has been treated may be reused. Specialized businesses should collect sewage sludge and transfer it to locations where it may be neutralized in line with current laws. Figure 1 depicts the hydraulic fracturing flowchart.

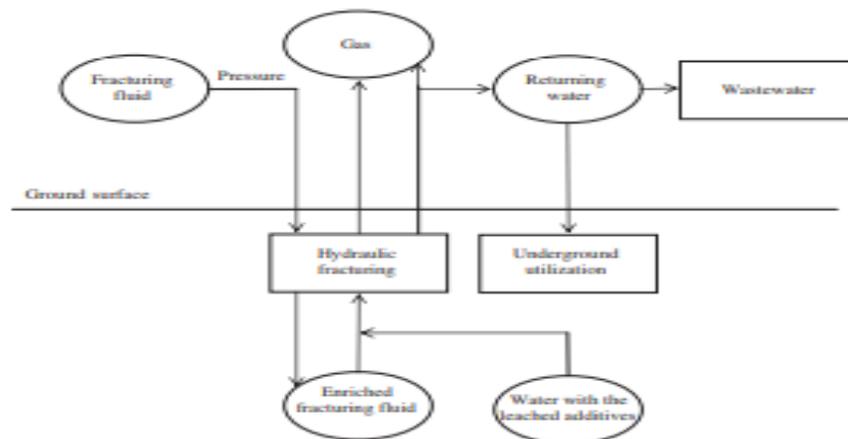

Figure 1: Flowchart Representing the Shale Gas Extraction

Special double-walled tanks, trays, or protective foil put on the ground underneath the tanks prevent fracturing fluid leakages into the surface. Furthermore, each fracturing operation is preceded by borehole cementation condition tests (acoustic and pressure tests), which are utilized to identify any potential borehole pipe leaks. All chemical compounds utilized in the production of shale gas should be documented and recorded correctly. Only authorized and competent

personnel, as well as emergency services, should have access to them. The registration, assessment, and authorisation of chemicals (REACH) system regulates and supervises the chemical compounds used in the EU. The law addresses the safety of utilizing specific compounds by requiring their registration and evaluation.

TABLE 1: TYPES OF CHEMICALS ADDITIVES AND THEIR FUNCTIONS IN THE FLUIDS

Additive type	Function	Examples
Biocides	Preventing the growth of bacteria and other living organisms	Terpene hydrocarbons; glutaraldehyde; 1,2-benzisothiazol-3; 2-methylo-4-izothiazolin-3-one; 5-chloro-2-methylo-2H-izothiazol-3-one
Crosslinkers	Helping gel formation, increasing viscosity	Complexes of transition metals; boron, titanium and zirconium salts; triethanolamine
Buffers	pH control	Inorganic acids and bases (e.g. HCl, HF, NaOH, KOH) and their salts (e.g. Na ₂ CO ₃ , NaHCO ₃ , (NH ₄) ₂ SO ₄ , K ₂ CO ₃)
Sediment inhibitors	Preventing the precipitation of the mineral sediments	Dodecylbenzenesulfonate acid; citric acid; acetic acid; thioglycolic acid
Corrosion inhibitors	Piping and equipment protection	Phosphonic acid salts; formamide; methanol; isopropyl alcohol; acetic acid; acetaldehyde
Surface tension reducers	Reducing the surface tension	Amines; glycol ethers; phenol derivatives; dodecyl sulphate laureate; ethanol; naphthalene; 2-Butoxyethanol
Friction reducers	Causing the laminar flow instead of the turbulent flow	Polyacrylamides; petroleum derivatives; benzene; toluene; ethers
Viscosity reducers	Agents facilitating the fluid recovery	Sulphates; peroxides (e.g. ammonium persulphate, calcium peroxide); KBrO ₃
Gelling agents	Helping gel formation, increasing viscosity	Guar gum; hydroxyethyl cellulose; xanthan gum; methanol; terpenes; ethylene glycol

A typical fracturing fluid includes about 95 percent water and 3–4% sand. Chemical additives make up the remaining portion. The water utilized in the process may come from both above and below ground sources. It is only required at the start of the extraction process. The necessary quantity varies depending on the drilling depth, however it is typically 20,000 m³ per borehole. The purpose of the sand is to keep the cracks from sealing up once the pressure is reduced. It's utilized to keep the time it takes to pump water as short as feasible. The chemicals added to the fracturing fluid are identical to those that have been used for years in conventional wells and vertical boreholes. The quantity of chemicals utilized in directional drilling, on the other hand, is considerably greater than in vertical drilling. Chemical additives used in fracturing fluids may have different compositions depending on the technique employed and the condition of the rock. Despite the fact that chemical additives make up just 2% of the fracturing fluid mix, their characteristics and potential for contamination cause a lot of worry. The most common kinds of chemicals detected in fracturing fluids are listed in Table 1. It also includes various applications and examples[10]. Fracturing fluid compositions are determined by the application as well as the manufacturer.

Table 2 shows typical information on the contents of chosen hazardous chemicals and their concentrations in different manufacturers' fluids. In a newly published study, the physical, chemical, and biological properties of chemicals employed in hydraulic fracturing were detailed in depth. These additives' physical and chemical properties were evaluated using a publicly accessible chemical information database. Organic compounds account for 55 of the chemicals, with 27 of them being regarded easily or intrinsically biodegradable. Seventeen compounds have a high theoretical chemical oxygen demand and are utilized at levels that pose treatment difficulties. According to the Globally Harmonized System of Classification and Labeling of

Compounds, the majority of the assessed chemicals are non-toxic or have minimal toxicity, with just three being categorized as Category 2 oral toxins. However, toxicity data for tens of them could not be found, indicating flaws in the present state of knowledge and emphasizing the need for additional investigation to fully comprehend possible problems connected with the use of chemical additives in such applications.

The fluid manufacturers, as shown in Table 2, employ various marketing names for the same chemicals. When researchers attempt to figure out the actual chemical composition or the CAS number of a substance, they become confused. There have been calls for shale gas extraction companies to disclose the entire composition and amount of their fracturing fluids. Because some of the chemicals used today or in the past have proven harmful or poisonous, the topic has become a hot topic in the public discussion. In certain American states, the display of chemical compositions is mandated by law. The FracFocus website in the United States and Canada provides individual fracturing fluid compositions and other data for specific boreholes. Unfortunately, the data is often criticized for being incomplete and biased. Furthermore, manufacturers often resort to the trade secret in order to avoid disclosing all relevant information. Information on the composition of fracturing fluids used in certain nations is very restricted throughout Europe.

For example, data about the Cuatrillo field in the United Kingdom is accessible. Since 2013, the European Internet platform has been run by the International Association of Oil and Gas Producers. The composition of the fracturing fluids used in shale gas drilling may therefore be determined. All of the chemicals utilized in unconventional production are extensively used in industry, and data gaps in terms of toxicity, biodegradability, physical constants, and usage concentrations should be filled in order to provide accurate and informed environmental and health evaluations.

In Poland, there are no separate regulations on the use of chemical substances in the mining and extraction industry. The data of the Polish Ministry of Environment (October 2013) indicated that 49 exploration boreholes had been made in the areas with the concessions for the search and recognition of the unconventional hydrocarbon deposits. The hydraulic fracturing procedure was performed in 25 boreholes.

TABLE 2: TYPES AND CONCENTRATIONS OF THE SELECTED HAZARDOUS SUBSTANCES IN THE SELECTED FRACTURING FLUIDS

Commercial name	Hazardous substance	Mass content (%)	Concentration in the fracturing fluid (mg/L)
<i>Manufacturer—BJS</i>			
HCl	Hydrochloric acid	8	83.68
Cl-14	Propyl alcohol	5	0.23
Ferrotrol	Citric acid	70	18.50
XLW-32	Methanol	90	176.79
GW-3LDF	Petroleum distillates	60	356.24
BF-7L	Potassium carbonate	100	63.53
GBW-15L	Sodium chloride	14	17.09
FRW-14	Light petroleum distillates	40	374.20
Alpha 125	Glutaraldehyde	30	70.43
<i>Manufacturer—Fractech</i>			
HCl	Hydrochloric acid	8	89.26
40 HTL	Methanol	10	1.06
NE 100	Methanol	5	0.26
B9	KOH	20	22.86
BXL-2	KOH	10	12.98
ICI-150	Glutaraldehyde	50	124.66
FRW-50	Petroleum	20	171.21
<i>Manufacturer—Universal</i>			
HCl	Hydrochloric acid	8	89.26
Unilink 8.5	Ethylene glycol	40	123.19
Bioclear 200	2,2-dibromo-3-nitrylopropionamide	20	55.16
CGR 20	Polyethylene glycol	60	165.48
<i>Manufacturer—Halliburton</i>			
HAI-OS	Methanol	60	5.64
FE-1A	Acetic acid	60	6.53
HCl	Hydrochloric acid	8	89.26
K-34	Sodium carbonate	100	141.13
BC 140	Monoethylamine	30	58.15
FR-46	Diammonium sulphate	30	330.95
Aldacide G	Glutaraldehyde	30	70.43
<i>Manufacturer—Superior</i>			
AI-2	Glycol ethers	30	1.54
IC-100L	Citric acid	100	8.14
OB-Fe	Polypropylene glycol	40	2.39
Super Pen 2000	Iron sulphate	30	1.79
Super OW-3	Isopropyl alcohol	40	0.95
Super 100NE	Isopropyl alcohol	30	0.82
HCl	Hydrochloric acid	8	89.26
Bioclear 200	2,2-dibromo-3-nitrylopropionamide	20	55.16
SAS-2	Light petroleum distillates	30	270.06

(There are two horizontal boreholes and eight vertical boreholes.) The Polish Exploration and Production Industry Organization aspires to meet the public's need for information. As a result, it urges its members to disclose the fracturing fluid composition used in Polish exploratory boreholes.

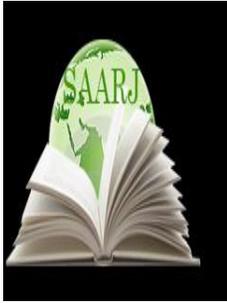

2. CONCLUSION

Shale gas extraction techniques and the usage of fracturing fluids containing many toxic chemicals may damage humans, animals, the water and soil environment, and air quality. Borehole drilling and monitoring of shale rock fracture and aquifers define the safe functioning of the water–soil ecosystem. Fracturing fluid composition, on the other hand, should be improved with non-toxic chemical components. In this way, the negative effects of fracturing fluids may be reduced. The use of fracturing fluids is linked with substantial environmental concerns. They are a result of both the composition and the application range. Regrettably, the majority of fluid manufacturers do not offer complete chemical composition information. Furthermore, they make no mention of the fluids' toxicological properties. If such data were available, it would be possible to focus on monitoring the most important substances. Toxicological features, maximum allowed dosages, and long-term impacts on humans and the environment may all be defined by researchers. The fluid returns to the surface in large amounts. Chemicals that may react in a number of ways are included. Ironically, shale gas production has resulted in the placement of local "environmental bombs." The extraction of natural gas from the environment requires the release of large amounts of hazardous substances into the ecosystem.

On the one hand, shale gas is a renewable energy source, yet hydraulic fracturing technique used to obtain it presents a major environmental danger. Living beings are poisoned by several widely used substances. As a consequence, it's crucial to know what these fluids are made of. However, evaluating risk and potential issues, particularly long-term hazards, is challenging without full cooperation from fracturing fluid producers and consumers. Such tight collaboration is needed not just for the environment, but also for present and future generations. This will also allow for the development of new or current technological techniques for their effective treatment.

A REVIEW ON NETWORKING AND INNOVATION: THE POTENTIAL ROLE OF INNOVATION POLES

Dr. Vipin Jain*

*Teerthanker Mahaveer Institute of Management and Technology,
Teerthanker Mahaveer University,
Moradabad, Uttar Pradesh, INDIA

ABSTRACT

There is considerable discussion in the literature about how to make Industrial Symbiosis (IS) effective, as well as the variables that may influence its implementation, such as networking and creativity. They've found little room for study thus far, preferring to focus on other technical and economic problems including the nature of the processes involved, regulatory difficulties, economic feasibility, and stakeholder engagement. They may, however, become important in certain situations, particularly when examined collectively and in their synergistic interplay. The Innovation Poles (IPs), which are government-sponsored consortia created within EU programs with the goal of stimulating innovation within networks of organizations and promoting competitiveness in specific industries or value chains at a local or regional level, are an interesting context to consider in this regard. In this article, we first describe how these issues have been handled in IS research so far, and then we examine the key characteristics of the IP model in order to determine if and how it may help to the growth and spread of IS. The study's knowledge base was built on a review of the literature through desktop analysis and direct investigation, with an emphasis on Italian patents. The findings indicate the beneficial role that the IP model may play, both in terms of its institutional activity of knowledge creation and distribution and, more importantly, as an applicative framework for IS.

KEYWORDS: Clusters; Industrial Ecology, Industrial Symbiosis, Innovation, Innovation Poles, Networks.

1. INTRODUCTION

Industrial Ecology (IE) is concerned with the effect of industry and technology on the biophysical environment, as well as the societal and economic changes that accompany them. To emphasize the possible reduction of environmental burdens, local, regional, and worldwide uses and flows of materials and energy in goods, processes, industrial sectors, and economies are examined. Industrial Symbiosis (IS) is a strategy within IE that encourages communities of businesses to collaborate to improve their economic and environmental performance. There is still a lot of discussion in the literature regarding how to make the IS effective and what variables influence its implementation, such as technical and organizational features, regulatory problems, company and stakeholder participation, and economic viability. The importance of networking and innovation is also acknowledged. Companies' networks are seen to be one of the most potential settings for IS because of their physical closeness and learned propensity for cooperation among the organizations concerned, particularly in the operational forms of industrial clusters or districts. Innovation is often seen as an important element of IS development, for example, in terms of offering new supporting technologies. Despite the fact that these topics are often addressed together, particularly in organizational studies, this seldom occurs in the context of IS development[1]–[4].

The Innovation Poles concept is an intriguing approach to explore in order to close this gap (IPs). They are government-sponsored consortia formed under EU initiatives with the goal of promoting local or regional competitiveness in particular sectors or value chains by encouraging innovation within networks of companies. Moving on from the fundamental characteristics of industrial networking and innovation, we look at the role that IPs may play in the creation and diffusion of IS in this article. The Italian territory is utilized as a source of regulatory and technical information on the IP model, which has spread rapidly and widely in this nation[5]–[8]. The study's findings will aid in the exploration of new spaces and possibilities for the development of IS in existing contexts, an area of research in which the authors have been involved for years, and they have conducted research on various forms of territorial agglomerations of companies, such as clusters, local supply networks, districts, and environmentally equipped industrial areas[9], [10].

The next sections detail the study methodologies utilized, and the existing areas for creativity and networking within the IS studies are explained to explain why these variables are deemed important. The idea of IP and its major characteristics are defined and explored in the second half of the essay to emphasize its potential and limits, as well as the roles that this model may play in relation to IS. At the end of the process, conclusions are made[2].

1.1. Networking and Innovation:

Industrial networks are hybrid patterns of economic activity coordination that incorporate the benefits of conventional governance methods such as vertical integration and market exchanges; they may take many different shapes and function at varied geographical scales. Innovation, according to the literature, refers to changes made by businesses to their goods, processes, and organizational structures in order to enhance their own operational or market performance. Organizational studies show that these two ideas are inextricably linked, and that their interplay may result in system changes. Many writers believe that businesses that are part of networks are more creative than companies that are not; this is due to the existence of relationships that allow for learning and information exchange. Geographical closeness is often important in creating and enabling information transfers among network members, which increases the probability of

innovation creation. Furthermore, it is a great tool for companies to communicate with one another. Economic geographers have also contributed to this discussion, pointing out that, in addition to physical closeness, cognitive and organizational dimensions are important factors in interactive learning and innovation within industrial networks.

1.2. Industrial Symbiosis:

IS networks are referred to as "complex adaptive systems" because they may emerge in a variety of ways and develop over time because to their resilience. An IS may include a variety of solutions (e.g., supply chain synergies, shared utility synergies, local use of by-products, energy, or wastes); it can depend on new or existing organizations; and it can develop in a planned, assisted, or spontaneous manner. Exchange connections are often facilitated by social relationships that are based on trust and cultural factors. Some of the participants (individuals or organizations) have a critical role (as external facilitators) in determining the IS's effectiveness. Participants gradually incorporate certain kinds of interaction, as well as other cultural aspects and values, over time, increasing their understanding of the program's original goals. IS has the potential to enhance the socioeconomic and environmental performance of the communities of businesses engaged, as well as the territory where it is created, in the long run. Despite its obvious promise, IS has had trouble spreading operationally. We can see from the dissemination rates that nations where it was able to design their development from the ground up (e.g., China) grew more quicker; in others, where development is based on existing industrial settings, cultural issues and resistance to change may emerge.

1.3. Industrial Ecology, Industrial Symbiosis and Innovation:

The book "Industrial Ecology and Spaces for Innovation" highlighted the possibilities for collaboration between innovation and IE research. According to the authors, innovation studies should examine how innovations alter socio-economic systems (including changes that affect the natural environment), while IE should shape socio-economic systems "metaphorically" as ecological systems (through a set of concepts and techniques that includes technological and organizational innovations). They also recognize that the two areas have a lot in common and that innovation is critical to attaining sustainable production and consumption, despite the fact that at the time, research on innovation were not being conducted in a systematic way in the IE community.

During the 2000s, the integration process has progressively developed, thanks to certain important contributions, such as the IHDP-IT Science Plan, which specified some realistic trajectories of technical and organizational change in terms of the environment, dubbed "Industrial transformation." In terms of methodology, significant progress has been made in the co-evolution of the perspectives of innovation studies (from individual initiatives to innovations within companies and sectors, up to systems of innovation) and IE studies (from individual initiatives to innovations within companies and sectors, up to systems of innovation) (from products, to processes, supply chains and whole economic systems). The incorporation of elements of policy and governance of socio-economic development under common research topics resulted from this holistic and systemic approach that currently defines the two fields of study. Some writers have recently concentrated their attention on figuring out how technology innovation might help with IE. SWIT (Sustainable Wealth Creation based on Innovation Systems and Enabling Technologies) is a comprehensive framework and model that incorporates the

utilization of suitable technologies and their integration into innovative supply chains. Other writers stress the importance of open innovation and business model innovation in putting recycling at the forefront of strategic business management[8].

There are just a few scholarly papers that explicitly examine the connection between innovation studies and information systems, and they all take various approaches to the subject. From an innovation standpoint, researchers developed a conceptual framework for evaluating sustainable supply network strategies. He stresses the importance of the "focal" business and suggests several methods. External orientation, transparency, learning capacity, leadership, autonomy, and results orientation are among the characteristics that characterize the strength of the business, according to him. Trust, clear plans, and an efficient information system all help to facilitate the exchange of these methods throughout the network. Other research examines the application of cutting-edge ICT techniques and tools in the context of IS, including modeling, mapping, and optimization of symbiotic networks.

1.4. Industrial Networking and Symbiosis:

Many scholars have emphasized the significance of industrial network studies in connection to eco-industrial systems. In the implementation of sustainable development methods within local and regional networks, the interconnections of economic, social, and environmental factors. He emphasized the need of multidimensional methods that include economic geography and regional economics research into certain "untreated interdependencies" (based on trust, cooperation norms, and routines) that constitute the foundation of local unique assets. The relationship between IS and the so-called "agglomeration economies," or positive externalities resulting from co-located businesses. It is discussed how various kinds of IS are adapted to different industrial setups. During the same time period, the significance of the linkages between the techno-sphere and the social system aspects in the study of IS was investigated by the IS program in Rotterdam. Several research on the emergence of IS in existing settings have focused on networking, both social and material. Some have explored the importance of tacit and explicit knowledge, as well as ICT technologies, in enhancing cooperation, while others have concentrated on embeddedness, which is linked to the notion of trust or closeness, in the application of Social Network Analysis (SNA). Several writers have recognized the potential of information systems (IS) to provide new possibilities and add value to local production systems, which is best shown by the industrial clusters or districts concept. In this way, networking may be seen not just as a precondition or an enabler of IS, but also as a result. Studies performed inside long-standing IS, such as symbiotic networks, have shown that they are capable of self-modifying, resulting in new areas for cooperation and relationships among the businesses involved[1].

1.5. Innovation Systems and Other Territorial Innovation Models:

The topics of innovation and networking are closely linked to the ideas of Innovation Systems (or System of Innovation) and, even more so, Regional Systems of Innovation in research on local and regional economies. Innovation Systems are a collection of interconnected components (local actors, institutions, business networks, and technical variables) that work together to generate, exchange, and distribute innovation, knowledge, and technological development in a given region. They can have various spatial scales (national, regional, and local) or spheres of interest (sectoral dynamics, technological, or organizational), and they can include individuals

from various contexts (public or private bodies, companies, research centers) or formalization levels (national, regional, and local) (spontaneous, planned). Their innovation activity may be assessed in a variety of ways, including the number of registered patents, the number of active initiatives, and R&D expenditures. Different variations of the idea of Innovation System may be found in the literature. They are sometimes referred to as Territorial Innovation Models by certain writers (TIM). A variety of new ideas have emerged as the conventional model of industrial districts or clusters has evolved into territorial organizations with significant scientific and technical implications. One that has gained popularity in recent decades is the Regional System of Innovation (RSI). The spatial size is the distinguishing characteristic of these systems. They are the result of the interplay of a number of variables linked to regional industrial growth (economy, technology, districts, research, learning, knowledge, and governance). Companies, institutions, infrastructure, knowledge, and a policy aimed at regional innovation are usually their building elements, and they are characterized by interactive learning (cross-fertilization), knowledge creation, proximity (geographical closeness), and social embeddedness (in terms of role of social relations)[7].

Other operational models based on networks of businesses, a territory, and innovation activities, such as Technological Districts and Science/Technology Parks, have expanded throughout EU areas in recent decades. Technological Districts are conglomerations of expertise in certain high-tech industries that have been designated as priority for a specific region. They are methods for transferring and connecting information about the circumstances that occur in a certain area. The Science/Technology Parks (STP) are a technical offshoot of the IDs, with the main goal of promoting the culture of innovation and competitiveness of businesses and organizations that produce knowledge. STPs facilitate the development of creative businesses by encouraging the flow of knowledge and technology among universities, R&D institutions, companies, and markets.

3. DISCUSSION

The research shows that partnerships (assured by the network) and changes (i.e., innovations) have been important in IS studies; it also shows that these two components have been positioned based on EU territorial innovation models, and therefore IPs. For these reasons, we think that IPs are attractive settings in which to study IS. A variety of factors have surfaced in favor of this, which are discussed.

It's worth noting that the environmental variable has been identified as a significant factor in almost 15 instances among Italian IPs. Some of them are in regions that have already begun to develop territorial solutions for environmental sustainability (for example, Tuscany's CLOSED project (Closed Loop System with Eco-Industrial Districts); Piedmont's development of the Environment Park Scientific and Technological Park; and Emilia Romagna's promotion of the so-called Ecologically Equipped Industries). However, there are no clear allusions to the idea of IS in relation to IP initiatives.

Specialization by industry: By definition, IPs are made up of businesses and entities that are part of the same supply chain or industry, implying a degree of homogeneity in terms of the processes, resources, and products produced in the network (as emerging in the Italian context). This feature, when viewed in light of the potential for IS growth, identifies both good and negative topics for consideration. Internal homogeneity means that resources beneficial to IS

(such as by-products and trash) are available in greater quantities and from a greater number of businesses, which may assist overcome certain "scaling" constraints. Other beneficial aspects include the ability to share expertise and the creation of shared management solutions for two or more businesses. On the other hand, because the involved organizations in the IS have similar flows, a high level of internal homogeneity in the network can reduce the chances of input/output matching; indeed, in some cases, a certain level of diversity among the involved firms is essential to allow symbiotic exchanges. Some of the barriers to sectoral homogeneity may be overcome by encouraging inter-IP synergy. In this scenario, the involvement of a coordinating organization (or knowledge-sharing among IP managers) would be required to enable the start of contacts between the businesses concerned.

Spatial scale: Scientific research and practical examples indicate that businesses in an IS do not have to be co-located. Long-distance transfers, however, may result in additional costs and environmental effects since IS is built on exchanges of low-value-added flows (e.g., trash). As a consequence, proximity, in general, favors high IS exchange efficiency; nevertheless, some findings indicate that, when dealing with recovery and recycling problems, it is impossible to assign any specific geographical scale a priori, since economic transaction motives often dominate. Other research suggests that a "local" scale may compensate for certain trade-offs (such as those between "technical and organizational skills" and "degree of personal affectedness"). IPs may have a varied geographic size, according on the data gathered. They may overlap existing industrial clusters or districts (as in some cases in the Tuscany region), or they may involve companies from the same region or even beyond regional boundaries (as in some cases in the Abruzzo region), and then operate transversely to existing industrial sites (as in some cases in the Tuscany region).

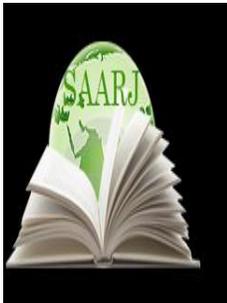

3. CONCLUSION

The potential synergies and critical issues between the two models of local development of Industrial Symbiosis (IS) networks and Innovation Poles (IPs) have been investigated in this article, which moves from the common features of industrial networking and innovation to the potential synergies and critical issues between the two models of local development of Industrial Symbiosis (IS) networks and Innovation Poles (IPs). The study's knowledge base was built on a review of the literature and firsthand investigation. The Italian territory has been utilized as a source of regulatory and technical information on the IP model, which has seen fast and widespread adoption in this nation. To begin, it was discovered that networking and innovation are two important elements in IS research; it was also verified that they have been underutilized as a common foundation for IS development, but are at the heart of EU territorial innovation models, including IPs. The positive role that IPs can play in the development and diffusion of IS in a given territory can be attributed to their institutional activity of knowledge and innovation production and dissemination, and, more importantly (if considered as applicative contexts for IS), to their promotion of the establishment of symbiotic relationships among their members. Some factors, such as sectoral specialization, geographical scales, the presence of social connections and trust, the involvement of stakeholders, and regulatory problems, have emerged as important in this regard. There were also a number of policy and management implications for local development that were discussed. To begin with, the potential advantages to the area from the spread of the IS model are many, and this should be carefully examined by regions and local officials. Second, since IPs were not designed with this goal in mind, important synergies

between the IP model and other methods and instruments for local sustainable development may emerge. Concerning the study's limitations, it should be noted that they are related to the study's scope (the sample is limited to Italian IPs) and the availability of data, as the IP model is still understudied, and examples of its practical application are too recent to provide a meaningful picture of how they work. Our future efforts will be focused on identifying new operational scenarios in which we may further develop and test our findings.

ABSTRACT

Purpose To guide the future science and medical practice, reviews of yoga studies that differentiate the outcomes of trials performed during (vs after) cancer therapy are required. As a result, we carried out a review of non-randomized studies as well as randomized trials of yoga treatments for children and adults receiving cancer therapy. Methods Research sources and reference lists were used to find studies. The following were the criteria for inclusion: (1) children or adults receiving cancer treatment, (2) yoga or an element of yoga as just an intervention, and (3) participant journal publication in English until October 2015. (1) samples receiving just hormone treatment, (2) therapies using only meditation, and (3) yoga given as part of a larger cancer recovery or insight meditation stress reduction program were all excluded. The majority of findings point to an improvement in psychological outcomes (e.g., depression, distress, anxiety). Yoga was also shown to improve quality of life in many trials, but further research is required to determine domain-specific effectiveness (e.g., physical, social, cancer-specific). In terms of physical and biological results, evidence is mounting that yoga improves sleep and tiredness; however, further study is required to confirm early findings for other therapeutic outcomes and stress/immunity biomarkers. Conclusions Evidence supports advising yoga to people receiving cancer treatment for improving psychosocial outcomes, with the potential to help improve physical symptoms. The evidence for yoga's effectiveness in pediatric oncology is inadequate. We provide recommendations for improving yoga research methods in order to improve clinical practice guidelines.

KEYWORDS: *Depression, Effective, Psychological outcomes, Stress, Yoga*

INTRODUCTION

Each year, more than 14 million people worldwide are diagnosed with cancer, and more than 8.2 million people die from it. High BMI, cigarette use, physical inactivity, poor diets, and excessive alcohol consumption are all behavioral risk factors that contribute to cancer genesis, development, and prognosis. Furthermore, through altering biology and affecting behaviors, persistent stress and depression may have impacts on cancer. Cancer diagnosis and treatment may also produce biological complications such as pain, sleep problems, tiredness, nausea/vomiting, and chemotherapy-induced immunodeficiency, among other things. Some of the effects of cancer are transitory, but many of them last a long time, forcing patients to deal with them on a long-term basis. Furthermore, these side effects make patients more susceptible to other diseases. People may employ mind-body activities like yoga, which is one of the most popular supplementary modalities amongst men and women having cancer in the United States.[1]

Telomere shortening, higher inflammatory cytokines, and reduced cell-mediated immunity are all linked to an increased cancer risk and worse cancer-related outcomes. Although stress does not cause cancer directly, it may promote it via endocrine pathways (e.g., sympathetic nervous system, hypothalamic-pituitary-adrenal axis) that raise inflammation, enhance angiogenesis, decrease anoikis, and diminish chemotherapeutic effectiveness. Yoga and other biobehavioral treatments have the potential to enhance cancer outcomes by reducing stress and interrupting its impact on cancer biology. Previous studies of the potential for yoga to help cancer survivors did not distinguish between individuals who were undergoing current cancer treatment and those who were post-treatment survivors. Efforts to compare the effectiveness of yoga during cancer therapy with post-treatment survival have shown mixed results. As a result, further study is needed to assess the function of yoga throughout various stages of cancer survival. As a result, the emphasis of this study is on individuals who are undergoing cancer therapy. Methods To find out whether yoga can help individuals who are undergoing cancer treatment.[2]

DISCUSSION

To find yoga studies for cancer patients, researchers used search keywords such as yoga, cancer, and over within headings terms (e.g., neoplasm) in CINAHL, MEDLINE, PsycINFO, and PubMed. Additional relevant studies were found using the reference lists of the highlighted publications. The following were the criteria for inclusion: (1) children or adults receiving cancer treatment, (2) yoga or a component of yoga as an intervention, and (3) peer-reviewed publications published in English through October 2015. The following samples were excluded: (1) hormone therapy-only samples, (2) meditation-only treatments, and (3) yoga given as part of a broader cancer rehabilitation or mindfulness-based stress management program.[3]

In pediatric samples, no RCTs of yogi during cancer therapy have been reported. Only single pilot trials in pediatric oncology have been reported. A total of 10 children with various cancer diagnoses were involved in the study. Parents/caregivers were included as yoga practitioners and/or proxy responders in all studies.

1. Non-randomized trials of yoga during cancer therapy in children:

1.1 Characteristics of the intervention:

Two pediatric research utilized particular yoga techniques, whereas the other two did not. All four featured a variety of yoga exercises, including a mix of movements, respiration, calm, and meditation. None, on the other hand, offered comprehensive class sequencing or treatment fidelity information. The dose ranged from a single 45-minute session to 60-minute sessions spaced out over 3–12 weeks, with one to 3 days per week. Three treatments were delivered as group courses, whereas one research did not identify the delivery method. None of them said they gave guidance for at-home practice. All of the teachers in the trials were certified to teach yoga, but only two of them had specialized cancer or therapeutic yoga training.

1.2 Feasibility:

Three of the four pediatric trials looked at the feasibility, attrition, and adherence of the treatment. The percentage of people that were recruited varied from 42 to 55 percent. The majority of children and adolescents (90 percent of children and 100 percent of adolescents) completed the single-session research. In a three-week program, ten of eleven participants fulfilled the a priori criteria for feasibility (60 percent of sessions attended), with a median of nine sessions. In the 12-week program, 55 percent of participants attended yoga sessions, with 73 percent completing the evaluations; cause of non-included vacation and sickness. Participants dropped out of multi-session trials for a variety of reasons, including time/scheduling problems, a dislike for yoga, or a belief that it was "not fast enough". Two pediatric investigations indicated that no adverse effects linked to yoga happened.

1.3 Outcomes

One study found statistically significant improvements in physical function, while the other found clinically significant changes in all QOL variables as evaluated by children and parents/caregivers. Additionally, statistically significant improvements in mobility, flexibility, and physical activity among children and statistically significant reductions in state anxiety amongst adolescents and parents who participated in yoga were found. These conclusions were backed up by qualitative evidence. Yoga was regarded as calming and beneficial for controlling stress/anxiety by participants in pediatric research. They also reported better energy, sleep, and happiness, as well as decreased nausea and pain medication usage.[4]

2. Randomized controlled trials of adult yoga during cancer therapy

2.1 Characteristics of the Intervention:

Three of the studies describing yoga style were based on generic yoga traditions, whereas the other six utilized a particular style of yoga. The majority of adult RCTs incorporated yoga elements such as postures, breathing, and meditation. Three studies did not include yoga moves; two focused exclusively on breathing, while the third included breathing, concentration, and the goal to handle uncertainty and anxiety.

2.2 Possibilities:

Defections averaged 20% prior to or shortly after randomization (i.e., before starting yoga sessions) in three trials, although one study showed 56 percent attrition among individuals

allocated to yoga immediately after randomization. Attrition was higher between yoga participants in the two studies, among matched controls in three studies, and roughly equal across groups in four studies with adequate data to compare. Two trials reported 100 percent completion. Although only two trials assessed participant satisfaction with the yoga treatments, subjective benefits and pleasure were usually high. Except for three studies the majority showed high levels of adherence (>70 percent of participants completing the bulk of courses). When home practice rates were reported, they were mixed. In a study of pranayama, participants spent an average of 3.2 hours per week practicing at home. In trials that included movement, up to 19 percent did not practice at home, whereas more than half did so at least three times per week.

2.3 Outcomes:

Several of the 13 RCTs found that yoga participants' mental health, including positive and negative affect, distress, depression, and anxiety, improved significantly. Yoga practitioners reported substantially improved emotional, mental, social, physical, and overall quality of life when compared to controls. Despite the fact that outcomes like self-esteem, spiritual well-being, or cognitive function were seldom assessed, yoga participants reported positive improvements in these areas. In two trials, including the sole study with an active control group, yoga practitioners had better self health than controls in terms of physical and biological outcomes. In many studies, treatment-related side symptoms such as sleep, tiredness, pain, appetite loss, nausea and vomiting, related discomfort, and toxicity improved among yoga participants. Yoga participants had superior post-operative outcomes than control participants, including less drain retention, faster suture removal, and shorter hospitalization.[5]

3. Non-randomized trials of adult yoga during cancer therapy:

3.1 Demographics of participants:

Nine adult non-randomized studies recruited a total of 155 (average n = 17) individuals, the majority of whom were Caucasian (78%) and female (81%). Various cancer kinds (e.g., lymphoma, gynecologic, breast, and lung) were represented, as well as all stages (0–IV). When indicated, chemotherapy (n = 61) and radiation (n = 40) were given while engaging in yoga treatments.

3.2 Characteristics of Intervention:

Seven therapies used a particular yoga style or a mix of yoga styles. The majority covered various aspects of yoga, such as movement, breathing, meditation, and/or yogic philosophy, while two studies solely included movements or breathing. Facilitated group talks were also used in two research. Three of the nine articles detailed particular class sequences, while five said that movements were tailored to the requirements of the person. Using an instruction manual and analyzing recorded sessions, one research guaranteed treatment fidelity.

3.3 Feasibility:

Five studies found that recruitment rates varied from 16 percent (by sending letters) to 74 percent (by approaching them in person). Recruitment issues hindered the completion of another

research. For reasons such as travel distance, loss in interest, scheduling problems, , seven studies reported attrition rates ranging from 8% (selected from a continuing yoga class) to 43% (selected from women undergoing treatment).

3.4 Outcomes:

Quality of life (QOL) and emotional, physical, and spiritual health were among the outcomes reported in the nine non-randomized adult studies. Because these studies usually lack comparison groups and sufficient power to identify statistically significant changes, the results offer early evidence on yoga's benefits that should be investigated further in properly powered trials. Effect sizes (clinical significance markers; e.g., Cohen's d 0.2 small, 0.5 medium, 0.8 large) and qualitative data are particularly useful in this early stage of research. Anxiety, sadness, mood, negative affect, relaxation, and general mental health all saw statistically and/or clinically significant improvements which were backed up by qualitative comments. Improvements in cognition, benefit discovery, spiritual well-being, social support, self-efficacy, and coping were among the other qualitative results. Physical health increased substantially in terms of physical QOL, tiredness, vigor, most-bothersome symptom, and activation of immune-related genes. Increased strength, release of stress, physical invigoration, and application of yoga in various circumstances (e.g., while attempting to sleep, during medical tests) were also mentioned in qualitative reports. Furthermore, yoga had a moderate impact size and a dose-response effect on sleep.[6]

Only four single-arm pilot trials of yoga have been conducted among children receiving cancer treatment. have been published. The feasibility, safety, and potential effectiveness of yoga in pediatric cancer are all supported by preliminary results from these non-randomized studies. However, unless further thorough studies are performed, its efficacy cannot be established (e.g., RCTs, larger sample sizes). The benefits of yoga on people receiving cancer therapy have been studied in nine non-randomized research and 13 randomized controlled trials. The effectiveness of yoga in improving psychological outcomes such as sadness, distress, and anxiety has been shown in both non-randomized and randomized studies. Several studies, especially RCTs, found that yoga participants had better QOL, but further research is required to determine the effectiveness of yoga for various kinds of QOL (e.g., mental, social, physical, cancer-specific), as well as spiritual well-being.[7]

Researchers reported fewer physical and biological outcomes, but it's unclear whether this is due to a failure to assess these outcomes or a refusal to disclose null results. Sleep and tiredness were the most frequently assessed non-psychological outcomes in both nonrandomized studies and RCTs, resulting in a growing body of data that yoga improves sleep and weariness among cancer patients. Additional research is required to confirm early results for additional treatment effects (e.g., nausea, surgical results, and cognitive function) and stress and immune biomarkers. Multiple limitations of past study samples and methodologies restrict the findings.[8]

The overwhelming majority of research, for example, have relied only on self-reported data. Furthermore, with a few exceptions, breast cancer patients make up the majority of the samples. Regardless of the fact that yoga may be mild enough for people with advanced illness and possibly influence critical outcomes, individuals with Stage IV illness of any kind are seldom included in yoga studies (e.g., distress, QOL). Variability in intervention procedures further limits generalizability. The majority of trials included multiple aspects of yoga (e.g., movement,

breathing, meditation), but intervention delivery (e.g., group vs. individual; instructor-delivered vs. home practice) and yoga dosage (i.e., frequency, length) varied significantly, as did retention and adherence rates. As a result, the quantity of yoga practice required to produce benefits is unclear. Yoga participants improved on endpoints such as psychological distress, tiredness, and immunity in several trials, whereas the waitlist control group deteriorated.[9]

Only two studies included an effective control group. As a consequence, non-specific, but possibly beneficial, components of yoga treatments cannot be separated from Bioactive elements (e.g., movement, breathing) (e.g., social support, attention). Participation, results, and generalizability may all be affected by recruitment techniques and other research design features. When sampling from individuals who are already enrolled in yoga courses, for example, enrolment and retention rates may be particularly high. Although these variables may affect participants' adherence and efficacy of treatments, researchers have seldom published details of their yoga instructors' training and experience particularly with individuals with cancer. The lack of information regarding studies' treatment fidelity attempts adds to the difficulty of understanding and implementing the findings. Despite these drawbacks, research has shown that yoga is likely to help adult cancer patients who are undergoing active therapy. Furthermore, no studies have shown any negative effects from practicing yoga during therapy. As a result, there is enough data to suggest yoga to people receiving cancer therapy, particularly breast cancer patients.[10]

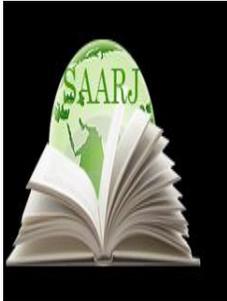

CONCLUSION

Yoga may be recommended to people receiving cancer therapy, especially women with breast cancer, based on current data. Existing research suggests that yoga may enhance or mitigate treatment-related changes in mental health, tiredness, sleep quality, and other elements of quality of life. With further study, support for additional advantages may become evident. Some cancer patients may be motivated to practice yoga because of treatment-related symptoms and stress and the obstacles to practicing yoga during cancer therapy may be fewer than for other kinds of exercise. Some studies have shown a link between regular yoga practice and better results.

As a result, it is suggested that obstacles be reduced by providing flexible class times and formats, integrating new technology, and involving family members. Notably, no adverse events were recorded in any of the studies included in our study. As a result, when compared to higher-impact types of exercise, yoga may be particularly safe and attractive to cancer patients. Finally, studies have shown that yoga treatments may enhance psychological distress, quality of life, physical function, and certain biological results in people undergoing cancer therapy. Yoga's potential to help individuals with cancer, on the other hand, may not have been completely realized yet. Theoretically, yoga encompasses more than the components included in most studies (i.e., movement, breathing, meditation). Its overall attitude and approach may have an impact on healthy living in general (i.e., food choices, exercise, life purpose, relationships). According to preliminary research, holistic lifestyle therapies have a lot of promise for combining with biological cancer treatments. Cancer survivors who have a normal BMI, are physically active, consume a mainly plant-based diet, refrain from cigarettes, avoid hazardous alcohol consumption, and are not depressed survive longer after diagnosis. Future study may look at whether a complete yoga approach helps individuals manage the adverse effects of cancer therapies, improve clinical results, and perhaps prolong and enhance survival.

ARTISTIC PSYCHOLOGY ON THE EXAMPLE OF THE WORK “SPRING DOES NOT RETURN”

Achilova Emina Sadullojevna*

*Master's degree,

Uzbek language and literature from the Chirchiq,
State Pedagogical Institute of Tashkent region,
UZBEKISTAN

ABSTRACT

This article provides scientific information about the psychology encountered in artistic works. Artistic psychologisms in the work of acute Hoshimov “Spring does not return” are studied scientifically. Opinions are based on evidence.

KEYWORDS: *Work, Psychology, creative, contemplation, man, Society, Life, event, phenomenon, law, period, innovator, form, environment.*

INTRODUCTION

The work of art is a product of creative thinking, in which the life of Man and society, his path of destiny and destiny are found. In each artistic work, events that occur in our lives or may occur in our lives are transmitted by the author to the reader-reader on the basis of the laws of artistry, the legislation of this artistry is polished at different times and continues to be regularly formed between tradition and innovation. The problems raised in the works of art, the issues addressed to the attention of the reader and hukmiga – the theme and content of the work of art are closely related to the social environment of the period in which the work was created.

About a certain period and its representatives, interesting and important events can be said without interruption, but simply the description of events takes the description of events to the level of the work of art, when the creator uses various artistic means of painting, in order to increase the level of the work of art. In the deep and complete disclosure of the character of the artistic image in the work, the author used not only artistic image tools, but also psychological image tools. In the game, the author refers to the deep penetration into the inner world of the hero, a detailed description of the spiritual world of the image, the image of the soul senses – “Artistic psychology”.

The term psychology is associated with such terms as psychological analysis, psychological image, psychological image, psychological novel, psychological story and psychology. A. B. To the taste of Yesin, artistic psychology is a very complete, detailed and in-depth expression of the work by the use of specific artistic means of the imaginary world of personage, thoughts, reasoning. One of the first on the topic of psyche in the science of Russian literature was research N.G. Chernyshevsky says that psychological analysis can be diverse, and if one author tries to reveal the sides of the character, the other-shows the influence of society and life on the formation of the character; the third – describes the relationship of behavior with emotions; the fourth – describes the analysis of passions. If the concept of psychologism in Russian literature came into existence almost two hundred years ago, then this problem was solved by scientists of the world of Science A.A. Potebney, D.N. Ovsyaniko-Kulikovskiy brought, in Literary Studies M.M. Lucky for you, JI.Eat it. Ginzburg, A.B. Yesin, D.S. Likhachev, and in the science of psychology, L.S. Vigotsky, I.V. Strakhoviy, G.G. Granik, O.V. It was studied in depth by Soboleva.

Describing the history of the development of psychology in literature, the literary scientist L.Eat it.Ginzburg writes that “at a time when psychological news came down in the existing literary genres, there were already concomitant genres of artistic literature – rasoil, in the diaries, memoirs and autobiographical genres, psychology settled.” The term psychologism in its place has different definitions. In the encyclopaedic Dictionary of Russian literary terms “Psychology (in literature)-the inner world of Heroes: a deep and detailed picture of their fantasies, dreams, sufferings”. L.Eat it.While Ginzburg “... in-depth study of the conflicts of the world of entertainment”, A.B. Yesin refers to the fact that psychology has a wide and narrow meaning – in a broad sense it is understood that the character of all kinds of art that glorifies and characterizes human life, and in a narrow sense it is called the image of life and processes in the inner world of man.

In the dictionary of terms of literary studies compiled by scientists of Uzbek literature, the term artistic psychology is defined as “one of the important means of creating a full-fledged human image in an artistic work; the disclosure of the spirituality of the personage, the psychological justification of his actions and speech, the set of methods and means that serve these purposes”. In Uzbek literary studies, the issue of artistic psychology entered the scientific field in the middle of the last century, and in our National Literary Studies this term was synthesized and got its names such as spirituality (psychologism), the image of spirituality (psychological image), the interpretation of spirituality (psychological interpretation), the analysis of spirituality (psychological analysis).

Psychologism of the term” spirit ” (Greek. it is permissible to use the term psyche – soul; logos – learn) as a synonym, the reason for which is explained in the Explanatory Dictionary of the Uzbek language in 5 volumes – “soul”, and in the spirit – “state of Soul”. Although this explanation is certainly imperfect for the literary terminology, but both terms in meaning give one meaning. From the second half of the 20th century, Uzbek literary scientists conducted research on the issue of artistic psychology and psychological analysis. In Particular, A.Rasulov's character "molodeji v sovetskikh povestyakh sovetskikh sovremennikh uzbekskikh", N.Shodiev's "skill of psychological analysis in the works of Abdulla Qahhar", N.Problem psychologicheskogo analysis v uzbekskoy proze “Yuldashev ” (Vnutrenny monologue v romanakh A.Kadiri, Eybeka, A.Kaxxara, A.Yakubova) candidate's dissertations, X.Umurov's

doctoral dissertation "the problem of mental analysis in Uzbek novels", A."Psychology in the novels of Adil Yagubov" by kholmurodov , P.In the candidate dissertation and monograph of "principles of describing the hero's spirit in the current Uzbek stories" by kenjaeva, M.Bobokhonov's dissertation" artistic psychology in the current Uzbek storytelling", M.Sheralieva's " irony in the present Uzbek prose" social and psychological factors, role in the poetic system)", Yu.Eshmatova's artistic interpretation of the female psyche in the Uzbek narrative of the period of Independence, Sh.Artistic psychology in the current Uzbek novels "botrova ("balance" of Ulugbek Hamdam, " rebellion and obedience", On the example of the novels "Sabo and Samandar"), having studied various aspects of artistic psychology and psychological analysis in their dissertations, written in order to obtain the scientific degree of the doctor of Philosophy (PhD) in philological Sciences, M.Kilicheva's " problem of literary influence in the interpretation of psychological states in English and Uzbek literature (on the example of the motive of loneliness)", N.Qobilova conducted a comparative study on the themes of artistic psychology and psyche in their dissertations on the subject of philology (PhD) in order to obtain the academic degree of the doctor of philology (PhD) on the theme of "artistic psychology in the creativity of Jack London and Abdulla Kahhor".

Although the concepts of psychology and spirituality began to be recognized in the middle of the 20th century in the scientific periods of Uzbek literary studies, the interpretation and analysis of personality spirituality was also the leader in the work of representatives of eastern classical literature.

Utkir Hoshimov is a great creator. His works are translated into many languages of the world, improvised. Uzbek readers read with interest the works of Utkir Hoshimov. His story" Spring does not return " is known and popular to all of us. Today's article is about the essence of artistic psychologisms in the work "Spring does not return".

In the story "Spring does not return", the writer artistically analyzes the history of the decline, the spiritual crisis of a talented but selfless young man, whose talent is not appreciated, deprived of great goals. It was this artistic analysis that won the hearts and minds of many with its emotional richness and sincerity. From the beginning to the end of the story, the author's very delicate and delicate observations, the writer's heartbeat, colorful experiences, pleasures, longings, in short, a breath of different emotions are blowing. Here is a small excerpt from the end of the story, depicting the landscape after the death of the protagonist Alimardon:

"Why? the sun had set very hard that evening. It hung at the foot of the horizon and slowly sank to the ground.

A few days later, spring came and spread ... The generous spring covered Alimardon's grave like many others. The only tulip in the grass caught the morning dew. Sooner or later, it spilled, unaware that it was neither fragrant nor fruitful ... "

It is almost as if these last lines are written on paper with countless sorrows and tears. On the day of the hero's funeral, on that sad night, the sun sets, the horizon hangs for a long time, and then the hopeless alfalfa slowly sinks to the ground. The generous blue that adorns the whole place with light and color, the hero's heart is covered with grass, the tulip burning on the hero's grave, the melancholy image full of the details of his life, about the life of a man who lived an early life. the treasure sounds like the last cries of the song.

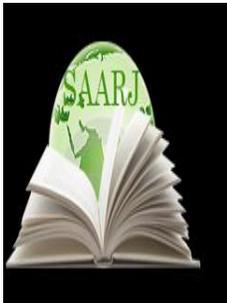

Hoshimov has a strong sense of humor. Even in the depiction of the spiritual crisis, tragedy, and destruction of the deceived person, he retains this feeling. In particular, he feels very free in the image of the heart and nature of good, noble, spiritually mature people. The writer's positive protagonists are childlike, delicate, emotional, and very influential people. Probably, this is one of the factors that captivated many Uzbek readers of the heroes of Utkir Hoshimov's works. The reader, who was brought up in the spirit of cruel, crude paintings of the cruel truth of life, has a little bit of very elegant, emotional expressions, simple, romantic, very emotional, touching heroes in the works of Utkir Hoshimov. It may seem more biblical, but the writer's way of thinking and expression does not have to be the same for everyone. However, it is inappropriate to discriminate, reject, or criticize the author's style because it contradicts another style. The more diverse the artistic thinking and expression in literature, the better.

In the works of Utkir Hoshimov, the lyro-romantic direction, which is accompanied by a sense of elegance in the interpretation of the character, is expressed in a special way, which is the richness of our national prose. So, Utkir Hoshimov, a well-known representative of the Uzbek literature of the new era, is a writer who has won the respect of the people with his multifaceted and meaningful works. Each work of the artist is recognized as a separate event in Uzbek literature. In particular, the work "Spring does not return" has won the love of readers in all respects. The work was republished, and a film was made based on the work.

So, it has become a favorite book of our people. As with other works by Utkir Hoshimov, literary criticism has commented on this story. Utkir Hoshimov's "Spring Will Not Return" is noteworthy for its echoes. In this sense, we can say that this topic is one of the new directions of our modern literature, our literary-critical views. The analysis of the work in the spirit of independence on the basis of new literary views is a requirement of time and science.

THE ROLE OF PARENTS IN THE UPBRINGING OF CHILDREN

Alimova Nargiza Usmanovna*

*Teacher of the Department of psychology of Termez State University,
 UZBEKISTAN

ABSTRACT

The article describes the impact of family and relationships on the upbringing of children, as well as the role of parents in the upbringing of children. Sometimes there are three cases of indifference towards the child even in well-off peaceful families. For example: the birth of an unexpected child, the mother is beautiful, but the daughter is khunuk, which irritates the mother. They want their children to be the people they want to be. However, conflict situations between parents in the family, conflict situations between parents lead to the opposite. The conflict situation is especially relevant when it comes to a different approach to Child Care by parents.

KEYWORDS: Family, Child, Parent, Upbringing, Attitude, Behavior.

INTRODUCTION

The family can be a factor of positive or, conversely, negative influence on the upbringing of the child. Positive influence on the child's personality is such that no one in the family, except for the closest people to the child - father, mother, grandmother, grandmother, brother, sister, sees the child as good as they are and does not care about him. At the same time, it is also possible that the family has a negative impact on the formation of the personality of the child, on the upbringing of them. Family-this is a specific team he has the main place in the upbringing of the child.

Taking into account the specific educational importance of the family, it is possible to increase the positive influence of the family on the child and reduce its negative influence. For this, it is necessary to clearly define the socio-psychological one of the internal family, which has educational significance.

Family is the highest product of human thinking. After all, this small place not only benefits our lives, but also plays an important role in the development of the country, in the development of society.

The main thing in raising a child is to achieve a heartfelt intimacy and moral bond between parents and the child. Parents should never abandon the upbringing process to their own condition, especially a child who begins to grow up. Because the child learns exactly the first life experience in the family, observes and learns how to behave in different situations.

What the child learns in the family should be reinforced with concrete, life-giving examples; the child should see that what the adults say is practically the same. For example: if a child hears that it is impossible to lie every day by his parents, then the leki will be cracked in the upbringing of the child if the parents do not follow this rule themselves without noticing it. Parents will see their own successors in their children. They want their children to be the people they want to be. However, conflict situations between parents in the family, conflict situations between parents lead to the opposite. The conflict situation is especially relevant when it comes to a different approach to Child Care by parents. In order to solve conflict situations in such cases, it is necessary to observe: - the second task of parents is to come to a common decision, -to convince each other, - to take into account the opinion of the second party before making a decision by the father or mother; the second task of parents-the child should not see the parents in their

Children very quickly absorb the thoughts they say and use them in their own way. Therefore, it is necessary for parents to think not only that they look at themselves in the first place in decision-making, but also to bring benefits to their children.

In order for the relationship between parents and children in the family to be positive, in the communication between adults and children it is necessary to follow the following: the parent must first of all take his child in the same way, in this case: the parent must look at the problems with the eyes of the children and feel them in their

The fact is that even parents love their children in spite of nothing. The child, in any case, will receive. If the child is in harmony with his parents' feelings and desires, that is, if he is well-read, good-natured, he will approach himself, but if the child does not respond to the parents' students, then in this case, the parents will take the children away from them and change them to the bad side of the relationship. And this brings out significant difficulties, the child does not trust his parents with their kindness.

In some families, the child is not accepted by parents at all. They are indifferent to the child and push him away from themselves for example: a family given to drinking. Sometimes there are three cases of indifference towards the child even in well-off peaceful families. For example: the birth of an unexpected child, the mother is beautiful, but the daughter is khunuk, which irritates the mother.

Errors in the upbringing of a child in the family are different districts. One of the most common among them is the reputation of parents in addition to Khad, their desire for khukmron. Every step of the child is controlled, independence in his behavior is eliminated. The child loses confidence in his own strength and opportunities. Internal desires and aspirations are guided by demands for obedience without formation.

Another type of error in family education is due to the fact that children have a husband, there is no demand for them. Parents in this case sometimes do a lot of their work on their own, without giving enough assessment to the possibilities of the child. As a result, the child does not develop

a sense of independence, diligence to work, responsibility for the assigned work. The child can not choose his work, can not bring it to the end, grow up servile.

Another of the most important difficulties is that the parents do not understand that in the upbringing everything is causative and conditional, education is a long process, in this process there is a number of interrelated joints, tools and methods, the normal passage of the process due to the fall of a joint in them does not understand the violation of the result of Parents do not take into account the importance of this situation, often make a claim that the child "suddenly" broke up. One type of mistake in the upbringing of children is the absence of a single student in upbringing by a mother or father, grandmother, grandmother, etc. In such families, children tend to adapt to the dependent opinions of adults. And this is hypocrisy in the child. it causes the formation of flattery and similar negative qualities.

In the formation of the personality of the child in the family, it is important that the relationship between the heads of the family and the children is good, respect for the elderly of the household, attention, the relationship of the children in the family is properly brought up, along with the upbringing of the children of the parents, the right order and

It is also important in the upbringing of the child that the parents have a relationship with each other, be able to behave themselves, all the rules of behavior in the family should be followed. Respect for adults, praise of the little ones, kindness to each other, especially honoring women should become a habit, a rule.

It is an important task of the father to teach children to respect the mother, to be kind to her. Usually the boy tries to be like his father, and the girls like his mother, to absorb the good qualities in them. Both father and mother make their own contributions to the upbringing of the child. As a rule, if the mother is caring, loving, submissive, the father is concerned for strength, courage, firmness, cares for the child's mental and physical development, the mother – walks, treats, feels satiety, tenderness.

Because both the father and the mother are equally responsible for the mental, moral physical perfection of the child, their sudden goal is aimed at raising a child. A healthy family environment is of great importance in the formation of the personality of the child in the family. Mutual respect, trust and loyalty between parents in the family have a direct impact on children's cheerful, cheerful growth, normal upbringing, the creation of a healthy environment in the apartment.

The fact that the family members can put their respect in place, they can burn souls for each other, be in a good relationship serves for the formation of similar characteristics in the child. In the family there is always sincerity and upliftment, which positively affects the mood of the family members, if the spirit prevails. On the contrary, if there is injustice, rudeness, hellish, badness, domination, then there will be no honesty.

Parents are obliged not to reproach each other in front of their children, not to bring down their reputation, to resolve family disputes at a time when they do not have it. Children are not born bad or good-natured, Fe'l-tempered. In the process of its growth, the family environment plays a decisive role, the influence of relations on the parents, people, the environment. Harmony in the family, harmony, mutual respect and help, sweetness, diligence and correctness will positively affect the child.

The Thinker Joseph khoshib in his book "knowledge of the fire", referring to the upbringing of the child, writes: "the more educated the child, the smarter his parents' face was so light." He pays special attention to the responsibility of the father in the upbringing of the child. "Whoever has a son-daughter erka, he writes to him that the same person himself cries as a mungli. There is no sin in the child if the father makes the child bebearer in his smallness all the jafo in the father himself; if the behavior of the son-daughter is naughty, then this naughty deed will be done by the father. When the father controls his children and teaches them various funerals, when they grow up, he rejoices that I have a son-daughter; it is necessary to teach the boy-girl skill and knowledge, so that with this skill their feats are beautiful."

The issue of raising children in the family also occupies a worthy place in the heritage of the great thinker poet Alisher Navoi. In his opinion, the maturity of society, its fate and the future are tied to the fullness of youth, accordingly, the upbringing of children in the family is a noble task facing parents, he says.

In the family, great responsibility for the upbringing of a child falls primarily on the parent. In the upbringing of the child, along with the parent, the teacher is also responsible when he begins to go to school. And for this, the teacher himself must be well educated. In this place it is necessary to say one thing separately that the main impulsive force in the upbringing of children is the mother. The father is engaged in the economic affairs of the family, while meeting and providing for the material needs of the family in most peoples. This is a well-known fact from the history of Uzbek families and a tradition that has become a legacy from our ancestors. Accordingly, more mothers with the child will be together. It is not surprising that in Uzbeks "comes out with a soul that enters with milk". High moral virtues enter the child's spirit with more Mother's milk.

It can be seen that the norms of morality-respect for adults, compassion for the little ones, honesty, diligence, diligence, etc. – begin with the family. These mentioned pedagogical philosophical concepts are closely related to the worldview of the head of the family.

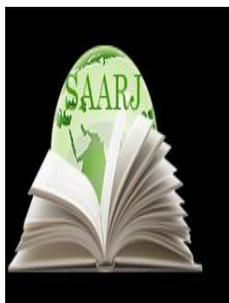

We also provide the following recommendations for effective organization of child care in the family;

- To ensure the psychological literacy of parents in the creation of a positive psychological atmosphere in the family;
- To teach young people the art of communication, treatment, listening in the case of different treatment situations in the family,
- In strengthening mutual parental and child relations in the family, various family "puzzles" consist in recommending games such as, say, verse, summoning the content of Proverbs.

ABSTRACT

In addition to auxiliary enzymes, fungal proteins, as well as organic acids, phytase generated by filamentous fungus on chosen feed components increases feed digestibility and access to phytin in plant cells. Phytases are phosphohydrolases that start the process of removing phosphate from phytate one step at a time. These enzymes have long been used in animal feed to enhance phosphorus nutrition or decrease phosphorus contamination from animal manure. The use of phytases to improve human nutrition of important trace elements found in plant-derived foods is being investigated. This study focuses on the growing biotechnology utilized to create novel effective phytases with enhanced characteristics, as well as the fundamental biology and use of phytases.

KEYWORDS: *Biotechnology, Environmental Pollution, Mineral Nutrition, Phytase, Phytic Acid.*

1. INTRODUCTION

Phytase is necessary for increasing the nutritional content of feed as well as promoting animal development and health. It hydrolyzes phytate substrates to generate phosphorous in a free form that animals may ingest, reducing the need for inorganic phosphorus supplements. Furthermore, adding phytase to feed reduces the amount of phosphorus excreted in manure, resulting in a reduced environmental effect from livestock production. Phytase for feed is generated via

microbial strain fermentation and is mostly utilized in swine and poultry diets. Phytase is worth \$300–350 million and accounts for approximately 40% of the entire feed enzyme market. The market price for phytase varies significantly, and the substance is available in various concentrations. The market price for a product standardized at 5000 FTU/g may range from \$1 to \$5 per kilogram [1].

The cheapest phytase products are those made in China for the domestic market. However, comparing one product to another cannot be done only on the basis of FTU activity since other factors will influence the enzyme's performance. Four essential criteria distinguish one phytase from another without delving into complicated technical issues. Cereal and legume seeds acquire a significant quantity of phytic acid during ripening (myo-inositol 1,2,3,4,5,6-hexakis dihydrogen phosphate). As a consequence, the majority of these seeds and co-products contain 1–2% phytic acid, which accounts for more than 60% of their physico-chemical parameters. A significant part, if not all, of phytic acid in seeds is probably in the form of phytate salts. Although phytate is the primary source of energy and phosphorus for seed germination, simple-stomached animals have limited access to the bound phosphorus. To fulfill the nutritional demand for phosphorus, inorganic phosphorus, a non-renewable and costly mineral, is added in swine, poultry, and fish diets. Meanwhile, in places where extensive animal husbandry is practiced, unutilized phytate phosphorus from plant feeds is excreted, creating an environmental contaminant. Excess phosphorus in the soil washes into lakes and the sea, producing eutrophication and promoting the development of aquatic species that may generate neurotoxins that are harmful to people. Furthermore, positively charged divalent cations bind with negatively charged phytic acid. As a result, the bonded metals are poorly absorbed in the small intestine. This is due in part to widespread human nutritional deficits in calcium, iron, and zinc in developing nations where plant-based diets are the norm. Overall, problems in animal feeding, environmental protection, and human health have spurred the rapid development of phytase research and innovation [2].

1.1 Phytase Characteristics:

The quantity of inorganic phosphate generated per minute from a certain substrate at a specific pH and temperature is used to determine phytase activity. Phytase activity or function is influenced by the enzyme's intrinsic characteristics as well as the action circumstances, much like other enzymes. The following characteristics of phytase are important in practice:

The substrate specificity as well as affinity of several phytases have been extensively studied. Plant phytases and certain fungal enzymes, such as the one from *A. fumigatus*, seem to have a wider substrate specificity or are responsible for breaking down the lower inositol phosphates, while microbial phytases appear to have a strong affinity for phytic acid. Although most phytases may degrade phytic acid to inositol monophosphate ester *Bacillus* sp. phytases hydrolyze every second phosphate preferentially over the neighboring ones, degrading the phytic acid molecule to inositol triphosphate [3].

Phytase converts inositol, phosphate, as well as other divalent minerals from phytate. Phytate is a dihydrogen phosphate of myo-inositol-1,2,3,4,5,6-hexakis that includes 14–28 percent phosphorus as well as 12–20 percent calcium. Phytate also chelates iron and zinc trace elements (1 to 2%) between phosphate groups within a single phytate molecule or between two phytate molecules. Phytase is the sole enzyme that can start phosphate hydrolysis in the inositol ring of

phytate at carbon 1, 3, or 6. Calcium, iron, zinc, or other metals are released when phytase removes the phosphate group.

1.2 Phytase nomenclature:

Phytases are inositol phosphate esters and inorganic phosphate phosphohydrolases that catalyze the stepwise phosphate splitting of phytic acid (IP6) or phytate to lower inositol phosphate esters (IP5-IP1) (Figure 1). Plants and microorganisms, including bacteria, yeast, and fungus, have been shown to contain phytase genes and proteins. *Aspergillus niger* PhyA, which is encoded by a 1.4 kb DNA fragment and has a molecular mass of 80 kDa and 10 Nglycosylation sites, will be the first and possibly best described phytase.

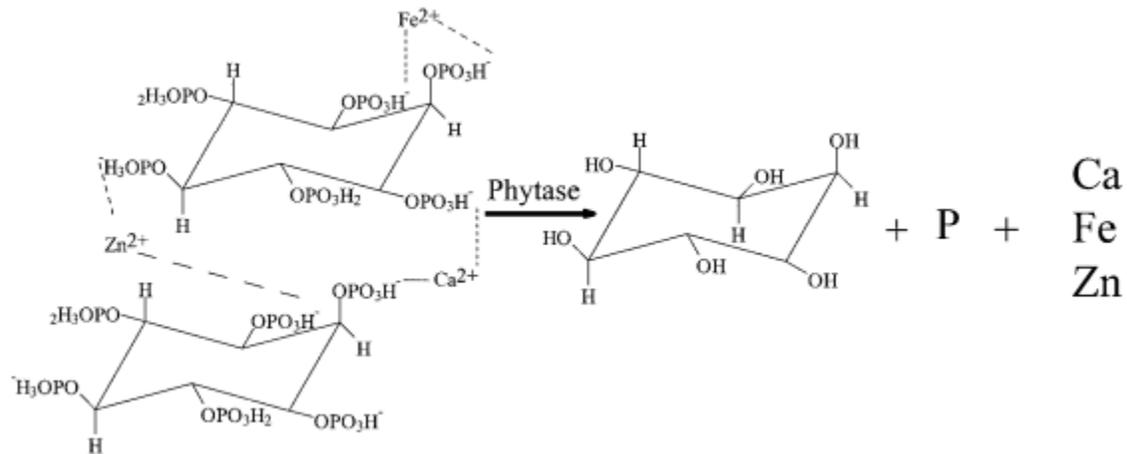

Figure 1: Phytase hydrolyzes phytate to produce inositol, phosphate, or other divalent chemicals[4].

1.3 Optimal pH and temperature:

The pH optimal range for most isolated phytases is 4.5–6. Phytases from *Bacillus* sp., on the other hand, exhibit pH optimalities that are neutral or alkaline. The pH profile of *A. Niger* phytase (phyA) shows two pH maxima at 2.5 and 5.5, with a drop in activity between these two sites (Han & Lei 1999). To maintain a high specific activity at the stomach pH, mutagenesis was used to eliminate the decrease in activity in the pH range 3–5. Most plant and microbial phytases prefer temperatures between 45 and 60 degrees Celsius. These relatively high optimum temperatures prevent phytases from fully activating at swine or chicken stomach temperatures (37–40 C), resulting in even worse phytase efficacy in fish.

1.4 Thermostability:

Because commercial feeds are often pelleted, a process that involves high temperatures (60–80°C) and steam, all feed enzymes must be heat stable to prevent significant activity loss. The capacity of any particular phytase, like other proteins, to withstand heat denaturation, such as in hyperthermophile animals, and/or to refold properly into the native-like, fully active conformation following heat denaturation determines its thermostability. Environmental factors such as buffer specificity may have an impact on the latter assumption.

1.5 Resistance to proteolysis:

A high resistance to hydrolytic degradation by digestive proteinases in the digestive system is required for an efficient phytase. Pepsin and trypsin sensitivity differs between fungal and bacterial phytases, and the latter seems to be more resistant to proteolytic destruction than the former. Site-directed mutagenesis may be used to block or modify the protease-sensitive sites of phytases, which are usually found in exposed loops on the surface of the molecules[5].

1.6 Phytase's current and future uses:

Phytase has traditionally been utilized primarily, if not exclusively, as a feed additive in diets for pigs, poultry, and to a lesser degree, fish. Phytase may replace about 1 g inorganic phosphorus supplementation and decrease total phosphorus excretion by 30–50%, according to many laboratory studies and field trials

1.7 Phytase biotechnology:

If the demand for phytase arose from increased environmental awareness of phosphorus contamination caused by animal manure, biotechnology has accelerated its development to the present level. Phytase was first discovered to hydrolyze phytate phosphorus in chick diets 30 years ago. Due to the poor activity output and expected high cost of the traditional phytase fermentation method, commercialization has been impossible for many years. Large quantities of the enzyme may be generated for animal feed at cheap prices thanks to the advent of heterologous microbial expression methods.

1.7.1 Expression of microbes:

Submerged or solid-state fermentation of filamentous fungus overexpressing phytase (i.e., *Aspergillus* species) provides high quantities of phytase at cheap cost. Recently, there has been a lot of study on the usage of methylotrophic yeast. *Streptomyces lividans* and *Lactobacillus plantarum* have both been shown to produce phytase. Combining phytase with the beneficial probiotic lactic acid bacteria is possible with the latter expression method. In soybean or alfalfa seeds, a fungal phytase has been effectively expressed.

The most significant sources of phytase are bacteria and fungus. Phytase sources from microbes. For commercial phytase synthesis, *A. niger*, *Aspergillus ficuum*, *Aspergillus fumigatus*, and *S. cerevisiae* are frequently utilized yeast strains. The hydrolysis of dietary phytate by exogenous microbial phytase. They discovered that chicks fed maize–soybean meal diets containing *Aspergillus* preparations had better phosphorus utilization. Phytase produced from *S. cerevisiae* is particularly important for bread making. Similar to cell-bound phytase from *Pichia anomala* and *Candida krusei*, cell-bound phytase from *Pichia anomala* and *Candida krusei* has potential uses in food processing since it is stable at high temperatures and acidity[6].

1.7.2 Plants and animals that are transgenic:

To enhance rice iron bioavailability to humans, transgenic rice has been created to over-express alleles encoding for phytase from *Aspergillus fumigatus*, ferritin from *Phaseolus vulgaris*, and a cysteine rich metallothionein-like protein. The plant was crossed with a rice line that produces -carotene, which was recently created. Meanwhile, overexpressing phytase in the salivary glands of mice and pigs has resulted in transgenic mice and pigs[7].

1.8 Protein engineering is a technique for modifying proteins:

Although phytases have different characteristics, no one wild-type enzyme is optimal or suitable for use in the field. An 'ideal' phytase, in theory, should be catalytically efficient, proteolysis-resistant, thermostable, and inexpensive. In fact, this good's phytase may never be discovered or produced. However, genetic modifications have been effective in improving single or several phytase characteristics[8].

1.9 Phytase-related issues:

Phytase has several advantages, but it also has certain drawbacks that need further study. Phytate, a powerful chelator of iron and zinc, may function as an antioxidant in plant meals, reducing free radical production caused by these metals. Indeed, pigs given phytase for four months were more susceptible to high-iron-induced lipid peroxidation in the colon than control pigs. Low-phytic acid grain, on the other hand, may have a negative impact on human health, particularly in those who have large iron reserves as a result of high dietary intakes of readily accessible iron from animal products or high dietary intakes of fruits that substantially increase non-heme iron absorption. As a result, extreme care should be used while spreading the low-phytic acid grain approach beyond animal production. The second question is whether supplementary phytases hydrolyze phytate-phosphorus from digesta faster than the animals can absorb it, releasing more free phosphorus into the environment than when the animals are not given phytase. By upgrading local exhaust systems and wearing all protective gear and masks with P2 filters, hypersensitivity symptoms may be prevented[9], [10].

2. DISCUSSION

Phytase is necessary for increasing the nutritional content of feed as well as promoting animal development and health. It hydrolyzes phytate substrates to release phosphorous in a free form that animals may ingest, reducing the need for inorganic phosphorus supplements. Furthermore, adding phytase to feed reduces the amount of phosphorus excreted in manure, resulting in a reduced environmental effect from livestock production. Phytase for feed is generated via microbial strain fermentation and is mostly utilized in swine and poultry diets. These enzymes have long been used in animal feed to enhance phosphorus nutrition and decrease phosphorus contamination from animal manure. The use of phytases to improve human nutrition of important trace elements found in plant-derived foods is being investigated. This study focuses on the growing biotechnology utilized to create novel effective phytases with enhanced characteristics, as well as the fundamental biology and use of phytases.

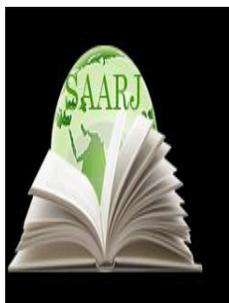

3. CONCLUSION

As phytase becomes more widely utilized throughout the globe, research and technology linked to the enzyme have rapidly developed into a new fascinating area. Supplemental phytases clearly enhance dietary phytate-phosphorus utilization in food-producing animals and decrease phosphorus pollution from animal waste in places where extensive animal production is practiced. The potential of phytase in enhancing human nutrition and health, as well as creating particular phytic acid or inositol-derived products, is gaining traction and will continue to grow as a new phytase path. Biotechnology has shown to be a very successful technique for creating and enhancing phytase enzymes and their delivery systems, and it will continue to be so.

REVIEW ON ENVIRONMENTALLY FRIENDLY FERTILIZERS

Kusum Farswan*

*Department of Agricultural Sciences,
Teerthanker Mahaveer University, Moradabad, Uttar Pradesh, INDIA
Email id: kusum.agriculture@tmu.ac.in

ABSTRACT

Fertilizer is essential for maintaining soil fertility, boosting yields, and enhancing the quality of harvest. However, a substantial amount of fertilizer is wasted, raising agricultural costs, squandering energy, and damaging the environment, all of which pose difficulties to modern agriculture's long-term viability. Environmentally friendly fertilizers (EFFs) have indeed been created to satisfy the needs of increasing yields without harming the environment. EFFs are fertilizers that slow or even stop the flow of nutrients into the soil, thus reducing pollution caused by nutrient loss. The majority of EFFs are used as coated fertilizers. In this article, we look at current research on the materials in use in EFFs and their environmental impact. The following are the main results discussed in this review: 1) EFF coatings may act as a physical barrier to limit urea contact in water and soil, lowering the rate of urea hydrolysis and reducing nitrogen oxide (NO_x) and nitrogen dioxide (N_2) emissions. 2) EFFs may boost the amount of organic matter in the soil. 3) hydrogel/superabsorbent coated EFFs may buffer soil acidity or alkalinity, resulting in an optimum pH for plants; and 4) hydrogel/superabsorbent coated EFFs can improve soil water retention and holding capacity. Finally, EFFs play an essential role in improving nutrient efficiency and decreasing pollution in the environment.

KEYWORDS: Agriculture, Environmentally friendly, Nutrient releases, Sustainability, Soil.

INTRODUCTION

Over the last century, increased fertilizer, water, and pesticide inputs, as well as new technology, have resulted in enormous advancements in contemporary agriculture. Crop output per unit of land has significantly risen, allowing for more population and economic growth. However, although these advancements have been substantial, the environmental consequences have often gone unmeasured. Overuse of pesticides and fertilizers has resulted in water algal blooms and toxicity, groundwater pollution, air pollution, soil quality deterioration, and even ecosystem disruption, raising concerns about contemporary agriculture's sustainability[1].

Increasing agricultural output without harming the environment may be accomplished through improving fertilizer and water efficiency, reducing pesticide usage, and using integrated agricultural systems management. The focus of this review is on studies on the environmental consequences of improving fertilizer efficiency. Fertilizer applications are necessary for intensive high-yield agriculture. Higher fertilizer inputs are required for increased food production. These inputs have aided in keeping global agricultural production in line with human population increase, as well as improving rural economic development. In traditional agriculture, however, misuse of fertilizer, which is sprayed in surplus of plant need, is a very well inefficiency that presents a danger to the environment. Fertilizer efficiency must be significantly improved to prevent harmful environmental effects[2].

Improved recommended fertilizer methods, such as split or concentrated application, highly precise fertilization, fustigation-fertilization via irrigation, and use of environmentally friendly fertilizers (EFFs) are among the techniques used to increase fertilizer use efficiency and reduce negative environmental impacts. EFFs are a cost-effective method to increase nutrient efficiency, decrease fertilizer leaching and evaporation losses, and reduce environmental risks. They minimize pollution caused by nutrient losses by delaying or even regulating nutrient delivery into the soil. EEF is another name for them. EFFs are often designed in such a manner that nutrients are coated with ecologically beneficial compounds that can be decomposed in soil and turned into carbon. Due to the compound fertilizer's delayed release characteristic, it has water-holding and water-retention capabilities in soil. Using chitosan as a covering material may save manufacturing costs while also making the fertilizer more eco-friendly. The chitin was coated just on fertilizer cores with epoxy dissolved in acetone, which may be a possible drawback of this system. Because of the organic solvent emissions, this technique may pollute the environment[3].

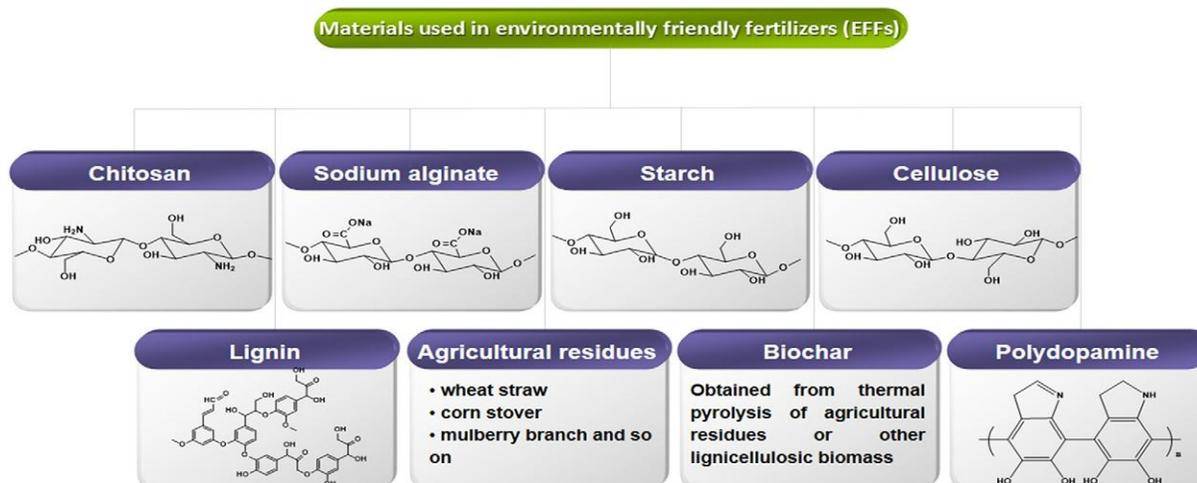

Figure 1. The structures or sources of natural materials that are most used in EFFs are as follows: chitosan, sodium alginate, starch and its derivatives, cellulose and its derivatives, lignin, agricultural residues, biochar, polydopamine[1]

DISCUSSION

1. EFFs and natural materials:

To reduce nutrient release and improve fertilizer efficiency, several materials have been utilized as coatings. Environmentally friendly coating materials, the majority of which are derived from natural resources, have been developed as part of the development of EFFs. Due to their environmentally benign source, these natural materials have a number of benefits over synthetic polymers, including cheap cost, easy availability, and biodegradability. The positive and negative characteristics of the natural materials most often utilized in EFFs.

1.1 Chitosan is a kind of chitin:

Chitosan is a polysaccharide made by the (partial) n - deacetylation, which is a key component of the shells of crustaceans including crabs and shrimp. Chitosan is plentiful in this naturally renewing resource. It is also non-toxic and biodegradable. Chitosan has been widely utilized in a variety of industries, including agriculture, because to these characteristics. Because it is naturally occurring and biodegradable, it should not create pollution; as a result, it has been extensively used in EFFs. It has been created a nanocomposite films nitrogen, phosphorus, and potassium combination fertilizer. The inner coating of water-soluble nitrogen, phosphorus, and potassium fertilizer granule cores was chitosan, while the outside coating was strands acid-co-acrylamide) (P(AA-co-AM) hydrogel polymer. Nitrogen (N) 8.06 percent, phosphorus (P) 8.14 percent, and potassium (K) 7.98 percent made up the nutritional content. On the 30th day, the percentages revealed for N, P, and K were 79, 62, and 69 percent, respectively. On the 30th day, the percentages for N, P, and K were 79, 62, and 69 percent, respectively. The compound fertilizer has waterholding and water-retention characteristics in soil, in addition to its delayed release behavior. Using chitosan as a covering material may save manufacturing costs while also making the fertilizer more eco-friendly. The chitosan were coated on the fertilizer cores using epoxy dissolved in acetone, which may be a shortcoming of this method. Because of the organic solvent emissions, this technique may pollute the environment[4].

1.2 Sodium alginate:

Sodium alginate (SA) is a brown seaweed-derived linear polymer with 1–4 linked -L-guluronic and -D-mannuronic acid moieties of various compositions. With the introduction of Ca^{2+} in an aqueous solution, it may be ionic crosslinked. It is extensively utilized as a controlled release fertilizer formulation because to its moderate gelation characteristic. However, in the absence of monovalent cations, the sodium alginate network has a low mechanical strength and is readily destructible. In addition, sodium alginate hydrogels do not always show controlled-release behavior, and instead show a burst supply of nutrients followed by a gradual of the remaining resources[5].

1.3 Starch and compounds of starch:

Starch is a polysaccharide made up of several simple sugars or sugar (glucose) molecules linked together by -1,4- and/or -1,6-glycosidic linkages. It is the most common storage polysaccharide in plants and the primary carbohydrate source in the human diet. Because of the vast variety of hydroxy groups accessible, there are many possibilities for starch derivatives. Starch and its derivatives have been extensively utilized in EFFs because to its ease of modification, environmental friendliness, and cost.

1.4 Biochar:

Biochar is a carbon-rich substance produced from the pyrolysis process of agricultural wastes or other cellulosic biomass at a relatively high temperature. Because of its positive environmental effects, such as increased agricultural profitability, reduced eutrophication risk, carbon sequestration from the atmosphere and restoration of degraded land, biochar has been used as a biofertilizer or a supporting document for the controlled release of fertilizer. A recent research used a polymer matrix made up of cotton stalks (CSs), acrylic acid (AA), 2-acrylamide-2-methylpropanesulfonic acid (AMPS), and bentonite (bent) to create biochar-based slow-release nitrogen fertilizers (BSRFs) in NH_4^+ loaded biochar (N-BC). These fertilizers had an increased nitrogen efficiency (64.27%), low nitrogen migrate-to-surface-loss (7.4%), and low nitrogen-leaching-loss percentages (10.3 percent). Furthermore, they successfully decreased nitrogen release (69.8% nitrogen released after 30 days) and, as a result, efficiently improved cotton plant development[6].

2. The environmental impact of EFFs:

Water contamination, air pollution, soil quality deterioration, and other undesirable consequences occur from fertilizer loss. EFFs help to reduce pollution by lowering nitrogen oxide (NO_x) and nitrogen dioxide (N_2) emissions, raising soil organic matter levels, changing soil pH to an optimum pH, and enhancing soil water retention and holding capacity.

3. Obstacles and prospects:

The expense of EFFs is the most significant impediment to their use. The following factors contribute to the high cost: coating ingredients are considerably costlier than fertilizer; the manufacturing process is complex; a size separation equipment is used to produce a flawless coating; and labor costs rise.

As a result, compared to traditional chemical fertilizers, EFFs have been and continue to be a tiny market. The deterioration of the materials on EFFs is another issue. Pure biodegradable

organic polymers are vulnerable to microorganisms and enzymes, and thus are unable to properly regulate fertilizer release over time. There are two issues regarding the degradability of natural thermoplastic polymer blends or copolymers. The first is the maximum percentage ratio of synthetic polymer in blends or copolymers that may be used. Second, in asserting the degradability content of blends or copolymers, what is the permissible upper limit of degradability (percentage). EFFs should, in theory, be able to satisfy the crop nutrient requirement for the whole season with a single application. Plants need more nutrients throughout the growth phase, while they do not require any nutrients during the early stages of plant development or during maturity. However, the majority of EFFs do not directly react to plant nutrient needs[7].

Furthermore, no appropriate research of EFF release behavior under a variety of environmental circumstances, such as varying temperatures, ambient moisture, soil types, soil pH, soil bioactivity, and so on, has been conducted. The release behavior of fertilizers coated with hydrogels/super absorbents is particularly sensitive to water in the environment. During irrigation or rain, hydrogels/super absorbents expand, allowing nutrients to be released. Hydrogels/super absorbents dry up during irrigation or rain intervals, delaying nutrient delivery. This may not be in accordance with crop development cycles or nutritional requirements. What is apparent, however, is that the environmental advantages of EFFs are worth further investigation, particularly for high-value crops[8].

Furthermore, governments may find the environmental advantages helpful in calculating cost-sharing to encourage farmers to adopt EFFs in their agricultural production systems. In light of the aforementioned difficulties, the authors make the following recommendations: Although different natural materials have been used as coatings to slow the release of nutrients and improve fertilizer effectiveness, they must be processed and produced in an environmentally friendly and cost-effective manner[9]. Plants need more nutrients throughout their growth phase, however most EFFs release nutrients quickly during the early stages of plant development. The insufficient hydrophobicity of these natural-materials-based coating compounds is always the source of this imbalance. To synchronize nutrient release with crop development timelines or nutrient requirements, novel biodegradable and renewable coating materials with extreme hydrophobicity should be researched and developed[10].

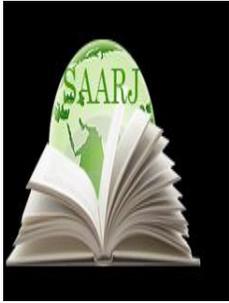

CONCLUSION

Fertilizer losses not only lower nutrient efficiency, resulting in lower plant yields, but they also have negative environmental consequences. Efforts to address these issues have resulted in a wide range of solutions. Eco friendly fertilizers (EFFs) in particular are an efficient method to increase nutrient-use efficiency, decrease fertilizer leaching and volatilization losses, and reduce environmental risks by delaying or even regulating nutrient release into soil. However, there are still certain obstacles to overcome. The following factors should be taken into account. To begin, coating material should be biodegradable and inexpensive. In order to promote large-scale fertilizer production, the preparation procedure should also be easy and cost-effective. Degradable natural fibres, which have sparked interest in covered fertilizers, may be considered in the development of new kinds of EFFs in this regard. Second, good EFFs should be able to satisfy crop nutrient needs throughout the season with only one application. A better knowledge of the impact of different environmental factors including temperature, ambient moisture, soil type, soil pH, and soil bioactivity will open up new avenues for more efficient EFFs. However,

although the use of EFFs has not been connected to the development of sustainable modern agriculture, it has been linked to advancements in the sustainability of water and pesticide usage, energy input, manufacturing, and other economic sectors that have a major effect on the environment.

AN OVERVIEW ON BUILDING ENERGY USAGE INFORMATION

Dr. Amit Sharma*

*Faculty of Engineering, Teerthanker Mahaveer University,
 Moradabad, Uttar Pradesh, INDIA
 Email id: dramit.engineering@tmu.ac.in

ABSTRACT

Concerns about supply shortages, depletion of energy supplies, and severe environmental consequences have already arisen as a result of the world's fast increasing energy use (global warming, climate change, ozone layer depletion etc.). Buildings' contribution to global power usage, both residential and business, has continuously risen, reaching estimates of 20 to 40 percent in industrialized nations, and has surpassed the contributions of other key sectors such as industry and transportation. The growing trend in energy consumption will continue in the future, thanks to population growth, rising demand for building services including comfort levels, and an increase in time spent within buildings. As a result, building energy efficiency is now a top priority for energy policy at the regional, national, and worldwide levels. The rise in energy consumption of HVAC systems is especially notable among building services (50 percent of building consumption or 20 percent of total consumption in the USA). This study examines the existing data on building energy usage, especially as it relates to HVAC systems. Many questions emerge, such as: Is the information required available? What are the most common kinds of structures? What end uses should be taken into account throughout the breakdown? Specially for commercial structures, comparisons across various nations are given. The case of offices is investigated in more depth.

KEYWORDS: *Building energy use, HVAC consumption, Air conditioning consumption.*

1. INTRODUCTION

Global energy use Concerns about supply shortages, depletion of energy supplies, and severe environmental consequences have already arisen as a result of the world's fast increasing energy use (ozone layer depletion, global warming, climate change, etc.). The International Energy Agency has compiled alarming statistics on global energy usage patterns. Primary energy has

increased by 49% and CO₂ emissions by 43% during the past two decades (1984–2004), with an average annual growth of 2% and 1.8 percent, respectively. According to current forecasts, this upward tendency will continue. Energy consumption in developing economies will increase at a 3.2 percent annual pace, surpassing that of developed countries (North America, Western Europe, Japan, Australia, and New Zealand) at a 1.1 percent annual rate by 2020. China's example is remarkable, since it took just 20 years to double its energy consumption at a 3.7 percent annual growth rate. The study of the evolution of the major global energy indicators between 1973 and 2004 yielded some interesting results[1].

- The pace of population growth is much lower than the rate of GDP growth, resulting in significant increases in per capita personal income and global wealth.
- Primary energy consumption is increasing at a faster pace than population, resulting in a 15.7 percent rise in per capita value over the past 30 years.
- CO₂ emissions have increased at a slower pace than energy consumption, which has increased by 5% during the same time span.
- Electrical energy consumption has increased dramatically (by more than two-thirds), resulting in a percentage increase in total energy consumption.
- Energy resource efficiency, as measured by the relationship between final and primary energy, has decreased by 7%, owing mostly to rising electricity use.
- Final and primary energy intensities have decreased as a consequence of GDP growth outpacing the rate of increase in energy consumption, resulting in an overall improvement in global energy efficiency.

1.2. Building energy usage:

The final energy consumption is typically broken down into three categories: industrial, transportation, and 'other,' which includes agricultural, the service sector, and residential. This makes gathering statistics on building energy usage very challenging. Energy consumption in structures other than homes, for example, accounts for a small portion of the services provided by the 'other' important sector. Given its importance in industrialized nations (buildings account for 20–40% of total final energy consumption), we think it should be included separately as the third major sector, with domestic and nondomestic buildings separated at the very least[2].

Building energy consumption has surpassed that of transportation and industry as a result of population growth, improved building services and comfort levels, and an increase in time spent within buildings. Buildings have had a major impact on the ratio of industry (down nine points) and the growth of 'other' (up six points). The phrase "other sectors" is vague and causes a lot of misunderstanding. Many international, national, and regional sources contain a variety of end applications in this notion, making comparisons difficult. Finally, we consider the development and significance of building energy use[3].

Building energy consumption in the UK has risen at a pace of 0.5 percent each year, somewhat less than the European average of 1.5 percent. Building energy usage in Spain, on the other hand, is growing at a pace of 4.2 percent per year, far above the European (1.8 percent) and North American (1.8 percent) rates. Economic development, the rise of the construction industry, and the proliferation of building services, particularly heating, ventilation, and air conditioning

(HVAC) systems, are all factors. (2) Buildings used 37 percent of final energy in the EU in 2004, more than industry (28 percent) and transportation combined (33 percent). The percentage of energy used in buildings in the UK (39%) is somewhat higher than the European average. This is due in part to the move away from heavy industries and toward activity in the service sector. In comparison, the proportion for Spanish buildings is just 24%, 14 points lower than the European norm, and is projected to increase sharply as economic development brings the country closer to the European average[4]. Many types of buildings (schools, restaurants, hotels, health facilities, museums, and so on) with a wide range of purposes as well as energy services (HVAC, water heating (DHW), lighting, refrigeration, food preparation, and so on) are included in the service sector, which covers all commercial and public buildings. Size of the economy raises the demand for services (health, culture, leisure, education and so on) as well as energy usage. Since the 1950s, energy consumption in the service sector has increased from 11% to 18% in the United States[5].

1.3. HVAC (heating, ventilation, as well as air conditioning) is a term that refers to (HVAC):

Energy efficiency or savings techniques have become a key goal for most nations' energy policies due to the growth of energy use and CO₂ emissions in the built environment. The European Energy Performance of Buildings Directive is a good example (EPBD). The escalation of energy consumption in HVAC systems, which has now become practically necessary in tandem with the expansion of demand for thermal comfort, which was formerly regarded a luxury, has been particularly significant. Heating, ventilation, as well as air conditioning are the most common energy end uses in both the residential as well as non-residential sectors. When compared to other end users, its dominance is apparent. It uses approximately half as much energy as DHW and is more than twice as efficient. IDAE estimates HVAC energy consumption in non-domestic buildings to be approximately 48 percent, which is still lower than the 57 percent in the United States and comparable to other sources[5].

In Europe, data provided by governments at the national, regional, and municipal levels is inadequate for effectively planning future building energy regulations and coordinating actions to meet each of the end uses. Governments should fund sector-specific analyses, such as those produced by the EIA for residential and commercial buildings, so that a comprehensive data set of the building stock and energy parameters (consumption, expenditures, fuels, end uses, and so on) can be used to plan for the future. In most industrialized nations, HVAC usage accounts for half of all energy consumption in buildings and a fifth of total national energy consumption. Furthermore, projections show a huge increase in energy consumption and conditioned area in the EU over the next 15 years, with an increase of about 50%.

1.4. Non-domestic structures:

The kind of usage and activities in non-domestic buildings have a significant effect on the quality and amount of energy services required. Few sources, however, provide data by typology, and there is no uniform categorization, making analysis very difficult. Following a review of various sources, the following basic conclusions may be drawn: (1) In recent years, energy consumption in this sector in the United Kingdom has stabilized, with increases in floor space and service levels being compensated by efficiency gains. Commercial energy consumption is growing faster than other sectors in the rest of Europe, owing mostly to the growth of HVAC systems in new buildings. In the UK, new service sector construction rates are

usually about 2%, while in Spain, the average annual rate of growth since 2000 has been 6.1 percent, with projections indicating that this will continue to rise. In 2003, this sector accounted for 11% of total energy consumption, which was comparable to the United States (18%) and the European Union (EU) (11 percent). Despite having the fastest growth rate, energy regulations have tended to concentrate on the residential and industrial sectors, leaving the service sector out[6].

- The most power typologies are office and retail, which account for more than half of all non-domestic building energy use. Hospitals and schools, as well as hotels and restaurants.
- With a weight of close to 50%, HVAC is the most important end use, followed by lights (15%) and appliances (10%). The distribution of energy end uses (Fig. 5) and their energy intensity are both influenced by the kind of building. This necessitates the creation of separate research per building type.

1.5. Buildings that house offices:

Office buildings, together with retail, have the highest consumption and CO₂ emissions in the business sector. In the United States, offices account up 17% of total non-domestic space and approximately 18% of total energy use, or 3.2 percent of total consumption. They account for a third of business sector energy consumption and almost 2.7 percent of overall energy consumption in Spain, and 17 percent of energy consumption and 2% of total energy usage in the United Kingdom. As a result, it's a good idea to start with office buildings while doing a commercial study. Other factors that support this type of energy surveys include[7].

A significant rise in the overall constructed area of office buildings as a result of economic success, with numerous new commercial projects in the outskirts of major cities. In Spain, 9.3 million square meters were constructed between 1990 and 2000, with no accurate data on the overall developed area. The per capita area in the United States is about 4 m², which is much higher than the European number of 2 m². Between 2000 and 2005, the overall floor space of offices in the United Kingdom grew by around 4%.

The quantity of artificial lighting needed, as well as the usage of IT equipment and the use of air conditioning, has constantly risen. More than 90% of businesses in Spain utilize IT technology, and almost all new offices are air-conditioned. Even in milder climates, such as the United Kingdom, more than half of new workplaces are air-conditioned. It's a typology that's very consistent throughout the building portfolio, both in terms of envelope as well as building services, with three major energy end uses, HVAC, lighting, or appliances, accounting for about 85% of total energy consumption[8].

LITERATURE REVIEW

Hye Sun et al. studied about The Korean government has set a goal of decreasing greenhouse gas emissions by 37% by 2030 compared to business-as-usual (BAU) levels. Because the construction industry is so essential for reducing greenhouse gas emissions, numerous measures to decrease building energy are being reinforced. As a result, a nationwide research effort is underway to install systems for continuous monitoring of energy consumption by end use in sample buildings, as well as to develop a reference power intensity (EUI) database as well as benchmarking system for comparison analysis. The research also discovered methods for measuring such usage and converting the findings into EUI data. As examples, forty complexes

with a total of 200 units were chosen. The sample building installation will take place in stages over the next four years, beginning in 2015, and systems have already been installed in ten complexes and 50 units. After 2020, a reference EUI database for residential buildings will be accessible, as will a benchmarking tool based on the database, and equivalent systems for office towers are now being developed[9].

Kang et al. studied about The growing need for sustainable smart buildings necessitates the development of an efficient decision-making approach for managing building energy consumption. Data-mining techniques that utilize different data types will be required in the future for decision-making assistance in BIM-based power management. A rule-set-based Building information modelling data-mining approach for data integration as well as function extension support is proposed here, which takes functional variability and extensibility into account. Its efficiency was shown by the construction and implementation of a building-energy-management scenario, as well as the analysis of the outcomes. Based on the results of the work effectiveness study, we discovered that the suggested approach increased the efficacy by 14.4 to 20.5 times. Users may obtain intuitive BIM-based decision-making information and adapt the flexible process for different use cases using the suggested approach[10].

DISCUSSION

As a result of the world's rapidly growing energy consumption, concerns about supply problems, depletion of energy sources, and severe environmental repercussions have already emerged. Buildings' contribution to world energy consumption, whether residential or commercial, has steadily increased, reaching estimates of 20 to 42 percent in developed countries and surpassing other important sectors such as plants and vehicles. Because of population expansion, increasing demand for building services or comfort levels, as well as an increase in time spent inside buildings, the rising trend in energy consumption will continue in the future.

As a consequence, energy efficiency in buildings is now a major concern for regional, national, and global energy policy. As the growth of carbon dioxide emissions on the built environment has led to the creation of new building standards and certification systems that now include minimum requirements, energy efficiency measures have become a priority for energy policy. As the need for thermal comfort has solidified, HVAC systems (and their associated energy consumption) have become an unavoidable asset, accounting for almost half of the energy consumed in buildings and around 10–20 percent of total energy consumption in developed countries. The increasing trend in construction energy use will continue in the next years, as long as resource use and environmental depletion or global downturn do not intervene. To attain a sustainable energy future, private initiative, in conjunction with government action, will be needed to encourage energy efficiency, new energy production technologies, limiting energy use, and raising public knowledge about energy usage.

CONCLUSION

Building energy consumption accounts for 20–40% of overall energy consumption in industrialized nations, and is higher than that of industry and transportation in the EU and the US. However, the information provided is obviously inadequate and not proportionate to the significance of the issue. It is not regarded as a separate sector, and there is a scarcity of reliable data, making it difficult to comprehend the underlying changes that influence energy use in this industry. It is critical to make complete building energy data accessible in order to conduct

appropriate analyses and effectively plan future energy strategies. In this regard, the EIA's research on the energy use of residential and commercial buildings in the United States are a useful resource.

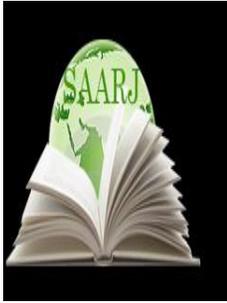

Energy efficiency measures have been a priority for energy policies as the proliferation of energy consumption and CO₂ emissions on the built environment has led to the development of new building standards and certification systems that now contain minimum criteria. HVAC systems (and their related energy consumption) have become an inescapable asset as the demand for thermal comfort has consolidated, accounting for almost half of the energy used in buildings and approximately 10–20 percent of total energy consumption in industrialized nations. Due to the growth of built area as well as related energy requirements, the rising trend in building energy consumption will continue in the future years, as long as resource and environmental depletion or economic recession do not prevent it. To attain sustainable energy economy, private initiative, in combination with government action, will be required to promote energy efficiency, new technologies for energy generation, restricting energy consumption, or increasing societal awareness about the rational use of energy.

A BRIEF REVIEW ON THE INTELLIGENT BRAKING SYSTEM

Harish Kumar*

*Faculty of Engineering, Teerthanker Mahaveer University,
 Moradabad, Uttar Pradesh, INDIA
 Email id: harish.engineering@tmu.ac.in

ABSTRACT

Using the built-in system architecture, the braking mechanism was developed and integrated to the vehicle to guarantee the safety of the driving phase. The majority of crashes occur as a result of the driver's failure to apply the brakes in a timely manner. However, throughout this project's development, the braking mechanism is specified such that the brake should be applied depending on the ultrasonic sensor and the vehicle's speed. Cars are now equipped with active protection systems to minimize the danger of accidents, which are common in metropolitan areas. The most popular types are Antilock Braking Systems (ABS), Traction Control, and Stability Control. Various kinds of sensors are employed in these gadgets to constantly monitor the vehicle's surroundings and react in an emergency scenario. An ultrasonic wave emitter on the vehicle's front side is used in the intelligent braking system. Furthermore, the receiver is mounted on the vehicle's front end and receives a reflecting ultrasonic pulse. The distance between the problems and the vehicle is determined by the reflected wave (detected pulse), while the car's speed is determined by the RPM counter. The microcontroller assists the identification pulse information in shifting the foot lever to apply the brake to the automobile, which is unexpected for safety reasons.

KEYWORDS: ABS, brake, Hydraulic Brake, Intelligent, Microcontroller, Sensor,

INTRODUCTION

Commercial vehicles' braking systems have traditionally been given top attention in terms of safety considerations, particularly active safety. These cars' improper braking may result in severe accidents. Longer stopping distances and better brake energy performance, particularly in the case of vehicle combinations[1]. The conventional braking medium (compressed air) is also handled at a higher speed and with more precision thanks to new technological capabilities. In

commercial vehicles, IBS is used to offer quick braking response and release for any single wheel. Electronic control is also utilized to provide a rapid amount. The purpose of a braking system is to slow and stop the vehicle's movement. Various components within the braking system must convert the vehicle's moving energy into heat in order to do this. Friction is used to accomplish this. Friction is the resistance to movement that two things exert against one another. A vehicle's control is affected by two types of friction: kinetic or moving friction and static or stationary friction. The degree of friction or resistance to movement is determined by the materials in contact, the smoothness of their rubbing surfaces, and the pressure that holds them together.

In a word, a car brake works by generating friction and turning kinetic energy into heat energy by applying a static surface to a moving surface of a vehicle. The following are the high-level mechanisms. Rough-texture brake pads or brake shoes are pushed against the spinning components of the vehicle, whether disc or drum, when the brakes on a moving car are applied. The vehicle's kinetic energy or momentum is subsequently transformed into heat energy by the rubbing surfaces' kinetic friction, and the automobile or truck slows down. Static friction holds a vehicle in place when it comes to a halt. Any movement is resisted by the friction between brake surfaces, as well as the friction between tires and roadways. Brakes are released to counteract the static friction that keeps the vehicle from moving. The car moves because the heat energy of the in-engine combustion is transformed into kinetic energy via the transmission and drive system. Figure 1 shows the sketch of the intelligent braking system.

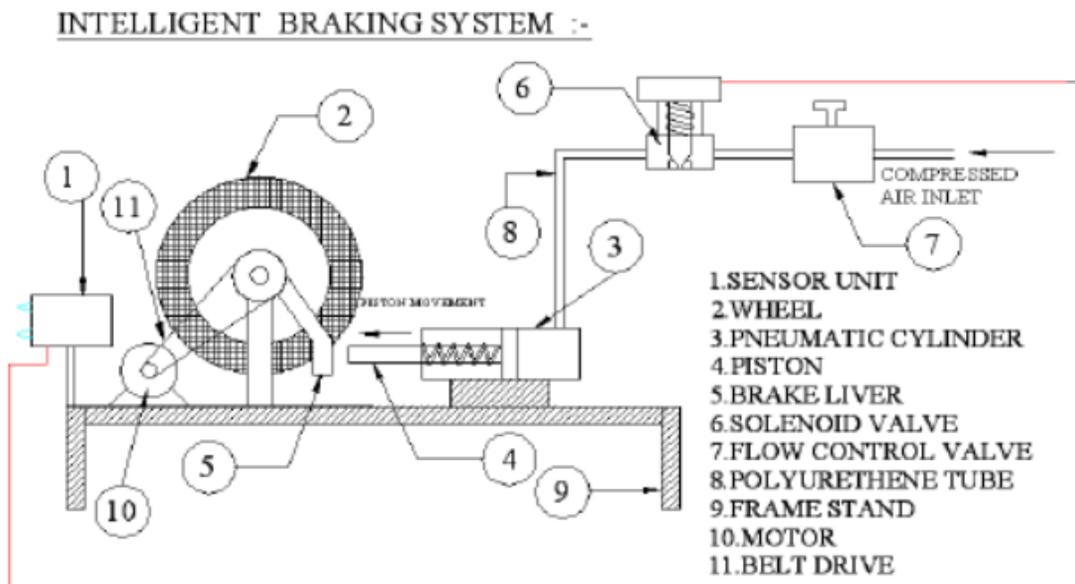

Figure 1: The Sketch of the Intelligent Braking System[2].

By adopting better brake system control, the braking distance will be drastically reduced. Such a complex task put on the management of the braking mechanism cannot be sustained by the driving force's capability and must be carried out independently of it. It would be much simpler to complete the job if the ABS braking powers could be better controlled. The braking force management method described here is based on intelligent regulation of braking force

application between the propelled vehicle's front and rear axles, as well as between the towing/trailer combination and the tractor/semi-trailer combination [3].

Intelligent braking systems have a wide range of potential uses, particularly in emerging nations, where car and intelligent highway research smart is gaining traction. When coupled with additional subsystems such as automated traction control, intelligent throttle control, auto cruise control, and so on, the system would result in smart vehicle handling. The rider will be the leading force at the end of the day, safety will be prioritized, and the trip will be designed in terms of its slow duration, cost, productivity, and luxurious capacity [4]. The impact of such design and manufacturing would be comparable with the needs of a society up to this point, which likewise strives to a quality drive to meet those needs. Technological advancements, particularly in the area of smart sensors and actuators [5] The creation of a digital signal processor boosts the microcontroller's power and usefulness. The value of the inter-vehicle distance from the infrared laser sensor and the speed of the following car from the speedometer are sent into the DSP for processing, resulting in the DSP functioning well to the actual situation [6].

1.1 Need for the Proposed Framework:

Accidents are caused by either a technical failure within the vehicle or a driving mistake. Drivers often lose control of their vehicles, and irresponsible driving may result in an accident. When it comes to drivers, they become frightened when they see the vehicle going into a collision, and they don't use the brakes. This is how the majority of injuries occur [7]. The gadget was created to prevent such accidents. Keeps track of all types of cars approaching from behind. It will keep track of the distance between the two vehicles. If two vehicles are dangerously close together, the system's microcontroller may activate the brakes to bring the vehicle to a halt [8].

1.2 Current System

In addition to Volvo's Laser-assisted braking, Honda's idea of ABS enables the rider to have a stress-free stopping experience on slick and wet terrain by providing dispersed braking and avoiding skidding and wheel locking. This system can anticipate a collision up to 50 mph and immediately activate the brakes. ABS can only activate assistance if the rider actively sets the time and controls the space measurements [9].

1.3 Characteristics of Brakes:

Several qualities are often used to characterize brakes, including:

The greatest decelerating effect that may be achieved is known as the peak force. The peak force is often higher than the traction limit of the tires, resulting in a wheel skid.

1.3.1 Continuous power dissipation:

When brakes are used, they get hot and may fail if the temperature rises too high. Continuous power dissipation is the maximum amount of power (energy per unit time) that may be dissipated via the brake without failure. The temperature and speed of ambient cooling air, for example, have a significant impact on continuous power dissipation. Brake fade occurs when a brake becomes less efficient as it warms up. Some designs are prone to fading by nature, while others are quite resistant. Furthermore, factors such as chilling have a significant impact on the fade.

1.3.2 Smoothness:

Skids may be caused by a brake that is grabby, pulses, chatters, or otherwise applies variable braking force. Railroad wheels, for example, have limited traction, and friction brakes without an anti-skid system often cause skids, increasing maintenance costs and giving passengers a "thud thump" sensation.

When a modest human application force results in a braking force that is greater than usual for other brakes in the same class, the brakes are characterized as "strong." This concept of "powerful" has nothing to do with continuous power dissipation, and it may be perplexing since a brake might be "powerful" and brake forcefully with a moderate brake application, yet have a lower (worse) peak force than a less "powerful" brake.

1.3.3 Pedal feel:

The subjective impression of braking power output as a function of pedal travel is referred to as brake pedal feel. The fluid displacement of the brake and other variables affect pedal travel. Off-brake drag varies based on the design of the system to accommodate overall system compliance and deformation that occurs during braking, as well as the capacity to withdraw friction material from the rubbing surface in the off-brake state.

1.3.4 Durability:

Friction brakes have worn surfaces that need to be replaced on a regular basis. The brake shoes or pads, as well as the braking disc or drum, are all wear surfaces. There may be compromises; for example, a wear surface with a high peak force may wear rapidly.

1.3.5 Weight:

Brakes are often considered "added weight" since they provide no other use. Furthermore, brakes are often placed atop wheels, and unsprung weight may adversely affect traction in certain situations. The term "weight" may refer to the brake itself or to extra support structures. Brakes typically make a small noise when applied, but they often make loud squeals or grinding sounds.

LITERATURE REVIEW

If implemented, the Intelligent Braking Device may avoid numerous accidents and preserve human lives and property. Because the implementation of such a complicated system is often made mandatory, similar to the use of seat belts, injuries are frequently prevented to some extent. After being integrated into a single system, our Intelligent Braking Technology provides a glimpse into the long-term protection of cars, and the way in which these particular devices are more complex is also utilized to prevent accidents and safeguard car occupants [10].

DISCUSSION

Arduino is an open-source platform for the creation of electrical projects. Arduino is made comprised of a microcontroller and some software, known as an IDE (Integrated Programming Environment), which is used to create and upload code to the device's physical screen. To load fresh programming onto the Arduino, you won't need a separate piece of hardware (called a programmer) - all you'll need is a USB connection. The Arduino IDE, on the other hand, utilizes a simplified form of C++, making it easier to learn about the program.

In a nutshell, a car brake generates friction and converts kinetic energy into heat energy by applying a static surface to a vehicle's moving surface. The high-level mechanisms are listed below. When the brakes of a moving automobile are applied, rough-texture brake pads or brake shoes are pressed against the spinning components of the vehicle, whether disc or drum. The rubbing surfaces' kinetic friction converts the vehicle's kinetic energy or momentum into heat energy, and the vehicle slows down. Static friction keeps a vehicle in place when it comes to a stop. Friction between brake surfaces, as well as friction between tires and roads, oppose any movement. To overcome the static friction that prevents the vehicle from moving, the brakes are removed. The transmission and drive system convert the heat energy of the in-engine combustion into kinetic energy, which allows the vehicle to move. The intelligent braking system is shown in Figure 1 as a drawing.

To monitor and identify the existence of an entity, ultrasound spectrum and identification of high-frequency sound wave devices are used. These devices either compute or monitor the reflection of sound waves on surfaces. When artifacts move between the transmitter and the receiver, the sound beam is disrupted. A transducer is used by the ultrasonic sensor to produce electrical output signals in response to the received ultrasonic wave. For a span of 75 meters between vehicles, the horizontal opening angle must be at least 8 degrees.

The hydraulic braking system follows Pascal's law, which states that "all pressure forces operating inside the system are acting in the same general direction." This law states that when friction is added to a fluid, it will move in a similar manner. The instructions also cover all four wheels with constant braking. The braking cylinder will feel the force at the connecting rod that enables the piston to move when the foot pedal is pressed. The fluid within the brake cylinder cavity rushes into the brake caliper, causing the pistons inside the caliper to experience fluid friction, allowing them to push the brake pad against the caliper. A braking force is applied to a rotating disc.

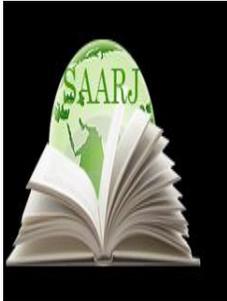

CONCLUSION

If implemented, the Intelligent Braking Device may avoid numerous accidents and preserve human lives and property. Because the implementation of such a complicated system is often made mandatory, similar to the use of seat belts, injuries are frequently prevented to some extent. Our Intelligent Braking Technology provides a glimpse into the long-term protection of cars, and the way in which these more complex devices are integrated into a single system is also utilized to prevent accidents and safeguard automobile occupants. The development of sophisticated technology has surpassed the long run of vehicle safety; the approach to safety is changing. The Intelligent Braking System's approach to safety is a major departure from the conventional method, yet it is essential to achieve meaningful advantages.

ESSENTIAL PROBLEMS OF TEACHING ENGLISH LEXICOLOGY

Azimbayeva Ranohon Yuldashevna*

*Associate Professor of Foreign Languages,
 Tashkent Financial Institute,
 UZBEKISTAN

ABSTRACT

This article highlights essential problems of teaching English lexicology as well as its specific aspects. Traditionally, the teaching of vocabulary above elementary levels was mostly incidental, limited to presenting new items as they appeared in reading or sometimes listening texts. We do not control this process consciously but there seems to be some important clues to consider. First, retention in short-term memory is not effective if the number of chunks of information exceeds seven. We could not talk about vocabulary teaching nowadays without mentioning Lewis, whose controversial, thought-provoking ideas have been shaking the ELT world since its publication.

KEYWORDS: *Oxford Dictionary, Language, Verb, Adjective, And Noun, Concrete, Abstract, And Structural, Lexicalized Grammar, Topic, The Teacher, Multi-Word Verbs, Idioms, Strong And Weak Collocations.*

INTRODUCTION

Learning the words of a foreign language is not an easy business since every word has its form, meaning, and usage and each of these aspects of the word may have its difficulties. Indeed, some words are difficult in form (daughter, busy, bury, woman, women) and easy in usage; other words are easy in form (enter, get, happen) and difficult in usage. Consequently, words may be classified according to the difficulties pupils find in assimilation. In methodology some attempts have been made to approach the problem. The analysis of the words within the foreign language allows us to distinguish the following groups of words: concrete, abstract, and structural.

Words denoting concrete things (book, street, sky), actions (walk, dance, read), and qualities (long, big, good) are easier to learn than words denoting abstract notions (world, home, believe, promise, honest). Structural words are the most difficult for Russian-speaking pupils.

In teaching pupils a foreign language the teacher should bear this in mind when preparing for the vocabulary work during the lesson.

Advanced learners can generally communicate well, having learnt all the basic structures of the language. However, they need to broaden their vocabulary to express themselves more clearly and appropriately in a wide range of situations. Students might even have a receptive knowledge of a wider range of vocabulary, which means they can recognize the item and recognize its meaning. Nevertheless, their productive use of a wide range of vocabulary is normally limited, and this is one of the areas that need greater attention. At this stage we are concerned not only with students understanding the meaning of words, but also being able to use them appropriately, taking into account factors such as oral / written use of the language; degree of formality, style and others. Traditionally, the teaching of vocabulary above elementary levels was mostly incidental, limited to presenting new items as they appeared in reading or sometimes listening texts. This indirect teaching of vocabulary assumes that vocabulary expansion will happen through the practice of other language skills, which has been proved not enough to ensure vocabulary expansion. Nowadays it is widely accepted that vocabulary teaching should be part of the syllabus, and taught in a well-planned and regular basis. Some authors, led by Lewis (1993) argue that vocabulary should be at the centre of language teaching, because 'language consists of grammaticalised lexis, not lexicalized grammar.' There are several aspects of lexis that need to be taken into account when teaching vocabulary.¹

Boundaries between conceptual meanings: knowing not only what lexis refers to, but also where the boundaries are that separate it from words of related meaning (e.g. cup, mug, and bowl).

- Polysemy: distinguishing between the various meaning of a single word form with several and closely related meanings (head: of a person, of a pin, of an organization).
- Homonymy: distinguishing between the various meaning of a single word form which has several meanings which are NOT closely related (e.g. a file: used to put papers in or a tool).
- Homophony: understanding words that have the same pronunciation but different spellings and meanings (e.g. flour, flower).
- Synonymy: distinguishing between the different shades of meaning that synonymous words have (e.g. extends, increase, expand).
- Affective meaning: distinguishing between the attitudinal and emotional factors (denotation and connotation), which depend on the speakers attitude or the situation. Socio-cultural associations of lexical items is another important factor.
- Style, register, dialect: Being able to distinguish between different levels of formality, the effect of different contexts and topics, as well as differences in geographical variation.
- Translation: awareness of certain differences and similarities between the native and the foreign language (e.g. false cognates).
- Chunks of language: multi-word verbs, idioms, strong and weak collocations, lexical phrases.
- Grammar of vocabulary: learning the rules that enable students to build up different forms of the word or even different words from that word (e.g. sleep, slept, sleeping; able, unable; disability).

- Pronunciation: ability to recognize and reproduce items in speech.

The implication of the aspects just mentioned in teaching is that the goals of vocabulary teaching must be more than simply covering a certain number of words on a word list. We must use teaching techniques that can help realize this global concept of what it means to know a lexical item. And we must also go beyond that, giving learner opportunities to use the items learnt and also helping them to use effective written storage systems. Understanding how our memory works might help us create more effective ways to teach vocabulary. Research in the area, cited by Gairn's offers us some insights into this process. It seems that learning new items involve storing them first in our short-term memory, and afterwards in long-term memory. We do not control this process consciously but there seems to be some important clues to consider. First, retention in short-term memory is not effective if the number of chunks of information exceeds seven. Therefore, this suggests that in a given class we should not aim at teaching more than this number. However, our long-term memory can hold any amount of information. Research also suggests that our 'mental lexicon' is highly organized and efficient, and that semantic related items are stored together. Word frequency is another factor that affects storage, as the most frequently used items are easier to retrieve. We can use this information to attempt to facilitate the learning process, by grouping items of vocabulary in semantic fields, such as topics (e.g. types of fruit).

Oxford dictionary suggests memory strategies to aid learning, and these can be divided into:

- creating mental linkages: grouping, associating, placing new words into a context;
- applying images and sounds: using imagery, semantic mapping, using keywords and representing sounds in memory;
- reviewing well, in a structured way;
- employing action: physical response or sensation, using mechanical techniques.

The techniques just mentioned can be used to greater advantage if we can diagnose learning style preferences (visual, aural, kinesthetic, tactile) and make students aware of different memory strategies. Meaningful tasks however seem to offer the best answer to vocabulary learning, as they rely on students' experiences and reality to facilitate learning. More meaningful tasks also require learners to analyze and process language more deeply, which should help them retain information in long-term memory. Forgetting seems to be an inevitable process, unless learners regularly use items they have learnt. Therefore, recycling is vital, and ideally it should happen one or two days after the initial input. After that, weekly or monthly tests can check on previously taught items. The way students store the items learned can also contribute to their success or failure in retrieving them when needed. Most learners simply list the items learnt in chronological order, indicating meaning with translation. This system is far from helpful, as items are de-contextualized, encouraging students to over generalize usage of them. It does not allow for additions and refinements nor indicates pronunciation. Teachers can encourage learners to use other methods, using topics and categories to organize a notebook, binder or index cards. Meaning should be stored using English as much as possible, and also giving indication for pronunciation. Diagrams and word trees can also be used within this topic/categories organization. The class as a whole can keep a vocabulary box with cards, which can be used for revision/recycling regularly. Organizing this kind of storage system is time-

consuming and might not appeal to every learner. Therefore adapting their chronological lists to include headings for topics and a more complete definition of meaning would already be a step forward. In my opinion the most important aspect of vocabulary teaching for advanced learners is to foster learner independence so that learners will be able to deal with new lexis and expand their vocabulary beyond the end of the course. Therefore guided discovery, contextual guesswork and using dictionaries should be the main ways to deal with discovering meaning. Guided discovery involve asking questions or offering examples that guide students to guess meanings correctly. In this way learners get involved in a process of semantic processing that helps learning and retention. Contextual guesswork means making use of the context in which the word appears to derive an idea of its meaning, or in some cases, guess from the word itself, as in words of Latin origin. Knowledge of word formation, e.g. prefixes and suffixes, can also help guide students to discover meaning. Teachers can help students with specific techniques and practice in contextual guesswork, for example, the understanding of discourse markers and identifying the function of the word in the sentence (e.g. verb, adjective, and noun). The latter is also very useful when using dictionaries.

Students should start using EFL dictionaries as early as possible, from Intermediate upwards. With adequate training, dictionaries are an invaluable tool for learners, giving them independence from the teacher. As well as understanding meaning, students are able to check pronunciation, the grammar of the word (e.g. verb patterns, verb forms, plurality, comparatives, etc.), different spelling (American versus British), style and register, as well as examples that illustrate usage.

Another strategy for advanced learners is to turn their receptive vocabulary items into productive ones. In order to do that, we need to refine their understanding of the item, exploring boundaries between conceptual meaning, polysemy, synonymy, style, register, possible collocations, etc., so that students are able to use the item accurately. We must take into account that a lexical item is most likely to be learned when a learner feels a personal need to know it, or when there is a need to express something to accomplish the learner's own purposes. Therefore, it means that the decision to incorporate a word in ones productive vocabulary is entirely personal and varies according to each student's motivation and needs. Logically, production will depend on motivation, and this is what teachers should aim at promoting, based on their awareness of students needs and preferences. Task-based learning should help teachers to provide authentic, meaningful tasks in which students engage to achieve a concrete output, using appropriate language for the context. We could not talk about vocabulary teaching nowadays without mentioning Lewis, whose controversial, thought-provoking ideas have been shaking the ELT world since its publication. We do not intend to offer a complete review of his work, but rather mention some of his contributions that in our opinion can be readily used in the classroom.

His most important contribution was to highlight the importance of vocabulary as being basic to communication. We do agree that if learners do not recognize the meaning of keywords they will be unable to participate in the conversation, even if they know the morphology and syntax. On the other hand, we believe that grammar is equally important in teaching, and therefore in our opinion, it is not the case to substitute grammar teaching with vocabulary teaching, but that both should be present in teaching a foreign language.

Lewis himself insists that his lexical approach is not simply a shift of emphasis from grammar to vocabulary teaching, as 'language consists not of traditional grammar and vocabulary, but often

of multi-word prefabricated chunks'. Chunks include collocations, fixed and semi-fixed expressions and idioms, and according to him, occupy a crucial role in facilitating language production, being the key to fluency.

An explanation for native speakers' fluency is that vocabulary is not stored only as individual words, but also as parts of phrases and larger chunks, which can be retrieved from memory as a whole, reducing processing difficulties. On the other hand, learners who only learn individual words will need a lot more time and effort to express themselves.

Consequently, it is essential to make students aware of chunks, giving them opportunities to identify, organize and record these. Identifying chunks is not always easy, and at least in the beginning, students need a lot of guidance.

Hill explains that most learners with 'good vocabularies' have problems with fluency because their 'collocational competence' is very limited, and that, especially from Intermediate level, we should aim at increasing their collocational competence with the vocabulary they have already got. For Advance learners he also suggests building on what they already know, using better strategies and increasing the number of items they meet outside the classroom.

The idea of what it is to 'know' a word is also enriched with the collocational component. According to Lewis 'being able to use a word involves mastering its collocational range and restrictions on that range'. I can say that using all the opportunities to teach chunks rather than isolated words is a feasible idea that has been working well in my classes, and which is fortunately coming up in new course books we are using. However, both teachers and learners need awareness raising activities to be able to identify multi-word chunks.

Apart from identifying chunks, it is important to establish clear ways of organizing and recording vocabulary. According to Lewis, 'language should be recorded together which characteristically occurs together', which means not in a linear, alphabetical order, but in collocation tables, mind-maps, word trees, for example. He also suggests the recording of whole sentences, to help contextualization, and that storage of items is highly personal, depending on each student's needs.

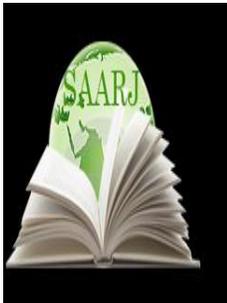

We have already mentioned the use of dictionaries as a way to discover meaning and foster learner independence. Lewis extends the use of dictionaries to focus on word grammar and collocation range, although most dictionaries are rather limited in these.

Lewis also defends the use of 'real' or 'authentic' material from the early stages of learning, because 'acquisition is facilitated by material which is only partly understood'. Although he does not supply evidence for this, I agree that students need to be given tasks they can accomplish without understanding everything from a given text, because this is what they will need as users of the language. He also suggests that it is better to work intensively with short extracts of authentic material, so they are not too daunting for students and can be explored for collocations.

ABSTRACT

The state awards of the Independent Republic of Uzbekistan consist of the title "Hero of Uzbekistan", honorary titles, orders, medals and honorary titles. In this article, information on the creation of the legal basis of state awards, the procedure for awarding citizens, some benefits to those who are awarded are covered.

KEYWORDS: Law, State Award, Honorary Title, Orden, Medal, Honorary Title, Hero Of Uzbekistan, Independence, Glory, Friendship, Courage, Health, Honorary Coach, Courage, Future Creator, Fame, Healthy Life.

INTRODUCTION

After the independence of the Republic of Uzbekistan, large-scale changes in all spheres began to be carried out. In particular, the system of state awards was formed and its legal basis was created. It is worthwhile to emphasize the Constitution of the Republic of Uzbekistan, which is considered to be our main body as a preliminary legal basis. In particular, Article 78 of the Constitution provides for the Joint Powers of the legislative chamber and Senate of the Oliy Majlis of the Republic of Uzbekistan, which includes the issue of "Establishment of State Awards and titles", Article 93 stipulates that the president of the Republic of Uzbekistan shall award "the orders, medals and labels of the Republic of Uzbekistan and shall [1].

On December 22, 1995, the law "on state awards" was adopted. This law became the first normative-legal basis for the system of state awards of this direction. On April 11, 2018, the law on amendments and additions to the law "on state awards" was adopted. This law paved the way for further improvement of work in the field of state awards. The law consists of general rules, the system of state awards, the provision of state awards, the awarding of awards with them and the use of state awards, the closing rules. The state awards include the title of "hero of

Uzbekistan"; honorary titles of the Republic of Uzbekistan; orders of the Republic of Uzbekistan; medals of the Republic of Uzbekistan; honorary titles of the Republic of Uzbekistan.

In this law, special attention was paid to the issues of awarding the state awards, and the presentation on awarding the state awards was made to the president of the Republic of Uzbekistan by the chairman of the Senate of the Oliy Majlis of the Republic of Uzbekistan, the Speaker of the legislative chamber, the Prime Minister of the Republic of Uzbekistan, the Constitutional, governors of Regions and cities of Tashkent, heads of state and economic management bodies, other republican institutions, non-profit organizations shall be introduced by Republican bodies. Awarding of State Awards is carried out by the president of the Republic of Uzbekistan. Awarding the president of the Republic of Uzbekistan with state awards is carried out on the initiative of the chambers of the Oliy Majlis of the Republic of Uzbekistan. Awarding of the state awards of the Republic can be carried out even after the death of a person. Persons awarded with state awards are simultaneously given a certificate of the established sample[2].

The highest award of our country was the title of Hero of Uzbekistan, established on May 5, 1994. This title is awarded to the citizens of the Republic of Uzbekistan for their services in connection with the heroic courage before the state and the people. The person awarded the title of "Hero of Uzbekistan" will be awarded the medal "Golden Star". Persons awarded with the title of "Hero of Uzbekistan" receive a reward from the master who is paid monthly in the amount of the base calculation in addition to the monthly salary or Pension [3].

In the process of reforms in this field, on 26 April 1996, the law "On the establishment of honorary titles of the Republic of Uzbekistan" was adopted. The honorary titles of the Republic of Uzbekistan were established in order to promote the services of citizens in labor, productive state, social and creative activities and they include: "the art figure of the Republic of Uzbekistan", "The scientist of the Republic of Uzbekistan", "The pride of Uzbekistan", "People's artist of The Republic of Uzbekistan", "People's writer of the Republic of Uzbekistan",

"People's artist of, "People's memory of the Republic of Uzbekistan", "employee of services in the field of utilities, household and trade of the Republic of Uzbekistan", "communication officer serving in the Republic of Uzbekistan", "artist serving in the Republic of Uzbekistan", "geologist serving in the Republic of Uzbekistan", "coach of youth serving in the Republic of Uzbekistan", "journalist serving in the Republic of Uzbekistan", "irrigator serving in the, "Employee of Culture who served in the Republic of Uzbekistan", "architect who served in the Republic of Uzbekistan", "Pakhtakor who served in the Republic of Uzbekistan", "stair worker who served in the Republic of Uzbekistan", "industrial worker who served in the Republic of Uzbekistan", "health worker who served in the Republic of Uzbekistan", "sports teacher who served in the Republic of Uzbekistan", "sportsman who served in the Republic, "Employee of public education who served in the Republic of Uzbekistan", "rancher who served in the Republic of Uzbekistan", "lawyer who served in the Republic of Uzbekistan", "agricultural employee who served in the Republic of Uzbekistan", "builder who served in the Republic of Uzbekistan". Persons awarded the honorary titles of the Republic of Uzbekistan shall be awarded a badge of the established pattern and a certificate on it[4].

On May 5, 1994, the law on the order of "Independence" of the Republic of Uzbekistan was adopted. In accordance with the regulations on the order of "independence", citizens of the Republic of Uzbekistan and order will be rewarded for their great contributions to the restoration

and strengthening of an independent legal state, ensuring peace and development in the Republic, and will receive a lump-sum monetary reward of seventy-five times the amount of the base calculation[5].

On 26 April 1996, the law of the Republic of Uzbekistan "Amir Temur" order was adopted. With Orden, citizens of the Republic of Uzbekistan will be rewarded for their great services in the strengthening of statehood, for their great contributions to the development of architecture, science, literature and art, including military skills. The order of Amir Temur will also be awarded for making a special contribution to the strengthening of cooperation, peace and friendship between nations. Persons awarded with this orden will receive a one-time cash prize in the amount of seventy times the amount of the base calculation[6].

On August 30, 2000, the law on the order of the Republic of Uzbekistan "Jalaliddin Manguberdi" was adopted. With the order of Jalaliddin Manguberli, military servicemen who showed high military skills, heroism and courage in the protection of the country's independence, the borders of Vatan, the soil of the native land, as well as in the preservation of it in the field of sight, made a huge contribution to the strengthening of the defense power of our state will be awarded. The order of Jalaliddin Manguberdi is the highest military award of the Republic of Uzbekistan. Persons awarded with this order receive a one-time cash prize in the amount of sixty-five times the amount of the base calculation [7].

On August 29, 1996, the law on the order of the Republic of Uzbekistan "For Great Services" was adopted. Orden and citizens of the Republic of Uzbekistan and foreign countries will be awarded for their great services in the development of Science and technology, economy and culture, development of state cooperation and significant contribution to the implementation of domestic and foreign policy aimed at increasing the international reputation of Uzbekistan, and will receive a monetary reward or a memorable gift equal to this amount of money[8].

On August 28, 1998, the law of the Republic of Uzbekistan on the order of "El-yurt hurmati" was adopted. With Orden, citizens of the Republic of Uzbekistan who have made a great contribution to the strengthening of the country's independence, its economic power, National spirituality and culture, who are worthy of public self-esteem with their hard work, scientific, Public Work, Labor and patriotism will be rewarded and receive a one-time monetary reward in the amount of fifty times [9].

On August 29, 2003, the law on the order of the Republic of Uzbekistan "for selfless services" was adopted. With Orden, citizens and military servicemen who have made a great contribution to the economic and cultural development of the country, the strengthening of defense power and national security, peace and stability in society, solidarity of the nation, improving the welfare of the people, giving their talent, knowledge and experience to the prosperity of our motherland and showing the example of self-sacrifice will be Persons awarded with the order "for selfless services" receive a one-time cash prize of forty-five times the amount of the base calculation[10].

On August 30, 1995, the law of the Republic of Uzbekistan "On the order of Labor Glory" was adopted. With Orden, citizens of the Republic of Uzbekistan will be rewarded for their great work, which will serve to increase the economy and culture in Uzbekistan, increase the well-being of the people, maintain peace and stability, and will receive a one-time monetary reward of forty times the amount of the base calculation[11].

On May 7, 1993, the law of the Republic of Uzbekistan on the order "for the healthy generation" was adopted. People with Orden are rewarded for their exceptional services in the protection of motherhood and childhood, providing the best material conditions and moral environment for the perfection of a healthy generation. The order "for a healthy generation" will consist of two levels: Level I and Level II. Level I orden is considered a higher level. The award is first made in the form of an award of the II degree, with an order of the I degree after at least three years have passed. Persons awarded with Level I orders receive a one-time cash prize of twenty-five times the amount of the base calculation, persons awarded with Level II orders receive a one-time cash prize of twenty-five times the amount of the base calculation[12].

On August 30, 1995, the law "On the order of glory of the Republic of Uzbekistan" was adopted. Orden and citizens of the Republic of Uzbekistan shall be rewarded for the dedication and courage shown in the defense of The Motherland, for their great services in strengthening the defense power and national security in Uzbekistan, increasing the combat readiness of the armed forces and ensuring law enforcement. The order of Glory will consist of two levels: Level I and Level II. Persons awarded with Tier I orders will receive a one-time cash prize of twenty times the number of persons awarded with Tier II orders in the amount of forty times the amount of the base calculation[13].

On May 5, 1994, the law on the order of friendship of the Republic of Uzbekistan was adopted. Orden and the citizens of the Republic of Uzbekistan shall be rewarded for their great achievements in the work of strengthening friendship, mutual solidarity and harmony among representatives of all nationalities and nationalities living in Uzbekistan, for the development of friendship and cooperation of the people of Uzbekistan with the peoples of other countries, and shall receive a lump sum cash reward[14].

On September 11, 2012, the law on the order of courage of the Republic of Uzbekistan was adopted. Military servicemen and other citizens of the Republic of Uzbekistan, who have devoted themselves to the protection of the motherland and service of the native land, who have shown courage and courage, will be rewarded with Orden and will receive a monetary reward in the amount of fifteen times the amount of the base calculation[15].

On May 26, 2020, the law on the order of "Health" of the Republic of Uzbekistan was adopted. Citizens of the Republic of Uzbekistan with Orden will be rewarded for their special services in the development of the health system, improvement of Public Health and strengthening of international cooperation in this field. Orden is level I and II. Persons awarded with Tier I orders receive a one-time cash prize of twenty-five times the amount of the base calculation, persons awarded with Tier II orders receive a one-time cash prize of thirty times the amount of the base calculation[16].

On June 9, 2020, the law on the order of "Honorary coach" of the Republic of Uzbekistan was adopted. Orden has made a worthy contribution to the formation of active civil position and ideological immunity, initiative, self-sacrifice and moral qualities in the representatives of the younger generation, as well as with his deep knowledge and rich life experience, as well as comprehensive support of young people and families who have fallen into a difficult situation, to provide employment and to teach entrepreneurship., for this purpose, citizens of the Republic of Uzbekistan, who show a personal example, will be rewarded for creating favorable conditions.

Persons awarded with the order of "honorary coach" will receive a one-time prize of forty times the amount of the base calculation[17].

On May 5, 1994, the law on the medal "Courage" of the Republic of Uzbekistan was adopted. With the Medal, military servicemen of the Republic of Uzbekistan, employees of the State Security Service, National Guard and internal affairs bodies will be awarded for their courage and courage in ensuring the national security of the Republic, maintaining public order and combating crime, fulfilling military duty or duty. With the medal "courage" citizens of the Republic of Uzbekistan or persons who are not citizens of the Republic of Uzbekistan can be rewarded for their courage shown in the maintenance of public order during natural disasters, fires and other emergency situations, in the preservation of people's lives, State and public property. Persons awarded with medals receive a one-time cash prize in the amount of ten times the amount of the base calculation[18].

On July 6, 2007, the law on the medal "For loyal services" of the Republic of Uzbekistan was adopted. Citizens of the Republic of Uzbekistan who demonstrate their high professional skills, commitment to military and patriotic duty with medals will be rewarded for their great services in strengthening the country's defense capabilities and national security, increasing the combat capabilities of the Armed Forces of the Republic of Uzbekistan and ensuring law enforcement in Uzbekistan, and will receive a lump sum [19].

On December 28, 2017, the law of the Republic of Uzbekistan on the Medal "The future builder" was adopted. Citizens of the Republic of Uzbekistan who have demonstrated the qualities of patriotism, self-sacrifice and hard work with the Medal, serve with loyalty to the interests of the people, increase the prestige of our homeland in the international arena and make a worthy contribution to the glory, serve their peers with activity and initiative in the socio-political life of the country, the prize money paid in one lump sum in the amount will receive[20]. On May 5, 1994, the law on the medal "Shohrat" of the Republic of Uzbekistan was adopted. Citizens of the Republic of Uzbekistan, as well as non-citizens of the Republic of Uzbekistan who have achieved great success with their honest efforts in the development of the economy, science and culture of the Republic, in the spirit of educating the younger generation in the spirit of patriotism and loyalty to the ideas of national independence and social development[21].

On May 26, 2020, the law of the Republic of Uzbekistan on the medal "Healthy life" was adopted. With medals, doctors of health institutions, dietologists, physical education instructors, representatives of the mass media covering health issues, bloggers, exemplary families, athletes, heads of organizations and departments of all levels, heads of sports schools, secondary schools and preschool institutions, sports trainers, other specialists of the field of physical education and sports, representatives of the defense system, judges and sports organizations, governors of all levels and, heads of physical education and sports organizations, sponsors, heads of enterprises and organizations attached to the sports federation (associations) will be awarded and will receive a one-time cash prize of ten times the amount of the base calculation[22].

On December 17, 2009, the law on the honorary title of the Republic of Uzbekistan was adopted. In accordance with the regulations on the honorary title of the Republic of Uzbekistan, citizens of the Republic of Uzbekistan will be rewarded for their labor and combat services, productive state, social and creative activities. Also in some cases, enterprises, institutions, organizations, public associations, creative communities and military units, administrative and territorial units

of the Republic of Uzbekistan can be awarded. Persons awarded with the honorary title of the Republic of Uzbekistan receive a monetary award or a memorable gift of the same value, which is given once in the amount of five times the amount of the base calculation[23].

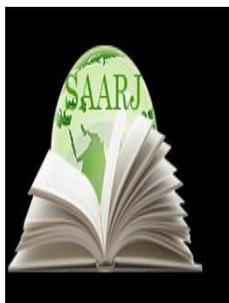

CONCLUSION

In conclusion, we can say that from the first years of independence to the present, a lot of work has been carried out on the worthy awarding of citizens of their services to the state and the people. The system of State Awards has been formed, its legal basis has been created, the importance of state awards in the formation of feelings of inviolability and patriotism in our citizens is increasing. With the state awards, representatives of many spheres of our society are awarded, so the benefits and incentives set out in the laws are also used. It would not be an exaggeration to say that our state pays attention to the selfless and energetic citizens of our society through the high Awards, which are now called New Uzbekistan.

ABSTRACT

Due to depletion of fossil fuels and the pollution caused by their burning, there is a pressing need for renewable, clean fuel alternatives for our future energy source. Scientists have been paying close attention to hydrogen, a regenerative and ecologically benign fuel with a high calorific value. The hydrogen economy idea proposes that, rather than fossil fuels, hydrogen fuel would be used to provide the majority of future global energy needs. Hydrogen production should be properly developed initially in order for the technology to be deployed in a sustainable, clean, and cost-effective way for a smooth transition to the hydrogen economy. The hydrogen industry has been recognized as a viable replacement for the non-sustainable fossil fuel economy. The development of ecologically safe and cost-effective hydrogen manufacturing techniques, which are critical for the hydrogen economy, is now ongoing. Using aluminum and its alloys to convert water or hydrocarbons to gas is one of the most promising methods to generate hydrogen. This article provides a review of aluminum-based hydrogen generation techniques, as well as their limits and commercialization difficulties. A recently developed idea for hydrogen and electromagnetic energy co-generation is also addressed.

KEYWORDS: Aluminum, Aluminum Alloys, Alcohols, Hydrogen Production, Electricity Generation.

INTRODUCTION

Aluminum and its alloys are regarded as one of the most appropriate metals suited for future hydrogen generation for specific metal reactants that may cause hydrogen developing chemical processes, and there is a tendency to use them as an energy source, particularly in recent years. Furthermore, metal usage has been found as an efficient, user-friendly, and safe method for both

hydrogen generation and energy storage. The goal of this article is to provide an overview of the current techniques for generating hydrogen utilizing aluminum and its alloys, as well as their limits and commercialization difficulties. These techniques are divided into two categories: aluminum–water reactions and aluminum–alcohol reactions, which convert water and hydrocarbons into hydrogen, respectively. In addition, a relatively new potential idea, hydrogen and electrical energy cogeneration, will be addressed in the next section[1][2].

1. Production and storage of hydrogen are now at a standstill:

Despite the fact that hydrogen is the most common element in the cosmos, it is seldom found on Earth. As a result, hydrogen must be extracted from either water or hydrocarbons, both are plentiful on the planet. Biological mechanisms, electrochemical water electrolysis, and chemical techniques are now used to produce hydrogen.[3] Chemical techniques control the industry for commercial hydrogen generation, owing to the poor conversion efficiency of biological systems and the high cost of hydrogen production. Steam or partial oxidation reforming of natural gas, coal gasification, biomass reforming, water photolysis, and other methods may all be used to physically extract hydrogen from its sources. Currently, steam/partial oxidation reforming of natural gas and coal gasification produce about 95 percent hydrogen. Despite the fact that these methods are mature and then have the lowest prices, they cannot be utilized as a long-term plan for the hydrogen fuel cell since the raw materials required are all derived from fossil fuels, which are neither renewable nor clean. Although biomass reforming, a plentiful and renewable resource, may be considered a sustainable method to generate hydrogen, its carbon dioxide (CO₂) neutrality remains a point of contention. Furthermore, the poor hydrogen production and energy content of biomass severely limit this method. Furthermore, the conversion of syngas to hydrogen through the water–gas shift process will need extra energy. Another drawback of biomass use is the high expense of producing, collecting, and transporting biomass. Water photolysis, a potential advanced chemical technique, is still under research, and technical challenges keep it from reaching commercial applications.[4]

2. Aluminum and its alloys are used to make hydrogen:

Aluminum and its alloys have a variety of mechanical, electrical, and thermal characteristics that make them useful. They're extensively utilized in a variety of industries, including transportation, construction, electrical engineering, and packaging. Because of its high energy density of 29 MJ/kg, there has been a growing worry in recent years about utilizing aluminum-based materials as an energy storage or converter medium. Aluminum is considered a "viable metal" since it is the most plentiful crustal metal on the planet and can be completely recycled. Its use corresponds to today's subject of creating sustainable energy. Aluminum's low weight is another benefit. Aluminum is the lightest of all widely used metals, with a density of 2700 kg/m³. Its various alloys have densities ranging from 2600 to 2800 kg/m³. A feature like this may enable a system's overall weight be reduced significantly. Aluminum's usage in batteries is a good illustration of how it's used in the energy sector. The potential for the discharge reaction of pure aluminum in a highly alkaline electrolyte (pH 14) may be as low as 2.33 V compared to the typical hydrogen electrode. Aluminum also has a high electrochemical equivalency of 2.98 Ah/g due to its trivalence and low weight.[5]

Aluminum is a good anode metal for hundreds of years because of all of these characteristics. Li and Bjerrum looked examined a number of different aluminum batteries in depth. The

aluminum–air battery, which consists of an aluminum anode, a gas permeation cathode, and an aqueous alkaline (sometimes neutral) electrolyte, was said to be the sole battery system that could provide an electric vehicle with a range and resupply time similar to internal-combustion-engine vehicles.

DISCUSSION

3. *Production of hydrogen from aluminum–water interactions:*

3.1 *Aluminum–water reaction with alkali aid:*

In highly alkaline conditions, hydrogen ions (OH) may dissolve the oxide layer on the aluminum surface, producing AlO_2 . As a consequence, even at ambient temperature, aluminium alloys dissolve easily in a highly alkaline, resulting in hydrogen generation. Sodium hydroxide (NaOH) is the most frequently encountered alkali, and it undergoes the following sequence of reactions

This hydrogen production process is thought to include the two stages indicated in the equations above. The NaOH that was depleted for hydrogen production will be replenished by the $\text{NaAl}(\text{OH})_4$ breakdown. As a result, if the reaction is correctly regulated, only water is used during the operation. The total reaction despite the fact that this is a well-known parasitic reaction that is undesired in alkaline–aluminum–air batteries, it does offer a small supply of hydrogen. This process has been used to create a variety of hydrogen production devices. However, generating hydrogen via this reaction has the drawback of being highly corrosive, making it unsuitable for hydrogen generation in cars or home power systems.[6]

Other hydroxides were employed as the reactive base for hydrogen generation in addition to NaOH. By raising temperature and basic concentration at same time in potassium hydroxide (KOH) solution, a synergistic impact on hydrogen liberation performance was discovered. Unfortunately, due to its interaction with CO_2 in the air, KOH was consumed, slowing down the reaction rate. A recent research evaluated the performance of three distinct hydroxides in hydrogen generation: NaOH, KOH, and $\text{CaOH}(\text{OH})_2$. Aluminum consumption in NaOH solution was observed to be faster.[7]

4. *In a neutral state, the interaction between aluminum and water:*

4.1 *without using alkalis, aluminum may react directly with water:*

According to the preceding equation, the predicted hydrogen output of this reaction for a molar ratio combination of aluminum and water is only 3.7 weight percent, although it is still greater than other metals like Mg and Zn (3.3 wt. percent and 2.4 wt. percent, respectively). If the water generated by the driven fuel cell is fully recovered again for aforementioned process, the potential hydrogen yield rises to 5.6 wt.%, nearing the 6.0 wt.% goal established by the US Department of Energy for hydrogen storage devices.

This technique is found more safer than alkali-assisted reactions, although surface passivation in aqueous electrolyte is much easier to achieve, and metal activity with water is very low. As a result, increasing aluminum activity in water may be a critical job in this situation. The chemical activity of a freshly exposed metal surface is greater. Cutting, drilling, or grinding aluminum and its alloys in water, with the fresh surface of the metal exposed in water, resulted in the emission of hydrogen gas. Grinding produced the greatest amount of hydrogen per unit volume of metal removed. However, owing to the fast passivation of the metal surface, the reaction ceased soon

after the machining stopped. Metal particles of tiny diameters, which enhance the particular exposed surface area of metals, are preferable for continuous hydrogen production. High-energy ball milling, a technique in which materials are broken into tiny particles by ball-powder impacts, is one method to create fine metal powders. Ball milling size reduction is highly dependent on the mechanical characteristics of metals.[8]

4.2 At high temperatures, an aluminum–water interaction occurs:

Apart from the above-mentioned aluminum corrosion processes in water under moderate circumstances, a combination of aluminum and water vapor may react (burn) at high pressure and temperature, resulting in the reaction:

Because of its potential use in propulsion systems, this response has gotten a lot of attention. Nano-scale aluminium with strong chemical activity, similar to alkaline metals, was used to promote this reaction. Water-soluble polymers, such as polyacrylamide, were also added to the water to prevent water evaporation during the combustion process and enable the reaction to proceed in a layer-by-layer fashion. Recent research found that this extremely exothermic combustion process (heat release of 15.4 MJ/kg) may boost hydrogen generation from NaBH_4 hydrolysis without using precious metal catalysts. In contrast to the realistic hydrogen production of 5 wt. percent for hydrolyzing NaBH_4 alone, burning of $\text{NaBH}_4/\text{Al}/\text{H}_2\text{O}$ mixtures yielded a hydrogen generation efficiency of percent and a hydrogen yield of 7 wt. percent.[9]

5. Cogeneration of hydrogen and electrical energy is a concept:

Aluminum, as previously stated, has long been a popular material for battery anodes. The aluminum–air battery was shown to be the best option for powering cars among a range of aluminum batteries. However, one serious issue with aluminum–air cells is that a parasitic reaction, occurs at the anode in conjunction with the current-generating reaction, significantly reducing the batteries' coulombic efficiency. The following two elements are the focus of efforts to inhibit this unwanted reaction: (i) high purity aluminum or aluminum alloys doped with these elements, and (ii) corrosion inhibitors added to the electrolyte. Both of the aforementioned methods, however, substantially raise the battery prices. Instead of inhibiting this reaction, Zhuk et al. suggested that it be used to produce hydrogen in a positive way. Calculations based on actual experimental results confirmed the viability of this concept. When the energy stored in the liberated hydrogen is taken into account, the fuel efficiency of commercially available aluminum alloys, which are more vulnerable to parasitic corrosion, is similar to that of special anode alloys in a combined system.[10]

The replacement of the oxygen diffusion anode in the aluminum-air batteries with a hydrogen-evolution cathode is an alternate approach for the co-generation of electricity generation and hydrogen. The neutral NaCl solution has been used as the electrolyte in recent experiments on this approach. The cathodic process generates the majority of the hydrogen in this approach, with the self-corrosion reaction just at anode contributing a little amount. Figure 1 depicts the structure of a combined system developed by Zhang et al. A reactor, an electrolyte reservoir, and mechanisms for electrolyte flow and hydrogen flow rate control make up the system architecture. To meet certain electrical output requirements, a number of aluminum alloys cell units that may be mechanically charged are linked in series or in parallel inside the main reactor.[11]

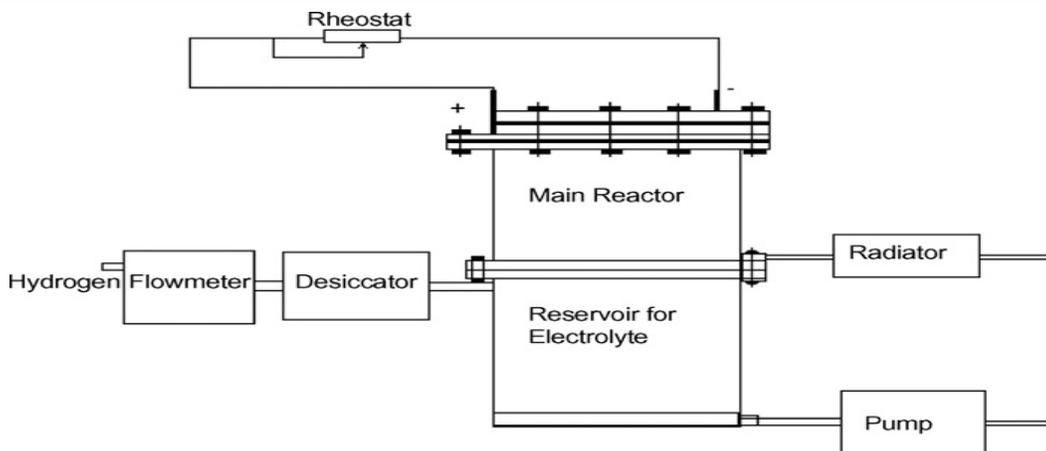

Figure 1: Structure of Aluminum water Hydrogen generator[1]

When the system is in stand-by mode, the electrolyte is stored in the reservoir underneath the main reactor. The electrolyte will be injected into the primary reactor from the reservoir to start the reaction by touching the electrodes, and the free space in the reservoirs will be utilized for hydrogen collection while the reactor is in operation. Excess electrolyte in the main reactor will flow back into the reservoir via a top-of-the-reactor exit. This kind of electrolyte circulation also aids in the removal of precipitated $\text{Al}(\text{OH})_3$ as well as the heat produced during the reaction. The rate of hydrogen production is controlled by changing the battery's discharging density using an auxiliary rheostat. A maximum open-circuit voltage of 19.8 V and a maximum short-circuit current of 7.8 A were reported in a series of experiments on a system with the configuration shown in Figure 1 utilizing Ni nets as the cathodes. The system provided a steady power supply at a voltage of 0.45 V and a current of 7.5 A throughout the 180-minute testing period, while the hydrogen production rate remained at 1.0 L/min and above. Because the cathode activity determines the hydrogen production characteristics as well as the battery capacity of a combined system, considerable effort has gone into developing novel cathode materials with strong electro-catalytic activity at cheap prices.[12]

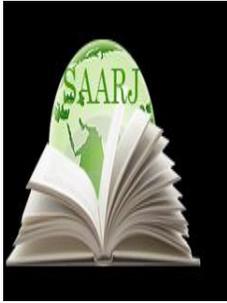

CONCLUSION

Aluminum alloys are very helpful in the generation of hydrogen. Aluminum's strong activity allows it to extract hydrogen from a variety of sources, including water or hydrocarbons. Aluminum–water interactions in either alkaline or neutral circumstances are the most often used reactions, whereas metal combustion and metal–alcohol reactions have received less attention. Despite significant attempts to address this issue, metal surface passivation remains a serious stumbling block. Although a theoretical hydrogen conversion yield may be achieved using difficult treatments such ball milling and specific metal doping, further study is required to improve cost efficiency and fully use the energy contained in aluminum-based materials. Systems for co - generation of hydrogen with electrical energy were suggested, inspired by aluminum batteries. Its viability, on the other hand, has to be investigated further. Aluminium alloys will play a significant part in hydrogen generation as a result of continuous research and development.

ABSTRACT

This article provides a conceptual overview of the main crimes that result in ID fraud and millions of dollars in damages for businesses and individuals across the globe each year. The article examines the unique successful approaches for the long-term development of preventive measures that have been made available to individuals and businesses. Furthermore, the article analyzes the research and highlights the most efficient methods for individuals and businesses to protect themselves against identity theft, since victims may face a long process of repairing the harm to their reputation, credit rating, and employment. Identity theft is when someone obtains someone else's private information without their permission in order to abuse it. It will be shown how criminals use both technology-based and social engineering methods to obtain personal information. Finally, people and organizations will be given many effective preventive methods for protecting critical data and information against identity theft. Typically, criminals use human factors to get over security measures. As a result, the proposal places a strong emphasis on raising people's understanding via public and corporate training.

KEYWORDS: *Identity, Theft, Fraud, Prevention, Personal Information.*

1. INTRODUCTION

To avoid fraud as a consequence of identity theft, businesses and individuals should be careful in safeguarding their identities. How certain are they that they will not be one of the million people targeted by identity thieves in 2010? According to the Federal Trade Commission, 9.9 million Americans (22 percent higher than in 2007) were victims of identity theft in 2008, and "ID theft costs consumers approximately \$50 billion annually"[1]. Despite efforts to enforce the law, the number of new identity theft victims increases on a daily basis all over the world. The

preparatory stages of acquiring, holding, and trafficking in identity information for future use in current crimes such as personation, fraud, or abuse of debit card or credit card data are referred to as ID theft.

Credit card numbers, CW2 numbers (on the back of credit cards), Credit reports, Social Security (SIN) numbers, Driver's license numbers, ATM numbers, Telephone calling cards, Mortgage details, Date of birth, Passwords and PINs, Home addresses, and Phone numbers are the top twelve types of private personal information stolen by identity thieves.

ID theft is one of the main issues that costs individuals and companies billions of dollars each year all around the world. The main sources of ID theft include social and technical reasons, according to an analysis of four key variables: political, economic, social, and technology. Social engineering is a thieving method in which criminals take advantage of people's online habits, such as on Facebook, to steal personal information. This study looks at the many kinds of scams that are common as a result of identity theft. ID fraud, financial fraud, tax fraud, medical fraud, resume fraud, mortgage fraud, and organized crimes such as money laundering, terrorism, and illegal immigration are all scams that arise from ID theft. In addition, the different methods used by thieves to target people and organizations are explored. Physical and technical methods are the two main categories of techniques. Traditional methods such as mail theft and insider theft are examples of physical tactics. It is critical for managers to understand that, despite modern technology-based methods, insiders are responsible for more than 70% of ID theft.

ID theft, by definition, is typically linked with fraud and results in financial damages for victims, both people and businesses. Because victims may face a long process of clearing up the damage, such as their reputation, credit rating, and employment, it is critical to learn effective methods to safeguard individuals and businesses from ID theft. As a result, it is essential to examine the major potential variables, such as political, economic, social, and technical, and how they may promote or reduce ID theft. ID theft tactics, ID fraud, and methods of ID fraud prevention will also be addressed, since individuals and businesses need to know how to avoid fraud as a consequence of ID theft.

1.1. Analysis of Political, Economic, Social, And Technical (Pest) Factors

It is essential to scan and evaluate external or micro-environmental variables in order to take effective measures to prevent and reduce ID theft in a society. One of the major frameworks for evaluating how political, economic, social, and technical variables influence ID theft is the PEST analysis. Factors such as politics and economics, as well as identity theft ID theft has substantially increased in emerging countries due to a lack of political and economic stability, particularly in developed countries. Every year, millions of individuals from poor nations move to wealthy ones to escape poverty or political unrest[2]. More than ten million undocumented Mexicans, South and Latin Americans, and Asian immigrants reside in the United States, according to statistics. As can be observed, adverse political and economic circumstances drive individuals to immigrate illegally, resulting in identity theft and fraud.

1.2. Factors Such as Politics and Economics, as Well as Identity Theft

ID theft has substantially increased in emerging countries due to a lack of political and economic stability, particularly in developed countries. Every year, millions of individuals from poor nations move to wealthy ones to escape poverty and political unrest. The cost of illegal immigration is borne by American society in the form of identity theft, when illegal immigrants steal identities such as social security numbers or driver's licenses in order to work[3]. For example, in March 2007, the United States District Court for the Southern District of New York sentenced 20 undocumented Mexican immigrants to prison for identity theft, document fraud, and abusing Social Security numbers. As can be observed, adverse political and economic circumstances drive individuals to immigrate illegally, resulting in identity theft and fraud.

1.3. Identity Theft and Social Considerations

ID theft is influenced by the social environment and variables such as habits and social network communication. In a society, particularly in the .com sector, people's understanding of how to utilize social networks and their role in preserving privacy is critical. Companies, organizations, and individuals use a variety of security measures to safeguard their privacy, sensitive data, and personal information. Social engineering, on the other hand, is "alive and well" and "probably remains the most successful hacking method" for obtaining personal and sensitive data. Social engineering, according to Applegate, is a "methodology that enables an attacker to circumvent technological restrictions by targeting the human aspect in an organization"[4]. Social engineers remain a powerful danger to people's cultural attitudes and behaviors in social networking, as communication via social networks such as Facebook, Twitter, and Skype grows. According to a study conducted by the point for credit union research and guidance in the United States, Canada, the United Kingdom, France, Germany, and Spain in 2008[5],

- 25% of Germans and 60% of Americans have given their account passwords with a family member or acquaintance. As a consequence of this societal mindset, 3% of Germans have had their identities stolen.
- Half of all Americans use family member names, significant dates, nicknames, or their pet's name as passwords for internet accounts.
- Approximately 40% of customers in all six countries show personal information on their social media profiles, and some of them use the same information as their passwords.
- In France, more than a quarter of customers utilize their social network posted date of birth as their internet passwords.

As a result, attackers have unfettered access to this information on users' profiles. Attackers use this information to get more information without raising suspicion in preparation for a final assault, such as identity theft and fraud. A social engineer, for example, gets a financial manager's information on a social network, allowing the attacker to learn the manager's first and last name, occupation, and date of birth.

1.4. Factors Such as Technology and Identity Theft

People and institutions are threatened by technological forces. People's behavior in managing their private information, such as credit cards and social insurance numbers, has altered as new technologies, such as PDAs, mobile phones, USB, Wireless, and laptops, have entered the World Wide Web arena[6]. When individuals utilize their private information, such as banking account information, they are not completely secure no matter where they are online or at work. Fraudsters now see the Internet as a new frontier, simple to access, and a wealth of personal information from which to steal people's identities.

Mostay estimates that individuals and organizations lose approximately \$40 billion per year in internet activity due to identity theft and communication fraud[7]. Furthermore, almost 80% of financial institutions use wireless technology, such as smart phones, in their operations, while only 75% of devices use mobile security. As a result, when individuals utilize new technology like Wi-Fi or online banking, it's critical that they alter their habits. One of the most common blunders is storing the online banking login and password in the browser. Individuals and technology managers must alter their attitudes and actions as a result of the new technology boom, and explore cautious measures while utilizing new technology[8]. People and individuals may be protected against identity theft by utilizing proper security measures, such as avoiding storing account information on computers, employing anti-spyware programs, and using wireless safeguards. As a result, new technological risks and their impact on identity theft vary depending on the behaviors and measures taken by people and management.

1.5.the creation of new accounts

With personal information and identification such as a victim's name, address, and social security number, fraudsters can open new bank accounts, credit accounts (credit cards, lines of credit, or loans), in-store accounts, cell phone accounts, and student loan accounts using the victim's real information; they will then change their billing address to hide their activities from the victim. In such situations, fraudsters have more time and chances to conduct fraud, and victims are usually unaware until collection agencies approach them or their credit applications are denied.

1.6.Shopping on the Internet

Fraudsters use victims' personal information and ID to buy online in a distant region, typically Africa, and ask for goods to be delivered to a trusted third party. They then request that purchases be repackaged and sent to the fraudsters. This kind of fraud became more prevalent in Canada in 2003, when an Albertan bought goods online using a stolen ID and credit card information, then requested that his order be sent to North Dakota, where it was repackaged and re-shipped to Edmonton.

1.7.Medical Espionage

When someone takes vital information or identification, such as a victim's health card, they use it to claim or receive medical services in the victim's name. One of the potential outcomes of medical fraud is deceiving health-care professionals, putting a patient's life in jeopardy. According to statistics, about 500,000 Americans have been victims of medical fraud. Although there is no data for Canada, the Ontario Ministry of Health and Long-Term Care says that medical fraud (health care fraud) is the most common result of identity theft in the province [9].

1.8.Tax Evasion

ID thieves utilize their victims' identities, such as job data or social security numbers, to file their taxes and collect their refunds. According to the United States District Court for the District of Arizona (2010), between 2005 and 2008, a gang of fraudsters submitted income tax returns using stolen IDs and received approximately \$4 million in tax refunds[10].

2. DISCUSSION

Businesses and organizations must have a strategic strategy in place to safeguard critical information since they store people's identities and private information in their databases. Institutions, such as financial or governmental organizations, must ensure that red flags can be recognized by their security systems in the initial phase to have an effective and secure system. As a result, identity theft prevention programs should be made available, and they should have the following key components:

- First and foremost, reasonable rules and processes for detecting "red flags."
- Secondly, look for the red flags that have been recognized.
- Thirdly, after detecting red signals, take necessary action.
- Lastly, the preventive program should be evaluated and updated on a regular basis.

Furthermore, Collins claims that, contrary to popular belief, the bulk of ID theft occurs in the workplace rather than online. Collins claims that workers or people impersonating employees are responsible for more than 70% of ID theft in businesses; as a result, Collins advises businesses to use the following preventive measures:

- To ensure that businesses have a suitable and effective personnel selection strategy in place to ensure that honest people are hired.
- To carry out a risk assessment.
- To use an e-business risk assessment tool to spot ID theft red flags.
- To make it mandatory to shred any papers containing personal information and sensitive information about people and businesses before discarding them.
- Educate and educate staff on how to spot fraudulent applications.
- To improve the organization's ethical culture.
- To recognize and encourage workers who promote organizational honesty.

Senior Virus Research Engineer at McAfee, recommends the following preventive measures to businesses to minimize ID theft:

- Appoint someone to be in charge of the organization's security system.
- To reduce hazardous behavior such as sending and receiving email without discretion and downloading applications by providing training, outlining user duties, and documenting the information system and network's regulations.
- Create a secure network and implement secure hardware and software.
- Adopting manageable solutions for workers who are in charge of system support.

- Document all actions such as diagnosing, installing, testing, and restoring the organization's network.
- To formalize corporate network use, such as adding or removing users.
- Identify, detect, block, and report questionable online activity using preventive security technologies.
- To install dependable security systems on all terminals (servers and workstations) that link to the business network, such as anti-virus, anti-Trojan, and anti-spyware.
- To keep all security software up to date on a regular basis.
- To evaluate, update, reconfigure, and manage the company's security system.
- To disregard any free remote security system audits that may be available.
- To safeguard the organization's data backup devices.
- To avoid storing sensitive information and data on portable computers such as laptops.
- To evaluate, monitor, and manage the wireless network and devices of the company.
- Limit physical access to computers to safeguard the organization's information system.
- To reduce the danger of critical data being copied or stolen by monitoring staff turnover and job mobility.
- To manage information flow outside of the corporation's computer network, such as interviews, questionnaire answers, conference presentations, and private or public information exchanges.

3. CONCLUSION

Identity theft is becoming a significant crime all around the world, posing a danger to both individuals and businesses. Thieves, fraudsters, and criminals employ a variety of methods to acquire private information from individuals. Fraudsters' motivation, skill, and dedication are reflected in the diversity of methods they use to get personal information and the quantity of money they make. Facts indicate that thieves change their methods depending on their motivation; as a result, the costs of ID theft vary for people and organizations. As previously stated, societal and technical elements are important motivators for criminals. These two causes are intertwined and contribute to an increase in identity theft. Furthermore, fraudsters are motivated by new technology and a lack of public awareness about how to safeguard personal information.

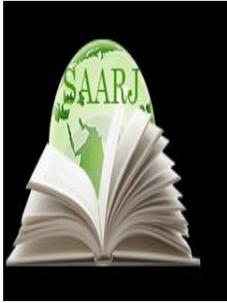

As a result, identity thieves are expected to use new methods to acquire personal information, especially in the internet context. As a result, it is critical to improve people's understanding of how to defend oneself in online networks via media education. In terms of public education expenses, it is important to note that governments and other large businesses should see these costs as investments rather than expenditures in order to create a secure society. Banks, financial institutions, and retail shops, for example, are more susceptible than other small companies or corporations since they gather people's personal information in their databases. As a result, these institutions must have proper strategies, policies, and procedures in place to defend themselves

against widespread identity theft. Security awareness, training, technical control, and an efficient information management plan should all be part of a sound defensive approach.

Identity theft by insiders is a significant issue for companies, according to statistics; thus, organizations should consider implementing a robust and effective internal control to prevent identity theft. Organizations should educate workers on the most common kind of assault, social engineering, and its effects. Managers should also be aware that poor performance and disregard for the impact of possible assaults not only results in significant financial losses, but also tarnishes the company's reputation. Individuals and organizations must recognize that they are susceptible to identity theft; as a result, implementing the most effective security system should be linked to increasing awareness of potential risks, since "knowledge is power."

A BRIEF REVIEW ON THE RUSTIC CUSTOMER'S WHILE SELECTING MOBILE PHONE

Manoj Agarwal*

*Teerthanker Mahaveer Institute of Management and Technology,
 Teerthanker Mahaveer University,
 Moradabad, Uttar Pradesh, INDIA
 Email id: manoj.management@tmu.ac.in

ABSTRACT

Marketers have begun to give attention to the Indian rural market in this age of globalization, not only to serve the requirements of urban consumers with value, but also to serve the needs of rural customers. The Indian mobile sector is the fastest expanding in the world, with more mobile phone connections being added every month. The liberalization of communications regulations and policies has contributed to this development. According to a Gartner study, India will be Asia Pacific's fastest growing telephone market after China. Many marketers see the Indian rural market as a tremendous opportunity because of its size and demand base. Around 840 million people live in rural India, accounting for around 70% of the population, 600,000 villages, and 56% of national revenue. The rural market in India accounts for about half of the country's gross domestic product. The buying patterns of rural consumers are improving somewhat as their discretionary income rises. The fact why India has a large mobile phone market is owing to the country's large rural population. Marketers must develop strategies to capture the expanding rural market by first recognizing the requirements of rural customers, which vary from those of urban consumers in terms of affordability and tastes, and then attempting to offer those goods and services in order to make a profit. Companies must do thorough assessments while marketing to rural India. There are about 700 million mobile phone subscribers in India, with 320 million of them living in rural areas (How smartphones are penetrating deeper in rural India, 25th May 2015, the rural Marketing Journal). In the past four years, the rural market's mobile phone penetration has risen from 22 percent to 38 percent. This study is an effort to bridge the gap by focusing on the mobile phone as a possible market owing to its "critical" requirement in India's rural areas.

KEYWORDS: *Advertisements, Brand, Buying, consumers, Mobile.*

1. INTRODUCTION

The Indian mobile industry is growing fastest in the world and continues to add more mobile phone connections every month. This growth is noticed due to liberalization of telecommunication laws and policies. According to Gartner report, after China, India would be the fastest telephone market in Asia Pacific. Due to growing competition between the mobile phone manufacturers as well as competition between the service provider, the prices of mobile phones and the call rates has dropped respectively enabling many consumers to buy the products and use the services. Subscriber rates are growing further, every month. The consumers are also spending on buying mobile phones with better technology[1]. Mobile phone and technology development has a long history of innovation and advances that have arisen as a result of dynamic changes in customer demands and tastes. Among these advancements, mobile phones have had one of the highest rates of household adoption of any technology in contemporary history. Mobile phones have become an essential component of people's everyday lives and personal communication all around the world[2].

In today's highly competitive mobile phone industry, manufacturers are always battling to discover new competitive advantages and distinguishing features that will convince customers to choose their brand over a competitor's. Various research have been done to discover characteristics that distinguish businesses from their rivals in terms of influencing consumers' purchasing decisions. Consumers of mobile phones all around the globe are heavily affected by the many variables that influence mobile phone purchasing decisions[3]. These variables may be linked to the consumer's traits as well as the functionality of mobile phones. As a result, mobile phone firms have developed a wide range of phones with various brands and functions. Various research studies have been performed to discover variables that influence customers' mobile phone choices. A variety of things were identified as a determining factor affecting purchasing decisions in these investigations[4].

It was predicted that mobile phone subscriber base would grow from over 500 million in 2013 to over 800 million in 2019 (Number of mobile phone users in India from 2013 to 2019,. In India, 13 million new connections were added in the third quarter of 2015, followed by China which added 7 million, US 6 million, Myanmar 5 million and Nigeria added 4 million subscribers, according to Ericsson Mobility Report for 2015. (Business Standard, 18th November 2015). Globally, the subscriptions of smart phones are expected to increase from 3.4 billion in 2015 to 6.4 billion by 2021. India is pegged at 77 percent penetration of mobile phones against global average of 99 per cent[5]. Rural India comprises around 840 million people; around 70% of population, with over 600,000 villages and 56 per cent of national income. The Indian rural market with its vast size and demand base offers greater opportunities to many marketers. It accounts for around 55 per cent of the manufacturing GDP; rural areas were host very closer to 75 per cent of new factories built in the last decade, while the rural factories account for 70 per cent of all new manufacturing jobs[6].

At present due to the change, today's rural consumer is value driven. A product is worth purchasing if it enhances his life in a meaningful way. Rising literacy and exposure to the same commercials as urban consumers has created a demand for typically urban products and services.

Villagers are willing to adopt new products or services if they are clear about the benefits that accrue. Better road infrastructure has led to increased mobility; with people travelling, not just for visiting family or pilgrimages, but more often further afield in search of entertainment in the form of cinema. Figure 1 shows the conceptual framework of the study.

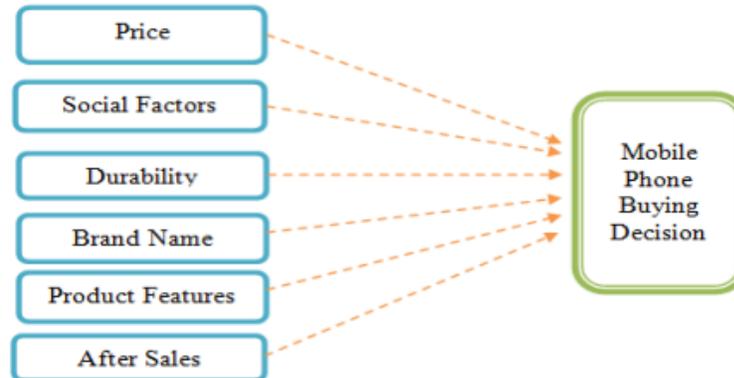

Figure 1: Conceptual Framework of the Study[7]

During the period 2009–2012, rural consumption per person increased by 19 percent annually, according to National Sample Survey Organization (NSSO). (Indian Rural Market, November 2013). In incremental terms, spending in rural India during this period, increased by US\$ 69 billion, significantly higher than US\$ 55 billion by urban populations. According to TRAI report of Jan 2016, India is currently the fastest growing subscriber rate, with total subscriber base of 1017.97 million. In 2015, India added over 67 million subscribers while in China; the total subscriber growth was closer to 30 million in 2015.

The graph below shows the respondents' current phone use as well as which brand they would want to switch to in the future. As a result, Nokia mobile phones are used by 67 percent of respondents, with Techno (11.8 percent), Other Chinese brands (9.2%), and Samsung following closely behind (5.3 percent)

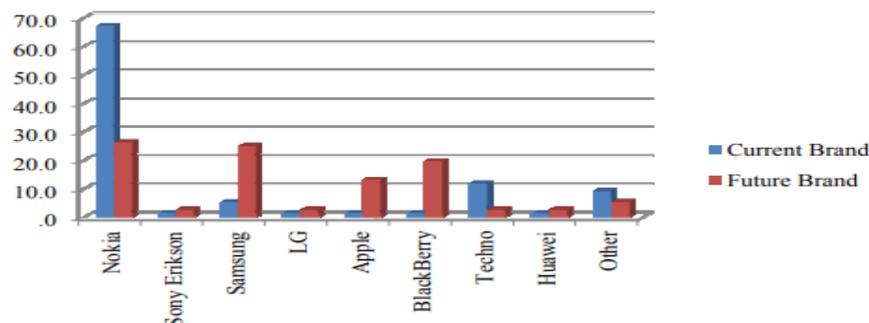

Figure 2: The Respondents' Current Phone Use As Well As Which Brand They Would Want To Switch to in the Future.

Urban Indian subscribers were 582.95 million, and mobile subscription of rural India was of 435.02 million. **Urban mobile subscriber share stands at 57.27% to that of rural subscriber with 42.73%.** Thus, Indian rural market is more of an opportunity to the marketers and hence the need to understand their purchase behavior.

1.1 Applicability in India as whole:

There are over 6, 27,000 villages in India. The rural region is home to about 3/4 of the overall population. The rural population's development is crucial to the nation's development. In terms of price sensitivity, brand knowledge, and purchasing decision making, the villages are comparable to some degree, if not all to the same extent. As a result, a (customized) sales strategy developed for these areas may be used to a few additional villages that are comparable in composition in most respects.

1.2 List of variables under study:

Independent variable: Age, Income, Gender, Key Opinion Leader, Brand preference, and advertising.

Dependent Variable: Rural Consumer Behavior

2. REVIEW OF LITERATURE

In India, research has been conducted to understand urban and rural consumers on factors like function, quality, style, price and brand in different states of India, but not in Karnataka. The discussions on research conducted at national and international context and the gaps which inspired for this research are as follows:

Md. Abbas Ali, Venkat Ram Raj Thumiki and Naseer Khan, (2012), in their study on Factors Influencing Purchase of FMCG by Rural Consumers in South India, commented that as the trust in retailers is more by rural consumers, retailers focused strategy should be considered as a strategy for the marketers in addition to low-price strategy without compromising on quality[8]. Since the study was focused on FMCG products, this could serve as a background for other researchers to focus on different products like automobiles, electronic goods, etc.

Aniruddha Akarte, and Dr. Amishi Arora, (2012), Indian telecom market in transitive economy: A comparative study on buying behavior of rural and urban buyers on mobile phones was conducted in Amaravati district in Vidarbha region, focused at understanding buyer behavior of both urban and rural consumers with respect to features like, current trends, quality, function, price, style and brands. This research ignored the role of KOL and educated youth's influence on the buying behavior[9]. Dr.Kavaldeep Dixit and Priyanka Sharma, (2012), in their research on Innovative marketing strategies experimented by MNCs for exploring vast Indian rural Potential, focused on understanding how Procter & Gamble and Unilever have tapped semi-urban and rural areas of India to expand business. This was a secondary research aimed to understand marketing mix better on the basis of 4A's of rural marketing. This study gives good information on SWOT and Marketing Mix to be used to tap rural markets to enhance business opportunities. Since India is expected to be 5th largest consumer economy of the world by 2010, has to be tapped. This research is a general research based on secondary research gives a general view of marketing mix, but is not specific on a particular product[10]. The study considered just one village. Thus, may not be possible to generalize about rural consumers of Karnataka. Accuracy of information on income may not be reliable There might be bias of respondents, since the awareness on brands, among all the respondents may not be the same. Changes happen dynamically, few products/brands may get outdated very soon. The brands that are available now, may not be available later or new brands may enter the market, and thus the current data on availability of existing brands in future may be a challenge.

3. DISCUSSION

The Indian mobile sector is the fastest expanding in the world, with more mobile phone connections being added every month. The liberalization of communications regulations and policies has contributed to this development. According to a Gartner study, India will be Asia Pacific's fastest growing telephone market after China. Prices of mobile phones and call rates have decreased as a result of increased competition between mobile phone makers and service providers, allowing many more customers to purchase the devices and utilize the services. Every month, the number of subscribers increases. Consumers are also spending money on more technologically advanced mobile phones.

The number of mobile phone users in India was expected to increase from over 500 million in 2013 to over 800 million in 2019 (Number of mobile phone users in India from 2013 to 2019). According to the Ericsson Mobility Report for 2015, India gained 13 million new connections in the third quarter of 2015, followed by China with 7 million, the United States with 6 million, Myanmar with 5 million, and Nigeria with 4 million. (Source: Business Standard, November 18, 2015). Smart phone subscriptions are projected to rise from 3.4 billion in 2015 to 6.4 billion by 2021 globally. India has a 77 percent mobile phone penetration rate, compared to a worldwide average of 99 percent.

Around 840 million people live in rural India, accounting for around 70% of the population, 600,000 villages, and 56% of national revenue. The enormous size and demand base of the Indian rural market provide more possibilities for various marketers. It accounts for approximately 55% of manufacturing GDP, with rural regions hosting close to 75% of new factories constructed in the past decade, and rural factories accounting for 70% of all new manufacturing employment.

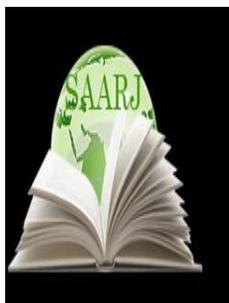

4. CONCLUSION

Karnataka having a population over 6.6 crores is a huge market for almost all products. Thus, essential product being a mobile phone is not to be neglected. By understanding respondents of few more villages in every district, it becomes easier for marketers to know the similarities and differences of rural consumers towards mobile phone. According to Ericsson Mobility Report, November 2015, India is expected to have 180 million smartphones by 2019, contributing to 13.5 percent of global smartphone market on the basis of rising affordability and better availability of data services. According to Microsoft report, India will emerge as a leading player in the virtual world by having 700 M internet users of the 4.7 billion global users by 2025. Due to government favorable policies 4G hitting the market, Indian telecommunication sector is expected to witness fastest growth in the next few years. Due to the fact that 70 percent of India lives in villages, this study would help marketer to devise marketing strategy focused on rural consumers need to enhance mobile sales. Changes happen dynamically. This is true in the case of rural consumers too. This study helps in understanding the 'change' in awareness due to growing literacy rates, television penetration in villages, thus creating TV as a source of awareness, to promote products and increase sales. Books say that KOL play a vital role in purchase decision-making, while the increased TV penetration is found to have more impact on rural consumers. This study will help marketers understand rural consumers better and thus develop marketing programmes focused at increasing sales of mobile phones. Since is almost 70% rural, everyone in the academics, especially in the area of management, should know; rural,

rural consumers and rural market. This research study will be of use for academicians and students in order to understand rural marketing in the context of Karnataka and the factors influencing the rural consumer buyer behavior towards mobile phones better. India being agrarian is thus very crucial for academicians to know the backbone of India, 'Rural India'.

ABSTRACT

This contribution is focused on the valuation of the spaces that remain vacant at the city border, as part of a future urban Green Infrastructure. To that end, they have been identified and characterized. Furthermore, a specific GIS has been developed for Madrid, the largest urban metropolitan area in Spain. This chapter is organized in five parts and the final conclusions. First of all, in the introduction, the general objectives are exposed and the concept and importance of the open spaces in the city are studied. Secondly, the methodology describes the design of the research and the development of the GIS. Afterwards, the urban and territorial contexts, where these pieces have their origin, are characterized. This is a synthetic approach which also includes the recent evolution of the legislation as well as that of the city. Through this evolution it is possible to see how these pieces have been framed into a failed green belt since the middle of the last century. Fourthly, a presentation of these open spaces, their urban regime and their land uses is carried out. Subsequently, their valuation in a potential network of open spaces in the Madrilenian metropolitan area is performed. The basic criteria for this valuation are the land adjacent to each of these open spaces. Finally, in the conclusions, we set out the evidence arising from this research, requiring the need for having accurate tools, such as GIS, in order to reach solid proposals that deal with the challenge of Green Infrastructures. We also believe that

the conservation and integration of open spaces should be a priority in general strategies of urban development for mitigation Climate Change and to reduce the effects of Global Warming.

KEYWORDS: *Periphery, Metropolitan, Sustainable, Urban, Environmental.*

1. INTRODUCTION

The phrase "Open Spaces" was most likely coined about 1833 by the London "Select Committee on Public Walks" (Turner 1992). Over the past several decades, open spaces have evolved into a component of green infrastructure. The European Council defines them as "a network of natural and semi-natural areas and other environmental components that provides a broad variety of ecosystem services." The European Commission has created a Green Infrastructure Strategy (Council of Europe 2013a) that is very important in territorial planning and natural resource protection. This strategy outlines the potential components of a Green Infrastructure: legally protected natural areas, healthy ecosystems and areas with high ecological value outside of protected areas, natural landscape features, restored habitats, artificial features such as eco-ducts or eco-bridges designed to improve wildlife movement, and multi-functional zones where compatible land uses can help to maintain biodiversity (Council of Europe 2013b). Land use changes significantly alter the conditions of the near-surface atmosphere (rise in temperatures) above cities and peri-urban regions, exacerbating the effects of climate change. Mitigation measures are required in urban areas, and adaptation activities have been suggested by the European Environmental Agency (2012) based on data from the Intergovernmental Panel on Climate Change.

Open Spaces and Green Infrastructures are critical to urban adaptation to climate change and the long-term viability of the urban environment.

The city of Madrid has been examined, and the present plan for a Green Infrastructure includes some of the components listed above, such as urban green spaces or protected natural areas designated at the regional level. However, in this chapter, a suggestion is presented so that some of the peripheral areas, whether non-urban or urban territory but without urban development, may become part of a network of open spaces from the city's core to its outskirts [1]. The recognized free areas may be divided into two categories: urban green land and edge open space, which is made up of uninhabited periphery lands. In this second category, there are three sub-categories: Protected Natural Areas, Wasteland (unfinished urbanization projects), and Future Open Urban Land (areas undergoing transition into General Systems such as roads, equipment, and public spaces).

The functions of open spaces are often divided into two categories: those that offer leisure and other societal benefits, such as health, and those whose primary goal is the preservation of natural assets. These two methods are based on the assumption that open spaces with recreational functions are concentrated in urban regions, while those with protection of natural values are concentrated in rural areas. This work proposes a third option in which some of the remaining open spaces within urban and metropolitan space, under specific planning figures, can develop a function of conservation of natural, agricultural, landscape, visual, and aesthetic values, as well as of reduction of urban densities, reducing the recreational and landscaped role with an intensive use, which has become much more common [2].

A model is recognized in many European regions, which is created by a triangle whose vertex is “agricultural landscapes—versus—nature—versus—urban development.” Land use changes in this triangle do not have the same power and dynamic: transitioning from agricultural to urban lands is more simpler and more common than transitioning from natural regions to urban or agricultural lands. This lack of resistance to change in agricultural regions against urbanization is intriguing and necessary for understanding the development of these spaces and their current scarcity. This is what Maruani and Amit-Cohen call a "market failure," since the market value and speculative value of these areas are much more than the value of the land preserved as open space. In certain instances, the use of restricted zoning has proven to be an effective instrument in the protection of open spaces, leading to the acquisition of property for the continuation of agricultural operations. This is where planning comes into play, enabling us to discover iconic examples in Euro, as well as research that has conducted comparative studies in connection to the management of urban green areas.

Furthermore, the ESDP recommendations (European Spatial Development Perspective) on urban-rural gradient planning are focused on: accelerating agrarian restructuring, diversifying rural economies, mobilizing and increasing natural resource production through the valuation and enhancement of cultural services, and promoting sustainable development [3]. The development of European urbanization has been extensively researched. Various cycles and phases have been identified. In them, new features and buildings encroach on old landscapes, which remain but are fractured and lose character, giving way to functionally identical regions. Transport routes have played an important part in these urbanization processes, with accessibility being the most important element in landscape change, not only because of the influence of the transport route itself, but also because of the indirect impacts it causes. Suburbanization, counter urbanization, and reorganization are the acknowledged stages shows that the transition from urbanization to suburbanization happened in the southern European area in the 1990s. This is when the case of Madrid could be formulated. These dramatic changes in land use posed a danger to the landscapes and their patrimonial values, prompting changes in legal categories (zoning or planning control) and urban planning, leaving the surrounding regions vulnerable.

Cutting-Edge Open Spaces in Madrid and Its Surrounding Area of the city's residents are unprotected, living in the "urban—shadow." Furthermore, research on the evaluation of the natural potential that these lands have is abundant (Weber et al. 2006; Beer 2005), albeit almost always from an ecological perspective and with large areas, with research on the key role that these pieces can play in landscape quality and agrarian functionality being scarcer [4].

2. DISCUSSION

The places of interest, as well as their buffer zones, are situated in the municipal borough of Madrid (Fig. 1). These zones were established in accordance with the development of the General Plan of Madrid (GPM 1997), with special consideration given to the regions included in the GPM's adjustment to the Land Law of Madrid (9/2001). Most are situated around the municipal boundary (Edge Open Spaces, EOS), as well as neighboring lands that were included in a buffer of 700 m around the polygon's exterior edge. Four methodological methods were used: searching for digital and bibliographical material, doing fieldwork, analyzing and validating theme information to assess its socio-environmental relevance, and lastly implementing all of this information in a Geographical Information System [5].

- Digital and bibliographical data. Data on development were acquired in shapefile and dgn formats from the Planning, Housing, and Infrastructure Area of the Madrid City Council. All of the additional geo-referenced data was created specifically for this study. The major topic areas of the bibliographic information were open spaces, green infrastructures, and city dynamics.
- Work in the field. Using orthophotographies, 22 basic tracks were created in shapefile format. Different theme information was recorded for each track, and they were relocated using DGPS Trimble Nomad 6G (items of interest and terrestrial photography). A second evaluation of the data was Madrid and surrounding towns (2016). Source The Community of Madrid compiled this list. Cutting-Edge Open Spaces in Madrid and Its Surrounding Area was created, and if additional tracks were required to complete the information, they were constructed. The attribute table is related to the form and number of tracks. All tracks were coded in line and point format, with accompanying metadata.
- Using Geographic Information Systems analyze and validate thematic data. Green spaces were defined as valuable social-environmental regions and areas protected by existing legislation, with the latter being spared from development initiatives. Protected areas of the Community of Madrid Network are among the places exempt from urban development. Protected Areas (Regional Parks, Preserved Forest, Geological Points of Interest), Nature 2000 Network (Special Conservation Areas, Special Protection Areas for Birds), and Important Bird Areas (Birdlife International). Rivers and protected meadows are also incorporated through a 100-meter buffer from the thalweg. New forms were digitalized over PNOA orthophotographies: landscapes, driven highways (drawn over 1956 aerial photography of the USAF and PNOA, they also contain legally protected margins) [6].

All variables were saved as shape files (ArcGis 10.x) and kHx files (Google Earth). In alphanumeric format, three complimentary characteristics (landscape categorization, toponymical reference, and environmental value) were evaluated for each shape.

- Information generation via synthesis. To assess urban carrying capacity, landscape units were utilized (UCC). These components provide a synopsis of social-ecological and geographical factors. Their social-environmental values were described as follows: litho logy, geomorphology, topography, drove roads and excluded margins, rivers and excluded margins, protected areas, and vegetation and land uses [7].

The areas were categorized as having a high or medium ecological value or being of interest in the urban environment based on this value. We have established three types of urban carrying capacity based on this classification: high, medium, and low urban capacity (proposed protected areas). Singularity and dispersion criteria were used to categorize synthesis data, using two scales of reference: local and metropolitan [8]. The connection of these places with neighboring zones has been addressed at both sizes, and therefore the significance of these areas in an open spaces network has been examined.

The very comprehensive research allows for a more accurate evaluation of Edge Open Spaces' social-environmental benefits. Without this comprehensive perspective, determining the true value of the EOS and the findings and conclusions of this chapter would be difficult. F. Allende et al. 3 Madrid's Open Spaces Evolution Planning of open spaces surrounding the municipal border of Madrid throughout the Recent Municipal General Plans (1963–1997) is a chronicle of a continuing failure [9]. The legally obligatory urban planning started in the 1950s. The first three

General Plans created a series of green belts that were repeatedly breached. The fourth, which was adopted in 1997 and is still in effect, proposes full urban development for the whole municipal territory. The Spanish housing bubble (1996–2006) encouraged this expansionist strategy of almost limitless urbanization, which was always backed by local authorities. Currently, Madrid has just a tiny representation of underdeveloped edge open areas. The continuity with traditionally protected woods increases the footprint of these tiny regions on the outskirts of the city [10].

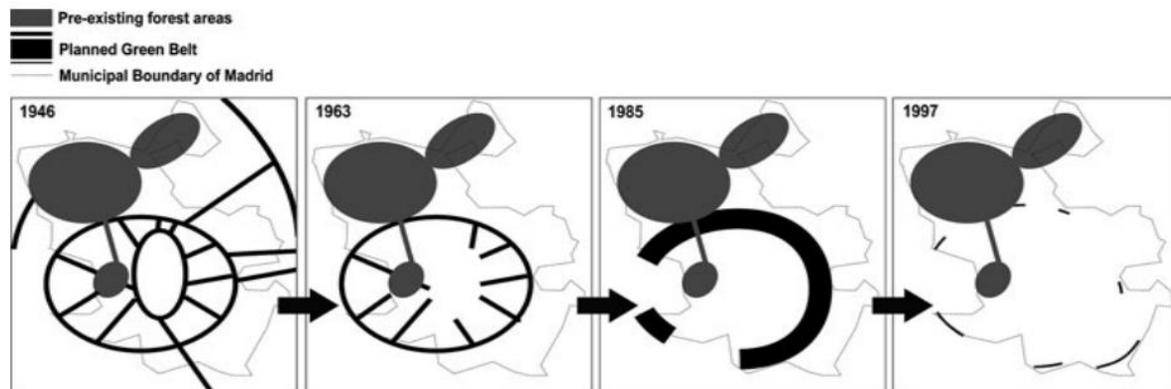

Figure 1: Schematic representations of the structures of the successive Green Belts

Following a definition of the city's recent history, including the genesis and structure of the main important open spaces, we will thoroughly examine the substance of each General Plan and their vision for these places. The demolition of the green compromise for a more livable and greener city will then be debated. The demise of this compromise begins with the partial invasion of planned open areas and ends with the neoliberal urban model's final extinction. Figure 1 discloses the Schematic representations of the structures of the successive Green Belts.

3. CONCLUSION

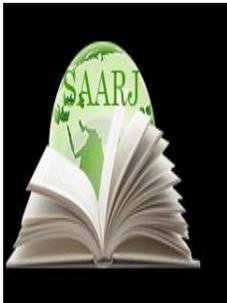

To begin with, there has been a noticeable shift in the ethical and aesthetic approaches that characterized the city model presented by public authorities via their many General Plans. This is inferred not just from the ultraliberal emphasis of the 1997 General Plan, but also from the 2020 Madrid City Future plan. The blueprint that should have guided conservative municipal policy focused on increasing transportation and smart city management, but it overlooked problems connected to green infrastructure. In contrast to previous General Plans, it did not aim to establish a Green City. As a result, there is a stark contrast with other European cities determined to strengthen their green belts, such as Oresund, Copenhagen's metropolitan region, which was named European Green Capital by the European Commission in 2014, as well as Vitoria-Gasteiz in Spain and Hamburg in Germany, which won cities in previous years.

Second, even while acknowledging the limits of the Madrid territorial model of open spaces, the value of what currently exists should be emphasized. In crowded and dynamic cities like Madrid, the ability to rearrange the territory is critical. In this view, intervention over the wastelands is critical, since they are places that are deteriorating due to rural abandonment but still have landscape, aesthetic, ecological, and strategic assets. They may serve as the foundation for the articulation of regional open spaces.

Third, we call on increased political commitment in order to achieve an agreement on a new territorial model in which open spaces play a significant role as environmental services. The significance of these areas for urban planning has previously been highlighted. Nonetheless, these regions continue to be devalued in planning. The percentage of green spaces, the recent changes in their overall size, the number of departments responsible for these areas, and the experience with public involvement all has a role in the effectiveness of this planning. Fourth, protection and integration of open spaces in a network of green infrastructures have been identified as a priority measure for climate change mitigation, and we think that their inclusion in general urban development plans is required. Finally, it has been shown as a critical concept that the design of GIS tools and the technical competence of local governments are critical factors for the creation of an effective information management system. It is doubtful that an appropriate intervention plan can be provided without a thorough examination of the EOS. This is the primary contribution of the study presented here.

 English Philology Department, Bukhara State University
 UZBEKISTAN
 Email id: erkdil2004@mail.ru

ABSTRACT

This paper attempts to present information about the role of speech acts in English language teaching and learning. For the sake of the study, pragmatics has been selected as the speech act of refusals which may occur in different scenarios and contexts. There are some authentic activities and samples that may assist the educators to implement into their teaching process. Firstly, the article introduces some background information about speech acts and their categories; secondly, it focuses on the speech act of refusals and their interpretations. Finally, it indicates a detailed activity demo which can be used in various contexts and aspects.

KEYWORDS: *Refusals, Interpretations, Pragmatics, Indicates*

INTRODUCTION

General background

The wide-spread of the English language throughout the world has already made it “global”. This globalism is urging people to speak English for different purposes and reasons. Using the language proficiently does not only rely on mastering linguistic features of the language corpus, but also speakers or producers to be pragmatically competent in order to acclimatize themselves to various needs of different contexts.

It can be denominated that the aspects of speech acts are highly involved in this process and their subfields such as culture of the language, the status and sex of the interlocutors can be utilized efficiently. According to Yuan (2012) pragmatics reveals the following crucial components, for example, users of the target language, context and meaning, social interaction.

Taguchi (2003) points out that pragmatic competence is a specific capability to perform the language properly in terms of negotiators and the settings. Thus, pragmatics builds a robust bond between the linguistic patterns and social factors.

Introduction to the speech act of Refusals

Austin's (1962) speech act concept mainly comprises the compliments, refusals, apologies, requests, complaints and others. Among these speech acts one of the toughest is the speech acts of refusals. Searle (1969) sends them to the list of commissives which commit the language users to a future course of action.

Traditionally, the speech acts of refusals may occur when the speaker simply denies or rejects the suggestion. That may happen with specific utterances, for instance, with "no" which may inform that the request is not accepted. Even these refusals can be presented in a polite or impolite way.

Example 1. Polite refusal

A: Shall we go to the city center?

B: Unfortunately, I have to say "no" as I am seeing off my parents tonight.

Here the respondent is denying the offer, but it is being done in a good manner. Firstly, the respondent reveals his being sorry and then says "no". Moreover, the speaker informs about the reason of not accepting the proposal.

Example 2. Impolite refusal

A: Shall we go to the city center?

B: No.

It is a bit inconvenient when you receive the direct rejection. Thus, the respondent uses the word "no" directly which seems to be impolite, even somehow rude towards the communicator.

It should be highlighted that the significance of refusals mostly derives from the fact that they are so over-sensitive to diverse social aspects, for example, they illustrate the power, gender, age, social distance of the speakers. Apart from this, it is crucial to know about facial expressions/gestures of the speakers as they also play an integral part in the process of interaction. As an illustration it can be cited that some people deny the proposal by wearing a smile in their face, however, the other people may negatively nod and demonstrate their attitude towards the request.

According to the social context refusals can be constructed in different scenarios, such as, refusing invitations (inviting to the cinema, inviting to the picnic, inviting to the party), refusing borrowings (refusing to give a pen, refusing to lend a book, refusing to share a room).

Example 3.

A: I would like to rent a room in a dormitory; I am planning to share it with you as we did last year. Do you agree John?

B: I beg your pardon, but I have already rented a room with Rob.

Even though the respondent to the suggestion is not using the utterance of refusal ("no"), it is still clear from the message that the invitation has been denied.

A sample activity for using to teach learners to the speech acts of refusals in the ESL classroom

Panel discussions for speaking classes

Brief description

It is a kind of activity which can be used in group cooperation. This method helps learners develop their speaking skills, critical thinking and logical perception. A panel discussion is utilized in schools, colleges, lyceums or even in higher education. In a real fact, themes must be adjusted to the levels of the learners; moreover, initial interests of the students should be taken into consideration. Thus, they can be arranged according to face to face interviews in which learners can have an interview with each other (the specific notion is using the pragmatic speech acts of confirming and refusing during the conversation).

This activity is beneficial for enhancing speaking skills and critical thinking of the learners. It assists to overcome barriers of the learners who have challenges in speaking and negotiating.

Target group: B1 level learners (can be successfully used for B2 and C1 level learners)

Time: 40-45 minutes

Objectives

This activity is beneficial for enhancing speaking skills and critical thinking of the learners. It assists to overcome barriers of the learners who have challenges in speaking and negotiating. This method can be used both in small and bigger groups.

Directions for the students

Students will ...

- follow the explanations
- choose the topic
- present topics turn by turn
- ask questions from each other
- keep note-taking skills
- clarify questions and answers
- follow the time limit
- listen to their partners carefully

Teacher's instructions to students

Teachers will ...

- explain rules and process
- demonstrate some questions
- divide learners into groups
- observe the process

- motivate the speakers
- ask learners to stop the procedure
- evaluate the performance of each speaker

The role of the teacher

- facilitator
- observer
- motivator
- assessor

Activity tools and equipment

- board
- cards
- posters

Advantages of this activity

- develops speaking skills
- improves critical thinking
- broaden learner's horizons

Disadvantages of this activity

- time-consuming
- some learners can be in an inactive state

Stages

An instructor represents some topics for discussion and asks learners to choose any of them for this type of presentation. Topics may cover different themes, such as, social issues, teenager problems, book reviews or some cultural identities.

The teacher selects topics and sticks them on the board and students choose themes by voting. Then the teacher invites five or six candidates to present the topical questions in front of their mates.

All of the learners think about the topics. Students, who are “panelists”, revise and think about the topic that they have chosen. Learners who are in the role of interviewers prepare some questions according to each topic.

Here are some sample questions that can be modified during the diverse groups and classes.

Sample situation 1

Imagine a stranger asking you to carry his bag. Choose one option out of three and explain your choice.

A) I will approach him and help

B) I will say “no” and ignore his request

C) I would act as if I hadn't seen him

Sample situation 2

Your classmate is inviting you to come to the party which she is organizing on her birthday, but you cannot attend as you have to look after your young brother. How would you react?

A) I will directly refuse the invitation

B) I will indirectly refuse the invitation

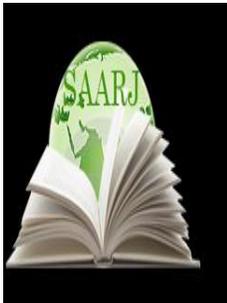

C) I will not go and explain the reason

Summary

As it has been outlined above, speech acts of refusals are diverse and they are varied according to the different aspects which speakers may face with, or feel in depth, such as the factors of gender, social distance, culture and age. These phenomenal features should be taken into account when educators start to perform the process of teaching.

ABSTRACT

For the result of analyse modern condition of storing and applying cotton raw material to the production at the planet cotton sheds based on nessesserty of using new maker of using control of cotton press, using control of apply cotton with the help of closed automatic system. Stricture plan of AD-TPH systemis presented.

KEYWORDS: *Raw Cotton, Riot, Disassembly, Automation, Productivity, Control, Analysis, Technological Indicators.*

INTRODUCTION

Acceleration of the pace of development of the national economy of Uzbekistan today cannot be achieved without the implementation of measures to save material and labor resources. This is primarily due to the rational consumption of electricity by installations of technological equipment of enterprises of the cotton ginning industry. Automation of processes in which work is performed without service personnel, the comparative simplicity of electrical equipment leads to a decrease in energy consumption.

In the organization of long-term storage of cotton at the factory and outside the factory procurement points, two storage methods are used - closed (in barns, warehouses, sheds) and open - at riot sites, and the latter is the main type of storage of raw cotton and makes up about 75% of the total volume storage cotton.

For the mechanization of the processes of disassembling cotton riots and supplying it to production, disassemblers of the RP brands and a pneumatic transport unit of the suction type are used, which require. Their work is accompanied by significant expenditures of manual labor, exceeding the normative ones, which reduces the efficiency and productivity of labor. In addition, the disassembly of raw cotton by RP feeders is carried out with a large uneven supply of cotton to production, the fluctuations of which, with a capacity of from 3 to 18 t/h, is 3-8 t/h. It follows that the share of downtime associated with insufficient supply of raw cotton to production accounts for 15.8 to 57% of the equipment downtime.

The above disadvantages are mainly explained by the imperfection of the technological scheme of the RP machine, which causes difficulty in creating an automatic control system for this machine in order to increase the uniformity and ensure a controlled supply of cotton with the required productivity.

When choosing a technological scheme for a device with a new working body capable of sorting cotton in an automated mode, the following were taken into account:

- the cotton is disassembled by the method of separation from the mass using pegs, as the simplest and most reliable in operation;
- since the bulk density along the height of the laid cotton mass is uneven and varies from 800 to 3000 kg / m, the disassembly of the stored cotton must be carried out with a peg drum with a vertical axis of rotation simultaneously along the entire stacking height;

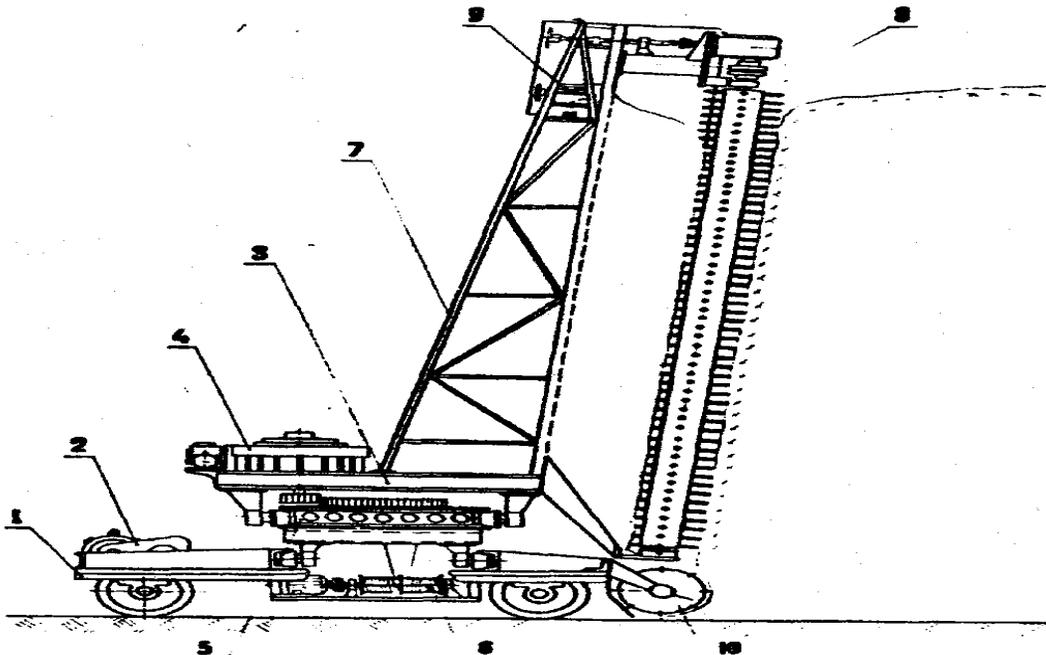

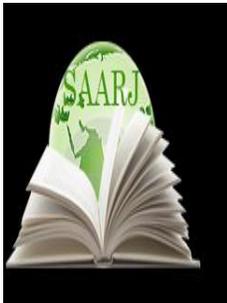

Figure 1. Technological diagram of a raw cotton picker with a peeling auger working body

- a high level of mechanization of disassembly and uniform supply of cotton to production with the use of automated control systems and regulation of productivity in the range of 8 - 20 t / h;

The technological diagram of the developed disassembler (Fig. 1), taking into account the formulated requirements, contains a self-propelled bogie 1 with a drive 2. A platform 5 and a

REVIEW ON OZONE DEPLETION AND GLOBAL WARMING

Dr. S.R. Ali*

*Faculty of Engineering, Teerthanker Mahaveer University,
Moradabad, Uttar Pradesh, INDIA
Email id: drsr.ali.engineering@tmu.ac.in

ABSTRACT

Natural refrigerants are presented as the perfect, ecologically benign refrigerants and the final answer to ozone loss and global warming in this article. In refrigerated and air-conditioning systems, HFC refrigerants are presently the most common alternative for CFC and HCFC refrigerants. However, they are just as alien to nature as CFCs and HCFCs, providing a solid foundation about the need to embrace natural refrigerants as a substitute for halocarbon refrigerants. This study also looks at the possibilities of refrigerants and their uses in refrigerated and air-conditioning systems. Both oil used in R12 or poly-ol-ester oils in use in R134a systems are miscible with natural refrigerants, particularly hydrocarbons, and their combinations. They are also fully compatible with in all materials typically used in refrigeration systems, with the exception of ammonia. Finally, the results of this study show that natural refrigerants are the best long-term options in refrigerated and air-conditioning systems.

KEYWORDS: Atmosphere, Carbon, Global warming, Ozone, Refrigerants.

INTRODUCTION

Refrigeration technology is very essential in today's world. It not only offers pleasant and healthy living conditions, but it is also considered necessary for surviving harsh weather and storing food. Food preservation, in particular, is critical to global stability and economic growth. Food conservation is accomplished by delaying metabolic processes to limit bacterial growth. This is readily accomplished by chilling or freezing without the need of additional preservatives. Refrigeration technology provides the technological means to keep food cool along the cold chain, from manufacturing to transit through storage, sale, and storage in a refrigerator at the consumer's house[1].

Air-conditioning systems and industrial operations are examples of other applications. Air-conditioning systems aid in improving human comfort for both residential and commercial reasons, as well as maintaining health and increasing efficiency. However, rapid technological development and economic growth around the world over the last century have resulted in serious environmental issues, forcing us to acknowledge that while technological advancements may improve human comfort, they also pose a risk to the planet through atmospheric depletion and global warming. Ozone layer depletion & climate change are two significant environmental issues that have severe consequences for the refrigeration industry's future growth. Actions to prevent ozone depletion and climate change are now having an impact on the business. Ozone is a kind of oxygen that has three oxygen atoms in its molecule[2].

Ozone is a toxic gas that may be fatal if breathed. The stratosphere, which is approximately 11 kilometers above the earth's surface, is surrounded by an ozone layer. For this life-protecting layer, life on Earth has been protected for thousands of years. It serves as a barrier, shielding the planet from the sun's damaging UV radiation. By absorbing the majority of the sun's damaging ultraviolet B (UV-B) radiation, the ozone layer effectively screens all of the sun's harmful ultraviolet rays (Ultra-Violet A is allowed through while ultraviolet C is captured by oxygen). Because the ozone layer protects the ecosystem and life on Earth from damaging UV-B radiation, any disruption to it may have serious consequences. Increased UV-B radiation may cause eye damage (such as cataracts, lens deformation, and presbyopia), induce skin cancer, slow plant development, disrupt ecosystem balance, and raise illness risk[3].

Nobody imagined that human activities might endanger the ozone layer until the early 1970s. The most significant ozone depletion and greenhouse gas, halocarbons, are entirely due to human activity. Halocarbons are a class of chemicals that are mainly man-made gases that include both carbon and one or more halogens (fluorine, chlorine, iodine, and bromine). They're usually created in a lab for industrial reasons. They were created for the first time in 1928. They've been extensively utilized for a number of applications since then, including propellants in aerosol cans, the production of soft and hard foams, refrigeration and air conditioning, and cleaning solvents. Chlorofluorocarbons (CFCs), hydro chlorofluorocarbons (HCFCs), and hydro fluorocarbons (HFs) are all members of this category (HFCs)[4].

One chlorine atom may destroy 100,000 ozone molecules, according to research. The longer a compound's effect on the ozone layer lasts, the greater its chlorine concentration. Because CFCs contain more chlorine than HCFCs, they have a greater risk for ozone depletion. The effectiveness of ozone destruction is often evaluated using a comparison unit called Ozone - depleting potential (ODP), which would be based on the ODP of trichlorofluoromethane (CFC-11) being given a value of one. CFCs are thought to account for approximately 70% of all man-made ozone damaging compounds in the atmosphere. The creators of these refrigerants could not have predicted how damaging they would be to the ozone layer. They went out of their way to find refrigerants that had remarkable stability, which was enforced as one of the criteria of the perfect refrigerant they were asked to create.

Global warming is a positive thing in and of itself since it allows for the existence of life in all of its forms. Man's actions, it is feared, are increasing the density of greenhouse gases, increasing the quantity of absorbed infrared radiation, and resulting in higher atmospheric temperatures and long-term climatic changes[5]. The quantity of radiant energy absorbed by refrigerants is quantified by the Global Warming Potential index (GWP). GWP is the quantity of infrared light

that a gas may absorb over a 100-year period when compared to carbon dioxide (which has a GWP of 1). Total Equivalent Warming Impact (TEWI) is a more accurate estimate of a refrigerant's impact to global warming (TEWI).

DISCUSSION

1. Refrigerants derived from nature:

Over the 160-year history of refrigeration, over 50 different compounds have been employed as working medium in some capacity. The majority of them will have been rejected as inappropriate for different reasons, but there are still a few options to adapt to varied application circumstances. Natural coolants such as water, ammonia, hydrocarbons, and carbon dioxide are among them. Natural refrigerants are an environmentally friendly alternative to CFC, HCFC, and HFC refrigerants. They are compatible with typical elastomer materials used in refrigerating systems and are soluble in standard mineral oils, in addition to having zero ozone depletion potential (ODP) and minimal or no greenhouse effect (GWP). Natural refrigerants do not react with water because they do not include chloride or fluorine atoms, and therefore do not produce the powerful acids that may cause early system failure. The following table examines the possibility of several of these refrigerants as viable replacements to ozone-depleting refrigerants and greenhouse gases[6].

1.1 Ammonia is used as a refrigerant:

For more than 120 years, ammonium is a very well refrigerant in large-scale industrial applications. Technology know-how is widely distributed, both in developed and developing nations. Thermodynamic and transport characteristics of ammonia are much better to those of CFCs, HCFCs, and HFCs. When compressor speed, pipe size, and heat transfer equipment are chosen based on economic factors, an ammonia plant always has much higher energy efficiency in practice. Tolerance to typical mineral oils, minimal sensitivity to tiny quantities of water in the system, easy leak detection, limitless availability, and cheap pricing are all significant benefits. All of these elements contribute to its long-term popularity and widespread use. The drawbacks of ammonia are mostly related to safety in big systems; however, there are now additional economic disadvantages in small systems. Ammonia's toxicity is generally not a significant issue; the odor is detectable at quantities as low as 5 ppm. At the same time, 50 ppm is the upper limit for daily exposure that should not be exceeded. At 500 ppm, ammonia is intolerable to humans, whereas acute toxicity begins at 2500 ppm and flammability begins at 15 vol. percent. Obviously, almost every danger is obvious in before, making ammonia a highly safe refrigerant in terms of direct risks.

1.2 Refrigerants based on hydrocarbons:

Propane, pentane, and butane are examples of hydrocarbons (HCs), a type of naturally occurring chemicals. Energy efficiency, critical point, solubility, transport, and heat transfer characteristics all make HCs ideal refrigerants. They are a safe and ecologically friendly replacement for CFCs, HCFCs, and HFCs. Hydrocarbons and their mixes have minimal ozone depletion potential and a very modest global warming potential, and they have no refrigeration-related issues. The most serious issue of using hydrocarbon as a refrigerant is that they are flammable. It's worth remembering that billions of tons of hydrocarbon are safely used every year for cooking, heating, powering cars, and as aerosol propellants all across the globe. Procedures and regulations have

been established and implemented in these sectors to guarantee that the product is used safely. It is critical that the refrigeration sector takes the same strategy[7].

1.3 Refrigerant in the form of water vapour (R718):

Water has been considered as a refrigerant, and it is one of the best natural refrigerants due to its non-toxicity, non-flammability, zero-ODP, zero-GWP, and cheap cost. Desiccant, cooling, absorbing chiller, adsorption chiller, and compression chiller are all examples of how water may be utilized as a refrigerant. Water's thermo-physical characteristics are compatible with a vapour compression chiller capable of achieving a high COP. According to Lorentzen, open cycle water vapour devices are sometimes employed for direct evaporation cooling in circumstances where the high power consumption is of little significance in comparison to the investment and labor expenses. The amount of vapors to be compressed is huge, comparable to that of an exposed cold air cycle of comparable capacity. Normally, steam ejectors are used. Water has also been suggested as a refrigerant in conventional systems that use turbo- or special rotary compressor. These devices' physical dimensions grow to be very enormous, and cost must be an issue. Water, on the other hand, is an excellent working medium for high-temperature heat pumps. For many years, it has been widely employed in open systems to concentrate liquids via evaporation. The COP rises to 20 or higher in certain situations since the temperature raise is restricted to what is needed for heat transmission. The low lift also allows for the use of simple, low-cost single-stage turbo compressors. Water is the natural option for open or closed cycle heat pumps in a range of manufacturing applications in the range of temperature of 80–100°C[8].

1.4 Refrigerant made of carbon dioxide (R744):

Carbon dioxide (CO₂ or R744) is among the few non-flammable and non-toxic natural refrigerants. It is low-cost, readily accessible, and does not have the same harmful effect on the environment as other refrigerants. CO₂ has a GWP of 1, however since it is a waste material from industrial manufacturing; it has no net global warming effect when utilized as a technical gas. CO₂ is a good natural refrigerant alternative, particularly in situations where ammonia and hydrocarbons' toxicity and flammability are a concern. CO₂ has been favored in a wide range of refrigerators and air conditioners, including automotive, residential, commercial, and industrial. The most pressing concerns are improving energy efficiency and lowering system costs to an appropriate standard. R744 was employed as a refrigerant in ships' refrigerators and other fixed systems in the 1930s and 1940s. When ships traveled through tropical areas, however, refrigerant capacity fell quickly. Because of its decreased capacity at high temperatures and the advent of chlorofluorocarbons (CFCs) and hydro-chlorofluorocarbons (HCFCs), R744 was phased out as a refrigerant (HCFCs)[9].

2. Material and refrigerant compatibility:

2.1 Lubricants:

The use of oil in vapour compression operations is inherent and inevitable since oil is needed to maintain the internal working components of the compressor in order for it to operate properly. The lubricant, on the other hand, creates a seal between the moving components, allowing for effective vapour compression. According to Gibb et al., the advantages of using more efficient energy refrigeration lubricants may result in a 15% decrease in energy usage and indirect

reductions in greenhouse gas CO₂ emissions. Despite its critical role in improving compressor energy efficiency, lubricant oil may migrate from the compressor and into other parts of the system, such as the evaporation, condenser, expansion device, and connecting piping, inevitably altering heat transfer and frictional characteristics.

2.2 Metals and sealing materials are listed in section:

Steel, brass, copper, and sealing materials are among the materials utilized in refrigeration circuits. With ester-based lubricants and HFC refrigerants, certain metals, particularly zinc alloys or solders, exhibit enhanced corrosion. There are no known issues with using hydrocarbons as a refrigerant. All materials typically used in refrigeration systems are completely compatible with natural refrigerants, with the exception of ammonia[10].

3. Natural refrigerant selection guidance:

Refrigerants are chosen for their ability to contribute to system efficiency. Alternative refrigerants are tested for compliance with system and equipment design before being used. A comprehensive study both with refrigerant providers and equipment manufacturers is also required to verify that refrigerants are completely compatible with and appropriate for the application software design [11].

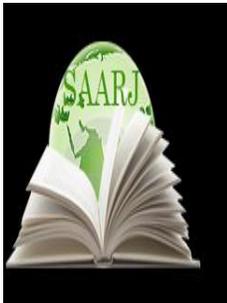

CONCLUSION

Accelerated technological economic growth around the world over the last century have resulted in serious environmental issues, forcing us to acknowledge that while technological advancements may improve human comfort, they also pose a risk to the planet through atmospheric depletion and global warming. For the last several decades, halocarbon refrigerants used in refrigeration and air have been a source of considerable worry. The issue is not with the refrigerants themselves, but rather with their discharge into the environment. Because Earth seems to be the only planet in the universe with a habitable atmosphere, maintaining the ozone layer and decreasing greenhouse gas emissions are two of the many critical measures that must be taken to ensure the survival of life on earth for future generations. The earth's protective ozone layer has been shown to be harmed by CFCs and HCFCs. As a result, the Montreal Protocol and other international accords ban their manufacture. In refrigerator and air-conditioning systems, HFC refrigerants are presently the most common alternative for CFC and HCFC refrigerants. However, they are just as alien to nature as CFCs and HCFCs, so using natural chemicals, which are already circulating in large quantities in the biosphere and are proven to be safe, is apparent and much preferable.

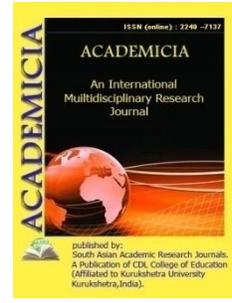

As a result, the issues and causes of ozone emissions and global warming are discussed in this article. It lays a solid foundation for the need to accept natural refrigerants as a viable alternative to halocarbon refrigerants. It also examines the possibilities of different natural refrigerants, as well as their uses in refrigeration and air-conditioning systems. Natural refrigerants, particularly hydrocarbons, and their combinations are flammable with the both mineral oil and poly-ol-ester oils, which are used in CFC and HFC systems, respectively. They are also fully compatible with in all materials typically used in refrigeration systems, with the exception of ammonia. Finally, the results of this study show that natural refrigerants are the best long-term options in refrigeration and air-conditioning systems.

SMART PHONE ADDICTION AND MINDFULNESS: A REVIEW

Dr. Amit Sharma*

*Faculty of Engineering, Teerthanker Mahaveer University,
 Moradabad, Uttar Pradesh, INDIA
 Email id: dramit.engineering@tmu.ac.in

ABSTRACT

The addictive nature of smart phone technology is especially dangerous for young people. The authors of this study look at the smart phone addiction cycle and health consequences of young and elderly people through the prism of their mindfulness characteristics. The absence of mindfulness, assessed as a thoughtless characteristic, is significantly linked to smart phone addictions, as well as health and quality of life consequences, according to qualitative and quantitative research. Younger and older customers have different levels of mindlessness and smart phone-related health consequences. Mindlessness had a larger detrimental effect on quality of life in younger people than in older ones. To counteract addiction, the paper recommends promoting mindfulness training and using marketplace applications. Smart phone addiction is on the rise, and this article adds to a better knowledge of the issue as well as social solutions for its resolution. This is the first empirical study to look at the link between a thoughtless characteristic and smart phone habits, as well as the health consequences.

KEYWORDS: Behaviour, Internet, Mindfulness, Smart Phone, Technology.

1. INTRODUCTION

The evidence that the Internet is addictive is growing, with an increasing number of people being treated for Internet Addiction Disorder. According to estimates, addiction prevalence rates in the United States and Europe may reach 8.2 percent. Other research suggests that youth are especially susceptible, citing longitudinal studies of Hong Kong high-school students with prevalence rates as high as 26.7 percent. It is no surprise that market analysts have said that the Internet is driving us insane. The Internet not only keeps us hooked to our screens, but it also has an impact on our intellect and capacity to focus. According to neuroscience studies, while utilizing information technology such as a smart phone, dopamine is produced in the brain, causing a habitual feedback loop. The mobile smart phone increases the habitual feedback loop

by providing people with internet access 24 hours a day, seven days a week. Many people have admitted to sleeping with their smartphones. People experience health effects as a result of increasing screen time through smart phones, including stress, anxiety, phantom ring syndrome, FOMO, neck issues, hand problems, withdrawal from social situations, and others. Addiction and other negative health effects have an impact on one's quality of life; therefore, it is important to look at the individual characteristics and behaviours that influence this connection [1]–[5].

This study aims to learn more about how young people are trapped in an online addiction cycle, as well as how this expresses itself in specific use and health behaviours. The degree to which users use their phones mindlessly, or their level of awareness, is thought to explain the differences in addictive behavior between young and older smart phone users. Mindfulness has been used to help people break thoughtless behaviours. It is described as "the awareness that emerges from paying attention on purpose, in the present moment and nonjudgmentally". It has been proposed as a strategy for counteracting the negative impacts of other addictive behaviours, including smart phone addiction, in addition to helping people overcome stress-related illnesses like mindless eating. The purpose of this study is to see whether a degree of mindlessness (a lack of mindfulness) may assist explain variations in smart phone addiction.

To summarize, the primary goals of this study are to get a better knowledge of how the mindlessness characteristic affects how individuals become trapped in a smart phone addiction loop, and how this vicious cycle leads to specific smart phone use and health effects. In order to accomplish so, an online poll of customers between the ages of 18 and 70 was performed, comparing young and elderly smart phone users. 35 interviews with young people were performed to further enrich our empirical study, which, when combined with the literature analysis, defined the empirical model [6]. The results indicate that mindlessness has an effect on smart phone addiction behaviours in general, as well as in various ways depending on age, with younger customers being more affected. There are also variations in health outcomes depending on how the smart phone is utilized.

The remaining parts of the article are:

- Background
- Grounded research framework
- Conceptual model, premises and hypotheses
- Empirical study
- Results
- Discussion and implications.

1.1 Usage of Smart/Cell Phones:

Smart phones (also known as mobile phones) are increasingly being used for a variety of tasks ranging from communication (phone calls and texting), to social networking and web browsing, to task-oriented activities such as online banking. According to Simmons market research, people of all generations use mobile phones for a variety of purposes, with the younger generation utilizing them more often. Aside from the many applications, the frequency of usage indicates a significant risk of addiction. According to Gallup data, 72 percent of people claim to check their smartphones at least once each hour. Young people aged 18 to 29 check their phones every few minutes, compared to 12 percent of those aged 30-49, 6% of those aged 50-65, and 3% of those aged 65 and above.

In the fields of health, medicine, psychology, business, and law, mindfulness has been researched. Mindlessness is the root of consumption-induced issues, who state that modern consumers "sleepwalk through a cloud of urges, habits, addictions, compulsions, and decision biases". They also point out that mindfulness practice is an antidote to empowering people to change their purchasing habits. Mindfulness entails paying attention to things as they are rather than reacting to them. As a result, it has been demonstrated to enhance people's ability to self-regulate. It has also been said to assist counteract the automaticity and responsiveness of the marketplace. Indeed, "disengaging people from automatic thoughts, routines, and harmful behavior patterns" is a key advantage of mindfulness. Mindfulness has been utilized in the medical sector to help people overcome addictions.

Mindfulness methods are five times more successful than conventional smoking cessation programs. Mindfulness training may aid in the overcoming of habitual patterns by enabling the practitioner to substitute healthier self-regulatory actions for unpleasant thought and body experiences. Given this degree of effectiveness, it is no surprise that mindfulness has been proposed as a strategy for overcoming other addictions, such as Internet addiction, which may have a similar psychological mechanism to nicotine addiction. While mindfulness has been proposed as a possible cure to smartphone addiction, there is little evidence of its effectiveness. Instead, most of the mindfulness advice has been on

- Utilizing smartphone applications to overcome addiction issues
- embarking on a digital detox
- Altering existing habits.

Smart phones may be used in a variety of ways to help people practice mindfulness, promote healthy behaviours, alter tech habits, remain on target, and express appreciation. Digital detox programs are becoming more popular, including both formal getaways and website restrictions. Mindfulness has also been proposed as a method for controlling phone use, such as by turning off the phone periods, turning off alerts, limiting the amount of applications, and so on.

It is necessary to develop the mindfulness characteristic in order to change one's smartphone use habits. However, there is no scientific evidence that the mindfulness characteristic may help people overcome their harmful smartphone addiction. The process of behavior modification is aided in part by the brain's ability to remodel itself via neuroplasticity, enabling the person to better self-regulate. Both mindfulness and smart phone usage impact the brain through neuroplasticity, and the existence of a mindfulness characteristic may be able to counteract the detrimental consequences of smart phone use. Despite the theoretical connection between mindfulness and smart phone addiction based on neuroplasticity, there has been little actual research on the subject [7]–[10].

An online poll was performed with a total of 403 Amazon Mechanical Turk online panelists to explore our conceptual model. Those who did not pass the attention check questions were not included in the following analyses, leaving us with 339 survey respondents who could be used.

1.2 Measurement

1.2.1 Mindlessness:

Brown and Ryan designed and validated a 15-item Mindfulness Attention Awareness Scale (MAAS) to assess mindlessness (2003). Individual variations in mindfulness characteristic are

measured by MAAS. On a six-point Likert scale (1=almost never, 6=almost often), participants were asked to evaluate how frequently they participate in each everyday experience (e.g., “I find it difficult to remain focused on what's occurring in the present”, “I find myself doing things without paying attention”). The elements are arranged in such a way that they quantify mindlessness, or the lack of awareness. Despite the fact that MASS was designed as a single-factor scale with acceptable psychometric characteristics, exploratory factor analysis employing maximum likelihood estimation indicates that this is not the case. Instead, a two-factor solution was discovered, accounting for 49% of the overall variation. The items whose factor loadings are below raise concerns about poor indicator reliability as well as weak convergent validity. The notion of assessing smart phone addiction is a relative one. When it comes to smart phone addiction, is not yet classified as an addiction in the Diagnostic and Statistical Manual of Mental Disorders. It does follow symptoms comparable to gambling in the Diagnostic and Statistical Manual of Mental Disorders, Fifth Edition (DSM-5), according to psychGuides.com.

- In order to get the intended impact, the smart phone must be used more often.
- Repeated efforts to use smart phones less frequently fail.
- Preoccupation with the usage of smart phones
- Uses a smart phone to cope with negative emotions such as worry or sadness.
- Excessive usage leads to a loss of sense of time.
- Excessive smartphone usage has jeopardized a relationship or a career.
- Requirement for the most recent phone or application.
- Withdrawal if the phone or network is down.

Interviewees mentioned many of these symptoms, and survey findings revealed that young people had statistically significantly greater levels of smart phone obsession than older ones. The study findings show that thoughtless conduct has a negative effect on smart phone usage and health consequences in both younger and older people. Mindlessness was shown to enhance bad health experiences, psychological health problems, and a substantially worse quality of life by dramatically increasing the hours spent on undesirable behaviours such as utilizing social media. According to the qualitative study, mindless behavior is triggered by contextual cues that drive smart phone users into a habitual habit and obsession with their phones. Increased usage leads to physical health concerns as well as psychological ones such as social anxiety and a sense of not being included or measuring up to others' virtual lives. Time spent on negative activities on a smartphone deprives consumers of better, real-world social connections, which may enhance one's health and quality of life.

The findings indicate that younger people are especially susceptible to the technologies' addictive nature. Given that, younger people were more careless in general; this has an impact on their future phone use. Indeed, younger people were more preoccupied with their phones, experienced more psychological health problems, and used their phones in ways that are more inappropriate. While changing cultural conventions, such as switching from phoning to texting, may make it harder to change habits, initiatives to increase young consumers' levels of mindfulness may be feasible.

2. DISCUSSION

It is necessary to assess indicator reliability (factor loadings), criterion related (composite reliability), convergent validity (AVE), and discriminant validity for reflective components (preoccupation, mindfulness, and quality of life, in our model). Factor loadings, composite reliability, and AVE all exceeded the suggested criteria. The author has used criteria to determine if the aforementioned notions conceptually vary from one another (i.e., discriminant validity). Each reflective construct's AVE is greater than its squared correlation with the other two constructs, as seen in Table 6, showing acceptable discriminant validity. Because of the aforementioned analyses of the measurement model assessment, we can confidently state that the model satisfies validity and reliability requirements and is appropriate for structural model analyses. Hair and his colleagues' (2012) criteria for evaluating the inner model were utilized for structural model assessment.

The amount of explained variation of the endogenous constructs in the model is the primary criteria for inner model assessment. The R² value shows a model's explanatory capacity, and acceptable R² values vary depending on the study setting. The following are the R² values for each endogenous variable in the model: obsession, quality of life a total of 196 hours were spent on pleasant activities. A total of 191 hours were spent on unpleasant activities. I have had a bad health encounter. The problems with mental health, as well as the usage of a cell phone in an improper manner. We next investigated the hypotheses, which was more directly related to the study goal.

Technology, ironically, may also be a part of the answer. Young individuals who want to start practicing mindfulness may utilize online programs and applications to incorporate it into their hectic schedules. Marketplace applications like Buddafy, Headspace, and Simple Habits provide systematic methods to learning mindfulness abilities like meditation. Consumers may keep track of their mindful development using applications like Insight Timer. Such assistance is required since mindfulness must be practiced in order to reap its advantages. Finally, various forms of social reinforcement may aid in the retraining of customers to be more aware and less reliant on their phones. National disconnect days, as well as designating specific times of day or public spaces as no-tech zones, may all be part of the answer. Again, public service announcement (PSA) marketing may play a part here.

In conclusion, this study provided a qualitative and quantitative look at young people's smart phone usage. The findings show that thoughtless conduct is a major contributor to the addiction. One approach that may help you overcome this issue is to practice mindfulness. There are limits to this study, like with any research, that must be addressed when interpreting the results and planning future research. The qualitative study focused only on college students, but it may be extended to include other young people or even young smart phone users, as the age of the first smart phone continues to decrease, currently standing at 10.3 years. In addition, the nationwide survey conducted via Amazon Mechanical Turk should be repeated and extended to include other people and cultures.

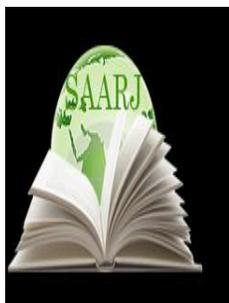

3. CONCLUSION

The author has concluded about the smart phone addiction and mindfulness, The authors of this research examine the smart phone drug cycle and its health implications in young and old individuals through the lens of their mindfulness features. That according qualitative and

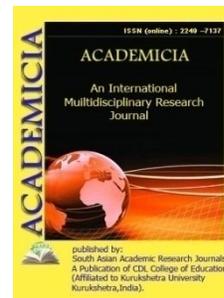

quantitative study, the lack of mindfulness, defined as a thoughtless feature, is substantially related to smart phone obsessions, as well as economic and quality of life repercussions. Mindlessness and smart phone-related health effects vary between younger and older consumers. Younger individuals had a more negative impact on their quality of life than older persons. The study suggests encouraging mindfulness training and utilizing marketplace apps to combat addiction. The prevalence of smart phone addiction is increasing, and this essay contributes to a deeper understanding of the problem as well as societal alternatives for its resolution. The Online not only keeps us glued to our screens, but it also affects our intelligence and ability to concentrate. Dopamine is generated in the brain when using telecommunications such as a smart phone, according to neuroscience research, resulting in a habitual feedback loop. By giving individuals with internet access 24 hours a day, seven days a week, the mobile smart phone enhances the habitual feedback loop. Many individuals confess to sleeping with their phones in their hands. Stress, anxiety, phantom ring syndrome, FOMO, neck difficulties, hand problems, withdrawal from social settings, and other health consequences are common because of increased screen time through smart phones.

ABSTRACT

Laboratory mice offer a convenient supply of monoclonal antibodies with a wide range of affinity or specificity (mAbs). The intrinsic immunogenicity of rodent antibodies has hampered the development of these molecules as medicinal treatments. The use of transgenic mice producing repertoires of human antibody genetic codes has been investigated as a method of producing low immunogenicity mAbs for in vivo treatment. Over a dozen pharmaceutical as well as biotechnology firms have already used this technique to create novel therapeutic mAbs, and there are now at least 33 medicines in clinical testing—including many in pivotal trials—that include variable sections expressed by human sequences from transgenic mice. The preliminary results from these studies provide a peek into the safety and effectiveness concerns that these compounds may face. Nonetheless, real product approval is needed to properly verify this technology as a medication discovery tool, which is the greatest hurdle thus far. It may be feasible to expand this technique beyond rodents in the future by using transgenic farm animals to create and synthesize human sequence polyclonal sera directly.

KEYWORDS: *Antibodies, Biotechnology, Transgenic Animals, Therapeutic Mabs.*

INTRODUCTION

Transgenic animals are commonly used as models in biomedical research in the lab. Genetically engineered animals, mostly mice, account for almost 95% of those utilized. They are essential tools for studying human illness, since they are utilized to better understand gene function in the context of disease susceptibility, progression, and treatment response. MABs were one of the first medicinal compounds to be authorized by the FDA thanks to contemporary biotechnology. However, it took 8 years for the US Food and Drug Administration to approve the next therapeutic mAb following the launch of muromonab-CD3, a murine mAb targeting CD3 that was authorized in 1986 for treating severe organ transplant rejection (FDA). The immunogenicity of mouse antibodies in healthy patients was one factor contributing to the gap, which could also lead to rapid clearance, reduced efficacy and an elevated chance of infusion reactions, which can range from relatively harmless fevers and rashes to cardiopulmonary and anaphylactic-like adverse events[1]. Biotechnology or pharmaceutical firms have addressed this issue by developing reduced immunogenicity antibody molecules utilizing molecular biology techniques. In vitro, mouse antibodies were reengineered to exchange framework amino acids with human sequences^{5,6}. Novel, laboratory-derived antibodies have also been discovered by screening libraries of human and synthetic immunoglobulin sequences.

The FDA has already authorized 17 therapeutic monoclonal antibodies (mAbs) (Figure 1). Except for three, they've all been modified to be less immunogenic and include at least some human DNA. Human sequencing mAbs may provide a possible answer to the immunogenicity issue that has plagued rodent-derived antibodies. Early efforts to mine genuine human antibody repertoires through cancer or highly contagious patients, however, mainly yielded IgM antibodies with poor affinity or specificity. Although recent advancements have solved many of the technical challenges involved with producing human mAbs directly from human B cells, the human immune system's natural tolerance for human antigens, as well as the fact that human patients cannot be exposed to the same kinds of vaccination schemes used to generate rodent antibodies. Our capacity to reach human B cell-derived antibodies is limited to the wide range of sites that rodent antibodies can access. In this review, they describe the present state of medicines produced from transgenic mice containing human immunoglobulin repertoires, an alternate method for producing low immunogenicity therapeutic mAbs. Because the immunogenicity of rodent antibodies was the main reason for creating transgenic mice platforms, this study focuses on immunogenicity evidence for human sequence antibodies in the clinic. Transgenic technology is frequently addressed in relation to the development of polyclonal antibody-based medicines[2].

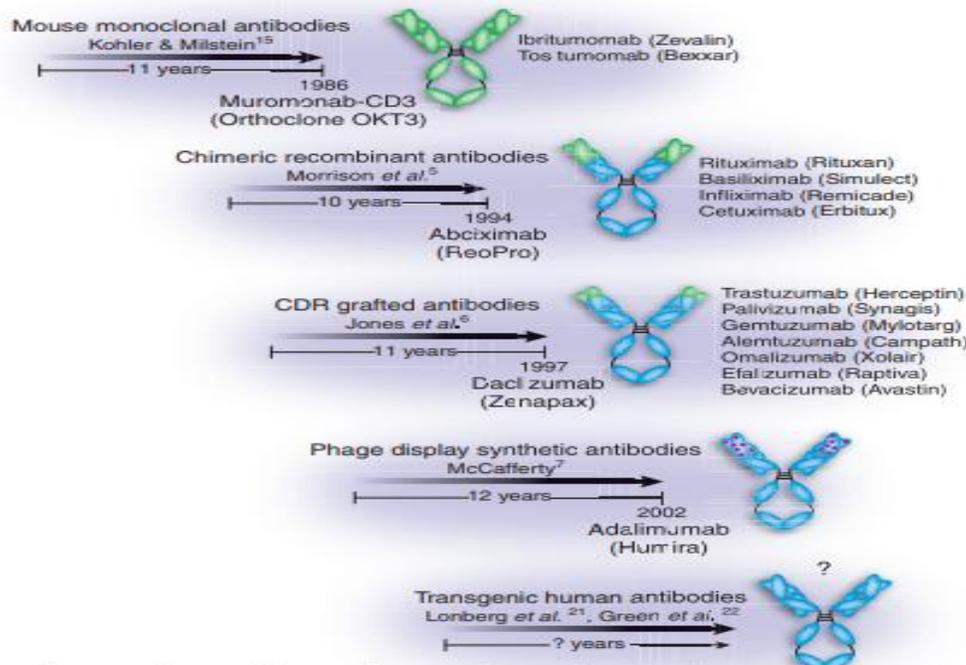

Figure 1: Evolution of therapeutic antibody technology and progress to the clinic[3].

1.1. Mammalian immunoglobulin gene in transgenic mice:

Alt et al.¹⁶ proposed that transgenic technology might be used to generate novel human sequence mAbs from un-rearranged, germline-configuration transgenes twenty years ago. Although this was "conceptually absurd," the writers decided that it might "be achieved in the not-too-distant future." The production of a repertoire of human heavy chains, as well as the development of a transgene-encoded immunological response in mice¹⁷, were first reported in 1989. The race to create a mouse with diverse human heavy- and light-chain skills and abilities able to make a contribution to a true secondary immune system of high-affinity human mAbs, in the surroundings of disrupted mouse heavy- and light-chain genes, was fueled by this report and the invention of methods for introducing specific modifications into the mouse germ line[4].

The constant region was incorporated in the light-chain transgene. yeast protoplast fusion to deliver minilocus transgenes based on the yeast artificial chromosome (YAC). The heavy chain in this instance comprised 5 VH, all 25 D, as well as all 6 JH gene segments, as well as and constant-region gene segments. This design was VDJ joined and expressed both IgM and IgD antibodies. The light-chain YAC construct contained two functioning V and all five J segments, as well as C. the endogenous -lightchain locus, which contributes just 5% of the B-cell repertoire in normal laboratory mouse strains. A subset of B cells with functional -light-chain expression produces hybrid B-cell receptors and released antibodies with human heavy- as well as mouse-light chains. Despite the existence of this subpopulation, hybridoma cell lines secreting completely human monoclonal IgM22 or IgG21 mAbs that recognized the target antigens for which the mice had been vaccinated were isolated[5].

Given that each of these two mice strains only retained a portion of the normal human V repertoire, the effective isolation of human mAbs selectively directed against a particular antigen was unexpected. This begs the issue of why mammals seem to have been chosen for their vast

germline V repertoires. For the production of different antibody sequences at the six composed regions (CDRs), which allow direct interaction with specific antigens, large germline repertoires may be needed. The expressed antibody repertoire, on the other hand, is a result of three sources of diversity: combinatorial, junctional, and somatic, with the germ line providing just one of them (combinatorial).

The capacity to produce antibodies against a wide range of targets utilizing minilocus transgenes with a small fraction of complete human combinatorial diversity may represent the relative significance of these three sources of variation. Although the germ line fully encodes naïve B-cell CDR1 and CDR2 sequences, junctional variability, which is preserved in minilocus transgenes, generates most of the heavy-chain CDR3 repertoire. CDR3 sequences seem to be crucial for antigen recognition by unmutated B-cell receptors, and they may account for the majority of the main repertoire. Primary repertoire B cells with low affinity for the immunogen may subsequently undergo affinity maturation through T cells, which has been demonstrated to produce high-affinity antibodies from a small V-gene repertoire[6].

1.2. Human mAb immunogenicity in transgenic mice:

A study of the existing clinical data mentioned above allows us to question if the transgenic mice platforms have really addressed the immunogenicity issue that prompted their creation in the first place. Despite the fact that transgenic mouse-derived human mAbs have yet to complete a phase 3 clinical trial, giving data equivalent to that available for authorized medicines, the first findings are promising.

The lack of severe infusion responses and minimal interpatient variability of drug exposure further testify to this molecule's low immunogenicity. Because mAb is likely to be linked not only to the molecule's intrinsic characteristics but also to the patient's immunological state, data from studies including patients with inflammation or autoimmune illnesses may be useful. None of the 85 patients in the zanolimumab psoriasis study, who each got four doses over a month, showed a significant immune response to the human mAb63[7].

Trials using CTLA-4 mAbs have produced some of the most dramatic results from individuals with increased immune responses. Human immunoglobulin-producing transgenic mice may be beneficial over other technologies merely because of inherent variations in the drug discovery processes required by the various systems, in addition to offering a platform for the identification of low immunogenicity therapeutic mAbs. For generating low immunogenicity mAbs in vitro, a procedure similar to that employed for small-molecule drug development is required: lead identification followed by a potentially long period of lead optimization. In transgenic mice, however, the lead optimization step can be skipped entirely but since B-cell development as well as affinity maturation can produce in vivo optimized antibodies. This enables a process in which each potential candidate is tested in a series of increasingly sophisticated in vitro and in vivo assays before being selected as a lead in essentially the same molecular form as it will be used in humans[8].

Selections for genetically engineered mouse platforms are based on information from preoptimized leads; however, selection decisions for lead optimization-based processes must rely on data from unoptimized leads, that aren't always relevant to the characteristics of the finished optimized compound. Furthermore, because clonal antibody-secreting cell lines are directly generated by the hybridoma fusion methods commonly used to generate drug candidates

from transgenic animals, the process is well suited for screening protocols that use a variety of cell-free, in vitro cell-based, and/or in vivo assays.

1.3. Large animals' polyclonal antibodies:

In many respects, therapeutic mAbs on the market now are far superior than the polyclonal serum treatments pioneered by Kitasato, Behring, and Ehrlich over a century ago for the treatment of diphtheria and tetanus. Although MAbs have proved to be a reliable source of well-characterized, low-immunogenicity, and highly effective medicines, polyclonal human serum-derived and even animal serum-derived antibodies still have a role in the clinic. In certain instances, polyclonal antibodies may be preferred to mAbs for passive immunotherapy, much as the natural human immune system prefers polyclonal antibodies to mAbs when reacting to infections. Polyclonal antibodies have several advantages, including increased potency in immune complex formation, utility in combating infectious diseases caused by multiple strains of pathogens or that require neutralization of multiple epitopes for effective treatment, and the ability to neutralize snake and insect venoms with multiple toxic components. Cows, chickens, and rabbits are examples of nonrodent transgenic animals that may be used in the biological manufacture of human polyclonal antibodies. In the scientific literature, some work toward this aim has already been published[9].

Artificial chromosomes containing the complete human germline heavy-chain and -light-chain loci were implanted into transgenic calves. Human heavy- and light-chain antibody transcripts were rearranged properly in the calves. To produce homozygous heavy-chain knockout mutant calves, the same group utilized successive gene targeting in fibroblast cells along with nuclear transfer cloning. Combining these methods with light-chain knockouts may result in a novel transgenic platform for generating human-sequence polyclonal antibodies from animals. The capacity to hyperimmunize the animals against particular pathogens or human disease-associated proteins, as well as better lot uniformity and decreased danger of human pathogen contamination, are all possible benefits of this approach[10].

2. DISCUSSION

Mice have also been genetically engineered to generate human antibodies spontaneously, which may be used as treatments. Between 2006 to 2011, seven of the eleven monoclonal antibody medicines authorized by the FDA were generated from transgenic mice. The use of transgenic farm animals to generate vast amounts of complicated human proteins for the therapy of human illness is also being investigated. Currently, therapeutic proteins are generated in mammalian cell-based reactors, but this method is costly. The cost of constructing a new cell-based manufacturing plant for one therapeutic protein, for example, was projected to be above \$500 million in 2008.

Monoclonal antibodies with a broad range of affinity or specificity are readily available from laboratory mice (mAbs). Rodent antibodies have been hindered in their development as medical therapies due to their inherent immunogenicity. The use of transgenic mice expressing human antibody gene repertoires as a means of generating low immunogenicity mAbs for in vivo therapy has been explored. Over a dozen pharmaceutical and biotechnology companies have previously utilized this method to develop new therapeutic mAbs, as well as at least 33 medications are now in clinical studies, with several in pivotal trials, that contain variable portions produced by human sequences from transgenic mice. Nonetheless, in pivotal trials, each

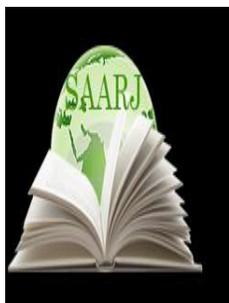

of these mAb-based therapies will need to demonstrate meaningful patient benefit. It's possible that one of these chemicals will be the first novel biologic produced in a transgenic mouse if it proves to be helpful to humans. This method has the potential to generate large transgenic farm animals that may be used to make therapeutic monoclonal antibodies antibody in the future.

3. CONCLUSION

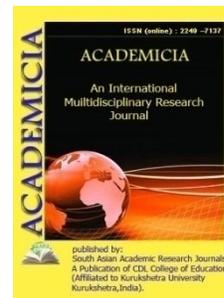

High-affinity humans sequence mAbs against a broad range of potential therapeutic targets have been generated using transgenic mice that produce human antibody repertoires. The first results from clinical trials of 33 transgenic-derived human mAbs show a variety of medicines that are both active and well tolerated. Nonetheless, each of these mAb-based medicines will need to show real patient benefit in pivotal studies. If one of these compounds proves to be beneficial to patients, it may be the first new biologic developed in a transgenic mouse. This technique has the potential to create huge transgenic farm animal that can be utilized directly to produce therapeutic human-sequence polyclonal antibodies in the future.

DETECTION AND SPATIAL MAPPING OF MERCURY CONTAMINATION IN WATER SAMPLES USING A SMART-PHONE

Dr. Pavan Kumar Singh*

*Faculty of Engineering, Teerthanker Mahaveer University,
Moradabad, Uttar Pradesh, INDIA
Email id: pavan.engineering@tmu.ac.in

ABSTRACT

The majority of bulky and expensive analytical equipment are used to detect environmental pollution such as trace-level hazardous heavy metal ions. However, there is a significant worldwide need for portable, quick, specific, robust, and cost-effective detection methods that can be utilized in resource-constrained and field environments. We present a smart-phone-based hand-held platform that enables for the measurement of mercury (II) ions in water samples with a sensitivity of parts per billion (ppb). We developed an integrated upto-mechanical connection to a smart phone's built-in camera module to digitally measure mercury content utilizing a magnetic gold powder (Au NP) and aptameric based colorimetric transmission assay applied in disposable test tubes for this purpose. We quantified mercury(II) cu(ii in water samples using a two-colourradiometric method using light-emitting diodes (LEDs) at 523 and 625 nm and a custom-developed smart application to process each acquired transmission image on the same phone to actually accomplish a limit of detection of 3.5 ppb with this 40-gram smart-phone attachment.

KEYWORDS: *Detection, Light, Measurement, Smartphones, Techniques.*

1. INTRODUCTION

The development of detection techniques for real-time and long-term monitoring of mercury contamination in environmental and biological samples has been a major priority since the discovery of mercury's severe neurotoxic effects in the 1960s^{1,3}. The organic form of mercury, methylmercury (MeHg), which is known to accumulate in the food chain⁴ and pass the blood brain barrier after human consumption, has been primarily blamed for various neurological consequences of mercury poisoning^[1]. While these discoveries have raised awareness of the

dangers of organic mercury pollution, inorganic mercury, namely mercury (II) ions (Hg^{2+}), should not be overlooked. In reality, owing to bacteria-assisted biotransformation processes, mercury (II) ions constitute the main mercury pollution in the aquatic system and the “precursor” form of methylmercury. Furthermore, since it accumulates mainly in the kidney's proximal tubule cells, inorganic mercury is known to be more nephrotoxic than its organic counterpart[2].

As a result, detecting and quantifying mercury(II) ion pollution in water systems is critical, and this information may be utilized to help prevent mercury ions from entering the food chain. To meet this requirement, spectroscopic techniques such as atomic absorption spectroscopy (AAS), inductively coupled plasma mass spectrometry (ICP-MS), and atomic fluorescence spectrometry (AFS). These methods, on the other hand, require time-consuming sample preparation, costly and cumbersome equipment, and professionally trained people to conduct the tests. As a result, they are not well adapted for on-site mercury detection, and they may not even be accessible in poor nations. Recent developments in microfabrication and nanoscience, on the other hand, have allowed the creation of portable detection assays that are integrated with lab-on-a-chip systems, showing tremendous promise for application in resource-constrained settings. Figure 1 shows the Design of the ratio metric optical reader on a smart-phone[3].

Figure 1: The above figure shows the Design of the ratio metric optical reader on a smart-phone.

However, owing to their relatively large equipment, higher prices, and lack of wireless connection, which is critical for distributed sensing and spatiotemporal mapping of contamination in distant places and field settings, these current systems that use NPs are still restricted. The detection of subppm quantities of mercury (II) ions has recently been shown

utilizing dye-embedded polymer sheets as colorimetric substrates that are digitized using, for example, smart-phone cameras as an alternative to Au NP-based plasmonic methods. We created a mercury contamination map using our smart-phone-based detection technology by assessing water samples from municipal tap water sources, rivers, lakes, and beaches in California (USA). This sensitive and accurate heavy metal detection platform running on cellphones could be quite useful for shared sensing, tracking, and sharing of increased pollution personal data as a function of both space and time, thanks to its cost-effective design, size, and wireless data connectivity[4]–[6].

However, because of inevitable changes in ambient light conditions and human operation and/or alignment during the picture capture process, this current method does not take use of the phone's processing/computational capacity, and thus has limited detection sensitivity and repeatability. To provide a field-portable, cost-effective, and wirelessly connected platform for sensitively quantifying heavy metal ion concentration in water samples, we present a battery-powered mobile sensing device that consists of a lightweight (37 g) up-to-mechanical attachment to a smartphone, as well as a custom-developed Android application for quantification, reporting, and sharing detection results. This lab-on-a-phone gadget uses dual-wavelength illumination using light-emitting diodes (LEDs) at 523 and 625 nm to measure mercury-induced modest transmission variations in a colorimetric assay using citrate-stabilized plasmonic Au NPs and aptamers (Apt) combined in disposable test tubes. We demonstrated sensitive detection of mercury contamination in water samples with a limit of detection (LOD) of 3.5 ppb, which is the same order of magnitude as the maximum contaminant level (MCL).

Mercury (II) recommended for drinking water, i.e., 2 and 6 ppb, as established by the shift in the plasmonic resonance wavelength of dispersed and aggregated Au NPs in response to mercury (II) ions. We also showed geographic mapping of mercury(II) pollution in California using our cellphones-based colorimetric detection technology by analyzing water samples taken at more than 50 sites, including tap water sources as well as natural sources such as rivers, lakes, and beaches. This heavy metal detection system for smartphones may be a useful supplement to existing mobile-phone-based imaging, sensing, and diagnostics devices²⁵⁴², and it has a lot of promise for distributed sensing, spatiotemporal mapping, and mercury pollution monitoring across the world. Indeed, by the end of 2013, global cellphones subscribers had surpassed 7 billion, and smartphone penetration is on the rise, with estimates of more than 60 percent, 45 percent, and 25 percent in North America, Europe, and Africa, respectively, by the end of 2015. As a result, using mobile phones for bioanalytical measurement science, as well as reporting and sharing results, provides widely scalable, cost-effective, and yet rather powerful/competitive solutions to implement various tests and measurements even in resource-constrained and field settings, which is a major motivation for this research[7]–[9].

1.1 The Smart-Phone-Based Mercury Reader's Optical Design:

Using a colorimetric nanoparticle and aptamer assay, we developed an optical imaging interface that is mechanically connected to the current camera module of a smartphone to measure mercury content. This attachment includes two button cells (3 V) that are utilized to power two LEDs.

These LEDs are spaced far enough apart (26.5 mm) from the rectangular test tubes (which hold the sample and control solutions) and are diffused by optical diffusers to guarantee uniform

lighting of both tubes (Figure 1a). These LEDs' emission wavelengths were chosen to be 523 and 625 nm, respectively, to match the change in the extinction wavelengths of dispersed and aggregated Au NPs. The green LED lit the bottom half of each cuvette while the red LED illuminated the top half in order to gather multispectral information from a particular water sample (Figure 1a). To prevent crosstalk between the green and red lights, the optical pathways of the two LEDs were separated by an opaque clapboard before reaching the cuvettes (Figure 1a, inset) and went via two rectangular apertures (6.6 5 mm, one for each hue) in front of each cuvette. The transmitted light from the sample and control cuvettes was then gathered via two additional rectangular apertures of the same size and photographed using a plano-convex lens ($f = 28$ mm) on the smart-digital phone's camera. The demagnification factor of this external lens was selected to be 7 so that the two 6.6-mm wide sample cuvettes could be photographed concurrently inside the active region of the smart-phone CMOS imager chip[10].

Plasmonic Colorimetric Assay and Mercury-(II) Ion Concentration Measurement Spherical Au NPs have previously been investigated as new mercury (II) ion sensing probes. 1921 The Au NP-based colorimetric detection test is based on the distinctive color shift of Au NPs from red to purple or blue following aggregation, which is caused by mercury (II) ion binding events. Most Au NP-based probes, on the other hand, require a surface modification step to bind mercury (II)-specific ligands to Au NPs, and the LOD varies depending on the capturing ligand used. We use a different strategy here, relying on the thymine-rich aptamer sequence's strong affinity for mercury (II) ions and citrate-stabilized Au NPs as colorimetric signal transducers to achieve high detection sensitivity. The use of Au NPs in this technique eliminates the requirement for surface functionalization stages, making it much easier to employ in the field. The probe solution is made up of 0.64 nM Au NPs (50 nm diameter) and 3 mM aptamer in 20 mM Tris-HCl buffer (pH 8.0) in a conventional mercury detection experiment. The probe solution is then mixed with 4 liters of water sample solution and incubated for 510 minutes (see Methods section for details). Even in a high-salt environment like 10 mM NaCl, aptamer creates a protective coating on the surface of Au NPs, preventing them from aggregating. The presence of mercury(II) ions, on the other hand, will strip away this aptamer layer, resulting in the creation of more stable T-Hg²⁺-T complexes. 50,51 As a consequence, in the presence of NaCl, unprotected Au NPs may undergo a unique color change from red to blue (Figure 2a), which can be detected using our dual-wavelength smart-phonebased colorimetric reader to measure mercury concentration.

1.2 A smart tool for mercury testing based on Android.

We developed a bespoke Android app that enables mobile assessment and sharing of mercury quantification findings. The user may hold the smartphone horizontally after connecting the colorimetric mercury measuring equipment to the smart-phone camera unit and then conduct mercury tests using this smart application. The user may start a new test, build a device-specific calibration curve, examine previously performed tests, exchange test results, and study the operating instructions from the application's main menu. By photographing, for example, chemical control samples at established quantities, the user may calibrate the application for attachment-specific changes. Various devices/attachments may save and reuse these calibration curves. After recording a colorimetric transmission picture of the sample, the user may see it on the screen before digitally analyzing/processing. For processing/testing, the app may alternatively utilize an image file already saved on the phone's memory. Following the image-processing procedures described in the preceding section, the transmission signal ratios between

the sample and control areas will be automatically computed on the phone after clicking the "Process" button. The computed signal ratio is converted into the mercury concentration level of the sample (in ppb) using a previously saved calibration curve, and the findings are then shown on the phone's screen. On the Android phone (Samsung Galaxy S II), it took 7 seconds to calculate the mercury concentration. The final test results may be stored on the phone's memory with a time stamp and the test's GPS coordinates, and they can also be shared with a secure server for spatiotemporal mapping using a Google Maps-based interface, for example. The findings may also be seen as a function of time per place using the same Android application's graph-based interface.

Calibration and Specificity Tests are two types of tests. Each normalized G/R ratio calculated from a recorded RGB picture correlates to a particular mercury concentration measurement in our cellphone-based mercury detection technology (ppb). The default calibration curve in the Android app was created by measuring the normalized G/R ratios of a series of known concentration mercury(II) solutions with concentrations ranging from 0 to 5 M. (see Figure 4). As the concentration of mercury(II) ions climbed beyond 10 nM, the values of these normalized G/R ratios increased, reaching saturation at >1000 nM. (Figure 4). The aggregation of Au NPs, which is induced by the mercury(II) ion concentration, is mostly responsible for the signal rise in the 101000 nM range. This Au NP aggregation process increases the extinction at red wavelengths (e.g., 625 nm) while decreasing the extinction at green wavelengths (e.g., 523 nm), as shown by our UV is spectroscopic measurements. This Plasmon-resonance-based phase shift occurred quickly after approximately 5 minutes (Supporting Information, Figure S2), showing that the NP/aptamer-based colorimetric test has a fast reaction time, making it suitable for application in field settings. The transmission signal of the red channel dropped because of these plasmonic changes caused by NP aggregation, while the transmission signal of the green channel rose.

2. DISCUSSION

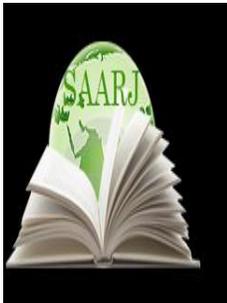

The author has discussed about the detection and spatial mapping of mercury contamination in water samples using a smart-phone. However, there is a considerable global need for portable, fast, specific, robust, and cost-effective techniques that can be used in resource-limited and field settings. We demonstrate a smart-phone-based hand-held platform for measuring mercury (II) ions in wastewater sample with an accuracy of parts per billion (ppb). Using a magnetic gold powder (Au NP) and aptameric-based colorimetric transmission assay used in disposable test tubes, we created an integrated upto-mechanical link to a smart phone's built-in camera module to digitally detect mercury level. As an alternative to Au NP-based plasmonic techniques, the detection of subppm amounts of mercury (II) ions has recently been shown using dye-embedded polymer sheets as spectrofluorometric boards that are digitized using, for illustration, smart-phone cameras. We assessed water samples from potable water sources, rivers, lakes, and beaches in California to produce a mercury toxicity map using our smart-phone-based detection technique (USA). Because of its cost-effective design, location, and wireless data connection, this sensitive and precise heavy metal detection platform operating on smartphones may be very helpful for shared sensing, monitoring, and sharing of increasing pollution private information as a function of both place and time.

3. CONCLUSION

In conclusion, the author presented a sensitive and cost-effective smart-phone-based mercury(II) ion sensor platform that employs a battery-powered opto-mechanical reader connected to a smart-existing phone's camera module to digitally quantify mercury concentration using a plasmonic Au NP and aptamer-based colorimetric assay. On the same phone, we used a two-colour ratio metric detection technique with LEDs at 523 and 625 nm, as well as a custom-developed Android application for fast digital image processing of the recorded transmission pictures. This mobile device has a mercury(II) ion LOD of 3.5 ppb, which is on the same order of magnitude as the maximum allowed amount of mercury(II) ions in drinking water specified by the US EPA (2 ppb) and WHO (2 ppb) (6 ppb). Furthermore, we created a geospatial mercury(II) pollution map by analyzing over 50 samples obtained in California from a variety of sources, including tap, river, lake, and ocean water samples. The sensitive heavy metal detecting gadget incorporated into cellphones cost-effective design, mobility, and internet connection may be very helpful for widespread sensing, tracking, and sharing of water pollution information as a function of both location and time, according to a new study.

ABSTRACT

The role of science and technology in achieving energy efficiency in all areas of production is invaluable. That is, the use of energy-saving technologies and processes in production must be the result of scientific research. In particular, the efficient use of electricity, first of all, the use of energy-saving motors in electric drives, load adjustment, adjustment of active and reactive power consumption depending on the load level, reducing power loss, optimal management and finding solutions to dozens of other pressing issues research and design activities.

KEYWORDS: *Efficiency, Current, Electricity, Electric Drive, Voltage, Power Coefficient.*

INTRODUCTION

In accordance with the Resolution of the President of the Republic of Uzbekistan PQ-3379 "On measures to ensure the rational use of energy resources" Consistent modernization and technological re-equipment of electricity and gas supply in the country, the basics of energy saving measures are being taken to improve the mechanisms of mutual settlements for energy and natural gas.

At the same time, the lack of a differentiated approach to determining the value of energy resources delivered to different categories of consumers leads to their irrational use and does not encourage the introduction of energy-saving technologies and alternative energy sources.

Current norms and regulations in the field of urban planning do not meet modern requirements for energy efficiency of facilities. Insufficient attention to the use of energy-saving materials and

technologies in the construction and reconstruction of buildings and structures also leads to excessive consumption of energy resources.

It is known that about 60-70% of the electricity generated worldwide is consumed by electric drives of various mechanisms and equipment. Almost 50% of the world's electricity is generated by AC and DC electric drives. Therefore, it is important to ensure energy efficiency through automated electric drives and training competitively qualified personnel in this field. There are several basic ways to save energy with an automated electric drive:

- Correct selection of the motor power of the electric drive by improving the motor selection method depending on the real change in the load of the production mechanism, because if the motor power is less than the load capacity, the motor inefficiently changes energy and the power dissipated in the transmission line is greatly increased.
- Replacement of automated electric motors of production mechanisms with energy-saving electric motors with increased efficiency and power factor due to the increase in the active mass (copper and iron);
- The transition from non-adjustable electric drives to speed-adjustable electric drives will save resources (water, heat, etc.) not only in the automated electric drive system, but also in the production mechanism.
- Development and creation of special technical solutions that ensure minimum energy consumption in non-adjustable electric drives when the load is variable, as well as in controlled automated electric drives due to changes in the coordinates of the electric drive in accordance with the requirements of the technological process. The choice and implementation of one of the above ways to save energy depends on the specific conditions created by the technological mechanism, each of which has its own advantages and disadvantages. Given the energy crisis and rising energy prices, a way to save a significant portion of the energy required by improving power management is of particular importance. The most promising way is the fourth way, which will save 30-40% of energy by improving the automated control algorithm. Therefore, the main attention should be paid to the theoretical issues and computational methods of energy-saving automated electric drive due to the radical improvement of the control algorithm and the development of new automated electric drive systems that provide the least energy consumption due to the most convenient (optimal) control. It is known that the largest consumers of electricity in all countries are mainly AC electric drives, especially asynchronous motor drives, which convert almost half of the electricity produced worldwide into mechanical energy. Operation of the main part of these motors with low load or at values much smaller than the nominal leads to a significant reduction in the Efficiency and $\cos\varphi$ of the electric drive. This has a significant impact on the overuse of electricity and heat in the world. Therefore, the object of analysis is mainly an automated electric drive with an asynchronous motor. But it is also important to consider the optimal way to control DC electric drives.

We consider the analysis of the characteristics of an induction motor for a load characterized by a constant static moment $M_S = M_N = \text{const}$ at normal and optimal (energy-saving) currents, operating in frequency-adjustable electric drive systems. Based on the above method, the operating and tuning characteristics were calculated for a 4A series asynchronous motor with a power range of 0.6 -15 kW, operating on frequency-adjustable electric drives, and for $k = 1$ harmonics. Given the almost uniformity of the results for different powers, below are the

descriptions for a single brand of asynchronous motor (4A80B4Y3) built in relative units. The basic values are the rated currents of the stator and rotating, the magnetic current, slip, electromagnetic and total losses, the power factor and the efficiency, and the product of the coupling $\varphi=1$ and $m = 1$.

In Figure 1, the frequency is nominal in a speed-adjustable electric drive system

The operating characteristics of the current function of an induction motor at

$F = 1$ are given. The stator current I_S is equal to the geometric sum of the magnetizing current I_0 and the applied current of the rotor φ ; the applied current of the rotor is inversely proportional to the current and therefore decreases with increasing. Therefore, the connection of the I_S to the current has a nonlinear and curved appearance. Power dissipation: electromagnetic ΔP_{EM} and total $\sum \Delta P$; also, the power required by the network P_N will have a similar shape in the φ function. When the excitation power dissipation and the magnetic flux gain of the alternating power dissipation are equal, the power dissipation has an extreme value. It should be noted that the stator current does not change when the control frequency changes, while the extreme value of power dissipation changes relative to the value corresponding to the nominal frequency (shifted to the right or left when the frequency decreases or increases).

As the magnetic flux increases, the speed of the induction motor increases slightly, resulting in a decrease in slip s , while the useful power increases. Therefore, the minimum value of power required from the network is the smallest value of the magnetic flux relative to the minimum value of electromagnetic energy dissipation. Characteristics of electromagnetic indicators: Efficiency η power coefficient $\cos \varphi$ and their multiply $\eta \cos \varphi$. Reach a maximum at a certain value of current. When the values of variable power dissipation and excitation power dissipation are equal, the efficiency reaches its maximum value. The power coefficient increases and reaches its maximum value at small values of current, and as the current increases, the active component of the stator current decreases and the magnetizing current increases significantly.

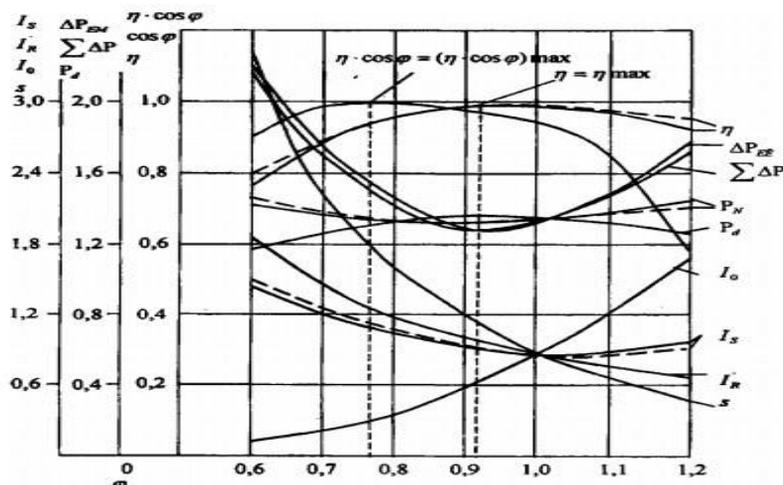

Figure 1. Characteristics of the magnetic flux of electrical and energy parameters of a 4A asynchronous motor in a frequency-adjustable electric drive with a frequency value of $F = 1$.

The typical curve of the load dependence of the induction motor efficiency is shown in the figure. Figure 2 shows that an overestimation of the installed power of the motor leads to a

decrease in its efficiency, i.e. inefficient power consumption. The efficiency of a converter based on powerful semiconductor devices is much higher. Transformer losses are mainly determined by the voltage drop across the semiconductor device. We can assume that the average $U = 2$ V is $U = 4.0$ V for bridge circuits.

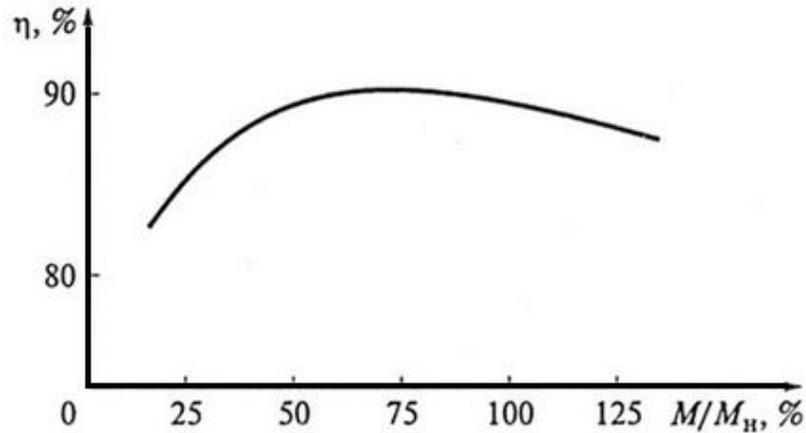

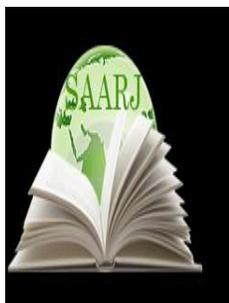

Figure 2. Dependence of asynchronous motor on efficiency load

DEVELOPMENT OF UZBEKISTAN TRANSLATION SCHOOL FROM UZBEK TO RUSSIAN LANGUAGE IN THE BEGINNING OF XXTH CENTURY (ON THE BASIS OF UZBEK WRITERS' WORKS)

ABSTRACT

Translation – one of the most pristine human occupations. Its roots go back to those distant times when the proto-language began to disintegrate into separate languages and the need arose for those who knew several languages who were able to act as intermediaries in the communication process with representatives of various linguistic communities. Nevertheless, for a number of reasons, in particular due to its interdisciplinary nature, the translation formed into an independent science only at the beginning of the XXth century.

KEYWORDS: *Translation, Literary Work, Arts Of Literary Translation, Uzbek Literature, Culture, Poets, Stories*

INTRODUCTION

The idea that it is necessary "to lay the fundamental foundations, if not science, then at least a practical guide to one of the most difficult and demanding arts - the art of literary translation" [1] was expressed at the very beginning of the last century, and in response to this, in the twentieth century, fundamental research on translation studies were conducted by prominent Russian, Western-European and other scientists from the former fraternal republics, which have now become Newly Independent States. The array of the works of scientists and practitioners is devoted to the main problem - the adequacy of the translation to the original literary text. The Uzbek translation school, based on the achievements of Russian and world translation practice, has created a number of reference samples of the Russian literature translation into the Uzbek language. Today, in all its poetic brilliance and polyphonic sound, the Uzbek reader is presented

with the novel by Alexander Sergeevich Pushkin "Eugene Onegin" translated by Aibek. The heroes of Lev Nikolaevich Tolstoy are rushing about in this strange and unexpected world, thinking and speaking in Uzbek, thanks to the novel "War and Peace", professionally adjusted and talented recreated in the Uzbek language by Abdulla Kahhar. Together with the great Dante, Uzbek reader "walkalong" the circles of Hell of the "Divine Comedy", compassing the heroes and grieving about their tragic fate, and all is because the artistic world of the "Comedy" of the great Italian, was fully recreated in Uzbek translation by the National poet of Uzbekistan Abdulla Aripov. At the same time, meridian works of Uzbek literature found their place on the bookshelves of a Russian reader as a result of hard work, talent and sincere love for Uzbek literature of many famous Russian writers and translators. Enough to mention the translations into Russian of the works of Abdulla Kahhar, gazelles and "Xamsa" by Alisher Navoi, the lyric poetry of Hamid Alimzhan and Mirtemir, the novels of Abdulla Kadiri and Aibek. Almost every translation of the Uzbek classics into Russian became not only an event in the literary life of that time, expanding the cultural horizons of Russian-speaking readers, but a lot of examples of this undoubtedly poured into and rightfully "settled down" in the multilingual literary process of the 20th century. "Tales of the Past" by A. Kahhar, "Bygone Days" by A. Kadiri, "Navoi" by Aibek, short poems and poems by Hamid Alimdzhan are known to the reading public in Russia as well as "Peter the First" by A. Tolstoy, "The Brothers Karamazov" by F. Dostoevsky and the stories of A.P. Chekhov, poetry of Konstantin Simonov, as well as works of many others.

However, it should be noted that, for a number of reasons, the modern Uzbek literature appears less and less in Russian translations, and therefore the publication in the magazine "Zvezda Vostoka" ("Star of the East"), and then in the "thick" Russian magazine "DruzhbaNarodov" ("Friendship of nations") of the stories of the famous Uzbek writer Salamat Vafo, aroused particular interest among readers [2]. The stories were translated into Russian by the talented poet and translator Zoya Aleksandrovna Tumanova. The translator was faced with a difficult task: not only to correctly display the informative content of the original literary work in Russian, for this knowledge of the language and acquaintance with the realities of national mode of life is enough, but to clearly determine how and to what extent in the translated literary work "Separate elements of the reflected reality, according to D. Likhachev, are combined with each other ... in a certain system, artistic unity" [3]. In other words, for translator, before taking up the pen, it is important to deeply study the author's intention and his\her vision of the world through the system of linguistic artistic-visual means used by the Uzbek writer in her stories. After all, only after this the artistic world of the written piece can appear before the translator as a whole, as a kind of complete and independent system. And in order to preserve that "flavor" of the original, the translator should try to recreate the artistic function of verbal forms in other language, ethno-linguistic features of the expression of thought and the individual author's use of the original linguistic means. And only after this can there arise what Ninel Vasilievna Vladimirova called the ability to "breathe" the stylistic atmosphere of the translated author" [4].

Let's make a reservation right away, the translation of SalomatVafo's stories into Russian by Zoya AleksandrovnaTumanova was done professionally and extremely conscientiously. But, in our opinion, it is still necessary to note that sometimes the translation loses not only the "flavor" and "stylistic atmosphere" of the original, but also, to some extent, obscures the intention of the author of the original. Let us take, for example, the very first paragraph of the story, a paragraph that serves as a kind of spring of action, since in several lines the Uzbek writer was able to

succinctly and concisely express the entire conflict basis of the work. Let's turn to the text and compare the original and the translation [5]:

Interlinear translation: They say that once they woke up, people saw in the edge of the border a suddenly appeared from somewhere. It was called "Mount Bhutan", that is, a mountain transferred from other places.

Z. Tumanova's translation: Waking up early in the morning, in the morning haze, you can see a mountain in the distance behind the duval. It is called "Mount Bhutan", or otherwise - a mountain transferred from other places.

Original: When people woke up, they found a mountain in the village. It has been called the "Bhutanese mountain," meaning "the mountain from which it has moved."

We will not dwell on the fact that the Russian version became, if it may be said so, somewhat loose due to the introduced words that were absent in the Uzbek version: утренняядымка, вдализадудалом, можнобылоувидеть. This liberty of translation would not be so striking if from the very first lines of translation, as a result of this liberty, the semantic component of Vafo's story would not be distorted.

The writer focuses the reader's attention on the suddenness and complete unpredictability of the appearance of a mountain on the edge of the aul. The author needs this in order to emphasize the similarity, a kind of parallel alienation and almost the same "unwrittenness" in the "local landscape" of his heroine and the mountain covered with mystical aura: « I didn't come from another place like Menhamoshatoqqa » (**And I, just like this mountain, came here from other places, - says the heroine**). If "just like this mountain", then both the Bhutan-mountain carried by the angels, and the lyrical heroine who arrived of her own free will, the phenomena in these places are accidental, temporary. The reader of the original perceives the beginning of the story in this way, which cannot be said about the Russian reader.

The Uzbek writer is laconic, she uses the expressive means of her native language extremely economically, this is the case about which it was said "words are cramped - thoughts are spacious". Not verbosity of Salomat Vafoseems like it invites the reader to go beyond the "semantic limits" of words, phrases, sentences. The brevity and capacity of the verbal constructions in the story makes the reader himself speculate, or rather "follow" the movement of the writer's thought and inner vision, sometimes called the reader's instinct, to try to "understand" what the writer thought about but didn't put a word into it. It is known, however, that sometimes a pause is more meaningful than a lengthy verbal tirade. In two very short phrases, at the very beginning of the story, the author creates two almost tragic images: a mountain transferred from somewhere by angels, which will disappear from these places on the Day of Judgment, and a woman who will leave these places forever after a terrible sentence, the truth of the earth: « Сенбуернингодамиэмас ... ». («**You are not from these places...**»). These words will be uttered by the most dear and only person whom the heroine of the story almost deified. The words, cruel in their categoricalness and hopelessness, seemed to slam the gates to the world of happiness and love in front of the woman, concentrated for her in one person - Kokhin. If the mountain continues to rise on the edge of the aul in anticipation of a divine judgment, then for the heroine of the story, after these words, the Day of Judgment has already come. The person for whom she here uttered terrible words, their meaning: "This is not your world, and there is no way for you there." The excommunication from Paradise took place,

almost tantamount to Dante's: "give up hope ...". This author's idea and writing style of SalomatVafo, speaking succinctly and laconically, completely disappeared in Russian translation. Moreover, the interpretation of the beginning of the story, which was not clarified in the translation into Russian, led to the fact that the translator ends the work of SalomatVafo also with a heavy and very verbose tirade "about":

"Oh my world ...

Oh my spiritual mentor Sheikh Sa'non. I am in two worlds yesterday and today ... Priceless desert, sands, sadly crawling, reeds swaying. The sun, rising higher and higher, begins to burn the desert, the voice of the Kochin, filled with longing, is heard and then silenced ... But four angels, lifting by its four ends, like a bed, carry Mount Bhutan after me. " (journalpunctuationretained) [6]

The original ends like this: "When I came out of the Bujyurt (Kohinaitmok), a voice came from my throat: **When I left this (as Kokhin put it) "not my world" a groan escaped my throat: "O great teacher and my idol, Sheikh Sanan, I, just like the mountain, Bhutan, forever lost in the space between two worlds)**

The meaning of this last long-suffering phrase of the heroine will be understandable only to those who are familiar with the legend of the great Sheikh Sanan, who, for the sake of love for a beautiful Christian woman, was ready to renounce the faith. But the legend ends quite unexpectedly: the Lord appears to the girl in a dream, she falls in love with him and leaves this world, Sheikh Sanan, who was madly in love with her, as it turned out, was fulfilling a divine ordinance. And, nevertheless, having escorted the girl to heaven, he sadly says: "Blessed are those who complete the journey and unite with the Beloved ... And the bitter fate of those whose destiny is to lead others to the Goal ..."

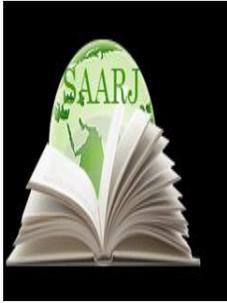

The heroine of Vafo's story is in love with a young man, but unrequitedly. She is ready for any humiliation, like the legendary sheikh for the sake of a Christian girl. Family, child, morality, her whole old world - are thrown on the sacrificial altar of love. But Kokhin, as she calls this man, rejects the love of the heroine. But if in the legend, after the girl's ascension to heaven, the sheikh comes to his senses and continues to faithfully serve God, then in the story the heroine, rejected by her beloved man, does not stop loving him. A legend is always a lesson, and therefore its end, as a rule, is clear and unambiguous. SalomatVafo's story is polyphonic, and it ends not with a dot, but with ellipsis. She leaves the world alien to her, leaving in it her heart, her beloved, but the world to which she is forced to return is also alien to her. There is no beloved. This duality is expressed by the author in the final lines of the story very subtly and tragically: forever lost in the space between two worlds.

And it immediately becomes clear that the rather heavy phrases introduced into the translation text and absent in the original do not serve to reveal the writer's artistic intention, but, on the contrary, to some extent obscure the semantic component of the episode and the story as a whole, thereby distorting the artistic world of the literary work ...

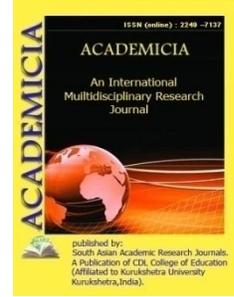

And, nevertheless, the stories "sounded in Russian" by the talented Uzbek writer SalomatVafo, in my opinion not yet appreciated by either Uzbek or Russian critics, were a significant event in the literary life of Uzbekistan.

ABSTRACT

The article analyzes the relationship between a mentor and a disciple, the sixth feast of Saint Bukhara, the representative of the Khojagon teaching Sayyid Amir Kulola (1281-1370) and the founder of the Naqshband teaching Bahauddin Naqshband (1318-1389), as well as his role in the development of Naqshband. On the basis of manuscripts and translated sources, as well as a comparative analysis and the method of hermeneutics, the date of birth of Amir Kulol was clarified, the years of his upbringing Bahauddin Naqshband were based on the teachings of Sayyid Ota and Muhammad Boboi Samosi. The ideas of Amir Kulol about knowledge, practice and knowledge of Ladun are analyzed, the role of epistemological ideas in the teachings of Khojagans in the improvement of Bahauddin Naqshband is shown. The tolerant attitude of Amir Kulol towards the attitude of Bahouddin was revealed and this contributed to the acquisition of new knowledge from Orif Revgari and Kusam Sheikh, thereby improving their knowledge, as well as to practice Zikr Khufi in the Naqshbandi teachings, which is a characteristic feature of this tariqah. It was shown that Bahauddin Naqshband, having thoroughly studied the teachings of Khojagan from Amir Kulol, founded the world famous Naqshbandi teaching.

KEYWORDS: Amir Kulol, Khojagon, permitted food, tarikat, Sayyid ota, Yassaviya, Muhammad Bobo Samosi, Bahauddin Naqshband, Naqshbandiya, knowledge, action, divine knowledge, tolerance, secret dhikr.

INTRODUCTION

Amir Kulol was the great man who connected the Khojagon and Naqshbandiya educations. There is no information about birth date of him but in sources there is some words that he was born in Sukhor village near Bukhara. Shahobiddin ibn binti Amit Khamza in his "Maqomoti Amir kulol" mentioned him as Sayyid Amir Kalon as-Sukhori (p.2), at that time there were an addiction of the birthplace in the names of great people, it means he was born in Sukhor. Ali Safi's "Rashahatayn ul hayot" also states that Amir Kulol's birthplace was Sukhor (p. 43).

"Maqomoti Amir Kulol" states the following: The father of Amir Kulol is a close friend of Sayyid Ata, a great man of Yassavi's discipline. The sources say that Sayyid Ata was a follower of Zangi Ata, a student of Turkish teacher of sheikhs Ahmed Yassavi. According to the source, "One day, Sayyid Ata came to Afshana village and told Sayyid Amir Kulol's father," O my friend, you will have a child by Allah whose light will be enough to the whole world. Of course, put him name Amir Kalon. "

Indeed, after a short while, the prophecy of Sayyid Ata was fulfilled, and Amir Kulol appeared on the stomach of his dear mother and quickly reflected his qualities. There is a story of Amir Kulol's mother in "Maqomot", "when I was pregnant to Amir Kulol, if I ate something doubtful, there were such severe pains so I felt unconscious. Then I realized that this is the blessing of our child. "

The story of Sayyid Amir Kulol's mother indicates that Amir Kulol used to live only in purity even in his mother's body. The dirty and dubious food did not be accepted by his pure body. Purity has been a divine donative of the Great. The following reference is made in the source after the description of this event:

Nishoni on, ki man farzandi pokam,

Padar ham pok, modar ham afifa

Dilampok as tu, domanpokdoram,

Tariqirostroh buy aqiqa.

It means:

The purity of my parents is the source of my purity. My heart and my body are also pure, that's why my road is pure and the smell of purity comes from it.

The poem shows that when Sayyid Amir Kulol came to the world, his purity and truth were accompanied by him. That means that the main means of reaching the truth is purity.

The first teacher of Amir Kulol was Turkish Sheikh Sayyid Ata, the representative of the Yassavi teaching method. Although he predicted the birth and statue of him, he also named him. Later Sheikh was engaged in the education of Amir Kulol. Sayyid-Ata said, "From the pure ghosts I have learned that the rank of Amir Kulol is very high, and it is beyond me." According to the source, this event was in Hijri 680.

The second teacher of Amir Kulol was Muhammad Boboi Samosi (dead in 1336), a prominent teacher of the Khojagon education, who was the student of Khoja Ali Romitani, who was also known as Hazrat Azizon. With this great man, Khazrat Amir Kulol met at the age of 15 and

served him for 20 years without stopping. Muhammad BoboiSamosi gave him right of being teacher of the education.

Muhammad BoboiSamosi Sayyid educated Amir Kulol and gave the instruction to BahauddinNaqshband to give them all the knowledge that he had given them. At the same time, Amir Kulol fulfilled his teacher's requirements.

The sources also contain honorary titles that are given according to the levels of the teacher's degree of Sufism. These blessed degrees and titles allow to know full, complete knowledge of his personality. These are: *Sayyid(sayyid)*, *shaykhul-shuyukh(teacher of teachers)*, *raisiarbabiltasavvuf (chairman of Sufism)*, *sultanil tariqa(the king of education)*, *burkhanilhaqiqat(supporter of truth)*, *murshid us saliqin(teacher of good people)*, *sayyidalorifin(great knowledgeable)*, *sharafulmustaffavvin(great Sufi man)*, *zaynulvorisonvalmuhaqqiqin(inheritor of telling truth)*, *hazratiborifat(chastity)*, *saint and telling the true prophecy*.

Khazrat Sayyid Amir Kulol's teachings are influenced by the ideas of the Yassavi education founded by Ahmad Yassawi and Khojagon Sufism's which was founded by AbdulkholikGijduvani. An analysis of the essence of the Lord's teachings shows that he was a fan of the moderate flow of tasawwuf ideas. Because his ideas are in full compliance with the Islamic religion and are based on the Qur'an and Hadis Sharif.

He tells his followers that it is always haram and halal to know good and evil, and act accordingly. Amir Kulol said:

Mayozormuru, mayozor kas,

Rahiroskorihaminastu bas.

It means:

Do not harm insect or the man,

This is the right way.

Amir Kulol said in the universe everything else, whether it's a sledgehammer or a small insect or everyone is a blessing created by God, not to mention or harass them. Himself was also fully committed to it. It is written in "Maqomot" in this regard as follows:

"Once a day, Amir Kulol had decided to wash his clothes with his friends team. In one of the Romitan gardens, he washed his clothes and when they were about to dry, Amir Kulol said:

- Oh my friends, do not hang your clothes on walls, you may harm thorns, do not hang your clothes on trees, you may harm the branches of it, do not lay your clothes on the ground, you may harm the grass.

Friends asked:

- Amir, how do you want to dry your clothes?
- I hang it on my shoulders and keep it into sunshine and wait until it dries.

The Amir Kulol's students had *aloniya* remembering in a loud voice. In the book Rashahat, it is written: "During the last illness, Amir Kulol called his followers to obey BahauddinNaqshband. One of the disciples asked Amir Kulol:

- Why you to obey him, but did not obeyed you in *aloniya* remembering in a loud voice?

Amir responds:

- Everything that passes by it will be by Allah's wisdom. There is no choice of that person.

The fragment mentioned, first, indicates that the Sayyid Amir showed the existence of *aloniya* in the disciples, and, secondly, it indicates that the act of zikr was followed by the heart of the students. BahauddinNaqshband followed the teachings of AbdulkholikGijdivani. Amir Kulol also obeyed God's command and taught Bahauddinkhufiya zikr –silent remembering.

The most important of the teachings of the Amir Kulol is the importance of acquiring knowledge and knowledge. Regarding knowledge, he told his disciples that Prophet Muhammad (peace be upon him) repeatedly said "Every muslim man and woman must get knowledge."

The Amir Kulol forced everyone getting knowledge and valued an ignorant man more impersonal than an animal.

Agar farzandisultoniyukhoni,

Chu donnish nest badtarazsagoni.

It means: If you are a son of a Sultan and a khan, but you do not have a science, you will be worse than the dog.

The Amir Kulol thinks that the ability given to human beings by Allah is important and basic, and that without the knowledge of the unseen, nothing can be achieved.

The knowledge that Allah has given is superior to each other's knowledge:

Ilme, ki muallimash dar sina buvad,

Darsi nabuvad har on chi dar sina buvad,

Sad xona kitob xoni sude nakunad,

Onro ki kitobxona dar sina buvad.

It means:

It is not possible to learn the knowledge that is placed by Allah in the heart. Even if you read the books that are in your house, you will not be able to equate with what you have learned in the heart.

These verses indicate that Amir Kulol was embodied in the idea that the truth can be achieved by the knowledge given by Allah. He emphasizes that a soul is the place where there is divine knowledge.

Amir Kulol calls for the discovery of the importance of conversing with intelligent, intelligent people in the process of learning, and to stay away from the ignorant. Because sharing with the ignorant can lead to their influence.

Bo bad manshinu, bosh begonia u,

**Bar dam afti gar xuri donai u,
Tir az pai rosti kamonro kaj did,
Didi, ki chi guna jast az xonai u.**

It means:

Do not sit with bad person, stay away from him, because you can be influenced by him. And you see how arrow has escaped after seeing the curvature of the bow, so escape the evil.

**Chi khush guft on xiradmandi suxandon,
Ki ruy az suhbati nodon bigardon,
Daraxkhi nafsi nodon bar nayorat,
Huzurash juz ba dardisar nayorat.**

It means: It is true that the clever word must ignore an ignorant person. The ignorant tree does not know the boundary, so it does not bring anything except headaches.

Amir Kulol considers that science and practice are closely related, and knowledge gained in practice becomes a treasure.

**Har kiro ilmu aql piroya ast,
Har kiro in du nest be moya ast
Ilm boyad bo amal ganje buvad
Az on ,ki be donishamalranjebuvad.**

It means: Who ever wishes to be wise, he is happy, for without it life becomes baseless. Science becomes treasure only when it is with practice. Knowledge without practice brings a lot of disappointment.

Amir Kulol says that obtaining science is a very complex process:

“Dar har kujo boshet dast az talabi ilm dur nadoret. Agar shumozdaryoyiobvaotashboyadguzashtan, biguzaredvaimbodastored.” it means: Be knowledgeable, wherever you are. If it is necessary to cross the river on a flammable or aqueduct river, you must thrive, but gain the knowledge.

**Dar bodiyayilmavidan chi xushast,
Vazolamimanisuxanshunidan chi xushast.
Sad bor ba ittifoq bo dil guftam,
Az suhbatinoqlburidan, chi xushast.**

It means:

It's nice to run after science. How wonderful it is to hear words from the world of words! I said from my heart that it was time to cut off the conversation with ignorance people.

Sayyid Amir Kulol's the seven-centuries old though-provoking teachings of knowledge, knowledge and practice, intelligent propaganda are in harmony with past, present and particularly future life.

The following are the words of Amir Kulol: "Know, the purity of the heart and the tongue is from halâl food. Imagine a human body as a pool of water. Every flower and fruit from this pure water and soil will be absolutely clean and beneficial. The Prophet, may Allah bless him and grant him peace, said, "Whoever consumes only halal food for 40 days, his heart will be opened and he will enjoy the knowledge and wisdom." This is only possible if only pious people (who follows taqwa)."

"Find the nutrition by profession or handicrafting. Find your food with honest work and ... do not waste. "

"Keep your eyes away from looking at what is haram and your ear from the haram, and your hands from the haram, and your feet from the haram."

He was alive in the history by good children and clean disciples. Bahauddin Naqshband is the student who made known his masters name to the world.

According to the source, Amir Kulol had four sons and four caliphs. He gave his four sons to the four Caliphs. His sons followed their father. Their father was a teacher, the guide of the Sufism. His first son, Amir Burhan, were brought up by Bahauddin Naqshband, the second Amirshah by Sheikh Yodgor, the third Amir Khamza by Mavlono Arif Deggarani and the fourth Amir Umar by Jamoliddin Asiya.

The total number of Hazrat Amir Kulol's companions was 114. Among them Khoja Muhammad Bahauddin, Sheikh Muhammad Khalifa, Amir Kulol Doshi, Alouddin Gijduvani, Khoja Shaykh Dorzuni, Shamsuddin Kulol, Jaloliddin Keshi were famous.

Hazrat Amir Kulâl said in the last few days:

- I have been thinking for three days and nights that what will happen to us and our friends? A voice came from the unseen and said: "O Amir Kulol, we blessed you and your neighbors, our friends, and all who obey you."

Shodamki zi man bar dili kas bore nest,

Kasro zi manu, kori man ozore nest

Gar nek shumorandu, gar band guyand,

Bo neku badi hech kas kore nest.

It means:-I am very glad that there is no weight in my heart. When I and my work do not hurt others, I have nothing to do with their good and bad.

This verse testifies to the fact that Amir Kulol has passed through a calm life through honesty and purity.

In the days when the above words were spoken, spirits left the universe and traveled to immortality. This incident took place on Thursday, the eighth day of the jumadulavval 772 Hijri, in 1370 AD

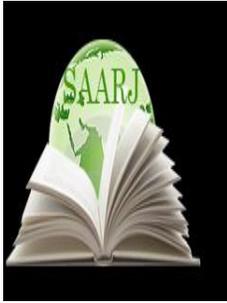

CONCLUSION

In general, it can be said that Hazrat Amir Kulol is a great teacher of Bahauddin Naqshband who closely interacts with the teachings of Naqshband and Khojagon educations.

ABSTRACT

Traumatic brain injury (TBI) may manifest itself in a variety of ways, ranging from minor changes in awareness to a permanent vegetative condition and death. In the most severe form of TBI, a diffuse kind of damage and edema affects the whole brain. Treatment options range from regular cognitive therapy sessions to drastic surgery such as bilateral decompressive craniectomies, depending on the degree of the damage. Guidelines for the best treatment of TBI have been established, but they must be considered in the context of the situation and cannot be used in every case. We have described the present state of TBI therapy in clinical practice and fundamental research in this review paper. We have included a short review of the different subtypes of traumatic injuries, optimum medical treatment, noninvasive and invasive monitoring methods, as well as surgical procedures that may be required in certain cases. We've reviewed the most significant advances in fundamental research in the quest for TBI treatment methods. From an experimental standpoint, we've also addressed the future path of TBI therapy development.

KEYWORDS: *Intracranial Hypertension, Management, Treatment Strategies, Traumatic Brain Injury.*

1. INTRODUCTION

TBI continues to affect millions of people every year all around the globe. The overall combined rates of TBI-related emergency department visits, hospitalizations, and fatalities have risen throughout the decade 2001–2010, according to the Centers for Disease Control. Individually, however, the incidence of TBI-related fatalities has dropped during the same time period, owing in part to greater awareness, more structured management and standards, and substantial technical advances in current treatment regimens. We must also recognize that a certain proportion of TBIs never get medical attention, implying that total TBI rates are likely underreported. TBI is most common in children (0–4 years old), as well as teenagers and young adults (15–24 years old). Another surge in occurrence occurs in those over 65 years old. Falls and motor vehicle accidents are the two most common causes of TBI. We have a rising group of people living with severe impairments directly linked to their TBI as a consequence of an overall increasing number of TBIs but a reduced incidence of associated fatalities[1]–[4].

Path Physiology of TBI:

TBI pathogenesis is a multi-step process that begins with a primary injury and progresses via subsequent injuries to result in temporary or permanent brain impairments. The main deficiency is directly linked to the brain's major external effect. The secondary injury, which may occur minutes to days after the initial hit, is caused by a molecular, chemical, and inflammatory cascade that causes further brain damage. The release of excitatory neurotransmitters like glutamate and aspartate causes depolarization of the neurons, which leads to a rise in intracellular calcium. Intracellular calcium triggers a cascade of events including the activation of enzymes such as caspases, calpases, and free radicals, resulting in cell death either directly or indirectly through the apoptotic process. This deterioration of neuronal cells is accompanied by an inflammatory response that destroys neuronal cells even more and causes a breach in the blood-brain barrier (BBB), resulting in more cerebral edema. Through various mediators, this whole process is both up and down controlled. After the second damage phase, the healing period begins, which includes morphological, molecular, and functional remodeling[5], [6].

Concussion:

Concussions are often regarded as mild TBIs that do not result in any severe structural damage as a result of a non-penetrating TBI. They typically occur as a result of direct strikes to the head, with following acceleration and deceleration forces. A concussion usually leaves the victim with various degrees of temporary altered mental status, ranging from mild disorientation to complete unconsciousness for a few minutes. Routine neuroradiographic imaging, such as computerized axial tomography scans (commonly known as CT scans) and magnetic resonance imaging (MRI) reveal no abnormalities right away. Newer MRI imaging methods such as diffusion tensor imaging and functional MRI, on the other hand, may lead to an earlier diagnosis of concussion. Even in the face of a mild TBI, modest degrees of axonal damage have been hypothesized to occur.

Chronic Traumatic Encephalopathy (CTE):

Mild TBI may lead to CTE, which is a delayed manifestation of mild TBI. This entity has received widespread public attention since one of the terrible outcomes of CTE is mental problems, which have resulted in suicidal conduct in a number of high-profile players in professional sports. Dysarthric speech, tremors, trouble paying attention, memory and executive

function impairments, incoordination, and pyramidal symptoms are some of the other clinical indications of CTE. CTE is most likely the consequence of increasing neuronal loss.

Extra-axial Hematomas:

Epidural hematomas (EDH) and subdural hematomas (SDH) are both types of extra-axial hematomas (SDH). EDH is caused by a direct hit to the temporal area, which may sometimes result in a skull fracture and a rupture of the middle meningeal artery. However, venous injuries, such as transverse sinus disruption, have also been linked to more posteriorly directed EDH. Once a threshold level of intracranial pressure (ICP) is achieved, EDH may quickly increase in size, allowing a person to present with basically normal mentation, followed by worsening along the herniation syndromes cascade.

Traumatic Subarachnoid Hemorrhage and Contusions:

In most cases, contusions occur as a consequence of coup and countercoup forces. Coup injuries happen at the point of impact, while contrecoup injuries happen on the other side of the impact, most often injuring the frontal lobe and anterior temporal lobe. Trauma is the most common cause of subarachnoid hemorrhage, which occurs when tiny capillaries rupture and leak blood transiently into the subarachnoid region. Because blood is pushed into the subarachnoid space under artery pressure in spontaneous aneurysmal subarachnoid hemorrhage, traumatic subarachnoid hemorrhage is often not as serious a brain damage as spontaneous aneurysmal subarachnoid hemorrhage.

Diffuse Axonal Injury (DAI):

The most severe kind of axonal shearing damage is DAI. For such an injury to occur, significant rotational acceleration/deceleration forces are usually needed. Radiographically, it appears as modest hemorrhagic foci in the corona radiata, corpus callosum, internal capsule, brainstem, and thalamus on T2 and gradient echo sequences. Patients may appear with different degrees of clinical symptoms depending on where the axonal shearing occurs. A minority of DAI patients may have altered consciousness for a few days, while others may develop hemiparesis as a result of internal capsule involvement. Others never recover consciousness because portions of the reticular activating system have lost axonal integrity.

TBI Medical Interventions:

i. Height of the Head:

Raising the head of a person who has suffered a traumatic brain injury usually has immediate consequences. The displacement of CSF from the cerebral compartment, as well as the stimulation of venous outflow, both lower ICP. Although ICP is decreased and cerebral blood flow (CBF) is unchanged by head of bed elevation, mean carotid pressure is reduced.

ii. Hyperventilation:

ICP is reduced by hyperventilation because the intra-arterial carbon dioxide partial pressure (PaCO₂) is reduced, resulting in vasoconstriction. The decrease of cerebral blood volume is the end consequence of this sequence of events. Because vasoconstriction decreases CBF, prophylactic hyperventilations are not usually advised. Focal regions of ischemia may develop in

areas where autoregulation is maintained. In the case of severe TBI, hyperventilation is typically only required for a short time during acute neurological deterioration.

iii. Hyperosmolar Therapy:

In the event of a TBI, hyperosmolar treatment may be given as a bolus or as an infusion. The initial effects of mannitol have been demonstrated to be caused by changes in blood rheology. A rise in CBF occurs when blood rheology improves and blood becomes less viscous. Transient vasoconstriction is the body's autoregulatory reaction to this, which eventually lowers CBF. Although mannitol has osmotic diuretic characteristics, this method for lowering ICPs is believed to occur after the main impact.

iv. Cooling for Therapeutic Purposes:

TBI is believed to cause oxidative stress as a side effect. Therapeutic hypothermia has been demonstrated to reduce oxidative damage in babies and children. The cerebral metabolic requirement reduces when the body temperature drops. Changes in blood sugar, platelet count, and coagulation factors are all hazards associated with this kind of treatment. When someone is brought to a hypothermic condition, their platelet count and coagulation factors must be evaluated before any invasive treatment. Therapeutic cooling has had inconsistent success in the treatment of severe TBI and is now considered a second-tier treatment option.

v. Monitoring of the ICP:

In the case of ICP monitoring in brain-injured patients, several indications have been proposed as recommendations. Some individuals have clinical symptoms of severe neurological impairment but no obvious signals that they need emergency surgery. In patients with a severe TBI, a GCS of 3 to 8, and an abnormal CT scan of the head, there is Level II evidence for using an ICP monitor. If two or more of the following are observed at admission: age over 40 years, unilateral or bilateral posturing, or systolic blood pressure of 90 mm Hg, Level III evidence supports putting an ICP monitor in patients with a severe TBI and a normal CT scan of the head.

Regeneration of the Neurovascular System:

It's been suggested that neuronal and vascular regeneration play a part in brain healing after a head injury. Neurogenesis has been discovered in the subgranular zone of the hippocampus's dentate gyrus (DG) and the subventricular zone of the adult brain. TBI has been shown to promote neurogenesis in the cerebral cortex, DG, and CA3 in animal models. In cells, Thymosin 4 (T4) is an essential G-actin-sequestering molecule. Tb4 injection promotes NPC growth in animal models. Tb4 also promotes NPC differentiation and increases angiogenesis. There is a specific population of astrocytes in the subventricular and subgranular zones that may divide and differentiate into new neurons. After a TBI, these newborn neurons are thought to play a role in replacing neurons in the olfactory bulb, brain, and hippocampus. The number of regenerated neurons in young animals is higher than in older animals, according to animal models. The process of NPC proliferation and differentiation peaks 2 to 5 days after TBI, but some investigations go as far as 14 days[7], [8].

2. LITERATURE REVIEW

H. Dash et al. discussed about Management of Traumatic Brain Disease[9]. Traumatic brain injury (TBI) has been dubbed the modern-day "hidden pandemic" since it is the greatest cause of

death and morbidity in children and young people in both industrialized and developing countries. TBI therapy has experienced a paradigm change in recent years. The Brain Trauma Foundation's protocol-based recommendations are suitable for the treatment of severe TBI. Prophylaxis and early treatment of intracranial hypertension and secondary brain damage, preservation of cerebral perfusion pressure, and providing sufficient oxygen supply to injured brain tissue are the goals and objectives of its management. The authors of this paper address protocol-based methods to the treatment of severe TBI in accordance with current recommendations.

W. Peeters et al. discussed about Traumatic Brain injuries[10]. Traumatic brain injury (TBI) is a major public health and socioeconomic issue throughout the globe, necessitating epidemiological surveillance of TBI incidence, prevalence, and outcomes. The goal of this study was to characterize the epidemiology of traumatic brain injury in Europe and to assess incidence study methods. A comprehensive review and meta-analysis of publications reporting the epidemiology of TBI in European nations were conducted. The keywords epidemiology, incidence, brain injur*, head injur*, and Europe were searched in the PubMed electronic database. Only papers published in English between 1990 and 2014 that reported on data gathered in Europe were included. In all, 28 epidemiological studies on TBI were found in the literature, representing 16 European nations. Between studies, there was a lot of variance in case definitions and case selection. The two most common causes of TBI were falls and road traffic accidents (RTA), with falls being recorded more often than RTA. TBI incidence peaked in the oldest age groups in the majority of studies. An overall incidence rate of 262 per 100,000 for hospitalized TBI was calculated in the meta-analysis. Differences in inclusion criteria and case ascertainment make it difficult to interpret published epidemiologic research. Despite this, changes in epidemiological trends have been discovered: falls are now the most frequent cause of TBI, particularly in the elderly. For accurate monitoring of epidemiological trends and to guide proper targeting of preventive efforts, the quality of standardized data collection for TBI must be improved.

3. DISCUSSION

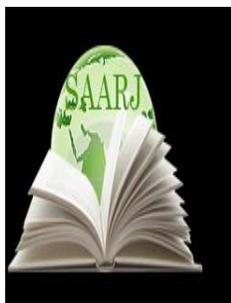

Traumatic Brain Injury (TBI) is a disturbance in brain function caused by a blow, bump, or jolt to the head, the head striking an item abruptly and forcefully, or an object piercing the skull and entering brain tissue. Mild TBI, often known as a concussion, Moderate TBI, and Severe TBI are the three major forms of TBI. Concussions are a kind of TBI that is relatively mild. Mild types produce just transient symptoms that go away within a few days or weeks. TBIs with the most severe consequences may result in irreversible brain damage, coma, or death. TBI is most often caused by falls from a bed or ladder, down stairs, in the bath, and other falls, especially in elderly people and children.

4. CONCLUSION

A severe hit or jolt to the head or body typically causes traumatic brain damage. Despite the fact that there is no effective therapy for TBI rehabilitation today, attempts to create therapeutic methods for TBI recovery have been ongoing for decades. In the acute treatment of TBI patients, standard medical and surgical procedures are always important. The number of TBI survivors with different impairments has grown owing to the increasing population of TBI survivors as a result of improved acute treatment recommendations in the acute phase of TBI. This necessitates a transition in TBI research to the fields of neurorestoration and neurorehabilitation.

ABSTRACT

HIV/AIDS has long been one of the world's most widespread illnesses. HIV infection and AIDS are caused by the human immunodeficiency virus (HIV), which is a lent virus. AIDS is a human disease in which the immune system gradually fails, allowing life-threatening infections and malignancies to flourish. HIV infection is spread via the transmission of blood, sperm, vaginal fluid, and breast milk. HIV is found in various body fluids as free virus particles as well as virus inside infected immune cells. HIV infects important immune cells such as helper CD4 T cells and macrophages. Through a variety of processes, including pyroptosis of infected T cells, HIV infection causes low numbers of T cells. The symptoms of AIDS are mainly caused by diseases that do not occur in people who have a sound immune system. The majority of these infections are caused by bacteria, viruses, fungi, and parasites that are usually regulated by immune system components that HIV destroys. When a couple with one infected partner uses condoms on a regular basis, the risk of HIV infection is less than 1% per year. Female condoms may offer an equal degree of protection, according to some research.

KEYWORDS: AIDS, HIV, Symptoms, Transmission.

INTRODUCTION

AIDS is caused by the HIV virus. Our bodies normally have an immune system that fights viruses and germs. White blood cells in the immune system defend us against infections. CD4+ cells, commonly known as helper cells or T cells, are found in white blood cells. A person who has been infected has the ability to grow. The immune system of the body is exploited by these illnesses. These infections cause a variety of health issues and may even result in death. HIV is unable to defend against illness, and the number of CD4 cells in the body declines as a result. Although there is no cure for AIDS, there are medications that may help to delay the progression of the illness and keep you healthy for longer. Diseases can't be cured with medication[1], [2].

AIDS is caused by the HIV virus. Our bodies normally have an immune system that fights viruses and germs. White blood cells in the immune system defend us against infections. CD4+ cells, commonly known as helper cells or T cells are found in white blood cells. A person who has been infected has the ability to grow. The immune system of the body is exploited by these illnesses. These infections cause a variety of health issues and may even result in death. HIV is unable to defend against illness, and the number of CD4 cells in the body declines as a result. Although there is no cure for AIDS, there are medications that may help to delay the progression of the illness and keep you healthy for longer. Diseases can't be cured with medication[3].

HIV:

H-It infects only human beings and also transmitted between humans not from animals. It is not transmitted from bites of mosquitoes, bats or any other species.

I-Our bodies have an immune system that protects us from germs, infections, and other diseases. A person with HIV, on the other hand, is unable to fight illnesses. However, the immune system deteriorates.

V-Virus is a tiny, basic organism that is dormant outside of the human body and becomes active once inside.

AIDS:

A-It is not inherited, which means it cannot be passed down from generation to generation. It is spread from an infected person to a healthy one.

I-It causes the immune system to deteriorate.

D--Induces a CD4+ cell deficit in the immunological system.

S-It is a group of illnesses.

Structure of HIV:

Figure 1 shows the structure of HIV and its parts are stated below:

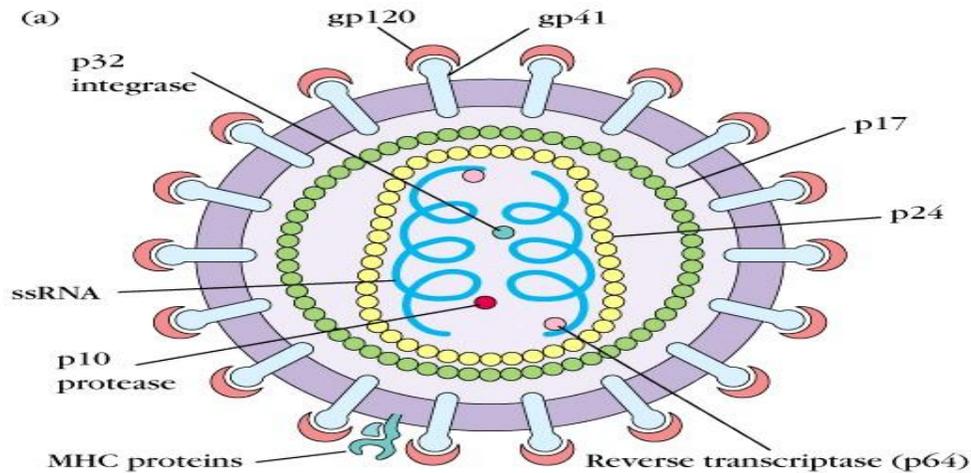

Figure 1: Illustrates the structure of HIV[4]

- *Gp120*:Gp120 gets its name from its molecular weight of 120. It is required for viral entrance into cells because it aids in the attachment of viruses to particular cell surface receptors.
- *GP41*:GP41 is a component of retroviruses' envelope protein complex, which includes the human immunodeficiency virus. It's a group of enveloped viruses that utilize reverse transcriptase to reproduce in their host cells. It goes after a host cell. Envelope of the viral it is the envelope that the virus adheres to.
- *P17*:Protein makes up the viral core. It's in the form of a bullet. Reverse transcription, integrase, and protease are three enzymes needed for HIV replication.
- *P24*:P24 is a part of the HIV capsid.
- *Protease*:Protease is a retroviral aspartyl protease that is required for HIV, the retrovirus that causes AIDS, to complete its life cycle. This enzyme cleaves freshly produced polyproteins at the proper sites to produce the natural protein components of the HIV virus.
- *Integrase*:Retrovirus-produced enzyme that allows the retrovirus' genetic material to be incorporated into the DNA of infected cells. RNA Long strands of DNA are used by all species, including most viruses, to store their genetic material. Retroviruses are unique in that their genes are made out of RNA.

Causes:

It is brought by through sexual intercourse between two people. HIV is a kind of virus. When a person contracts HIV, the virus weakens and destroys their body's defense mechanism (the immune system), rendering it incapable of fighting diseases. It is brought on by:

- Sharing drug needles or syringes.
- Sexual encounter with someone who is HIV positive, whether it is vaginal, or oral.
- Other sexually transmitted illnesses including syphilis, herpes, and gonorrhea seem to enhance the risk of HIV infection during unprotected sexual contact with an HIV-positive partner.

- iv. During pregnancy, delivery, and breastfeeding, an HIV-positive mother may infect her baby.

Transmission:

HIV is spread mostly via sexual contact, blood transfusions, blood products, and infected needles, and transmission from mother to child. Despite the fact that gay interaction is still a significant source of HIV in the United States, “heterosexual sexual transmission is the most important method of HIV transmission globally today.” In industrialized nations, treatment of blood products and donor screening has virtually reduced the danger of HIV transmission via tainted blood products, but the virus continues to spread among intravenous drug users who share needles. Infected blood and contaminated needles continue to be major sources of infection in poor nations. Thirteen to thirty-five percent of HIV-positive pregnant women will pass the virus on to their kids; transmission happens both before and after delivery. Infected moms' breast milk has also been shown to have significant amounts of the virus[5], [6].

The fecal-oral route, aerosols, insects, or casual touch, such as sharing household goods or hugging, do not transmit HIV. Direct inoculation by needle sticks is the main source of danger for health care personnel. Although tiny amounts of the virus may be found in saliva, the virus cannot be transmitted via kissing. HIV may be transmitted from one infected individual to another in the following ways:

- Blood (including menstrual blood)
- Semen
- Vaginal secretions
- Breast milk.

Symptoms:

Many individuals living with HIV show no visible signs or symptoms at all. According to recent research, 70 percent to 90 percent of individuals infected with HIV have flu-like symptoms within a few weeks after infection. Fever, rash, and a severe sore throat are the most frequent symptoms, which all appear at the same time. These symptoms in a person who is otherwise healthy may suggest that they have just been infected with HIV. Patients with HIV may have yeast infections (oral or vaginal) that may not go away or recur often. Herpes infections, which may cause oral, vaginal, or anal sores, are also prevalent[7]–[10].

Infected individuals are more likely to get herpes zoster (shingles). Other pulmonary infections (pneumonia) or atypical mycobacterial infections may be life-threatening for your loved one. Pelvic inflammatory illness, which does not respond to therapy, may affect women. The virus may affect the neurological system (nerves, spinal cord, or brain) and cause a wide range of symptoms, including tingling in the feet and difficulty walking, as well as memory problems.

Diagnosis:

HIV is most frequently diagnosed by looking for antibodies to the virus in your blood or saliva. Unfortunately, your body needs time to produce these antibodies, which may take up to 12 weeks. A novel kind of test that looks for HIV antigen, a protein generated by the virus shortly

after infection, may help confirm a diagnosis fast. The tests for HIV AIDS diagnosis are as follows:

- *Test at home:*

A home test that has been authorized by the Food and Drug Administration. You swab fluid from your upper and lower gums to perform the test. If the test results are positive, you should visit your doctor to have the diagnosis confirmed. If the test is negative, the findings must be repeated three months later to be confirmed.

- *Treatment Tailoring Tests:*

If you are diagnosed with HIV/AIDS, you may undergo a variety of testing.

These tests include the following:

- *CD4 count:* CD4 cells are a kind of white blood cell that HIV targets and destroys.
- *Viral load:* This test determines how much virus is present in your blood. According to studies, individuals with greater viral loads had a worse prognosis than those with lower viral loads.
- *Drug resistance:* This blood test reveals if your HIV strain is resistant to particular anti-HIV medicines.

Treatment:

HIV is treated with antiretroviral medications. These are antiretroviral medicines that work against the human immunodeficiency virus (HIV). They can help you live longer and have a better quality of life. The following are the antiretroviral medication classifications:

- Zidovudine (AZT), Didanosine, Lamivudine, and Tenofovir are examples of nucleoside reverse transcriptase inhibitors (NRTIs).
- Nevirapine, Delavirdine, and Efavirenz are nonnucleoside reverse transcriptase inhibitors.
- Indinavir, Nelfinavir, Amprenavir, Lopinavir, and Atazanavir are all protease inhibitors.

HAART: It is an antiretroviral treatment with a high level of activity. HAART may also be used to treat HIV. It's a three-drug combo.

DISCUSSION

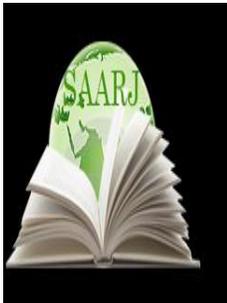

The human immunodeficiency virus (HIV) is a virus that affects the immune system of the body. AIDS may develop if HIV is not treated (acquired immunodeficiency syndrome). Knowing the fundamentals of HIV may help you stay healthy and prevent the spread of the virus. The human immunodeficiency virus causes HIV infection. HIV is acquired via contact with HIV-infected blood, sperm, or vaginal secretions. The majority of individuals acquire HIV by having unprotected intercourse with an HIV-positive person. Sharing drug needles with someone who is HIV-positive is another frequent method to acquire it. HIV cannot be eradicated by the human body, and there is no effective HIV treatment. As a result, if you have HIV, you will have it for the rest of your life. People with HIV, on the other hand, may live long and healthy lives while preventing HIV transmission to their sexual partners by taking HIV medication (also known as antiretroviral therapy or ART).

CONCLUSION

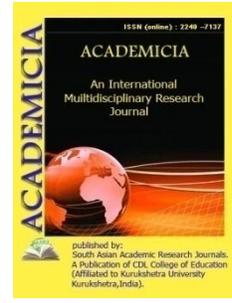

Historically, HIV prevention efforts have mainly focused on creating risk reduction strategies for those who are at high risk of contracting the virus. Only 18 (32.7 percent) of 55 state and municipal submissions to the CDC for funding for HIV prevention programs identified HIV-infected people as a target group for HIV prevention initiatives, according to a 1999 study. Despite the fact that millions of individuals in the United States are at "behavioral risk" for HIV infection, the virus can only be transmitted between infected persons. As the number of people living with HIV continues to rise as a result of antiretroviral therapy (ART), so does the need for lifetime preventive measures tailored to them.

ABSTRACT

The resistance of the cement mortar to aggressive influences, when exposed to Alr, lime becomes denser due to gas formation in the Alr, the durability of the garage erected in the building. It has also been found that exposure to harmful exhaust gases increases, usually in wet conditions.

KEYWORDS: *Cement Mortar, Aggressive Action, Acid, Carbonic Acid, Carbonization, Tubular Pores, Crystalline Hydrate, Calcium Hydroxide.*

INTRODUCTION

Durability of cement stone means its resistance to the aggressive effects of the external environment (fresh and mineral waters, the combined effects of water and cold, as well as high temperatures, wetting and drying, and the accumulation of salt solutions in the capillaries and pores of cement stone to other crystal hydrates). Because portland cement is a material that is

very resistant to weathering. When cement stone interacts with Alr, lime condenses better and is more durable due to carbonation from carbon dioxide in the Alr.

Aggressive gases, on the other hand, can usually only affect cement in humid conditions. In this case, they often act as acids (SO_2 , H_2S , Cl_2 , etc.). It is known that Portland cement consists of very small tubular pores. The gas penetrates these cavities very easily. With the appearance of wet conditions, the crystals of $\text{Ca}(\text{OH})_2$, which is the main structural element of cement stone in tubular small cavities, are broken down. This poses a very significant risk to the strength of concrete structures.

Cement stone is a material that is not exposed to the harmful effects of Alr. When exposed to Alr, lime becomes more dense due to carbonization with carbon dioxide in the Alr, increasing its durability.

The effects of harmful gases are usually exacerbated in humid conditions. The processes of erosion in this case are almost indistinguishable from the processes under the influence of water.

To better visualize the resistance of cement stone to aqueous media, let us briefly review the history of research in this area.

The invention of Portland cement promoted his work in the field of concrete. From the second half of the XIX century, Portland cement began to be used as reinforced concrete in construction.

As a result of the widespread use of Portland cement in hydraulic structures in the 20s and 30s of the last century, it became clear that the structures were not resistant to water, and many hydraulic structures were demolished.

The degree of water resistance of Portland cement-based hydraulic structures in Russia and European countries was determined by Professor A.R. Shulyachenko, engineer V.I. Charnomsky and Academician A.A. Studied by Baykov (late nineteenth and early twentieth centuries). The science of concrete erosion was established as a result of the analysis of the causes of the deterioration of Portland cement under the influence of water, especially sea water. Scientists have also achieved certain results in the study of the water resistance of cement in general. Consider, for example, the effect of fresh water. The best soluble among the hydration products of cement is calcium hydroxide, which is soluble in 1.3 grams per liter of water. In terms of solubility, the next place after lime is hydroaluminum, hydrosulfoaluminum (batsilla), followed by hydrosilicates. In general, cement can be completely melted, but the process is very slow.

If the concrete hardens without reaching the rhythm, its pores are large and water penetrates through them, then the harmful effects of water are clearly visible. Due to the carbonization of the lime separated from the concrete, white saline spots appear on its surface. In most cases, these moldy spots are referred to as salinization of concrete.

Salinity of concrete is the leaching of lime milk from the concrete mass. This process, in turn, weakens the bond with the fillers, thereby reducing the strength of the structure.

The solubility effect of water increases with increasing water hardness. Extremely hard water can also strengthen concrete due to its ability to form calcium carbonate in the pores and surface.

Often concrete also decomposes under the influence of carbonic acid water. Initially, dissolved carbonic acid reacts with $\text{Ca}(\text{OH})_2$ to form

The advantage of this process is that well-soluble Ca (OH)_2 is converted to 40 times less soluble CaSO_3 than itself. However, when SO_2 is 250,300 milligrams per liter, the following secondary process occurs.

The easily soluble calcium bicarbonate $\text{Ca (HSO}_3)_2$ is then washed out of the cement stone. Instead, Ca (OH)_2 is formed again. Thus, almost all of the cementite minerals are soluble. Water with a temporary hardness of not more than 24°C is not dangerous for concrete.

To save concrete from salinization, the surface of concrete structures is plastered with bitumen, varnish, natural stone, and even lead tin. But these are very expensive and at the same time do not last long. It is also possible to compact the surface of concrete by vibration. The effectiveness of these measures is less. This is because if the top protective layer is damaged by impact, the concrete will break down more easily.

The problem of water erosion under the influence of water was solved by the German scientist M. A. M. and the Russian scientist A. A. Baykov. They made the right decision, they have made extensive use of puttsolan and similar trass, tuff, pumice additives to increase the water resistance of free lime, which is well soluble in water in hardening portland cement. The emergence of Portland cement had put the use of puttsolan unused.

At an international congress in St. Petersburg in 1908, Russian cementers proposed the mandatory placement of Portland cement used in the construction of hydraulic structures, but this was in fact nothing new.

Puttsolan cement is mainly used in the construction of structures under water and underground, as well as in groundwater. In ancient times, for example, in Bukhara, in the construction of foundations, dam walls, pools, baths in swampy, wet and saline soils, lime puttsolan cement, which is called "ridge", was widely used. "Kir" mainly acted as a surfactant for plant ash, lime (sometimes a mixture of gypsum), grape seed and egg white.

Thus, in Russia, hydraulic compounds such as tuff, opoka, diatomite, trass and tuff, which are not inferior to Italian puttsola, began to be widely used. Previously, 10..15% admixture was used in Portland cement in factories, but later it was added to 20..40% to the extent that it does not affect the strength of cement. This both increases the water resistance of the cement and lowers its cost.

If the water absorbed into the concrete contains dissolved salts, the chemical melting process will also go away. Salts are present in almost all waters and degrade the quality of cement. One ton of river water contains on average up to 1.5 kilograms of salt. Salts of river water: consists of calcium sulfate and calcium carbonate, while salts of sea water contain: table salt 78%, magnesium chloride 11%, magnesium sulfate 5% and various salts of calcium 4%. For this reason, conventional Portland cement is not used in the construction of underwater hydraulic structures at sea. For this purpose it is necessary to create special cements.

It is known from construction experience that concrete sometimes cracks under the influence of water containing calcium, magnesium, sodium, ammonium salts of sulfuric acid and their mixtures. This is because such substances in water chemically react with the hydroaluminates

$3\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot 6\text{N}_2\text{O}$) in ordinary Portland cement, which solidifies to form needle-like crystals reminiscent of bacilli. Often such a compound is also called a "cement bacilli". Its chemical expression is as follows:

When this compound, sometimes called calcium hydrosulfoaluminate, is formed, the hardened cement tends to expand in volume. As a result, the internal tension increases and cracks appear in the cement. This is because the accumulation of dissolved gypsum with insoluble $3\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot 6\text{N}_2\text{O}$ causes an increase in the volume of formation of insoluble hydrosulfoaluminate (relative to insoluble $3\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot 6\text{N}_2\text{O}$) by about 4.6 times. As the cement stone expands, its structure deteriorates, its strength decreases, and it breaks down. Cement bacilli are dangerous for concrete, and are especially dangerous when combined with salinity. Under the influence of bacilli, the structure cracks and cracks, opening the way for water in the concrete. Consequently, favorable conditions are created for the dissolution of calcium hydrate. Thus, the "cement bacilli" accelerates the salinization of cement.

Proper selection of binding materials is important in increasing the water resistance of concrete. This in turn extends the service life of the concrete. To increase the resistance of Portland cement to sulphate water, it is necessary to remove $3\text{CaO} \cdot \text{Al}_2\text{O}_3$ from it. But there is a downside to this measure. When this mineral is completely removed from the cement composition, the hardening of the cement is greatly slowed down. To prevent this, it is necessary to limit the amount of $3\text{CaO} \cdot \text{Al}_2\text{O}_3$ in the resulting cement. In the production of such cement, great attention is paid to the composition of the raw material. In this way, the spread of "cement bacilli" is reduced.

Also, cement made on the basis of clinker, which releases less lime during hardening, is resistant to washing of lime.

If the water that seeps into the concrete is contaminated with industrial effluent, it will have a worse effect on the concrete. Because concrete is an alkaline product, it contains a lot of free-standing lime hydrate. It is therefore, by its very nature, resistant to the effects of acid. Lime dissolves very quickly under the influence of acid. Therefore, the concrete floors of containers, pipes and appliances, walls and ceilings, cellulose, some types of fertilizers, lactic acid and foodstuffs are quickly destroyed.

Alkaline solutions (NaOH, KOH) have different effects on Portland cement. Low concentrations of alkaline solutions do not damage the concrete. From time to time the alkali solution on the cement stone begins to carbonize and crystallize in the presence of carbon dioxide gas. The alkaline salts formed form wet hydrates with the moisture in the Alr. The cement stone then expands in size, but such dangerous expansion is rare under the constant action of dilute alkaline solutions.

Alkaline solutions with very high concentrations break down the cement.

Under such conditions, the solubility of $\text{Ca}(\text{OH})_2$ decreases due to the presence of the same ions (OH), but the solubility of other components in the cement stone, especially aluminate compounds, is greatly increased. Under the influence of high concentrations of alkaline solutions, the cement stone breaks down quickly. Thus, increasing the chemical resistance of cement stone is an issue of great importance in the national economy.

V.M.Moskvin has divided the following three mAln types of cement stone depending on the mAln signs of corrosion (deterioration) in the aqueous medium:

Type 1 corrosion - cement stone is damaged as a result of melting of components;

Type 2 corrosion - cement stone is broken as a result of exchange reactions between substances in water and cement components;

Type 3 corrosion - cement stone is broken down as a result of precipitation and crystallization of insoluble salts in the pores of cement paste.

A complete classification of the mAln types of corrosion of concrete under the influence of natural waters was developed by V.V.Kind.

1. Spontaneous melting of calcium hydrate oxide in cement stone, leaching and alkalinization corrosion;

2. Erosion due to the action of acids with a pH value of at least 7 - acid corrosion;

1. Carbonic acid corrosion, which is somewhat similar to acid corrosion and causes the erosion of cementite;

2. Sulfate corrosion, which in turn is divided into: a) corrosion of sulfoaluminate, which occurs under the influence of ions with a concentration of 0.25 ... 0.3 to 1 g / l;

b) sulfoaluminate - gypsum corrosion, the concentration of which in the solution is more than 1 g / l, formed mAlnly under the influence of sulfate ions (SO₄);

c) gypsum corrosion caused by water containing large amounts of Na₂SO₄ and K₂SO₄;

5. Magnesium corrosion, which in turn is divided into: a) magnesium corrosion caused by the action of magnesium cations in the absence of SO₄⁻ ions in water;

These types of corrosion can occur under the influence of natural waters, industrial and domestic wastewater. In addition, the combined effect of gypsum and acid can also be of great importance. Corrosion under the influence of hydrogen sulfide is unusual. In addition, cement and concrete structures can also be exposed to beef fat, vegetable oil, carbohydrates, alcohol, phenol, sugar, various acids and alkalis.

No matter how different the substances that cause corrosion, we will consider some of the classifications of V.M.Moskvin and V.V.Kind the corrosion under their influence.

Sulfoaluminate corrosion is a type of sulfate corrosion that occurs under the influence of sulfate waters containing 0.25..1g / l ions in cement and concrete. If the amount of SO₄⁻ ions exceeds the specified amount, this corrosion will turn into sulfoaluminate gypsum corrosion. If the concentration of sulfate ions drops below 0.25 g / l, according to V.V.Kind, this will not be dangerous for Portland cements.

Natural waters or industrial effluents contain NaSO₄, Na₂SO₄, MgSO₄, MgCl₂, NaCl, and similar salts may be present in varying amounts:

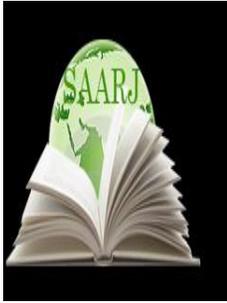

Sodium hydrate oxide is a well-soluble substance that is washed away from the cement stone, forming a sparingly soluble calcium hydrosulfoaluminate during the reaction. As it crystallizes, it absorbs 30..32 moles of water, expands in volume by about 4.6 times, resulting in a sharp deterioration in the strength of the cement stone.

Calcium hydrosulfoaluminate crystals consist of long thin needles that look like some bacilli. Because of this similarity, as well as its very dangerous effect on cement stone, calcium hydrosulfoaluminate is called “cement bacilli”.

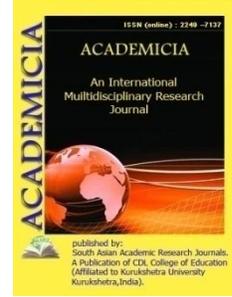

In the first period, when calcium hydrosulfoaluminate (ettringite) is formed (even when the gypsum is saturated), it contributes to the compaction of the cement, but as a result of the accumulation of sulphate water, the cement begins to break down rapidly.

DEVELOPMENT OF TOURISM IN THE REPUBLIC OF KARAKALPAKSTAN

Jollybekova Indira Baxytovna*

*Associate Professor PhD,
 Karakalpak State University named after Berdakh,
 UZBEKISTAN
 Email id: j_indira@larsu.uz

ABSTRACT

The oldest caravan routes in Karakalpakstan are the road connecting the East with the West through the famous Silk Road, and ancient and medieval civilization contributed to the emergence of highly original sources and wonderful examples of spiritual culture. Sufficient ignorance of tour operators, the lack of strong links between them and the influx of foreign tourists to the country, the influence of cultural institutions, non-governmental organizations have a negative impact on the development of tourism. Particular attention was paid to the spiritual development of society, a comprehensively developed person, the enrichment of spiritual culture. A number of important measures have been taken in the Republic of Uzbekistan and laid the foundation for future development.

KEYWORDS: *Institutions, Comprehensively, Non-Governmental, Caravan*

INTRODUCTION

First of all, independent Uzbekistan pays special attention to the restoration of ancient national culture and spirituality, the establishment of interaction with world civilization. Indeed, "it is more important than ever to pay attention to spirituality and enlightenment, moral education, the aspiration of young people to education and perfection in today's rapidly changing world and various new threats and dangers that threaten the stability and sustainable development of peoples."

The independence of the Republic of Uzbekistan marked a new era for the revival of national culture and traditions, as well as national crafts. The basis has been laid for the entry of the Republic of Uzbekistan into the world arena. The development of national culture is of great importance for the development of people in all aspects. The restoration of spirituality and values

is the basic conceptual and methodological principle of the model of historical development - the unity of the universal and national spiritual basis, cultural heritage, the restoration of historical programs, the principles of restoration and development of interethnic relations, special consideration of education and enlightenment¹.

The oldest caravan routes in Karakalpakstan are the road connecting the East with the West through the famous Silk Road, and ancient and medieval civilization contributed to the emergence of highly original sources and wonderful examples of spiritual culture. There are thousands of historical monuments and antiquities in the country, most of which are of historical and archaeological significance.

Law of the Republic of Uzbekistan on Tourism,² Decree of the President of the Republic of Uzbekistan on measures to ensure the accelerated development of the tourism industry of the Republic of Uzbekistan, PF-4861 of December 2, 2016 In accordance with the Decree³, the Republic of Karakalpakstan annually holds cultural and entertainment events, which are distinguished by the culture, identity and art of the people.

Sufficient ignorance of tour operators, the lack of strong links between them and the influx of foreign tourists to the country, the influence of cultural institutions, non-governmental organizations have a negative impact on the development of tourism. To see many unique historical, scientific, artistic and cultural heritage sites in the territory of the Republic, including the Travel Tourism route: Mizdakkhan archeological complex of Khojayli district, Davut ota shrine of Kungrad district, Sultan Uvays bobo shrine of Beruni district, Hakim ota mausoleum of Moynak district, Sheikh Jalil bobo mausoleum of Amudarya district, Norinjon bobo mausoleum of Elinqala district, Chinja bobo mausoleum of Elikqala district; Ecological tourism route: Aral Sea of Moynak district, Lake Sudoche, Kuyi Amudarya biosphere reserve, Ustyurt plain of Kungrad district, Borsakelmes salt lake (salt deposit), open-air ship cemetery, Urga village;

The archeological tourist route includes: Chilpik, Ayazqala, Tpaqraqala, Gyaur kala, Djampiq kala, Iyshan kala, Qizil kala, Kat kala, Jambas kala archeological sites and many others with a total of about 291⁵ sites. Of these, 131 are archeological sites, 24 are architectural objects, 91 are monumental objects and 45 are attractions^[1].

In the field of tourism, the steady growth of the eastern direction is widely observed. He noted that the number of people wishing to visit Karakalpakstan is growing. The countries of Central Asia are united on the basis of a single Great Silk Road chain, which includes about 20 countries, including the road from Japan to Europe.⁶

The Baday-Tugay sanctuary located in the Beruni region of the Republic of Karakalpakstan can be used as a tourist attraction. With its small area, the trek is very rich in flora and fauna.

On the Kokcha hill in the Turtkul region of the Republic of Karakalpakstan, there is a little-known "angry forest" monument of the Stone Age. It can become one of the most interesting objects for everyone in the development of tourism.

Director of the Institute of History of the Karakalpak branch of the Academy of Sciences of the Republic of Uzbekistan, member of the New York Academy of Sciences VN Yagodin made his contribution to the development of tourism in Karakalpakstan. The Institute of History, Archeology and Ethnography of the Karakalpak branch of the Academy of Sciences of the Republic of Uzbekistan in cooperation with the Tashkent Institute of Reconstruction has

developed a number of projects in the framework of the "Golden Ring of Ancient Khorezm". Many historical sites have been preserved in good condition, despite the fact that historical monuments have been around for thousands of years.⁷

It is necessary to use certain ecological features in the development of tourism in the country. A project to develop tourism in Karakalpakstan has been developed in cooperation with the media, historians and museum staff. A modern car camp has been built in the south-western part of the capital of Karakalpakstan. Every day there are car tourists from Kazakhstan, Russia, Turkmenistan and the Baltic States.

In developing the tourism project, Arab sheikhs and Japanese exoticists expressed interest in visiting unique archeological sites, nature reserves, and expanding tourism infrastructure around the world^[1].

The Ayazkatur travel agency, which was established in 1998, has a special place in the development of tourism in Karakalpakstan. By the year 2000, the summer tourist camp "Ayazkala" began its activities. In 2005, on the basis of a UNESCO grant, the company installed solar panels and water filters.⁸

The main goal of the project on construction and protection of clay constructions in Central Asia on the basis of the UNESCO project was to preserve the clay structures of Karakalpakstan in the climatic conditions of the Aral Sea. Good results have been achieved in a very short period of time since the establishment of Ayazkala-Tour. In October 2007, an international symposium entitled "At the Crossroads of Culture along the Aral Sea" was held in Nukus, Boston and Beruni. The second part of the seminar is dedicated to the 100th anniversary of the great researcher SP Tolstov, who studied the ancient Amudarya rivers. In this symposium: M.Mambetullaev (Nukus), N.Boroffka (Germany), S.B.Bolelov (Russia), M.M.Rojanskaya (Russia), I.A.Arjantseva (Russia), Yu.F.Buryakov (Tashkent), R.A. Hed-don (UK), M.Sh.Kdyrniyazov (Nukus), E.A.Armarchuk (Russia), EDZilivinetskaya (Russia), AITorgoev (Russia), A.V.G.Betts, Head of Archaeological Research of Karakalpakstan and Australia, and V.N.Yagodin participated with their reports.

According to the Resolution of the President of the Republic of Uzbekistan dated February 28, 2017 No PP-2803 "On additional measures for economic development and employment of Muynak district of the Republic of Karakalpakstan in 2017-2018" on October 24-25 in Muynak district International Music Festival, the International Eco-Festival "Restoration of the Aral Sea and the Muynak" and the gastronomic festival "99 dishes from the fish of the Aral Sea". More than 30 tourists from 9 countries of the world (Kazakhstan, Russia, France, Germany, Belgium, South Korea, China, America and England), 18 hotels from the Republic of Karakalpakstan and regions, including Ratmina, Massaget, Ayaz Yurt, Tourism companies such as "Jipek Joly", "Doslyq" and 5 "Movluda Qaldirgosh", "Tazabay Grant Servis", "Moynak Tur", "Nice Nukus", "Ayaz Yurt" took part in it.

At the international gastronomic festival "99 kinds of fish from the island" chefs prepared 112 fish dishes. Chefs of Muynak district prepared 78 fish dishes, 37 of which are ancient. The first place in the gastronomic festival "99 kinds of food from the fish of the island" was awarded to the chefs of Muynak district. The second place was taken by Khorezm region, and the third place was taken by skilled cooks of Amudarya district. Within the framework of this festival, in the

nomination "The best black house" the shepherds of Chimbay, Beruni and Amudarya districts were awarded.⁹

Decree of the President of the Republic of Uzbekistan dated February 3, 2018 No PF-5326 "On additional organizational measures to create favorable conditions for the development of tourism potential of the Republic of Uzbekistan",¹⁰ February 7, 2018 No PP-3514 "On accelerated development of domestic tourism In accordance with the decisions of the Government of the Republic of Uzbekistan "On measures to ensure the provision of tourism" provides for the organization of tourism and excursions throughout the country. A total of 211,478 people, including 48,745 Uzbeks, 13,319 foreign tourists, 68,980 young people and 80,434 people visited the museums for free in order to implement the project "Travel around Uzbekistan". In order to promote the museum exhibits, employees of state museums provided information about the activities of museums in 43 articles in newspapers and magazines, 202 TV and radio broadcasts through the media.

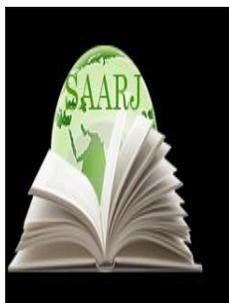

Within the framework of this project, the State Museum of Art's named after IV Savitsky of the Republic of Karakalpakstan was visited by 637 guests from Tashkent, Bukhara, Navoi, Kashkadarya, Samarkand regions, Urgench, Khiva region of Khorezm region in February 2018.^[10]

The transition to market relations has identified a number of important factors in the national and cultural revival of Karakalpakstan. Particular attention was paid to the spiritual development of society, a comprehensively developed person, the enrichment of spiritual culture. A number of important measures have been taken in the Republic of Uzbekistan and laid the foundation for future development. Socio-economic and spiritual changes and the transition to market relations are a large-scale and multifaceted process, but also include major changes in the cultural sphere as an important factor.

**“MIXED EDUCATIONAL TECHNOLOGIES OF ACCELERATED
 TEACHING OF ENGLISH IN CLUSTER CONDITIONS” (ON THE
 EXAMPLE OF NON-PHILOLOGICAL STUDENTS)**

N.N. Yusupova*

*Language and Literature named after A. Navai,
 Tashkent State University of Uzbek,
 UZBEKISTAN

ABSTRACT

The article is devoted to the extremely topical issue of choosing the most effective methods of teaching foreign languages to students of higher education institutions, which can provide motivation for learning a foreign language and increase students' activity. The role and importance of informational and pedagogical technologies have been determined, as well as the effectiveness and expediency of their introduction into the educational process of the educational establishment has been substantiated. The modern innovative pedagogical technologies of teaching English for future preschool teachers and primary school teachers are considered. The purpose of learning a foreign language is to form an educated person, capable of engaging in intercultural communication and solving linguistic tasks. Innovative technologies of teaching foreign languages in higher educational establishments of Ukraine are characterized. The contents of the concept of “technology” and “pedagogical technology” have been clarified. The factors that contribute to the effectiveness of foreign language training of students of pedagogical specialties are clarified and the necessity of introduction of pedagogical technologies in the process of teaching foreign languages is substantiated. Qualitative foreign language training for students is impossible without using of innovative pedagogical technologies. Modern innovative technologies in education are the use of information and communication pedagogical technologies in the educational process, project work, work with educational computer and multimedia programs, distance technologies in learning foreign languages, creation of presentations in Microsoft PowerPoint software environment, use of Internet resources. These technologies help to implement a person-centred approach to learning, provide individualization and differentiation of learning based on students' abilities and level of

knowledge. Modern pedagogical technologies, which combine the communicative and cognitive goals of foreign language training, are used for the formation of communicative competence (communicative skills formed on the basis of linguistic knowledge, skills and abilities).

KEYWORDS: *Foreign Language Teaching, Foreign Speech Activity, Teacher, University, Competence, Teaching, Technology, Pedagogical Technology*

INTRODUCTION

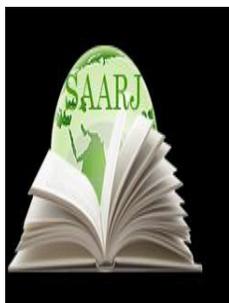

Today, there is a steady trend towards a reorientation of the higher education system towards new values, where humanization of the pedagogical process and the democratization of interpersonal relations have become paramount. A graduate of a higher school must be competitive, in demand on the specialty, which implies a high level of its general development, possession of information and communication competence, high professionalism, an ability to make independent decisions, innovative thinking and productive adaptation to changing. The main task of the state is to prepare highly qualified specialists who knows one or more foreign languages. Educational reforms contributes to the emergence of new teaching methods for the development of creative personality, changed the authoritarian style of educational activity on a humanistic approach taking into account the individual characteristics of the youth. Foreign language is now a means of intercultural communication, that is why the mastery of foreign language speech activity is not only aimed at development of communicative competence (language, speech, sociocultural, crosscultural etc.), but also education by means of foreign language. World changes very fast so using of new and modern pedagogical technologies are not only “trend”, they are very important and necessary for educational process. Analysis of recent research and publications. Speaking foreign language has always been one of the main tasks of methodology of teaching foreign languages. Domestic and foreign methodologists, such as G.E. Boretska, O.P Datskiv, Y.O. Dyachkova, V.L. Skalkin, A. Maley, A. Duff, A.L. Berdychevsky, N.F. Borysko, L.P. Golovanchuk, A.G. Gordeev, V.A. Maslova, V.V. Safonov, S.G. Ter-Minasov used different approaches as for teaching and learning speaking of foreign language. Researchers of scientists and requirements for knowledge of students of higher educational institutions indicate the need to improve educational process using the most effective methods and technologies of learning foreign language. The purpose of the article. The main purpose of this work is to analyse modern pedagogical technologies of teaching and learning English language, to identify and disclose educational opportunities for the use of innovative technologies in teaching and learning English language for future pre-school and primary teachers in high educational establishments. Presenting main material. Pedagogical activity should be innovative as it’s one of the essential factors for the successful educational process of any educational institution. Innovative activity creates the basis for creating the competitiveness of an institution in the educational services market and on the other hand it determines the directions of professional growth of teachers or lecturers and their creative search that really contributes the personal growth of students [1]. In this regard, nowadays, the use of modern informational and pedagogical technologies in educational establishments has become increasingly widespread, representing not only modern technical means, but also new approaches to the educational process. This is due to the main purpose of teaching foreign languages: the formation and development of the communicative culture of students, their practical mastery of a foreign language. The task of the university teacher or lecturer is to create all conditions for the

practical training of the language by each student. This involves the selection of such teaching methods that would allow him to show his activity and his creativity. Modern innovative technologies are related to the use of various informational and pedagogical technologies and Internet resources. An analysis of the activities of universities shows that today ensuring of the principle of variability helps the pedagogical process be flexible to any educational model and tasks. As for the background of the development of various options for the content of education, we should identify ideas, which became the introduction of the concept of educational technology into the philosophy of education. According to the Interpretative dictionary technology is a set of techniques used in any business, skill or art. Among the large number of definitions of this concept, we should mention an interpretation of pedagogical technology proposed by B.T. Likhachev: “this is a set of psychological and pedagogical attitudes that determine a special set and layout of forms, methods, teaching methods, educational tools that form the organizational and methodological aspects of the pedagogical process” [4]. I.P. Volkov came to a conclusion that pedagogical technology is a description of the process of achieving the planned learning outcomes [2]. Proceeding from this, among the list of various pedagogical technologies, the most confidently tested by time are the following: multilevel training; cooperative learning; individual and differentiated approach; project method and others. All of them contribute to the development of innovations in education, involving the improvement of pedagogical technologies and related methods, techniques and learning tools, developing students’ ability to motivate actions and to navigate independently using and analysing the information; the formation of their creative thinking and the disclosure of their natural abilities. Pedagogical technologies are associated with the widespread use of new information technologies, which make it possible to fully reveal the didactic functions of these methods and to realize the potential educational opportunities. Since today free access to the necessary information is required, in the information centres all the opportunities are created for access to scientific, cultural and information centres around the world in order to form their own independent opinion as a part of educational process according to the tasks. Thus, students should be provided with favourable conditions for using the technological capabilities of modern means of communication both for searching and receiving information, and for developing cognitive and communicative abilities and developing their ability to make decisions quickly in difficult situations. This process proceeds more successfully using informational and communicational training technologies, including specific methods and technical means (computers, audio and video, telecommunication networks, etc.) for working with information. Today, this type of pedagogical technologies is designated by the term “computer technology of instruction”, which continues to develop the ideas of programmed instruction, opening up new technological possibilities of educational process with advantages connected with computers and telecommunications. According to the latest data provided, in particular, by the Internet, currently all universities in Ukraine use innovative technologies during educational process (seminars and conferences). They are attended by both specialists of higher education institutions and teachers of secondary schools. All the types of educational establishments that use innovative technologies are always open to modern scientific research. In the curriculum of such establishments we can find such forms of training as design development, training, internships in production, as well as participation in research organizations, practice of different types. Considering the technological aspect of teaching foreign languages in pedagogical institutes and universities, we think that the most widely used are personality-oriented and informational based

learning technologies. Personally- oriented technologies are represented by technologies of differentiation and individualization of instruction, design technologies, etc. The main forms of using information technology are: 1) multimedia English lessons (using the basis of computer training programs); 2) testing on computers; 3) English lessons on the basis of computer presentations during lectures, seminars, labs and students' reports. Using the PowerPoint computer program, English teachers can organize a series of multimedia lessons, training modules, electronic study guides that allow students to integrate audiovisual information presented in various forms – graphics, slides, text, video, chat etc.; 4) telecommunication projects, work with audio and video resources online; 5) distance learning, including all forms of educational activity, carried out without personal contact of the teacher or lecture and student. Almost any educational services are presented on the global Internet today, from short-term continuing education courses to comprehensive higher education programs; 6) using of an interactive tablet Smart Board; 7) voice chat on the local network, used to teach phonetics. For the implementation of the chat, free Net Speakerphone or Speaker programs are used, which allow to communicate in any mode: teacher – student, student – student, conference mode; 8) linguaphone devices, which include the teaching console and workplaces of students, as well as equipment according to one of the following schemes: audio-passive, audio-active or audiocomparative [8, p. 125]. Audio passive devices aim to provide students with the opportunity to listen to phonograms; audio-active devices allow students not only to listen to phonograms, but also to train themselves in loud speech, audio and audio devices allow you to record your speech on a tape recorder, and then listen to this recording and compare it with the example. All this is aimed for creation of a foreign language environment in the process of teaching foreign languages and achieving of technical and informational means of instructions. Computer training programs in foreign language classes allow lecture to carry out the following forms of exercises as: pronunciation, grammar material, vocabulary, writing, teaching monologist and dialogical speech etc.

ABSTRACT

In the United Kingdom, cardiovascular disease is a major and increasing issue, accounting for almost one-third of all fatalities and causing considerable morbidity. It is also of special and urgent importance as emerging nations undergo lifestyle changes that bring new risk factors for cardiovascular disease, resulting in an increase in cardiovascular disease risk throughout the developing globe. Because the burden of cardiovascular disease may be reduced via deliberate risk reduction, primary prevention should be a top goal for all health policymakers. International recommendations agree on the significance of quitting smoking, losing weight, and exercising, however guidelines differ somewhat in their approach to hypertension and significantly in their approach to achieving an optimum lipid profile, which remains a controversial topic. Although formerly popular concepts like the polypill seem to be empty of in-vivo effectiveness, there are still areas of potential interest, such as the advantage of lowering serum urate and the utility of lowering homocysteine levels.

KEYWORDS: Alcohol, Cardiovascular Disease, Diet, Exercise, Hypertension, Primary Prevention, Smoking, Uric Acid.

INTRODUCTION

Coronary heart disease (CHD), cerebrovascular disease (CVD), peripheral arterial disease (PAD), rheumatic and congenital heart disorders, and venous thromboembolism are all examples of cardiovascular disease (CVD). CVD is responsible for 31% of global mortality, with CHD and cerebrovascular accident accounting for the bulk of this. Throughout England, CVD accounts for almost 34% of all fatalities, while in the European Union, the number is closer to 40%. As the incidence of CVD risk factors increases in formerly low-risk nations, the global rate of CVD is expected to climb. Currently, 80 percent of CVD deaths occur in developing countries, and CVD is projected to overtake infectious illness as the leading cause of death in most developing countries. CVD is not only a major cause of death, but it is also the leading cause of disability-adjusted life years worldwide.

The INTERHEART research investigated the impact of CVD risk factors such as dyslipidemia, smoking, hypertension, diabetes, and abdominal obesity, as well as the preventive benefits of fruits and vegetables intake and regular physical exercise. These risk variables were shown to be constant across all populations and socioeconomic levels examined, indicating the feasibility of globally consistent methods to CVD primary prevention[1]–[4].

Lifestyle Modifications:

Exercise:

Exercise is widely acknowledged to have a beneficial influence on the majority of health outcomes, and CVD is no exception. Even at extremely high levels of exercise, the risks of death and morbidity are low, and in the vast majority of cases, the benefits exceed the dangers. The National Institute for Health and Clinical Excellence (NICE) recommends 150 minutes of moderate intensity aerobic exercise or 75 minutes of intense aerobic activity each week. This may be characterized in terms of perceived changes in metabolic rate or in terms of relative metabolic rate changes. They also recommend doing muscle-strengthening exercises two or more times each week. NICE only makes a consensus recommendation on the benefits of exercise for primary prevention, while the AHA and ESC guidelines provide class 1 A recommendations with almost similar prescriptions, based on a robust and consistent body of evidence.

Diet:

Diet is believed to have a major influence in CVD risk, but the body of data isn't conclusive, and the recommendations aren't unanimous either. The American Heart Association recommends the DASH diet, which is low in sugar and saturated fats and rich in vegetables, fruits, and whole grains. This has been proven to reduce blood pressure (BP) and low-density lipoprotein cholesterol (LDL-C), both of which are independent risk factors for CVD, but it does not claim to demonstrate a direct reduction in CVD risk[5], [6]

Smoking:

Smoking has long been recognized as a significant risk factor for cardiovascular disease. Smoking doubles the 10-year CVD death rate in Europe, according to 21 studies, and smoking is responsible for 30% of CVD mortality in the United States. Not only is it harmful, but it also has a dose-dependent impact with no known safe lower limit. Passive smoking is also

hazardous, since it raises CVD risk by 30% in the workplace, and UK public health measures such as smoking bans have been linked to a substantial reduction in CVD occurrences.

Stopping smoking is the most cost-effective strategy in CVD prevention, with some benefits seen as soon as a month after quitting. Regardless of the duration or severity of the smoking habit, all recommendations suggest quitting, with immediate and long-term advantages. Nicotine replacement treatment (NRT), bupropion (a norepinephrine dopamine reuptake inhibitor), and especially varenicline (a partial nicotine receptor agonist) are all widely prescribed pharmacologically. Both of the first two increase abstinence rates by 50–70%, whereas varenicline triple abstinence rates.

Weight:

BMI > 25 is a risk factor for CVD, with the lowest all-cause mortality observed at BMI 20–25. However, since BMI 20 is associated with higher all-cause mortality, reductions below this level are not usually advised. No particular weight-loss strategy is recommended in the recommendations, although maintaining a healthy weight is recommended to reduce CVD risk. BMI is a strong predictor of CVD risk, especially at higher levels, although there is solid evidence that visceral adiposity and liver fat are important risk factors at all levels of BMI. This helps to explain why the CVD risk profile in overweight people differs depending on where the adipose tissue is deposited. There is growing evidence that, in addition to lowering BMI, lowering waist circumference as a proxy for lowering visceral fat should be a key goal for lowering CVD risk.

Alcohol:

Given the recognized consequences of frequent and excessive alcohol use, alcohol consumption is a contentious topic. The problem arises because previous data indicated a J-shaped curve in terms of risk, with abstention linked to an increase in CVD compared to light drinkers, and low levels of alcohol use linked to a reduced risk of CHD. Aside from the known physiological effects of alcohol, such as interfering with platelet aggregation, data from the INTERHEART research seems to support these assertions, indicating lower risk for those who drink moderately or little [7], [8].

However, a recent large mendelian study by Holmes et al. found that decreases in alcohol consumption are linked with lower CVD risk throughout the alcohol intake spectrum within a genetic subgroup for alcohol dehydrogenase. This suggests that lowering alcohol consumption, especially for moderate drinkers, is linked to a lower risk of cardiovascular disease. The ESC recommendations state that there is no safe amount of alcohol consumption.

Medical Treatment:

- *Lipid-reduction therapy:*

Lipid-lowering interventions have long been utilized in primary prevention, and sub-fractions of blood lipids have been investigated to distinguish their separate impacts on the CVD risk profile. LDL-C is the most well-studied atherogenic subfraction, with a significant link between LDL-C levels and CVD risk: lowering LDL-C by 1.0 mmol/L reduces CVD mortality and non-fatal MI risk by 20–25 percent.

Although it has been suggested that increased levels of high-density lipoprotein cholesterol (HDL-C) are cardio protective, the causal connection has yet to be established. The negative CVD profile of HDL-raising medications like torcetrapib, as well as a recent randomized randomization study showing no inherent advantage from naturally higher HDL-C levels, support this debate.

- *Anti-Hypertensive Therapies:*

Hypertension is a risk factor for the development of CVD on its own. Increasing blood pressure over 115/75 mmHg has a constant and exponential impact, with each 20 mmHg rise in systolic blood pressure (SBP) or a 10 mmHg increase in diastolic blood pressure (DBP) doubling the risk of a cardiovascular event. Previous meta-analyses have revealed a decrease in CVD risk over a broader range of blood pressures, indicating that there is no upper limit to the benefit of lowering blood pressure and no clear cut-off point beyond which additional reductions become detrimental. According to recent meta-analyses, the advantages of decreasing blood pressure from a baseline of 140 may be ambiguous or perhaps harmful. This data suggests that lowering blood pressure reduces mortality in hypertensives, but there is no evidence for early therapy in normotensive or pre-hypertensive individuals.

- *Glucose in the Blood:*

Glucose management is important in diabetics, but it has no statistically meaningful relationship with CVD risk in non-diabetics. On average, people with diabetes mellitus (DM) have a higher risk of cardiovascular disease (CVD), while those with impaired fasting glucose (IFG) have a higher risk of CVD and DM development. Serum glucose decrease has been found to lower CVD risk in diabetics, with the lowest risk occurring at normal blood sugar levels. More severe glucose reductions were harmful, with specific thiazolidinediones and dipeptidyl peptidase-4 inhibitors posing a particular CVD risk. In contrast to conventional treatment, recent studies with oral hypoglycaemics from the sodium/glucose transporter 2 inhibitor family, such as empagliflozin, have proven to decrease all-cause mortality by 32 percent, CVD death by 28 percent, and HF death by 35 percent. Although it seems that these advantages were mediated by cardio-renal haemodynamic effects rather than glucose reduction, the significant benefits shown would suggest that it be used early in diabetes patients. More evidence on these medicines is needed to update current recommendations.

- *Anti-platelet Therapy:*

Antiplatelet treatment is an important component of secondary prevention, however it should be avoided in individuals without comorbidities for primary prevention owing to a higher risk of bleeding and no evidence of CVD risk reduction. The counsel given to diabetic patients is contradictory: According to ESC recommendations, the danger of bleeding outweighs the advantages of aspiration treatment, while the American College of Chest Physicians recommends aspirin therapy in patients with DM and a 10% chance of a 10-year CVD event.

LITERATURE REVIEW

B. Reamy et al. discussed about prevention of cardiovascular disease[9]. In the United States and across the globe, cardiovascular disease is still the leading cause of mortality. Cardiovascular disease prevention is a goal that can be achieved. According to a World Health Organization study published in 2010, lowering risk factors in young people and maintaining an optimal risk

profile until age 50 may avoid 90% of atherosclerotic cardiovascular disease occurrences. Poor risk profiles are caused by a variety of factors, including misinformation and poor execution of established preventative measures, misguided concerns about medicines, and a misunderstanding of optimal food and lifestyle choices. Every patient needs a personalized cardiovascular disease preventive plan that includes methods for reducing modifiable cardiovascular risk factors.

S. Wiloughby et al. discussed about Platelets and Cardiovascular disease[10]. Platelets have an essential function in cardiovascular disease that is frequently overlooked. For example, greater pro-aggregatory stimuli or decreased anti-aggregatory chemicals may change the platelet's usual response, resulting in enhanced platelet activation/aggregation, which can occur in both chronic (e.g. stable angina pectoris) and acute cardiovascular disease situations (e.g. acute myocardial infarction). Furthermore, platelet hyper aggregability has been linked to coronary artery disease risk factors (e.g. smoking, hypertension, and hyper cholesterolaemia). Finally, the growing usefulness of anti-platelet treatments in the therapy of the aforementioned disease states underlines the critical role platelets play in cardiovascular disease etiology. The normal physiologic role of platelets in maintaining homeostasis, the pathophysiologic mechanisms that lead to platelet dysfunction in cardiovascular disease, and the role and advantages of anti-platelet treatments are all covered in this article.

DISCUSSION

Cardiovascular disease (CVD) is a general term for conditions affecting the heart or blood vessels. It's usually associated with a build-up of fatty deposits inside the arteries (atherosclerosis) and an increased risk of blood clots. Signs and symptoms can include: Chest pain, chest tightness, chest pressure and chest discomfort (angina) Shortness of breath. Pain, numbness, weakness or coldness in your legs or arms if the blood vessels in those parts of your body are narrowed. The most important behavioural risk factors of heart disease and stroke are unhealthy diet, physical inactivity, tobacco use and harmful use of alcohol. The effects of behavioural risk factors may show up in individuals as raised blood pressure, raised blood glucose, raised blood lipids, and overweight and obesity.

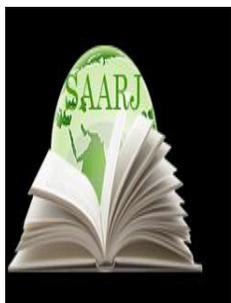

CONCLUSION

The goal of CVD prevention is to decrease the incidence of major cardiovascular events, resulting in less early impairment and morbidity while also extending survival and quality of life. The American, European, and British recommendations all show a variety of strategies for lowering CVD risk profiles, with significant agreement on smoking and exercise, but minor differences in other variables. Pharmaceutical choices have evolved over time, while lifestyle recommendations have remained essentially constant. Primary prevention is evolving, and as more long-term evidence becomes available, we will have a better knowledge of how to decrease CVD risk. If we want to decrease the burden of a preventable illness, we must maintain our efforts.

ABSTRACT

Since the late 1800s, scientists have noticed that the development of certain bacteria inhibits the growth of other germs. Natural anti-bacterials were discovered as a result of these findings of antibiosis between microorganisms. This article discusses key results from many national and worldwide combined organizations' educations on a short overview of antibacterial agent detection in recent years. In India, particularly in the emerging antibiotics, techniques for the appropriate choice of medication are needed to address a complex issue involving prescribers, dispensers, and consumers.

KEYWORDS: *Antibiotic, Antibiotic resistance, Bacterial Infection.*

INTRODUCTION

Infection therapies were mainly dependent on medical folklore prior to the early twentieth century. Over 2000 years ago, antimicrobial mixtures that were employed in the treatment of infections were reported. 1 To cure illnesses, several ancient civilizations, including the ancient Egyptians and Greeks, utilized carefully chosen mold and plant materials and extracts. In the late 1880s, Paul Ehrlich pioneered synthetic antibiotic chemotherapy as a science and the creation of antibacterials. He then suggested the concept of developing compounds that would function as a selective medication, binding to bacteria and killing them without hurting the human host. In 1907, he found a medicinally effective chemical, the first synthetic antibacterial salvarsan, now known as arsphenamine, after screening hundreds of colors against different species[1].

Antibiotics:

Selman Waksman and his colleagues coined the word antibiotic in 1942 in a journal article to designate any chemical generated by a microbe that inhibits the development of other bacteria in high dilution. Substances that kill bacteria but are not generated by microbes were omitted from this criteria (hydrogen peroxide). Synthetic antibacterial substances, such as sulfonamides, were also eliminated. The word "antibiotic" is now used to refer to any medicine that kills or slows the development of bacteria, regardless of whether the medication is generated by a microbe or not. Antimicrobial medication used to treat and prevent bacterial infections. Bacteria may be killed or inhibited by these substances. Antibiotic (which means "against life") is a word that is often used interchangeably with antimicrobial to refer to any chemical that is used to fight microorganisms. Antibacterial and antibiotic are two different things, according to some sources; antibacterial is used in soaps and disinfectants, while antibiotics are employed in medicine. Antibiotics were a game-changer in medicine in the twentieth century. This has resulted in widespread issues, prompting the Globe Health Organization to designate antimicrobial resistance as a "major danger." Antimicrobial resistance is occurring today in every area of the world and has the potential to harm anybody, of any age, in any nation[2]–[7].

Medical Uses:

Antibiotics are drugs that are used to cure or prevent bacterial and protozoan illnesses. When an infection is suspected of causing an ailment but the pathogen responsible has yet to be identified, empiric treatment is used. This entails the administration of a broad-spectrum antibiotic depending on the indications and symptoms given, and is started while test results are awaited, which may take several days. When the pathogenic bacteria responsible for the infection is identified, definite treatment may begin. Typically, this will include the administration of a narrow-spectrum antibiotic. The antibiotic used will also be determined by its cost. Identification is essential since it may decrease the expense and toxicity of antibiotic treatment, as well as the risk of antimicrobial resistance developing. Antibiotics may be used for non-complicated acute appendicitis to prevent surgery.

Side-effects:

Antibiotics are thoroughly tested for adverse effects before being approved for clinical use, and they are generally regarded as safe and well tolerated. Depending on the kind of antibiotic administered, the microorganisms targeted, and the particular patient, certain medicines have been linked to a broad range of undesirable side effects ranging from moderate to severe. Side effects may indicate the antibiotic's pharmacological or toxicological characteristics, as well as hypersensitivity or allergic responses. Newer medicines' safety characteristics are often less well known than those with a lengthy history of usage. Diarrhea is a common side effect caused by a shift in the species composition of the intestinal flora, which may lead to an excess of harmful bacteria like *Clostridium difficile*. Antibacterials may also alter vaginal flora, causing yeast species of the genus to overgrow.

Correlation with obesity:

Antibiotics aren't known to induce obesity in people. Antibiotic exposure at an early age (6 months) has been linked to an increase in body mass in studies (at 10 and 20 months) Another research discovered that the kind of antibiotic used was important, with macrolides having the greatest risk of being overweight when compared to penicillin and cephalosporin. As a result, there is a link between early antibiotic exposure and human obesity, although whether this is a

causative connection is unknown. Although there is a link between antibiotic usage and obesity in children, the impact of antibiotics on obesity in humans must be balanced against the benefits of clinically justified antibiotic therapy in infancy[8].

Interactions:

Birth control pills:

There are few well-controlled research on the effects of oral contraceptive failure and antibiotics. Antibiotics do not interact with birth control pills, according to the majority of research, including clinical trials that show the failure rate of contraceptive pills caused by antibiotics is extremely low (about 1 percent). Noncompliance (forgetting to take the pill), vomiting, or diarrhea are all factors that may lead to oral contraceptive failure. ethynyl estradiol serum levels in the blood are affected by gastrointestinal problems or interpatient variations in oral contraceptive absorption. Women with irregular periods are more likely to fail, therefore they should be encouraged to take backup contraception throughout antibiotic therapy and for one week thereafter. Backup contraception is indicated if patient-specific risk factors for decreased oral contraceptive effectiveness are identified.s

Alcohol:

Interactions between alcohol and some antibiotics may occur, resulting in adverse effects and reduced antibiotic treatment efficacy. While modest alcohol intake is unlikely to produce severe adverse effects with many common antibiotics, there are certain medicines for which alcohol consumption may induce serious side effects. As a result, the kind of antibiotic used determines the possibility for adverse effects and efficacy. Additionally, alcohol intake may decrease the effectiveness of doxycycline and erythromycin succinate. The reduced activity of the liver enzymes that break down the antibiotic molecule is another impact of alcohol on antibiotic action. Antibacterial action may be dependent on the bacterial development phase, and it often requires continued metabolic activity and bacterial cell division. These results are based on laboratory research, and they have also been proven to eradicate bacterial infection in clinical situations. Because antibacterial activity is often dependent on concentration, in vitro antibacterial activity characterization frequently involves determining the lowest inhibitory concentration and minimum bactericidal concentration of an antibiotic.

Resistances:

The development of antibiotic resistance in bacteria is a frequent occurrence. Resistance typically arises as a result of evolutionary processes that occur during antibiotic treatment. Antibiotic therapy may favor bacterial strains with physiologically or genetically improved resistance to antibiotics at high dosages. It may result in the preferred development of resistant bacteria under certain circumstances, while the medication inhibits the growth of vulnerable germs. Biodegradation of medicines, such as sulfamethazine-degrading soil bacteria introduced to sulfamethazine via treated pig feces, may lead to resistance. Bacterial survival is often due to inheritable resistance, although antibacterial resistance may also spread via horizontal gene transfer. Antibacterial resistance may come at a biological cost, lowering the fitness of resistant strains and therefore limiting the proliferation of antibacterial resistant bacteria in the absence of antibacterial chemicals, for example. Additional mutations, on the other hand, may compensate for this fitness cost and let these bacteria survive. Antibiotics and antibiotic resistance are both

old substances and processes, according to paleontological evidence. Antibiotic targets for which mutations have a detrimental effect on bacterial reproduction or viability are useful. A mutation in the bacterial chromosome or the accumulation of extra-chromosomal DNA causes acquired resistance.

Vaccines:

Immune modulation or augmentation is used in vaccines. Vaccination either activates or strengthens a host's immunological competence to fight infection, resulting in macrophage activation, antibody production, inflammation, and other typical immune responses. Antibacterial vaccinations have resulted in a significant decrease in bacterial illness worldwide. Vaccines produced from attenuated whole cells or lysates have mostly been superseded with less erectogenic cell-free vaccines made up of purified components like as capsular polysaccharides and their conjugates, as well as inactivated toxins (toxoids) and proteins.

Phytochemicals:

Some antioxidant dietary supplements, such as grape seed extract, also include phytochemicals (polyphenols), which have antibacterial effects in vitro. Phytochemicals have been shown to decrease peptidoglycan production, harm microbial membrane structures, change the hydrophobicity of bacterial membrane surfaces, and alter quorum sensing. With the rise in antibiotic resistance in recent years, researchers are looking into the possibility of novel plant-derived antibiotics.

LITERATURE REVIEW

S. Sengupta et al. discussed about roles of antibiotics and antibiotic resistance[9]. Antibiotics are chemotherapeutic drugs that have been used to treat bacterial infections in clinical practice since the 1940s. However, after the widespread development and spread of antibiotic-resistant bacteria, the advantages provided by these magic bullets have been significantly diminished. While it is clear that overuse and misuse of antibiotics contributes substantially to the development of resistant strains, antibiotic resistance has also been found in wild bacteria from distant locations that are unlikely to be affected by human activity. Antibiotic biosynthetic genes and resistance-inducing genes are known to have evolved billions of years ago, long before antibiotics were used clinically. As a result, it seems that antibiotics and antibiotic resistance determinants play additional functions in nature that are frequently overlooked due to the overemphasis on antibiotics' therapeutic significance and the problem presented by antibiotic resistance in pathogens. Antibiotics are often found at sub-inhibitory quantities in the natural environment, serving as signaling molecules that aid quorum sensing and biofilm development. They also affect host-parasite interactions and play a key role in the generation of virulence factors (e.g., phagocytosis, adherence to the target cell, and so on). Antibiotics and antibiotic resistance in the naturally existing microbial population are poorly understood from an evolutionary and ecological standpoint. As a result, more research into the function of antibiotics in nature is required. Studies into the complexities of microbial physiology promise insight into the intricacies of microbial physiology and are expected to offer some guidance in preventing the development and spread of antibiotic resistance. This article summarizes some of the most current research on the function of antibiotics and the genes that confer antibiotic resistance in nature.

G. Cheng et al. discussed about Antibiotic alternatives[10]. Sub-therapeutic doses of antibiotics have been used in food-animal feeds for decades to protect animals from illness and enhance production performance in contemporary animal husbandry. Meanwhile, worries about the development of antibiotic-resistant bacteria as a result of overuse of antibiotics and the advent of less new drugs have spurred attempts to create "antibiotic alternatives." The question of whether the alternatives can really replace antibiotics is still being debated. This article covers current developments in antibiotic alternatives as well as their future prospects. Immunity modifying agents, bacteriophages and their lysins, antimicrobial peptides, pro-, pre-, and synbiotics, plant extracts, pathogenicity inhibitors (bacterial quorum sensing, biofilm, and virulence), and feeding enzymes are all extensively addressed. Finally, the viability of antibiotic alternatives is thoroughly examined. It's difficult to predict if alternatives will be able to replace antibiotics in veterinary care in the near future. At this moment, the best and quickest approach to minimize the negative consequences of antibiotic misuse and guarantee the safety of animal-derived food and the environment is to use antibiotics wisely and develop scientific monitoring systems.

DISCUSSION

Antibiotics are antimicrobial substances that are effective against microorganisms. Antibiotic medicines are extensively utilized in the treatment and prevention of bacterial infections since they are the most common kind of antibacterial agent. Bacteria may be killed or inhibited by these substances. Antibiotics are very useful in the battle against illness, but they may also be dangerous in certain cases. Antibiotics may induce allergic reactions and severe, perhaps life-threatening diarrhea, which is caused by the bacterium *Clostridium difficile* (C. diff). Antibiotics should be given for 7 to 14 days in most cases. Shorter treatments may sometimes be just as effective. Your doctor will choose the appropriate antibiotic kind and duration of therapy for you.

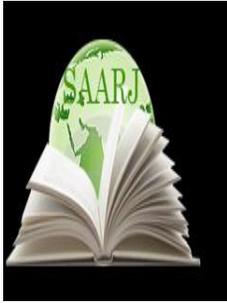

CONCLUSION

Antibiotics have saved millions of lives and revolutionized contemporary medicine, but their effectiveness is waning. Antibiotics: The Essential Elements Healthcare workers, health systems, hospitals, clinics, and nursing homes may all play a role in advancing antibiotic use. Antibiotics are used to cure, prevent, and regulate illness in food animals, as well as to enhance feed utilization in certain instances. Antimicrobial agents ensure food safety and quality by decontaminating or sanitizing animal production facilities, transport facility equipment, and effective hygiene during food processing. Following the Fundamental Elements has already improved the quality of antibiotic recommendations in several hospitals. Patients get the greatest antibiotic therapy when antibiotic regimens and protocols are approved.

ABSTRACT

In this article it is analyzed the questions of practical activity of school pupils in fulfilling of the lowborn on physics. The first relationship is between learners and symbols (for example, drawing, drawing, diagram, bar graph, formula) as each teaching material appears in the form of speech or formula [1]. The student is undergoing a formal change. Changing content in the process of performing laboratory work in physics in the process of a creative approach to performing laboratory work in physics. Each result is obtained in at least two combinations: understand the laboratory work; concept, formula, law, use laws (1) and theoretical knowledge, practical skills and abilities, methods of activity, activation of the student's activity (2). A functional description of the problem or process should come first. Awareness of the need and determination of the significance of the process, assessment of its connection with other processes is associated with functional analysis.

KEYWORDS: *Interest, Motivation, Personality, Activity, Sinter, Analyze, Process, Phenomenon, Creativity, Attract, Didactics, Consciousness.*

INTRODUCTION

Interest in performing laboratory work in physics reveals the motives of knowledge and skills.

Personality develops from the need to think, from the dynamics of thinking to the dynamics of movement. The student, in the synthesis of external influence and internal affect, begins to think creatively. The result is expressed as an independent activity[2].

In the process of interaction between study and activity, two relations are distinguished: the student and the educational material, the student and the existing reality. The first relationship is between learners and symbols (for example, drawing, drawing, diagram, bar graph, formula) as each teaching material appears in the form of speech or formula [1]. The second relationship is between students and reality. The reality revealed in laboratory classes in physics is considered the direction of academic subjects.

The student's activity in terms of relationships consists of the following stages:

1. Collision with the legend.

In this process, two changes appear:

- a) Under the influence of the student, the conventions are brought into a conscious form;
- b) Under the influence of conventional designations, the origin of the student changes - designations, the content is distributed on their basis[3].

1. Rewriting the content based on conventions in its direction. This process also shows two changes:

- a) Changing the content of the symbols under the influence of the student, determining the area, the direction to which the collection belongs;
- b) Under the influence of the student's conventions, a change occurs - the concept of reflection, synthesis and analysis. Thus, the study of didactic designations (for example, drawing, drawing, diagram, histogram, formula) explaining their meanings[5].

The study of the relationship between designation and their meaning is a methodological problem awaiting its researchers.

The student is undergoing a formal change. Changing content in the process of performing laboratory work in physics in the process of a creative approach to performing laboratory work in physics. In the process of a creative approach to the implementation of laboratory work in physics, the changes in the content that have appeared have a didactic meaning[4].

Thus, the content, the analysis of its content is a problem related to the didactics of creativity. When performing laboratory work in physics, a student in the process of translation is faced with the conventions of practical activity, as well as the specialty of making various connections. According to the importance of the relationship, they are divided into 2 groups:

- a) negative connections;
- b) positive connections.

Negative connections hinder the active conduct of laboratory classes, as well as the development of meaningful connections by the student [6]. The material for the student to conduct laboratory studies should carry information. Negative connections lead to a misunderstanding of the goals of performing laboratory work, not being able to distinguish the difference between knowledge and reality, not being able to distinguish between methods for conducting practical exercises, applying connected theoretical knowledge in educational practice, as well as in life.

Overcoming negative connections, the student contributes to the active conduct of the practice.

By reducing negative connections, positive connections are simultaneously increased, the student improves practical skills. Therefore, it is important for a teacher, as well as a teacher-researcher, to know positive connections, to be able to apply them.

There are the following connections between the student and the performance of laboratory work:

1. Communication depending on the content. When performing laboratory work in physics, the ability to memorize the methods of cognitive and practical activity of the student when performing a particular laboratory work. The theoretical foundations for performing laboratory work can be particularly understood by synthesis and analytical analysis of the results. The student leads to an increase in the educational effectiveness of the monitoring of progress.
2. Purposeful communication. This type of communication is determined by the content of the laboratory work. There are usually two ways to achieve a concept by a student.

Objectives of laboratory work in physics: the purpose is understood with the help of the material necessary to perform laboratory work, studying problems, classes, self-explanation of laboratory work[7]. This makes it possible to understand the purpose of laboratory work, leads to mutual understanding between the student and the teacher.

By posing problematic questions and having experienced difficulties in solving these problems, the student understands his goal.

The second method of goal setting in laboratory work is considered effective, but at the same time dangerous, since the student may misunderstand cognitive and practical difficulties, and may also refuse them. This danger becomes less with the development of the ability to perform laboratory work, as well as the development of thought.

3. Functional communication. A functional description of the problem or process should come first. Awareness of the need and determination of the significance of the process, assessment of its connection with other processes is associated with functional analysis. When performing laboratory work, the student performs certain functions. For example, when performing laboratory work in grade 6 on the topic "Useful working coefficient", the following functional properties of theoretical knowledge, practical skills and practice development can be divided: the relationship between general work and useful work; development of the student's consciousness by determining the difference in their content; correct writing of the formula for general and useful work; knowledge between weight and force of movement, knowledge of the physical meaning of performing work, correct spelling of units of measurement, correct concept of unit of measurement[5].

Bringing to the student the function of laboratory work performed by objects has the double meaning of the student's practical activity: determining the relationship between the laboratory work performed, the laboratory work performed or future work. Ensuring the relationship between different objects.

3. Real connection. When performing laboratory work at school, the information about the object and the method of the object's activity are interrelated. For example, there is a rule that in the

formulas $A = FsA = PhF = maF = mg$ when changing the places of the factors, the value of the product does not change.

This topic contains information about any multiplier, as well as a description of the student's method of practical activity - by changing the places of the multipliers. ($A = sFA = hPF = amF = gm$). Currently not paid to the methods of practical activity of the student.

Therefore, in modern pedagogical activity in the first place is the question of gaining knowledge on topics. In fact, the methods of developing practical skills in a student are two sides of the studied object. The organization of the student's practical activity is chosen by moving from the performance of laboratory work by the student to the receipt of information.

Thus, one of the important properties of the student's practical activity is the student's use of the teacher's theoretical knowledge, practical skills in order to enrich the level of knowledge.

Mutual influence in the learning process has 3 stages: primary, secondary, and last. In accordance with these stages, the student prepares himself in consciousness to perform laboratory work: to be aware of the performance of laboratory work, to make and apply decisions by performing laboratory work[5].

Each result is obtained in at least two combinations: understand the laboratory work; concept, formula, law, use laws (1) and theoretical knowledge, practical skills and abilities, methods of activity, activation of the student's activity (2). Decision-making for obtaining information with the help of devices (1) and the psychological mechanism of the student's practical activity - memory, thinking, the use of methods of mental activity (2); application of knowledge for laboratory work (3) and logical methods - distribution of choice, induction or deduction.

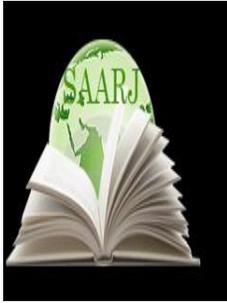

A student in the process of performing laboratory work achieves the results of 3 types:

1. Consciousness. Physiological technology and the corresponding means are involved in this process of practical activity.
2. Making decisions. In this method of performing laboratory work, psychological technologies of practical activity and the corresponding means are involved.
3. Execution. In this case, logical technology and the corresponding means are involved. The process is based on the use of physical and psychological technologies.

PRACTICAL STUDY OF THEORETICAL INFORMATION IN PRIMARY SCHOOL MOTHER TONGUE LESSONS

Tajbenova Saule Sarsengalievna*

*Doctor of philosophy in Pedagogical Sciences (PhD),

Department of primary education of Nukus State Pedagogical Institute named after Ajiniyoz,
UZBEKISTAN

ABSTRACT

The subject and objectives of the methodology of teaching the mother tongue in primary school. The subject of study of the methodology of the mother tongue is the process of acquiring the mother tongue in the educational environment. Simultaneously with the teaching of the methodology to take into account the requirements of educating students to develop their speech, thinking, to develop them as individuals. To prepare answers to the questions of mother tongue teaching methodology in primary school, what the student needs, how to teach, why it should be taught, and so on.

KEYWORDS: *Mother tongue classes, methodology of teaching, structure and graphics, skills, practical knowledge.*

INTRODUCTION

The role of the mother tongue in the school education system and in life. The need for consistency and perspective in mother tongue teaching in the primary grades. The content of knowledge and types of lessons in the native language in primary school.

Principles of structure of the native language program in primary school. Program sections, their general and specific aspects. The amount of knowledge, skills and competencies that need to be mastered in each department.

The scientific basis of the methodology of teaching the native language to primary school and its place among other disciplines. The connection of the methodology with the theory of worldview with the sciences of language, pedagogy, psychology, psycholinguistics, logic, literature.

Principles of mother tongue teaching. Relying on the instructions of other disciplines in the development of the principles of teaching methods of mother tongue. The principle of paying

attention to the matter of language, the internal connection of language, cultivating sensitivity to language, paying attention to the expressiveness of language, the principle of forming oral speech before written speech.

Methods of testing the methods of teaching the native language. Theoretical methods of research: the methodological basis of the phenomenon, the study of related disciplines: the study of "history of the problem" and its evaluation in terms of current tasks: the study of methods of research of related disciplines: the analysis of experimental materials and the formation of practical recommendations.

Empirical (experience-based) methods of verification: study of the work experience of advanced teachers: purposeful observation of the teaching process: a common experimental method in the development of methodology, its differences from the previous ones, tasks. Stages of research. A brief description of the methodological heritage in the field of mother tongue teaching in primary school.

Literacy teaching methods. Goals and objectives of literacy teaching methods. Reading and writing is a type of speaking activity. Psycho-physiological analysis of the reading and writing process of a child and a literate person who has just started school. Sound structure and graphics of the Uzbek language, their interdependence.

Modern analysis-synthesis sound method in literacy teaching. The traditional (habitual) principles of the modern method of analysis-synthesis sound in teaching literacy are educative and nurturing, based on the live speech of students, the method is based on the acquisition of sound; organizational preparation and division into main periods and the principles that are relatively closely formed or in the process of formation.

Differential and individual approach to students in the process of literacy teaching; to teach basic concepts of grammar and spelling without theory; word analysis by syllable-sound; draw a copy of the concept. Incoming modeling element; (educating students).

Educational tasks of literacy classes. To study the readiness of children to teach literacy. Literacy process. The preparation period in literacy teaching, the topics of reading and writing lessons at this stage, and the types of work.

The main period in literacy teaching (alphabet period). Tasks of the main period. Reinforcing reading lessons in which new material is studied and the types of work used in it. The dependence of the construction of the "Alphabet" on the order of learning sounds and letters in the process of teaching literacy. Differential and individual approach to literacy teaching.

The final part of the main period, its functions. The main types of training sessions during literacy training are: work on sound; articulation of sounds, work on diction. Enhancing students' speech in the process of teaching literacy; work on the dictionary. Basic practical knowledge of grammar, spelling in the period of literacy teaching. Peculiarities of lesson organization in low-component schools.

Teaching elementary writing during literacy training. Content and tasks of teaching writing; stages of writing skills formation. Description of the current font. Methods of developing calligraphy skills in connection with teaching writing. Organizational and hygienic conditions of teaching writing. ways to teach letter writing. Typical graphic errors encountered in students.

Basic spelling elements in the process of teaching writing. Enhancing students' speech in writing lessons. During literacy training and writing lessons, the requirements for them. Types of reading and writing lessons, the system of reading and writing lessons. New research in the field of literacy. Literacy problems and prospects. Preparing children for literacy in the family and in kindergarten.

Methods of reading in the classroom. Educational significance and tasks of reading lessons in the classroom. Tasks to teach reading in primary grades and to form active readers. Educational opportunities of reading lessons. The concept of reading skills. The qualities of reading skills are conscious, expressive reading. Ways to improve the process of formation of reading skills. Types of errors in reading and ways to eliminate them.

To study the subject of tense in verbs. Person-number suffixes in verbs. Enhancing students' speech in the process of verb learning. Learning the elements of syntax and punctuation in elementary school. Classification system of materials. Conditions for the formation of basic syntactic concepts in students. Introduce punctuation to younger students.

Methods of learning spelling. Grammatical and anti-grammatical directions in teaching correct writing. The psychological nature of spelling skills. Methods of working on the spelling rule.

Spelling exercises grammatical-spelling analysis, transcription, dictation and its types, lexical-grammatical analysis, description. Exercise selection criteria. Important conditions for the formation of spelling skills.

Testing knowledge, skills and competencies in the mother tongue. Description of four-year primary education "Mother tongue" lessons. Mother tongue lessons. General description of the lesson.

Types and structure of mother tongue lessons. Methods of developing students' speech. Ways and tasks of developing speech in young students. The concept of speech and its cultivation.

Speech development is the responsibility of the native language learner. Requirements for student speech. Speech is an important tool in developing students thinking. The interrelationship of student speech development with other types of lessons from the mother tongue.

Working on the dictionary. Lexicology is the linguistic basis of the methodology of working on a dictionary. The main directions of work on the dictionary in school. Vocabulary enrichment: clarification of students' vocabulary; speech conditions and its role in vocabulary enrichment. Methods of explaining the meaning of words. Work on synonyms and antonyms, polysemous words.

Ways to activate students' vocabulary in connection with reading, retelling a work of art, studying the material, preparation for narration and essay. Syntactic work in the system of student speech development.

The level of syntactic skill that students acquire. Working on vocabulary and speech in primary school. Types of speech exercises. A general understanding of connected speech.

Types of exercises from related speech. Specific skills in related speech. Related speech. Oral retelling and written narration. Requirements for retelling and writing a sample text. Types of

retelling and narration. Close to the sample text or its full retelling and narration: selective retelling: abbreviated retelling and narration: creative retelling and narration.

Related speech. Oral story and written essay. Essays are a form of expressing students' knowledge, thinking, imagination, and a means of independently applying all the skills they have acquired in language.

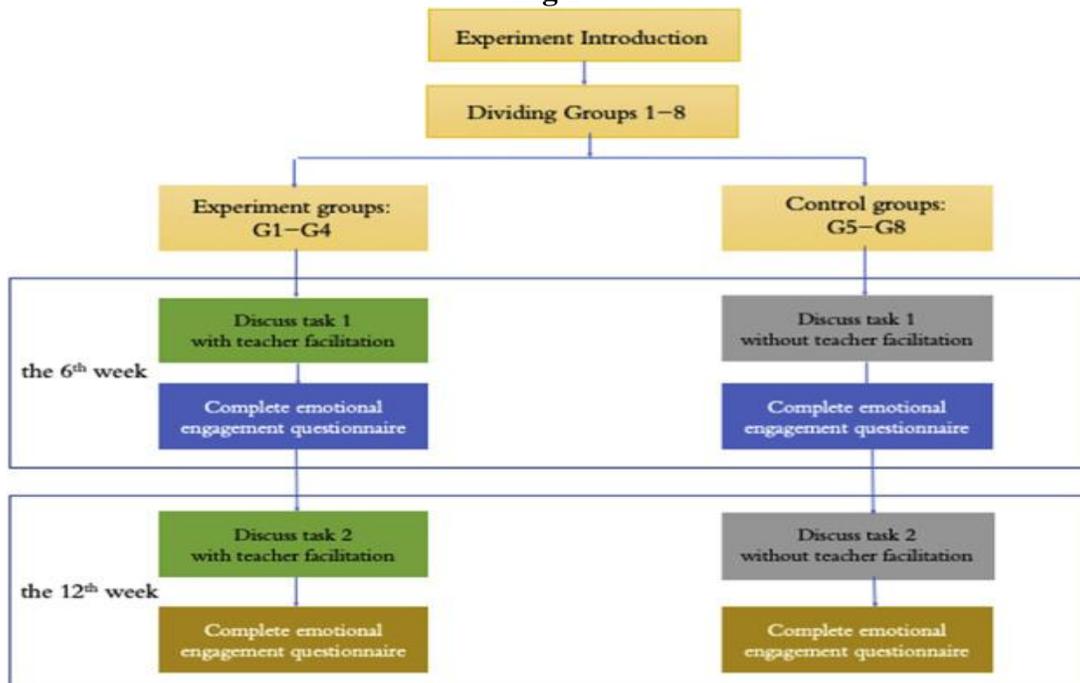

Types of oral and written essays. The importance of essay in educating students. The subject of the essay, breaking it down; collection of material, systematization, planning and preparation for the essay: the ability to use the plan in writing the essay, the language preparation of the text of the essay: work on writing and improving the essay. Student essay analysis and follow-up.

Speech errors and ways to eliminate them. The main types of speech errors that students make, ways to correct and prevent them. Extracurricular activities in the native language. Forms and tasks of extracurricular activities. Types of work in extended day groups.

Competing teams - is the collection of a large number of ideas, freeing students from the same inertia of thinking, overcoming the ideas that first appeared in the process of solving creative tasks.

Development of creative activity experiences revives scientific thinking, encourages the development of new problem-solving skills, conscious research in problem-solving.

Fig 1

Test lessons in group work

Performing didactic functions - (Formation of didactic functions) the formation of mental activity in students; consolidation and application of knowledge; the activity of the future specialist in the learning process is not only learning, but also the development of didactic rules aimed at its implementation to consist of; it is envisaged that the learning activities of students

will be as close as possible to the future professional activity, character and structure, as a result of which the activities of the teacher and the student will be projected. Cognitive assignments are created by the teacher.

The teacher's knowledge of cognitive tasks, his experience in the field of composing cognitive tasks, skills, performs the work of the subject, moving from one state to another. In order to study and generalize the existing experience in designing creative activities of students in mother tongue education, lessons of primary school teachers were observed and

The following questions were answered:

a) questions related to the purpose of creative education - the relevance of the purpose, objectives of the creative organization of education;

b) questions related to the content of creative education – creativethe relevance of the assignments to the content of the educational material, the relevance of the students to the real learning opportunities, the place of this or that creative work in the system of educational assignments;

c) questions related to the process features of creative education - the type of lesson, the appropriateness of the stages of creative tasks, the real learning opportunities of children in creative education, the pace of work, the methods used in creative work,application of previously learned knowledge and methods of activity in the performance of creative tasks, means of recording new knowledge and methods of activity;

g) questions related to the results of creative work - the relevance of the importance of this or that creative work for students, the adequacy of assignments for students to fully master the content of educational material, the role of creative work in the formation of independent activity in children.

Experimental work in three stages 2016-2017, 2017-2018 - implemented during 2019. A total of 420 students participated in the experimental and control groups. Of these, a total of 136 people in the experimental work on the example of general secondary schools (regional) in Navoi region (70 people in the experimental group, 66 people in the control group) and a total of 140 people in the experimental work on the example of secondary schools (regional) in Bukhara region,72 people in the control group, 68 people in the control group) and a total of 144 students (70 people in the experimental group, 74 people in the control group) took part in the experimental work on the example of general secondary schools (regional) in Samarkand region.

The purpose of the identification experiment or confirmatory experiment is to study the role and importance of designing students 'creative activity in mother tongue education as a creative learning tool, to determine the level of research of the problem, ie to design students' creative activity in primary school mother tongue education , the study of the psychological, pedagogical, methodological bases of the design of education, the search for ways to solve specific problems related to the features of the design. To do this, we began by looking for answers to the question of whether the organization of lessons based on the design of creative activities of students in mother tongue education increases or decreases the level of knowledge of students.

By choosing a general secondary school, students were able to complete only 2-3 exercises in each session allocated for the experiment. Most of them attended the lesson as “observers”.

Students' activity was observed in the lessons organized on the basis of a certain preparatory project by designing the creative activity of students in mother tongue education. The students managed to do 4-5 exercises in each lesson and their answers to the teacher's questions were also reasonable. Student assessment rates increased.

In the process of designing elementary school native language lessons the following conclusions were drawn in the technology of student activation:

1. The analysis of the state educational standard of mother tongue in secondary schools, the basic curriculum, the curriculum of primary school mother tongue, pedagogical-psychological, methodological literature and research work and the genesis of innovative teaching ideas, didactic and methodological bases of student activation in the process of designing primary school mother tongue lessons were studied.

2. In the process of designing primary school mother tongue lessons, opportunities for modeling the learning process based on innovative approaches and principles of student activation technology were identified.

3. Activation of students in native language lesson technology design process (communicative, information work, self-development, socially active citizenship, national and cultural, mathematical literacy, science and technology news improving the use of tools and methods (activating game technologies, competing teams, performing didactic functions, relay task relay) in the development of basic and general science-related competencies (learning tasks, relay handouts, media visual aids) creative thinking on the basis of the principles of visual-figurative and verbal-logical presentation of educational material on the subject (sociality, convenience, science, mobility, membership).

4. Ensuring freedom of speech and speech development in the process of designing technologies for activating students in primary school mother tongue lessons (reproductive A1, productive A1, the scientific ideas of the practical application of the partially researched A1, creative A1) to achieve the level of creative mobility were formed.

5. Cognitive tasks in the development of speech skills of primary school students are an educational chain between linguistic exercises and learning problems. They are an important step in the integration of classroom, group, individual work in the classroom: they are designed for students' thinking, focused on an active learning situation. By changing the status of the student in the traditional educational environment, it makes him a subject of the educational process, serves to stimulate the emotions, motivation, emotions of students.

6. Development of the content of the subject of mother tongue in primary school, the formation of current knowledge of speech and language in students, the formation of speaking skills, the experience of creative activity, education and development of language and its attitude to the people and homeland. Based on the tools and opportunities to develop the creative abilities of each student, technological maps and developments of lessons were developed and implemented in primary school mother tongue classes.

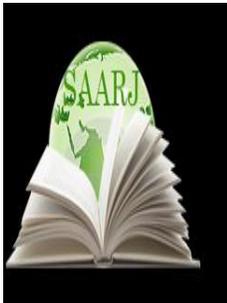

7. The creative organization of the subject of mother tongue in primary school was carried out in grades 1-4: from the 2nd half of 1st grade the simplest forms of cognitive tasks were used in conjunction with the phonetic, lexical, grammatical aspects of the language; From the 2nd grade onwards, students were taught to group, compare, and draw independent conclusions through

cognitive tasks, and from the 3rd grade onwards, they were taught to analyze, reunite, apply, and evaluate evidence in their native language. In the 4th grade, students developed skills such as the ability to work independently, to expand and narrow the text, to describe the object on the basis of evidence, to evaluate the results of their own activities and the activities of others.

8. Experience has shown that the knowledge, skills and abilities of students, the experience of creative activity, the attitude to the elements of language are highly developed. As a result of the experimental study, the coefficient of mastery of the training material was transferred from the experimental group to the control group increased by 11.7% compared to.

INFORMATION ON THE ECOLOGY OF GLOSSY IBIS- (PLEGADISFALCINELLUS L.1766) ANDEURASIAN SPOONBILL- (PLATALEA LEUCORODIA L.1758) 'S SOUTH-KYZYLKUM WATER DISTRIBUTION

Turaev Muxtor Murodovich*

*Bukhara State University,
UZBEKISTAN

ABSTRACT

The article presents the data on the ecology of colonially nesting birds in the reservoirs of desert zones of Uzbekistan, the ways of colony formation, the influencing factors and features of the adaptation of birds. In the formation of colonies involving mixed species, the attitude of the members of the colony towards vital needs, especially food and nesting site, plays a decisive role. The flight of the bird during the spring and autumn migrations is recorded in the literature in a number of regions of the country, such as Tashkent, Bukhara, Navoi, Kashkadarya, Samarkand, Surkhandarya (Maslov, 1947, Sagitov, 1989, Mitropolsky 2007).

KEYWORDS: *Desert Zone, Colony, Environmental Factor, Adaptation.*

INTRODUCTION

Every change that occurs in natural biotopes due to human economic activities is primarily noticed by the representatives of the fauna of the region and reacts to it with appropriate ethological actions (Turaev, 2019). As far as we know, the Aral Sea waters of the Republic and the surrounding tugai forests have long been chosen as a favorite habitat of representatives of the fauna of the region, including birds. However, since the 1950s, the unfavorable ecological situation that has arisen has begun to have a negative impact on the life of aquatic and underwater bird species, as well as all representatives of animal autonomy. As a result, species that have lived for many years have left the area one after another. This situation requires a re-analysis of the ecology of the distribution of species in the country.

The following article provides information on the ecology of the distribution of caravans and spoons from a small number of species in the country, where in recent decades there have been attempts to build nests in the ornithofauna of water bodies in the desert zone of the republic.

MATERIALS AND METHODS

These data were obtained on the basis of our observations in the south-western part of the Kyzylkum in Karakir, Zamonbobo, Dengizkul, Khadicha, Zikri, Cho'chqaxona lakes, Tudakul Water Reservoir and Kagan fishery during 2001-2020. It should be noted that during our observations, 16 species of birds listed in the Uzbek and International Red Data Books were recorded among the birds registered in the reservoirs. Below we find the following species of glossy ibis (*Plegadis falcinellus* L.1766), spoonbill (*Platalealeucorodia* L.1758). In this case, the analysis of species home ecology was based on the method of Novikov (1949), the ecology of birds was based on the method of Kashkarov (1927), the collective analysis of species was based on the method of Lanovenko, Felatov, Felatova in 2017

RESULTS AND DISCUSSION

Glossy ibis (*Plegadis falcinellus* L.1766) and spoonbill (*Platalealeucorodia* L.1758) which are analyzed in this article, are considered to be migratory, nest-building species of our country's ornithofauna. Due to its small number and the limited size of the nesting area, the species mentioned above are listed in the "Red Book" of Uzbekistan as a declining species.

Glossy ibis (Plegadis falcinellus L.1766) - There are 3 subspecies of blackbirds in the world fauna, which are found in a number of countries (Africa, America, Europe, Asia, Australia) on almost all continents of the world, and in different types - in flight, wintering, reproduction.

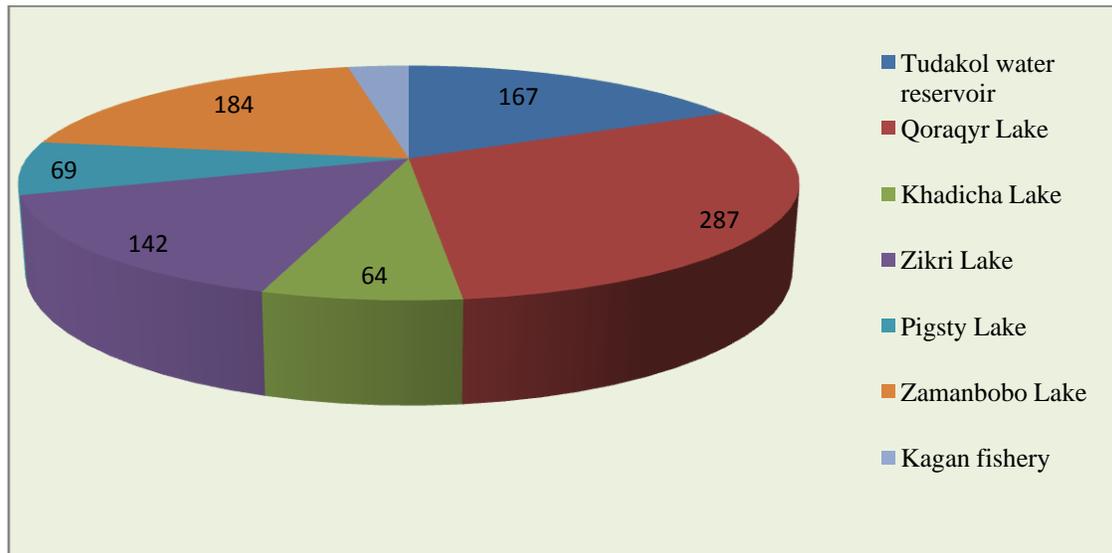

The only subspecies of glossy ibis (*Plegadis falcinellus* L.1766) found in the territory of the Republic is believed to be a migratory nest-building species. In the literature, until the second half of the last century, the species' nest-building efforts were reported to occur only in the Aral Sea basins of the lower reaches of the Amudarya (Sagitov, 1987). The flight of the bird during the spring and autumn migrations is recorded in the literature in a number of regions of the country, such as Tashkent, Bukhara, Navoi, Kashkadarya, Samarkand, Surkhandarya (Maslov, 1947, Sagitov, 1989, Mitropolsky 2007).

In the literature on the occurrence of the species in the basins of the Zarafshan downstream, Lemmani (1882), Gladkov (1932), Maslov (1947) and others have noted that it occurs in small numbers in spring and sometimes in autumn flight.

Our long-term observations show that in the basins of different types of water formed in the southern part of the Kyzylkum Desert, there are some changes in the number, range, duration and habitat of this species, as observed today in the lives of a number of water and underwater birds. Spring migration of the bird takes place a little later. In our long-term observations, the spring flight time of the bird was observed from the second half of March (14.03.2020, 26.03.2017) to the first ten days of April, depending on the air temperature, and these movements lasted until mid-April (7.04.2002; 11.04.2011;) continues. In the first days of migration, the glossy ibises form a small herd (from 5 to 25) and are in the shallows and ponds of almost all water basins of the region - actively feeding, and from the last ten days of April (25.04.02) the glossy ibises begin to build nests.

During our observations, the first attempts of the birds to build nests in the waters of Bukhara region and adjacent regions were recorded in the reeds of the Kagan fishery (Turaev, 2003). 287 nests were registered in Qoraqyr Lake, 64 nests in Khadicha Lake, and 69 nests in the reeds of

Cho'chqaxona Lake. In 2015-2018, 184 nests were recorded in Lake Zamanbobob and 142 nests in Lake Zikri.

Distribution of glossy ibis involved in reproduction across regional waters

It should be noted that in the regional water basins, the movement of cattle to build nests is often changed. This is due to the strength of anthropogenic impacts in water bodies and human control of the hydrological regime in water bodies (in Kagan fishery ponds, Zikri and Khadicha - frequent changes in water levels), reed mowing in reefs or "weeding" reeds ("Foot rot" (Oyoqog'itma), Qoraqyr, Khadicha lakes), sometimes associated with high levels of poaching activity.

The movement of laying the first eggs in the nests in the observed basins (depending on air temperature) begins in the last days of April (27.04.02., 30.04.03) and lasts until the first half of May.

Glossy ibises are a species that lives as a community. This bird builds nests in a mixed community with blue and straw crows, little blackbirds, some white crows with some snouts, and straw crows.

In the formation of colonies involving mixed species, the attitude of the members of the colony towards vital needs, especially food and nesting site, plays a decisive role. Usually in the colony the nutrient composition of the species or the location of the hive, the homogeneity of the building material of the hive forms them as competitors for these elements and the species try to squeeze each other out of the colony, otherwise harmony between different species is observed (Sioxin, Chernichko 1988; Turaev, 2019).

Therefore, during our observations in the ponds of Tudakul and Kagan fisheries of Bukhara region grey heron - *Ardea cinerea*, purple heron - *Ardea purpurea*, little egret - *Egretta garzetta*, pygmy cormorant - *Phalacrocorax pugmaeus*, Eurasian spoonbill - *Platalea leucorodia* and glossy ibis - *Plegadisfalcinellus*, the diversity of species in the food spectrum and the presence of hierarchical features in nest placement showed that a healthy environment between species was

formed. There was a consensus among the members of the colony on the placement of the nests of the species in the reeds on the reeds and in some external disturbances (Turaev etc., 2019).

In the community, the nests of caravans are 3.0-5.5 cm above the water level in the lowest tier. placed at a height of 15.0–17.0 cm. The nests were placed between reeds, reedbeds (Kagan fishery, Zikri Lake, Khadicha Lake) or on the branches of a willow bush (Tudakul Reservoir, Zamonbobo Lake, Qaraqyr Lake), depending on the vegetation cover of the water basin where the community is located.

The composition of the building material of the hive also varies in terms of the amount of material. We observed that the nesting material of nests placed between reeds and reeds was low (in Kagan fishing ponds, Khadicha and Zikri lakes), but in nests located in willow bushes (Tudakul reservoir, Zamonbobo, Qaraqyr lake) the weight of construction material was used.

The composition of the building materials of the hive consists of thin stalks of reeds, leaves, balls of flowers and slender twigs. Nest size (n -10): nest height-190 mm, nest width - 210 mm, nest width 170 mm, nest depth 31 mm (Turaev, 2006).

Caravans' nest-building activities were first recorded in May 2003 among gargoyles in the watershed in the Kogon fishery.

We have witnessed that the nests were completely laid in eggs in the first ten days of May. Efforts to build the nests were made almost simultaneously, with the number of nests in the community on May 6 being 29, and on May 10 laying eggs in 50 nests. Up to 4-6 dark blue eggs (n-40) are laid in the nests, with an average of 4.2 eggs per nest. The dimensions of the eggs are very close to the dimensions recorded in the literature, length 57.0-54.0 mm, width 37.0-35.0 mm. average 52.0-36.0 mm. Also, the weight of low-pressed eggs was 31.4 to 42.0 g (n-17) with an average of 38.0 g. (Turaev 2006).

Eggs are laid for 21 days in the presence of both sexes, and the bird, which is released from laying eggs, feeds along the shores of the shallows of the water basin.

In the observed nests, the first chicks appear in the second half of May. On May 20, we noted that there were 3 chicks of 4-5 days old in one of the nests on the team. The body of the chicks is covered with a sparse black downy feathers, when their body size is measured: the weight of the chicks - 53 g; 59 gr; 69 gr ;, beak length - 14mm; 16 mm; 16.5mm ;, wing -23mm; 25mm; 26mm ;, tarsus - 26mm; 27mm; 29mm;, were identified.

Examination of food debris in the hive revealed that the hive consisted of shrimp, perches, water beetles and aquatic insects. 05/26/02 we observed the discovery of chicks in almost all nests of the colony. However, the percentage of hatching from eggs laid by cattle was relatively low (72.3%). The average number of opened chicks in 14 surveyed nests (p = 14) was 3.1. The main reasons for this are:

-First of all, due to the fact that the nests are located too close to the water level, the water level in the pools fluctuates, which leads to the partial death of chickens and eggs in the nest.

- In addition, due to the inconvenient placement of thrush nests between reed stems and reeds, it is sometimes observed that when the parent bird flies out of the nest and lands, eggs and young chicks die, falling into the water. On the first day of May 2003, during our observations, it was noted that 3 eggs from 2 nests were released into the water.

From the first days of July, chicks begin to fly out of the nest. It is observed that birds of prey arrive from the shores of islands near reed thickets, where nests of communities are located, and then feed in groups in neighboring water bodies. Since August, shepherds completely leave the nesting site. It prepares for the flight since the last days of August, and in September it meets its last representatives for feeding only in some waters of the region, including the Tudakul reservoir, the Kagan fishing ponds, the shores of Dengizkul and Zikri lakes. In warmer autumn years, the autumn emergence of glossy ibises can last until the last days of October (10/29/2013, 10/27/2017, 10/30/2019). Hunting for cattle is prohibited. Protected in the waters of Sudocha, Tuzkon, Qaraqyr, Dengizkul of the republic.

Spoonbill- (*Platalea leucorodia* L.1758)- It belongs to the family of ibises of the genus spoonbilled-stork and is one of the weakest, most endangered species of flying or nesting species in the avifauna of Uzbekistan. Listed in the Red Book of Uzbekistan 2 (VU: D).

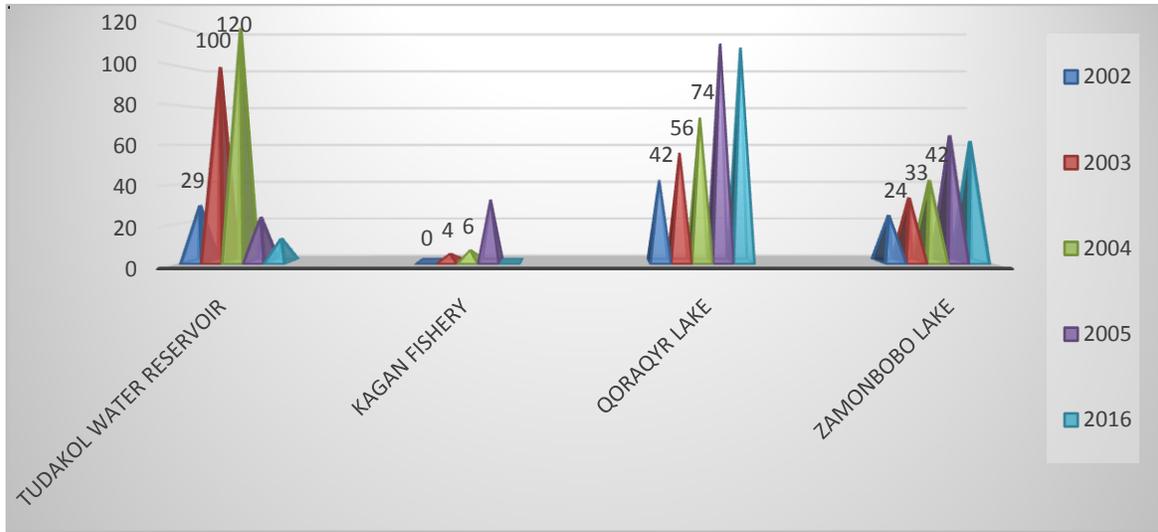

In Uzbekistan, there is a subspecies *Platalea leucorogia* L. Information is presented in the works of a number of researchers on the ecology of the distribution of this species in Uzbekistan (Kenzhegulov, 1967, Ametov, 1984, Zagitov, 1987, Shernazarov, 1996, Mitropol'skiy, 2007). These data indicate that reed habitats around the waters of the Lower Amu Darya and Syr Darya deltas are the main breeding grounds for the species.

In the middle reaches of the Audarya and the lower reaches of the Zarafshan River, snails are noted as a small migratory species (Maslov, 1947, Akhmedov, 1950, Salikhbaev, Ostapenko, 1966, Sagitov, 1987, Mitropolsky, 2007).

However, as a result of the ecological crisis in the Aral Sea region, from the second half of the last century, changes began to be observed in the ecology of the distribution of snails, like all species of the Aral Sea. By the second year, the bird's range expanded southeast of the Aral Sea. Confirmation of our opinion is the fact that in the last years of the century birds met during the construction of nests in the lakes Aydarkol and Alan of the republic.

It was noted in our observations that similar changes have taken place in Bukhara region and adjacent areas. On March 27, 2002, in the pond of the Tudakul Reservoir, in the center of a colony of grey herons and large glossy ibises, 29 nesting holes were recorded (Turaev etc., 2003, 2006).

After that, the nest-building efforts of squirrels were recorded in a number of water basins of the region, including Kagan fishery (32), Khadicha Lake (6), Zikri Lake (12), Zamonbobo Lake (65) and Cho'chqaxona Lake (29). was found. Although this species seems to have adapted to the region's waters for a short time and is growing in numbers, their numbers have been observed only in the spring and autumn migrations in the Tudakul Reservoir and Kagan fishery ponds, where the first nests were built (Turaev, 2003).

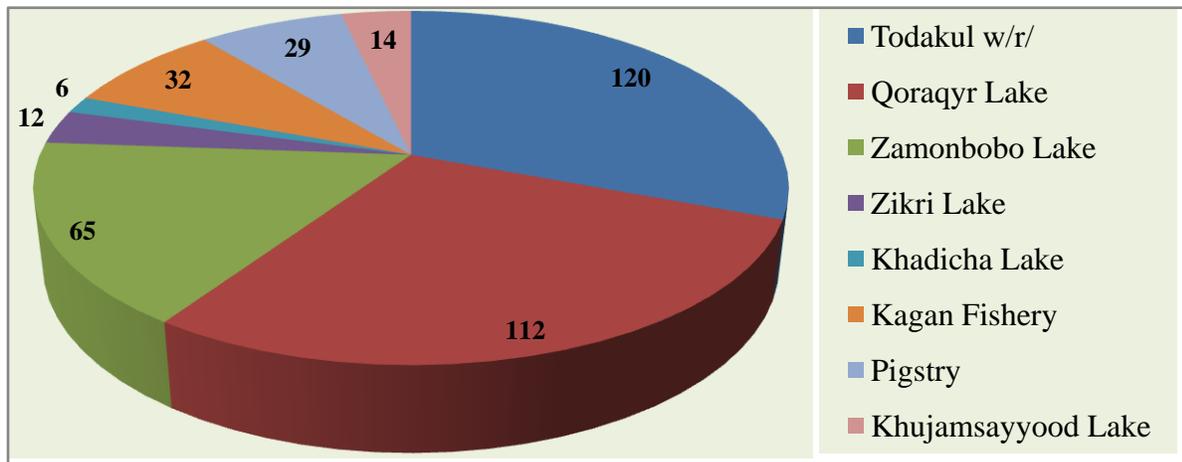

Dynamics of change of nesting movements of spoonbills over the years in water reservoirs

By 2016-2018, the nest-building efforts of squirrel nests show that the number of nests in the newly selected Lakes Zamonbobo, Qoraqyr, Zikri, Cho'chqaxona, Khojamsayod remains relatively stable.

If one of the largest reservoirs of the country, Lake Aydar, has been observed to nest on the same island for several years (Shernazarov, 1996), in our observations, it is noted that spoonbills often change their nesting sites in the waters of Bukhara region.

This is due to the high impact of anthropogenic activities around the region's waters (reed harvesting, weeding of reeds, grazing of livestock around water bodies and frequent control of water levels in water bodies, etc.), as well as the proximity of water bodies. due to which it is done in the short term.

Pools where nesting attempts of spoonbills are recorded

Spring migration of spoonbills in the region is observed from the second half of March to the last days of March, depending on the air temperature (27.03.02., 21.03.13.). From the first ten days of April, nest-building efforts begin (4.04.04., 8.04.16.). Spoonbills are a species that lives as a

community at all stages of life (migration, feeding, resting and nesting). When building a bird's nest, sometimes a small number of nests is formed, consisting of 6-12 nests (in Zikri, Khadicha, Kagan fisheries), sometimes up to 47-130 nests (Tudakul reservoir, Qaraqyr, Zamonbobo lake). The nests are mainly composed of grey heron - *Ardea cinerea*, purple heron - *Ardea purpurea*, little egret - *Egretta garzetta*, great cormorant - *Phalacrocorax carbo*, pygmy cormorant - *Phalacrocorax pugmaeus* and glossy ibises - *Plegadis falcinellus*. In this case, the bird chooses its nests in a separate part of the colony (often the center of the colony). The distance between the nests is 44.3cm depending on the nesting capacity. from 2.0 to 3.0 meters, at a height of 44.2 to 86.3 cm above the water level. As a building material for the nests use last year's dried stems and leaves of reeds.

The earliest egg-laying movements in the mentioned colonies were recorded in the Tudakul Reservoir pond in the first ten days of April (09.04.2002, 12.04.2008), while in the second half of April to the first half of May (19.04.2002, 24.04.2004). , 5.05.2012.). attempts to lay eggs en masse in the nests are observed. But the number of nests in the colony increases throughout the season. Due to this, the time of egg laying in the nests in the colony varies. In particular, on May 18, 2008, when inspecting the colony in the ponds of the Kagan fishery, it was noted that in 10 out of 12 nests eggs of different stages were laid, and in 2 nests the chicks hatched from eggs (Turaev, 2012).

Similarly, on May 31, 2009, 16 of the 29 nests recorded in Cho'chqaxona Lake had 4 eggs, 3 eggs in 8 nests, 2 eggs in 2 nests, and construction of 3 nests had already begun. The nest-building efforts of snails, like most aquatic and underwater species in the region, have been shown to continue until July, depending on air temperature. During our observations, chicken nests were recorded in the last days of August (23.08.2003) in a colony in a pond west of Tudakul. In one of the nests, 3 and in the remaining 2 nests, 3 bird nests were registered, with 2 hatchlings (approximately one month old). We can observe that this condition occurs only under the influence of air temperature, and most importantly anthropogenic factor. Such actions were recorded in 2008 in the Kagan fishery ponds. Due to the sharp drop in the water level, the island where the 12 chicks nested was connected to the coast, and the chicks in the nests were completely killed by jackals and stray dogs. This forces the birds to rebuild their nests.

During our observations, we have seen that the number of eggs in re-laid nests is 2, sometimes 3 (Turaev, Azimov, 2012). In the nests lay up to 3-5 large brown-spotted, white eggs. An average of 3.8 eggs were observed in 60 nests recorded in the colony. This figure corresponds to the figure in other waters of the republic (Shennazarov, 1994). The period of laying eggs in the basins of the region begins in the second half of April (18.04.2003, 16.04.2016). The eggs are laid for 21-25 days in the presence of both sexes. x 44.3 mm. From the second half of May the chicks hatch from the eggs, and in June and July the chicks leave the nests completely and spread out to feed on the shallow shores of the ponds. The food composition of snails is based on various aquatic invertebrates, aquatic insects, shrimp, small fish, dogs, and sometimes young frogs. It has been preparing to fly since the last days of August and in September it feeds only on the last representatives in some waters of the region, including the Todakol reservoir, Kagan fishing ponds, Zikri, Zamonbobo, Dengizkul, Qaraqyr, Oyoqogitma lakes. In the warmer years of autumn, the autumn flight of spoonbills can last until the last days of October (29.10.2013, 27.10.2017, 30.10.2019).

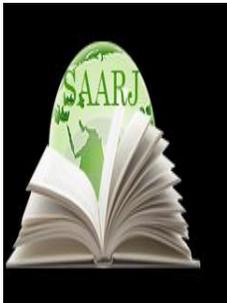

CONCLUDING

During the ecological crisis around the Aral Sea, a number of birds of the republic, including sparrows and blackbirds, a rare species of our fauna, have been expanding their range in the waters of Bukhara region since the last century and becoming regular nesting species. As mentioned above, the habitat of these species in the region is observed in the lakes Zamonbobo, Qaraqyr, Zikri. Given the fact that these reservoirs, in turn, are included in the list of important ornithological regions (IOR) of international importance, the opportunities for further increase in the number of these species in the regional reservoirs are expanding.

ABSTRACT

Indoor air pollution (IAP) is a major health hazard that kills millions of people each year. IAP may be caused by a variety of contaminants, therefore it's critical to determine their primary sources and concentrations; as well as develop methods for controlling and improving indoor air quality (IAQ). We examine and evaluate the main sources of significant pollutant emissions, their health impacts, and problems connected to IAP-based diseases, such as sick building syndrome (SBS) and building-associated sickness, in this paper (BRI). In addition, methods and approaches for controlling and reducing pollutant concentrations are highlighted, and current developments in attempts to resolve and enhance IAQ are described, along with their distinct benefits and potentials. The development of new materials for sensors, IAQ-monitoring systems, and smart houses is expected to be a viable approach for controlling and improving IAQ in the future.

KEYWORDS: *Indoor Air Quality, Indoor Pollution, Human Diseases, Smart Home.*

INTRODUCTION

Because most individuals spend 90 percent of their time inside, mostly at home or at work, the quality of the indoor environment has a significant impact on human well-being. Indoor air pollution (IAP) is responsible for the deaths of 3.8 million people per year, according to the World Health Organization (WHO). Inside houses or buildings, IAP may be produced by inhabitants' activities such as cooking, smoking, using electrical equipment, using consumer goods, or emitting from building materials. Carbon monoxide (CO), volatile organic compounds

(VOCs), particulate matter (PM), aerosol, biological contaminants, and others are all harmful pollutants found within buildings. As a result, research on air quality management has shifted from outside to interior settings during the last decade, reflecting lifestyle changes related to increasing levels of urbanization. Reduced IAQ has been shown to have a detrimental impact on human health by generating building-related disease. IAP exposure, both short- and long-term, may result in a variety of illnesses. As a result, the development of monitoring systems is critical to IAQ regulation[1]–[5].

Indoor Air Quality (IAQ) and Indoor Air Pollution (IAP):

IAQ, as defined by the EPA, is the air quality within and around buildings and structures, particularly as it pertains to the health and comfort of building occupants. IAP, on the other hand, refers to the presence of pollutants in the interior air of non-industrial buildings, such as volatile organic compounds (VOCs), particulate matter (PM), inorganic compounds, physical chemicals, and biological variables, all of which may have harmful effects on the human body. IAQ has evolved and grown as a study area in order to safeguard humans from such contaminants. Pollutant concentrations, environmental conditions (temperature, airflow, and relative humidity), light, and noise are the primary factors used to assess IAQ. Thermal conditions are important in IAQ for two reasons: (i) a variety of issues associated with poor IAQ may be addressed easily by changing relative humidity or temperature, and (ii) building materials in high-temperature buildings can be highly released.

Main Pollutants in Indoor Air Environment:

Many indoor air contaminants have been identified as having negative effects on IAQ and human health. NO_x, volatile and semi-volatile organic compounds (VOCs), SO₂, O₃, CO, PM, radon, hazardous metals, and microbes are the most common indoor air pollutants. Some of these may be found in both indoor and outdoor settings, while others are native to the outdoors. Organic, inorganic, biological, and radioactive contaminants may all be classed as indoor air pollutants[6]–[8].

Particulate Matters:

Carbonaceous particles in combination with adsorbed organic compounds and reactive metals are classified as PM. Sulfates, nitrates; end toxin, polycyclic aromatic hydrocarbons, and heavy metals are the major components of PM (iron, nickel, copper, zinc, and vanadium). PM is divided into three categories based on particle size: (i) coarse particles, PM₁₀, with a diameter of 10 μm; (ii) small particles, PM_{2.5}, with a diameter of 2.5 μm; and (iii) ultrafine particles, PM_{0.1}, with a diameter of 0.1 μm. PM is particularly dangerous since it may be inhaled, creating severe health problems by damaging the lungs and heart. Indoor PM levels have been found to frequently surpass outside PM levels. Particles that move from the outside and particles produced by inside activity are both causes of indoor PM. PM are spread within buildings due to cooking, fossil fuel combustion activities, smoking, machine operation, and household hobbies. Due to its penetrability into the tiny airways and alveoli, PM_{0.1} produced by fossil fuel burning poses a higher health risk than PM₁₀ and PM_{2.5}.

VOCs:

VOCs (volatile organic compounds) are gases that include a range of chemicals and are released by liquids or solids. One of the most common VOCs is formaldehyde, a colorless gas with an

unpleasant odor that is produced by numerous construction materials such as particleboard, plywood, and glues. Indoor VOC concentrations are at least 10 times greater than outside values, independent of building location. Interior VOCs are primarily produced by four sources: (i) human activities such as cooking, smoking, and the use of cleaning and personal care items; (ii) indoor chemical reactions; (iii) penetration of outside air via infiltration and ventilation systems; and (iv) building materials. Air exchange rates, home age and size, building modifications, outside VOC levels, and door and window opening may all influence VOC concentrations.

NO_x:

Nitric oxide (NO) and nitrogen dioxide (NO₂) are the two main nitrogen oxides, both of which are produced by combustion sources such as stoves and heaters. NO and NO₂ concentrations in the environment fluctuate dramatically depending on local sources and sinks. Their typical concentration in buildings without combustion activities is half that of the outdoors, but indoor levels frequently surpass outside levels when gas stoves and heaters are utilized. NO₂ is generally considered a main pollutant since it is quickly reduced to NO under ambient circumstances. Nitrous acid (HONO) is formed when NO₂ reacts with water. It is a powerful oxidant and a frequent indoor contaminant. Interior NO₂ levels have been shown to be a result of both outside and inside sources; therefore, high outdoor NO₂ levels from combustion or local traffic sources may affect indoor levels.

Ozone:

Ozone is a strong oxidizing agent that is mostly generated in the atmosphere through photochemical interactions of O₂, NO_x, and VOCs. Due to its delayed reactivity with most airborne contaminants, it cannot be utilized to remove other indoor chemical pollutants. Although ozone allows for quick reactions with a variety of indoor contaminants, the reaction products may irritate people and harm materials. The outside environment and the functioning of electrical equipment are the primary sources of indoor ozone. Photocopiers, disinfection devices, air-purifying equipment, and other office machinery are typical sources of indoor ozone gas. Corona discharge and photochemical processes are the two types of ozone emission methods used by these devices.

SO₂:

Among the sulfur oxides (SO_x) found in the atmosphere, sulfur dioxide (SO₂) is the most frequent gas. SO₂ is mainly generated through the burning of fossil fuels, and it mixes with aerosols and PMs to create a complex collection of different air particles. Vented gas appliances, oil furnaces, cigarette smoke, kerosene heaters, and coal or wood stoves are all producers of SO₂. Furthermore, outside air is considered a major source of indoor SO₂. Indoor SO₂ levels are often lower than those seen outside. Because of its reactivation, SO₂ emissions inside are typically low and readily absorbed by interior surfaces. It is well known that the hourly concentration of SO₂ in buildings is often less than 20 parts per billion. Humans are only exposed to SO₂ via inhalation, which may affect respiratory function.

CO_x:

Combustion activities, such as cooking or heating, generate the majority of carbon monoxide (CO) in indoor air. CO may also be introduced into interior settings through infiltration from the outside air. Unvented kerosene and gas space heaters; leaky chimneys and furnaces; back-

drafting from furnaces, gas water heaters, wood stoves, and fireplaces; gas stoves; generators and other gasoline-powered equipment; and tobacco smoke are all significant sources of indoor CO emissions. The typical CO concentration in a building without any gas stoves is about 0.5–5 ppm, while the concentration around gas stoves may vary from 5 to 15 ppm, and even 30 ppm or more. CO exposure may have negative health consequences, including I cardiovascular and neurobehavioral impairments at low concentrations, and (ii) unconsciousness or death at high doses.

Toxic Metals:

Human activities and natural processes both emit heavy metals into the atmosphere. Infiltration of outside pollutants (dust and dirt), smoking, fuel consumption products, and building materials are all sources of IAP by heavy metals. Heavy metals in indoor dust may harm people's health if they enter their bodies via inhalation, ingestion, or skin contact. Heavy metals in indoor air are divided into two groups based on their effects on humans, according to the International Agency for Research on Cancer (IARC): I non-carcinogenic elements such as cobalt (Co), aluminum (Al), copper (Cu), nickel (Ni), iron (Fe), and zinc (Zn); and (ii) both carcinogenic and non-carcinogenic elements such as arsenic (As), chromium (Cr), cadmium (Pb).

Aerosols:

Indoor aerosols are either primary aerosols produced by indoor gas-to-particle reactions or secondary aerosols produced by indoor gas-to-particle processes. Furthermore, outside particles that find their way inside are likely to be a source of indoor aerosols. Secondary inorganic aerosols (SIAs) are PMs made up of inorganic components such as anthropogenic or crustal sources and water-soluble ions, while secondary organic aerosols (SOAs) are produced when VOCs are converted from gas to particle.

Radon:

Building materials, soil gas, and tap water are the main sources of indoor radon. Because soil contains small amounts of radium, radon is most likely one of the components of the gas filling soil pores. When it comes to radon emissions from construction materials, every substance that contains tiny quantities of radium has the potential to emit radon. Masonry materials (i.e., stone, concrete, and brick) are the most common sources of indoor radon emission among building materials, with tons of such materials utilized in construction.

Pesticides:

Inorganic and organic pesticides are widely used as impregnation or surface coating protectants for timber construction materials these days. Bacteria, fungus, insects, rodents, and other creatures are all controlled and prevented using pesticides. Pesticides are typically semi-volatile substances in the interior environment, and depending on characteristics like vapor pressure, product viscosity, and water solubility, they may exist as gas or particle. Furthermore, it has been suggested that carpets and textiles may act as long-term reservoirs for organochlorine pesticides. Pesticides in fibers are thought to move into polyurethane foam pads when used in carpets, textiles, and cushioned furniture, resulting in carpets, textiles, and cushioned furniture reflecting an integrated pesticide exposure throughout their lifespan. Furthermore, pesticides may infiltrate buildings from the outside. Because they are protected from sunshine, severe temperatures, rain, and other elements once inside, they may last for months or years. In the indoor environment,

possible exposure pathways include dermal absorption, ingestion, and inhalation of particles or volatile molecules containing pesticides. Pesticide exposure is linked to a variety of health problems, including (i) short-term irritation of the skin and eyes, dizziness, migraines, and nausea, as well as (ii) long-term chronic effects including cancer, asthma, and diabetes.

Biological Pollutants:

Biological allergies (e.g., animal dander and cat saliva), house dust, cockroaches, mites, and pollen) and microbes are examples of biological pollutants found in indoor settings (viruses, fungi, and bacteria). Antigens, or biological allergens, come from a variety of insects, animals, mites, plants, or fungus, and react with particular immunoglobulin E (IgE) antibodies to cause an allergic reaction. Furry pets (dog and cat dander), house dust mites, molds, plants, cockroaches, and rodents are common indoor sources of allergies, but there are also outdoor ones. Viruses and bacteria are often transmitted by humans and animals. Exposure to biological allergens has been shown to induce sensitization, respiratory infections, respiratory allergic disorders, and wheezing, while indoor exposure to bacteria and viruses is likely to produce noninfectious and infectious health consequences.

LITERATURE REVIEW

J. Hao et al. discussed about Indoor air pollution and its control[9]. The present state of interior air pollution and its management in China is examined by outlining the polluting characteristics of key indoor air pollutants, the methods and techniques used to control indoor air pollution, and the significant issues that now plague indoor air pollution control. Although formaldehyde and benzene interior pollution has been successfully reduced in China in recent years, toluene and xylenes indoor pollution remains a significant problem. Furthermore, research indicates that particulate matter (PM), biological pollutants, and semi-volatile organic compounds (SVOCs) indoor pollution is a significant problem in China. In China, the creation and implementation of IAQ-related laws and standards, research on indoor air pollution and its management, and the growth of the indoor environmental monitoring and cleaning sector have all played important roles in avoiding and managing indoor air pollution. However, issues like the lack of mandatory IAQ standards, the lack of regulation and labeling of pollutant emissions from indoor decorating and refurbishing materials, the lack of an effective performance evaluation system for air cleaning products, and the lack of proper air cleaner maintenance must all be addressed in order for IAQ to improve further.

M. Bentayeb et al. discussed about Indoor Air Pollution and respiratory health[10]. There are few studies on the impact of indoor air pollution on the elderly respiratory system. The goal of this review is to provide available epidemiological data to synthesize current understanding on the harmful respiratory consequences of indoor air pollution in those over 65 years old. We selected relevant articles published in English between 1991 and 2011 on the respiratory health consequences of indoor air pollution in elderly (>65 years) using the MEDLINE database via PubMed. A total of 61 studies were found, and 33 relevant publications were chosen after applying the following inclusion criteria: (i) epidemiologic studies published in English in peer-reviewed journals between January 1991 and December 2011, (ii) study population aged 65 or older, and (iii) outcome of respiratory symptoms and disease excluding lung cancer. The majority of studies found links between major indoor air pollutants and different short- and long-term respiratory health outcomes including wheezing, dyspnea, cough, phlegm, asthma, COPD,

lung cancer, and, more infrequently, lung function loss. Chronic obstructive pulmonary disease (COPD) and ambient cigarette smoke have the most consistent connection (ETS). In order to establish causal connections between exposures to indoor air pollution and underlying processes in this sub-population, further research in the senior population is required.

DISCUSSION

Indoor air pollution is the deterioration of indoor air quality caused by hazardous chemicals and other elements, and it may be up to ten times more damaging than outside air pollution. According to statistics, the health effects of interior air pollution significantly exceed those of outdoor air pollution in developing nations. Excess moisture, volatile organic compounds, carbon monoxide, and radon are four significant indoor air contaminants, according to the Environmental Protection Agency. The majority of indoor air pollution is caused by sources that emit gases or particles into the atmosphere. Pollution is continuously released by things like construction materials and air fresheners. Indoor pollution is also caused by other sources such as cigarette smoke and wood-burning stoves. Some contaminants in indoor air have been present for a long time. By not smoking inside and keeping craft materials in well-ventilated locations, you may help the environment. Ensure that your gas stove is well-ventilated, and keep clutter to a minimum to avoid interior air pollution.

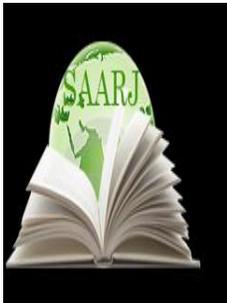

CONCLUSION

To summarize, contaminants in the indoor air environment have a major role in the development of human illnesses. PM, VOCs, CO, CO₂, ozone, radon, heavy metals, aerosols, pesticides, biological allergens, and microbes are just a few of the indoor air pollutants that may cause poor indoor air quality and therefore damage human health. The majority of these pollutants come from two primary sources: (i) human activity in buildings, such as combustion, cleaning, the use of certain building materials during construction or restoration, and the operation of electronic equipment; and (ii) transportation from outside sources. Even though these pollutants are often present in low quantities in buildings, long-term exposure may pose serious health concerns. Sick building syndrome (SBS) and building-related disease are the two most common types of building-related illness (BRI). Many methods and procedures for the management and reduction of pollutant concentrations have been adopted to minimize IAP's effects. The development of improved materials for sensors, IAQ-monitoring systems, and the smart home is anticipated to be useful in the future for the control and improvement of IAQ.

A REVIEW ON GLOBAL GENDER DIFFERENCES IN OBESITY

Sandeep Verma*

*Teerthanker Mahaveer Institute of Management and Technology,
 Teerthanker Mahaveer University, Moradabad, Uttar Pradesh, INDIA
 Email id: dr.sandeepverma2003@gmail.com

ABSTRACT

Obesity is a worldwide epidemic. However, the incidence of obesity and overweight among males and females varies considerably within and across nations, with more women than men being obese on average. In underdeveloped nations, especially in the Middle East and North Africa, gender inequalities in overweight and obesity are accentuated. In industrialized nations, however, males are more likely than women to be overweight. According to current research, a variety of societal factors across the globe aggravate gender inequalities in excessive weight gain. Gender variations in food intake are caused by a variety of contextual variables, and women typically report eating healthier meals but may eat more sugar-laden foods than males. Both males and females acquire weight as a result of acculturation, which occurs via complicated sociocultural processes. Excess weight gain has impacted both genders as a result of the dietary shift going to take place in so many developing nations, but it has had an even larger effect on women's physical activity levels. Furthermore, in certain cultures, greater physical size amongst women or men is seen as a signal of fertility, health, or wealth. More study on gender inequalities in obesity and overweight will enhance our knowledge of the worldwide obesity epidemic as it progress.

KEYWORDS: *Disparities, Gender, Obesity, Physical activity, Weight gain.*

INTRODUCTION

What was once a worldwide obesity crisis has now become a pandemic? Excess weight gain is usually caused by an energy imbalance. Excessive calorie consumption, especially of energy-dense foodse.g. sugar-sweetened drinks (SSB), increasing food portions, and sedentary behavior are frequently blamed for the epidemic. Sex “refers to biological and physiological traits that distinguish men and women,” while gender “refers to the socially created roles, attitudes,

activities, and qualities that a particular culture deems acceptable for men and women,” according to the World Health Organization. Obesity has biological and social factors that differ significantly by gender or sexuality[1]. Power and Schulkin examine the sex variations in adipose storage and metabolism in more depth, speculating on the evolutionary roots of these differences. Excess weight gain may have different health consequences depending on gender. Menopause is a biological condition that changes fat distribution in women, which may raise the risk of obesity or aggravate the harmful consequences of obesity on health. Gender inequalities and associated sociocultural variables are generally missing from the population health (obesity) discourse, and hence from possible policies and remedies, despite these physiological factors linked to sex-specific variations in excess weight gain[2].

According to global survey statistics, the incidence of overweight and obesity in both men and women varies by area and has significantly risen between 1980 and 2008. Global trends in women overweight and obesity have been recorded by studies based on a country's economic position (gross domestic income or gdp), not just among men (or both sexes). However, some research suggests that not only do worldwide disparities in obesity incidence vary by gender, but so do the social factors of obesity. This study looks at global changes inside the prevalence of overweight by gender, as well as how these trends are linked to sociocultural gender disparities and, as a result, their impact on overweight and obesity globally[3].

We performed a review of available survey data with a focus on observational studies that contained data on the prevalence of overweight in both male and female adults. We only considered publications published in English, and the normal adult population was defined as community-dwelling people who did not have specific dietary requirements and were not pregnant or nursing. We looked for papers published between 1988 and February 2011 in the MEDLINE (accessible via PubMed) and EMBASE databases. Additional papers were found by scanning references in relevant articles and manually checking the contents page of journal articles (Obesity Reviews), as well as Google Scholar, for articles published between 1988 and February 2011. Attempts were undertaken to locate research on nations that were not included in the original search. A total of 1800 items were received; 287 articles were chosen for possible eligibility based just on specific criteria, and 191 of these were examined. The parameters mentioned in the published paper were utilized to classify overweight and obesity. The CDC BMI cutoffs for overweight (25.0 BMI 30.0) and obesity (BMI 30.0) were utilized in the majority of studies. However, the majority of publications about people in East Asia and the Pacific, as well as a handful about people in Sub-Saharan Africa and Latin America and the Caribbean, employed different definitions for overweight (27.0 BMI 31.0) and obesity (BMI 31.0)[4].

When the 105 nations and territories studied were classified by World Bank income categories, we discovered that all income levels had a higher overall incidence of female obesity than male obesity. However, there was a higher incidence of male overweight relative to female overweight in the elevated [non-Organization for Economic Co-operation and Development (OECD) and OECD) categories. OECD (all high-income) countries and territories included Australia, Belgium, Canada, Denmark, England, Estonia, Finland, France, Germany, Greece, Ireland, Israel, Italy, Japan, Luxemburg, the Netherlands, Norway, Poland, Portugal, Slovenia, Spain, South Korea, Sweden, Switzerland, and the United States, according to the World Bank classification; and high-income nonOECD countries and territories included Australia, Belgium,

Canada, Denmark, England, Estonia, Finland, France, Germany, Greece, Ireland, Israel, Furthermore, when grouped by area, the Middle East and North Africa showed the largest inequalities in woman obesity and overweight (Fig. 1), while both Europe and Asia and the OECD countries had a higher incidence of male overweight relative to female. Gender differences in obesity and overweight were also found between urban and rural regions within each income category and region, with urban areas having larger gender disparities for obesity and overweight than rural one[5].

DISCUSSION

We classified developed nations as elevated countries and countries like all low- and middle-income countries, according to the World Bank. It's tough to quantify socio cultural influences. However, societal and cultural variables seem to affect both food consumption and physical activity at a worldwide level, and may be linked to gender differences in weight gain. We examine established and developing nations separately since socio cultural variables differ between them. Finally, we examine individual Arab nations, which include both poor and high-income countries, but which have comparable but distinct traditional cultures.

1. Developed nations

In the second part of the twentieth century, the bulk of occupational positions for both men and women in industrialized nations were inactive, and recreational time physical exercise for both men and women was scarce. In the U.S, for example, more than half of people follow the public health guideline of 30 minutes of physical exercise each day. The bulk of physical activity in all European Union nations is sedentary, and it does not differ significantly by gender. As a result, gender differences in obesity and overweight in these nations are likely driven by food consumption rather than or in addition to the physical activity and associated sociocultural variables[6].

Despite the fact that sociocultural variables influence food consumption habits, the percentage of energy consumed from animal source meals is greatest in high-income nations. Gerbens-Leenes et al. discovered that high-income nations consume the most kcal per capita per day, as well as the highest percentage of energy consumption from fat, based on a global study. Furthermore, researches based on data from industrialized nations have shown that there are gender-based dietary preferences and that one's sociocultural milieu affects these choices. Despite the fact that women are more likely than males to report eating or desiring to eat "healthier" meals, they seem to prefer and consume more energy-dense packaged foods including such cookies, chocolate, and ice cream. Women consume less dairy foods than males, according to national survey data both from the United States and Europe. Men, on the other hand, drink much more alcohol than women. Men consume a higher proportion of their calories from protein than women, according to studies. This is likely owing to men's predilection for and consumption of meat-based items[7].

Alcohol use is thought to be a cause of or linked to weight gain in males but not in women. Although males drink more alcohol than women, there are significant variations in alcohol metabolism between the sexes. The amount of alcohol drunk and the kind of alcohol ingested seems to have an impact on whether or not it promotes excessive weight gain. In both men and women, cross-sectional studies in a variety of groups have shown a positive association between alcohol intake and waist circumference (WC). Tolstrup et al. showed that, in males, drinking

frequency was not related with changes in WC and was negatively associated with significant WC gain in a large prospective cohort of Danish middle-aged men and women (that the authors defined as 5-y change in WC above the highest quintile of the sex-specific distribution, 6.9 cm for men). Drinking frequency was shown to be negatively related to both WC and significant WC increase in women. Furthermore, there's no significant connection between the quantity or kind of alcoholic beverage consumed and substantial WC increase in either sex in this research[8].

In addition to the impact of sociocultural variables on excess weight increase as a consequence of gender variations in food intake, cultural influences may also have an impact on weight gain via other, more difficult to quantify ways. Christakis et al. conducted a new social network study of the Framingham Heart Study cohort and discovered that men had a 100 percent increased risk of becoming fat if a male friend became obese, while the same impact of friend on fat was not significant among females. Acculturation may also play a role in obesity inequalities between men and women. The majority of studies that have looked at the relationship between acculturation and obesity and related factors (such as dietary intake and physical activity) have focused on acculturation in the United States, particularly among Mexican Americans, who are among the fastest growing segments of the population. Mexican Americans are not just more obese than their non-Hispanic white counterparts, but women are considerably more fatter than males, while non-Hispanic whites have no significant gender difference in obesity incidence. Mexican-American males, like non-Hispanic whites, are more overweight than Mexican-American women. Oza-Frank and Cunningham discovered a substantial positive connection between BMI and the amount of time spent in the United States among migrants, and that this relationship was stronger among females than men, especially Hispanic females[9].

Furthermore, acculturation regarding family attitudes was linked to a less favorable body fat deposits in Mexican-American men, so although structural assimilation (or assimilation to the presenter country's social network and structure) was linked to a more advantageous adiposity and less excessive weight gain in Mexican-American women. The adaption of dietary and physical habits that are typically unhappier (e.g., higher in added fats and sugars) and much more sedentary than an immigrant's home country is thought to be the source of the impact of acculturation on excess weight gain. Physical activity and smoking both substantially increase with cultural assimilation among women but not males among U.S. Latinos, according to a study of the relationship among cultural assimilation and obesity-related health variables among U.S. Latinos[10].

Gorman et al. founds that by increasing acculturative stress exacerbates chronic health conditions (e.g., type 2 diabetes, hypertension, and heart disease) at a higher rate in men than in women, and also that gender discrepancies in the effect of acculturation on wellness are mediated by the significantly lower rate of acculturation in men compared to women. As a result, although acculturation seems to affect excess weight gain in both Mexican-American men and women, as well as probable immigrants from those other countries, it tends to have a larger impact on women; yet, it appears to be more linked to the development of chronic illnesses in males.

2. Developing nations

In many emerging nations, daily food and lifestyle have altered dramatically as a result of economic development. The line between a traditional diet and an agricultural lifestyle has

blurred. Often, they are developing nations in the midst of a dietary shift. The nutrition transition is defined by markets with existing, demographic, ecological, and cultural changes that have a detrimental impact on both energy intake and expenditure. Rapid urbanization, as well as rising domestic output and importation of edible oils, has had a lasting nutritional effect on developing nations. Diets tend to contain more fat, sugar, and processed carbohydrates when dietary changes occur, and lifestyles grow more sedentary[11].

For most of the second part of the twentieth century, occupation remained a major example of physical activity in many developing nations, especially when compared to industrialized ones. Men engage in much more daily physical activity than women in a variety of nations and regions in South Asia, the Middle East, North Africa, Sub-Saharan Africa, Latin America, and the Caribbean. However, in many developing nations around the end of the twentieth century, there was a shift away from agricultural work (both for output and sustenance) to wage labor, which reduced women's physical activity more than men's. In rural regions, the shift in employment that leads to a reduction in daily exercise is more common both between men and women. Physical inactivity linked to unemployment or underemployment in Russia has been linked to weight increase.

Although Westernization has had a significant impact on food and lifestyle patterns throughout East Asia and the Pacific, traditional ideas about body image remain, according to Davis et al. in a literature review. A bigger body type is acceptable in many nations, and it may nevertheless be culturally linked with a higher social position. Cultural attitudes may also affect how overweight and obese people are seen in these nations, according to data from of the Marshall Islands. Thinness, especially among women, has been linked to infertility and disease, while bigger body forms have been linked to good health. Cultural ideas like these may have an impact on dietary choices and lifestyle behaviors in the Islands[12].

3. Arab nations with distinct cultural traditions

Other sociocultural variables that may be linked to physical inactivity and, as a result, influence excess weight growth are also worth considering. Women are frequently overprotected in conservative cultures, especially in the Mideast area and the high-income nonOECD nations of Oman, Kuwait, and Saudi Arabia, and are unable to openly engage in physical exercise owing to cultural or religious restrictions. In Egypt and the West Bank, women have been shown to be more accepting of excessive weight gain than males. Furthermore, Al-Riyami et al. in Oman claim that both (high) fertility and illiteracy are linked to higher central adiposity through impairing a woman's understanding of "the significance of [her] body." As a result, bigger socioeconomic developments, in combination with the pre-existing sociocultural context, have had an even higher effect on women's physical activity levels in some nations.

CONCLUSION

Gender differences in weight gain are influenced by a variety of sociocultural factors throughout the globe. Gender inequalities in obesity, on the other hand, are largely unexplored, much alone addressed. Since the middle of the twentieth century, sociocultural variables linked to eating habits seem to have a larger impact on gender inequalities in obesity and overweight in industrialized nations, where both men and women's jobs have been mainly sedentary. Physical activity habits have altered significantly in many developing nations lately, affecting women in particular. Women, who are typically more sedentary than males, seem to be particularly

susceptible to the effects of these meals on excess weight gain when combined with a concurrent dietary shift that has pushed an increased intake of energy-dense foods rich in refined carbs. In developing nations, sociocultural ideas and norms about physical exercise and fatness are more visible, and therefore seem to have a larger impact on gender inequalities in obesity and overweight than in developed countries.

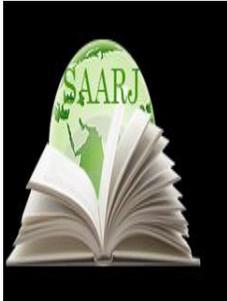

Both qualitative and quantitative techniques should be improved to better evaluate gender-specific features, in addition to additional study that tackles the possible sociocultural reasons of gender inequalities in obesity. This is especially true when it comes to epidemiologic studies that inquire about employment status. Women often claim to be jobless in surveys, despite the fact that they may have a full day of domestic chores and child care, as well as employment in the formal labor market. As a result, we recommend that surveys be better structured to capture the bulk of responsibilities that a woman may have in a normal day. More study on the impact of policies and associated cultural norms on excess weight gain is needed at the national level to understand how macro-level variables may both drive and ameliorate gender inequalities in obesity. Given the worldwide gender inequalities in obesity, gender-specific or gender-tailored remedies may be required to halt or reverse the global obesity epidemic. Obesity prevention measures, from community-level initiatives to national policy, may be the same for men and women in the end. However, if they are delivered in a gender-specific way, they may be more helpful in preventing obesity. If (better) customized to gender, tools and methods intended to assist obese people with weight reduction or the prevention of future weight gain is more successful. However, caution must be used to ensure that weight management policies and initiatives do not unintentionally create or aggravate gender inequalities in excess weight growth or loss.

ABSTRACT

Credit - after the delivery of goods (services) at an agreed price on the basis of the contract (rendering of services) and the satisfaction of the project owner - is allocated and transferred to the account of the supplier (service provider). The fact that part of the directed loans does not reach the destination and its other return is focused on higher sectors will lead to a faster head of the relatively wealthy society. In this article, we will pay more particular attention to the effectiveness of the authority loans which is given to businessmen in order to flourish economics. That is, even people who do not fall into the poorer category will seek to obtain these loans and, if possible, bet on the sector that will bring the greatest benefit to the economy.

KEYWORDS: *Potential Projects, The Government Loans, Minimum Wage, Expense Of Resources, Credits , The Government, , The Minimum Wage , Return, Program, Poorer Category*

INTRODUCTION

New projects with the potential in our country, Uzbekistan, to create high-performance and sustainable jobs can be allocated soft loans at the rate of 8% per annum in the amount of more than 1,000 times the minimum wage at the expense of resources under the program (studied in detail with the involvement of relevant specialists on site). In this article, we will pay more particular attention to the effectiveness of the authority loans which is given to businessmen in order to flourish economics.

Giving loans to the population at 7% for a number of reasons may not make them richer. First, with a market interest rate of around 20%, a 7% loan is a very scarce commodity that everyone wants to get. That is, even people who do not fall into the poorer category will seek to obtain these loans and, if possible, bet on the sector that will bring the greatest benefit to the economy. The government, no matter how well-intentioned it may be, will not be able to take full control of the entire republic (as has been the case before). That is, once these loans begin to be issued, some (large enough) of the loans will not reach their intended destination and will even be diverted to another more lucrative sector of the economy. Naturally, the main beneficiaries in this process will be people who are closer to the lenders or people who are willing to pay extra to get a loan. The fact that part of the directed loans does not reach the destination and its other return is focused on higher sectors will lead to a faster head of the relatively wealthy society. That is, if the rich get richer faster with cheap credit, then the poorer the population, the poorer the poor, the richer the poor.

Secondly, such projects have been implemented many times so far. But I don't think any such projects have improved the lives of the poor. Let's say the loans started to be given to the poor at the same time, which will not only affect the market price of the pets mentioned in the project, and secondly, there will be a noticeable increase in feed prices as a result of the simultaneous increase in demand for pet food. That is, while loans are cheaper for the poorer segments of the population, the fact that these households buy pets more expensively and feed them more expensively than in the past can significantly reduce the attractiveness of these loans. Let's say no one at the market interest rate is doing this. Because he knows that the return on this business is at a lower interest rate on the loan.

In this case, as other costs increase, the proximity of "cheap" loans to the market price will lead to a decrease in its profitability, and the purchase of animals and the fact that the price of feed will reach a certain point will lead to unprofitable losses. This could lead to further impoverishment of the relatively poor population using "cheap" loans.

Thirdly, the fact that loans are three times cheaper than the market price is, of course, in stark contrast to the central bank's inflation targeting policy. That is, these loans put pressure on inflation. In the short run, a further rise in inflation, or at least a slower-than-expected decline, will inevitably lead to more suffering for the poorer sections of the population compared to other sections of the population.

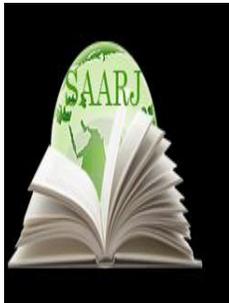

CONCLUSION

In general, no matter how good a decision is made and with good wishes, the decision itself will be bad. Not only will this decision do great harm to the economy in general, but it could also

lead to the fact that the lives of the poorer segments of the population that we want to improve are actually not better but worse.

THE IMPORTANCE OF TEXT CONTENT IN THE FORMATION OF INDEPENDENT THINKING IN PRIMARY SCHOOL STUDENTS

Ahmadaliyeva Muborakxon Mahkamjonovna*

*Teacher of the Department of Methods of Primary Education,
Andijan State University,
UZBEKISTAN

ABSTRACT

This article discusses the characteristics of independence, activity and curiosity, as well as the qualities that encourage students to think independently, so that they can think independently.

KEYWORDS: *Education, Thinking, Activism, Attention, Method, Technology, Independence.*

INTRODUCTION

Shavkat Mirziyoyev spoke in his speech at the conference about "Ensuring social stability, preserving the purity of our sacred religion - the need of the hour" in Tashkent on June 15, focused on the education of the younger generation.

"Another important issue that has always been on our minds is the morals and behavior of our young people, in a word, their worldview," he said. World is changing fastly today. Young people are the ones who feel these changes the most. But at the same time, don't forget about yourself. May the call to know who we are and what a generation of great people always resonate in their hearts and motivate them to remain true to themselves. How do we achieve this? Upbringing, upbringing and only at the expense of upbringing," the President said.

Literature review and methodology

It is known that the attention to the education and all-round development of the younger generation in our country is growing day by day. The successors of the future are the young generation, who will develop into intelligent, perfect people, show their talents, make a worthy contribution to the development of society, naturally, worldview, free thinking and independent thinking. thinking is important.

Independent thinking is an individual, unique trait that requires activity, concentration, achievement of goals, and a creative approach to problem solving. This, in turn, leads to a better

understanding of the content of teaching and learning tasks in the classroom and a critical assessment of the current situation.

DISCUSSION

We all know that the attention paid to the education and all-round development of the younger generation in our republic is growing day by day. As a result of the teacher giving targeted learning assignments on the topic and students thinking and completing them independently:

- connect the topic with real life in the process of thinking;
- Analytical, logical approach to the issue;
- Independent observation, reflection;
- Perception of abstraction;
- To understand the essence of things and events that are not reflected in our eyes;
- Enrichment of personal concepts by covering various aspects of life, the laws;
- serves for independent decision-making in problematic situations.

Based on the above ideas, we have developed a lesson plan for the formation and development of students' independent thinking on the example of the topic "Modern Family" in the textbook "Grade 3" of primary education.

TOPIC I.: My friend's family (3rd grade).

II. Aim of the lesson:

Educational aim:

Develop students' independent thinking, reasoning, knowledge, skills and competencies in the subject;

To achieve students' literacy through textbooks and additional tools;

To gain a broader understanding of the family, its place in society, its responsibilities, and the modern family.

Upbrining aim:

Instilling in students a love for books;

To make them realize that the family is the Motherland, the family is the sacred place;

To gain the warmth and attention of family members, relatives, and friends.

Developmental aim:

Development of independent thinking;

Broadening the scientific worldview on the topic;

Improve fluency, etc.

III. Basic concepts and terms: designer-engineer, editor, art exhibition, university, student.

IV. Method of the lesson: "Chain of Thought", "Concept Analysis" technologies.

V. Form of the lesson: conversation, question-answer.

VI. Lesson method (way): visual method.

VII. Materials used in the lesson: textbook, handouts, pictures on the topic.

VIII. During of the lesson:

Result.

1. Organizational part: greeting students, information on duty, determining attendance, talking about the weather.

2. Review the topic, control homework:

Learnt lesson: "Istiqlol" ship.

Review questions:

1. What did you learn about Abu Rayhan Beruni?

2. Tell us about the planets?

3 On which planet do we live?

3. Chain of ideas. The purpose of this method is to gather as many ideas as possible from them, to give students a diversity of opinion without giving up the same way of thinking. "Homeland begins at home", "Book - a source of knowledge". By comment these translations:

- The teacher listens to the answers and identifies the options that reveal the meaning of these stories;

- Explain to students that books are our friends, increase their love for books.

4. New topic statement (worked with the textbook).

My family

The Behruz`s family is respected by everyone in the neighborhood. Because they have big libraries in their homes. Would you please tell me how many books there are? His father calls the library a "treasure," but he is not jealous of anyone. The gates are always open for book lovers. If you want to read a book, young or old, you can easily go to the library. Folk tales, poems and interesting stories collected on separate low shelves for children are the soul of Behruz. His father said that books played an important role in his success in life.

His father is a designer-engineer at a large enterprise. Whenever you look, your desktop is full of drawings and books. Her mother is the editor of a popular magazine. She also loves to read. Behruz and his brother tell a story every night before going to bed. Her sister Lola is a painter. Behruz used to think that artists shouldn't read books. "A person who doesn't read a book is not an artist," says Lola's sister.

His brother Dilshod is a student at the University of World Languages. In addition to Uzbek, she speaks Russian, English, Chinese and French. It has a separate shelf in its libraries. Behruz is very jealous of his sister and brother. She wants to be a doctor in the future. The Behruz family is called a "modern family" in the neighborhood. Behruz is very proud of that.

5. Methods for strengthening a new topic: "Concept Analysis" technology.

The purpose of the technology: to determine the level of mastery of the topic and mastery of basic concepts on the topic, the ability to express their knowledge independently, work individually and in small groups, respect the views of colleagues, as well as independent thinking to teach them to put their knowledge into a system.

Materials used in the lesson: handouts, list of basic concepts, slides.

Training schedule:

- students are divided into groups;
- Students are introduced to the requirements and rules of the course;
- handouts are distributed to team members;
- Students comment on the concepts in the handout based on their knowledge (individually);
- The teacher reads the concepts on the topic in the handout and together with the team marks the correct explanation of each concept or is presented on the screen with a slide with the explanation of each concept;

At the end of the lesson, each student will identify the differences between the correct answers, gain the necessary understanding, and reinforce their knowledge.

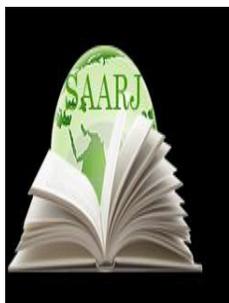

CONCLUSION

IX. Homework: Re-learn the topic. Write an independent text on the topic "My family". This means that students need to develop independence, activism and curiosity in order to think independently. These are the qualities that encourage independent thinking. In order to develop students' independent thinking in the classroom, it is necessary to develop their ability to independently analyze their work, the causes of errors and their elimination, creative approach to the process, control and independent evaluation of their work.

ABSTRACT

Laboratory liver tests are diagnostic and therapeutic tests used to evaluate and treat individuals with hepatic dysfunction. The liver is in charge of glucose, protein, and fat metabolism. Some enzymes and end products of the metabolic pathway that are very sensitive to abnormalities may be used as biochemical markers of liver malfunction. Serum bilirubin, alanine amino transferase, aspartate amino transferase, ratio of aminotransferases, alkaline phosphatase, gamma glutamyl transferase, 5' nucleotidase, ceruloplasmin, and -fetoprotein are some of the biochemical indicators discussed in this article. Clinical diagnosis of illness involving the liver or other organs may be complicated by a single or conjugated change of biochemical indicators of liver damage in patients. The term "liver chemistry tests" is a loosely defined word that refers to a variety of serum chemistries that may be used to evaluate hepatic function and/or damage.

KEYWORDS: Alanine Amino Transferase, Alkaline Phosphatase, Bilirubin, Gamma glutamyl transferase, 5' nucleotidase.

1. INTRODUCTION

Serum Bilirubin:

Bilirubin is a catabolic product of haemoglobin generated inside the reticuloendothelial system. It is released in an unconjugated form that enters the liver and is transformed by the enzyme UDP-glucuronyltransferase to conjugated forms bilirubin mono and diglucuronides. The normal range for total bilirubin in the blood is 2 to 21 mol/L. Bilirubin levels are fewer than 12 mol/L for indirect (unconjugated) bilirubin and less than 8 mol/L for direct (conjugated) bilirubin.

Serum bilirubin levels more than 17 mol/L indicate liver illness, whereas values greater than 24 mol/L indicate abnormal liver testing in the lab. At a blood concentration of approximately 40 mol/L, bilirubin becomes visible inside the sclera, skin, and mucous membranes, causing jaundice. Unconjugated hyperbilirubinemia is caused by excessive bilirubin synthesis, poor hepatic absorption or conjugation, or both. Gilbert's disease, Crigler-Najjar syndrome, reabsorption of massive hematomas, and inefficient erythropoiesis are all caused by a hereditary deficiency of UDP-glucuronyltransferase. Higher levels of serum conjugated bilirubin are observed in viral hepatitis, hepatocellular damage, toxic or ischemic liver injury. In acute viral hepatitis, hyperbilirubinemia is related to the degree of hepatocyte histological damage and the length of time the illness lasts[1]–[3].

Alanine amino transferase (ALT):

When compared to other bodily tissues, ALT is present in the kidney, heart, and muscle, with a higher concentration in the liver. The transamination process is catalyzed only by ALT in the cytoplasm. The normal range for ALT in the blood is 7-56 U/L. Any kind of liver cell damage may cause ALT levels to rise. Nonspecific levels of up to 300 U/L are considered high. People with illnesses that target mainly hepatocytes, such as viral hepatitis, ischemia liver injury (shock liver), and toxin-induced liver damage, have significant increases of ALT levels higher than 500 U/L. Despite the fact that there is a link between high ALT levels and hepatocellular disorders, the absolute peak of ALT elevation does not correspond to the degree of liver cell damage. A significant rise in aminotransferase levels may be caused by viral hepatitis A, B, C, D, and E.

Aspartate amino transferase (AST):

The transamination process is catalyzed by the AST enzyme. There are two genetically distinct isoenzyme forms of AST: mitochondrial and cytoplasmic versions. When compared to other bodily tissues such as the liver, skeletal muscle, and kidney, the heart has the greatest concentration of AST. The normal range for serum AST is 0 to 35 U/L. Extensive tissue necrosis after myocardial infarction, as well as chronic liver disorders including liver tissue degeneration and necrosis, are associated with elevated mitochondrial AST. The mitochondrial isoenzyme contributes around 80% of AST activity in the liver, while the cytosolic isoenzyme is responsible for the majority of circulating AST activity in healthy individuals. The ratio of mitochondrial AST to total AST activity, on the other hand, is useful in detecting liver cell necrosis and alcoholic hepatitis. AST increases are common in individuals with cirrhosis and even in liver disorders when the ALT is usually elevated. AST values were 73U/L in hyperemesis gravidarum, 66U/L in pre-eclampsia, and 81U/L in hemolysis with low platelet count and high liver enzymes in symptomatic pregnant patients[4]–[7].

AST/ALT ratio:

Clinically, the ratio of AST to ALT is more useful than evaluating individual high values. A lack of the coenzyme pyridoxal-5'-phosphate may lower serum ALT activity, which raises the AST/ALT ratio. The ratio rises as the liver's function deteriorates, with 81.3 percent sensitivity and 55.3 percent specificity in detecting cirrhotic individuals. In alcoholic liver disease and post necrotic cirrhosis, the mean ratios were 1.45 and 1.3, respectively. With 87 percent sensitivity and 52 percent specificity, a ratio higher than 1.17 was observed in one-year survival among patients with viral cirrhosis. Advanced liver fibrosis and chronic hepatitis C infection are indicated by a ratio higher than 1. However, alcoholic hepatitis is characterized by an AST/ALT

ratio higher than 2. The AST/ALT ratio of 0.9 in NASH and 2.6 in individuals with alcoholic liver disease was used to distinguish nonalcoholic steatohepatitis (NASH) from alcoholic liver disease in a recent research. In individuals with NASH-related cirrhosis, a mean ratio of 1.4 was discovered. Wilson's illness may cause the ratio to surpass 4.5, and hyperthyroidism can also produce an altered ratio.

Alkaline phosphatase (ALP):

ALP is found in the small intestine mucosal epithelia, proximal convoluted tubule of the kidney, bone, liver, and placenta. In the gut, it transports lipids, and in the bone, it calcifies. The liver is responsible for the majority of serum ALP activity, with bone contributing 50%. The normal range for serum ALP is 41 to 133 U/L. ALP is typically normal or slightly elevated in acute viral hepatitis. Hepatitis A presenting cholestasis is linked to an increase in ALP with persistent itching. Tumors release ALP into the bloodstream, and isoenzymes including Regan, Nagao, and Kasahara are unique to tumors. ALP levels may also be increased as a result of hepatic and bone metastases. Other illnesses that induce an increase in ALP include infiltrative liver diseases, abscesses, granulomatous liver disease, and amyloidosis. Cirrhosis, hepatitis, and congestive heart failure may all cause somewhat increased ALP values. Hypothyroidism, pernicious anemia, zinc insufficiency, and congenital hypophosphatasia all cause low levels of ALP[8].

Gamma Glutamyl Transferase (GGT):

Hepatocytes and biliary epithelial cells, renal tubules, pancreas, and intestine all contain GGT, a microsomal enzyme. It is also found in the cell membrane, where it transports peptides into the cell and participates in glutathione metabolism. Even though it is present in higher quantity in renal tissue, serum GGT activity is mostly ascribed to the hepatobiliary system. GGT levels range from 9 to 85 U/L in the typical range. GGT levels peak in acute viral hepatitis in the second or third week of illness, and in some individuals, they stay high for up to six weeks. About 30% of individuals with chronic hepatitis C infection have an elevated level. GGT levels were also increased in patients with simple diabetes, acute pancreatitis, myocardial infarction, anorexia nervosa, Guillain Barre syndrome, hyperthyroidism, obesity, and dystrophica myotonica. In alcoholism, serum GGT levels are elevated by more than 10 times. It's linked to structural liver damage, activation of hepatic microsomal enzymes, and alcoholic pancreatic injury. Because serum antioxidant carotenoids such as lycopene, -carotene, -carotene, and -cryptoxanthin are inversely related with alcohol-induced increases in serum GGT in moderate and heavy drinkers, GGT may be used as an early predictor of oxidative stress. In more than half of individuals with nonalcoholic fatty liver disease, GGT levels are 2–3 times higher than the upper reference range.

5' Nucleotidase (NTP):

NTP is a glycoprotein that is widely distributed throughout the body and is found in the cytoplasmic membrane, where it catalyzes the release of inorganic phosphate from nucleoside-5-phosphates. The recognized normal range is 0 to 15 U/L. Patients with obstructive jaundice, parenchymal liver disease, hepatic metastases, and bone illness had higher levels of NTP activity. NTP is a specific marker for primary or secondary hepatic tumors in the early stages. ALP levels rose in conjunction with NTP, indicating intra- or extra-hepatic blockage caused by cancer. NTP levels are elevated in both acute infective hepatitis and chronic hepatitis. When compared to chronic hepatitis, acute hepatitis causes a greater increase in NTP activity, which is

attributable to the shedding of plasma membranes with excessive NTP activity owing to cell destruction or the leaking of bile carrying high NTP activity. In the second and third trimesters of pregnancy, serum NTP activity was modestly but substantially increased.

Ceruloplasmin:

Ceruloplasmin is an acute phase protein that is produced in the liver. It binds to copper and acts as a primary copper transporter in the bloodstream. Ceruloplasmin levels in the blood range from 200 to 600 mg/L. Infections, rheumatoid arthritis, pregnancy, non-Wilson liver disease, and obstructive jaundice can raise the amount. Menke's illness, kwashiorkor, marasmus, protein-losing enteropathy, copper insufficiency, and aceruloplasminemia may all cause low levels. Ceruloplasmin levels are low in Wilson's illness. Because ATP7B is damaged, a decreased rate of ceruloplasmin synthesis is responsible for copper buildup in the liver due to a copper transport deficiency in the golgi apparatus. In chronic active liver disease (CALD), serum ceruloplasmin levels were higher, while in Wilson's disease, they were lower (WD). As a result, it is the most reliable standard chemical screening test for distinguishing CALD from WD.

α -fetoprotein (AFP):

The AFP gene is highly active in the foetal liver, although it is suppressed substantially soon after birth. The mechanisms that cause postpartum liver AFP transcriptional suppression are not well known. AFP is a significant serum protein generated at high quantities by the foetal liver and visceral endoderm of the yolk sac, and at low levels by the foetal gut and kidney in the growing mammalian foetus. AFP protects the developing female brain from estrogen exposure during embryonic development, which is necessary for female fertility. The conclusion that maturation stoppage of liver-determined tissue stem cells causes hepatocellular carcinomas was reached in response to liver damage and during the early phases of chemical hepatocarcinogenesis. AFP levels should be between 0 and 15 g/L. In individuals with cirrhosis, an AFP value of 400-500g/L has been deemed diagnostic for hepatocellular carcinoma (HCC). In HCC patients, a high AFP concentration of 400g/L is linked to larger tumors, bilobar involvement, portal vein invasion, and a poorer median survival rate.

When cut-off values of 10% to 15% are utilized, Lens culinaris-reactive AFP, also known as AFP-L3, is the predominant glycoform of AFP in the blood of HCC patients, and it may be identified in about one third of patients with minor HCC (< 3 cm). AFP-L3 is a measure for HCC clearance after therapy. It has been observed that an AFP-L3 level of 15% or above is linked to HCC-related portal vein invasion. The AFP-L3 / AFP ratio may be used to assist in HCC diagnosis and prognosis. The risk of sudden infant death syndrome (SIDS) is directly linked to maternal blood alpha-fetoprotein levels in the second trimester, which may be mediated in part by decreased foetal development and premature delivery.

2. LITERATURE REVIEW

P. Jamjute et al. discussed about Liver Function test and pregnancy[9]. The physiological alterations in liver function that occur during pregnancy are often transitory and very rarely permanent. Pre-eclampsia and eclampsia, acute fatty liver of pregnancy AFLP, haemolysis, high liver enzyme and low platelets HELLP syndrome, cholestasis, hyperemesis gravidarum, and isolated instances of raised liver enzymes may all have severe consequences during pregnancy. Early interpretation of liver function tests (LFTs) may lead to prompt treatment and perhaps

minimize problems in both the mother and the baby. Normal LFTs may not necessarily imply a healthy liver. The interpretation of basic blood LFTs may lead to a variety of problems. LFTs are often utilized to evaluate liver damage rather than hepatic function. Abnormal LFTs may suggest an issue with the liver and give clues to the nature of the disease, although this is not always the case. This overview discusses the different biochemical tests, their etiology, and a method for interpreting aberrant LFTs. Alanine transaminase, aspartate aminotransferase, alkaline phosphatase, bile salts, bilirubin levels, albumin, and prothrombin time are all common assays.

A. Blann discussed about purpose of Liver Function test[10]. The liver is the biggest single distinct organ in the body. It performs four main functions: metabolism and synthesis, excretion, storage, and possible toxin detoxification. Because of these many roles, a single test is insufficient to completely evaluate how the liver is working; at least five separate liver function tests are needed. Part 2 of a four-part series, this article cover the information that these tests may give on acute and chronic liver illness, as well as how disease impacts liver function.

3. DISCUSSION

A liver function test is one of many tests that look at the amounts of enzymes and other proteins in your blood. A hepatic panel, commonly known as a liver function test (LFT or LF), is a collection of blood tests that give information about the condition of a patient's liver. Prothrombin time (PT/INR), activated Partial Thromboplastin time (aPTT), albumin, bilirubin (direct and indirect), and others are among the assays available. In a patient with some degree of intact liver function, the liver transaminases aspartate based test (AST or SGOT) as well as alanine aminotransferase (ALT or SGPT) are helpful indicators of liver damage. The majority of liver disorders have minor side effects at first, but they must be identified early. Hepatic (liver) functioning in some illnesses may be critical. This test is done on a blood sample from a patient. Some tests are related to functioning (e.g., albumin), cellular integrity (e.g., transaminase), and biliary tract conditions.

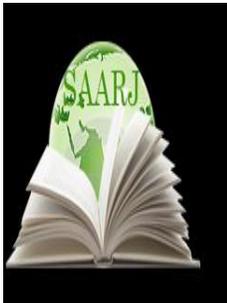

4. CONCLUSION

Laboratory liver tests aid in determining the changes in indicators that indicate liver disease. The evaluation of enzyme abnormalities such as the prevailing sequence of enzyme modification, the amplitude of enzyme alteration in the case of aminotransferases, isolated elevation or in conjugation with another parameter, the rate of change and the nature of the course of alteration, or a follow-up period of 6 months to 1-2 years aids in disease diagnosis. However, since many severe liver illnesses are associated with normal levels, and abnormal levels may be detected in asymptomatic healthy people, a single laboratory liver test is of limited use in screening for liver disease. The pattern of enzyme abnormalities, when evaluated in light of the patient's symptoms, may help guide the diagnosis.

THE IMPACT OF MINIMIZING INTERNATIONAL PROCESSING ON THE GROWTH, DEVELOPMENT AND YIELD OF COTTON

Makhsetbay Embergenovich Ismailov*

*Candidate of Agricultural Sciences,
Karakalpakstan Institute of Agriculture and Agrotechnology,
Nukus, UZBEKISTAN

ABSTRACT

On the saline soils of the Republic of Karakalpakstan, field studies were carried out to identify the effectiveness of minimizing inter-row cultivation of cotton. According to the results of the study, it was established that when several operations are combined in one pass of the tractor, fuel costs are significantly reduced, soil compaction is reduced, and good conditions are created for the normal growth and development of cotton. With international processing, it is possible to combine inter-row cultivation and furrowing before vegetative irrigation.

KEYWORDS: *Soil, Processing, Minimization, Combining, Cultivation, Cotton, Cotton Growth And Development, Saving Fuel And Energy.*

INTRODUCTION

In cotton growing, the bulk of work is mechanized. Cultivation of cotton is carried out with the use of heavy tractors and agricultural machines, which cause, especially with their repeated use, excessive soil compaction. The bulk density of the soil increases, the water, air, nutritional regime of the soil deteriorates, which affects the activity of beneficial microorganisms, and, in general, adversely affects fertility, as a result, the yield of plants decreases. In the conditions of the Republic of Karakalpakstan, where most of the irrigated lands are saline and low-humus, soil compaction is especially undesirable.

The transition to the minimization of soil cultivation, by combining several operations for preparing the soil and caring for plants, with the implementation of two, three methods in one pass of the tractor unit is one of the important conditions for preserving the potential soil fertility, reducing labor and material costs.

As you know, the main purpose of inter-row cultivation is loosening the topsoil and combating weeds. The depth and frequency of processing are important. With a delay in the timing of inter-

row cultivation, moisture is lost, soil compaction and debris increase, which creates unfavorable conditions for the formation of the root system, growth and development, and the yield of cotton.

Research method - field method.

The object of research is saline soils, the frequency of processing, cotton.

Research results and their discussion. The experiment studied two varieties of cotton, C-4727 and Chimbay 5018, the frequency of inter-row cultivation (8 and 5), incl. eightfold - studied as a control.

According to the results of phenological observations carried out on August 1 and September 1, it was established that in 2013 the height of the main stem of C-4727 variety with eightfold processing was 85.3 cm, and with fivefold processing 89.4 cm, the number of sympodial branches, respectively, 9.3 and 8.9 pieces, the number of bolls 4.7 and 4.8 pieces. For the Chimbay 5018 variety, respectively, they amounted to 80.4 and 81.2 cm, 9.0 and 9.1 pieces and 2.8 pieces. When observed on September 1, the height of the main stem and the number of sympodial branches remained almost unchanged, and the number of bolls doubled, i.e. for grade C-4727 with eightfold processing they amounted to 8.1 pieces, and with fivefold processing 9.1 pieces, and for grade Chimbay 5018, respectively, 8.2 and 8.6 pieces. According to table 1, it can be seen that the Chimbay 5018 variety lags behind the C-4727 variety in all indicators, i.e. these are the biological characteristics of varieties. With all the multiplicity of inter-row processing, the height of the main stem and the number of sympodial branches are almost the same, and the number of bolls of variety 4727 with eightfold processing was 8.1 pcs, and with fivefold processing - 9.1 pcs, i.e. increased by 1.0 pcs, and for the Chimbay 5018 variety, 8.2 and 8.6 pcs, respectively. The differences depending on the frequency of processing are insignificant, but by minimizing inter-row processing, energy and material costs are saved.

Thus, for the normal growth and development of cotton varieties C-4727 and Chimbay 5018, it is advisable to minimize inter-row cultivation, i.e. instead of eight times, it is necessary to carry out five times inter-row processing.

TABLE 1 INFLUENCE OF MULTIPLICITY AND INTER-ROW TREATMENTS ON THE GROWTH AND DEVELOPMENT OF COTTON

№ var.	Variants		on I.VIII			on I.IX		
	Cotton varieties	Frequency of inter-row processing	Main stem height, cm	Number of sympodial branches	Number of bolls, pcs	Main stem height, cm	Number of sympodial branches	Number of bolls, pcs
2013 y.								
1	C-4727	8	85,3	9,3	4,7	88,2	9,7	8,1
2	C-4727	5	89,4	8,9	4,8	92,6	9,6	9,1
3	Chimbay 5018	8	80,4	9,0	2,8	84,6	9,0	8,2
4	Chimbay 5018	5	81,2	9,1	2,8	84,5	9,6	8,6
2014 y.								
1	C-4727	8	68,5	8,8	1,7	79,6	9,2	7,5
2	C-4727	5	65,5	9,3	1,5	76,8	9,9	6,8
3	Chimbay 5018	8	53,0	8,8	1,4	68,9	9,8	6,4

4	Chimbay 5018	5	62,0	9,2	1,2	72,8	9,5	7,0
2015 y.								
1	C-4727	8	76,7	9,0	5,2	83,6	9,0	7,0
2	C-4727	5	81,3	9,0	5,7	87,1	9,1	7,3
3	Chimbay 5018	8	66,1	9,1	4,2	68,7	9,8	7,3
4	Chimbay 5018	5	72,7	8,5	5,7	75,5	9,1	7,6

The yield of raw cotton in terms of cotton varieties averaged 29.4-32.2 c / ha. With eightfold processing, the yield of raw cotton of the C-4727 variety was 30.8 c / ha, and with fivefold processing 32.2 c / ha, i.e. contributed to an increase in yield by 1.4 c / ha with significant savings in energy and material costs.

The yield of cotton of the Chimbay 5018 variety with eightfold processing is 30.5 c / ha, i.e. the additional yield was 1.1 c / ha. The data on the yield of cotton varieties C-4727 and Chimbay 5018 indicate that there is no need to carry out eightfold inter-row cultivation, since with fivefold processing no less was obtained than eightfold, even contributed to an increase in yield by 1.1-1.4 c / ha, with significant savings in energy and material costs.

CONCLUSIONS

In the conditions of saline lands of the Republic of Karakalpakstan, for normal growth, development and obtaining a high yield of raw cotton, instead of eightfold inter-row cultivation, it is necessary to carry out a fivefold inter-row cultivation. With fivefold inter-row cultivation, cotton does not lag behind in growth and development compared to eightfold, and the yield is 1.1-1.4 c / ha higher than in the control option.

TABLE 2 INFLUENCE OF THE FREQUENCY OF INTER-ROW CULTIVATION ON COTTON YIELD

Variants			Yield of raw cotton			Average	Deviation, ±
№	Cotton varieties	Frequency of inter-row processing	2013 y.	2014 y.	2015 y.		
1	C-4727	8	36,6	28,4	27,5	30,8	00
2	C-4727	5	37,9	29,0	29,8	32,2	1,4
3	Chimbay 5018	8	34,9	25,9	27,5	29,4	00
4	Chimbay 5018	5	36,0	25,8	29,8	30,5	1,1

C-4727 variety md = 0,8; 0,9; 0,67 c/ha.

P = 1,28; 2,0; 1,4%

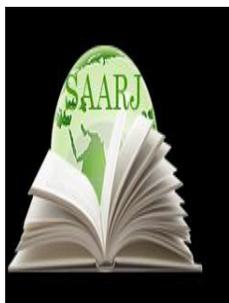

Chimbay 5018 variety md = 0,8; 0,9; 0,67 c/ha.

P = 1,62; 2,7; 1,53%

INFLUENCE OF COMPOSTS ON THE GROWTH, DEVELOPMENT AND PRODUCTIVITY OF COTTON

Uzakbay Embergenovich Ismailov*

*Professor, Doctor of agricultural sciences,
Karakalpakstan institute of agriculture and agrotechnologies,
Nukus, UZBEKISTAN

ABSTRACT

The field experiment was carried out on studying the effectiveness of using different types of composts together with mineral fertilizers in feeding cotton in the conditions of saline soil of the Republic of Karakalpakstan. According to the results of the research the growth, development and productivity of cotton are provided when mineral fertilizers N250 P175 K125 kg/ha were used with rice and wood husk - 25%, manure - 25%, chicken manure - 45% and phosphogypsum in the amount 20 t/ha.

KEYWORDS: *Compost, Mineral And Organic Fertilizers, Saline Soil, Cotton, Productivity.*

INTRODUCTION

Today, the role of agriculture in economics and work is very important. Industry and intellectual level of the country is directly connected with agriculture.

As shown in the world agricultural experiments, crop productivity is dependent on the amount of fertilizers in soil. Chemical agriculture is an important source of increasing crop productivity, the most effective way of fastening agricultural industry economically.

The basis of agricultural politics of the Republic is fastly developing agriculture mainly by mechanizing and meliorating.

In recent years, requirement for ecological free products has been increasing in the world. Therefore, working by planning beforehand is the demand of the time. Using mineral fertilizers and at the same time, giving organic green manure crop fertilizers to agricultural crops provides the improvement of ecological free products.

One of the most important agrotechnical actions is providing crop with mineral fertilizers on time and amount. Therefore, the importance of the theme is using composts, which made from organic waste replacing mineral fertilizers and phosphogypsum, at the same time local fertilizers.

Especially, using composts instead of mineral fertilizers is an important task and according to the results of the scientific works:

The method of the research. Field experiment. Effectiveness of different structural composts, mineral and organic fertilizers in feeding cotton was studied comparing with each other.

The object of the research. Saline soil, C-4727 type of cotton, mineral and organic fertilizers, composts.

Results of the research and analyzing them. We prepared three types of composts to feed the cotton.

Compost type 1 contains rice and wood husk – 25%, manure – 25%, chicken manure – 45 %, phosphogypsum – 5%.

Compost type 2 contains rice and wood husk – 25%, manure – 25%, chicken manure – 35 %, phosphogypsum – 15%.

Compost type 3 contains rice and wood husk – 25%, manure – 25%, chicken manure – 25 %, phosphogypsum – 25%.

In the experiment the following methods of feeding were studied: only mineral fertilizers in the amount N250 P175 K125 kg/ha, manure 10 and 20 t/ha with mineral fertilizers, compost types 1, 2, 3 with 10 and 20 t/ha mineral fertilizers.

According to the received results, different types of composts and their amount, mineral and organic fertilizers influence on the growth and development of cotton in various ways.

When the growth and development of cotton were determined on the 1st of September, the height of the main stem was 72,5-82,0 cm, number of fruitful branches - 9,5-11,5 and number of buds - 7,5-8,1, when only mineral fertilizer was used. When organic fertilizer was used together with mineral fertilizer (in variants 2-3), the height of the main stem was 79,0-90,1 cm, 83,0-88,0 cm, number of fruitful branches - 11,0-12,5 pieces, 11,5-14,0 pieces and number of buds - 8,0-8,6 pieces, 8,5-9,3 pieces. There was not many difference when organic fertilizer was used in the amount of 20 t/ha.

When compost type 1 (contains rice and wood husk – 25%, manure – 25%, chicken manure – 45 %, phosphogypsum – 5%) was used with mineral fertilizers in the amount of 10 t, the height of the main stem of cotton was 84,5-92,5 cm, number of fruitful branches - 13,5-15,5 pieces, and the number of buds - 10,0-10,5 pieces. When the amount of compost was used as 20 t/ha (variant 5) the height of the main stem was 91,5-94,5 cm, number of fruitful branches - 14,5-15,1 pieces and the number of buds - 11,0-11,6, so the number of buds increased by 1,0-1,1 pieces.

In compost types 2 and 3, when the amount of chicken manure was decreased, instead the amount of phosphogypsum increased, there was not almost any difference in the growth and development of cotton.

So, it is expedient to use compost type 1 in the amount of 20 t/ha together with mineral fertilizers in the amount of N250 P175 K125 kg/ha.

Influence of compost and mineral fertilizers in different structure and amount on the growth and development of cotton, 2010.

9	88,3	13,5	5,1	87,5	13,5	9,6

One of the factors which influence on the amount of cotton yield is the weight of cotton in one bud. When mineral fertilizers were used in the amount of N250 P175 K125 kg/ha the weight of cotton in one bud was 4,3 g. When 10 and 20 t/ha organic fertilizer was used together with mineral fertilizer the weight of cotton in one bud was 4,5 and 5,0 g, and it was more by 0,2 and 0,7 g comparing to using only mineral fertilizer.

When different structural composts were used in the amount of 10 and 20 t/ha, it was 5,2-5,4 and 5,3-5,6 g. It was more by 0,9-1,3 g comparing to using only mineral fertilizer.

Cotton yield was 26,4 c/ha when mineral fertilizers were used N250 P175 K125 kg/ha. It was 30,4-33,6 q/ha when different structural composts used additionally to mineral fertilizers. In this, when compost type 1 was used in the amount of 10 t/ha cotton yield was 31,5 q/ha, when used in the amount of 20 t/ha it was 33,6 q/ha, it provided to get 5,1 and 7,2 q/ha additional products comparing to using only mineral fertilizers. When compost types 2 and 3 were used together with mineral fertilizers 4,0 and 6,2 additional products were got comparing to using only mineral fertilizers. In order to get high yield from the cotton it is recommended to use mineral fertilizers in the amount of N250 P175 K125 kg/ha, and compost in the amount of 20 t/ha which is prepared from rice husk, manure, chicken manure and phosphogypsum.

CONCLUSION

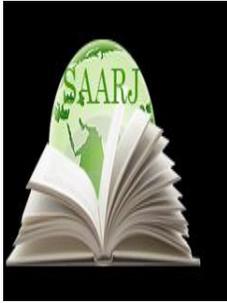

The use of composts of different types in combination with mineral fertilizers in feeding cotton has a positive effect on the growth, development and accumulation of high yields and on the improvement of agrophysical, agrochemical and microbiological properties of soil. Soil productivity increases, nutrient, water and air regimes improve, and a favorable environment is created for plant growth.

Due to the low soil fertility of Karakalpakstan, we must first of all think about increasing it. Therefore, we need to think about the use of organic green manure and compost of any composition in the soil.

ABSTRACT

The authors analyzed the results of surgical treatment of 98 ventral hernias in obese patients with saggy abdomen. Indications for surgical treatment of patients with large and giant POVH (postoperative ventral hernias), mainly, were decreased ability to work - 43 (43.8%) patients, cosmetic dissatisfaction - in 38 (38.7%), adhesive disease with symptoms of partial intestinal obstruction (coprostasis) - in 17 (17.3%) patients. The analysis of the influence of alloplast and skin autodermal plasty on the development of postoperative complications and healing was carried out.

KEYWORDS: *Ventral Hernia, Alloplasty, Autodermal Plasty.*

INTRODUCTION

Ventral hernia is one of the most common pathologies in general surgical practice and obesity is one of the reasons worsening the results of hernia repair [1,3,10-13]. Similarly, morbid obese patients have high intra-abdominal pressure compared to non-obese patients. Every year in the world, one can observe a tendency to an increase of up to 20–26% in the number of patients with large and giant incisional ventral hernias (POVH), which significantly reduce the quality of life, negatively affect the somatic, psychological and social status of such patients [4,6]. Large and gigantic hernias are diagnosed in 3–7% of the inhabitants of the Earth [7,9]. Most patients with POVH are people of working age. The urgency of the problem of surgical correction of the

ventral in patients with overweight is due not only to a large number of complications of the early and late postoperative period, relapses, but also to uncertainty in tactical and methodological approaches.

Aim of the study: Improvement of treatment results and quality of life in patients with overweight ventral hernias.

Materials and methods

The work is based on the analysis of the results of hernioplasty in 98 obese patients with postoperative, recurrent and primary ventral hernias. All operations were performed in the surgical department of the AndGosMI clinic from 2016 to 2020. The patients were divided into two groups: the control group (53) and the main group (45). Group 1 consisted of 53 people, consisting of patients who underwent only traditional hernioplasty and used standard diagnostic and treatment methods. The second group included 45 patients in whom hernioplasty was supplemented with the implementation of developed and improved methods of treatment and correction of recurrent GV, using autodermal plasty (ADP) and alloplastic grafts (ALG).

To characterize the hernial protrusion, the classification of J. Chevrel and A. Rath (1999) was used, which allows for a statistical study of the reliability of the relationships between different groups of patients and the percentage of relapses and recommended in the resolution of the 5th anniversary conference "Actual problems of herniology" (Moscow, October, 2006) [6,7]. 39 patients suffered from II degree obesity (BMI-36.7 kg / m²), in 28 people. there was degree I obesity (BMI-32.3 kg / m²), in 6 cases - III degree obesity (BMI-> 40.0 kg / m²). In all cases, obesity was combined with abdominoptosis. The classification provides for three positions. S - localization: median hernia (M), lateral (L) and combined (ML). W - the width of the hernial orifice: W1 - up to 5 cm (small hernias), W2 - 5 - 10 cm (medium size), W3 - 11-15 cm (large size), W4 - over 15 cm and over 30 (giant) ... R - presence and frequency of relapse (R0, R1, R2, R3,).

According to the classification (SWR), 10 patients in the control group and 12 in the main group had large (W3) and giant (W4) hernias. The overwhelming majority of patients, 28 (62.2%) and 32 (60.3%), respectively, had supra-umbilical (M1) and peri-umbilical (M2) hernias. The smallest number of patients had ventral hernias of lateral (L) 5 (11.1%), 7 (13.2%) and combined (M + L) locations 12 (26.7%) and 14 (26.4%). Of 98 patients, 12 (26.7%) and 12 (22.6%) of the main group had the first relapse (R1), while two or more relapses were observed in 33 (%) in the control group and in 41 (%) patients in the main group. groups (R2, R3, R4).

A fairly large number of patients (64) were previously operated (65.3%) for postoperative ventral hernias, 12 twice, and 4 6-3 times. Previously, they used plastics of the hernial orifice with local tissues (according to Sapezhko or Mayo), in three cases, plastic was performed with a mesh graft. The aggravating factor was concomitant obesity of varying severity, which took place in 18 (40%) patients in the comparison group and 32 (43.3%) in the main group.

All patients were admitted as planned after a standard preoperative examination on an outpatient basis: general clinical blood and urine tests; blood chemistry; coagulogram; blood test for the presence of hepatitis viruses, syphilis; electrocardiography; X-ray examination of the lungs; examination by a therapist. If necessary, the patients underwent a more complete study:

ultrasound, spirometry, examination by related specialists, etc. Electromyographic (EMG) was used to assess the functional state of the anterior abdominal muscular system.

In 13 (13.2%) studied patients with recurrent GV, the duration of herniation at the time of surgery was up to 1 year. At the same time, herniation for a period of 1 to 3 years was in 38 (39%), and 4-6 years - in 29 (29.6%) patients. The reasons for the duration of the anamnesis: (from 7 to 10 years or more), our patients (18) explained the fear of the operation, the presence of severe concomitant diseases and, in some cases, the abstinence of the surgeons from the operation.

The duration of hernia carriage in this contingent of patients played an extremely significant role in the outcome of surgical treatment: the longer POVH existed, the more often unfavorable conditions were created for the organism to adapt to an increase in intra-abdominal pressure in the early postoperative period.

The probable reasons contributing to the occurrence of large and giant POVH in this contingent of patients were: suppuration of the surgical wound - 21 (21.4%) cases, repeated surgical interventions - 18 (18.3%) cases, early physical activity - 11 (11, 2%) cases and ligature fistulas - 8 (8.1%) patients, cough, which served to increase intra-abdominal pressure in 9 (9.1). Pregnancy soon after surgery was the cause of recurrent GV in 8 (8.1%) patients, which was apparently associated with certain features of the lower median approach.

Hernia repair for recurrent GV, especially in elderly and senile people, is a serious intervention, accompanied by severe trauma, manipulations on pathologically altered tissues of the abdominal wall and abdominal organs. One of the most controversial issues is the problem of reducing the likelihood of developing various postoperative complications in the group of patients with the highest operational risk. This category includes primarily patients with a large defect in combination with obesity.

In this regard, patients with recurrent GV require special preoperative preparation.

The clinic uses a comprehensive preoperative preparation of patients with large and giant hernias with control of the study of cardiopulmonary activity. During the period of preoperative preparation, we solved the following tasks:

1. Prevention of a sharp increase in intra-abdominal pressure in the early postoperative period (bowel cleansing, elimination of cough and straining during urination).
2. Adaptation of the cardiovascular and respiratory systems to increased intra-abdominal pressure - wearing a strong bandage and tight elastic bandaging.
3. Corrective therapy of concomitant diseases (cardiac pathology, arterial hypertension, diabetes mellitus, etc.).
4. Prevention of complications from the postoperative wound by treatment and treatment with disinfectants, alcohol solutions, quartzization (excoriation, trophic ulcers and dermatitis).

Assessment of the state and reserve capabilities of the respiratory system. When studying the effectiveness of standard preoperative preparation, the following feature was noted. Only in 51.2% of patients in the main group, on admission, the function of external respiration (FVD) remained within the normal range. In 34 cases, a decrease in the compensatory capabilities of the

respiratory system was revealed. Respiratory failure was noted in 7 patients. This required treatment to maintain the proper level of ventilation and gas exchange processes. After correction of external respiration in 7-14 days, a repeated study of the FVD was carried out. Against the background of treatment, there was a good dynamics with a significant change in indicators, however, in general, the average value of all parameters was below the recognized norm - 62.2% in terms of VC.

Focusing on the indicators of VC, the value of which, according to spirometry data, should not be lower than 70% of the due value, only in 70.2% of patients by the end of treatment, the function of external respiration was within normal limits. Revealed changes after corrective therapy in 23 patients that fit into the 1st stage. DN and 2 grade II, demanded prolonged training.

The program of complex preoperative preparation as a whole had the goal of: drug treatment of diagnosed concomitant therapeutic diseases, vitamin therapy, correction of cardiopulmonary disorders, reduction of the patient's weight (up to 10-15 kg), abdominal volume and adaptation to increased intra-abdominal pressure, and also prevention of thromboembolic and purulent-septic complications from the surgical wound.

Patients were prescribed light laxatives, cleansing enemas every 2-3 days. After bowel preparation, the patient drinks only tea and water for 2 days before the operation. The deficiency of salts, carbohydrates and proteins, if necessary, is replenished by parenteral administration of saline preparations, concentrated solutions of glucose, amino acids, protein preparations.

The duration and intensity of preoperative preparation of patients with recurrent GV depended on the shape, size and size of the hernia, the presence or absence of its complications, age, as well as concomitant therapeutic and concomitant surgical pathology. Only a comprehensive preparation of patients for surgery, especially in elderly and senile people, makes it possible to expand the indications for surgical interventions, improves the conditions for performing the operation and contributes to a smoother course of the postoperative period.

For the prevention of thromboembolic complications in patients with recurrent POVH, we investigated the coagulation and anticoagulation systems of the blood. We studied the coagulation and anticoagulation system of the blood in 97 patients (including 15 men and 82 women) aged 32 to 74 years, 8 of them were over 50 years old.

In patients with recurrent GV, the blood clotting activity is significantly increased. This is evidenced by the shortening of the clotting time on average to 214 ± 13.5 sec and the recalcification time to 96 ± 13 sec ($P < 0.001$). At a normal rate of 638 ± 30 sec ($P < 0.05$), the test time for the patient's plasma sensitivity to heparin was shortened. This can be explained by the decrease in blood heparin observed in our patients. The content of procoagulants (prothrombin, proaccelerin, proconvertin), calcium in the blood serum was within the normal range.

In patients of the comparison group, we used the following plastic options: "traditional" - layer-by-layer restoration of the anatomical integrity of the abdominal wall; layer-by-layer suturing and creation of duplication of the musculo-aponeurotic layer according to the Sapezhko and Mayo type.

It should be noted that the "traditional" methods of hernia orifice plasty in this group of patients were not performed with gigantic POVH. At the same time, in these patients, the compared tissues in all cases were strong, i.e. retained the anatomical structure. At the same time, the

convergence of the tissues did not cause tension in the suture line. In addition, all of them did not have diseases from the respiratory system and cardiovascular systems of the body. The overwhelming majority were patients who did not perform heavy physical work.

Our experience in the surgical treatment of POVH indicates that the indications for this method of plasty in the studied patients are justified in the case of large POVH values. With its gigantic size, the indications for this method of plastics should be set strictly individually. This is due to the fact that the reduction of a significant volume of the contents of the hernia itself increases intra-abdominal pressure. At the same time, an additional decrease in the volume of the abdominal cavity due to duplication of the abdominal wall can further increase the intra-abdominal pressure with the ensuing consequences.

Patients of the main group who underwent hernia repair with autodermal plasty and alloplasty with a mesh implant had laxity of the musculo-aponeurotic layer, diseases of the respiratory system or the cardiovascular system or the gastrointestinal tract, most of the patients were engaged in heavy physical labor.

In addition, the majority of women were persons of reproductive age. In the main group, the skin incision was performed along the hernial protrusion. Then subcutaneously fatty tissue was widely separated to aponeurosis around the hernial sac. After that, the hernial sac was treated, hernial defects were repaired, and the diastasis of the rectus abdominis muscles was eliminated. All patients in the study group received a mesh implant. To prevent small abdomen syndrome and respiratory failure, according to indications, tension-free hernioalloplasty without suturing the aponeurosis or reconstruction of the abdominal wall according to Ramirez was performed.

The most optimal should be considered the use of wide bordering incisions with complete excision of the skin-subcutaneous fat flap together with the postoperative scar.

Along with this, it should be noted that the correctly selected shape and direction of the incision allow you to quickly expose the defect of the abdominal wall along its entire circumference and, moreover, does not disfigure the general configuration of the abdomen.

With the localization of recurrent GV, mainly in the epigastric region, it is preferable to make longitudinal and oblique transverse incisions, with localization in the mesogastrium, transverse. When localized in the hypogastrium, transverse or T-shaped with complete removal of the cutaneous and subcutaneous apron, which is especially pronounced in obese women.

For prosthetic repairs, the graft was fixed using the "onlay" technique. If necessary, in order to increase the volume of the abdominal cavity, to prevent the development of ACS, the plasty of the anterior abdominal wall was performed using a tension-free method, i.e., the mesh was applied to the aponeurosis without it. Suturing, as well as a combined method with the addition of mobilization of the sheaths of the rectus abdominis muscles according to Ramirez.

In the event of a deficiency and a defect in the aponeurosis, the peripheral sections of the explant were placed over the edges of the aponeurosis and fixed to it with a twisted suture. This method is a true tension-free hernioplasty. The mesh explant replaced the aponeurosis defect formed by the hernial protrusion. This type of surgery is indicated for large hernias that correspond to W3 – W4 according to the "SWR" classification.

After the completion of the plasty of the anterior abdominal wall, dermatolipidectomy was performed, along a line previously applied to the anterior abdominal wall before the operation, which borders the hernial protrusion, the old postoperative scar and the skin and fat fold. The weight of the excess skin and fat flap ranged from 4 to 12 kg. After the completion of hernioplasty, all patients in the control and study groups left a perforated drainage tube above the aponeurosis, the free ends of which were removed below the horizontal incision and fixed to the skin and drained. In the postoperative period, patients of both groups were prescribed banding of the anterior abdominal wall, antibiotic prophylaxis, early rising, breathing exercises, anticoagulants, and physiotherapy. The drainage tube was removed within 2 to 8 days under dynamic ultrasound observation.

Results. To assess the effectiveness of treatment results in patients in the groups under discussion, the following comparison parameters were used as the main criteria: 1. Abdominal complications of the early postoperative period. 2. Extra-abdominal complications of the early postoperative period. 3. Wound complications in the early postoperative period. 4. Long-term results of surgical treatment.

In patients of both groups, at the stages of treatment, the level of intra-abdominal pressure was measured over time. Based on the data obtained, regular changes in the indices of intra-abdominal pressure were revealed in the direction of their increase at the stages of the operation, associated with immersion of the hernial contents and hernioplasty. Tension-free hernioalloplasty and combined technique with mobilization of rectus muscles according to Ramirez, applied to 10 patients in the control group and 58 patients in the main group, which achieved an increase in the volume of the abdominal cavity, allowed avoiding an increase in intra-abdominal pressure.

The results of using various methods of hernioplasty in patients with recurrent GV were assessed according to the following criteria: the effectiveness of treatment; the percentage of complications in the postoperative period; postoperative mortality: the average number of bed-days in the postoperative period.

At the same time, we identified complications associated with surgical intervention and general complications that occur after various surgical interventions.

Postoperative complications from the wound in the studied patients were diagnosed in 30 cases. At the same time, hematoma was diagnosed in 6 (13.3%) patients of the comparison group and in 3 (5.6%) of the main group, wound infiltration - in 7 (15.5%) of the comparison group and in 2 (3.7%) of the main group. group, ligature fistula was observed only in 5 (11.1%) patients in the comparison group, wound suppuration - in 6 (13.3%) patients in the comparison group and in 1 (3.5%) of the main group.

In general, after hernia repair with hernia orifice repair using the "traditional" method, wound complications were diagnosed in 24 (53.3%) patients, and after ADP in 3 (12%) patients, after ALP also in 3 (10.7%). It should be noted that in the initial period of our work, we drained the subcutaneous fat only in obese patients.

In the long term, after plasty by the "traditional" method, good results were diagnosed in 28 (62.2%) patients, after ARP - in 23 (92%), after ALP in 27 (96.4%) patients.

Along with this, in 10 (22.2%) patients, we noted a satisfactory result - after plastic surgery by the "traditional" method, in 1 (4%) - ADP and in 1 (3.5%) with ALP.

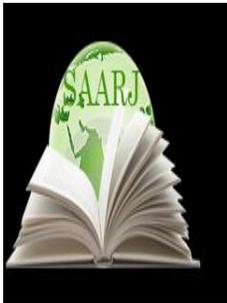

CONCLUSIONS

Thus, a feature of the clinical course in patients with ventral hernias and obesity is the presence of concomitant pathology, which requires special preoperative preparation. For medium and large hernias, alternatively, alloplasty with biologically inert polypropylene explants is applicable. For all forms of postoperative median ventral hernias, it is advisable to perform autodermoplasty, with placement and fixation using the "onlay" or "sublay" method with similar suture material, as well as tension-free methods of plastic surgery together with mesh allograft or autoderal plastic. The choice of plastic surgery for ventral hernias depends on the size of the hernial orifice according to the "SWR" classification (Chevrel J.P., Rath A.M., 2000). In case of W1, both plastic surgery with local tissues and explants using the "onlay" and "sublay" techniques is possible.

ABSTRACT

To determine the viability of a wound-management paradigm based on 4th-generation digital communication industry standards (4G) and smart phones or smart glasses. This wound treatment approach is a real-time, interactive platform for telemedicine, wound dressing changes, and surgeries. It was established in March 2015 between Jinhua, Zhejiang Province, and Shanghai, China, which are separated by 328 kilometers. A video program (APP), 4G internet, smart phones or smart glasses, and a central server were all included. This model service was utilized 109 times in one month on 30 patients with wounds on their lower limbs. The service functioned effectively after a brief learning curve and was considered user-friendly. After the research, two patients (6.7 percent) had healed wounds, while others needed wound dressing changes. This concept was well received by both local practitioners and patients (100 percent and 83.33 percent, respectively). This telemedicine approach is practical and useful since it allows for medical wound healing services in distant regions where experts are rare.

KEYWORDS: *Application, Light, Smart Glass, Smartphone, Telemedicine.*

1. INTRODUCTION

Since its inception in the late 1950s, telemedicine has been widely recognized as a valuable tool in the delivery of health care. Studies have also shown that telemedicine's application (APP) is especially helpful to wound care in isolated populations and distant areas. Smart phones with video APPs are currently quite popular and extensively utilized all over the globe. A smart phone may use a video APP to record, transmit, and save videos, as well as communicate online with people all over the globe. Phones have evolved beyond only making phone conversations to include Internet surfing and a broad range of device-based software applications (APPs). As a result, even in the most distant and resource-poor situations, it is the most popular acquisition

terminal for telemedicine. Meanwhile, new wearable computers such as Google Glasses (Google, Inc., Mountain View, CA) and Vuzix Glasses (Rochester, NY) are gaining worldwide attention from a variety of professions. They may be worn like regular glasses and enable video to be captured from the wearer's viewpoint. It also interacts with others and offers an interface for accessing the Internet[1]–[4].

When utilized, it has the benefit of being hands-free and relying mostly on voice instructions. Its potential to influence health care delivery, medical documentation, surgical training, and patient safety has been shown in studies. Since its inception in the 1990s by Gottmp, the wound healing center has grown into a well-known and widely recognized idea based on a multidisciplinary platform. Wound healing has been shown to benefit from telemedicine as a speciality that requires a significant visual component. Hangzhou was the first wound healing center in China, opening in 2004, followed by Xi'an, Lanzhou, and Shanghai. The apparent concentrated distribution of these developing wound healing clinics in major cities is one of their most distinguishing characteristics; nevertheless, there remains a scarcity of wound experts in rural regions. The distance needed to go to these major wound healing clinics in a big metropolis like Shanghai may be challenging for those patients who are unable to walk freely. To address this issue, we created a telemedicine system in 2011 that used fourth-generation mobile communication technology standards (4G) optical cable and high-resolution video to diagnose and treat wounds between the wound healing department at Ninth Hospital and community health care centers throughout Shanghai. It has been utilized over 600 times and has shown to be useful and beneficial. However, since basic infrastructure in rural regions of China is lacking, we devised a plan to utilize the Shanghai telemedicine model to assist improve wound care in these areas, the impact of which is yet unknown. To perform a cohort research, a novel telemedicine wound care model was built up utilizing 4G net with smart glasses or smart phones between Shanghai and Jinhua, which are 328 kilometers away[5]–[7].

Gold nanoparticle (Au NP)-based colorimetric assays are developing as an alternate method for heavy metal detection,1921 with excellent sensitivity, specificity, and simplicity of signal read-out utilizing UVvis spectrometers1921 or glass slide readers, for example. However, owing to their relatively large equipment, higher prices, and lack of wireless connection, which is critical for distributed sensing and spatiotemporal mapping of contamination in distant places and field settings, these current systems that use NPs are still restricted. The detection of subppm quantities of mercury(II) ions has recently been shown utilizing dye-embedded polymer sheets as colorimetric substrates that are digitized using, for example, smart-phone cameras as an alternative to Au NP-based plasmonic methods.However, because of inevitable changes in ambient light conditions and human operation and/or alignment during the picture capture process, this current method does not take use of the phone's processing/computational capacity, and thus has limited detection sensitivity and repeatability.

To provide a field-portable, cost-effective, and wirelessly connected platform for sensitively quantifying heavy metal ion concentration in water samples, we present a battery-powered mobile sensing device that consists of a lightweight (37 g) opto-mechanical attachment to a smartphone, as well as a custom-developed Android application for detection quantification, reporting, and sharing. This lab-on-a-phone gadget uses dual-wavelength illumination using light-emitting diodes (LEDs) at 523 and 625 nm to measure mercury-induced modest transmission variations in a colorimetric assay using citrate-stabilized plasmonic Au NPs and

aptamers (Apt) combined in disposable test tubes. We also showed geographic mapping of mercury(II) pollution in California using our cellphones.

The majority of bulky and expensive analytical equipment are used to detect environmental pollution such as trace-level hazardous heavy metal ions. However, there is a significant worldwide need for portable, quick, specific, sensitive, and cost-effective identification techniques that can be utilized in resource-constrained and field environments. The author present a smart-phone-based hand-held platform that enables for the measurement of mercury(II) ions in water samples with a sensitivity of parts per billion (ppb). The author developed an integrated opto-mechanical connection to a smart phone's built-in camera module to digitally measure mercury content utilizing a plasmonic gold nanoparticle (Au NP) and aptamer decorative transmission assay applied in disposable test tubes for this purpose. The author quantified mercury(II) ion concentration in water samples using a two-colourratio metric method using light-emitting diodes (LEDs) at 523 and 625 nm and a custom-developed smart application to process each acquired transmission image on the same phone to achieve a limit of detection of 3.5 ppb with this 40-gram smart-phone attachment. We created a mercury contamination map using our smart-phone-based detection technology by assessing water samples from municipal tap water sources, rivers, lakes, and beaches in California (USA). This sensitive and specific heavy metal detection platform running on cellphones could be quite useful for distributed sensing, tracking, and sharing of increased pollution information as a function of both space and time, thanks to its cost-effective design, field-portability, and wireless data connectivity[8].

The research protocol was approved by both participating institutes' medical ethics committees and followed the Declaration of Helsinki's standards. From April to May 2015, 30 patients with skin abnormalities on their lower limbs visited the First People's Hospital of Wucheng District in Jinhua, Zhejiang Province, China. All of the participants signed the informed consent. Specialists from Shanghai Ninth People's Hospital's Wound Healing Department, which is associated with Shanghai Jiao Tong University School of Medicine, provided remote consultation to the First People's Hospital in Wucheng District in Jinhua. Local surgeons from Jinhua's First People's Hospital's orthopaedic department were in charge of keeping track of each patient's medical data and carrying out the treatment plans suggested by distant experts. Local surgeons got pre-training in fundamental wound healing knowledge, which lasted around four days, to enhance their wound care skills. Under the supervision of wound healing experts in Shanghai, local surgeons were evaluated after a period of training to guarantee they fulfilled the criteria of wound care.

A video APP based on PCs and smart phones or the usage of smart glasses with a central server for multiway communication comprised the telemedicine system. Computers were accessible to specialists, smart phones were available to both experts and local surgeons, and smart glasses were available to local surgeons. The video APP enabled real-time viewing of the patients' wound in Jinhua to experts in Shanghai through a 4G wireless local area network (Wi-Fi). Figure 1 depicts the facilities in question. The ZTE M901C (Zhongxing Telecommunication Equipment Corporation, Shenzhen, Guangdong, China) smart phones utilized in this research featured a 13-megapixel camera and a 6.0-inch display with a resolution of 1280720 pixels. It was able to produce a video with a resolution of 19201080 pixels at a frame rate of 30 frames per second. Lenovo Vuzix M100 Smart Glasses were utilized as the smart glasses (Lenovo NewBusiness Development, Beijing, China). A computerized central processing unit, a display screen, a high-definition camera, a microphone, a conduction transducer, and wireless connection were all

included in the smart glasses. It shot movies at a resolution of 1080 pixels at 30 frames per second using a 5-megapixel high-definition camera. The video APP was created by livecast media (Vancouver, BC, Canada), and it allowed for multiway communication, including one-to-many, many-to-one, and many-to-many[9], [10].

In one instance, a person in Shanghai called "shep1" and a user in Jinhua named "shglass2" were both online and able to communicate in real time.

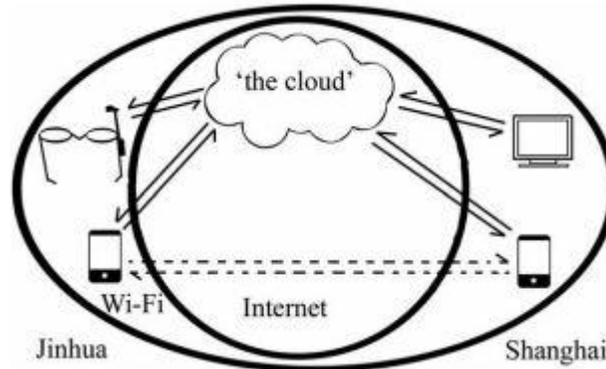

Figure 1: The above figure shows the telemedicine wound care model.

1.1 Adherence and comprehension training for users:

Before launching this model, we tested it in healthy volunteers to see whether it was feasible and to educate both remote experts and local surgeons on how to utilize it. Local surgeons spent an average of three days of training. A YES or NO questionnaire was used to gauge local surgeons and patients' approval of the model.

1.2 The telemedicine system's procedure

When each patient arrived at the clinic, an expert surgeon conducted a physical examination and obtained comprehensive medical information. The surgeon reported the patient's medical record to experts after preparing the patient. Wound healing experts in Shanghai evaluated the wound and provided expert comments via a multiway real-time video conversation. Following a discussion, the expert and the local doctor jointly determined the final treatment choices. Following that, the surgeons and patients decided to meet again for the following session. If patients needed surgery, wound healing experts may use the telemedicine system to offer real-time intraoperative consultation.

2. DISCUSSION

Where there is 4G connectivity, this telemedicine platform with APP for smart phones or smart glasses may be used. Costs were expensive in the late 1950s, when telemedicine was first introduced. Increasing network coverage and lowering prices in developing nations, on the other hand, offer a broad variety of possibilities for smart phone APPs in everyday life, which has been particularly beneficial to telemedicine. Telemedicine is now affordable thanks to modern technology, particularly mobile phones with great mobility and high-speed telecommunication networks. Indeed, telemedicine lowers expenses and enhances the quality of life for patients in distant and rural regions by decreasing transportation and staff time. We described our recent experience with smart phones or smart glasses and 4G for wound treatment in this paper, a

wound care model that emerged from talks between Shanghai and the First People's Hospital of Wucheng district, Jinhua, Zhejiang province in China. This wound care approach was considered user-friendly after its debut. This approach was generally well received by both local surgeons and patients.

The advantages of this type are many. To begin with, it offers a platform for popularizing the idea of wound healing while also allowing local health professionals to undergo systematic wound care training. Local surgeons were interested in our research and shown excellent compliance with the usage of smart phones and smart glasses. Second, it guarantees that individuals who are unable to move freely get health treatment as quickly as possible. Local participants in this research got high-quality medical care close to their homes. Third, a wound-care approach is interactive, real-time, and remote, similar to video conferencing. A single case might be presented in multiple clinics, and physicians could debate it and make a conclusion collectively. Telemedicine effectiveness requires effective communication between distant experts and local surgeons. Local surgeons often follow experts' recommendations, although their ideas may be crucial to the treatment strategy in certain instances.

Fourth, telemedicine may reduce the number of needless referrals to specialists, saving time and money. In wound healing, like in dermatology, a significant visual component is thought to be beneficial. The majority of wound diagnosis and treatment is done via morphological observation, which is possible with the telemedicine system. However, the clinical history, physical examination, and, if required, auxiliary examination are still essential. Specialists advised the usage of elastic bandages in one instance owing to varicose veins. Following a physical examination, one patient with sores on their foot and ankle and a filariasis diagnosis dating back over 30 years was sent to a specialist hospital to address lymphatic obstructions. Because the trial lasted just one month, the majority of participants still needed therapy at the conclusion. Because these patients had long-standing wounds and were of an older demographic, their wounds would take longer to heal fully. Telemedicine is not without its difficulties. Smart phones and smart glasses both have fundamental flaws that restrict their use in telemedicine. Because the smart phone is not hands-free, the consultation cannot take place when there is just one local surgeon on site and examining the wound.

Local surgeons using smart glasses must also put their face near to the wound because it fails to gain magnification of regional anatomy, which has the ability to infect patients. Furthermore, in recent years, issues about privacy and security during telemedicine have gotten a lot of attention. Many individuals are concerned that health-related data may be abused. The usage of the telemedicine service is jeopardized by such ethical and legal problems. There were other publications that addressed the necessity of creating legal rules related to telemedicine, with many of them believing that adequate security and privacy safeguards were required. It should not, however, exclude the utilization of telemedicine services. In this research, a telemedicine wound care model was presented using smart phones or smart glasses, and the results were consistent with our prediction. This approach is especially beneficial since it allows for high-quality medical care in distant regions where wound healing experts are rare.

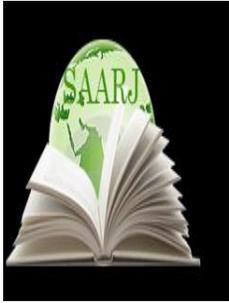

3. CONCLUSION

This wound care approach, in general, is an interactive, real-time, and remote treatment method aimed at improving health care service. It is a novel method of implementing telemedicine that

may be used to change wound dressings or perform procedures with the assistance of expert views. This concept was well received by both local surgeons and patients.

THE BRIEF REVIEW ON THE VARIOUS THERMODYNAMIC CYCLES

Arun Kuamr*

*Faculty of Engineering, Teerthanker Mahaveer University,
 Moradabad, Uttar Pradesh, INDIA
 Email id: arun.engineering@tmu.ac.in

ABSTRACT

The organic Rankine cycle and the super critical Rankine cycle for the conversion of low heat to electricity are discussed in this paper, as well as the collection of possible workflow parameters, the screening of 35 workflow fluids for two cycles, and an overview of fluid characteristics output on the loop. Thermodynamic and physical characteristics, durability, environmental consequences, protection and compatibility, supply and prices are all important considerations when choosing an operating liquid. The kinds of working fluids, the effect of latent heat, density, and actual heat, and the overheating efficiency are all covered in this article.. Superheating is needed for moist fluids in organic Rankine cycles. In the case of dry fluids, superheat may have a detrimental impact on cycle efficacy. Fluids with low critical temperatures and pressures are good candidates for the supercritical Rankine cycle.

KEYWORDS: *Organic Rankine cycle, Rankine, Renewable energy source, Supercritical Rankine cycle.*

INTRODUCTION

A thermodynamic cycle is a connected series of thermodynamic processes that include the movement of heat and work into and out of a system while changing pressure, temperature, and other state variables, and that ultimately restores the system to its original condition. The working fluid (system) may function as a heat engine by converting heat from a heated source into productive work and disposing of the leftover heat to a cool sink while going through a cycle.

The cycle may also be reversed, with labor being used to transport heat from a cold source to a warm sink, thus functioning as a heat pump. The system is in thermodynamic equilibrium at all times throughout the cycle, making it reversible (its entropy change is zero, as entropy is a state

function). Part of the world's energy demand will be met by renewable energy sources such as thermal and geothermal energy sources, as well as a large amount of industrial waste heat. Traditional ways of generating electrical power, on the other hand, are unable to efficiently convert the moderate temperature heat generated by these sources, resulting in huge quantities of moderate temperature heat being wasted [1]. In this instance, research into how to convert this low-quality heat source into energy is of great importance.

The organic Rankine cycle, the supercritical Rankine cycle, the Kalina cycle, the Go swami cycle, and the three-way flash cycle are among the thermodynamic cycles suggested and studied for converting low-quality heat sources into electricity[2]. Despite widespread claims that Kalina cycles have 15 to 50 percent higher heat induction than organic Rankine cycles, data shows that the difference in efficiency for the Kalina loop is only three percent in real operating cycles and simulations under the same atmospheric temperature and cooling system conditions. The biological Rankine cycle, on the other hand, is much less complicated and needs less maintenance [3]. The Figure 1 shows the sketch of the Rankine cycle.

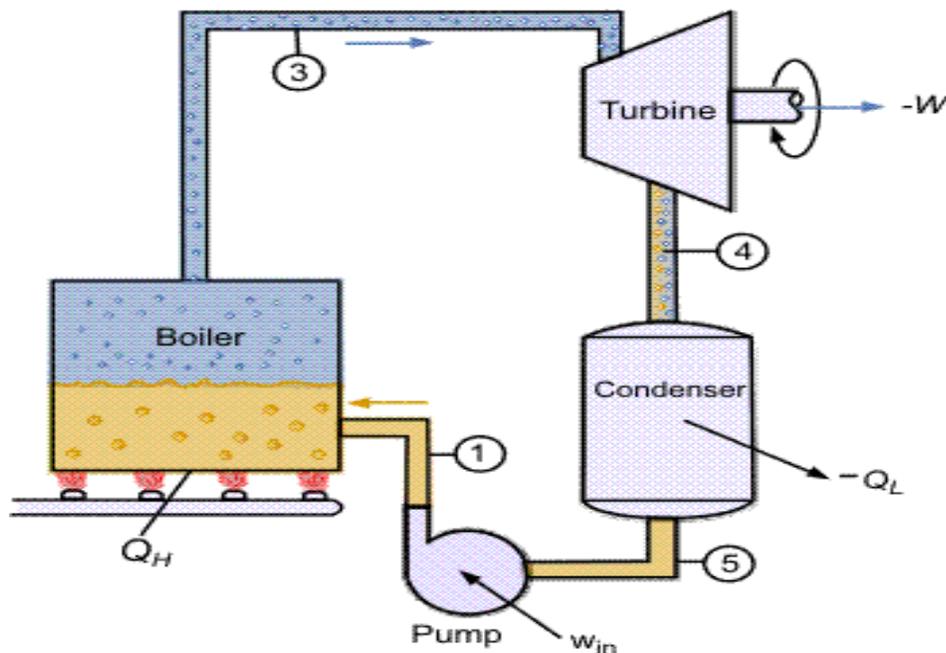

Figure 1: Rankine Cycle[4]

The fundamental working cycle of all power plants is the Rankine cycle, in which the operating fluid continually evaporates and condenses [5]. The working fluid used is mainly determined by the temperature range available. Pressure-enthalpies (p-h) and temperature-entropy (t-e) are used to depict this loop (T-s). The Rankine cycle operates in the following stages:

Isobaric Heat Transfer 1-2-3 The feed pump delivers high-pressured liquid that has been heated to saturation temperature. More energy is incorporated into the liquid, allowing it to evaporate before being fully transformed to saturated steam.

Expansion 3-4 Isentropic. In the turbine, the steam is expanded to produce work that may be converted to electricity. As the process moves into the two-phases region, the expansion is

limited by the temperature of the coolant medium and the corrosion of the turbine blades caused by the liquid training in the vapour flux. The quality of the exit vapour should be more than 90%.

4-5 Isobaric Heat Rejection The vapor-liquid combination left by the turbine (4) is condensed at a low pressure in a surface condenser, usually with cooling water. In properly-built and operated condensers, the vapour pressure is far below ambient pressure.

Isentropic compression of 5-1. The condensate pressure in the feed pump has been increased. Pump effort is generally low due to the tiny real volume of liquids, therefore thus is often ignored in thermodynamic measurements.

Many application cycles have previously been discovered after the researchers developed and tested variants of the Rankine heat transfer cycles into electricity. However, there is still more to be learned in terms of improving output and lowering prices. This is a side-by-side comparison of the two periods.

Organic Rankine Cycle: The organic rankine cycle (ORC) is based on the steam rankine cycle principle, but it recovers heat using organic working fluids with low boiling temperatures. In a T-s diagram, an ORC structure and operations are shown. The loop includes an expansion turbine, a condenser, a pump, a boiler, and a superheater. Superheat is required. Pure working fluids such as HCFC123 (CHCl₂CF₃), PF5050(CF₃(CF₂)₃CF₃), HFC-245,fa (CH₃CH₂CHF₂), HFC-245,ca, isobutene, n-pentane, and flavored hydrocarbons (CH₃), isobutene ((CH₃)₂C=CH₂) [6]. Fluid mixes were also proposed for organic rankin cycles[7].

Water characteristics are prevalent in chemical job fluids. The slope of the job fluid saturation curve in a T-s graph may be positive (e.g. isopentane), positive (e.g. R22), or vertical (e.g. R11), indicating that the fluids are warm, dry, and isentropic. Wet fluids, such as water, are often overheated, while many dry or isentropic organic fluids do not need to be. Another advantage of organic fluids is that the ORC turbine often only needs a single phase expander, resulting in a smoother, less expensive approach[8].

Supercritical Rankine Cycle: To achieve a better thermal balance with the supply of heat, working fluids with low critical temperatures and pressures should be compressed at supercritical pressures and heated till expansion. The T-s diagram depicts the structure and process of the CO₂ supercritical Rankine cycle. The supercritical rank-in process isn't as straightforward as a two-phase area. The Rankine organic cycle produces a tighter thermal fit with less irreversibility. The supercritical Rankine cycle R143a and the standard organic Rankine cycle R152a both have the same thermal limit[9].

By establishing a set of assumptions, thermodynamic cycles may be utilized to simulate actual devices and systems. It is often essential to simplify assumptions in order to reduce an issue to a more manageable size. For example, a gas turbine or jet engine may be represented as a Brayton cycle, as illustrated in the diagram. The device itself is made up of a number of steps, each of which is represented as an idealized thermodynamic process in its own right. Despite the fact that each stage that interacts with the working fluid is a complicated actual device, it is possible to describe it as an idealized process that approximates its real behavior. If energy is provided by methods other than combustion, it is assumed that the exhaust gases will be transferred from the exhaust to a heat exchanger, which will sink the waste heat to the environment and reuse the working gas at the intake stage.

It's possible that the gap between an idealized cycle and real performance is substantial. The following Figure 2, for example, show the discrepancies in work output predicted by an ideal Stirling cycle and real Stirling engine performance:

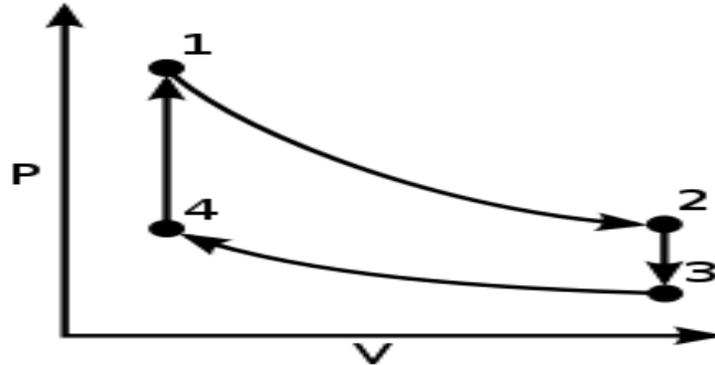

Figure 2: Deal Stirling Cycle

LITERATURE REVIEW

For variable temperature thermal sources, there is no one-size-fits-all fluid. Choices must be taken while selecting fluids. The critical temperature and the fluid's j value are important characteristics that indicate the time and working temperature of the fluid that can be supplied by the fluid, according to the authors [10].

DISCUSSION

For variable temperature thermal sources, there is no one-size-fits-all fluid. Choices must be taken while selecting fluids. The critical temperature and the j value of the fluid, according to the authors, are important characteristics that indicate the time and working temperature of the fluid that can be supplied by the fluid. Among the thermodynamic cycles proposed and researched for converting low-quality heat sources into electricity are the organic Rankine cycle, the supercritical Rankine cycle, the Kalina cycle, the Go swami cycle, and the three-way flash cycle[3]. Despite widespread claims that Kalina cycles have 15 to 50 percent higher heat induction than organic Rankine cycles, data shows that in real operating cycles and simulations under the same atmospheric temperature and cooling system conditions, the difference in efficiency for the Kalina loop is only three percent. The biological Rankine cycle, on the other hand, is simpler and requires less upkeep. The organic rankine cycle (BRC) uses organic working fluids with low boiling temperatures to recover heat, similar to the steam rankine cycle.

An ORC structure and operations are illustrated in a T-s diagram. An expansion turbine, a condenser, a pump, a boiler, and a superheater are all part of the loop. It is necessary to use superheated water. HCFC123 (CHCl_2CF_3), PF5050 ($\text{CF}_3(\text{CF}_2)_3\text{CF}_3$), HFC-245,fa ($\text{CH}_3\text{CH}_2\text{CHF}_2$), HFC-245,ca, isobutene, n-pentane, and flavored hydrocarbons (CH_3), isobutene($(\text{CH}_3)_2\text{C}_5\text{H}_2$)[6]. For organic rankin cycles, fluid mixtures were also suggested. Chemical work fluids have a lot of water properties. In a T-s graph, the slope of the job fluid saturation curve may be positive (e.g. isopentane), positive (e.g. R22), or vertical (e.g. R11), signifying warm, dry, and isentropic fluids. Water and other wet fluids are often overheated, while many dry or isentropic chemical fluids are not. Organic fluids also have the benefit of just

requiring a single phase expander in the ORC turbine, resulting in a smoother, less costly approach.

Working fluids with low critical temperatures and pressures should be compressed at supercritical pressures and heated till expansion to create a better thermal balance with heat supply. The structure and operation of the CO₂ supercritical Rankine cycle are shown in the T-s diagram. The supercritical rank-in process is more complicated than that of a two-phase area. With reduced irreversibility, the Rankine organic cycle provides a tighter thermal fit. The temperature limit of both the supercritical Rankine cycle R143a and the conventional organic Rankine cycle R152a is the same.

CONCLUSION

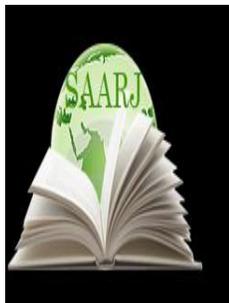

Organic rankine cycles and supercritical rankine cycles were explored for low-grade heat conversion to fuel. Organic Rankine cycles are not in compliance with the thermal sources, unlike an overly critical Rankine cycle, although the supercritical Rankine cycle usually requires greater operating pressures. The efficiency of the cycle is greatly influenced by the functional fluids. Thermodynamic and physical characteristics, durability, environmental implications, protection and performance, as well as availability and cost, are all aspects to consider when selecting a working fluid. Types of work fluids, latent heat effects, density and actual heat, and the effectiveness of superheating are all discussed in detail. Turbines with high-density working fluids and latent high heat have a high work performance. The study also discovered that isentropical and dry fluids are preferred in organic rankine cycles. Superheating is needed for moist fluids in organic Rankine cycles. In the case of dry fluids, superheat may have a detrimental impact on cycle efficacy. Fluids with low critical temperatures and pressures are good candidates for the supercritical Rankine cycle.

THE USE OF INCORPORATION TO INCREASE INFORMATION COMPETENCE IN PRIMARY SCHOOL MATHEMATICS

Mahliyo Haydarkulova Zafarovna*

*Primary Education 2nd year master,
 Faculty of Preschool and Bukhara State University,
 UZBEKISTAN

ABSTRACT

The essence of this article is to increase students' information competence by providing them with a variety of new information in math classes. In the process of passing the subject of mathematics, the teacher teaches, educates, forms some characteristics of students. Math lessons provide new and interesting information through a variety of text, pictures, numbers, and expressions, and increase the information competence of these intelligent students. That is the consequence of an interconnected world.

INTRODUCTION

At present, great attention is paid to the further development and radical improvement of education in our country. In particular, knowledge of mathematics, economics, foreign languages has become a modern requirement. The radical reforms in the field of education in our country are based on specific democratic, national and universal values. Due to the ongoing reforms in the field of education, the demand in this area has also increased. It is unthinkable to organize mathematics lessons in primary school without the use of integration. Because in math class, every subject is connected at least once. This will give the student new information. Through this topic, students develop information competence. Today, it is the duty of every educator to bring up students who have enough knowledge, who can apply their knowledge in practice, who can express their opinion on each topic independently, who have sufficient information resources. The advantage of information and communication technologies is that they teach students to think independently, broaden their worldview, listen and observe, strive and explore, develop thinking, and work independently. The teacher and the student work together. Today, students

need not only to have enough knowledge, but also to be able to put it into practice. This is what the concept of competence represents.

Competence is the ability to apply the theoretical knowledge, skills and abilities acquired by a student in a particular subject in solving practical and theoretical problems encountered in everyday life.

The concept of "competence" was originally introduced into the field of education as a result of psychological and pedagogical research, and is now used as a modern term. "Competentia" is derived from the Latin word, which when translated into Uzbek literally means "a person who knows well", "someone with experience". Therefore, the competence depends on the different situations that occur in the process of training, how the leader behaves in unexpected situations, the ability to communicate, the ability to understand the mental state of subordinates, new skills in dealing with competitors. The ability to apply the knowledge, skills and competencies acquired by the leader in the use of information full of contradictions in specific tasks, to have a plan for action in a constantly evolving and complex process.

A competency-based approach to mathematics education involves students acquiring a variety of skills that enable them to act effectively in situations encountered in professional, personal, and community life. Thus, the competency approach focuses on strengthening the practical application of the basics of mathematics education. Practical exercises and applications, as well as project work have been included in science curricula in order to build students' core competencies and increase their interest in learning general subjects through small-scale research. This not only improves the quality of learning in a particular subject, but also opens up opportunities for interdisciplinary and interdisciplinary communication in everyday life and increases the effectiveness of education. The organization of mathematics lessons requires a greater emphasis on practice than theory, and a certain abandonment of an approach based on providing students with ready-made teaching materials.

The teacher and the student work together. The teacher, as a manager, shows the student different directions. The student is active in the classroom and thinks independently. Teaching increases the effectiveness of the lesson. Like all subjects, mathematics has a role to play in improving information competence in primary school students. The word "information" refers to information about an expected or actual event. At present, all information can be relatively divided into the following types.

- Technical information
- Agro biological information
- Political information
- Legal information
- Economic information, etc.

The types of information are interrelated and complementary. Among this information, economic information is the main one, accounting for 80% of its volume. The word information is derived from the Latin word "informatio", which means "to explain, to describe". In many cases, the word "information" is used instead of the word "given". Information is a clear and practical

message. The data includes messages and observations. It becomes information when an opportunity arises for a need, such as increasing one's knowledge of something.

Information in general is broadly: a reflection of the real world; in the narrow sense: voluntary information consisting of the subject of storage, transmission, modification and management. In the modern sense, information is a scientific concept in the broadest sense, the exchange of information between people, between humans and animate and inanimate nature, especially computers. Information technology is a set of methods and tools for collecting, storing, transmitting, modifying, and processing information. New information technology in education means the latest information technology that can only be used in the educational process. New information technologies are the provision of computer-based information retrieval and processing services by various categories of users. Information technology is the use of computer technology and communication systems to create, collect, transmit, store, and process information for all areas of social life. No matter what profession a person has, if he approaches his work and training diligently and kindly, he will master its secrets, at the same time, he will understand himself and develop in this field. If a teacher loves and nurtures children, he will grow up and become wise. The teacher educates the future child.

Teaching with the use of interactive methods allows students to independently acquire all-round scientific and theoretical knowledge, to form knowledge and skills, and on this basis to form and increase the activity of students' scientific worldviews, to think freely. Provides teaching, identification and realization of creative abilities, formation of teacher-student cooperation and, finally, the achievement of a guaranteed end result. In interactive methods, the teacher is engaged in creating an environment for students to acquire independent and perfect knowledge, to direct them to the basics of science, to arouse interest and affection. New pedagogical technologies change the methods and forms of teaching, diversify them and make the student an active participant in the learning process.

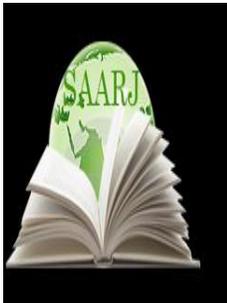

Competence includes not only the cognitive component, but also the motivational, ethical, social, and moral systems of value orientation. In elementary math classes, students learn a lot of information and feel the need for a lot of information. To prevent this, students need to be provided with an adequate supply of information. In this way, students develop information competence. The State Education Standards and Curriculum includes the basic and general science competencies to work with information, the content of which is as follows: to find, sort, process, store and effectively use the necessary information from media sources to acquire, to ensure their safety, to form the capacity to have a media culture. In addition, to be aware of mathematical literacy, scientific and technical innovations and to make personal, family, professional and economic plans based on accurate calculations in the competence of use, to be able to read various diagrams and models in daily activities, the formation of the ability to use scientific and technical innovations that lead to favorable conditions. These competencies are designed to increase the information capacity of the student. Many methods and tools are used to improve students' information competence in elementary math classes. One of the most commonly used methods is integration. That is, by linking math to other subjects, the student is given more information. In mathematics, each subject can be linked to English or another foreign language. Teaching students to say numbers in English, to name actions, or to name any term in a topic in English will be new information for the student. By linking the same math to each subject, it is possible to increase students' information competence. One of the great tasks of a

teacher is to teach students how to sort information. That is, the student must be able to distinguish between necessary and unnecessary information. This is one of the biggest challenges facing students and teachers today. Mathematics is the basis of knowledge of the universe and plays an important role in revealing the specific laws of events and phenomena in the environment, as well as in the development of production, science and technology. As the President Sh.M.Mirziyoyev noted, "Mathematics is the basis of all sciences. A child who knows this science well will grow up to be smart, open-minded and successful in any field." In the words of the famous Russian mathematician A.Ya. Khinchin: "As a result of mastering the science of mathematics, a person is brought up to be honest, truthful, courageous and patriotic. In short, it is important to increase information competence in students from primary school. Mathematics plays a big role in this. Every modern teacher uses different means of communication, different methods and interesting programs in the process of explaining each subject, each topic to the students. Elementary school students are very curious. That's why every piece of information is asked "why?", "Why?", "How?" often ask questions such as The main requirement of the teacher is to provide students with useful information.

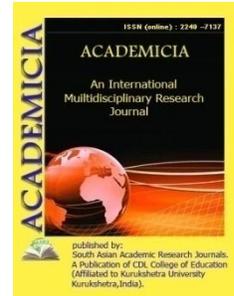

Many methods and tools are used to improve students' information competence in elementary math classes. One of the most commonly used methods is integration. That is, by linking math to other subjects, the student is given more information. In mathematics, each subject can be linked to English or another foreign language. Teaching students to say numbers in English, to name actions, or to name any term in a topic in English will be new information for the student. By linking the same math to each subject, it is possible to increase students' information competence. One of the great tasks of a teacher is to teach students how to sort information. That is, the student must be able to distinguish between necessary and unnecessary information. This is one of the biggest challenges facing students and teachers today.

CHARACTERISTICS OF MARRIAGE MOTIVATION IN YOUNG PEOPLE

Kayumova Guzal Narzullayevna*

*Master's degree from Termez State University,
 UZBEKISTAN

ABSTRACT

The article provides information on the problems associated with family and family relationships, the manifestation of marriage motivations in students and their perception of the causes of family divorce. Morshteyn's concept of "encouragement-value-role", which emphasizes that there are three stages in a row in all relations (in the period of choosing a spouse and preparing for marriage) in the period of marriage. Based on the practical work carried out in our research work, the motivations of marriage in the period before marriage were shown to change after marriage was established.

KEYWORDS: *Family, Motivation, Marriage Motivation, Family Divorce.*

INTRODUCTION

Family this is one of the most important social institutions and requires constant scientific research. In the period of economic, political and social changes in our country, it becomes necessary to study family problems and to develop methodological foundations for solving family problems.

The increase in the number of family divorces, especially in the early years of marriage, is due to the fact that young people form a solid basis for their attitude to family life, the ways of family stabilization izlash, in particular, the formation of an adequate image among young people, the ability to imagine the future spouse, and the provision of harmony between their

Family is the highest product of human thinking. After all, this small place not only benefits our lives, but also plays an important role in the development of the country, in the development of society.

A married couple is the basis for the formation of a family as a small group and a social unit. The family performs a number of vital functions, including economic, reproductive, educational, recreative, relaxation, management, etc.

In the course of research conducted by the researchers with different ages, it was found that the most serious mistakes were made by young people before they were married, during meetings. It was known that many young people in their spouses make decisions with carelessness, emphasizing insignificant, secondary features in family life.

The image of the future spouse is a sub - ideal representation of the psychophysical, psycho-physiological, psychological, socio-psychological and spiritual characteristics of the desired spouse, which is formed as a result of interiorization and demonstration of signs, structural features and relationships. The cleverly constructed image of a marriage partner is a real idea that reflects the physical, psychological and spiritual characteristics of the desired spouse of a man at a certain moment; it is formed without taking into account the laws of harmony of the spouses.

The results of psychological analysis of the theoretical material show that marriage motivations in young people have a specific feature and the predominance of some inappropriate marriage motivations can affect the formation of destructive behavior in their behavior after their marriage. The following models of partner selection are most often summarized and highlighted: (selection of a similar partner; selection of a partner of sympathy; selection of a partner in terms of value; selection of a partner in terms of psychological compatibility.) The partner is chosen depending on the possibility of repeating the accepted censor in the family with him.

The most widely structured and developed theory of choosing a marriage partner is Bernard Morshteyn's concept of "encouragement-value-role", which emphasizes that there are three stages in a row in all relations (in the period of choosing a spouse and preparing for marriage) in the period of marriage. According to his theory, only couples who have gone through all three stages have the opportunity to get married worthy. The first stage - stimulation-consists in separating a person from a large number of people. Based on this, the first choice of a partner, a pleasant activate appears. At this stage, the criteria for selection are external data, social status, the characteristics of the partner's self-presentation, the manifestation of his psychological qualities.

The stage of stimulation is not only the stage of assessing a partner, but also the stage of assessing his qualities. Guessing how much the person himself can interest the partner. At the incentive stage, it is important to approach the territorial closeness between partners and form the basis for mutual sympathy. Therefore, many people find their spouse among their neighbors, colleagues, acquaintances or classmates.

At the first stage of the relationship, the impact of external data on the choice of a spouse was also studied. Scientists have found out that both men and women prefer to have an attractive partner next to them. Men are more sensitive to the appearance of a partner in the early stages of their relationship, and for women, the attractive appearance of a partner is a factor that strengthens relationships in these mature stages.

In the study of the individual's attitude towards marriage building, marriage readiness and marriage building motivation are mainly used questionnaires and questionnaires. Included sociologist S.I. The "marriage motivations" questionnaire, developed by Golod, is also aimed at

studying exactly marriage motivations. According to the famous Russian sociologist Sergei Isaevich Golod, the leading reasons for getting married are: - Love, - common views and interest, - feeling lonely, - compassion,-waiting for a child, - casual, - material well - being; - possession of the shelter of my future husband.

According to the terms of this questionnaire, the respondent S.I. Of the 8 options offered by Golod, he should choose only one basic option that is acceptable to him. We conducted a research using the questionnaire "marriage building motivation" in order to investigate marriage motivations. The examiners were offered a series of 8 matrimonial motivations and were offered to choose one of them. 144 students participated in the research. The result was as follows:

«Indicators of respondents on the methodology of "marriage building motivation" (n=144)

TABLE 1

Marriage motives	1	2	3	4	5	6	7	8
Number of indicators	42	12	3	5	12	8	33	19
Percentage of indicators	29%	8,3%	2%	3,5%	8,3%	5,5%	23%	20,5%

As can be seen from the Table 1 data, in our research group, the student took the highest place in the youth as the marriage motivations were Love, material provision, the shelter of my future spouse. In fact, in the eyes of many young people, love is imagined as the basis of this strong family. Of course, young people can see love as a priority. But the pleasure in family life can not be given from self-indulgence. To do this, it is necessary to fight, strive, be able to withstand in the family, successfully pass the tests and take care of it until the end of the given life and try to preserve it and at the end of the life to leave it as the most sacred heritage to the children, to the future generation.

And some young people build a family with the aim of wealth, career, material or social cohesion. "If I marry this young man, I will live richly "or" if I marry this girl, I will achieve a certain career, position with the help of her parents, " she imagines her socio-economic future life on the basis of her thoughts. And this in most cases generates a chippakkaka of the imagination and desire of young people. Young people in the family should first be taught to rely on their efforts and strength, along with the support of their parents.

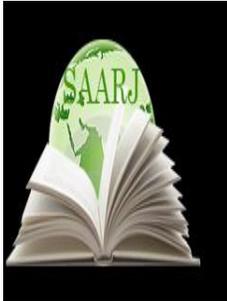

Based on the practical work carried out in our research work, the motivations of marriage in the period before marriage were shown to change after marriage was established. During the conversation with the respondents, more in them, the misunderstanding of their perception about real family life before marriage, the lack of attention to the important aspects of choosing a spouse for himself, the educational upbringing of sharqana, has shown that the influence on the family's resilience.

Based on the research work carried out, the following can be recommended: - to create national methodologies that study the motivations of marriage building in young people; - to study and focus on the Coordination of the motivations of marriage builders in the pre - marital period yet;

- to develop the national structure of marriage building motivations and to explain their content and essence in educational activities.

ANXIETY-AS AN EMOTIONAL STATE

Normuminova Dilafruz Erkinovna*

*Teacher of the Department of psychology of Termez State University,
 UZBEKISTAN

ABSTRACT

The article describes anxiety, its manifestations, the views of psychologists on anxiety, the causes and consequences of increased anxiety and ways to overcome it. The ideas in this regard were also put forward by Eastern thinkers, who expressed in their works their thoughts about the state of manifestation of such feelings as feelings of the individual, anxiety. The characterization of emotional states by its highly dynamic nature is noted both as a result of scientific research and as a result of daily observations. In some periods, these properties are more pronounced.

KEYWORDS: *Anxiety, Emotions, Emotional State, A Sense Of Fear, Overcoming Anxiety.*

INTRODUCTION

Through the state of anxiety in a person, a person can experience various emotional experiences, and this condition undoubtedly affects the perfection of the individual. The ideas in this regard were also put forward by Eastern thinkers, who expressed in their works their thoughts about the state of manifestation of such feelings as feelings of the individual, anxiety. The issue of personality formation in the works of Eastern thinkers is one of the topical issues. A number of opinions have been put forward on the fact that the psycho-physical changes that occur in the process of the formation of an individual are distinguished by their importance.

In particular, Abu Rayhon Beruni considers the cases of anxiety in them in the context of the content of moral qualities in man. As for Abu Ali ibn Sina in his extensive psychoneurological practice, various emotions prove that various changes in the body, heart, blood vessels, respiratory organs can lead to arrhythmia, nerve endings, sensations and fear can lead to a state of intoxication of the body. Ibn Sina believes that mental disorders are the result of physical discomfort, Having determined that there is a link between physiological phenomena and mental phenomena. Ibn Sina re-attaches importance to the leadership role of the central nervous system in the course of its activities, indicating that nervous disorders (fear, nervousness, suffering) lead to the weakening and weakening of the whole organism.

It is known that the formation of the human psyche is due to various factors. Such factors include natural, socio-psychological, purposeful educational factors and, of course, factors of the child's personal activity.[10] in the current period of Science and technology development, it is natural that various conditions, situations, objects frighten or cause human anxiety. This is how the need for scientific study of airing can be explained, rather than other fundamental feelings. Studies aimed at studying anxiety in psychology allow a broader understanding of this emotion. Anxiety was first described by Sigmund Freud [8]. From the point of view of Freud, anxiety is a function of the Ego, awareness of the approaching danger, threat helps a person to respond in such situations (danger, threatening situations) and is a method of adaptation[6]. Freud described anxiety as an unpleasant emotional experience, which is a signal about the expected danger. The meaning of anxiety is the experience of uncertainty and a sense of helplessness. Anxiety is characterized by three main features: 1) a specific unpleasant sensation; 2) corresponding somatic reactions, first of all heart palpitations; 3) awareness. [7]

Anxiety – belongs to the category of fundamental emotions of man (Gelgorn E, Lufbor-Roudj, 1966). It can be imagined that anxiety occurs in a person as a response reaction to a threatening stimulus. Understanding the risk, understanding it is formed in the process of life experience and personalitylararo attitude. But for some people, some independent pathogens gradually acquire the character of dangerous effects. As a result, a feeling of fear can occur involuntarily, accompanied by a strong feeling of excitement, anxiety or horror. Proceeding from the above points, one can say that fear is the emotions of a person who perceives danger and its consequences. [2]

K.Izard notes that fear is experienced as anticipation of danger, anxiety, insecurity. K.Izard divides the causes of fear into 4 types: a) external phenomena and processes; b) desire, aspiration and need; C) emotions; d) cognitive processes of the individual. [3]

Fears arising as a result of these reasons can be either congenital or acquired. The feeling of fear directly provokes anxiety and, as a strong stressor, causes a state of stress in a person.

Dressing from such an airing is carried out by overcoming stress, aimed at emotions, in order to cope with stress. Coping with stress aimed at emotions (Emotion-focused coping) stressogen provides for controlling the emotional response to events through the following methods: a) by changing behavior(bixoral approach); b) by changing one's own thoughts(cognitive approach).

Coping with stress aimed at emotions, people often use it in 2 cases: a) stress that can not be changed Inogen situations; b) when they do not have enough reserves to cope with the situation. To behavioral strategies used in overcoming stress aimed at emotions, it is possible to include the following:-to look at the situation from the outside; - to generalize cognitive redefining ("it was also possible to avoid this"); - by using such contemplative operations as comparison ("in others there is not the same");- to carry out a re - assessment of the situation from the positive side (what it will give).

Z.Freud's cognitive strategies (defenses) are also Coping. Z.It consists of Freud's defenses and rationalization of overcoming problems, projection, variable aggression, nostalgia, specialization, hero bending, regression, dreams, apathy, compensation etc.[7]

Problem-oriented (problem – focused coping) the goal of coping with anxiety is to reduce the risk of stressogen situation and reduce the person's resources to deal with it.Bunda as behavioral

strategies: a) stressogen a comprehensive analysis of the situation and the use of active actions to solve it; b) change the situation with the application of assertive behavior is applied. Stress management-based bixoral techniques use relaxation, systematic desensitization, biological feedback, modeling, and social learning to overcome anxiety about behavior change. Another of the techniques aimed at overcoming anxiety are cognitive techniques. Cognitive techniques: 1. A.Rational emotional therapy of Ellis; 2.A.On Beck, cognitive therapy can be introduced.

The characterization of emotional states by its highly dynamic nature is noted both as a result of scientific research and as a result of daily observations. In some periods, these properties are more pronounced. For example, sometimes due to the discrepancy between the size of the behavior or activity index imposed by adults on adolescent children and the low assessment of their capabilities, a teenager may have a strong anxiety and, as a result of repeated occurrence of this condition, may also become a feature of the adolescent's personality. It is desirable to prevent and correct such a condition in a timely manner.

Correction of the state of anxiety should be organized in the following two directions: the emergence of a state of anxiety and the relief from its negative consequences; the combination of the occurrence of anxiety as an interim personal experience. In the elimination of anxiety: to teach a person the methods by which he manages a strong sense of anxiety in himself; it is possible to carry out it by the formation of important knowledge, skills and skills that the individual has acquired, expanding his capabilities, increasing the effectiveness of his activities. Of course, in the formation of behavior, the family environment of the individual, the role of Group, community and social influences are important.[9]

Anxiety can be manifested by long-term, persistent, daily symptoms (general anxiety disorder) or short bursts of panic attacks, which significantly reduce the quality of life. The frequency, number and intensity of symptoms vary from person to person.

Anxiety can cause mental or psychological problems [3]. Behavioral manifestations of anxiety include avoidance of situations that cause anxiety or negative memories to come out, as well as a change in the sleep regime, a change in habits, an increase or decrease in food intake, and an increase or decrease in motor tension (such as touch).

Emotional manifestations of anxiety include "a feeling of fear, difficulty concentrating attention, tension or irritability, anticipation of the worst, irritability, anxiety, observation (and anticipation) of danger signs (and phenomena) and feeling of emptiness of consciousness."], and "nightmares, obsessive thoughts, Deja Vu and the feeling of being trapped in your own mind" [6].

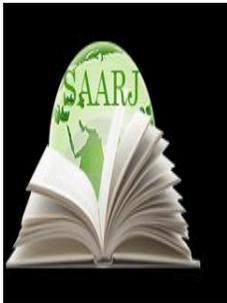

Cognitive anxiety is manifested by thinking about perceived risks, such as fear of death. "The pain in the chest seems to be the result of a fatal heart attack or head-to-head shooting pain in the area of the tumor. Thinking about death creates a strong sense of fear in a person, thinking about death more often than usual, or not being able to get it out of his head." Improper anxiety is a bad indicator of personal development, which in turn negatively affects it. It negatively affects the development of anxiety in the real problems that arise as a result of the work of the advocates [1].

Anxiety can be a harbinger of a neurosis or a symptom, as well as a means and mechanism of its development. Anxiety is the main components of post-traumatic stress disorder[1]. In particular,

mental disorders such as Phobia, hypochondria, hysteria, obsessive-compulsive disorder and others are also associated with anxiety. Due to this, the study and correction of anxiety characteristics of an individual is a period requirement.

ASSIGNMENTS THAT MOTIVATE PRIMARY SCHOOL STUDENTS TO CREATIVE ACTIVITY

Yusupova Gulshirakhan Zinatdinovna*

*Senior teacher of the Regional Center for retraining and,
 Professional development of the staff of public education of the Republic of Karakalpakstan,
 Researcher of Nukus State Pedagogical Institute named after Ajiniyoz,
 UZBEKISTAN

ABSTRACT

In this article, the topic of assignments that motivate primary school students to creative activity will be considered from a scientific and practical point of view. The development of creative activity in students depends on the educational materials presented to them, as well as didactic tasks based on these materials.

KEYWORDS: *PIRLS, TIMSS And PISA, Creativity, Nobility, Education, Didactic Assignments, Modeling, Creative Activity.*

INTRODUCTION

Today, the pedagogical importance of creative activity in the field of education is increasing. Creative activity, creative thinking and creative imagination formation PIRLS, TIMSS and PISA are required from readers in international research programs. The formation of creative activity [1] in students is associated with the development of personality and its perception. Creativeness intellect has a relatively high degree of appearance, and certain factors are the basis for its formation. Just as well as being creative activity is not born, it is formed in the process of Education. Bunda says that depending on how much support each reader receives from those around him or her inherent talents and abilities, the reader will realize his or her own strengths.

The development of creative activity in students depends on the educational materials presented to them, as well as didactic tasks based on these materials. The analysis of previous educational programs, textbooks, teaching and methodological manuals, compiled for primary classes, showed that the formation of creativeness in students consisted mainly of writing conditionally defined assignments, for example, essays and descriptions, conducting questions and answers, drawing pictures, making certain items. Most assignments are aimed at seeking answers based on

the students' intuition. To date, in the development of the national program of the primary class, evristical exercises, which serve to formulate creative activity in their students, algorithms for solving problems, as well as tasks of the character of modeling, designing, independent research are required.

In order for students to understand the essence of their personal creative activities, it is necessary to conduct current and final reflex exercises. For example, on page 25 of the current 4th grade "reading" textbook, creative assignments on the topic "What Remains of a man" by Joseph khoshib [2] :

- 1). Give examples of kindness and slowness.
- 2). What did the author mean when he said that it is necessary to collect the total good in life?
- 3). Joseph cite two analogies that khodhib reiterated about the uneducated man.
 1. _____
 2. _____
- 4). What Remains of the man from the proverbs how did you come to mind?

Similar reflection questions arouse creative thinking and creative imagination in students.

Below are examples of didactic questions and assignments that motivate students to creative activity:

1. What do you dream about?
2. What can you create?
3. What can you depict a picture of?
4. What colors do you like?
5. Do you love your parents?
6. What is the reason?
7. How do you want your parents to be?
8. What do you want to do in the future?
9. How do you dream of a school (class)?
10. Describe the school (class)in your dream.
11. Which training subject do you like?
12. What kind of work did you want to do in the lessons you liked?
13. How do you want the teacher to be the one who will teach?
14. What is the reason?
15. What kind of work do you do in your spare time outside the lesson?
16. What books do you read in your spare time outside the lesson?
17. What qualities did you have from what you read?

18. What heroes do you like in the books you read?
19. Write down the differences of the heroes in the work from each other _____

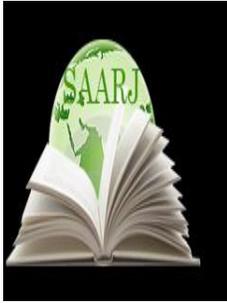

20. Write down how much the things in the work you read differ from each other _____

21. What does the author say about the work?
22. What conclusion did you draw on the work?
23. Which circles do you want to go to and why?
24. What kind of circle did you want to go to?
25. How do you want to spend your vacation?
26. Write down your impressions on the surface of the holiday
27. To whom did you want to be like? Why?
28. Who do you want to make friends with?
29. What should be a friend in your eyes?
30. Write down the five most important qualities of a friend
Why do you think those are important?
32. What do you think if you believe in the story in the work? "yes" or "no". Give one example.
33. Describe the most effective place in your work you read.
34. Write a short essay on the topic "the hero I love".

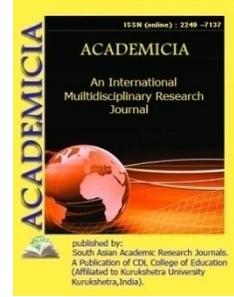

In order to determine the degree of formation of creative activity in students, educators are required to analyze and accurately assess each creative task performed by them. For the formation of creative activity in primary school students, it is considered necessary to form communication skills with the aim of their socialization. For the effective formation of creative activity, creativity, creative inclinations must first be formed in the pupils, and then this activity must be expressed in the products created by them.

ABSTRACT

In our republic, in the years of independence, large-scale measures have been taken to effectively use irrigated sands and sandy loam lands and improve the ecological and reclamation state of lands. The interpretation of their name in the sense of evil (disastrous), which is often found in popular literature, is just as wrong as the translation of Kyzyl-kum in the sense of red - beautiful. These sieves are brass and are sequentially inserted into one another, forming a single set (column), closed at the top and bottom. Standard consisting of 11 sieves was adopted.

KEYWORDS: *Independence, Large-Scale, Sequentially*

The main sandy massifs in Turkmenistan, Kazakhstan, Uzbekistan are located on an area of 300 thousand / ha. In Central Asia, desert-sandy lands make up 38 million hectares, or 38.2% of the total area. Today, the effective use of lands with a deteriorated reclamation state and low fertility is an urgent problem [1]. Through the use of various agro-technological measures, sandy and sandy loam soils are enriched with nutrients, innovative technologies are used to restore and increase soil fertility. Protection from the effects of winds of sands, sand dunes, sand rows with low fertility and prone to wind erosion, cultivation of agricultural crops in these lands, as well as the development of technology for the use of various fertilizers in natural and artificial screens (N, P, K, local fertilizers - manure, lignin) in proportional ratios, suitable times, norms and methods to increase the yield of high-quality cotton and wheat under irrigation conditions are

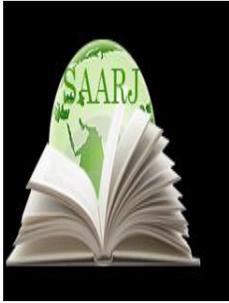

one of the urgent problems of agricultural soil science and agrophysics, cotton growing and grain growing [2].

In our republic, in the years of independence, large-scale measures have been taken to effectively use irrigated sands and sandy loam lands and improve the ecological and reclamation state of lands. As a result of these measures, on sandy and sandy loam lands, in particular, from each hectare of farmland in Central Fergana, an increase in the yield of raw cotton by 2-3 centners and wheat by 4-6 centners was achieved. At the same time, due attention has not been paid to the development of acceptable agricultural technologies aimed at determining the genesis, morphogenetic properties of sandy and sandy loam lands with a difficult reclamation state, preventing erosion processes occurring in them. In the Action Strategy of the Republic of Uzbekistan for 2017-2021 & quot;... further improvement of the reclamation state of irrigated lands, development of a network of reclamation and irrigation facilities, widespread introduction of intensive methods in agricultural production, primarily modern water and resource-saving agricultural technologies & quot; is defined as one of the important strategic tasks ... In this regard, research work to improve the reclamation state of infertile, difficult to reclaim sandy lands, the development and implementation of modern water and resource-saving agricultural technologies are becoming important [3]. The study, to a certain extent, serves to fulfill the tasks stipulated in the Decrees of the President of the Republic UP-4533 of April 19, 2013 & quot;On measures to radically improve the land reclamation system & quot; and UP-4947 of February 7, 2017 & quot;On the strategy of actions for the further development of the Republic of Uzbekistan »As well as in other regulatory documents adopted in this area [4]. Starting to study individual sand massifs, they find out the meaning of their local names, since they usually very aptly reflect the most characteristic features of the massif and each tract. At the same time, the distorted interpretation of the name also distorts the idea of the very nature of the massif and its economic significance. So, for example, in Central Asia there are a number of massifs called Kara-Kum, i.e. black sands. The interpretation of their name in the sense of evil (disastrous), which is often found in popular literature, is just as wrong as the translation of Kyzyl-kum in the sense of red - beautiful. These sands are called black because of the abundance of shrub vegetation in them, which determines the dark color of the horizon. Some of the names of the massifs really emphasize the color of the sands (Kyzyl-Kums — ancient red sands, Ak-Kums — young white dune sands), other names mark the characteristic vegetation (Ojorli-kum, Cherkezli-kum), and still others — the characteristic forms of relief. Elucidation of the connection with undistorted strata can give an answer about the origin of the winding sands in cases of their similarity with these strata. But sands can sometimes migrate thousands of kilometers from their power sources when transported by rivers and hundreds of kilometers when carried by the wind. In these cases, a microscopic examination of the sands is necessary to elucidate their genetic links. To determine the mechanical composition of sands, the most acceptable method of separating them into fractions is using a set of sieves with different hole diameters. These sieves are brass and are sequentially inserted into one another, forming a single set (column), closed at the top and bottom. standard consisting of 11 sieves was adopted. For the production of sand analysis on sieves, the weight of samples of fine-grained sand should be at least 200 g, and coarse-grained - up to 500 g These sieves can be used in an expeditionary setting, but the analysis on them is quite laborious (in 8 hours it can be divided into fractions and 6 - 8 samples of carbonate-free sands are weighed; in the presence of carbonates and the need to remove them by dissolution, the same period is required). To solve the problems of the genesis of sands, mechanical analysis is

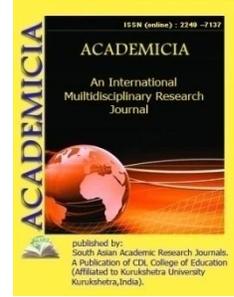

usually done not in the field. Sampling for chemical analysis of sands should be carried out either according to a method common for minerals, or according to the method of soil research. Sands in dry state are easily moved by winds, even at a speed of 3 m / s. In cases of weaker winds or more favorable climatic conditions, sand accumulations transverse to the winds can develop in the presence of sod cover. Influence of the landscape environment on the intensity and nature of sand movement.

1.0 ABSTRACT

Entrepreneurship and Start-ups have become the buzz words during the beginning of the 21st century in general in India and particularly in Bangalore City. Dubbed as the Silicon Valley of India and home to thousands of Information Technology (IT) and Information Technology Enabled Services (ITES) companies since the late eighties and blessed with a salubrious climate round the year and availability of technical manpower, it is not a surprise that Bangalore has become the leading City in India for start-ups. Whilst India has 44 Unicorns (technology enabled start-ups with a valuation of over a billion US dollars) and ranks third in the world amongst countries which have the most number of Unicorns, not surprisingly Bangalore is leading the pack and is home to 18 of these Unicorns. Undoubtedly, the enthusiasm amongst the founders of the start-ups in Bangalore is very high and highly infectious, to say the least. These founders have applied their minds, knowledge, and skills to offer innovative solutions in the areas of Fintech, Edutech, Foodtech, Agritech, e-Commerce, etc. Ideas alone do not guarantee that these start-ups will succeed. Key factors that contribute to the success of start-ups, amongst others, are leadership styles of the founders, access to capital, a sound and sustainable business model, ability of the founders to take moderate and calculated risks, and having products and services that meet the needs of customers. This research paper tries to examine the connection between the leadership style of the founders with specific reference to Transformational Leadership style and the growth of revenues of the start-ups. A survey was conducted in Bangalore City wherein a

questionnaire covering demographic data and the Multifactor Leadership Questionnaire (a standard tool used by researchers worldwide to measure Transformational, Transactional and Passive-Avoidant leadership styles) was sent to 476 founders of start-ups. The responses were analysed using statistical tools such as Regression Analysis and Anova. The hypothesis was tested using independent t-test. The analysis of data did not point towards a strong connection between Transformational Leadership and growth in revenues of the start-ups.

KEYWORDS: *Entrepreneurship, Start-ups, Leadership, Transformational Leadership, Revenues*

2.0 INTRODUCTION

Of late, Bangalore City has attracted a lot of global attention for becoming the start-up capital of India and for finding a place in the top 30 entrepreneurial ecosystems in the world. According to the Global Start-up Ecosystem Report 2021 released by Start-up Genome and Global Entrepreneurship Network in September 2021, Bangalore was ranked 23rd and figures in the top 30 cities of the world that have a good ecosystem to promote start-ups. The same report mentions that Bangalore City has 1800-2300 active start-ups and is also home to 18 Unicorns (technology based start-ups that have a valuation of US\$ 1 billion), the highest in the country.

Whilst this is good news as start-ups contribute to generation of employment and the economic development of the country, a worrying factor is the high rate of failure amongst start-ups in India (90% failure rate). The reasons for failure are many: not having the right leadership skills, not having the right business model, lack of capital, lack of an innovative idea, not understanding customer's needs properly, etc.

Northouse (2012) brings out the difference between Transformational Leadership and Transactional Leadership. Transactional Leadership focuses on the exchange that happens between leaders and followers, whereas Transformational Leadership is all about the leader engaging with a follower and influencing him to achieve more than what he is capable of. Transformational Leadership has often been compared to Charismatic Leadership, in terms of similarities between the two approaches.

In this context, this research paper tries to examine the impact of Transformational Leadership in not just sustaining the revenues of the companies but also ensuring growth in revenues of start-up companies in Bangalore City.

3.0 REVIEW OF LITERATURE

Northouse (2012) says that Transformational Leadership has often been compared to Charismatic Leadership, in terms of similarities between the two approaches. Some researchers have viewed Transformational and Transactional Leadership as being part of the same continuum. There have been other perspectives on characteristics of Transformational Leadership: *visionary, social architect, creating trust, and creative deployment of self* (Bennis and Nanus) and *model the way, inspire a shared vision, challenge the process, enable others to act, and encourage the heart* (Kouzes and Posner). The Transformational Leadership approach has an intuitive appeal and has been widely researched from many different perspectives. The approach gives a lot of importance to the follower's needs, values, and morals. Based on

research, it can be said that there is enough evidence to prove that Transformational Leadership is an effective form of leadership.

Nitu Bose Ghosh and GeethaRajaram (2015) in an article “Developing Emotional Intelligence for entrepreneurs: the role of Entrepreneurship Development Programs” looked at the correlation between Emotional Intelligence, decision making, creativity, emotional resilience, entrepreneurial motivation, risk taking, and the effectiveness of Entrepreneurship Development Programs in developing Emotional Intelligence amongst entrepreneurs. Their study concludes that when entrepreneurs have entrepreneurial attributes, Emotional Intelligence acts as a catalyst and influences the entrepreneurial skills of the entrepreneur, thereby increasing the chance of individuals starting their own business ventures (South Asian Journal of Management, Vol.22, No.4, 2015)

Richard Sudek, UCI Applied Innovation’s Chief Innovation Officer and Executive Director, in an article “What is the best leadership style for start-up companies?” published on the website <https://innovation.uci.edu>, talks about the difference between leaders and managers. He elaborates that while a leader creates mission and purpose for an organisation, a manager implements that mission or vision. He talks about two styles that seem to resonate with entrepreneurs – Charismatic Leadership and Transformational Leadership. Mr. Sudek further elaborates that an ideal leadership style is one that combines Charismatic Leadership and Transformational Leadership. He also talks about leaders being willing to practice the concept of Shared Leadership and concludes that there is no definite answer to the question of which leadership style is best and infers that it depends on the situation. Mr.Sudek emphasises that being genuine, giving people common cause & vision, sharing of leadership when needed are most important for an entrepreneur.

In an article titled “What entrepreneurs get wrong” published in the Harvard Business Review, Vincent Onyemah, Martha Rivera Pesquera, and Abdul Ali (2013) emphasise that salesmanship is the key to success in entrepreneurship. They state that the five mistakes entrepreneurs often make are: starting late, failing to listen to customers, offering discounts unnecessarily, selling to family & friends, and failing to seek strategic buyers. They further list five objections that entrepreneurs often face in their entrepreneurial journey: customers not being convinced about the efficacy of the product or service, credibility of the entrepreneur, size of the venture, not being convinced about the price for the product or service and the risk of incurring switching costs.

M. H. BalaSubrahmanya (2017), in an article titled “How did Bangalore emerge as a global hub of tech start-ups in India? Entrepreneurial ecosystem – evolution, structure, and role” says that characteristics of the entrepreneurs aside, it is the entrepreneurial ecosystem which plays a major role in ensuring that the start-ups successfully emerge and are able to stabilise, sustain, succeed and scale to eventually have a greater impact on the economy.

According to Jayson Demers (2015), the 10 most critical factors that dictate the success of start-ups are: *the idea, the leader, the team, the capital, the plan, the execution, the timing, the crisis response, the marketing, and the growth.*

Priyanka Shorewala and Priya Chaudhary (2016) in an article “Why Indian start-ups fail? – Do’s and Don’ts” list down the top reasons for failure as: not serving the needs of the market, not having adequate funds, having the wrong team, not estimating the competition properly, having

the wrong pricing, not having a user friendly product, having a flawed business model, not having the right marketing plan, ignoring customer feedback, and wrong timing to enter the market (IOSR Journal of Business and Management, Vol. 18, Issue 2, Ver IV, February 2016)

In “The changing role of the entrepreneur: models and strategy to master the changing role of leaders in today’s dynamic business environment”, Kelly Bruning (2009) says that entrepreneurs must become leaders by delegating responsibilities and focusing on vision, mission, and strategy. She argues that entrepreneurial transition includes: *doing*, *managing*, and *managing managers*.

Jason Cope et al (2011), write in their article “Exploring distributed leadership in the small business context” that the leader has to develop a broader range of leadership skills as part of the transition while the venture grows. They argue that entrepreneurship increasingly becomes a distinct form of leadership during the growth process.

Manfred F.R. Kets de Vries (2013), in his article “The Eight Archetypes of Leadership” points out that distributive, collective, and complementary leadership contribute to the success of organizations. He lays down the eight archetypes of leadership as: the strategist, the change-catalyst, the transactor, the builder, the innovator, the processor, the coach, and the communicator.

4.0 Objectives of the Study

- To get an insight into the start-up scenario in Bangalore City
- To get an insight into Transformational Leadership
- To study the impact of Transformational Leadership on the growth of revenues in start-up companies in Bangalore City

5.0 Research Methodology

The research methodology used for conducting the research is descriptive and exploratory in nature. A questionnaire pertaining to demographic data and the Multifactor Leadership Questionnaire was circulated to 476 founders of start-up companies in Bangalore. The sampling method used is Random Sampling and the sampling technique used is Simple Random Sampling. The responses were analysed using Regression Analysis and Anova. In addition, the hypothesis was tested using the independent t-test. The hypothesis used for the study is “Transformational Leadership has no impact on the growth of revenues in start-up companies”. Secondary data was collected from published sources, journals, and the internet.

6.0 Findings

Of the 476 respondents who responded to the survey, 393 were male and 83 were female. 55% of the respondents had recorded an increase in revenue as compared to the previous year whereas 45% had not.

6.1 Regression Analysis

Regression Analysis was used to find out the relationship between the dependent and independent variables. In this study, Revenue was taken as the dependent variable and all

questions pertaining to determining the leadership style of the leaders (questions 16-60) in the Multifactor Leadership Questionnaire were taken as independent variables.

TABLE 6.1: COEFFICIENTS^A

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.

Q54	-.031	.060	-.058	-.521	.603
Q55	-.020	.067	-.031	-.301	.764
Q56	-.045	.085	-.058	-.530	.597
Q57	.023	.080	.028	.283	.777
Q58	.062	.081	.083	.766	.444
Q59	-.086	.084	-.119	-1.023	.307
Q60	.022	.061	.029	.356	.722
a. Dependent Variable: Q11 (Revenues)					

1. B Coefficients: The B Coefficients tell us how many units of Revenues increase for single unit increase in each predictor. Likewise, 1 point increase on “I provide others with assistance in exchange for their efforts” corresponds to 0.55 points increase in revenues. Given only the scores on our predictors, we can predict the Revenues by using the formula:

$$\text{Slope (Y)} = mx+b; \text{ meaning= } Y = 1.725 + (-0.064 \times Q16) + (-0.021 \times Q17) \dots \& \text{ so on.}$$

The Column mentioned above as ‘Sig’ holds the p-values for our predictors. As a rule in statistics, we always say that a B Coefficient is statistically significant if its p-value is smaller than 0.05, in the above table none of the Coefficients are statistically significant

2. The beta Coefficients allow us to compare the relative strengths of our predictor.
3. The t-Statistic Column is used to check the null hypothesis Vs. alternate

6.2 SPSS Regression Output - Model Summary Table

TABLE 6.2: MODEL SUMMARY				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.284 ^a	.081	-.016	.502
a. Predictors: (Constant), Q60, Q42, Q34, Q20, Q32, Q36, Q18, Q43, Q22, Q17, Q33, Q50, Q27, Q56, Q48, Q16, Q58, Q25, Q35, Q38, Q47, Q26, Q54, Q59, Q37, Q23, Q28, Q57, Q39, Q55, Q30, Q52, Q21, Q19, Q53, Q40, Q44, Q24, Q49, Q31, Q51, Q41, Q46, Q45, Q29				

1. The model above predicts Revenues. R denotes the Correlation between the predicted & observed Revenues. In this case it is very low
2. R Square is simply the square of R, this indicates the proportion of Variance in Revenues that can be explained by all our predictors (Independent Variables). R Squared tells the researcher that how many points fall on the regression line.
3. Since, Regression maximizes R Square, this will be somewhat lower for the entire population, a phenomenon known as shrinkage. The Adjusted R Square estimates the population R Square for our model above and thus ensures and gives a more realistic indication of its predictive power.

6.3 Analysis of Variance (ANOVA)

Anova provides the researcher the information about the total variation of the dependent variables to the explained & un-explained portions

Model		Sum of Squares	Df	Mean Square	F	Sig.
1	Regression	9.512	45	.211	.839	.762 ^a
	Residual	108.377	430	.252		
	Total	117.889	475			
a. Predictors: (Constant), Q60, Q42, Q34, Q20, Q32, Q36, Q18, Q43, Q22, Q17, Q33, Q50, Q27, Q56, Q48, Q16, Q58, Q25, Q35, Q38, Q47, Q26, Q54, Q59, Q37, Q23, Q28, Q57, Q39, Q55, Q30, Q52, Q21, Q19, Q53, Q40, Q44, Q24, Q49, Q31, Q51, Q41, Q46, Q45, Q29						
b. Dependent Variable: Q11 (Revenues)						

The above **ANOVA table** denotes that the regression model predicts the dependent variable significantly or not! It is observed from the “**Regression**” row and continues till the “**Sig**” column and indicates the statistical significance of the regression model that was run above. Here p value (.762) which is >0.05 and indicates that the overall regression model is not statistically significant and cannot predict the outcome variable which is Revenues

6.4 Independent t-test to test the research hypothesis

Null Hypothesis: Transformational Leadership has no impact on the growth of revenues in start-up companies

	Q11 (Revenues)	N	Mean	Std. Deviation	Std. Error Mean
Q60	Yes	261	3.17	.622	.038
	No	215	3.14	.729	.050

TABLE 6.5: INDEPENDENT SAMPLES TEST

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	Df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
Q60	Equal variances assumed	4.022	.045	.469	474	.639	.029	.062	-.093	.151
	Equal variances not assumed			.462	422.45	.644	.029	.063	-.095	.153

Conclusion: from the above Independent t-test, since $p (0.644) > 0.05$ (2-tailed test) is more than our chosen significance level 0.05, the researcher does not reject the Null Hypothesis

7.0 SUGGESTIONS AND CONCLUSION

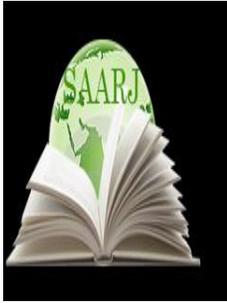

The output of the Regression Analysis and Anova tests have shown that there is no statistically significant relationship between Transformational Leadership and Revenues of start-up companies in Bangalore City. The independent t-test used to test the hypothesis also supports this and according to the t-test, the null hypothesis cannot be rejected and we can conclude that **Transformational Leadership has no impact on the growth of revenues in start-up companies.**

However, keeping in mind that the study was conducted to determine the impact of Transformational Leadership on the growth of revenues in start-up companies in Bangalore City only, the limitations of the study are that the results of the study may not be a true representation for the entire country. Further, there could be other factors that can impact the growth of revenues in start-up companies other than Transformational Leadership and this has not been considered in the study. This leaves scope for exploration by other researchers in the future.

ABSTRACT

The article is devoted to the analysis of the urgent problem of modern labor law: the effectiveness of the security functions of legal norms governing the conclusion of an employment contract and determining the procedure for agreeing and securing the terms of an employment contract by the parties. With the conclusion of an employment contract, its parties enter into new legal relations and become participants in labor relations. It is known that an employment contract is a legal fact that creates an employment relationship between an employer and an employee, therefore, from the moment the employment contract is concluded, the rights and obligations of the employer and employee under this contract arise. Although concluding an employment contract is not a lengthy process, concluding it in violation of the procedure established by law can violate employees' rights and cause many problems for employers. For this reason, the article states that concluding an employment contract in accordance with the rules established by the Labor Code is the responsibility of not only employers, but also employees.

KEYWORDS: *Labor Law, Labor Legislation, Employee, Employer, Labor Contract, Legal Fact.*

INTRODUCTION

With the conclusion of an employment contract, the parties, entering into new legal relations, become participants in labor relations. It is well known that an employment contract, being a legal fact, the emergence of an employment relationship between an employer and an employee,

therefore, the rights and obligations of both the employer and the employee arise from the conclusion of an employment contract.

Taking into account the importance of an employment contract for establishing employment relations and ensuring the rights and interests of both employers and employees, it can be argued that the current labor legislation clearly establishes the procedure and conditions for concluding an employment contract. The rules for concluding an employment contract are reflected

in §2 of Chapter VI (articles 77-87) of the Labor Code of the Republic of Uzbekistan, which are imperative, that is, an employment contract must be concluded by the parties by mutual agreement and in accordance with the law. At the same time, violations of the law aimed at ensuring the right of employees to freely choose a profession and work will entail the responsibility of employers in the future.

The conclusion of an employment contract requires compliance with all the principles established by the Labor Code of the Republic of Uzbekistan. Legal scholar M.V. Presnyakov notes that the conclusion of an employment contract should be based not only on special principles of labor law, but also on the business qualities of the hired personnel [1].

If you pay attention to part 3 of Article 72 of the Labor Code, you can see that it says that there are additional circumstances before the conclusion of an employment contract (passing a competition, appointment to a position, etc.).

M.Y.Hasanov notes that the list of legal facts before the conclusion of an employment contract provided for in article 72 of the Civil Code is not set out in detail. Based on the content of this norm, we can say that other circumstances are possible before the conclusion of an employment contract [2].

A number of such legal facts, with the exception of passing a competition and being elected to a position, include appointment to a position, sending an employee to work by an authorized state body, obtaining a preliminary employment permit (by foreign citizens and stateless persons), written consent of one of the parents or a person replacing the parent to employ an employee under the age of sixteen.

In accordance with national legislation, when concluding an employment contract, it is necessary to take into account the age of employees. According to article 77 of the Labor Code, persons who have reached the age of 16 will have the opportunity to exercise their constitutional right to work, since this article allows for the employment of persons under the age of 16. Therefore, employers should know the age of the hired employees.

There are several restrictions in the labor legislation regarding the age of employees. According to R.N. Rakhmatullin, the age restrictions of employees established by the legislation can be of two types:

- 1) General restrictions on all types of work;
- 2) Special restrictions for specific types of work.

These restrictions depend on the maximum and minimum age of the employee. The minimum age limit is set by labor legislation. And a special age limit is regulated by federal law for certain types of work[3].

To prepare young people for work, it is allowed to hire students of secondary schools, secondary specialized, vocational educational institutions to perform light work that does not harm their health and spiritual and moral development, does not violate the learning process, in their free time – after they reach the age of 15 with the written consent of one of the parents or one of the persons replacing parents.

In addition, the employment of persons under the age of 18 must be carried out in accordance with the requirements of article 241 of the Labor Code, which states that minors should not be allowed to work where unfavorable working conditions may harm the health, safety or morals of this category of workers. The list of such works and the limits of lifting and moving weights for persons under the age of eighteen is established in consultation with representatives of the Ministry of Labor of the Republic of Uzbekistan, the Ministry of Health of the Republic of Uzbekistan, the Council of the Federation of Trade Unions of Uzbekistan and Employers [4].

It should be noted that the OMT Convention No. 138 on the MINIMUM AGE FOR EMPLOYMENT (1973) and the 182 Convention on the PROHIBITION and IMMEDIATE MEASURES FOR THE ELIMINATION of THE WORST FORMS OF CHILD LABOR (1999) [5], ratified by the Republic of Uzbekistan, are directly relevant to the issue under consideration. The provisions of the above conventions are implemented in the Labor legislation of the Republic of Uzbekistan and our state fully complies with these norms.

According to the Russian scientist G.U. Golovina, when concluding an employment contract, it is necessary to take into account not only the age of the employee, but also the state of his health. If the employer imposes unacceptable work on the employee, then the law should establish responsibility for him[6].

Taking into account the correctness of S. Golovina's opinion, according to article 239 of the Labor Code of the Republic of Uzbekistan, all persons under the age of eighteen can be hired only after an initial medical examination and must undergo mandatory medical examination annually until they reach the age of eighteen. It follows from this that the labor rights of minors are fully guaranteed [7].

The process of hiring citizens in our country is one of the most complex processes, and the main means of protecting the rights of citizens is an illegal (unjustified) refusal of employment by employers.

The legal scholar M.Y.Hasanov has repeatedly mentioned this in his scientific works. In his opinion, the inadmissibility of illegal refusal of employment is the most important guarantee of the constitutional right to work for all [8].

Article 78 of the Labor Code lists the circumstances of illegal refusal to hire citizens, which, in our opinion, do not fully cover the rights of employees.

For example, the employer does not specify which persons should be hired. In the Russian Federation, this situation is regulated differently: the law prohibits refusal of employment in a case unrelated to his business qualities [9]. However, the labor legislation of the Republic of Uzbekistan does not say anything about the business qualities of an employee.

In addition, in the resolution of the Plenum of the Supreme Court of the Russian Federation No. 2 of March 24, 2004 the definition of the concept of "business qualities of an employee" is given,

according to which the business qualities of an employee should, in particular, be understood as the ability of an individual to perform a certain labor function, taking into account his professional and qualification qualities (for example, the presence of a certain profession, specialty, qualification), personal qualities of an employee (for example, health status, availability of a certain level of education, work experience in this specialty, in this industry) [10].

Consequently, if the Labor Code of the Republic of Uzbekistan also clearly defines the business qualities of an employee, then some practical problems will find their solution.

Article 78 states that the refusal to hire persons proposed by the employer is considered as an illegal refusal to hire. However, it does not explain the concept of "persons proposed by the employer".

M.Y.Hasanov gives his definition of this concept. In his opinion, in practice there are often cases when an employee's invitation letter is signed by the employer and the seal of the organization is affixed. If an applicant applies to this employer with a request to hire him within the time specified in the letter and submits all the necessary documents for employment, such a letter contains the employer's obligation to hire the proposed employee for a certain specialty and position. In most cases, this letter indicates not only the job function (specialty, qualification or position) offered for the job, but also some other working conditions (salary, structural units, etc.) [11].

In some foreign countries, we can see that the essence of this concept is fixed in the norm of the law.

Part 3 of article 78 of the Labor Code also reveals some misunderstandings. In particular, the article states that in case of refusal to accept a job, the employer must, at the request of the employee, provide a written response within three days, justifying the reason for the refusal to accept a job. But how can a person who is not hired be an employee? For this reason, we consider it necessary to make appropriate amendments to this article.

When applying for a job, the applicant is required to provide the relevant documents provided for in article 80 of the Labor Code. The article also states that it is prohibited to provide documents that are not provided for in legislative documents. However, in practice, the list of documents required from the employer is increasing.

According to the scientist-practitioner D.R.Matrasulov, despite the fact that the current Labor Code does not include such documents as a statement, description, autobiography, photographs, all employers require their submission. Therefore, if these documents are necessary for employment, then it should be proposed to amend the law [12].

In our opinion, the list of documents that employers may need for employment should be strictly fixed in the law with the corresponding amendments to the Labor Code.

The final stage of the employment contract is the execution of the employment contract. According to article 82 of the Labor Code of the Republic of Uzbekistan, employment is carried out on the basis of an employment contract between an employee and an employer. This order must be executed in full accordance with the content of the signed employment contract, and the employee must be notified and a receipt received.

The employment contract comes into force not from the date of issuance of an order by the employer confirming its conclusion, but from the date of its signing by the parties (article 83 of the Labor Code). An employer's order is a way of registering an employee's employment.

Failure to issue an order does not imply the conclusion of a contract, but may cause some problems for the employer. However, there is no provision in the labor legislation on the consequences of non-execution of an order to conclude an employment contract.

Also, article 82 of the Labor Code states that an employee can actually be hired with the consent of the employer and it is considered that he has concluded an employment contract from the date of commencement of work. However, this norm does not establish the obligation of employers to conclude an employment contract in the event of such a situation.

This gap in legislation may lead to further violations of workers' rights. Therefore, employers should avoid this and be responsible for it.

Articles 84-87 of the Labor Code relate to the probationary period before employment, and the norms describe in detail the purpose, conditions, terms, results and other conditions for inclusion in an employment contract.

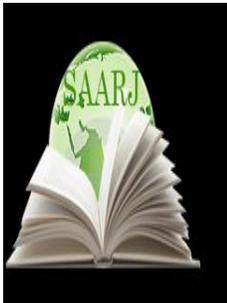

At the same time, the labor legislation allows citizens to work in several jobs and receive additional income. The procedure for combining and working in several positions and professions is reflected in the Resolution of the Cabinet of Ministers of the Republic of Uzbekistan dated October 18, 2012 No. 297 "On approval of the Regulations on the principle of combining and working in several professions and positions" [13].

In conclusion, it should be noted that signing an employment contract is not a lengthy process, but failure to comply with the procedures provided for in the law can lead to violations of workers' rights and create problems for employers. In this regard, the conclusion of an employment contract is an obligation not only of employers, but also of employees. In this case, responsibility and attention are required from them. In this regard, it is necessary to eliminate the existing uncertainties in the employment contract and fill in the gaps.

THE QUALITY OF PRESCHOOL EDUCATION AT THE PRESENT STAGE

Berdiyeva Muhabbat Meyliyevna*

*Senior Lecturer, PhD
 Termiz State University, Pedagogical Institute,
 UZBEKISTAN

ABSTRACT

The article reveals the concepts that are necessary to understand the multifaceted concept of "quality of preschool education." The presented material will be of interest to those who are interested in the preschool education system as the first stage of education, namely to teachers, methodologists and parents.

KEYWORDS: *Quality Of Preschool Education, Educational Conditions, Developing Subject-Spatial Environment.*

INTRODUCTION

Modern society is characterized by rapid and profound changes. The preschool education system is also changing and improving. She has always fulfilled and is fulfilling the most important social order of society, is one of the factors of its development.

At this time, there is a growing interest in assessing the quality of preschool education. This is a rather complex problem and it is connected with the fact that this formation is considered as one of the main resources for the development of the state at different levels.

Let's consider the concepts of this problem.

Quality is a methodological category that reflects the degree to which the result corresponds to a set goal.

The quality of education is understood in pedagogical science as

the set of its properties, which determine its adaptability to the implementation of social goals for the formation and development of personality.

The quality of preschool education is an integrative concept that includes several components: conditions for the implementation of the educational process; organization and content of the educational process; the effectiveness of education and its assessment; the cost of achieving performance.

Quality management of preschool education is a purposeful process of influencing management objects, carried out in the design and implementation of the educational process in order to establish, ensure and maintain the quality of education that meets the requirements of consumers.

The quality of preschool education as a whole is a multidimensional synthetic concept. It is this versatility that determines the approaches and sets the logic for the formation of the information base for its assessment. The problem of quality in pedagogical research is being developed in the following areas: the concept of education quality, methods of assessing the quality of education, methods of assessing the quality of education, the integrity of the system and the quality of education, the interaction of educational levels and its quality, factors that determine the quality of education, the market environment and the quality of education, the mechanism quality management of education, information technology, monitoring and quality of education, education quality management system [1].

The most pressing problems of preschool education:

- improving the quality of preschool education;
- mandatory minimum content of educational programs for preschool children in terms of preparing children for school;
- a system for assessing the quality of preschool education at the stage of a child's transition to school;
- ensuring continuity in the content of education between preschool and primary levels;
- equalization of starting opportunities for children in the transition to school as a scientific and practical problem;
- ways to achieve the physical and mental health of the child [2].

The main trends in the change in the species diversity of preschool educational institutions in recent years is an increase in the number of kindergartens with the priority implementation of various directions of development of pupils: physical culture and health, artistic aesthetic, intellectual and ethnocultural development and education of preschoolers.

According to the results of state accreditation, each preschool institution (both state and non-state) receives a certificate of the established form, according to which it is assigned an appropriate category [4].

The quality of education of preschool education graduates:

□ The specificity of preschool education is such that the achievements of preschool children are determined not by the sum of specific knowledge, abilities, skills, but by the totality of personal qualities. The planned results of the development of the basic

general education programs of preschool education are subdivided into final and intermediate;

- the planned final results of the mastering by children of the main general educational program of preschool education should describe the integrative qualities of the child that he can acquire as a result of mastering the Program;
- intermediate results of the Program mastering reveal the dynamics of the formation of integrative qualities of pupils in each age period of the Program mastering in all areas of children's development.

Concluding the above, it can be noted that the quality of education in a preschool institution is the result of the activities of the team, which is determined by the following positions:

how a child in an institution realizes his right to individual development in accordance with age-related capabilities and abilities;

how is the pedagogical process organized in kindergarten

(regime, choice of programs and technologies, provision of benefits, a system for improving the professional growth of teachers through various forms of methodological work, etc.);

what conditions are created in the preschool educational environment (educational environment focused on the intrinsic value of preschool childhood; positive microclimate in the team; a system of stimulating high-quality work, the creative orientation of the activities of the preschool educational institution and its leader; focus on educational needs and family needs; systematic collective discussion of the state of the educational process and acceptance competent management decisions, etc.) [2].

Thus, the quality of preschool education is integration:

guaranteed implementation of state educational standards, i.e. the quality of the educational process in a preschool educational institution, which allows the child, as a subject of the educational process, to achieve a guaranteed level of education, ensuring the transition to the next educational stage - primary school.

The ability of educational actors to set goals in different contexts and achieve them:

The quality of a full-fledged, age-appropriate development of the child, the preservation of his health;

The quality of professional and personal achievements of teachers of a preschool educational institution;

Quality of management of the preschool education system;

The ability to meet the requirements and expectations of major and indirect customers and interested parties, i.e. quality of preschool education outcomes meeting expectations

The needs of consumers (primarily parents) and corresponding to government regulations.

Striving for improvement, i.e. striving not only for the real, but also for the potential quality of education in a preschool educational institution.

Based on the foregoing, the following fundamental levels of manifestation of the quality of preschool education can be formulated:

providing parents with the opportunity to choose an individual educational route for their child,

ensuring social protection of the preschooler from incompetent pedagogical influences;

□ providing parents with guarantees that by the end of preschool childhood their child will receive the necessary level of preparation for successful education in primary school.

So, at the present stage of development, the system for assessing the quality of educational activities of pupils in a preschool educational organization does not provide for assessing the quality of educational activities based on the achievement of the planned results of mastering OEP by children, but involves assessing the quality of the conditions of educational activities provided by organizations.

The need for an educational organization to master new educational programs and technologies that are adequate to the social order of the state, family, society poses a problem for the organization to manage its quality.

One of the main tasks of quality management in an educational organization is the training and retraining of teaching staff. Teachers with the necessary amount of knowledge, skills and abilities ensure higher productivity and quality of work, which in turn has a positive effect on a qualitative change in the educational organization. In this regard, the psychological barrier of personnel of educational organizations to innovations, their intellectual activity, the growth of general culture, the ability to perceive and process scientific information, and use modern pedagogical technologies are reduced.

In order to improve the quality of knowledge of teachers, an innovative personnel policy is needed, ensuring their interest in the continuous improvement of professional knowledge [20]. The construction of a system for the development of employees within the organization is carried out at four levels: the level of strategic management, the level of management of the organization as a single living organism, the level of management of groups and associations of employees, the level of management of individual employees [14].

We consider it expedient to include the following elements in the effective human resource management system:

- analysis of educational needs and strategic planning;
- design of the educational process;
- resource management;
- the formation of motivation to improve the quality and increase the professionalism of teaching staff;
- measuring the satisfaction of participants in the educational process and managing social responsibility.

Based on the listed components, we consider it expedient to develop a quality management model for a preschool educational organization, which includes the goal, objectives, ways to achieve them, environmental subjects, its components, and expected results.

Work on the management of professional training and retraining of personnel should be an integral part of the training of the personnel reserve of an educational organization. In this case, measures for the training and retraining of personnel will be reflected in the planning system of the educational organization.

An educational organization that fosters a desire for knowledge (“want to know why”) in its educators thrives in the face of rapid change and renews its cognitive knowledge and applied skills to compete in the educational market.

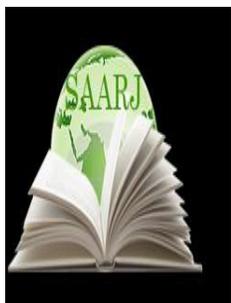

Thus, the education quality management system is of fundamental importance in the management of a preschool educational organization - a certain set of organizational structure, processes, powers and resources necessary to develop and achieve its goals in the field of quality. Quality management is the coordinated activity of directing and controlling an organization in relation to quality.

ORGANIZATION OF MULTIMEDIA EDUCATION IN PRESCHOOL EDUCATION

Turdiyev Azamat Gayratovich*

*Teacher,

Department of methods of preschool education of Termez State University,
UZBEKISTAN

ABSTRACT

In this article we will talk about the methodology of the organization of multimedia education in preschool education and its role in the education of children. Due to the lack of methods for their use in the educational process in MTCs, educators are adopting multimedia tools as multimedia technology. The term "pre-school education" was introduced by the decision of UNESCO in 1997 and forms the first stage of the system of continuing education. The evidence described above shows that the formation of computer literacy in children of MTM, teaching them to behave in an elementary way with the computer and preparing them for school education are one of the pressing issues. This is certainly a gratifying case. Since the methods of their use are not developed in the educational process, educators - educators adopt multimedia tools as multimedia technology.

KEYWORDS: *MTM, Information, Technology, Computer, Education, kindergarten, intellectual, multimedia, Occupation, teacher*

INTRODUCTION

Today, the realization of the intellectual potential of young people in the upbringing of a harmonious generation and their comprehensive development as a person has become a priority direction of the policy of our state. Because only physically healthy spiritual mature individuals create a great future.

Further improvement of the system of preschool education in the country, strengthening the material and technical base, expanding the network of preschool educational institutions, providing qualified teachers, radically improving the level of preparation of children for school education, modernizing the educational process In order to implement educational programs and

technologies, to create conditions for the full intellectual, moral, aesthetic and physical development of children, the President of the Republic of Uzbekistan Sh. Mirziyoyev, December 29, 2016, No. PQ-2707 "On measures to further improve the system of preschool education in 2017-2021" and September 9, 2017, "Measures to radically improve the system of preschool education No. PQ-3261 of September 30, 2018, No. PQ-3955 "On measures to improve the management of the preschool education system" was created.

Proper organization of the pedagogical process in the educational process leads to the fact that the educator acts as the main organizer or consultant in this process. This requires a lot of independence, creativity and willpower from the trainees.

In today's innovative processes, the education system will be able to absorb new information and evaluate their own knowledge, make the necessary decisions, become independent and free-thinking individuals.

The subject of pedagogy of preschool education is the study of the laws of comprehensive development of the child from birth to school. It provides for the unity of educational influence of preschool institutions and the family, the relationship between preschool and school work, the preparation of children for school, the tasks of education and upbringing in the context of social preschool education, developed its principles, content, methods, forms, and organization. It is an integral part of the preschool education system.

The theory and practice of preschool education is based on the objective of comprehensive upbringing of preschool children, the possibilities of the child and the role of upbringing him from an early age, the need to link preschool education with life, times, the decisive importance of the social environment in the formation of the personality of the child.

Currently, the development of various multimedia educational tools and their application in the educational process is developing rapidly. Due to the lack of methods for their use in the educational process in MTCs, educators are adopting multimedia tools as multimedia technology. It should also be noted that in addition to the specialized institution that produces multimedia tools, each MTM educator can use software and role-playing multimedia tools that can be developed by them. There are two types of multimedia teaching aids used in preschools:

There are tools for direct learning on the monitor screen, as well as visual aids.

One of the main objectives of computer education based on multimedia technology in preschool institutions is to guide children from preparing for school education. Therefore, it is important to develop a training form, content, method of conduct and evaluation criteria. Secondly, although some MTM are provided with computers, the methodology of their use in the educational process has not been developed. Therefore, the development of the methodology for the use of computer in the educational process under MTM conditions is one of the pressing issues. As noted above, when using multimedia technology during training, the content of the training will be deepened and transferred to the account of saving time in the study of this or that material.

The form, content and methodology of teaching and learning in pre-school institutions traditionally have been described in many literatures. In particular, in this matter P.Yusupova's "preschool education pedagogy" is widely covered. P.Yusupova writes about the form of education: "when we say the form of Education, the activities of the educator and the children specially organized are understood and held at a certain time on the agenda."

The earlier education begins, the sooner its effect is manifested and positively affects the whole way of life of a person. The term "pre-school education" was introduced by the decision of UNESCO in 1997 and forms the first stage of the system of continuing education. This is certainly a gratifying case. Since our current era is the age of technology, it has been stated that "computerization and informatization of educational processes at all stages will be carried out" in Article 9 of "national program of training of personnel" with the aim of increasing each educator in harmony with the Times. It was also noted in UNICEF's "child-oriented education program" that the use of new pedagogical technologies in the educational process of MTMs is an urgent issue.

The evidence described above shows that the formation of computer literacy in children of MTM, teaching them to behave in an elementary way with the computer and preparing them for school education are one of the pressing issues. Young children will be curious about the surroundings, events and employees, things and items. They like to see everything holding, fumbling, walking and coming to action.

Computer games increase this curiosity of educators. As a result, their mental development goes into shape. The fact that multimedia computer games increase the curiosity of educators is manifested on the basis of the following: 1) the fact that the object of the game displayed on the screen is given the effect of animation, and they are constantly moving and polished; 2) in Volume; 3) in Music; 4) in animation; 5) in the cartoon.

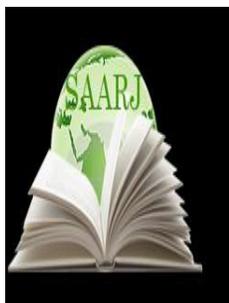

The methodology for the preparation of Multimedia tools and the formation of computer literacy of children personal computers are the main technical means of multimedia technology. When using mtms in the educational process, additional tools are required - compact discs, various presentations, slides, etc. Educational materials in Multimedia media have a dynamic character, they will be given by animation. The traditional visual materials used in the education system have a static character.

For example, during the teaching of the educator a letter A in the traditional way, the child shows his form made of paper or cardboard (a static tool). When displayed through Multimedia, the letter A vibrates on the computer (monitor) screen, attracting the attention of children (dynamic motor). Currently, the development of various multimedia educational tools and their application to the educational process is rapidly developing. Since the methods of their use are not developed in the educational process, educators - educators adopt multimedia tools as multimedia technology. When it comes to the Kezi, it should also be noted that in addition to a special institution that produces multimedia tools, it is possible to use software and role-playing multimedia tools (DVD-discs) that each MTM educator can prepare themselves. A DVD video disc has several advantages as a technical tool of multimedia. Using the disk, it is studied.

ABSTRACT

There are reports of fish infection with cestodes in artificial reservoirs of the Samarkand region. According to the results of the study, the level of fish pollution with custodies in the fish farm "Otabek Dustov" in the Kattakurgan region of the Samarkand region and in the Kattakurgan reservoir studied.

KEYWORDS: *Custody, Ligula Intestinally, Botriocephalus, Invasiveness, Invasive Intensity, Intermediate And Primary Host, Helminth, Sazan, Carp, Silver Carp.*

INTRODUCTION

Today, fish products play an important role in meeting the needs of our population for protein and vitamins. That is why in recent years the Government of the Republic pays great attention to the development of fisheries. In particular, with the adoption of the Resolution of the President of the Republic of Uzbekistan dated August 29, 2020 No PP-4816 "On measures to support and increase the efficiency of the fishing industry" opportunities are being create. There are also a number of factors, which hinder fish productivity. Helminthiasis is one of these factors, which has a significant negative impact on the development of the industry. Parasitic diseases of fish are not only economically harmful but also dangerous to human health. In fish, especially in diseases caused by ligula intestinally, there is a sharp decrease in the amount of protein, macro

and microelements needed by the human body. In order to solve these problems, it is important to conduct and study the bio ecological condition of water bodies, as well as in-depth research. The dynamics of seasonal infestation of fish in artificial reservoirs in the Samarkand region with helminthiasis, the spread of diseases in water bodies and the rate of damage almost not fully understood.

Currently, practical work is being carry out on fish farms in Samarkand and other regions to implement these decisions and decrees. However, in some fish species raised in artificial reservoirs, custodies from helminthiasis, especially in carp, have a negative impact on fish productivity, reducing their marketability. With this in mind, we set ourselves the goal of identifying custodies found in carp in artificial reservoirs in some districts of Samarkand region and identifying the factors that contribute to their spread, studying the dynamics of their damage and developing control measures.

Methods and scope of inspection. Our study was conducted at the Otabek Dustov Fishery, Kattakurgan Reservoir, located in the north-eastern part of the Kattakurgan district of Samarkand region. Four samples of 88 species of fish caught in the area were tested. The main methods used were organoleptic and parasitological dissection of the fish being examined.

Results and their analysis. The test results are presenting in the following table (Table 1). Of the 88 fish tested, 20 were, found to have three types of cestuses, accounting for 22.7% of the total contamination.

The degree of contamination of the tested fish with cestuses

TABLE 1

Fish type	The total number of fish examined	Thence		Custodies found		
		Damage d	%	Digamma	Ligula	Botryose gods
fish averages	33	6	18,1	2	2	2
Carp	21	4	19,4	1	2	1
Karas	12	4	33,3	1	2	1
silver carp	22	6	27,2	2	4	-
GENERAL	88	20	22,7	6	10	4

It seen from, the table that in carp, three types of custodies occur in 2 out of 6, and the intensity of the invasion is two. Only 4 out of 21 carp species have the disease, and 4 out of 12 carp species have the disease, but we can see that ligula intestinally accounted for 33.3% more. Of the 22 fish in the trout, six have the disease we encountered in our experiment, but here, too, ligula intisternalis is more common at 27.2%. Thus, in our studies, the level of centrode contamination in fish remains high.

The prevalence of fish cestodes in artificial ponds is growing every year. This is mainly due to the fact that due to the deterioration of the ecological environment and the drying up of the Aral Sea, fishing birds, which are the main hosts of cestodes, fly to artificial reservoirs, which leads to an increase in the incidence of the disease (Figure 1).

CONCLUSION

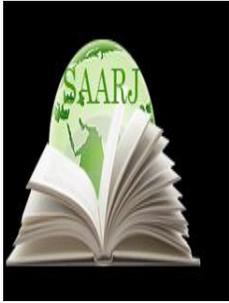

Centrode infestation in fisheries of Samarkand region averaged 22.7% of fish, infection in 4 species of fish averages 33%, silver carp 27,2 %, carp 19,4 %, sazan 18,1%.

ABSTRACT

The present paper focuses on a few stakeholders' strategies towards training, placement, and entrepreneurial activities in the present world's employability market, where cut-throat competition is prevalent for value-added products with high quality and minimum cost requirements. The authors primarily demonstrate the need for value addition into the curriculum, which lays the road for creativity and innovation. Towards the end of the program, every engineering student will have enough confidence in his trade, and employers will get industry-ready students; the institution's brand image is built up, which enhances the admissions year after year. The object of the paper is to provide quality technical knowledge (It is accomplished by knowledge production, transfer, and dissemination) And Accountability at a reasonable cost to all ambitious citizens with the highest level of transparency to secure the nation's long-term economic prosperity.

KEYWORDS: Stakeholders; Startups; Skill Development; Brand Image, Entrepreneurship

1. INTRODUCTION

God has given birth to a specific skill. We are the teacher should develop that specific skill in his four years of studies so that his sustainability in his professional future is more effortless. There are different types of people taking Engineering course by force, just stepped into it because the 12th course was high And rest of them are true Engineer too Really want to do something. The engineering management search that people who are genuinely interested in Engineering. India produces much more Engineering graduates, but they complain that they are not getting skill and talent required in industries .industry need innovation skill, designing skill, technical skill, conceptual skill, managerial skill, diagnostic skill, political skill, etc. After compiling their study, he must be creative, innovative, have lifelong learning habits, etc. To gain the above skill, the student should focus on good qualities of education, strong knowledge of theory and practical, read more journals, zero backlogs, and 100% attendance, etc.

1.1Syllabus

Syllabus Update, need-based delivery, course module must be applied engineering, Quality Professors; Engineering Colleges shout not as Profit centers, innovative mindset, and research. A syllabus should not design with specific textbooks and laboratories exercises. Upgrade the quality of the syllabus to global standards.[1,2] It must be industrial Employability and Entrepreneurship, Research & Innovation ecosystems, **vocationa lisation**, and startup.[1] shown in Fig.1

This may be accomplished by doing the following steps:

1. Process of teaching and learning that is innovative
2. Integrity education for employees
3. Project-based and allocated resources learning is focused.
4. Specialized programs are being offered
5. Changes in the job market should be recognized
6. Research and development learning opportunities

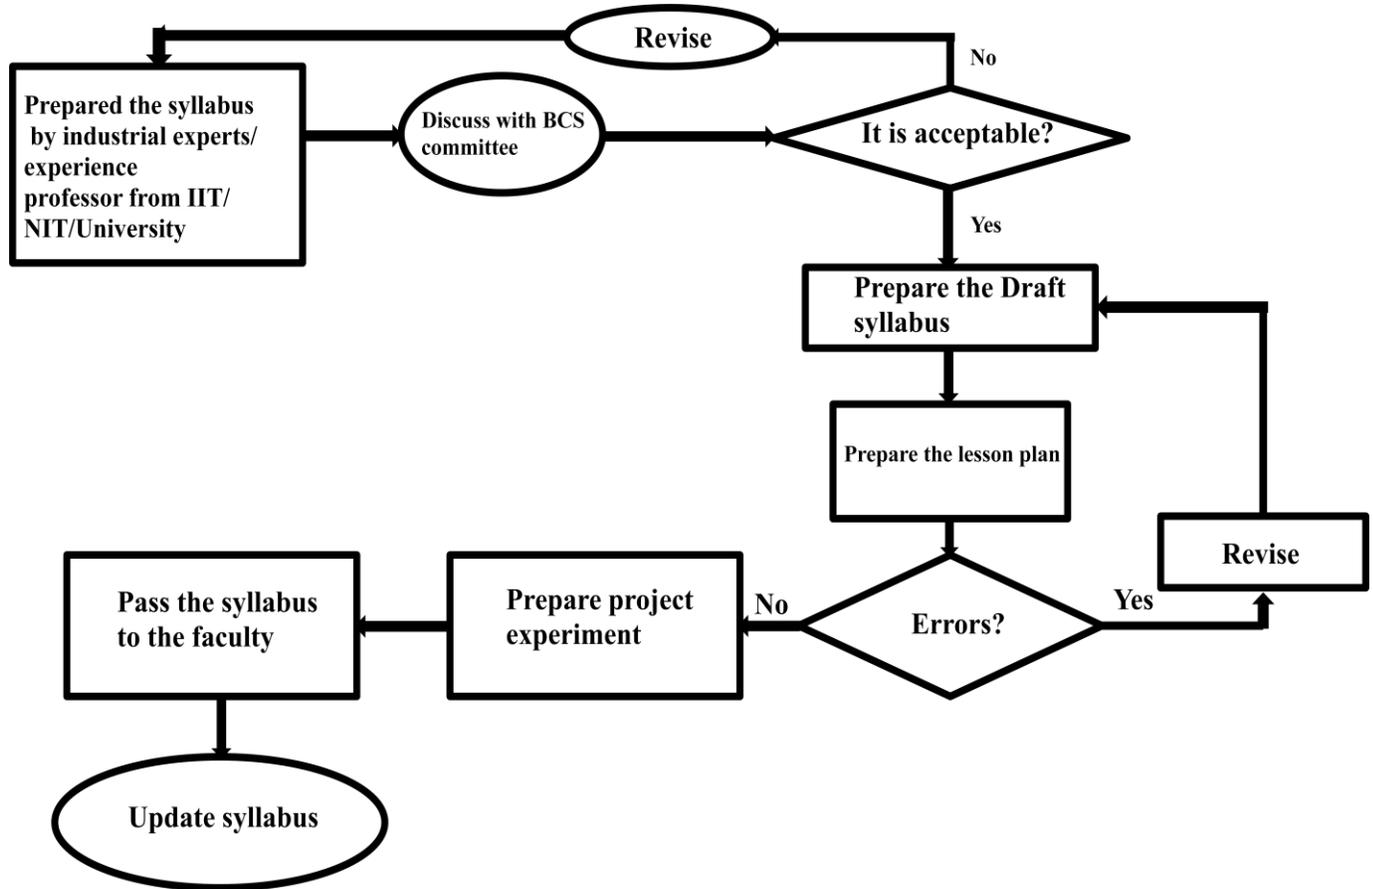

Fig. 1 Process for Preparing Syllabus

1.2 Faculty members' upskilling

Faculty members' abilities to be up-skilled the cornerstones of any educational system are teachers. Improving teacher quality will have a direct and significant influence on students' learning abilities[10]. In 2019, Prof. Anil Sahasrabudhe, Chairman of the AICTE, declared that technical instructors must also complete an eight-week course on "Orientation to Technical Education and Curriculum Aspects." "Communication Skills, Modes, and Knowledge Dissemination"; "Instructional Planning and Delivery"; "Technology Enabled Learning and Life-long Self-learning"; "Efficient Student Assessment and Evaluation Modes"; Three weeks of internship, as well as creative problem solving, innovation, and meaningful R&D.[3] The quality of technical teachers will undoubtedly improve as a result of this. As a result, training and skill development for faculty members should be prioritized to improve the quality of engineering education[4]. After a course's curriculum has been analyzed, interpret the learning results. In light of the learning outcomes, choose appropriate teaching approaches and tactics. Make a sittingdesign for the classroom, laboratory, workshop, and technology -based learning. For reinforcement of learning, link classroom delivery to appropriate assignments, examinations, and other activities. In addition to the classroom[5].

1.3 Skill development

Skill development (Most liking Area of the student), M.O.U. with industry towards skill development in college as similar to industry (every lab in college should be a slight manufacturing hub), Identify Industrial skill sets to be developed and practice in four years of his studies.[6]

Engineering education has become a manufacturing industry rather than learning and researching academic institutions. Quality of teaching and learning [6]. The motive of setting up such institutions in the private sector Apart from these queries. The majority of laboratory exercises are standardized, regardless of the engineering field. Experiments are usually carried out in groups rather than individually on the training apparatus[7]. This technique of educating and instructing has created several minor-sized businesses that provide ready-made equipment for setting up laboratories for the experiments specified.[7] This practically kills the enthusiasm to learn in a group and creative thinking. The creativity and ability to apply the learned skills are totally absent in the curriculum design. Research and entrepreneurship are not part of the curriculum at all practically nullifies divergent thinking. Lack of applied skills has been one factor affecting India's contribution towards quality research outcomes in precision and intellectual domains. Though the current population appears tech-savvy and well-informed through the internet, mobile, etc.,it's failing in terms of innovation. The use of technology is somewhat limited to searching information but creating such platforms. Localized innovative products were addressing local issues.[8] This is clearly reflected in terms of research output; product. Though India has been aspiring for the same, the education system has failed to deliver the necessary basic solution for a localized problem in so many years. Still, India imports most of the finished products and services from developed countries. With 1.6 million engineers churned out every year's not even a single product has been invented or exported in the last decade. This is due to a lack of quality in the education system[8-9]. The key parameter required for up skilling the faculty ,its process and outcome explain in Tab.1 and the source of skill development shown in table 2.

TABLE 1 REQUIRED FOR UPSKILLING THE FACULTY

Sl.No.	Key parameter required for upskilling the faculty	Process for upskilling	Outcome
1	Technical education and program orientation	Attending different orientation programs hosted by various sectors of the National agencies like MHRD, AICTE, U.G.C., DTE, NITTTRs, ISTE, DTE , Technical Institutes – I.T.I.s, Polytechnics, Engineering colleges, Universities, I.N.I., Excellence in Technical Education. - N.B.A., NAAC -	Adoption of the Curriculum Enhancement of life capabilities Establishment of a standard of excellence helpful suggestions from various perspectives Personality evaluation

2	Skill, Mechanisms, and Information Exchange in communication	Listening Speaking Reading and Writing	Improving the efficacy of teaching and learning, as well as incorporating media to increase classroom engagement.
3	Planning and delivery of Instructional material	After analyzing a course, interpret the learning outcomes. Prepare session plan Get comments to help you develop.	For reinforcement of learning, link classroom instruction to pertinent assignments, exams, and other activities. For a successful teaching-learning process, supplement classroom presentations with suitable media and tools.
4	Learning enabled by technology and Long term self-learning .	Identify free and open-source software [FOSS], open educational resources (O.E.R.), and other digital tools for establishing an active learning environment on the internet. Take advantage of MOOCs and webinars to improve your expertise. For professional development, use a variety of online journals and other learning tools.	Using a variety of instructional tools, create excellent courses. Create a variety of qualitative and quantitative techniques and tools for a technology-enabled learning environment. Advancement of knowledge Developing Educational Materials Social Networking Implementation
5	Evaluation and assessment of student.	use essential aspects of evaluation procedures. Create evaluation systems for convergent and divergent questions. Determine the validity of your question.	Updating syllabus. Preparation of question paper Linking with other courses Integrate various assessment software solutions for classroom teaching and learning that are relevant.
6	Long-Term self-learning	Gain a better grasp of how technology may help you connect CONTENT and CONTEXT during the teaching-	Case studies Designing course Interviewees from the stakeholders.

		learning process.	
7	New technology, Significant R&D, and Innovative	R&D Through Team Work Choosing a Research Design and Defining a Procedure Data collection and data analysis Research Report Writing and Research Report Evaluation	Establish excellent R&D teams Enhance the technical education system's different sub-components

1.4 Positive outcomes of the quantity based educational system

The growth of a number of engineering colleges has been such a pace that it has become a business model in the last two decades in India. But addressing the quality of education is a complex problem. It has to be validated with respect quality of human resources generated and its contribution towards the overall development of a country[10-11]. Quality of education also reflects the overall development of a country and not just as per economic data. Gross Domestic Product (G.D.P.) is just an economic indicator to measure the wealth of a nation. Human development index (HDI), quality of R&D measured in terms of import and export imbalance, number of patents filed, number of noble laureates, number of products invented, number of innovations can give an overall aspect of educational outcomes. This part of the critical review focuses on the not so positive outcomes of the quantity based educational system[12]

1.5 .Entrepreneurship

interdepartmental association towards product design, development, marketing, and revenue earning., Encourage stipends on the sale of products to students, create web of all available students with specific skills such that industries approach that department employment, Create solutions that can address local needs.[13]

Suggestions to increase students' tendency towards Entrepreneurship, Innovate for Digital India Challenge, India emerge and grow to become a top consumer market, Established startups to mentor and talk to people based on the rising number of startups (over 4200), India is the world's fifth-largest country. Entrepreneurs act as change agents in a country's economy. Micro enterprises assist in stimulating the growth process by affecting macroeconomic factors. The entrepreneurs also can create a spark for a developing country like India; it is necessary to restructure the economy [14-15]. This survey and additional research aimed to elicit the thoughts of current adolescents on the way to entrepreneurship and their preferences at the entry near in toward entrepreneurship. The overall study shows us that Indian adolescents haven't wholly reached the expectations of their involvement in entrepreneurship, which ought to be required in this present scenario.[18] Research findings suggest more and more new entrepreneurs be evolved from Indian youth by improving their notions about entrepreneurship and thus abolish the problem of unemployment in India.

The rate of unemployment is higher in rural than urban territories, and the rate of female unemployment surpassed the rate of male unemployment. In scenarios like this, there is a solid requirement for entrepreneurship in our nation. India needs work producers rather than work seekers. When we see the primary reasons for unemployment, we will discover the absence of employment opportunities, skill crises, high development of population, and moderate development of industrialization. The rate of joblessness has become speedier for individuals with practically no education than for those with some education. The government has not been able to give enough openings for work to all the jobless, and in the meantime, the unemployed youth populace has been expanding step by step. An entrepreneur is a person who works together with all assets, steps up with regards to begin something new, takes risks, gives work to numerous, and fills the gaps to make lives less demanding.[16]When we see the massive picture, we find that business visionaries can help a nation from various perspectives. It causes a nation

1. To decrease its joblessness rate (through independent work and giving work to others).
2. To wind up fiscally and technologically independent (through trading and developments)
3. One single entrepreneurial unit impacts such a significant number of lives and offices directly or indirectly; it also gives money-related security.
4. Income to the government drastically improves because of taxes paid directly and indirectly.
5. Foreign cash flows to the economy through fares (directly) and so on.

Thus an entrepreneur helps a nation in its general monetary improvement. In such a circumstance, the advancement of business is particularly required in a nation like India. As we already discussed in India, a larger piece of the populace is youth.[16] They have the potential for statistical profit, which happens when the extent of working individuals in the whole populace is more than the rest. It means that more nationals can work, be gainful and contribute to the countries' financial improvement. When more youngsters progress toward becoming business visionaries, at that point, the issue of unemployment can be lessened to an enormous degree.

TABLE 2. THE SOURCE OF SKILL DEVELOPMENT AND TRAINING PROGRAMMES UNDER VARIOUS DEPARTMENTS

Sl. No.	Department	Source Of Technical Development	Duration Of Training (Long-Term/Short-Term)
1	<i>Human Resource Development</i>	Polytechnics Institutions , pharmacy Institution, hotel Management Institution, architecture Institution	4-12month
		Community Polytechnic Scheme <i>NPTEL</i>	
	<i>Human</i>	National Institute of Open Schooling-Distance Vocational Education Programmes [Practical training through Accredited Vocational Institutes(AVIs)] National Programme on Earthquake Engineering Education(NPEEE)	FDP short-term and long-term programmes

	Resource Development	Modular Employable Skills(MES) Crafts Instructor Training Scheme(CITS) Advanced Vocational Training Scheme and Hi-tech Training Scheme <i>Supervisory Train in</i> <i>Women Training Institute</i> <i>Central Staff Traini and Research Institute</i> Model Training Institutes and Model Industrial Training Institutes.	1 year Short Term courses Long and short term Long and short term Short Term(1-3)years
2	Information Technology	DOEACC-,O "level CEDTI	Flexible duration Short courses
3	Labour & Employment (DGET)	Craftsmen Training Scheme(CTS) Apprenticeship Training Scheme(ATS)	Six months to Three years Sixmonthsto4years
4	Rural Development	National Institute of Rural Development (NIRD) Swarnjayanti Gram Swarozgar Yojana(SGSY) RUDSETI Strain Skill developmentof BPL @50000perannum	Short term Courses Need based short term Short term Short term
5	MSME [Small Industries Development Organisation(SIDO)]	Entrepreneurship Development Programme, Skill Development Programme(SDP), Management Development Programme	Both short term and long term
6	Textiles	Decentralized Training Programme, Weavers "Service Centers, Cooperative Training, Powerloom Centers, Indian Jute Industries Research Association, Central Wool Development Board, Central Silk Board, Training Centers for Handicrafts, North-eastern Handicrafts and Handlooms development Corporation Apparel Export Promotion Council(AEPC)	➤ Mainly short term (15 days to 3 months). ➤ SomecoursesunderHandicraftsareof1yearduration. 3 monthsto1year
7	HUDCO	640 Building Centers (HUDCO) Company run schools (NBCCHCC, L&T, ECC etc.) & Association etc. Construction Industry Development Council (CIDC) & others	Short term courses Short term courses 1 month to 6months

1.6 Culture of Innovation

To foster a culture of innovation. Establishment of the center of excellence lab such that publication product and pattern are delivered, Detailed D.P.R. to be prepared by R and D cell, and appropriate funding to be raised.

1.7 Center of Excellence (C.O.E)

A Center of Excellence (C.O.E.) is a (Normally, they are tiny) group of committed professionals administered from a single location apart from the functional areas they serve within a practice or organization [117]. The C.O.E., also known as a competency or capability center, is frequently the team that is at the forefront of experimenting with and implementing new technological tools, approaches, or practices Streamlining the contributions of resources with high-demand and distinctive knowledge or abilities across a wide variety of areas to optimize the company or practice.[17] Improving efficiencies and using reused assets to improve R.O.I. Improving efficiency and utilizing reusable assets to reduce delivery delays, development expenses, and maintenance costs.

2. Implementation of Advance Technology

The launch of many programs by the government to bring more people under the banking purview has resulted in the transformation of rural economies, focusing on a unique - 5M strategy- Manpower, Money, Meet up Events, Money and Market Access, The need for deep technology and digital is essential, cyber security, cryptology, block chain technology.

The growth of several engineering colleges has been such a pace that it has become a business model in the last two decades in India. But addressing the quality of education is a complex problem. It has to be validated for the quality of human resources generated and its contribution to its overall development.[18] Quality of education also reflects the overall development of a country and not just as per economic data. Gross Domestic Product (G.D.P.) is just an economic indicator to measure the wealth of a nation. Human development index (HDI), quality of R&D measured in terms of import and export imbalance, number of patents filed, number of noble laureates, number of products invented, number of innovations can give an overall aspect of educational outcomes[17-18]. This part of the critical review focuses on the not-so-positive outcomes of a quantity-based educational system. The the quality of outcome is improved as per the given the fish digram Fig 2.

Along with AICTE, technical universities in each state are responsible for administering and maintaining technical education quality. Engineering Institutions in India Engineering Institutions Quantity Indian Institute of Technology 23 N.I.T. 30 IIT 4 Other Public/Private Universities for Technology 117 State rung Government Engineering Colleges 33 Private run Engineering Colleges / Technology Management institutes 700.

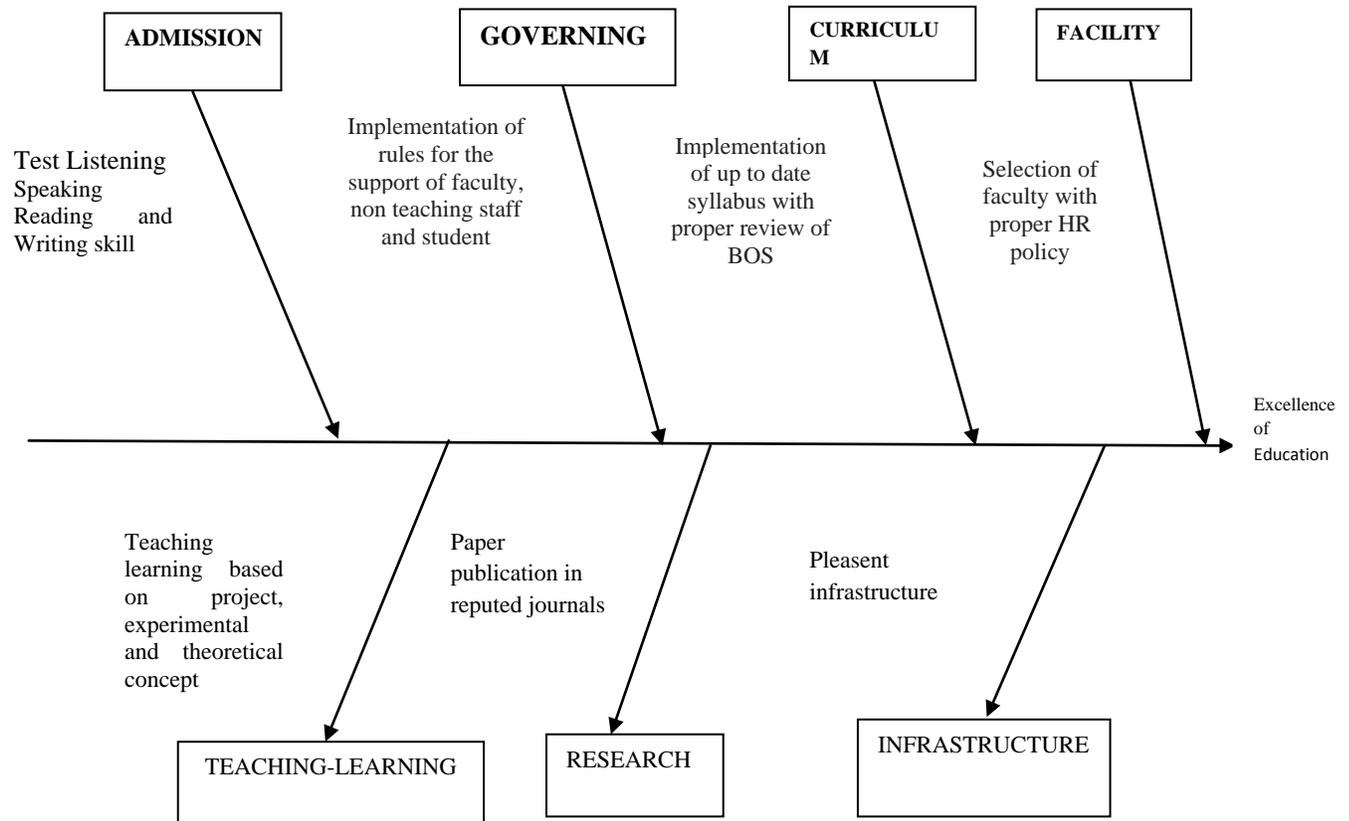

Fig.2 Excellence in technical education

2.1 What is the best way to persuade industry professionals to join the team?

The growing competition among professional technical educational institutes to build industry-ready engineering graduates establishes a robust situation to develop local tie-ups with industries. Student expands their industrial knowledge with industrial exports.[19]

2.2 How to create a persuasive case for bringing in industry expertise.

The growing rivalry among higher education institutions to produce business-ready graduates puts pressure on them to form closer links with industry. Getting on-board, either as a permanent professor or as lecturers upon this side, people with engineering expertise is one method for colleges to tap into the most up-to-date industry knowledge and exposing them to practices. Individuals with experience in the business are aware of current trends, methods, and processes. As a result, they're best suited to giving students an inside look at how businesses operate or sharing news from research laboratories. According to Ashok Mittal, Chancellor of Lovely Professional University, their first-hand expertise transfers into more vital information delivery skills. And the knowledge they provide is invaluable. Inviting industry leaders to speak on campus as guest lecturers can also help with campus recruitment.[18-19-20] According to Dr. Banerjee, state institutions can only afford to do so little to publicize their courses and facilities. Welcoming high-ranking engineering representatives to speak with scholars benefits raising knowledge and opening doors to new campus recruitment opportunities regularly. Employing subject specialists as a part of your team is undoubtedly a proud moment if you can get the right

people on board to teach the essential courses while maintaining their enthusiasm. Here are some suggestions for successful industry recruitment:

2.3 Ascertain that they are enthusiastic about academics

Teachers serve as role models for students. They have enormous sway on the following generation. It's a tremendous duty to shoulder, and it stands out from the rest of the industry. As a result, prospective faculty members must demonstrate a commitment to developing young minds and positively impacting the community. The creation of the transition from permanent engineering participation to academia is a huge step. A potential applicant always has the will to pursue fulfillment from incorporeal benefits and knowledgeable achievements.[20] Asking inquiries such as, "What inspires you?" What are your career aims and goals? Individuals who will become successful academicians can be identified during interviews.

2.4 Make them offers they'll be unable to reject

Make them offers they'll be unable to reject. Money is a significant motivation for industry professionals to leave their jobs and pursue academic careers, whether full-time or part-time. It also raises a lot of questions. According to Mittal, despite a significant increase in faculty compensation, industry experts continue to have misgivings about being appropriately compensated for their contributions.[21] He suggests assessing potential faculty members' merit and providing them a commensurate package. The remuneration is reasonable at this level. To entice people to transfer from industry to academia. [21]Affordably low UGC-mandated honoraria for visiting academics might also be a turnoff. Following U.G.C. rules is not enough to recruit specialists, according to Karnataka University's experience. As a result, starting this year, the institution will set aside funds to provide such services.

2.5 Demonstrate to them what they stand to gain

The deficiency of attraction and enthusiasm connected with learning is another typical barrier for industry professionals to enter higher education. Go-getters look for industrial jobs because they believe they will provide them with challenges and new experiences, and ample compensation if they do well. Demonstrating your dedication to research can help you land a faculty job and recruit industry talent. Individuals with academic interests generally desire to contribute to the current body of knowledge by doing cutting-edge research. In reality, it works in both directions. A research-based approach mindset is among the most popular crucial traits to aspect aimed at in a potential professor today because the information is no longer viewed as static. The quantity and quality of research conducted by a university improve its reputation and interests brilliant students. Making a caring atmosphere

Attracting industry talent requires an atmosphere in which recruits may reach their full potential. Mittal believes that providing vital Infrastructure and research facilities focused on physical and information technology will interest professionals with practical experience. It is also critical to invest in faculty development. Institutes offer regular F.D.P.

2.6 Make use of technology to connect with professionals.

Instructors may now teach any course from a distance, including across borders, without wasting time on travel thanks to information and communication technology (I.C.T.). Nonetheless, Dr. Chiplunkar feels that modern I.C.T. technology is best suited to enhance rather than replace

traditional classroom instruction. The University of Calcutta puts together an online system with a central hub to service its whole faculty. Thenovelapparatus will increase the number of possibilities for resource individuals to join the team. The nearby industrial employees are restricted because most big businesses are based in the north or west of the country. However, bringing in guest speakers from other areas of the country might be costly. We will be able to invite such specialists via web-conferencing without paying hefty fees[.21] The guest speaker can use the internet conference rooms that most organizations now have. If necessary, invitees get authorization from their bosses to give guest lectures and habit the company's web-conferencing system. In terms of collaborative Inputs, using technology for video lectures or tale presence may occasionally outperform live classes, especially if you have many campuses

3. CONCLUSION

Higher education in India has grown-up at a remarkable speed in the six decades since independence, but it is not equally available to all. In India, there is a essential to expand the amount of colleges and the excellence of higher education. To meet and exceed future demands, it is critical to revisit financial resources, workforce development, quality requirements, applicability, technology, and, lastly, responsiveness.

To make India's educational system more internationally relevant and competitive, new and transformative approaches must be used from primary to higher education levels. The quality and status of higher education institutions must be improved. Colleges and universities should have a decent infrastructure to attract students. For improved quality and collaborative research, The government should encourage cooperation among Indian higher education institutions and top foreign institutes, as well as establish linkages among national research laboratories and research centres at top institutions. There is a need to concentrate on graduate students by offering them courses in which they may succeed. And develop a better understanding of the topic to find jobs after being hired by firms, reducing the need for an unneeded rush to higher education. Preferential treatment, profit processes, and other such things should be eliminated from the educational system. Higher education should take an interdisciplinary approach so that students' knowledge is not limited to their particular topics.

However, worldwide competitiveness, changing global circumstances, job market demands, and the introduction of new technologies provide problems that need a review of current curricula and their future relevance. As a result, there is a pressing need to relocate higher education institutions, technical teachers, and Update and develop curriculum to increase 21st-century abilities for other professions and colleges.

Email id: ataullo98@mail.ru

ABSTRACT

The article is dedicated to the epics "Prince Hasan" and "Vokeoti Muhammadalikhan" by the famous Uzbek poet Jahonotin Uvaysi. Their place in Uzbek literature is defined. There is provided information about the literary environment of Kokand and the history, genesis and methods of artistic expression of "Karbalonoma epics" in Eastern literature. The role of Uvaysi's work in the development of epic poetry is discussed.

KEYWORDS: *Karbalonoma, Tradition, Plot, Vazn, Manoqib, Mysticism, Epic, Praise, Na't, Sulh, Narration.*

INTRODUCTION

Epic is the largest and most perfect genre in our classical literature. Creating it requires a unique artistic preparation from the creator. For this reason, the poet's maturity in poetry is also determined by his skill in epic writing.

It is known that Uzbek epic poetry developed under the influence of folk epics and traditions of epic writing in the classical literature of the East. "Representatives of the school of epic poetry of the XVIII-XIX centuries took an innovative approach to epic poetry. They enriched it thematically and ideologically. They made new discoveries in plot and compositional construction"[E. Ibrohimova, 1986, 18]. Some poets of this period (Nishoti, Hazikh, Uvaysi) took plots that were popular in all-Oriental literature, introduced into them the spirit of the period in which they lived [A. Qayumov, 1961, 357], and on this basis created their own epics. Such a tradition has existed and continued in the literature of the peoples of the East for many centuries. In particular, the epics included in "Khamsa" are very different in terms of artistic spirit and

ideological interpretation, but in terms of plot they are close to each other. The stories of Yusuf and Zulaikha, Ibrahim Adham have also been the basis for many works of art for centuries as such traveling plots.

The stories and narrations about the fate of the grandsons of the Prophet Muhammad (s.a.w), the children of Ali and Bibi Fatima, Prince Hasan and Hussein, were also the basis for the creation of many works of art.

Epics on this subject are called "Karbonomalar"¹ in our literature. There are many copies of them in Eastern literature, both in prose and poetry. Some have known authors, some have unknown authors, and some have been written in the form of folk books. Fuzuli's prose work "Hadiqat us-suado" is also written on this topic. The most complete and famous of such sources is the work of Hussein WazKashifi (1440-1505, Herat) "Ravzat ush-shuhado". It is dedicated to the history of Islam and our Prophet Muhammad (s.a.w). These pages of history tell the story of the martyrs who sacrificed their lives in defense of the honor, faith and justice of Muslims. In the play, the narrations received through the Qur'an, hadith and various other famous sacred words are retold in an impressive style, artistically. Kashifi's work has been translated from Persian into Uzbek several times. Among them are the prose translation of Muhammad AyubKashgari "Tazkirayianbiyovaavliyovashuhado" (XVIII century, Kashgar), the poetic translation by Sabir SaykhaliHisari (XVIII century, Hesar).

Especially in the XVIII-XIX centuries, the creation of works in this direction became widespread. by KholisTashkendi's "QissaiKarbalo (The Story of Karbala)", "Qissai Imam Hasan and Imam Hussein", "Qiyomatnoma", "Musibatnoma" works; Bibi Hajar's Qissai Imam Hussein; Nisa's "Death of Imam Hasan and Imam Hussein"; Hani's "VoqeahoilaiKarbonoyipurbalo" is a unique example. Works based on this plot have been created by artists such as Khasta, Kul Suleiman, Kazakh poet JusipbekShaykhul Islam oglu.

JahonotinUvaysi, a prominent representative of the Uzbek literature of the XVIII-XIX centuries, is a poet who was able to demonstrate his skills in more than a dozen active lyrical genres. At the same time, he was able to prove that his talent in epic poetry did not lag behind his lyrical skills. Three epics of the poet have come down to us: "Shahzoda Hasan", "ShahzodaHusayn" and "VoqeotiMuhammadalikhan".

Manuscripts and lithographs of the poet's works dedicated to Prince Hassan and Prince Hussein do not contain the names of epics by the author. This is why there is so much diversity in the literature on this subject. The poet's works are variously called "KitobiUvaysiy", "Karbonoma", "Qissaipurgussa". Literary scholar E. Ibrahimova suggests naming it "Epic about Prince Hasan", "Epic about Prince Hussein" [E. Ibrohimova, 1960, 38-44].

Methods

One example of epic poetry of the first half of the 19th century is Uvaysi's epic about Prince Hasan. In the play, the poet created the image of a just and peaceful ruler Hasan. The main essence of the epic is to promote goodness and justice. It is well known that Islam is a religion that is mainly engaged in the propagation of goodness and perfect morality. Therefore, such ideas are predominant in the works about "princes".

"Prince Hasan" is devoted to a religious theme. It describes the life of Imam Hasan. However, this is not the only purpose of the poet from the work. In it, as in his poetry, the main intention of

the poet was to open the eyes of his contemporaries, to reflect on them with the lessons learned from the poem. The main idea of the work is embodied in the image of Hasan. The poet has two sides to the emblem for artistic purposes. The first is to illuminate the character system as a king, and the second is to describe his image as an ordinary man, a person.

The poet was able to perfectly illuminate the biography of the main character in both directions. In the play, we can imagine him as a man of all-round character. In one place, Hasan's character as a person is described as follows:

Xushxo'y luqikitobasig'mas,
 Shirin so'zinikixalqbilmas.
 Ham erdimalihu, ham fasihdur,
 Yeryuzidago'yiy oMasihdur [QissaiImom Hasan,1837,201].
 (Kindness does not fit in the book,
 The people do not know sweet words.
 He was both a malihu and a fasih,
 He is the Messiah on earth.)

This epic was written at the end of a single copy of the poet's office No. 1837, kept in the manuscript fund of the Institute of Oriental Studies named after Abu RayhanBeruni. The Poet's Office ends on page 187 of the manuscript. It is acknowledged that the date of its compilation was 1274 AH, 1857 AD, and its secretary was MuhammadShahYunus Khan ibn EshanhojaEshan:

“RaqqamqildiMuhammadshohYunusxon
 Ki, nurichashmEshonxojaEshon.
 - 1274/1857 ”
 (Muhammad Shah Yunuskhan accounted,
 That light of eyes EshonkhojaEshan)

After a blank page, page 189 is turned and the epic "Qissai Imam Hasan" begins. The title of the epic is written in pencil, not by the secretary, but by the pager. Beginning on page 190, the main text of the work begins with a basmala. The work is clearly, beautifully, literally copied. There are almost no entries in the borders. Only in some places are some spelling errors corrected in the margins. On page "A" there is a race. However, on page B, this is not the case. Each page contains 17 bytes, only 13 bytes on page 1 (page 190) and 15 bytes on page 2 (page 191).

RESULTS AND DISCUSSION

The volume of the epic is 1450 lines, 725 bytes. It begins with 26 lines of praise and 20 lines of naat. Chahoryors are then described in 48 verses. Then begins the description of events related to the main plot of the epic. Initially, the birth dates of Imam Hassan and Hussein, the process of choosing a name, are skillfully described at the level of a dramatic scene.

Uvaysi emphasizes that the epic was written on the basis of manoqibs:

Ko'bdurkimanogibichrabuso'z,

Gar ummatesangeshittikibko'z[QissaiImom Hasan,1837,197]..

(This word is in the manaqib,

If you are an ummah, listen and look.)

As the poet points out, information about the lives of Imam Hasan and Husseyn has come through many manaqibs. Interesting stories about their complex, arduous, and glorious ways of life are prevalent among the people. For this reason, many works of art in the prose and poetry path on which they are based have been created. Although historical events were the basis for the birth of information about them, they cannot be accepted in a purely historical, scientific aspect. Because they were reworked by the creators. In showing his contemporaries how not to lose himself in the face of life's hardships and shortcomings, and how to overcome them with courage and skill, the brothers described the lives of imams as role models and lessons.

As mentioned above, the creation of this type of epics was influenced by Kashifi or Sabir Saikali epics, which were widespread in Central Asia. But when we compare these epics, we see that Uvaysi's works have many places that differ from them. This shows that the epics created by the poet are original works, in which the creative skills are fully reflected:

1. First of all, they are created in different weights. The work of Sabir Saikali (1793-1796) is written in the purpose of the Hazajimusammanimaksur (V - - -/ V - - -/ V - - -/ V--), as for the epic of Uvaysi, it is written in Hazajimusaddasiahrabimakbuzimakhzuf (- - V/ V - V - / V - -).

2. The events described in Prince Hasan in the Saikali epic are shorter than in Uvaysi's work. In Uvaysi, the legends about the life of Prince Hasan are more numerous and the events are described in more detail. In particular, the work begins with the narrations about the birth of Hasan and the choice of a name for him. In Saikali, however, the events began a little later, with the death of his father, Hazrat Ali, and the replacement of Prince Hasan as the ruler of Kufa.

3. In Saikali's epic, Hasan goes to Mawsil, to the friend's house, where he is poisoned 3 times; then 3 cases of poisoning and death by his wife, the punishment of his wife is described. Uvaysi narrates in detail that Hasan was the ruler, Muawiya, the ruler of Damascus, attacked Kufa with 60,000 troops, and Hasan went against him with 40,000 troops. The poet emphasizes that Hasan was a supporter of peace. Without thinking of his own glory, he prioritizes that the blood of the people should not be shed in vain. In this connection, the poet describes the prince's beautiful character, his perfect morals. Hasan creates an example for his contemporaries in the language:

“El sudiniistagumshabiro'z,

Bu so'znideyman shahi dilafro'z.

Oldimdabuelsalomato'lg'ay,

Yo'qxohishimo'lsaelparishon,

To bo'lmasafitna, bo'lsaimkon.

Gar fitnalig'sulhbehroq,

Har vaqtdeganImomiofoq[QissaiImom Hasan,1837,204]”.

These images, in a sense, connect the events of the work with the time of the poet. It shows his attitude to the struggle for the throne, for the state, in the social process. It is obvious that he puts peace, tranquility and health in the forefront.

4. In Saikali, Hasan's wife is called Asma. In Uvaysi it is called Juda (She describes Asma as described as the nanny of princes). While Saikali describes Asma's severe punishment, Uvaysi does not cover the process. In the poet's epic, the story ends by describing Hali's conversation with Juda after her poisoning. Hassan's death is also not described. When reading the end of the epic, the question arises as to whether this work was not completed at first. But we conclude that Uvaysi preferred to conclude the epic in this way, leaving it to the reader to conclude and learn from it in a manner peculiar to the poet's style. After the epic in the manuscript, another work of the poet, "The story of Muhammadalikhan" is quoted, which indicates the end of "Prince Hasan".

In the Uvaysi epic, several narrations related to the life of the princes are narrated. Initially, their disappearance is narrated. The poet notes that this narration was narrated by Ibn Abbas. Ibn Abbas was one of the great Companions, the teacher of the Makkah school of the three schools of tafsir. He then pays special attention to the martyrdom of Hazrat Ali and the enthronement of Prince Hasan on the throne of Kufa, and the use of this to draw the army of Muawiya, the governor of Damascus, who was in constant conflict. Apparently, Uvaysi narrates the narrations with certainty from authentic sources, in relation to specific individuals.

The composition of the epic is unique. As the main plot is told, lyrical digressions are given. They are sometimes told in the language of the poet, and sometimes in the language of the protagonist - Hasan. Then, in the style of folk epics, the narrator is addressed and returns to the leading plot:

“Roviyqalamingnitezyuritgil,

Xunobaijigardinonchayutgil...[QissaiImom Hasan,1837,212].

Or:

“Roviyyanaso'zboshig'akelg'il,

Shahzodakaromatiniayg'il...[QissaiImom Hasan,1837,210]”.

Lyrical retreats play an important role in the epic. They serve both to enrich the plot of the work and to serve as a lyrical relation. It is as if the poet connects the events with his time. It shows them the attitude of the poet.

Lyrical retreats are given in a variety of genres and forms. There are ghazal, masnavi, fard appearances. The individual genre is used in one place. It is written in the healthy weight of the hazajimusammanisolim(mafoiylun-mafoiylun-mafoiylun-mafoiylun; V - - - V - - - V - - - V - - -).

Even after the lyrical retreats in the ghazal genre, the thoughts are directly linked to the plot of the epic:

“Ammodedilarkiholtilda

Kechdikibubaytpokdilida:

“Vafoko'ztutmag'ileldinkiolaminvafosiyo'q,

G'aribo'lmaynetarya'nikishi gar asnosiyo'q.

Tutubhurmatkanora, elarosidinvafochetti,
 Bu kunuzgilko'ngilharikkisidinkimbaqosiyo'q.
 Nazarsolsangagarchandekibuyolg'onchiolamg'a,
 Aningjuzdardiranjimehnatjavrijafosiyo'q"[QissaiImom Hasan,1837,207]"

This lyrical retreat is created in the ghazal genre. It is written in the healthy weight of the hazajimusammanisolim. It is not in vain that the ghazal is given in the language of the protagonist. This weight plays an important role in conveying the pain and suffering in Hasan's heart. The protagonist's philosophical thoughts about the universe and man also have a universal meaning.

In some places a lyrical retreat is also given from the poet's language. In particular, the lyrical retreats given after the events of 3 times given by his friend that he was not affected by the poison, his friend's letter to Sham to Muawiya, and the man who took him to be eaten by a wolf on the way are given in the poet's language. He draws a generalized conclusion, a lesson, from the relationship between Hasan and his friend and its consequences. It serves as an example and guide for people at all times:

Gar qilsasitamkishikishig'a,
 Go'yositamaylamisho'zig'a[QissaiImom Hasan,1837,209].

(Translation: If a person oppresses someone,
 It's as if the oppression is self-inflicted.)

Here the lyrical retreat given from the poet's language is the same as the weight of the epic. The use of different weights in the epic served to reveal the general rhythm of the work, the mood and processes in it. The weights and genres used are not random. Perhaps they were all used for a specific purpose. The author has played an important role in shedding light on his views.

It is known that in Uzbek classical literature, epics are written mainly in 7 weights. "The weight of the hazajimusaddasimahzuf, which is widely used in epic poetry, is the weight" [D. Yusugova, 2011,98]. However, when Uvaysi chooses the weight for his epic, we see that it comes from the content of the work. In this regard, the poet-teacher follows the path of the poet Navoi. We know that the epic "Layli and Majnun" is tragic in terms of plot. For this reason, it is written in the weight of hazajimusaddasiahrahimbuzimahzuf(maf'ulu - mafoilun - fauvlun; - - V V - V - V - -), which is convenient for expressing the sad state of mind. Taking into account the sad and tragic ending of the plot in this epic, Uvaysi also creates it in the weight of "Layli and Majnun", that is, in the mahzuf of the last syllable of the hazajimusaddasiahrahimbuzimahzuf. In some places, he uses other variations of hazaj in order to express different moods.

In addition to the use of the style and composition of folk epics in the creation of the epic, the poet also uses folk proverbs:

"Chahqozsakishikishig'a, eyyor,
 O'ziyiqilur",-deganmasalbor"[QissaiImom Hasan,1837,212].
 (If a man digs a well,

he himself will fall)

As the poet describes the symbols and events in the epic, it is felt that he approached each of them from a unique point of view, from a different point of view. In particular, Prince uses the traditional style of classical literature when describing the image of Imam Hasan. Drawings on his image are represented by traditional metaphors, comparisons and means of artistic representation:

“Keldilarimomishahsuvori,
 Kunxiraetardiguluzori.
 Qulerdisanubar ul xiroma,
 Abro’sig’achokerdixoma.
 Maherdiqoshida soya yanglig’,
 Lab olidala’lsangixorayanglig’.
 Zulfinqoshidaxaserdisunbul,
 Lafziolida gung erdibulbul”[QissaiImom Hasan,1837,214].

But this is not the case in the description of the main events in the plot. The poet seems to have avoided the use of the silent, artistic allusions of the word. In our opinion, the author has taken such a path in order to convey the plot to the reader in a clear and understandable way.

In literary criticism, Uvaysi's epics are evaluated differently. Some studies also suggest that poetic epics are shallower in terms of artistic skill than poetry. However, all of these criteria are, to a certain extent, balanced by Oybek's conclusions. It clarifies our understanding of her work: “However, I do not think it is true to say that the poet's epics are inferior to his poems. The poet's epics Hasan and Hussein are highly artistic epics written with great skill. There is a lot of religious mood, but the poetess created these works with her heart because she has sincere feelings, tender feelings and deep feelings” [Oybek, XIII tom, 1989, 402] When we studied the epic, we witnessed that Oybek's views were not unfounded. Perhaps, due to the demands of the time, its creation on the basis of religious stories may have led to such an assessment. However, if we look at the work in terms of plot, composition, artistic design, content and ideology, we can see that it is a work that can meet the high requirements of art. The above-mentioned examples show the poet's fluent language, unique artistic means of expression, and a pleasant folk style.

The events of the epic end in a tragic mood. It is as if with Hasan's death, evil seems to have triumphed over good. But Uvaysi used the epic, which was based on a historical event, to express his views on goodness. From the poet's point of view, goodness always wins. His victory is in eternal stability, in eternity. Evil is always defeated. His defeat lies in being exposed by goodness. In the boundless hatred of the people for him. Uvaysi was able to convey these views to the reader with his skill. Therefore, at the end of the epic, we feel a growing sense of confidence in the eternal triumph of goodness in our hearts, despite the death of Prince Hassan. This is a product of the poet's skill.

The epic "VokeotiMuhammadalikhan"was also copied along with Uvaysi Devon. He arrived unfinished. It is kept at the Institute of Oriental Studies under inventory number 1837. The text of this epic consists of 14 pages in the manuscript (pp. 233-246). Each page has 22 lines of text.

So, the part of the epic that has come down to us is 208 lines, 104 bytes. The first bytes of the work consist of praise and notes (). Then Muhammadalikhan talks about his lineage. Some important points in the biography are remembered. The reasons for sitting on the throne are mentioned. Finally, attention is drawn to the main event that led to the writing of the epic - the Kashgar invasion. It is not divided into chapters.

There are several characters in the epic. Their nature, especially the character of Muhammadalikhan, is vividly expressed. In his style, the peculiarities of folk epics stand out.

But the epic does not end. This is probably due to the defeat of Muhammadalikhan in this war. Hakimkhan Tura's historical work "Muntahabut-tavorikh" gives detailed information about this march: "They immediately took control of Kashgar province, and the next day surrounded Gulbog fortress like a ring, and began the siege and war. Days later, the siege was extended to three months. With no action was it possible to capture the Gulbog fortress. Without choice, he evacuated several thousand people and returned to Hokand with their heads bowed" [Муҳаммадҳакимхон тўра, 2010,629].

Is'hakhonJunaydullohojaogluIbrat's "Farg'onata'rifi(History of Fergana)" (1916) also contains some important information about Muhammadalikhan and his history. In particular, the historian comments on the war of conquest in Kashgar: he did not achieve the nickname of Gazi without fighting. In fact, Amir Timur's grandson did not achieve the title of a ghazi, but in sermons and verses he was described as a master, but they did not call him a ghazi [Ibrat, 1991, 292].

In Hakimkhan Tora's work, it is said that Khan began to march to the Gulbog district of Kashgar, and in Ibrat's "History of Fergana" this situation is further clarified. In other words, IsobekMehtar and Buzrukkhan Tora, who were expelled from Kokand by Muhammadalikhan in 1832, merged and occupied the Gulbog district under Chinese rule. In our view, because of their conflict with them, the khan organized a march against them. But, as mentioned above, it ended in defeat: "O'ninchiyili (Muhammadalixonhukmronligining, ya'ni 1832 yil) Isobekmehtar ham qochib, Koshg'arboribdur. Buzruksonto' railanbirgalashib Xitoynimahkumidagi Gulbog'nimuhosaraqilibdurlar (Translation: In the tenth year (of Muhammadalikhan's reign, i.e. 1832) IsobekMehtar also fled and went to Kashgar. Joining with Buzrukkhan Tora, they invaded Gulbog, the district of China)"[Ibrat, 1991, 296].

It seems that such information in these historical works, to a certain extent, serves to enrich our understanding of the reason for the writing of Uvaysi's epic "VokeotiMuhammadalikhan (The Story of Muhammadalikhan)", its history and the reasons for its incompleteness.

CONCLUSIONS

As a result of studying the evolution of genres in Uvaysi's creative heritage, we came to the following conclusions:

Each genre in the poetry of the poet, the history of its perfection, the special study of its peculiar new aspects, is extremely relevant. Because the interpretation of this heritage in this context provides an opportunity to find solutions not only to Uvaysi, but also to many genre-related problems of Uzbek classical literature.

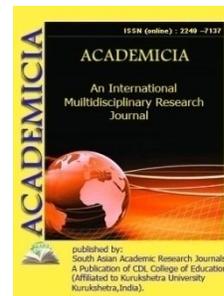

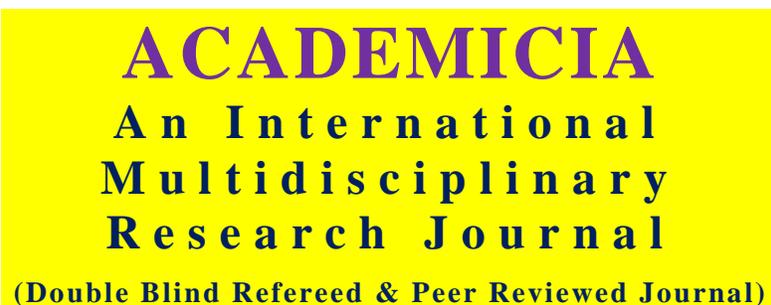

Uvaysi was able to show his unique talent in epic writing with three epics he created during his creative activity. In the works of the poet, we witness the embodiment of the traditions of classical poetry of the East and the style of expression typical of folk epics.

The author's epic "Qissai Imam Hasan" differs from other epics on this topic by many peculiarities. The principles of the poet's weight selection and use of artistic means are reflected in the poem.

The epic is of great importance for us today with its work that promotes the ideas of universal morality, such as purification of heart, living with the grief of the people, kindness, generosity, forgiveness, devotion. Thus, a comprehensive study of Uvaysi's work allows us to conquer many unexplored frontiers not only of the poet, but also of Uzbek classical literature. It leads us to the comprehensive, deep thinking world of our ancestors.

THE STRUCTURAL MODEL OF METHODOLOGICAL TRAINING OF TEACHER IN TEACHING BIOLOGICAL SCIENCES

Karimova Mavluda Khakimovna*

*Lecturer of Karshi State University,
UZBEKISTAN

ABSTRACT

The article deals with the composing of methodological modes of methodological training of biology teachers, including methodological, scientific-theoretical, peredmetical blocks. The model is a number of parameters: the requirements, knowledge, skills and qualities to the specialist, social and psychological qualities, take into account the effectiveness of methodological activities.

KEYWORDS: *Biology, Content, Methodical, Model, Pedagogical, Student, Methodist.*

INTRODUCTION

Methods of teaching biology in higher educational institutions are carried out within the structure of specially organized educational training of students. Elements of this structure are the goals of education, achieving them in the course of training of students. In addition, it includes the system of training courses, school, internship, course, and graduate work, the sequence, time and volume of study is determined in the curriculum. Each of them includes a certain content, as well as in certain organizational forms. The element of this structure is the system of monitoring the learning of educational content.

Literature review. The final result of methodological training in higher education institutions is the fact that graduates are prepared for teaching biology. To date, there are no objective criteria that characterize the level of methodological training of graduates.

According to experts, in general, higher education institutions can be considered satisfactory in the preparation of future biology teachers. However, methodological training in the sorting of various components of future biology teachers took the next place after science and psychological-pedagogical training.

Scientific novelty of the article. The main objections to methodological training sessions are not to know the insufficient knowledge of practical learning techniques and does not know certain normative documents on the organization of the educational process. Professional culture and professional knowledge occupies a unique position.

The components of professional culture are divided among the following: professional biological knowledge - the foundations of biological sciences, professional skills, tasks, content, personal features of professional significance, professionalistic features of professional activities - a person-oriented description Setting the desired target in the ability to design pedagogical activities and the educational process. Methodists point out that the school biology course is insufficient in terms of the content of the school and is not possible to design a lesson training material, so in the content of the school, they consider focus on the problems of school biology course.

As you can see, evaluation of the results of the professional training of teachers' teachers is primarily done within the framework of a methodological training system. These include: a quality new description of the biological content of the school, enriching the educational process with the ability to design the learning process independently and practical teaching methods.

According to demands, elements that allow methodical training, the elements that allow the teaching process to shape the training process in each student are not disclosed. According to teachers for pedagogical specialties, the main shortcomings of the methodological training of biology teachers are: not aware of the content of school biology, identification of means of achieving school biology, large difficulties in choosing them, organization of them and is notable to equip.

The purpose of the biological teacher in the higher education is to create conditions for students to develop the necessary activities in the successful implementation of practical activities at a modern school. Thus, the contradiction is determined between the two functions of the system of methodological preparation: creating conditions for mastering the methodological experience accumulated and ensuring an advanced study advanced study. In the system of methodological training, the knowledge system, on the one hand, is generalized on the one hand, on the other hand, on the other hand enriched with the news that requires constant understanding.

Analysis and results. The objectives of methodological preparations are primarily concerned with the development of certain types of practical activities. A number of cases in this problem: the combination of theoretical teaching and practical classes, the use of teaching technologies in the system and such similarities can be highlighted.

All changes in the system of the school biological education will show the general trend of the educational process to the reader. Methodological and methodological and teaching of the methodology of the school is aimed at the needs of each student's development.

In higher education, scientific-oriented methodology will be studied, where the main focus will be on biological composition and students are not discussed by its development mechanisms. This direction is reflected in the name "Biology learning methods" being implemented in the system of methodological training. Teaching means activity of the teacher. Therefore, the teaching activity is analyzed, and the student's activities are left out.

The new trends of teaching biology in general secondary education require a new look at biological content related to the discrimination of profile. Great attention is paid to the analysis of biological content in the educational process of students, and most of the time will be divided into this. The formation of these skills takes most of the time of reading. It should be noted that students assess their professional activity by analyzing the activities of teachers.

In some universities, students' choosing special courses will be significantly increased to satisfying their interest in professional and education.

Theoretical analysis of the preparation of biology teachers allowed to develop a systematic design methodological mechanical package of methodological conceptual ideas and principles in the system of methodological training of biology teachers in a continuous education system.

Among the leading ideas in choosing the teaching methodology of the teacher, the following opinions can be highlighted: the future reflects the ability to improve their professional skills. Biological education, focusing on the changing needs of modern schools and societies, offers various options for the preparation of biology teachers. Competition - reflects the use of knowledge obtained in solving methodological problems; Integrativeity Biology, pedagogy, and intercompasse offers the implementation of the biological training preparation system of teachers' methods of biology teachers.

It is known that the social order defines the requirements for the vocational training of modern biological teachers.

The scientific-theoretical and methodological basis of professional training of future biology teaches is blocks of biological sciences, pedagogy, psychology and methodological methodology. The scientific-theoretical training of methodological training of biology teachers ensures the implementation of the main purpose of methodological education.

A modern training room for the teaching of biology should be from the following components: educational equipment, specialized furniture, technical equipment and functional interior tools.

The holistic methodological system of biology teachers - didactic principles, curricula, curricula, textbooks, textbooks and manuals. Varogging in the preparation of biology teachers can be done through special circles, specialties and additional education.

In addition to the effective structure of teachers of biology, the efficiency of the correctly established classes - methodical research, methodical research, methodical projects, field experience, etc., will increase significantly through similar similarities. It is done with a unified system and stratified teaching.

The set of methodical equipment provides basic knowledge, skills and qualifications of students, the formation of worldview, creative thinking, and forming integral thinking.

Based on the functional work of leading methodist biologists and structure of teaching the educational content, we have developed a structural and functional model of methods of biology.

It is:

- Methodical knowledge;
- Scientific-theoretical knowledge of knowledge;

- Includes science and methods of knowledge.

Methodical block embellishes the problems of the current stage of school biological education reform.

The scientific-theoretical block is systematic knowledge in the field of teaching methods of teaching biology, that is, the basic principles of teaching, teaching, developmental and educational functions, the system of teaching aids, control functions, target determination function.

The subject-methodical block synthesizes knowledge of biological and environmental education and methodological training, and it is aimed at developing the professional composition of the teacher.

The system of multifunctional training of biology teachers determines professional pedagogical activity at various preparatory levels.

The following conditions are set for methodological training of biology teachers:

- Ensuring unity in the interpretation of ecological and biological concepts in the educational process;
- determination of the content of environmental and biological education, theories and concepts;
- Continuity in the study of concepts in the study of all departments of biological sciences;
- Use of a personal, active approach in teaching and educational process.

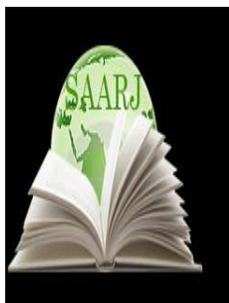

Methodological preparation of biology teacher: determined by motivation, cognitive and activities components. These components have a great impact on the efficiency of the development of teacher's methodological training. These components are used in choosing the content of educational and pedagogical tasks in the methodological training of biology teachers.

CONCLUSION

Thus, the professional methodical training of teachers of biology can be expressed in each stage with a system characterized by a flexible module consisting of blocks and modules that provide certain knowledge.

ABSTRACT

*The article describes the impact of non-traditional legumes *Crotalaria juncea* on the optimal sowing time and norms of the number of legumes, the number of grains in legumes, 1000 grain weight and grain yield. It is scientifically substantiated that it is possible to get an additional yield if *Crotalaria juncea* was sown 10 kg per hektare in early May (1-5.05), the number of legumes would be 15, the number of grains in legumes would be 4.1, the weight of 1000 grains would be 4.9 g compared to the variant sown 20 days earlier and higher to 9 pieces, 2.8 g in proportion to the variant sown 10 days early and as well as it is possible to get the yield at the rate of 5,2-3,8 c/ha when sowing 14 kg of seeds per hektare for a period of 1-5.05 compared to the early sown variants during the same period; 1.9 c/ha compared to the variant planted at 10 kg per hektare; 3.3 c/ha compared to the variant planted at 18 kg for a quality seed crop.*

INTRODUCTION

Rapid population growth in the world, lack of food stocks, long-lasting drought in Australia, rising demand for food in countries such as China and India will require further planting of cereals and legumes. Expanding the fodder base requires expanding the type and area of high-calorie fodder as well as food crops to ensure food security and keep it stable.

In order to provide our people with food, address protein shortages, provide livestock with nutritious food and increase soil fertility, it is necessary to increase the number of high-yielding, high-calorie new varieties and kinds of legumes. In exchange for expanding the area under legumes, first of all, it will provide the population with nutritious and high-quality products, and livestock with cervitamine, mineral-rich feed and increase soil fertility. This is one of the legumes.

Extensive research is being conducted in the world on advanced technology for growing non-traditional legumes, especially *Crotalaria juncea*. Taking advantage of the potential of crotalia, relying on the scientific basis of specific cultivation technologies, they produce environmentally friendly grain and hay crops and mature fiber products of species and varieties suitable for soil and climatic conditions, rich in protein and vitamins. At the same time, as a result of research on improving agrotechnologies for the cultivation of high-yielding varieties of crotalia, i.e. correct timing and norms of sowing, optimization of mineral and organic fertilizers and the correct application of crop rotation, restore and increase soil fertility, provide livestock with nutritious feed, quality fiber. Scientific research is being carried out on

LITERATURE REVIEW

Foreign scientists as A. Abdul-Baki, H. Bryan, A. Maroyi, G. Baird, C. Cook, Danielle, S. Gumari from, G. Zinati, C. Cook, C. Orwa, G. White, J. Haun, S. Sarkar, S. Hazra and others carried researches on the study of biological and morphological features of non-traditional legume crotalia plants, development of seed, selection and cultivation agro technologies and scientists of our republic M. Aberkulov, A. Kiderbaeva, D. Asilbekova, N. Ulchenko, N. Rakhimova, A. Nigmatulaev, A. Glushenkova fulfilled their scientific works on the issue in question..

Crotalaria juncea L. is a tropical Asian plant of the legume family. The origin of *Crotalaria juncea* is India, where it has been cultivated since the early days of agriculture. It was first reported in Sanskrit literature in 400 BC [11].

In some literatures, [7] the origin of *Crotalaria juncea* is not clear, but it has been cultivated in India since ancient times. According to L. Mannetje [8], this tropical plant came to the West from South Asia in the 19th century.

According to M. Tripathi, B. Chaudhary and others [13], *Crotalaria juncea* L. is a multi-purpose tropical and subtropical legume grown in many countries, especially in India, for high quality fiber. The crop is grown for green manure, to improve the reclamation condition of the soil

According to C.Cook and G.White, L.Purseglove [6; 9], *Crotalaria juncea* is a plant which ecologically cleans the land and biologically controls weed in agriculture.

According to M. Tripathi [13], green biomass production from *Crotalaria juncea* planted in India before the monsoon ranged from 22 to 27 t/ha. In Cuba, 3.4 tons of hay was harvested from two

crops. In Thailand, when rice is grown as green manure, a high quality crop of 2 t/ha is obtained in 6-8 weeks.

Indian scientists R. Ulemale, D. Giri and R. Shivankar [12] studied the effects of planting time, seed size and amount of phosphorus fertilizers on *Crotalaria juncea* yields. Biomass and seed yields were found to be high when 30 cm of furrows were planted early and 75 kg of phosphorus was applied.

In the research of A. Abdul-baki and others [4] *Crotalaria juncea* was harvested 100 days after planting and grown for another 70 days to increase the amount of nitrogen in the soil. Because *Crotalaria juncea* blooms 100 days after planting and begins to collect biomass.

In the experiments of M. Aberkulov and others, [1] it was found that the thicker the *Crotalaria alata* plant, the faster the growth of the plant, but the flowering and ripening periods are delayed by 2-3 days or even 4-5 days. [2] Experiments have also shown that *Crotalaria alata* can be planted as a siderate crop and replaced with cotton or rice to produce a good harvest.

The staff of the Institute of Plant Chemistry of the Academy of Sciences of the Republic of Uzbekistan D. Asilbekova and others [3] studied the chemical composition and nutritional value of *Crotalaria alata*. According to her, the protein content of plants grown in Tashkent was 9.3-13.5%, fat 2.3-3.7%, klechatka 22.5-28.9%, ash 10.4-15.3%.

Based on the analysis of the above literature, it can be said that *crotalaria juncea* is a crop that fully meets the needs of our people and has not been fully studied scientifically, it is important to improve agronomic techniques and introduce the results into production. The analysis of the literature shows that no research has been conducted on agronomic techniques, timing and standards of cultivation of non-traditional legumes – *crotalaria juncea*, which are grown as a main and secondary crop in different soil and climatic conditions of the country. Scientific works abroad have focused on its biology, the physiological processes that take place in it, and its role in increasing soil fertility.

Materials and methods: Research methods were carried out on the basis of the “Methods of State Variety of Agricultural Cultures” (1964, Moscow: Kolos), “Methods of agrochemical analysis of soil and plants” (1977, Tashkent), “Methods of agrophysical research” (1973, Tashkent).

Also, phenological observations, biometric measurements and determination of productivity were carried out on the basis of manuals “Methods of field experiments with grain cultures” (1971), “Methods of conducting field experiments” (UzPITI, 2007).

Field experiments were conducted in the conditions of degraded, saline meadow alluvial soils of Khorezm region. In the experiment, *Crotalaria juncea* was planted in three different periods (10-15.04; 20-15.04; 1-5.05) and three different norms (10; 14; 18 kg/ha) and the effect of sowing time and norms on its growth, development and yield studied.

The obtained results. It is known that the weight of a crop is determined by the quantity and quality of the elements harvested in the crop. In *Crotalaria juncea*, too, grain yield depends on the yield elements formed in the plant, i.e. the number of pods and the weight and quality of the grain in it. In turn, the quality of the harvest elements depends on the timing and rate of sowing the seeds.

The yield of legumes is also related to the number of grains and the weight of the grain. However, the abundance of grain is not always the basis for high yields. This is because only if the weight of the grain is at the level of demand, it will ensure a rich and high quality crop. How full the ripe grain is can be estimated based on the weight of 1000 grains. For this reason, the study of the number of grains in *Crotalaria juncea* legumes and the degree to which grain weight depends on planting dates and norms is of great scientific and practical importance.

In *Crotalaria juncea*, the emergence of both buds, flowers and pods in a single bush during the entire growing season was observed, and the formation of legume was detected in early June. The newly formed pod was light green in size, measuring 0.5-2 x 0.5-1 cm, and contained 6-8 seeds. The legumes are light brown when ripe and 3-4 (6) cm long. In the experiment, it was observed that 18-67 legumes were formed in one bush of *Crotalaria juncea* during the application period. Inside the pods were found grains (seeds) with a diameter of 4-6 mm, up to 6-14 gray-olive, dark gray, dark brown and black. 90% of the seeds ripen in mid-to late October.

To get a high and quality grain crop from *Crotalaria juncea*, it is necessary to correctly determine the timing and rate of planting. This is because when *Crotalaria juncea* is grown at different times, the influence of physiological processes during the formation of grains in the legumes is strong, resulting in the complete formation of some grains and the immaturity of some grains. For this reason, the formation of legumes, the number of legumes, the number of grains in legumes and the weight of 1000 grains were studied when *Crotalaria juncea* was grown at different times and norms.

According to the results of the experiment, in the case of September 1, the number of legumes produced per plant according to the options was 30-52; the number of grains in legumes was 8-13.5 grains, the highest results were observed in the variants of *crotalaria* sown on the 1st of May, the number of grains compared to the variants sown in the early period was 9-15 grains; the number of grains in legumes was found to be 2.6-4.1 grains higher.

The effect of sowing times on the number of grains and legumes was observed significantly. That is, when *Crotalaria juncea* was planted on April 10-15, the number of legumes produced per plant was 30-37, the number of grains per pod was 8-9.4, while the number of legumes planted 20 days later (1-5.05) was 42 -52; the number of grains in legumes was 11.6-13.5 and the number of grains in beans was 9-15 grains and the number of grains in legumes was 3.6-4.1 grains higher than in the early sown variants (Table 1).

TABLE 1 NUMBER OF LEGUMES, NUMBER OF GRAINS IN LEGUMES AND WEIGHT OF 1000 GRAINS IN CROTALARIA PLANTED AT DIFFERENT TIMES AND NORMS (2019)

Versions	Planting time	Planting norm, kg/ha	Number of legumes, pieces	Number of grains in legumes, pieces	Weight of 1000 pieces of grain, gr
1-version	10-15.04	10	37	9,4	36,0
2-version		14	36	9,0	35,3
3- version		18	30	8,0	35,0
4- version	20-25.04	10	43	10,7	38,1
5- version		14	40	10,2	36,6
6- version		18	35	9,0	35,7

7- version	1-5.05	10	52	13,5	40,9
8- version		14	50	13,0	39,5
9- version		18	42	11,6	38,4

The lack of biometric indicators in plants planted in the early period can be explained by the fact that *Crotalaria juncea* is a heat-loving plant and the temperature in these periods was insufficient.

Even when *Crotalaria juncea* was planted at different planting rates, the legumes and number of grains in legumes was studied and when sown at the rate of 10, 14, 18 kg per hectare on May, 1st, the number of legumes was 42-52 and the number of grains in legumes was 11.6-13.5. It was found that the number of grains in legumes and legumes decreased with increasing planting norms and high results were observed in *Crotalaria juncea* in low-planted varieties. It was found that with the increase of the sowing rate from 10 kg to 18 kg, the number of pods decreased by 10 units, and the number of grains in pods decreased by 1.9 units.

After the crop was fully ripe, 1000 grain weights were determined in all variants before harvesting. According to the data obtained, the weight of 1000 grains was 35.0-40.9 g according to the options, and with the early planting of the plant and the increase in the norms, a decrease in the weight of 1000 grains was observed.

The reason for the decrease in biometric indicators with the increase of planting norms is the decrease in nutrient area. This is due to the fact that both when sowing 10 kg per hectare and when sowing 18 kg per hectare, the same amount of mineral fertilizers, water and the same agro-technical measures were carried out.

The main task of agricultural research is to scientifically substantiate the impact of agro-technical measures and external factors on crop yields.

It should be noted that different effects of planting time and norms on plant growth, development, yield, and biometric performance were ultimately reflected in the grain yield of crotals.

Grain yields vary depending on cultivation technology, soil and climatic conditions. 450-900 kg per hectare in South Africa; 555-1000 kg in Colombia; In Hawaii, 1460-2240 kg of grain was harvested [5; 10].

Crotalaria juncea has a grain yield of 9.6-18.8 c/ha when sown at different planting times and rates, with a high yield of *Crotalaria juncea* observed in Option 8 (18.8 c/ha) with 14 kg of seeds per hectare on the 1st of May, at the same rate. 5.2 t/ha compared to variant 2 planted 20 days earlier; 1.9 c/ha compared to option 7, where 10 kg of seeds were sown per hectare; 18 kg of seeds per hectare were sown with an additional yield of 3.3 c/compared to variant 9 (Diagram 1).

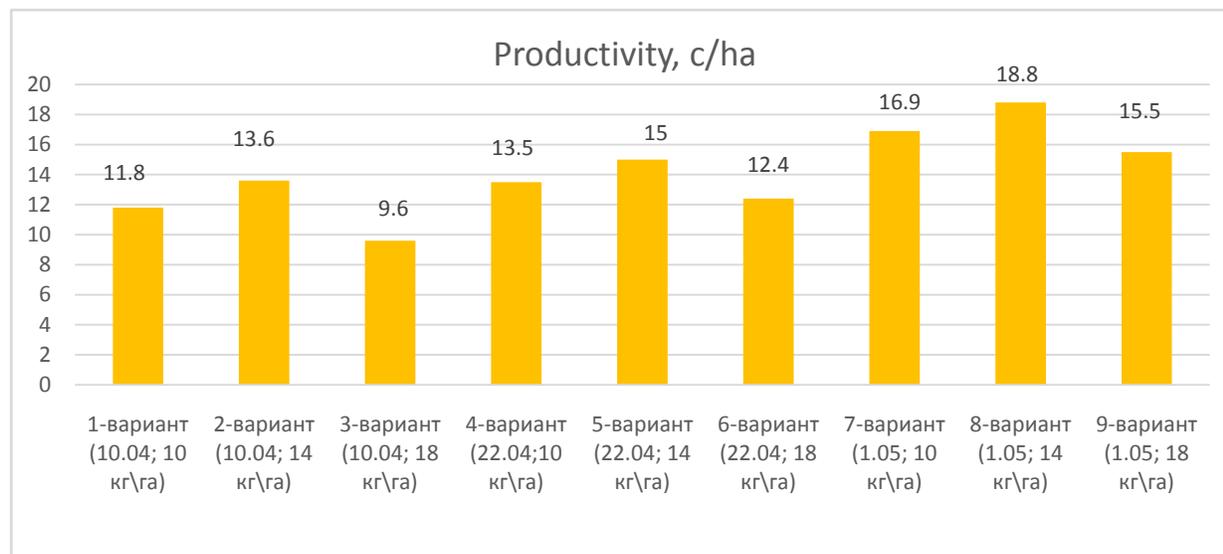

Diagram 1. Influence of sowing dates and norms on grain yield

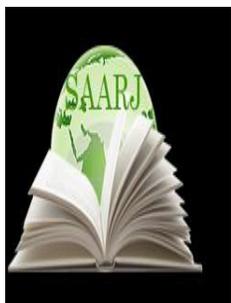

CONCLUSION

So, in the conditions of degraded meadow alluvial soils of Khorezm region, when planting *Crotalaria juncea* plant, sowing 10 kg per hectare in early May (1-5.05) is a guarantee to get a higher grain yield – 14 kg per hectare and high quality seed yield.

APPROACHES TO THE DEVELOPMENT OF INCLUSIVE COMPETENCE IN PREPARATION OF FUTURE TEACHERS FOR PROFESSIONAL ACTIVITY

Qayumova Dilsora Nuraliyevna*

*Basic Doctoral Student,
Uzbek Research Institute of Pedagogical Sciences named after T.N Qori Niyazi,
UZBEKISTAN

ABSTRACT

This article addresses one of the most important issues related to the active introduction of inclusive education, the training of teachers to work in an inclusive environment. Professional standard "Teacher (pedagogical activity in the field of preschool, primary, general secondary education) (educator, teacher)" related to pedagogical activity on design and implementation of educational process in preschool, primary, general secondary education generalized labor tasks are described.

KEYWORDS: *Individual Development Of Children, Activities In Inclusive Education, Individual Educational Needs, Professional Training Of Teachers, Competent, Poly-Paradigmatic, Person-Centered, Active, Variable, Acmeological, Axiological, Ontological, Systematic, Anthropological, Incidental, Interdisciplinary, Socio-Cultural, Cultural, Contextual Approaches.*

INTRODUCTION

The needs of inclusive education are also reflected in the professional standard in the form of psychological and pedagogical, including the need to master and use inclusive technologies. This is necessary to work with students with different contingents in a targeted and targeted manner, to develop and develop individualized educational programs for children, to know and understand what individual educational needs are related to.

There is no doubt that the training of teachers who are ready to implement the requirements of the professional standard requires new approaches to the organization of pedagogical training in all areas of vocational education, including in the field of professional development. This is evidenced by the survey conducted on March 24, 2016 at the Southern Federal University

(Rostov-on-Don) as part of the regional forum of principals of inclusive schools. Of the 105 principals surveyed in the Rostov region, 99% answered positively to the question about the need to train young teachers in activities aimed at educating children with disabilities and / or disabilities. Recommended options for such training include: additional education through certification, higher education, professional development courses, vocational retraining, and more.

We focus on higher education as a training of educators to operate in an inclusive education environment in our own interests.

At present, researchers prefer to resort to classical approaches, which allow to consider the process of organizing the professional training of teachers in the context of higher education. Among them, we distinguished competent, poly-paradigmatic, personality-oriented, active, variable, acmeological, axiological, ontological, systemic, anthropological, incidental, interdisciplinary, socio-cultural, cultural, contextual, and others.

The competent approach is currently being studied by scholars not only as the organizational basis of vocational training, but also as a methodological period in the development of the theory of vocational education. This is an “approach that recognizes that learning outcomes are important outside the education system”. It is aimed not only at deepening human knowledge and developing skills, but also at shaping a certain type of behavior, and the knowledge, skills and abilities acquired in it are practical, in our case, pedagogical activity.

A competent approach implies changes in the organization of the educational process in pedagogical education. The essence of the organization of the educational process is to create conditions for students to form an experience of independent solution of various professional tasks and problems that make up the content of education.

A competent approach means “a set of general principles for setting educational goals, choosing the content of education, organizing the educational process and evaluating learning outcomes” [4, p. 3].

According to scientists, “improving the training of university graduates on the basis of a competent approach is impossible without the introduction of innovative technologies that provide professional preparation, optimization of didactic goals and systematization of teaching materials, technologicalization of the pedagogical process in higher education. ... Competences only in the implementation of projects during student activities; when problem information is insufficient and in non-standard learning or real-world situations; it is manifested in the solution of tasks that require a combination of knowledge and experience, as well as the student's behavior and personal and other capabilities.». Thus, the resources of a competent approach in the course of our research define one of the important conceptual directions of designing a model of teacher training in the design of an inclusive educational environment.

In the field of education, there is now a “fully legitimate phenomenon” called polyparadigm. In the author's understanding, it is understood as a process of "historical birth, application and competitiveness of educational paradigms as different options for finding optimal forms of organization of educational processes in transitional cultural periods" [4, p. 49]. The author notes that “in the post-modern reconstruction period, the promotion of conflicting paradigmatic trends and models of education in Russia not only reveals the phenomenon of polyparadigm, but also

the need to build a unified educational environment and develop a common strategy for development. is becoming a process ”[5, p. 57].

Polyparadigmallik I.A. Kolesnikova, G.B. Kornetov, I.B.Nordman, O.G. Prikot, I.G. Fomicheva, E.A. It has been the subject of research by many famous scientists such as Hamburg and others. E.A. At the heart of the typology of pedagogical paradigms proposed by Yamburg is the principle of logical complementarity, arising from the rules of cognitive and private philosophy of education. I.A. Kolesnikova, G.B. Kornetov, O.G. Prikot and other scholars present polyparadigm as a form of coexistence of several methodological systems that form a coherent, complete model of the educational process through pedagogical theories, technologies, teaching and learning. In this regard, I.G. Fomicheva has an interesting idea. He argues that the existing universal paradigm as a single methodological framework can be replaced by many educational systems that have the right to co-exist in a common environment.

We I.B. We agree with Nordman that the main strategy for the development of education today is “the harmonization of educational paradigms”. We therefore view the polyparadigmatic approach as the theoretical basis for the design, organization and implementation of the teaching process in a high school setting.

S.B. According to Begaliev, a person-centered approach can be seen as a complex multidimensional process. According to the author, “the theoretical foundations of a person-centered approach apply to the teaching of students in all educational institutions, including high school”. K. Rodgers's Rules of Humanistic Psychology, L.S. Vygotskiy, P.Ya. Galperin, A.A. The ideas of the Leontevs, E.V. Bondarevskaya, V.V. Serikova, I.S. Yakiman’s concept of person-centered learning defined the general idea of a person-centered approach: “The procedural aspect of teaching is expressed in the change in motivation to acquire and apply knowledge in a person-centered environment. That is, the acquired knowledge should allow the student to apply them in practice by expressing their personality. In our opinion, a person-centered approach determines the professional training of teachers in the field of inclusive education to develop the spiritual qualities of the individual, his emotional, aesthetic, creative abilities and potential, which will serve as a basis for the formation of future humanistic pedagogical positions.

The active approach in all its partially transformed forms (project-activity, personal-activity, reflexive-activity, system-activity, etc.) is aimed at organizing the process of professional training of inclusive education teacher in such a way that he is an active subject of learning, work and communication. he understands and implements the set goals, monitors and tracks the process of personal professional development, analyzes and critically evaluates the results of his activities.

The alternative approach is viewed, on the one hand, as an “emergency socio-pedagogical phenomenon manifested in the form of a negative response of society and education to new socio-economic and psychological conditions,” and, on the other hand, is seen as a mechanism for shaping its flexibility and professional mobility.

Acmeological approach, S.P. According to Begaliev, "it implies a new paradigm in improving the training of future professionals." Its use in the organization of the process of professional training of teachers for an inclusive school involves taking into account the important pedagogical conditions of motivation and needs for achieving high results of personal

professional development, striving for creative activity, realization of personal intellectual and creative potential.

The axiological approach is an integral part of the humanistic pedagogical tradition. According to him, man is "the highest value of society and the only goal of social development." Under this approach, the future educator of inclusive education is a holistic individual who is ready to accept students with special educational needs, who belong to a different type of thinking and who have an inclusive pedagogical culture as the owner of valuable qualities. The axiological approach, which is considered as the main goal of our study, is a key link in the set of methodological approaches that determine the characteristics of professional training of teachers in the higher education system.

The ontological approach studies pedagogical processes from the perspective of their participants-subjects. Under this approach, the system of training future educators leads to the emergence of a subjective opinion that determines their attitude to the world, people and themselves in a broad inclusion. This creates the conditions for the formation of a person with a unique outlook, and such a person is in an ontological reality situation, which includes the subject itself, the subject environment and living conditions, which are characteristic of an inclusive society.

The systematic approach explores the importance of professional training of teachers to work in an inclusive education environment as an integrated system of elements designed to form the personal and professional qualities of teachers willing to work in diverse and diverse inclusive education institutions.

The anthropological approach allows to determine the amount of "humanity in man ...", "to look at man as the main goal and the highest value" [2. 62 p.] Serves as a basis for the formation of humanistic pedagogical thinking and value attitude towards each child, including students who are developing as individuals with special educational needs.

We consider the incidental approach as a basis for the implementation of meaningful and procedural reforms in the training of teachers in higher education. The peculiarity of this approach is that its etymology does not have the same meaning. On the one hand, it may be based on a specially organized phenomenon that models the conditions necessary for the formation of this or that professional quality. On the other hand, it may be based on the phenomenon of daily coexistence in an environment that does not involve the implementation of a specific plan, order, or project proposed by someone outside, but can be a guarantee of the life activities the student aspires to. In the course of our study, we focus on the third option of understanding the eventual approach. It combines deliberately organized events that naturally take place in the eventful environment of student life.

The interdisciplinary approach serves as the basis for a holistic understanding and perception of the surrounding being. In the framework of our research, an interdisciplinary approach is implemented in the design of curriculum materials for the basic education program in terms of understanding inclusion in terms of diversity by involving data from all disciplines in the field of research in this emergency.

The socio-cultural approach is based on the rule that human nature is determined by a set of biological, social and cultural factors and is manifested in the process of interaction with society

and all its various aspects. In this regard, based on the methodological area of the socio-cultural approach, we supplement the content of professional training so that the future teacher of an inclusive education system can feel like part of an updated, inclusive system of community values.

The cultural approach is very close in content to the socio-cultural approach, but it reflects the leading role of culture in the education of the individual. RFA academician E.V. Bondarevskaya's personality-oriented cultural concept is a clear proof of this.

The phenomenon of creating culture is based on the creation of a special environment for cultural exchange in the educational process of higher education, which implies the possibility of "growing" individual cultural values. The use of a cultural approach as a methodological basis for the formation of a system of teacher training in inclusive education is achieved by creating pedagogical conditions that support the cultural and creative goals of students, where the process of formation of a future teacher focused on the values of inclusive pedagogical culture.

Fundamentals of a contextual (thematic) approach A.A. Developed by Verbitsky, it is one of the crucial components of planning and organizing the educational process in high school. M.N. According to Shvetsova, contextual teaching "allows students to feel that science is relevant to a particular field, which serves as a tool for them to achieve their chosen professions". In order to sustainably develop students' learning and inclusive competencies, we rely on the basic principles of a contextual approach, creating a situation for them to "dive" into a career-oriented environment.

We have reviewed all of the approaches listed above and tried to assess the possibilities and options for using them as methodological foundations for professional training for educators to operate in an inclusive education environment. Each of them, in isolation, in our opinion, has great potential in specific aspects of the training of an inclusive school educator, which can be covered in detail only in the context of a separate fundamental research. For this reason, despite the large number of methodological bases for professional training of teachers to work in an inclusive education environment, we have identified the following basic approaches that underlie the development of a model of professional training for teachers to design an inclusive education environment: axiological, cultural, competent, personal and event. We will try to comment on our choice.

The axiological approach defines the content aspects of professional training aimed at forming a valuable core of the future educator's personality. Knowing, understanding and accepting the values of an inclusive society, forming a personal inclusive worldview, following the principles of inclusion in practice are the main results of using an axiological approach in preparing educators to work in an inclusive education environment. At the same time, based on the values of inclusion in general, we study this approach as the basis for the formation of an inclusive culture of the educator, which allowed us to apply the cultural approach later.

The socio-cultural approach is based on the rule that human nature is determined by a set of biological, social and cultural factors and is manifested in the process of interaction with society and all its various aspects. In this regard, based on the methodological area of the socio-cultural approach, we supplement the content of professional training so that the future teacher of an inclusive education system can feel like part of an updated, inclusive system of community values.

The cultural approach is very close in content to the socio-cultural approach, but it reflects the leading role of culture in the education of the individual. RFA academician E.V. Bondarevskaya's personality-oriented cultural concept is a clear proof of this.

The phenomenon of creating culture is based on the creation of a special environment for cultural exchange in the educational process of higher education, which implies the possibility of "growing" individual cultural values. ABSTRACT

This article examines the use of modern management methods to improve the efficiency of management at textile enterprises, and based on the use of improved models, proposals for improving the technology of managing innovative development at the enterprise are developed.

KEYWORDS: *Enterprise, Management Efficiency, Innovative Development, Management Technologies.*

INTRODUCTION

In order to adapt to a highly changing market economy, every industrial enterprise will need to make effective use of all available resources and opportunities. Improving the production efficiency of many textile enterprises operating in the Republic of Uzbekistan depends not only on the effective use of existing opportunities, but also on the organization of management of production processes on the basis of advanced models used in world practice. Therefore, an objective assessment of the effectiveness of enterprise management through a comprehensive study is one of the important factors in further improving the economic situation in the country. The third direction of the "Action Strategy for the five priority areas of further development of the Republic of Uzbekistan in 2017-2021" set by President Sh. Mirziyoyev is called "Strategic directions to increase the competitiveness of the national economy on the basis of modernization" [1]. Therefore, the use of modern management methods in ensuring the innovative development of textile enterprises, which are one of the key sectors of the economy of the republic, is gaining importance.

Analysis of the relevant literature.

The results of the analysis show that there are many sources in the economic literature and practice that deal with the problems of identifying, analyzing, and enhancing production efficiency. In this regard, the use of certain indicators in the practice of enterprises is established. Isaev R.A. The study of the development of textile clusters in the Republic of Uzbekistan focuses on strategic management [2]. This author studied the issues of improving the organizational and management mechanisms for the implementation of development strategies of textile enterprises in the integrated system of quality management and strategic management in the textile industry of the Republic of Uzbekistan [3].

Improving management efficiency in industrial enterprises, especially in the textile industry, is of great importance today. Therefore, the use of improved models in the search for opportunities to increase management efficiency is important.

The EFQM Excellence Model, a business improvement model developed by the European Foundation for Quality Management, has been in existence for more than 13 years since the early 1990s and is a generalized model of an ideal management system for organizations focused on sustainable development and competitiveness. The model is based on a philosophy of overall management quality and production quality, and is based on a systematic approach to management that takes into account the interests of all stakeholders in the organization. Since 1992, based on the EFQM model, competitions on management systems of various organizations have been held in many European countries [5,6]. The use of the EFQM model involves researching and measuring enterprise management capacity, evaluating the system performance of any organization, including model management, which can help in the implementation of so-called “self-assessment” work. However, in any competition, including the main European EFQM European Award, self-esteem is often overlooked. Competitive assessment is taken outwardly, while “self-assessment” is essentially an independent study of the enterprise management system by their managers. When the improvement model was presented in Europe as a European quality award model, it immediately went beyond the ‘quality’ competition, and these organizations began to be seen as a tool to assess their level of development relative to benchmarks, identify strengths of management systems and identify areas for improvement. .

The use of the EFQM model involves researching and measuring enterprise management capacity, evaluating the system performance of any organization, including model management, which can help in the implementation of so-called “self-assessment” work.

Research methodology

The research methodology is a dialectical method, and methods such as selective observation, comparison, and expert evaluation were used in the research process.

Analysis and results

We will look at a number of features that make it appropriate to use a ‘business model’ to manage an enterprise’s innovative self-development. According to G. Chesbro, the business model has the following features [7]:

1. Creating the essence of value proposition, i.e. the value that proposition creates for users based on this technology.

2. Identify the market segment, i.e. identify the users to whom this technology is useful and the purpose for which it is to be used.
3. Identify the composition of the enterprise value chain required to create and distribute the offer and the additional assets required to support the enterprise's position in that chain.
4. Identify the mechanism (s) of earnings for the enterprise and evaluate the composition of costs and target gross profit when using the offer, taking into account the options of the proposed value proposition and the structure of the value chain.
5. Describe the company's position in the value chain that connects suppliers and customers, including identifying potential additional participating firms and competitors.

In the task of technologicalization of solutions in the management of innovative self-development of the textile enterprise, it is necessary to determine the overall algorithm of such a solution that meets the requirements of objectivity, consistency, strategy and speed of implementation. Objectivity requirements can be achieved using the EFQM model.

Self-assessment processes can be implemented in a variety of ways. There are several ways to conduct a self-assessment. The choice of a particular method depends on the influence of a number of factors - the size of the enterprise, resources, areas of activity, organizational culture, etc., primarily on the objectives of self-assessment. The methods are not completely independent and can be used in conjunction with each other.

The most complex and labor-intensive method is the imitation method of participation in the competition. The method requires a lot of time resources, the involvement of specially trained specialists, but it is a precise method.

A method of imitation of participation in a competition. The method is based on self-assessment to prepare a bidder's report in the prescribed form, including the areas of activity and results for all components of the model, described in accordance with their content. The preparation of such a report involves a great deal of organizational work, with particular emphasis on designing a self-assessment process that includes the distribution of responsibilities and authority among employees to gather information on criteria. In this case, the criteria should cover the indirect activities of the textile enterprise from different angles, rather than the activities of individual departments. Thus, the effectiveness of self-assessment is strongly dependent on a properly chosen approach to shaping the self-assessment process, which requires the specific knowledge and skills of its participants. There will be concerns about the accuracy of the evaluation results and the consequent wrong decisions. At the same time, the method of imitation can serve as a basis for the formation of a reflexive-creative management mechanism in competition.

Proforma. A proforma is a special form designed to facilitate self-assessment based on evaluation criteria and areas. When a textile enterprise prepares a report in accordance with the established requirements, the method is closest to the method of self-assessment in award competitions. The difference is that it significantly reduces the time required to prepare a report, as well as includes evaluation elements in the form of an analysis of strengths and weaknesses, similar to the SWOT-analysis matrix. Completing the proshalk requires a significant understanding of the evaluation model, which is its undoubted advantage. Depending on the purpose of the self-assessment, enterprises use different modifications of the plans.

Matrix. The method of using a matrix (building tables) is one of the most common methods. It has various improved forms. The method involves the development of a special achievement chart of a textile enterprise based on an award model. The table contains a number of statements

about the achievements of the textile enterprise, which will be presented in ascending order of importance on the selected scale. The preparation of the table is carried out before the self-assessment and by professionals who are well acquainted with the award model and the actual state of affairs in the textile enterprise. In the self-assessment, individuals, based on the data in the table, record the achievements of the textile enterprise at the scale levels and express their mutual agreement with the level formulas given in the table.

Survey. Questionnaire is basically a type of matrix method. The method of conducting a self-assessment using a questionnaire requires a lot of initial preparation related to the preparation, distribution and processing of questionnaires. The questionnaires are developed based on the structural criteria and evaluation directions of the award model. Typically, the process of developing a survey includes: determining the form and content of the application to the participant in the survey process; choose the type of questions; formulation of questions; developing a questionnaire form. A typical example of an open questionnaire is a questionnaire to assess the criteria of the group "Opportunities" in the diagnostic model of T. Konti [8]. In assessing these criteria, there may be significant differences in the perception of activity by the 'internal supplier' and the 'internal consumer', which requires additional attention.

The strategy can be used to periodically implement the consistency requirement, consistently apply prepared expert evaluation procedures, and synthesize the results of the implementation of decisions made. The demand for speed is met, for example, by the technology and possible automation of expert evaluation procedures performed using an electronic software package. Many researchers and practitioners point out that the top management of textile enterprises understand the importance of self-assessment in developing objective criteria for performance, but this is not always the case in effective solutions.

It only makes sense to master the self-assessment and conduct it regularly when it becomes a necessary condition for the textile enterprise to activate its innovative self-development. In this case, self-assessment is carried out on a regular basis, which allows the enterprise to identify development trends and make adequate and timely strategic decisions, on the other hand, the results of self-assessment will be the basis for formulating annual action plans to improve performance.

The main reasons for this situation are that the management and staff of the textile enterprise are not sufficiently prepared in terms of the methodology of applying the models. While the main purpose of self-assessment is to participate in competitions and receive awards, there is no continuous process of performance improvement based on self-assessment. The algorithm shown in Figure 1 aims to overcome these shortcomings. The object of research was selected several enterprises that are part of the Association "Uztextile Industry", and the calculations were carried out on the example of "SANAM" Limited Liability Company (LLC).

This enterprise is one of the leading textile enterprises in the Republic of Uzbekistan. In this textile enterprise, the self-assessment method for enterprises based on the improved EFQM-model developed by us was applied in 2020. Within the framework of the EFQM-model, the use of the method of self-assessment in the search for unused internal opportunities in the textile enterprise was implemented.

Reporting on Form № (Report F.№1) involves recording the status of “Anyway” work in a textile enterprise, which in fact corresponds to the act of “self-determination” of managers (Figure 1).

№Report on Form 1. Based on the main processes of reflection of this meeting, the main meta-processes of reflexive-creative activity in management are formed. It all starts with a general idea of the development of a textile enterprise and the identification of the main results it wants to achieve. Thus, the beginnings of defining a reflexive position are: the strategic goals and strategy of the enterprise; the position of managers on the EFQM model as an enterprise development model and a systematic basis for demonstrating all activities in the enterprise.

The approaches used by management today emerge at the intersection of three vectors: the results vector as a result of the approaches applied in a particular field of activity; a vector for assessing the state of affairs in strictly defined areas of activity determined by the criteria of the model; a vector of requirements to describe activities in a particular field, defined by methodological requirements to represent a particular topic.

The most difficult part of starting to apply the EFQM model is to take an appropriate reflexive position to “correct” the situation in this enterprise. This requires a clear understanding of the basic concept of the EFQM model - the ‘Approach’.

Form №2 reporting (F.№2-report) is done during the self-assessment process and is aimed at identifying a list of areas for improvement. Each of these areas will be reviewed and given priority. The most important directions (priorities) form a group of important factors (GOIF) for achieving strategic goals. This activity corresponds to the act of ‘self-regulation’. The report form №2 can be a priority list of project ideas that form the basis for the initial cycle. №2 report form can be a list of project ideas that are distributed according to their importance in laying the foundation for the start cycle.

The report on Form №3 (F.№3- report) can be considered as the result of the initial cycle. Project priority ideas include pre-project research, the development of a project concept, the decision to open a project and include it in the company’s development project portfolio. The list of project concepts that form the basis of the project portfolio defines the structure of Report 3.

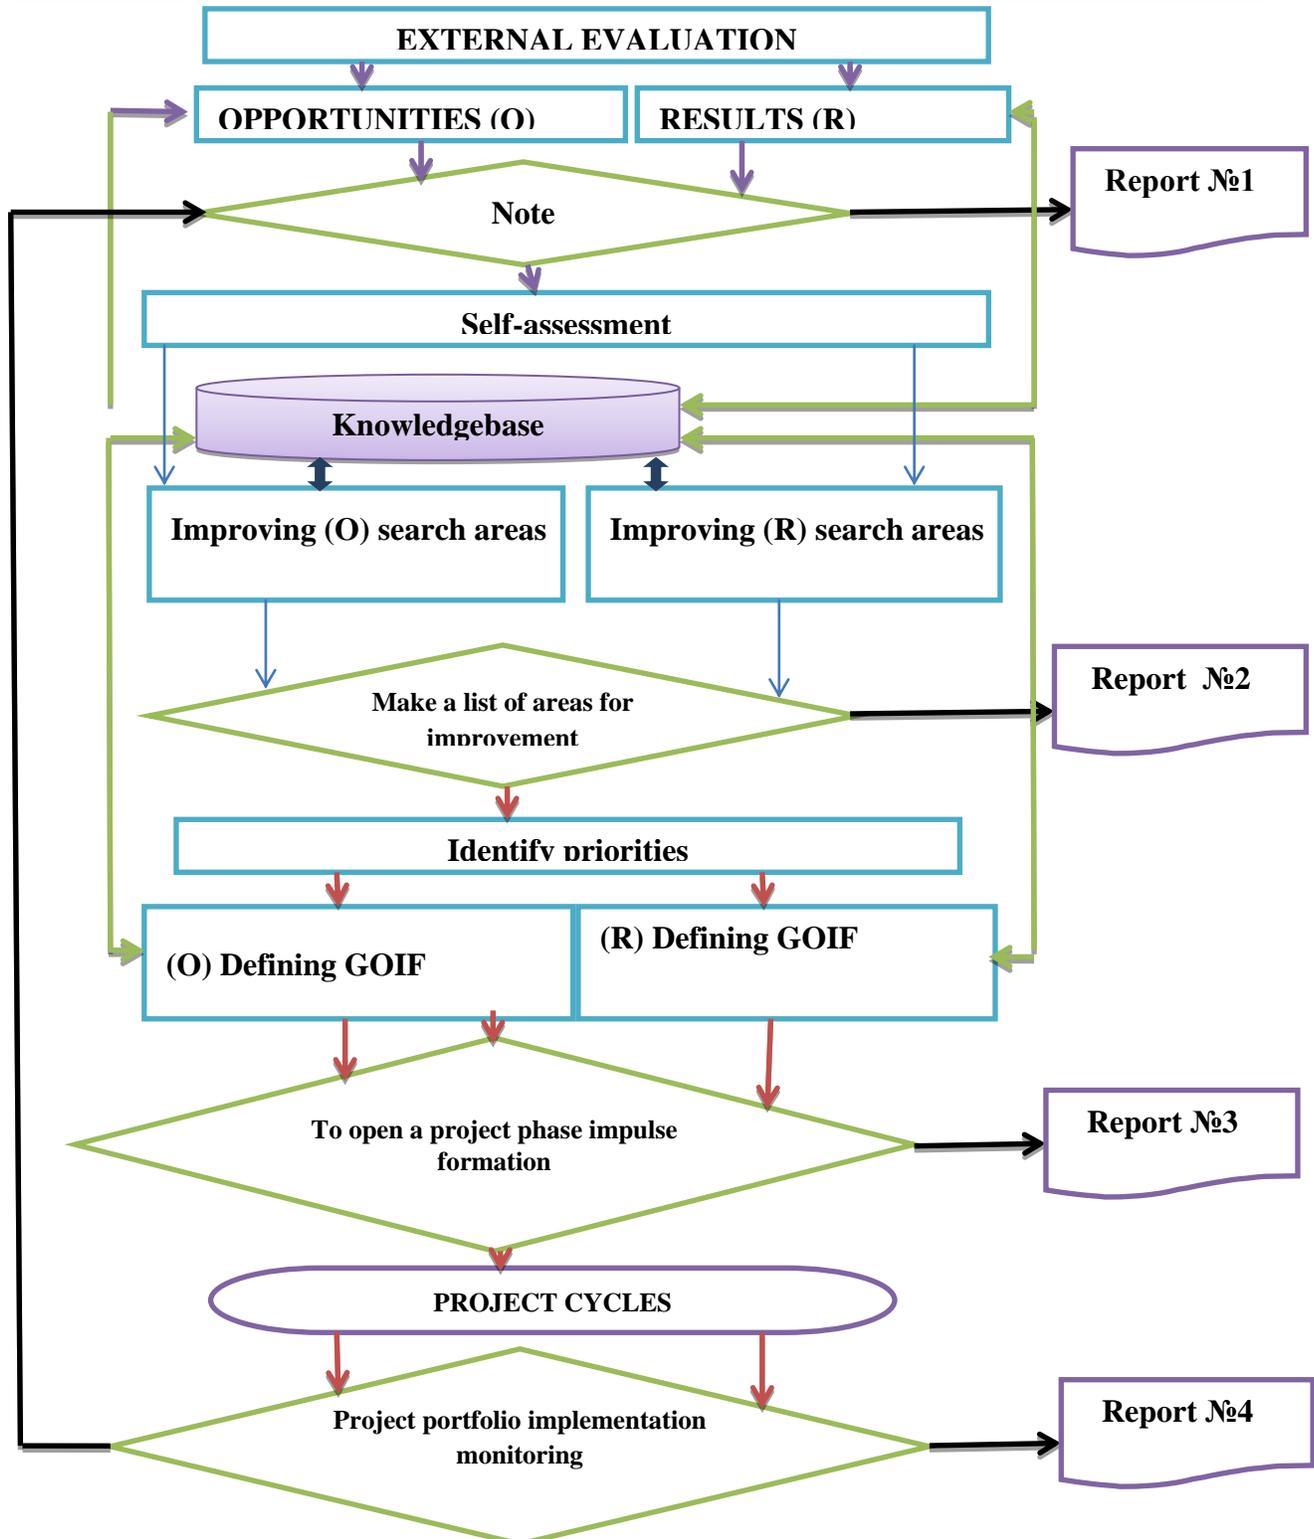

Figure 1. Algorithm for making decisions on innovative self-development of the textile enterprise (author's development)

№The report in Form 4 refers to the results of monitoring the portfolio of development projects. Depending on the project management practice in the textile enterprise, the report may take various forms, reflecting the characteristics of the development project portfolio, its monitoring and presentation of results. From the point of view of the general methodological approach, this cycle corresponds to the act of “self-transformation” of a textile enterprise, renewal or renewal of its business model.

The implementation of self-assessment in the limited liability company "SANAM" allowed to find directions for improving a number of business processes in its activities. The next step was to identify priorities for improving the activities of the textile enterprise. The self-assessment process should identify areas of activity that can be improved, from issues that require strategic solutions to specific tasks that can be addressed quickly. In this regard, there is a need to identify areas where the development of the textile industry plays the most important role. A more in-depth analysis of the results was carried out in order to improve the quality of activities in the textile enterprise, to identify important priorities for further increase its efficiency.

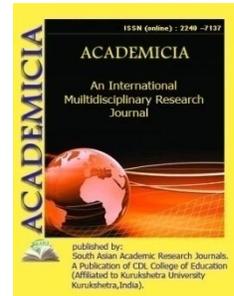

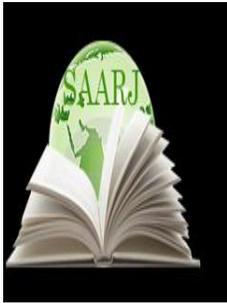

CONCLUSIONS AND SUGGESTIONS

Thus, the proposed algorithm provides a general view on the management of innovative self-development of the textile enterprise, the accumulation of existing experience and "best practices" of enterprises, the organization of work to take into account periodic changes in all components of the model, as well as knowledge base expert groups allows you to customize based on. All this allows to overcome the negative impact of the factors inherent in the self-assessment methodology associated with the difficulties of choosing a model that meets the needs of the company and the diversity of indicators that do not make it difficult to interpret the observations individually. allows to increase efficiency, provides flexibility in today's rapidly changing market economy, creates conditions for the application of cost-effective technologies in the production process.

ABSTRACT

This article examines the effectiveness of the use of modern management tools in the implementation of an integrated system of quality management and strategic management in the textile enterprises of the Republic of Uzbekistan.

KEYWORDS: *Quality Management, Strategic Management, Innovation, Management Quality, Development, Efficiency, Effectiveness, Modern Management Support, Self-Evaluation.*

INTRODUCTION

From the first years of independence in the Republic of Uzbekistan, economic reforms in all sectors of the economy, including the cotton sector, are aimed at further deepening. Great attention is paid to economic policy in this area, the implementation of structural changes in the production of the industry, ensuring the freedom of producers, the introduction of various forms of ownership and improving the logistics, financial and economic relations between farms,

organizations and enterprises. Improving the work of enterprises, giving them freedom, improving their management system will allow them to produce better quality products, resulting in increased production efficiency. There is a growing need in Uzbekistan to increase the production of high value-added export-oriented finished products based on deep processing of raw cotton. Successful implementation of such huge tasks requires the development of concrete measures to ensure more rational use of unused internal potential based on the use of modern management tools in the textile enterprises, which are one of the leading sectors of the economy. In this regard, the development of science-based proposals and recommendations to increase the application of advanced models in the management of innovative self-development of textile enterprises is one of the most pressing issues today.

Analysis of the relevant literature

The results of the analysis show that there are many sources in the economic literature and practice that deal with the problems of identifying, analyzing, and enhancing production efficiency. In this regard, the use of certain indicators in the practice of enterprises is also established. Isaev R.A. The study of the development of textile clusters in the Republic of Uzbekistan focuses on strategic management [1] and the improvement of organizational and management mechanisms for the implementation of an integrated systemic strategy in the textile industry [2]. Yusupov S.Sh. and the main directions of the development strategy of textile enterprises [3]. However, the systematization of the sources studied has led to the conclusion that many authors have only considered some aspects of management effectiveness. Xakimov G'.Q. and the application of an improved model in improving the effectiveness of quality management in the higher education institution of the Republic of Uzbekistan [3]. Improving management efficiency in industrial enterprises, especially textile enterprises, is of great importance today. Therefore, the use of improved models is important in finding opportunities to improve management efficiency.

The EFQM Excellence Model, a business improvement model developed by the European Foundation for Quality Management, has been in existence for more than 13 years since the early 1990s and is a generalized model of an ideal management system for organizations focused on sustainable development and competitiveness [4]. The model is based on a philosophy of overall management quality and production quality and is based on a systematic approach to management that takes into account the interests of all stakeholders in the organization. Since 1992, based on the EFQM model, competitions on management systems of various organizations have been held in many European countries [5,6]. The use of the EFQM model involves researching and measuring enterprise management capacity, evaluating the system performance of any organization, including model management, which can help in the implementation of so-called "self-assessment" work. However, in any competition, including the main European EFQM European Award, self-esteem is often overlooked. Competitive assessment is taken outwardly, while "self-assessment" is essentially an independent study of the enterprise management system by their managers. When the improvement model was presented in Europe as a European quality award model, it immediately went beyond the best "quality" competition, and these organizations began to be perceived as a tool to assess their level of development relative to benchmarking, identify strengths of management systems, and identify areas for improvement [7].

In 1997, the European Foundation for Quality Management proposed a simplified EFQM model for small businesses. Most (but not all) representatives of small and medium enterprises believe that simplified criteria make self-assessment more understandable and therefore more accurate. Indeed, it is very difficult for small companies, for example, to evaluate on the “2b” indicator. Policies and strategies are developed based on measurement, research, and data from cognitive and creative activities, which is inconvenient for them. However, although the model is evolving and slightly modified, skills to work with it have also been developed, new opportunities have emerged for its use, and many organizations have realized that this tool can be effective in improving business by sharing experiences based on benchmarking and learning best management practices. In 1999, a significant revision of the model was made and the word “business” was removed from its name (until 1999, the model was called the “EFQM Business Excellence Model”). This is primarily due to the fact that many NGOs have also seen the EFQM model as a tool for improvement and have used it successfully to improve management quality.

Research methodology

The research methodology is a method of dialectics, and in the research process such methods as experimental, selective observation, comparison, expert evaluation were used.

Analysis and results

We will consider a number of features that make it appropriate to use a ‘business model’ to manage an enterprise’s innovative self-development. According to G. Chesbro, the business model has the following features [8]:

1. Creating the essence of value proposition, i.e. the value that proposition creates for users based on this technology.
2. Identify the market segment, i.e. identify the users to whom this technology is useful and the purpose for which it is to be used.
3. Identify the content of the enterprise value chain required to create and distribute the offer and the additional assets required to support the enterprise’s position in that chain.
4. Identify the mechanism (s) of earnings for the enterprise and evaluate the composition of costs and target gross profit when using the offer, taking into account the options of the selected value proposition and the structure of the value chain.
5. Describe the company’s position in the value chain that connects suppliers and customers, including identifying potential additional participating firms and competitors.

In the task of technologicalization of solutions in the management of innovative self-development of the textile enterprise, it is necessary to determine the overall algorithm of such a solution that meets the requirements of objectivity, consistency, strategy and speed of implementation. Objectivity requirements can be achieved using the EFQM model. These are different areas of activity, forms of ownership and size of textile enterprises. According to a Financial Times survey, the EFQM model is used by 60% of the largest companies in the EU, including Siemens, Bosch, Nokia, Volvo, Yellow Pages, TNT and many other recognized world leaders.

The strategy can be used to periodically implement the consistency requirement, consistently apply trained expert evaluation procedures, and synthesize the results of the implementation of decisions made. The demand for speed is met, for example, by the technology and possible automation of expert evaluation procedures performed using an electronic software package. Many researchers and practitioners point out that the top management of textile enterprises understand the importance of self-assessment in developing objective criteria for performance, but this is not always the case in effective solutions. The main reasons for this situation are that the management and staff of the textile enterprise are not sufficiently prepared in terms of the methodology of applying the models.

The object of research was selected textile enterprises that are part of the Association "Uztextile Industry". In these selected enterprises, a self-assessment method was applied in 2020 to implement a quality management system (QMS) for enterprises based on the improved EFQM-model developed by us.

In the first phase of this process, the following preparatory work was carried out: the Quality Council was established; developed the Regulation on self-assessment of the enterprise; an action plan for the implementation of SMT at the enterprise; a working group was formed to conduct a self-assessment, consisting of heads of different levels and divisions of the enterprise, competent specialists (external experts) working in the relevant departments; the materials we provided were taken as a basis in the selection of the self-assessment model and methods; the identification of those responsible for conducting the self-assessment in accordance with the various criteria was carried out, and the persons responsible for each criterion and sub-criteria were identified; In order to learn about the procedure and methods of self-assessment of team members and employees of the enterprise, we organized seminars and trainings.

In the second - main stage of the event, a self-assessment was conducted to study the activities of all departments and structural units of the textile enterprise. Based on the analysis of the activities of textile enterprises operating in the country, we have developed an improved EFQM-model, which corresponds to it and can be used in all industrial enterprises of the country.

In the third and final stage of the event, the results were analyzed and based on the results, measures were taken to further improve the level of excellence of the textile enterprise and to develop measures based on the results of the main areas of further improvement of the enterprise. The results of the scores evaluated by the experts were processed and the results obtained were summarized.

The results of the analysis show that due to the implementation of a number of measures in this textile enterprise, the criteria of its "Opportunities" and "Results" groups had approximately equal overall scores: 311 and 303 points, respectively. Based on the values of the model criteria "levels of excellence" using the RADAR method, the initial state of SMT in the textile enterprise and its improvement are nine criteria: "Leadership", "Policy and Strategy", "Human Resources", "Resources and Partners", "Process Management", "Results for Consumers", "Results for Employees", "Results for the Company", "Basic Results of Activities".

Self-assessment of the activities of such textile enterprises was carried out at the following textile enterprises operating in the country: "Sanam" Llc, "Bek Mega Textile" Llc, "Best Color Textile" Llc, "Cotton Textile" Llc, Full Cotton Llc Betlis Tekstil "Llc.

The implementation of self-assessment in the limited liability company "SANAM" allowed to find directions for improving a number of business processes in its activities. The next step was to identify priorities for improving the activities of the textile enterprise. The self-assessment process should identify areas of activity that can be improved, from issues that require strategic solutions to specific tasks that can be addressed quickly. In this regard, there is a need to identify areas where the development of the textile industry plays the most important role.

In order to improve the quality of activities in the textile enterprise, to identify important priorities for further increase its efficiency, a more in-depth analysis of the results was carried out. The results are presented in Table 1.

TABLE 1 ANALYSIS OF THE RESULTS OF SELF-ASSESSMENT IN A LIMITED LIABILITY COMPANY "SANAM"

№	Criteria for self-assessment	The normative level of the criterion	The actual level of the criterion	Differences
1	The leadership role of leadership	10,0	7,1	- 2,9
2	Policy and strategy	10,0	6,2	- 3,8
3	Personnel management	10,0	5,6	- 4,4
4	Resources and partners	10,0	5,4	- 4,3
5	Process management	10,0	6,4	- 3,6
6	Results for consumers	10,0	6,3	- 3,9
7	Results for employees	10,0	4,8	- 5,2
8	Results for the company	10,0	6,7	- 3,3
9	Baseline results of activities	10,0	7,3	- 2,7

Source: Author's calculations.

The data in Table 1 show that the untapped opportunities and unfulfilled results in improving the quality of activities, further improving the efficiency of SANAM LLC in the following areas (criteria): In the "Capacity" direction - "Resources and partners", "Process management", "Personnel management", the lack of capacity in these criteria did not ensure the achievement of the desired goal of performance in the following "Results": "Results for employees", "Results for Consumers".

Therefore, the management and staff of SANAM LLC will have to develop and implement an action plan in these areas in the future.

CONCLUSIONS AND SUGGESTIONS.

The strategic priorities for the development of the textile industry are:

- Improving product quality and expanding the range;
- transition to innovative development;
- diversification of funding sources;
- development of material and technical base;
- Improving enterprise management.

In addition, in accordance with our proposals, the priorities of the policy of the textile enterprise in the field of improving the efficiency and quality of management were identified, which are:

- formation of a quality management system for production activities on the basis of legal requirements and generally accepted standards;
- development of human resource potential of the enterprise;
- Introduction of a quality monitoring system for training specialists using modern information technologies;
- Continuous improvement of the production process, taking into account the needs and desires of suppliers, employees, society and the state;
- Improving the competitiveness of the enterprise in regional, national and international markets of textile products;
- Strengthening the material and technical base of the textile enterprise.
- effective use of business models in order to improve the management of innovative self-development.

Review Process

Each research paper/article submitted to the journal is subject to the following reviewing process:

1. Each research paper/article will be initially evaluated by the editor to check the quality of the research article for the journal. The editor may make use of iThenticate/Viper software to examine the originality of research articles received.
2. The articles passed through screening at this level will be forwarded to two referees for blind peer review.
3. At this stage, two referees will carefully review the research article, each of whom will make a recommendation to publish the article in its present form/modify/reject.
4. The review process may take one/two months.
5. In case of acceptance of the article, journal reserves the right of making amendments in the final draft of the research paper to suit the journal's standard and requirement.
