ACADEMICIA

An International Multidisciplinary Research Journal

ISSN (online) : 2249 –7137

Editor-in-Chief : Dr. B.S. Rai

Impact Factor : SJIF 2021 = 7.492

Frequency : Monthly

Country : India

Language : English

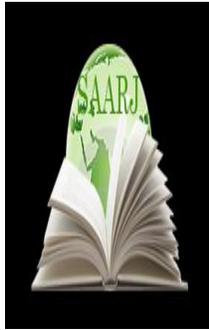

Start Year : 2011

Indexed/ Abstracted : Scientific Journal Impact Factor (SJIF2020 - 7.13), Google Scholar, CNKI Scholar, EBSCO Discovery, Summon (ProQuest), Primo and Primo Central, I2OR, ESJI, IJIF, DRJI, Indian Science and ISRA-JIF and Global Impact Factor 2019 - 0.682

E-mail id: saarjournal@gmail.com

VISION

The vision of the journals is to provide an academic platform to scholars all over the world to publish their novel, original, empirical and high quality research work. It propose to encourage research relating to latest trends and practices in international business, finance, banking, service marketing, human resource management, corporate governance, social responsibility and emerging paradigms in allied areas of management including social sciences , education and information & technology. It intends to reach the researcher's with plethora of knowledge to generate a pool of research content and propose problem solving models to address the current and emerging issues at the national and international level. Further, it aims to share and disseminate the empirical research findings with academia, industry, policy makers, and consultants with an approach to incorporate the research recommendations for the benefit of one and all.

ACADEMICIA

An International Multidisciplinary Research Journal

(Double Blind Refereed & Peer Reviewed International Journal)

SR. NO.	PARTICULAR	PAGE NO.	DOI NUMBER
1.	ASANAS AND POSTURES IN YOGA AND IMPACT ON PHYSICAL GROWTH AND HEALTH Dr. Anjana Lohan	1-8	10.5958/2249-7137.2021.02052.8
2.	COMPARATIVE ANALYSIS OF NEMATOLOGICAL SITUATION IN UCHKIZIL AND SOUTH SURKHAN RESERVOIRS Rakhmatullaev Bahodir Amanovich, Bekmurodov Abdujabbor Sattarovich	9-15	10.5958/2249-7137.2021.02053.X
3.	HARD REALISTIC INTERPRETATION OF SOCIETY AND SPIRITUAL AND MORAL SUNSET (ON THE EXAMPLE OF SHUKUR KHOLMIRZAEV'S NOVEL "OLABODZHI") Kochkarova Markhabo Khudoyberganovna	16-21	10.5958/2249-7137.2021.02054.1
4.	DEVELOPMENT OF STUDENT ARTISTIC THINKING IN THE TEACHING OF LITERATURE WITH SOCIAL SCIENCES IN HORIZONTAL(SYNCHRONIC), VERTICAL (ASYNCHRONIC) FORM, METHOD AND MEANS Mahmudov Yusup Ganievich, Toshpulatov Akmal Kholmiraevich	22-27	10.5958/2249-7137.2021.02055.3
5.	ROLE AND MEANING OF THE ROLE-PLAYING METHOD IN ENGLISH TEACHING Sevara Dusmuratovna Jumaeva	28-33	10.5958/2249-7137.2021.02056.5
6.	FAMILY TRADITIONS IN VOCATIONAL GUIDANCE, A GUARANTEE OF PREPARING YOUNG PEOPLE FOR INDEPENDENT LIVING Fotima Islomova, Fazilat Fayozova	34-38	10.5958/2249-7137.2021.02057.7
7.	THE ROLE OF GAMING TECHNOLOGIES IN TEACHING STUDENTS AT THE MIDDLE STAGE Rizayeva Zarnigor Ikramovna	39-43	10.5958/2249-7137.2021.02058.9
8.	METHODOLOGICAL PRINCIPLES OF DEVELOPING SPEAKING SKILLS AT DIFFERENT LEVELS OF TEACHING FOREIGN LANGUAGES Stepanyan Albina Anatolyevna	44-49	10.5958/2249-7137.2021.02059.0

9.	TERMINATION OF EMPLOYMENT AGREEMENT DUE TO LACK OF PROFESSIONAL QUALIFICATIONS M.R. Toshov	50-54	10.5958/2249-7137.2021.02059.0
10.	INSTABILITY SURVEY OF BASALTIC SOIL SLOPES IN MAHARASHTRA, INDIA Dr. Alpana Joshi, Dr. Sandeep Kumar, Dr. Shivani	55-63	10.5958/2249-7137.2021.02073.5
11.	A REVIEW ON RESOURCE CONSTRAINTS DUE TO RAPID POPULATION GROWTH Dr. Saurabh Tyagi, Dr. Alpana Joshi, Dr. Sachin Kumar	64-71	10.5958/2249-7137.2021.02074.7
12.	INFLUENCE OF NUTRITIONAL REGIMES ON THE GROWTH AND DEVELOPMENT OF COTTON Ismailov Uzakbay Embergenovich, Ismailov Bakhadyr Kalbaevich	72-76	10.5958/2249-7137.2021.02062.0
13.	THE IMPACT OF VIBRATION ON THE HUMAN BODY Bahrididnova Nasiba Muradovna	77-82	10.5958/2249-7137.2021.02063.2
14.	AN OVERVIEW ON THE CULTIVATION AND BREEDING OF MUSHROOM Dr. Sandeep Kumar, Dr. Subrata Das, Dr. Amit Kumar	83-89	10.5958/2249-7137.2021.02075.9
15.	A BRIEF DESCRIPTION ON BIOFERTILIZERS Dr. Alpana Joshi, Dr. Sandeep Kumar, Mr. Vikas Kumar	90-96	10.5958/2249-7137.2021.02076.0
16.	PROSPECTS FOR DEVELOPMENT OF INVESTMENT LIFE INSURANCE IN UZBEKISTAN Yuldashev Obiddin Toshmurzaevich	97-101	10.5958/2249-7137.2021.02064.4
17.	THE SPECIFIC ACTIVITY OF THE TEACHER OF TECHNOLOGY EDUCATION Doniev Bahodir Boshmanovich	102-106	10.5958/2249-7137.2021.02065.6
18.	AN OVERVIEW ON SETS IN MATHEMATICS Mr. Rahul Tomer, Sunil Kumar Gupta, Dr Nidhi Agarwal	107-114	10.5958/2249-7137.2021.02077.2
19.	A BRIEF DESCRIPTION ON THE FUNCTIONS OF TRIGONOMETRY Shamshad Husain, Dr. Jasvir Singh Rana, Rajesh Pandey	115-123	10.5958/2249-7137.2021.02078.4
20.	THE ROLE OF CLUSTER IN CONSTRUCTION MATERIALS INDUSTRY Salohiddin Ochilovich Ibragimov	124-128	10.5958/2249-7137.2021.02066.8
21.	VERSATILITY IN THE STORIES OF GAFUR GULAM Gulbakhar Muratova	129-132	10.5958/2249-7137.2021.02067.X
22.	AN OVERVIEW OF 3D PRINTING IN EDUCATION Dr. Ajay Rana, Dr. Jayanta Kumar Mahato, Ms. Abhilasha R. Goel	133-140	10.5958/2249-7137.2021.02079.6
23.	APPLICATION OF NANOTECHNOLOGY IN AGRICULTURE Dr. Shiva Sharma, Dr. Subrata Das, Dr. Divya Prakash	141-149	10.5958/2249-7137.2021.02081.4

24.	ACTIVE TEACHING STRATEGIES IN HIGHER EDUCATION Amanova Nodirabegim Furkatovna	150-152	10.5958/2249-7137.2021.02068.1
25.	TYPES OF EDUCATION AND TRADITIONS OF ITS ORGANIZATION IN THE 15TH CENTURY (ON THE EXAMPLE OF WESTERN EUROPE AND CENTRAL ASIA) Nurbayeva Marvarid Tavakkalovna	153-156	10.5958/2249-7137.2021.02124.8
26.	A REVIEW ON TYPES OF ANTENNA Dr. Ajay Rana, Dr. Aniket Kumar, Mr. Mohd Ahamad	157-164	10.5958/2249-7137.2021.02080.2
27.	AN OVERVIEW OF LITHIUM ION BATTERY AND ITS COMPOSITION Dr. Aniket Kumar, Mr. Jitendra Kumar Singh Jadon, Mr. Hamid Ali	165-172	10.5958/2249-7137.2021.02082.6
28.	WRITING SKILLS AT THE LEARNING LANGUAGE Nizamova Feruza Alimullaevna	173-177	10.5958/2249-7137.2021.02069.3
29.	ATYPICAL LOCATION OF TERATOMA IN CHILDREN FEATURES OF DIAGNOSIS AND TREATMENT Karimova Zevara Khadjibaevna, Kurambaev Yahshimurat Bekchanovich, Latipov Djavdat Akhmedovich, Yakubova Mariam, Sagdullaev Narzulla Norkeldievich	178-188	10.5958/2249-7137.2021.02070.X
30.	AN OVERVIEW OF MICROSTRIP ANTENNA Dr. Ajay Rana, Dr. Shiva Sharma, Dr. Neha Singh	189-196	10.5958/2249-7137.2021.02083.8
31.	A REVIEW OF THE INDIAN LITERATURE ON WOMEN IN AGRICULTURE Dr. Saurabh Tyagi, Dr. Dinesh Kumar, Mr. Amit Kumar	197-203	10.5958/2249-7137.2021.02084.X
32.	RESEARCH IMPACT OF DRIVING SYSTEMS OF TRACTORS AND WORKING BODIES OF TILLAGE MACHINES ON SOIL Murtazoev A.N, Shodieva S.U	204-208	10.5958/2249-7137.2021.02071.1
33.	IN THE WORK OF MIFTAHU-L-ULUMABOUT AUXILIARY WORDS THAT MAKE A VERB Akmalkhonov Akmalkhon Ahmad ogli	209-214	10.5958/2249-7137.2021.02072.3
34.	AN OVERVIEW OF THE NEW MATERIALS OF THE PERMANENT MAGNETS Dr. Aniket Kumar, Dr. Shiva Sharma, Mr. Mohd Ahamad	215-221	10.5958/2249-7137.2021.02085.1
35.	CYBER SECURITY LESSONS FROM NUCLEAR WEAPONS Dr. Ajay Rana, Dr. Sumit Badotra, Rohit Vats	222-229	10.5958/2249-7137.2021.02086.3
36.	METHODS OF STUDYING THE MEDIA TEXT Gazieva Dilfuza Mukhamedkadirovna	230-233	10.5958/2249-7137.2021.02122.4
37.	SPECIFIC WAYS TO IMPROVE MATHEMATICAL LITERACY IN THE PROCESS OF SENDING STUDENTS TO HINGER EDUCATION Saidakhon Raxmonberdiyevna Toshboyeva, Sodiqova Moxlaroy Shavkatjonqizi	234-240	10.5958/2249-7137.2021.02123.6

38.	THE IMPACT OF CLIMATE CHANGE ON NEPALESE AGRICULTURE Dr. Alpana Joshi, Dr. Divya Prakash, Dr. Sandeep Kumar	241-248	10.5958/2249-7137.2021.02091.7
39.	A REVIEW PAPER ON ARTIFICIAL INTELLIGENCE Dr. Ajay Rana, Dr. Niraj Singhal, Dr. Sumit Badotra	249-256	10.5958/2249-7137.2021.02087.5
40.	IN THE DRAMA "HAMLET" AND "ABULFAYZKHON" TRAGIK PAFOS Shodiev Shahobiddin Sharofiddinovich	257-263	10.5958/2249-7137.2021.02120.0
41.	THE IMPACT OF GEORGE ORWELL'S WORK ON WORLD AND UZBEK LITERATURE Kurbanova Shahlo Shuhratovna	264-270	10.5958/2249-7137.2021.02121.2
42.	WORK FROM HOME WORK CULTURE: A NEW NORMAL AND ALTERNATIVE TO TRADITIONAL WORK CULTURE Dr Shyamasundar Tripathy, Dr. Bindurani Rohidas	271-280	10.5958/2249-7137.2021.02125.X
43.	APPLICATION OF OPTICAL FIBER IN MAGNETIC RESONANCE Dr. Ajay Rana, Dr. Shiva Sharma, Dr. Neha Singh	281-288	10.5958/2249-7137.2021.02088.7
44.	IMPROVEMENT OF METHODOLOGICAL PEDAGOGICAL SKILLS OF DEVELOPING CREATIVE ACTIVITY OF PRIMARY SCHOOL STUDENTS Sharofutdinova Ranoxon Shavkatovna	289-292	10.5958/2249-7137.2021.02126.1
45.	PSYCHOLOGICAL FACTORS OF INCREASING LABOUR PRODUCTIVITY Nazarova Marguba Gulamovna, Usmonaliyeva Iroda Ablakhat qizi	293-297	10.5958/2249-7137.2021.02127.3
46.	AN OVERVIEW OF DEEP LEARNING Dr. Ajay Rana, Dr. Mamta Bansal, Dr. Sumit Badotra	298-304	10.5958/2249-7137.2021.02089.9
47.	A LOOK AT HOW SOLAR CHIMNEY INTEGRATED SYSTEMS MAY BE USED FOR ROOM HEATING AND COOLING Dr. Aniket Kumar, R.K. Jain, Mr. Hamid Ali	305-314	10.5958/2249-7137.2021.02094.2
48.	ICT - AS A MEANS OF ACHIEVING NEW EDUCATIONAL RESULTS IN TEACHING NATURAL DISCIPLINES IN SECONDARY SCHOOLS Kharaxonova Lobarkhon Musokhonovna	315-321	10.5958/2249-7137.2021.02129.7
49.	EFFECTIVENESS OF INDEPENDENT WORK IN THE EDUCATIONAL PROCESS Ibodova Mahfuza Namozovna	322-326	10.5958/2249-7137.2021.02130.3
50.	APPLICATION OF DEEP LEARNING IN FOOD Dr. Ajay Rana, Rajesh Pandey, Rohit Vats	327-334	10.5958/2249-7137.2021.02090.5
51.	MATERIALS, MODELS, AND APPLICATIONS OF THERMOELECTRIC COOLING Dr R.K. Jain, Rajkishor Singh, Mr. Anil Kumar	335-342	10.5958/2249-7137.2021.02095.4

52.	SEMANTIC STRUCTURE OF PROVERBS Djalilova Sarvaroy Mekhrojovna	343-347	10.5958/2249-7137.2021.02128.5

ASANAS AND POSTURES IN YOGA AND IMPACT ON PHYSICAL GROWTH AND HEALTH

Dr. Anjana Lohan*

*Associate Professor,
Head, Deptt. of Physical Education,
S.D. Mahila Mahavidyalay, Narwana (Jind), INDIA

ABSTRACT

Originally and still used as a generic word for a seated meditation pose, an asana is a bodily posture that may be in any position, including lying down, standing, inverted or twisting. According to Patanjali's Yoga Sutras, "asana" means "[a posture that is] stable and pleasant. One of Patanjali's eight limbs is the capacity to sit for long periods of time. In English, asanas are referred to as yoga poses or yoga postures. Some 84 asanas are included in the Goraksha Sataka and Hatha Yoga Pradipika from the 10th and 11th centuries, respectively, and the 17th and 18th centuries, respectively, in the Hatha Ratnavali. Due to the effects of colonialism, Indian nationalism favoured physical culture in the 20th century. A new method of yoga asanas was developed by pioneers like Yogendra, Kuvalayananda, and Krishnamachari in that setting (incorporating systems of exercise as well as traditional hatha yoga). Pattabhi Jois, the father of Ashtanga vinyasa yoga, and B.K.S. Iyengar, the creator of traditional Iyengar yoga, were both Krishnamacharya's students. Together, they penned hundreds of more asana descriptions, rekindled interest in yoga, and exported it to the West. Since Iyengar's Light on Yoga in 1966, which detailed around 200 asanas, many more have been created. Dharma Mitra drew hundreds more of them.

KEYWORDS: *Yoga Asanas, Asanas, Yoga and Key Advantages*

INTRODUCTION

In mediaeval hatha yoga literature, asanas were said to provide both spiritual and bodily benefits. There has been more recent research showing that they may help with health problems including asthma and diabetes by increasing flexibility, strength, and balance, as well as by reducing stress and the ailments that go along with it.

Many centuries have passed since asanas first appeared in literature. Figures of the Buddha, Jain tirthankaras, and Shiva are shown on meditation chairs such as lalitasana and other traditional meditative positions in religious Indian art. Asanas are more prevalent in literature and cinema, thanks to the growing popularity of yoga as a form of fitness.

Usage in Ancient times

Figure 1 : Mould of Pashupati seal with pose resembling Mulabandhasana

As Sir John Marshall pointed out in 1931, a central figure in the Indus Valley Civilization's Pashupati seal, dating from around 2500 BC, resembles Shiva. This is because he is three-faced, in a yoga position like Shiva's Mahayogin, has four animals like Pashupati, the Lord of Beasts, and has deer beneath his throne, as seen in mediaeval Shiva depictions. He also has a three-part headdress like Shiva's t This would be the earliest known asana if the information is accurate. With no evidence to support Shiva's Indus Valley ancestry anywhere and many conflicting interpretations of the Pashupati seal with no apparent means to choose between them, the seal's depiction of a yoga position cannot be relied upon. It might be anything.

India is where asanas got their start. According to Patanjali's Yoga Sutras, asana practise is the third of Patanjali's eight limbs (Sanskrit: astanga, from asht and anga, respectively) of classical or raja yoga (c. 2nd to 4th century CE). English speakers have been using the term asana since the 19th century to refer to a sitting position or a meditation seat, both of which are derived from the Sanskrit verb asana, which means "to sit down" in Sanskrit.

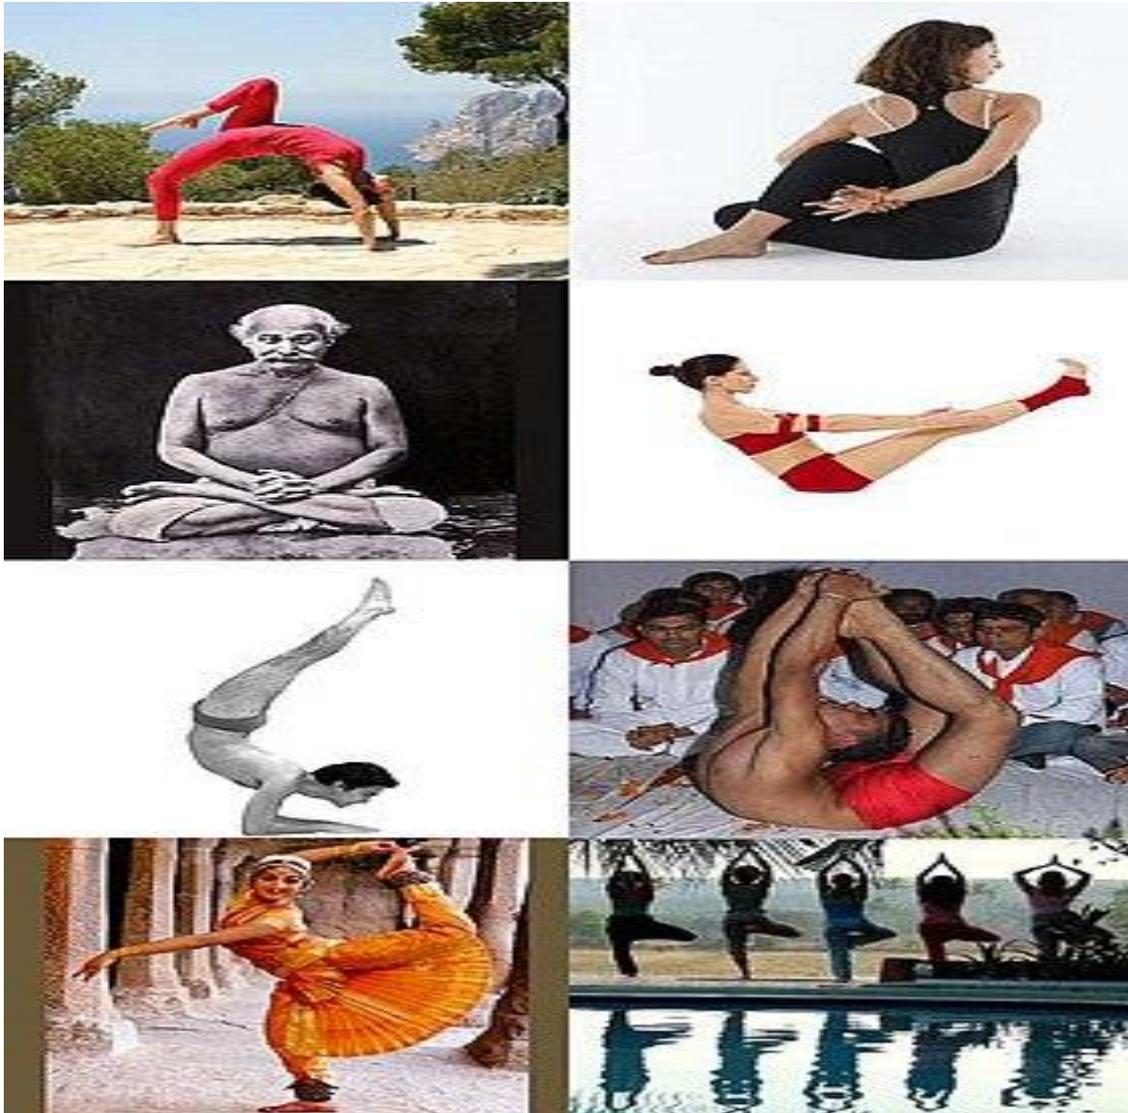

Figure 2 : Key Postures

Yamas, niyamas, asana, pranayama, pratyahara, sense withdrawal, concentration, dhyana, and meditation are the eight limbs in that order: social behaviour, self-observance, asana, and pranayama are the breath exercises (realization of the true Self or Atman, and unity with Brahman, ultimate reality).

There are physical motions known as asanas in hatha yoga, and breathing exercises known as pranayama in contemporary yoga. The sitting positions employed for pranayama and meditation, where meditation is the route to samadhi, transpersonal self-realization, are referred to as asanas by Patanjali as "stable and pleasant postures".

A good asana has the following qualities, which are not mentioned in the Yoga Sutras by name: The name of the god is Sthira, and his name is Sukha. The term "asana" refers to a pleasant and stable position. A commentary on Patanjali's Yoga Sutras known as the Bhasya commentary,

which contains the Sutras, has led some academics to speculate that the commentary is also by Patanjali.

Padmasana and Siddhasana, the two sitting asanas described in the Goraksha Sataka, are utilised for meditation and pranayama, respectively. For the first time, in the tenth or eleventh century, the text Vimanarcanakalpa mentions an asana that isn't seated: the balancing position Mayurasana (peacock). Poses like this were adapted by the Nath yogins after they were developed outside of Shaivism, the tradition's birthplace, by the scholar James Mallinson, and were linked with austerity.

According to the Goraksha Sataka (10th–11th century), or Goraksha Paddhati, an early hatha yoga book, the 84 classical asanas came to be as a result of a revelation made by Lord Shiva, the Hindu god.

According to the text, there are 84 lakh[b] or 8,400,000 species in all. This means that Lord Shiva created one asana for each lakh. The book names and explains just two of them in detail: Siddhasana and Padmasana. Because of its symbolic nature, the number 84 represents completion and sanctity. [c]

There is a relief statue at Hampi's Achyutaraya temple depicting an unnamed asana that seems to be balancing on one's hands. According to the Hatha Yoga Pradipika (15th century), the first four sitting postures, Siddhasana, Padmasana, Bhadrasana, and Simhasana, are the most essential. There are many relief sculptures of yogins in asanas on the pillars of the Achyutaraya temple in Hampi, dating from the 16th century, including Siddhasana on a stick, Chakrasana, Yogapattasana, and a hand-standing inverted position with a stick, among others.

More non-seated postures emerge in Hatha yoga practise by the 17th century, when asanas had become an essential part of the discipline. Srinivasa's Hatha Ratnavali from the 17th century is one of the rare books to make an effort to include all 84 asanas[e], but four of them are incomprehensible in Sanskrit and at least 11[f] are just listed without any explanation, their presence having been previously documented.

This assertion is repeated in the late 17th-century Gheranda Samhita, which says Shiva taught 84 lakh asanas, of 84 being the most important, and "32 are helpful in the realm of humans."

"Asana was seldom (if ever) the main element of the important Indian yoga traditions," says yoga instructor and researcher Mark Singleton after studying ancient texts. According to the historian Norman Sjoman, there is no evidence of a continuous yoga tradition dating back to the mediaeval texts, whether via asana practise or research.

In Los Angeles, Paramahansa Yogananda founded the Self-Realization Fellowship in 1925 and taught yoga to tens of thousands of Americans, including asanas, breathing, chanting, and meditation, according to his 1946 autobiography, *Autobiography of a Yogi*.

A combination of Hatha Yoga, Wrestling Exercises, and Modern Western Gymnastic Movement was created by Tirumalai Krishnamacharya (1888–1989) in the 1930s under Kavalayananda. It was unlike anything seen previously in the yoga tradition.

Sjoman asserts that Krishnamacharya based the Mysore Palace yoga method on the Vyayama Dipika, a gymnastic training textbook. According to Singleton's theory, Krishnamacharya was well-versed in the gymnastics culture of his time, which was heavily influenced by Scandinavian

gymnastics. His asana experiments and innovative use of gymnastic jumping between poses may explain the similarities between modern standing asanas and Scandinavian gymnastics, Singleton suggests. People like Russian Eugenie V. Peterson (aka Indra Devi), Pattabhi Jois (who founded Ashtanga Vinyasa Yoga in 1948), B.K.S. Iyengar (who founded Iyengar Yoga), T.K.V. Desikachar (his son), Srivatsa Ramaswami (who continued his Viniyoga tradition), and A G Mohan (co-founder of Svastha Yoga & Ayurveda) Together, they helped resurrect yoga's appeal and introduce it to the West.

In 1959, Vishnudevananda Saraswati released a book including 136 variations on the fundamental poses of yoga, which he called *The Yoga Sutras*.

The physical practise of asanas was systematised by Iyengar in his book *Light on Yoga: Yoga Dipika*, released in 1966 and accompanied with 600 photos of Iyengar performing about 200 asanas. Three million copies of the book were sold, and it was translated into 17 other languages.

A list of 1,300 asanas and their variants, published in 1984, by Dharma Mittra included pictures of himself in each position to illustrate the list's ancient and contemporary origins; the Dharma Yoga website indicates that he generated approximately 300 of them.

History of Asanas

Headstand (Kapala Asana) from the *Joga Pradipika* text, dating from the early 19th century. Some of the asanas date back to antiquity, while others are from the mediaeval period, and a rising number are more contemporary creations.

There are a few poses that seem classic, such *Virabhadrasana I* (Warrior Posture I), although they are really very contemporary. That pose was presumably created by Krishnamacharya about 1940 and popularised by his student, BKS Iyengar. Certainly newer is Pattabhi Jois' *Yoga Mala* (Revolved Side Angle Pose/*Parivritta*)'s *Parsvakonasana* (Revolved Side Angle Pose). Even though *Viparita Virabhadrasana* (Reversed Warrior Pose) is very new, it may have been invented as recently as the year 2000, according to some sources. Asanas like *Dog Pose* and *Trikonasana* (the triangle pose) initially emerged in the twentieth century as did the *Surya Namaskar* series of asanas (the sun salutation) (Salute to the Sun). The *Aditya Hridayam*, a distinct sun salutation, is mentioned in the *Ramayana's* "Yuddha Kaanda" Canto 107 as being old. The current version of *Surya Namaskar* was developed by the Raja of Aundh, Bhawanrao Shrinivasrao Pant Pratinidhi;

K. Pattabhi Jois described the Ashtanga Yoga variant forms of *Surya Namaskar A* and *B*, probably derived from Krishnamacharya. A contemporary, physical culture-oriented version of the ancient ritual of prostrating one's self to the sun may be found in *Surya Namaskar*. *Light on Yoga*, by B.K.S. Iyengar, published in 1966, described more than 200 asanas (postures), with approximately 50 basic poses and their variants. In contrast to many traditional asanas, which are named after objects (like *Vrikshasana*, tree pose), legendary figures (like *Matsyendrasana*, the sage Matsyendra's pose), or animals (like *Kurmasana*, tortoise pose), "an overwhelming eighty-three" of Iyengar's asanas have names that simply describe the body's position *Shatkonasana*, or "Six Triangles Pose," was named after this design and first documented in 2015. In his *Master Yoga Chart* from 1984, Mittra depicted 908 different postures and modifications, and since then, many more have been developed. There has been "amalgamation and borrowing," according to Sjaman, in the history of the names of asanas for millennia, making it difficult to trace their origins.

Because a name may refer to a different posture, and a pose may have had many names at various points in time, the existence of matching names is not evidence of continuity.

As a result, the figures shown here are derived from descriptions of the asanas themselves.

No. of asanas	Author	Date	English

c. 200	B. K. S. Iyengar	1966	Light on Yoga
908	Dharma Mittra	1984	Master Yoga Chart

Traditional and Modern Approach

There are many different yoga schools that agree that asanas are best practised after having had a bath, when the body is relaxed and the stomach is empty. Using asanas for physical rehabilitation means doing them on both sides equally, starting with the stronger side, according to sports medicine. Asanas are active stretches that help prevent muscles from damage.

Salutations to the Sun God

In Surya Namaskar, the Salute to the Sun, the downward-facing dog posture, Adho Mukha Svanasana, is done at least once and frequently twice.

Surya Namaskar, or the Salute to the Sun, is a dynamically articulated yoga sequence that may include up to twelve asanas. There are two sets in the series in a round; the second set advances the opposite leg first. Although Adho Mukha Svanasana (downward dog) is part of the sequence, it varies by school, with some schools having students choose between upward dog and cobra for one position in the series. As for the sequence itself, schools take different methods to it. For instance, in Iyengar Yoga, modifications such as adding Marichyasana I and Paschimottasana are recommended.

Styles

Asanas are taught in a variety of ways by different yoga schools in the West. Some asanas, like Trikonasana, are done in the identical manner by all of them. Here are a few methods that have been verified by other sources.

In Iyengar Yoga's Utthitha Trikonasana, which is a crucial posture, a yoga block is used as a support. The posture necessitates working various portions of the body in a variety of ways.

Rather of stressing quantity over quality, Iyengar Yoga "emphasises accuracy and alignment" and emphasises proper movement above quantity. This style of yoga holds poses for far longer than others, which enables the muscles to relax and stretch as well as promotes concentration on

the posture. Props, such as belts, blocks, and blankets, are available to students free of charge to help them in doing the asanas correctly. Standing postures are taught to new students from the very beginning, and each one is meticulously performed. It's not uncommon to see the feet spread wide in Trikonasana, with the front foot turned out and its centre of heel perfectly aligned with its arch, in order to achieve a broad stance.

Sivananda Yoga utilises hatha yoga asanas as a component of raja yoga in order to help students "sit in meditation for an extended period of time." Individual postures aren't given much attention; instructors stick to Sivananda and Swami Vishnu-fundamental devananda's teachings. Instead of reaching straight up in Trikonasana, the upper arm may be extended forward, parallel to the floor. According to Sivananda Yoga, the fundamental asanas are a collection of 12 poses. These aren't the simplest positions, nor are they the ones that every class does. In some schools, Trikonasana is the first of the 12 postures and is used to relax the hips before moving on to the next one.

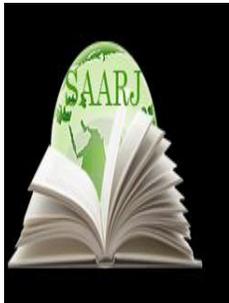

CONCLUSION

As eugenics and Lamarckism gained popularity in the 1850s, India created a culture of physical activity to combat the colonial stereotype of alleged "degeneracy" among Indians in comparison to the British. Indian nationalists like Tiruka, who taught exercises and unarmed fighting methods as yoga from the 1880s through the early 20th century, adopted this tradition. K. V. Iyer at his Bangalore gym, on the other hand, intentionally mixed "hata yoga" [sic] with bodybuilding as a proponent of Indian physical culture. Niels Bukh's Grundgymnastik eller primitiv gymnastik describes a number of postures that are similar to Parighasana and others like it (known in English as Primary Gymnastics). Their origins may be traced back to Pehr Ling, a 19th-century Scandinavian gymnastics tradition that made its way to India in the early twentieth century. In 1919, Yogendra, known as "the Father of the Modern Yoga Renaissance," introduced yoga asanas to the United States with his method, which was inspired by Max Müller's physical culture. Swamiji established the Kaivalyadhama Health and Yoga Research Center in Maharashtra in 1924 with the help of Swami Kuvalayananda. His "profound" influence on the development of yoga, according to historian Joseph Alter, came from combining asanas with Indian methods of training and contemporary European gymnastics.

ABSTRACT

The article provides a comparative analysis of the nematological situation in the Uchqizil and South Surkhan reservoirs. According to the results of the analysis, 119 species of free-living and phytoparasitic nematodes were identified in the reservoirs, 94 species in the Uchqizil reservoir, 93 species in the South Surkhan reservoir, and 66 species of nematodes in common for both reservoirs.

KEYWORDS: *Reservoir, Nematode, Soil, Root, Fauna, Uchqizil Reservoir, South Surkhan Reservoir.*

INTRODUCTION

Today, the biological potential of inland water bodies around the world requires rational use. This requires special attention to nematodes, which make up 58% to 90% of all invertebrates in the upper sedimentary layers of water bodies [9]. Nematodes are very common multicellular animals on Earth and are in an active biological development stage. They are actively involved in the utilization of organic matter in water bodies. Therefore, the development of measures to manage the diversity, specificity and quantity of biological species of nematodes is of great scientific and practical importance.

Free-living nematodes are a poorly studied group of invertebrates that have not been well studied theoretically and practically. They play an important role in the balance of organic matter in water bodies.

Free-living nematodes in the watersheds of Uzbekistan have not been studied to date, and we are studying it for the first time.

MATERIALS AND METHODS

Samples from coastal soils and coastal vegetation of the Uchqizil and South Surkhan reservoirs serve as research material. Sampling of nematodes was carried out in 2010-2020. During the study, samples were taken from a total of 800 coastal soils and 700 peripheral soils and plant roots by the route method.

The collected samples were brought to the problematic laboratory of phytohelminthology of Termez State University and nematodes in soil samples were isolated using the washing method. Samples taken from the top (1-2 cm) layer of soil to 1/4 m², with a total volume of 50-100 cm³, were placed in a special polyethylene bag and brought to the laboratory for research. To separate the nematodes from the soil mass, the samples were placed in a crystallizer, shaken, and the resulting fraction was poured into another crystallizer. This process was repeated several times. As a result, the nematodes floated to the surface of the water and were poured into another container. The molten fraction was passed through a gaseous sieve under a weak stream of water. The sediment left in the sieve was washed in a Peter bowl. The tip of the nematode was collected using a slightly bent entomological needle. Isolated nematodes were anesthetized in 4% formalin solution (fixation). The nematodes in the vial were treated with 7 parts glycerin, 23 parts 96% alcohol, and 70 parts distilled water. The solutions help to keep the nematodes for many years, and the glycerin in them helps to clear the nematode from the cuticle [1]. Permanent drugs were prepared by the method of Sainhorst [8].

Berman's funnel method was mainly used to separate nematodes from soil and plant tissues.

Samples of soil (20 cm³) and cut root (length 0.5–1cm, weight 20g) were placed in metal nets with milk filters, then in a 15 cm long glass funnel, filled with water by placing a clamped rubber on the narrow end, and 24 hours in summer, autumn and left at room temperature (10-200) for 48 hours in spring and 72 hours in winter. During this period, the nematodes emerge from the soil and roots into the water and settle in a rubber tube. Nematodes were fixed with 4% formalin.

The species composition of nematodes was studied under a light microscope MBR-3. Morphometric parameters of the De Man formula [104; 104 p.], Modified by Micoletzky [7], were used to determine the species.

RESEARCH RESULTS

Taxonomic analysis of the identified nematodes shows that in the Uchqizil and South Surkhan reservoirs of Surkhandarya region, 119 species of free-living and phytoparasitic nematodes were found in reservoir soils, hawthorn, taron aquatic plants and coastal reeds and sedges. It belongs to 18 subfamilies, 10 large families, 41 families, 40 subfamilies, 64 generations.

The identified nematodes belonged to 3 subclasses (Adenophorea, Chromadoria, Rhabditia), from which representatives of the subclass Adenophorea were found in large numbers in both reservoirs (Table 1).

TABLE 1 COMPARATIVE ANALYSIS OF NEMATODES DETECTED IN UCHQIZIL AND SOUTH SURKHAN RESERVOIRS

Subclasses	Families		Generation		Species		Individuals	
	Number	%	Number	%	Number	%	Number	%
Uchqizilreservoir								
Adenophorea	15	41,7	25	46,3	51	54,4	5701	54,3
Chromadoria	11	30,5	15	27,8	23	24,4	4106	39,1
Rhabditia	10	27,8	14	25,9	20	21,2	693	6,6
Total	36	100	54	100	94	100	10500	100
South Surkhan reservoir								
Adenophorea	15	40,6	22	40,9	43	46,4	2402	48,7
Chromadoria	10	27,0	13	24,0	21	22,5	1438	29,1
Rhabditia	12	32,4	19	35,1	29	31,1	1096	22,2
Total	37	100	54	100	93	100	4936	100

In the South Surkhan reservoir, the Rhabditia subclass included 12 (32.4%) nematodes belonging to the family, while in the Uchqizil reservoir, 11 (27.8%) nematodes belonging to the family were found.

Adenophorea subclass in the Red Reservoir 5701 individuals (54.3% of the total identified individuals), Chromadoria subclass 4106 (39.1%), Rhabditia subclass 693 (6.6%), and Adenophorea in the South-Surkhan reservoir junior class 2402 (48.7%), Chromadoria subclass 1438 (29.1%) and Rhabditia subclass 1096 (22.2%) individuals. According to the analysis, members of the subclass Adenophorea and Chromadoria are more common in the Uchqizil Reservoir than in the South Surkhan Reservoir.

"Floristic spectra" are widely used in botany, representing the main features of the systematic composition of floristic complexes. Analysis of the structure of faunistic complexes, especially helminths, has been developed by foreign scientists [1,2, 3,4].

The nematodes identified in the Uchqizil and South Surkhan reservoirs were distributed among the families as follows (Table 2).

TABLE 2 DISTRIBUTION OF NEMATODES IDENTIFIED IN THE UCHQIZIL AND SOUTH SURKHAN RESERVOIRS BY FAMILIES

№	Families	Uchqizil reservoir		South Surkhan reservoir	
		Number of species	%	Number of species	%
1	Alaimidae	2	2,1	1	1,1
2	Enoplidae	1	1,1	1	1,1
3	Oxystominidae	1	1,1	1	1,1

41	Hoplolaimidae	-	-	3	3,2
	Total families	36		37	
	Types	94	100	93	100

The data in the table show that all nematode families are represented by a small number of species. Some of them include 8-10 species, others 3 species, and the rest 1-2 species. Analysis of

the “Faunistic Spectrum” of nematodes in the Uchqizil and South Surkhan reservoirs allows to divide them into at least 3 families (dominant, subdominant and recessive).

The group of dominants includes families with 5-10 species. Representatives of 6 families (Tripylidae, Tobrilidae, Mononchidae, Dorylaimidae, Plectidae, Cephalobidae) in the South Surkhandarya reservoir and 6 families (Tripylidae, Tobrilidae, Mononchidae, Dorylaimidae, Plectidae, Cephalobidae) in the Red Reservoir.

The group of subdominants includes representatives of the family, which includes 2-4 species. There are 13 in the South Surkhandarya Reservoir (Qudsianematidae, Ironidae, Mylonchulidae, Cyatholaimidae, Monhysteridae, Leptolaimidae, Axonolaimidae, Chronogasteridae, Rabdolaimidae, Rhabditidae, Panagrolaimidae, Paraphelenchidae, Apavaidaida, Hoplolaimida, Hoplolaimida) ,Ironidae, Mylonchulidae, Cyatholaimidae, Mikrolaimidae, Monhysteridae, Leptolaimidae, Axonolaimidae, Chronogasteridae, Rabdolaimidae, Rhabditidae, Aphelenchoididae, Tylodoridae, Pratylenchidae).

The group of residents consists of representatives of the family, which includes 1 species. There are 18 (Alaimidae, Enoplidae, Oxystominidae, Prismatolaimidae, Aporcelaimidae, Nyqolaimidae, Paradorylamidae, Thornidae, Chromadoridae, Misrolaimidae, Cyndrolaimidae, Teratocephalidaida, Aphelenchididae, Aphelenchididae, Aphelenchididae, Aphelenchididae) in the South Surkhan reservoir. (Enoplidae, Oxystominidae, Nyqolaimidae, Paradorylamidae, Chromadoridae, Ethomolaimidae, Cyndrolaimidae, Teratocephalidae, Neotylenchidae, Anguinidae, Criconematidae, Paratylenchidae).

According to the results of faunistic studies in the Red Reservoir, 94 species (10,500 individuals) of nematodes were identified, of which 65 species (8,771 individuals) were free-living nematodes, 17 species (433) in the *Charafragilis* plant, and 12 species (311) torons. (*Polygonumhydropiper*) was found in the root and stem part of the plant, 28 species (533) in the root and root soil of reeds (*Phragmitesaustralis*) and 19 species (452) in the root and root soil of the plant (*Typhalatifolia*).

Of the total 65 species of nematodes identified in the Trinity Reservoir, 23 species (*Enoploidesfluviatilis*, *Paramphidelusdolichurus*, *Odontolaimuschlorurus*, *Tripylaglomerans*, *T. steineri*, *T. brevisetosis*, *T. longisaudatus*, *T. longus*, *T. abberans*, *Laimydorusflavomaculatus*, *Aquatidesaquatusis*, *Ironustenuicaudatus*, *I. americanus*, *Miconchusniddensis*, *M. tunbridgensis*, *M. trionchus*, *Punctodorasalinari*, *Aphanolaimusaquatusis*, *A. viviparous*, *Axonolaimusspinosus*, *Paraphanolaimusbehningi*, *Plectusparainquirendus*, *Teratocephalussostatus*) for the fauna of Uzbekistan.

According to the results of faunistic studies in the South Surkhandarya reservoir, 93 species (4936 specimens) of nematodes were identified, including 60 species (2963 specimens) of free-living nematodes, 18 species (336) in the plant Chara (*Charafragilis*), 25 species (547). Toron (*Polygonumhydropiper*) plant root and stem part, 27 species (596) reed (*Phragmitesaustralis*) plant root and iliac soil, and 19 species (494) maple (*Typhalatifolia*) plant root and rhizome soil.

Of the 60 species of nematodes identified in the soils of the South Surkhandarya Reservoir, 20 species (*Enoploidesfluviatilis*, *Paramphidelusdolichurus*, *Odontolaimuschlorurus*, *Tripylaglomerans*, *T. steineri*, *T. brevisetosis*, *T. longisaudatus*, *T. longus*, *T. abberans*, *Ironustenuicaudatus*, *Miconchusniddensis*, *M. tunbridgensis*, *M. trionchus*,

Punctodorasalarim, *Aphanolaimusaquatus*, *A. viviparus*, *Axonolaimusspinosus*, *Paraphanolaimusbehningi*, *Teratocephalussostatus*, *Mononchoidesstriatus*) were recorded for the first time in Uzbekistan.

CONCLUSION

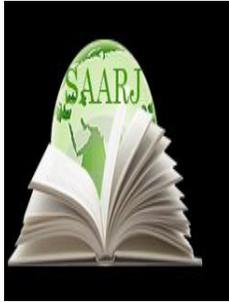

Of the 119 species of nematodes identified in the study, 66 species were common species and were found in both reservoirs. *A. primitivus*, *P. intermedius*, *T. affinis*, *T. papillata*, *T. cornuta*, *L. flavomaculatus*, *L. conurus*, *E. acuticauda*, *A. superbus*, *A. aquatus*, *P. macrolaimus*, *I. americanus* in the Trinity Reservoir, *M. aquaticus*, *M. signaturellus*, *E. pratensis*, *M. globiceps*, *M. filiformis*, *P. parietinus*, *R. filiformis*, *A. karakalpakensis*, *A. dasylocercus*, *C. hexalineatus*, *H. viviparus*, *D. intermedius*, *P. wescolagricus*, *P. pratensis* nematode species have been recorded and not found in the South Surkhandarya reservoir, *T. medius*, *T. allophusis*, *D. tepidus*, *E. centrocercus*, *M. attenuates*, *N. brachyuris*, *M. africana*, *M. palidicola*, *R. longicaudata*, *P. rigidus*, *P. subelongatus*, *D. rivalis*, *M. striatus*, *E. mucronatus*, *E. oxyuroides*, *E. striatus*, *A. maximus*, *P. batavicus*, *P. myceliophthorus*, *T. davainei*, *H. erythrinae*, *H. multicinctus*, *H. tylenchiformis* nematode species have been identified in the South Surkhandarya reservoir.

According to the analysis, the population density of nematodes in the Uchqizil reservoir is higher than in the South Surkhan reservoir. This situation can be explained by the low annual average turbidity in the Red Reservoir, the average annual mineralization, the high content of nitrogen in the water and the high phytobiomass. The Uchqizil reservoir is explained by the similarity of the nematode fauna to the South Surkhan reservoir, as well as the fact that the Surkhandarya water flows into the Uchqizil reservoir through the Zang canal.

**HARD REALISTIC INTERPRETATION OF SOCIETY AND SPIRITUAL
 AND MORAL SUNSET (ON THE EXAMPLE OF SHUKUR
 KHOLMIRZAEV'S NOVEL "OLABODZHI")**

Kochkarova Markhabo Khudoyberganovna*

* Senior Researcher,
 Doctor of Philology Institute of the
 Uzbek Language, Literature and Folklore of the Academy of Sciences of the
 Republic of UZBEKISTAN

ABSTRACT

The article examines the ruthless realistic interpretation of the novel "Olabodzhi" by the people's writer of Uzbekistan Shukur Kholmirzaev, in particular, the decline of society and the new artistic trajectory of the decline of personality. The author analyzes in detail the ugliness of the rotten Soviet system in Uzbekistan, which in the early 90s was part of the former Soviet Union, in a detailed descriptive manner, internal checks of the protagonist, keeping secrets, revealing secrets in an artistic way.

KEYWORDS: *Novel, Spiritual And Moral Perspective, Ruthless Realistic Interpretation, Society, Personality, Shukur Kholmirzaev.*

INTRODUCTION

The famous writer Shukur Kholmirzaev is one of the great writers who made a great contribution to the development of modern Uzbek literature. The author entered literature in the 60s of the last centuries. One of his first stories, "Waves", attracted the attention of the creative teacher Abdullah Kakhhor. Shukur Kholmirzaev actively worked in various genres of Uzbek prose. In particular, a novel (4, 1 unfinished), a story (about 10), a story (3 volumes), essays (about 20), literary articles and conversations (1 volume), a drama (2), etc. Created by genre.

The life and work of Sh. Kholmirzaev are constantly studied by our critics and are in the center of their attention. In particular, U. Normatov, O. Togaev, I. Gafurov, A. Kattabekov, H. Boltaboev, H. Dustmukhammad, H. Karimov, Sh. Doniyorova, G. Tilovova, O. Toshboev, M. Kochkarova, M. Khamidova ... Many literary scholars and young researchers, such as O. Safarov, studied it. Shukur Kholmirzaev wrote such novels as "The Last Stop" (1976), "The

Bridge” (1984), “The Passenger” (1987), “Olabodji” (1992), The Dinosaur (Book 1, 1996). In Shukur Kholmiraev's novels "The Last Station", "Passenger" and "Olabozhi", vivid artistic images reflected the beginning of the collapse of Soviet society in the 70s and 80s.

The novel "Olabo'ji" was published in 1, 2, 3, 4 issues of “Shark Yulduzi” magazine in 1992 with some abbreviations. Under the final chapter of the novel, the magazine notes that the author finished writing the work in 1991. After the magazine version of the novel "Olabodzhi " literary scholars U. Normatov, Kh. Karimov, K. Yuldashev, Sh. Doniyorova, O. Tashbaev, M. Khamidova, K. Shakhobov analyzed and interpreted the dissertation in print [5; 4; 2; 1; 6; eleven; 7.].

While in the novel "Olabodzhi" the author reveals the spiritual depravity and immorality of the individual, society and society in a brutal realistic artistic picture, the author examines in detail dozens of problems of the life of society. In particular, the repair of rural schools, the hypocrisy of officials, the moral depravity of people speaking different languages, the same problems, environmental problems (environmental pollution, garbage processing, mine exploration, damage to the mountain fauna), illegal extermination of animals from the Red Book, destruction of shrines and traditional national values, misinterpretation of the national repressive movement in Soviet history, torture of talented and honest people by officials, destruction of people, human lives and destiny outside many problems were resolved, such as management and acting under the direction of officials, preserving historical sites, and accusing ordinary people of libel in robbing the state.

“Olabodzhi” described the genre of the novel in the magazine as "a story more than a novel." In our opinion, the writer symbolizes the scale of the social, spiritual and moral problem underlying the novel, and calls the genre “a story more than a novel” because of his great love for the “story” genre. Therefore, in an interview with Olim Toshbaev, the author explains why he defined the genre of the novel in this way: “... my opinion about the novel is such that I have not yet written such an ideal work. I have tricked me into relative perfection. I called it a "story." When a story is told, the person does not restrain himself, but speaks succinctly and limits himself in relation to the image.

I mean, there is neither arrogance nor humility in this. If you're lucky, one of the publishers might want to publish the novel. Then it comes out completely. And this is declared a direct novel "[6. 453-454.].

The protagonist of the novel is Ulton Sultanov, a young man who graduated from the Faculty of History and Archeology, but teaches natural sciences at a rural school. He is extremely honest, a martyr of nature and deeply concerned about environmental pollution. That is why he often participates in the press with serious articles on environmental topics. He considers himself the guardian of nature, loves creatures with boundless love, Alatag and mother nature in his chest. But his love for nature and society, his work goes on without any ambition. The main storyline of the novel is based on the script of Tokliboy Kochkarov, a play about the life and fate of a young and honest youth Ulton. Tokliboy Kochkarov was actually a teacher. He also taught the history to Ulton. Tokliboy Kochkarov loves literature and history of Mashrab, he loves his work and even writes poetry. To please the official, amateur singers will perform poems by the secretary of the district committee Tokliboy Kochkarov. Tokliboy Kochkarov, an official who graduated from pedagogy, hires a young writer Bakhor to the polyclinic. Bakhor, which sees

drinking and smoking as a sign of modernity, wants to marry Ulton. To make this wish come true, the official Tokliboy Kochkarov, according to his own scenario, chases Ulton, deliberately arranges a meeting of young people, jointly calculates how much it will cost to renovate the old school, and sends them both to the school to write a report.

In the novel, this plot becomes the main event. Pure volunteer Ulton and Tokliboy Kochkarov, who had caught him in a trap, Bakhor and his henchmen rushed to the wedding of the young bride and groom and immediately arranged a wedding. The "tolerant man" Tokliboy Kochkarov will personally come to the wedding. When Ulton thinks of Bakhor, a beautiful modern girl who has suddenly entered his peaceful life, he thinks, "She suits me, she is an angel." The acquaintance and close connection with Bakhor are gaining momentum so much that Ulton is amazed that these romantic and family events in his life have accelerated so much. Even with his inner experiences, he understands that there is some kind of mystery in these events. But the well-known secret is that all people, even those close to Ulton Karava, know that Bakhor was the death of Tokliboy Kochkarov for many years. But nobody discloses this "secret" to Ulton. Until Ulton returns home after the wedding, hoping to leave for Alataga and stay there, the "sinister secrets" will only be revealed when he catches two naked. Tokliboy Kochkarov forced young Ulton to go to a psychiatric hospital because he witnessed embarrassment. On the whole, in this psychiatric hospital, most of the patients are healthy, honest people who have witnessed the secrets of officials, or those who were ceremoniously interfered with by officials, are "crazy" and die from moral torture. Bakhor will help Tokliboy Kochkarov hospitalize these talented people. Bakhor writes a medical report stating that her legal husband Ulton should be immediately hospitalized due to her mental disorder. We can say that Shukur Kholmiraev approaches society and personality from a moral point of view through the novel "Olobodzhi" and the example of dozens of images in the work. That is, society has become so ugly and polluted that it symbolizes not only that the planet is overflowing with garbage, but also human spirituality has become even more dirty and morally degraded than dirty garbage.

The writer himself tells the interlocutor about the character of the protagonist of the novel Tokliboy Kochkarov: "You said in one of your conversations: "Tokliboy Kochkarov is a man struck by God, the soul of Mashrab is crippled."

- Right! Tokliboy Kochkarov is a fan of Mashrab.

He also reads his poems about his wife according to his mood. As you know, in a number of verses of Mashrab, Allah is meant when he speaks of help. That is, love for the earth is love for Allah.

It is also beautiful because the light of Allah shines. To love the earth is to love Allah. At the end of the play, I think I didn't mind. Mashrab hits him! If he is lucky enough to write a sequel to the novel, it will lead to a great tragedy.

May be?! Ulton and Tokliboy Kochkarov will share their places in the next performance! "[6. 454.].

Thus, from the conversation between the author and Olimboy Toshbaev, it is clear that the writer still plans to continue the novel "Olobodzhi". Indeed, at the end of the novel, Ulton becomes Olobodzhi. However, the real "olobodzhi" in the work are Tokliboy Kochkarov and his henchmen. We know that Shukur Kholmiraev was full of great creative plans and creative

ideas. Olabodja has a lot of groundbreaking artistic thought, new dimension and groundbreaking challenge. According to the author's plan, in the second part of the novel, Ulton was to return to society, to the people, and the real giant Tokliboy Kochkarov had to be taken to Alatag(Olatog'). Because the author himself admitted in the conversation above. But, unfortunately, the writer was not lucky enough to write the second new part of the novel.

In the novel, Ulton's personal tragedy turns into a social tragedy. In the novel, the author embodies the image of dozens of officials, Soviet activists represented by Tokliboy Kochkarov, Tarakanov, Butaboy Sopi, Odil Mirshab, Makhfirat Egamkulov. K. Shakhobov studied the characters of the novel "Olabodzhi" as a transitional generation [7. 15].

The volume of the novel is quite large, almost six hundred pages. It involves about fifty large and small images. Of course, a novel can be approached and analyzed on a variety of scientific issues. In particular, the aforementioned young researcher K. Shakhobov approaches the novel on the basis of "heroes of the transition period" and "events of the transition period".

The novel has an extremely deep analysis of the problem of personality and society. The drama of events, "an ominous secret" and "disclosure of secrets", the casting of the protagonist in an insane asylum, Ulton's escape with the help of an honest doctor Berdy Urdikulov, an attempt to shoot Tokliboy Kochkarov, one-on-one conversations with the participants, analytical sheets of the work done were extremely impressive. But, deciding the fate of each event and the main characters of the novel, the writer immeasurably accelerates the events. Tokliboy Kochkarov lost his job and became an ordinary school teacher. Bahor could not forgive Ulton for his injustice and impersonality, drank the acid, and her throat burned out. Ulton's father, Sultan, promised to hold his son's wedding, and several flocks of sheep in the state's flock went into debt and disappeared without a trace. Ulton tries to shoot Tokliboy Kochkarov, but misses the target and falls into a trap. Ulton goes to a psychiatric hospital for the second time. The second time, when he manages to escape from the hospital, at the insistence of the doctor, he leaves this community, this village and makes Alatag his home. His hair grows like fluff and turns into a wild man. Sometimes the villagers see it. The villagers call him Olabo'ji. In fact, Olabodji is not Ulton. In fact, in the novel, Tokliboy Kochkarov and his henchmen, distinguished by ugliness, spiritual and moral depravity, impersonality and arrogance, are Olabodzhi. Ulton cannot live in this society filled with Olabodji with his honest and pure heart. He is not allowed to live and breathe as he wants in this society. In this sense, Ulton is a pure image that embodies the feeling of honesty, purity, pure love. In fact, the aesthetic ideal of the writer manifested itself in this frank image of Ulton. Unfortunately, a young man with a pure heart like Ulton does not fit into this enlightened society. Rather, they do not fit.

In this regard, we came to the conclusion that as a result of K. Yuldashev's essay "Loneliness" attached to the article "Life of Freedom of Speech" about Shukur Kholmiraev and our personal observations, certain parts of the author's psyche and personality are embodied in the Image of Ulton. Consequently, the scientist who worked together for months at the Dormon resort of the Writers' Union had a long conversation and closely followed the spirit and worldview of the writer, writes: "In fact, this is a person who by nature loves loneliness, strives for it and is more able to talk with grass and birds than with people. For there is no greed in anything, except for a person" [6. 486].

In addition, it can be concluded that the image of Ulton was created on the basis of a close friend of the author-archaeologist Mengziyo Safarov. Some of the human qualities of Menziyo Safarov's character, including patriotism, love of nature, nationalism, were transferred to the image of Ulton. After all, the famous essay "On the soil of ancient Bactria" about a friend of the writer was created. This essay was first published in 1973 in "Sharq Yulduz" magazine under the title Look Back. In the essay, the writer mentions Mengziyo Safarov: "... After university I stayed in Tashkent. A year later, I went to Boysun. I met Mengziyo Safarov in Termez. (This young man studied at the Faculty of History and Archeology of the University and loved to discuss. He often turned to history, and I turned to literature) "[9. 48.]. As you can see, both Ulton and Menziyo Safarov graduated from the Faculty of History and Archeology. In our opinion, Shukur Kholmiraev was amazed by Mengziyo Safarov's deep knowledge of Russian history, archaeological research, hard work and devotion to nature. We are far from claiming that the life of Menziyo Safarov was completely passed on to Ulton. But the positive qualities in this person were transferred to the image of Ulton. According to Sayera Kholmiraeva, who compiled the author's 5-volume "Selection" for publication, the essay "He was not like us", which was not published in the writer's personal archive, was dedicated to Menziyo Safarov. Mengziyo Safarov, unique, unlike ordinary people and beyond reasonable dreams, implies that the protagonist of the novel "Olabodzhi" in some sense served as a partial prototype for the image of Ulton.

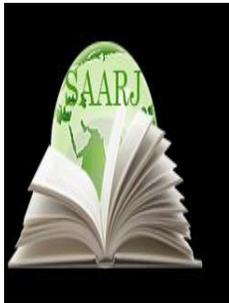

In the novel "Olabodzhi" there is another important socio-political problem, a great artistic and philosophical idea that cannot be artificially developed, history, human life and destiny. This great idea is skillfully revealed in the novel using vivid examples of the wounds inflicted by the Soviet era, the limitations of national history, values, traditions and discrimination against the nation. Tokliboy Kochkarov tried to use his position to give Ulton an artificial, fake love and family. But when the "sinister secrets" were revealed, Ulton realized that his head was at a dead end, that his life had become hell. After all, his life and fate are playing in someone's hands, like a toy. He knew that a fate built on such deceit, conspiracy and deceit did not interest him. That is why Ulton Tokliboy Kochkarov, Bakhor and their comrades rebelled. Unfortunately, his rebellion ends in alienation from society. A closer look at the hero's life and rebellion reveals that Ulton has chosen a natural, not artificial, lifestyle.

In addition, the novel presents the first sketches of the author's later stories "Freedom" and "Caught eagle" (Bandi burgut). The conclusion suggests itself that, as Shukur Kholmiraev himself admits, "Olabodzhi" is the most perfect of the writer's novels. In the novel, the writer very effectively used the possibilities of traditional realism in a detailed description of the individual, society, and moral problems. In the novel, the decline of the individual and the decline of society are presented as extremely artistic studies from the point of view of the moral ideal.

ABSTRACT

This article describes the development of students' artistic thinking in the teaching of literary studies in the horizontal and vertical connection with the social sciences: the form, methods and means are logically consistent, consistent and scientifically described.

KEYWORDS: *Teaching, Process, Cognition, Mastery, Management, Activity, Knowledge, Skill, Competence, Competence, Form, Method, Tool, System, Goal, Task, Theory, Idea, Concept, Exercise, Statement, Thinking, Problem.*

INTRODUCTION

The teaching process is a process in which the learning objectives are achieved through the interaction of the student's learning activities aimed at mastering a particular teaching material, learning methods and pedagogical activities of the teacher based on the organization and management of this process.

The development of students' artistic thinking in the horizontal and vertical connection of literature with the social sciences requires the use of various innovative forms of teaching. A course that is a form of teaching that fulfills the requirements of the program, in connection with which excursions, homework, extracurricular and extracurricular activities should be used in a timely and effective manner. These forms of teaching form a system of teaching literature by connecting the social sciences horizontally and vertically.

In-class, out-of-class, out-of-class, and out-of-school activities, combined with the horizontal and vertical linking of literature with the social sciences, provide general learning objectives as well as the development of student artistic thinking. Mastering the learning material by the student serves to analyze the results obtained. In the teaching of literature in the horizontal and vertical connection with the social sciences, certain methods and tools are used, depending on the selected educational content, purpose, task in different forms of organizing the process of developing students' artistic thinking.

Therefore, the choice of forms of teaching by the teacher in this process is important. The content of education should take into account the purpose, tasks, role of these forms in the educational process, their relevance to specific goals. For example, if the subject is related to teaching aids, as well as artistic content, theory, ideas, laws, exercises, essays, essays, then it is necessary to choose a course that is the main form of teaching.

In addition to the lesson, extracurricular and extracurricular activities play an important role in the development of concepts related to artistic thinking. With regard to the problems of artistic thinking, the use of laws is important.

Pedagogical experience - the preparation of didactic and handout materials with the correct understanding of the goals and objectives of the forms of teaching by students involved in the experimental work, based on the principle of demonstration of didactics. Thus, the forms of development of students' artistic thinking in teaching literature, social sciences horizontally and vertically: lessons, excursions, homework, extracurricular and extracurricular activities form a certain system, they acquire knowledge, skills, competencies and competencies defined by the student, the scientific worldview. expansion, the formation of a conscious attitude towards nature and society through the development of artistic thinking, the acquisition of methods of cognitive activity and the increase of the effectiveness of teaching.

Textbook is the main form of teaching, its structure, organization, in which the organization, management and activation of the student's cognitive activity is the main problem of the methodology of teaching literature. Ensuring continuity and continuity of education in accordance with the requirements of the curriculum, expanding the student's scientific outlook through the effective use of teaching methods and tools in this process, developing artistic thinking, the formation of educational content and its components, inculcating national ideas in students is increased. The quality and effectiveness of teaching and learning depends on the organization of the lesson, the organization, management and activation of the student's learning activities. In order to study the content standardized by the curriculum, literature is organized in the classroom on the basis of a strict schedule, within a specified time in groups (classes) of students of the same age, level of preparation, with a permanent content.

The quality and effectiveness of teaching and learning depends on the organization of the lesson, the organization, management and activation of the student's learning activities. In order to study the content standardized by the curriculum, literature is organized in the classroom on the basis of a strict schedule, within a specified time in groups (classes) of students of the same age, level of preparation, with a permanent content.

Depending on the content of the topic being studied, lessons can be organized in literature museums. The content of education in the literature curriculum is given taking into account the age and psychological characteristics of the student, the knowledge base. The content of the

study of literature is divided into separate parts, chapters, topics in a logical sequence and sequence. As the study of the content of each topic is done in the lessons, the lessons also form a specific system and are logically connected.

Teaching in the classroom is organized on the basis of a curriculum that is common to the student. The teacher carries out pedagogical activities aimed at organizing, managing and activating students' learning activities in accordance with the content of the studied topic, educational, pedagogical and developmental goals. Thus, the student's activity in the classroom is his educational activity, and the teacher's activity is a pedagogical activity aimed at organizing, managing and activating this activity. Educational goals can be achieved in the classroom only when the student's learning activities are organized in accordance with the student's pedagogical activities.

Each lesson serves to build a conscious attitude to the environment through the acquisition of knowledge, skills, abilities and competencies of the student on the subject, broadening his scientific outlook, intellectual development, upbringing as a person, the development of artistic thinking. The teacher contributes to the fulfillment of the general goals and objectives set forth in the teaching of literature.

The following didactic requirements are set in the course of teaching literature synchronously and asynchronously with the social sciences:

- Clearly define the educational, pedagogical, developmental goals of each lesson and their place in the system of lessons;
- The level of preparation of students, the objectives of teaching, the optimal choice of educational content in accordance with the didactic requirements of the curriculum;
- To identify ways to develop artistic thinking on the basis of the concepts of general and formed fiction, which are developed in the course, the knowledge, skills, abilities and competencies;
- Activation of student learning through the identification and coordination of effective teaching aids, tools, methods of control and motivation for the implementation of each stage of the lesson;
- To set clear educational goals, taking into account the knowledge of the student, the expansion of the scientific worldview of the subject, the possibility of spiritual, moral, intellectual, hygienic, physical, sexual, economic education, aesthetic sense, diligence, artistic culture;
- to meet the needs of students for independent acquisition of knowledge, skills, competencies and competencies, the study of literature, synchronous and asynchronous connection with the social sciences, the development of interest, encourage creative activity and initiative in student activities;
- Development of a scientifically-methodical design of the subject on the basis of the plan;
- creation of handouts and didactic materials in the context of the development of artistic thinking, educational tasks for monitoring and evaluation of student knowledge, a set of differential tasks;
- create a technological map of the lesson to ensure the efficient use of time.

Lessons are studied systematically in the development of students' artistic thinking in the teaching of literature in synchronous and asynchronous connection with the social sciences.

Therefore, the teacher must know the types and types of lessons, the specifics of modern educational technologies used in them.

It is necessary to know the peculiarities of modern educational technologies used in the classroom in the teaching of literature in the horizontal and vertical connection with the social sciences.

Modern educational technologies used in the horizontal and vertical connection of literature with the social sciences are organized on the basis of questions and assignments in the context of artistic thinking.

1. The use of conference creative game, game exercises of didactic game technology in cases where the tasks of artistic thinking are of a reproductive and productive nature:
2. The use of problem-based learning technology brainstorming, conflict of ideas in cases where the tasks of artistic thinking are productive and creative in nature:
3. The use of individual modular curricula of modular educational technology in cases where the tasks of artistic thinking are of a reproductive, productive and partially exploratory nature.
4. The use of methods of collaborative learning technology, such as team teaching, when the learning tasks in the context of artistic thinking are reproductive, productive, partially exploratory and practical in nature.

Homework is inextricably linked with the lesson, which is a logical continuation of the topic studied in the lesson and a factor in the independent learning of students.

According to the teacher's assignment and instructions, students do exercises, dictation, narration, study of additional literature in essay writing, preparation of lectures or abstracts on specific topics, do their work. The student prepares the ground for mastering the methods of cognitive activity by completing learning tasks.

In the lesson, the teacher implies teaching through a combination of educational content, teaching methods and tools that prepare the ground for the interdisciplinary development of students' artistic thinking. However, not all topics can be studied in class, for example, dictation, essays, essays are used in extracurricular activities.

Extracurricular activities are a form of compulsory education performed by a student under the guidance of a teacher. According to the requirements of the program, the student must perform extracurricular activities individually or in small groups. The student's extracurricular activities are, by their very nature, a means of thinking and reasoning. Because the information received in extracurricular activities is perceived, processed. On this basis, new knowledge is created. The student engages in extracurricular activities and engages in certain interactions with different learners. They face different situations. Therefore, the more diverse the student's extracurricular activities, the wider the range of his or her attitudes and the more effective his or her spiritual growth will be.

Extracurricular activities include discussion nights, art evenings on specific topics, teaching aids, and preparation of visual aids. Depending on the content of extracurricular activities, poetry readings, various competitions can be held in the literature classroom.

The summer assignments on the subject of literature include questions and assignments on artistic thinking, the results of which will be used in the future in the form of visual materials. It is an important form of excursion-educational process for the development of artistic thinking, which allows students to get acquainted with the objects, phenomena, laws, basic theoretical ideas of social life, to apply theoretical knowledge in practice, to master the methods of knowing and understanding the art world. During the excursion on the development of artistic thinking, the knowledge acquired by students is used to connect the acquired knowledge from the literature, to consolidate, complete, systematize and generalize the knowledge in the process of learning a new topic.

Excursions also provide an opportunity to activate and develop students' independent learning activities. During the excursion, students acquire new knowledge through the use of previously acquired knowledge, skills, competencies and competencies in the process of completing learning tasks individually or in small groups.

The above-mentioned forms of developing students' artistic thinking in the teaching of literature in the horizontal and vertical connection with the social sciences: there is a constant consistency, continuity, coherence and connection between lessons, lessons and extracurricular activities, which ensure the integrity of the educational process.

In the horizontal and vertical connection of literature with the social sciences, the control of students' educational and creative activity in accordance with the requirements of the State Educational Standards (SES) focuses on the protection of students' attention and personal views, if their opinions are evaluated and encouraged. As a result, new ideas are put forward. Only in the case of a positive approach to these issues in the teaching of general subjects, the problem of forming a conscious attitude of students to fiction will be solved.

The results of pedagogical experiments conducted in general secondary schools for 2019-2021 confirmed that the organization of the lesson in such a way has a positive character.

Comprehensive development of students mentally, spiritually, physically and practically, it is desirable to use a complex of interactive methods in the process of interdisciplinary teaching of literature. In the educational process organized in this way, there was an opportunity to increase the interest of students in fiction, to teach them to work mentally, to direct them to the profession and to prevent stress.

The results of pedagogical experiments confirm that in order to activate the cognitive activity of the student during the lesson, a gradual transition from one source of knowledge to another, from one type of activity to another is envisaged. For example, the quality and effectiveness of education is high in lessons organized on the basis of independent practice of listening to the lecture, dictation, narration, writing an essay, then discussing the results of the experiment, listening to the teacher's brief opinion, and then choosing practical exercises and their independent implementation. will be.

The use of commentary, etc. is an acceptable way. These methods serve to motivate the student, to show his interest and ability to learn. The main purpose of the integration of education is to give students a good idea of nature and society at school and to form their own attitudes to the laws of development. The study of literature and social sciences and the establishment of interdisciplinary links are the methodological basis of the approach to the integration of

education. This can be achieved by going back many times to the concepts of different lessons, deepening and enriching them, identifying important signs that are understandable at this age.

Thus, any lesson that includes a well-formed group of concepts should be based on integration.

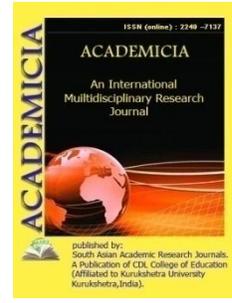

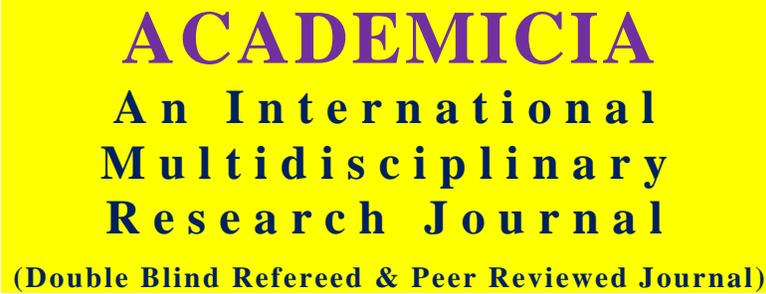

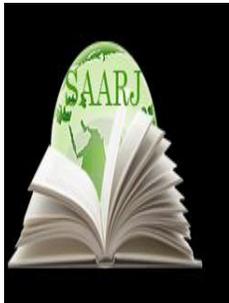

The article divides the integration of sciences into the following components:

- object integration - an object is included in a topic, section or course in different disciplines;
- Integration of theory is studied in the literature in general;
- methodological integration - the implementation of integration of specific methods of scientific knowledge;
- problematic integration - interdisciplinary problems are covered and solutions are developed;
- Integration of activities - discussion of problem solving, work in small groups, development of interdisciplinary action plans, preparation of projects, etc .;
- creation of technical products on the basis of processes that are important in practical integration.

In the process of teaching literature horizontally and vertically by connecting it with the social sciences, connections in form, content, object, concept, problem, activity, and practical connections were used. Educational integration is a high level of interdisciplinary communication, a tool that allows you to create a whole integrated knowledge. Definitions of the concept of integration are different. The common denominator of these definitions is that integration is about achieving a holistic view of the being around us. The basis of integration is interdisciplinary connection and finds its development in the idea of integration. The study of disciplines with integrative content is considered as the knowledge of future professionals, the employment factor.

Tashkent, UZBEKISTAN

ABSTRACT

This article deals with role playing games, which are practical and capable of attracting students to teach foreign languages, mainly English. We are talking about the thematic features of the method, its uniqueness, how much it can attract students, and its practical aspects. In particular, the objective side of this method, different from other methods, is that during classes, the student, putting himself in free behavior, allows him to easily express his opinion through his actions, gestures, facial expressions. In turn, it will be easier for a student to feel in the environment of the English language, showing role playing games, various actions during classes, and at the same time acquire skills incomplete understanding of the language.

KEYWORDS: *Role-Play, Modern Worldview, Opinion, Practical, Educational Technologies, Discussion, Classes, Teaching*

INTRODUCTION

The current era, which is taking place with every moment full of news, requires us to be swift in this area. Learning foreign languages is part of this accelerated process. Foreign languages contribute to forming a modern worldview, the aesthetic education of contemporary youth, while young people reach adulthood, can think and enter into discussion quickly. That's certain.

The decision of the President of the Republic of Uzbekistan Sh.M.Mirziyoyev "On measures to bring activities to popularize the study of foreign languages in the Republic of Uzbekistan to a qualitatively new level" from 19.05.2021 PQ-5117 was another critical step in support of the study of foreign languages.

Let us pay attention to one of the methods of teaching English, which is now raised to a high level of demand in almost all areas of our time.

The main results and findings

The question arises: what is the central aspect you need to pay attention to in creating an English language environment?

The practical organization of the training environment is associated with educational technologies, methods used in the educational process. At the same time, the psychological state, the ability and attitude of the language student to study the language, his intellectual potential are considered. Suppose the student is in a free language environment. In that case, the opportunity to be in this language environment is created using various interesting methods, then the student's interest in the language is formed independently. The teacher, who managed to summarize the above two aspects, considers the lesson to be high-quality and effective and contributes to the formation of language learning skills in the student [1].

Teachers should pay attention to the following matters:

- a) Consider students prior knowledge;
- b) View learning as a process of transformation which led to them; the conception of conceptual change in students self;
- c) Engage students in science through experimental activities for conceptual change or knowledge, which is constructed through the active participation of students in hands-on activities and mind;
- d) pay attention to social interaction by involving students in group or class discussions.

The person, first of all, has to have a care and interest in learning languages and formation of abilities to learn languages. It will be obligatory to depend on external factors. It is required to harmonize more English-speaking literature, create friends from foreign countries, and communicate quickly with them in a foreign language. One of the most effective learning methods is obtaining language skills through roleplaying games that are a part of Game-based Learning. It is a social space that develops speaking and listening skills. It gives children the opportunity to reflect on and expand their knowledge of a topic while sparking and enhancing creativity and imagination.

- In what features of roleplaying games are reflected?

What is role-play? Role-play is any speaking activity when you either put yourself into somebody else's shoes, or when you stay in your own shoes but put yourself into an imaginary situation!

Imaginary people - The joy of role-play is that students can 'become' anyone they like for a short time! The President, the Queen, a millionaire, a pop star the choice is endless! Students can also take on the opinions of someone else. 'For and Against' debates can be used and the class can be split into those who are expressing views in favour and those who are against the theme. Imaginary situations - Functional language for a multitude of scenarios can be activated and practised through role-play. 'At the restaurant', 'Checking in at the airport', 'Looking for lost property' are all possible role-plays.

Why use role-play? It is widely agreed that learning takes place when activities are engaging and memorable. Jeremy Harmer advocates the use of role-play for the following reasons:

- It's fun and motivating
- Quieter students get the chance to express themselves in a more forthright way
- The world of the classroom is broadened to include the outside world - thus offering a much wider range of language opportunities

In addition to these reasons, students who will at some point travel to an English-speaking country are given a chance to rehearse their English in a safe environment. Real situations can be created and students can benefit from the practice. Mistakes can be made with no drastic consequences.

Tips on successful classroom role-play Prepare for success Role-play is possible at elementary levels providing the students have been thoroughly prepared. Try to think through the language the students will need and make sure this language has been presented. Students may need the extra support of having the language on the board. I recently did a 'lost property office' role-play with elementary adults and we spent time beforehand drilling the structures the students would need to use. When the role-play began the students felt 'armed' with the appropriate language. At higher levels the students will not need so much support with the language but they will need time to 'get into' the role.

The role of the teacher Some of the possible teacher roles are:

- Facilitator - students may need new language to be 'fed' in by the teacher. If rehearsal time is appropriate the feeding in of new language should take place at this stage.
- Spectator - The teacher watches the role-play and offers comments and advice at the end.
- Participant - It is sometimes appropriate to get involved and take part in the role-play yourself [2].

- What purpose of the application of this method?

In answer to these questions, we pay attention first of all to objective aspects:

1. Roleplay will promote an increase in interest in language, which is learned first of all by the linguist
2. At students skills of friendly work in collective are formed
3. Provides to student's presence in the English environment.
4. Helps students to have a mental state
5. Strengthens trust in the student
6. Provides tranquility and tranquility
7. Talab in English-speaking times will be had by an opportunity to speak fluently.

Now I want to add here several vital purposes of role plays that can help:

- To convey-share information

- To elaborate specific skills
- To develop a situation for analysis
- To boom understanding of points of view of others
- To increase insight into a typical way of dealing with an issue
- Provides an opportunity for social interaction among members;
- To develop communication skills
- To involve everybody to work cooperatively for a common goal
- To try new behaviors in the presence of co-learners
- To encourage thinking as well as creativity
- To create motivation (more important purpose)

Roleplay is a classroom activity in which learners take on roles and act in an imagined or real scenario. It helps to boost all domains of learning, cognitive, psychomotor, and affective skills [3-6]. The second thing I should mention is that roleplays are extremely useful for building interpersonal skills. What's more, the roleplay method elaborates a greater understanding of the complexity of professional practice. Role-playing games are a vital source for reflection by students of English-speaking grammatical times. As an example in The present continuous Tense, it is possible to organize the next roleplaying games:

- What are they doing?

Students, entering for a role, show the state provided as a task without voting, using actions of parts of a body, and answers can be:

Jane is dancing

My mother is cooking my favorite national cook

This role play will proceed in the following state, and since the same processes, students' interest in this method will grow.

What aren't they doing?

They aren't playing football at the moment

Students can study keywords in advance and use them during this game.

So, it follows from these examples that thanks to this method, the students at the same time gain knowledge of the structure of the time of Present continuous tense, of the system of keywords, forms of a tree, interrogation, seek to understand the present employing the movement in a visual home look.

One more example is that small stories in the form of texts that well-read stories are issued to readers. After their reading, realizing a situation, execute heroes of the story in the form of roleplaying. What an authentic way! As a result

- They are in a very pagan environment

- Because they represent themselves as heroes of the work, they form responsibility for how they cope with a task
- It will give them pleasure
- Are in a friendly situation
- People will have a culture of behavior

The next crucial thing I can mention is that role plays can help students explore emotive culprits like smoking, engaging in mobile phones, or other cultural issues by showing their attitude. Now, let us turn our thoughts to several opinions about this method:

1. Hirsch argues that role play consists of the critical elements of the experimental learning
2. David Kolb defined role to play as a "process whereby knowledge is created through the transformation of experience."

RESULTS AND DISCUSSIONS

From this point of view, if through roleplaying games the English studies, then at the researcher the technique of visual judgment will be created that is the significant aspect. Unlike other methods, the whole human body participates in role scenes that, first of all, improve the researcher's mood. It, in turn, leads to the excellent development of a subject by the student. It will surely provide a perfect mental condition for students.

It is irrefutable that role plays promote leadership in any age. To be a leader, the learner should have strong knowledge of the field of science as well they must have a sense of self-reflection, indeed. In that case, students can achieve the goals which they expected from this vital, effective method. It is impossible to deny the role of this method information of leader abilities at students.

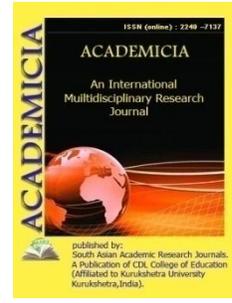

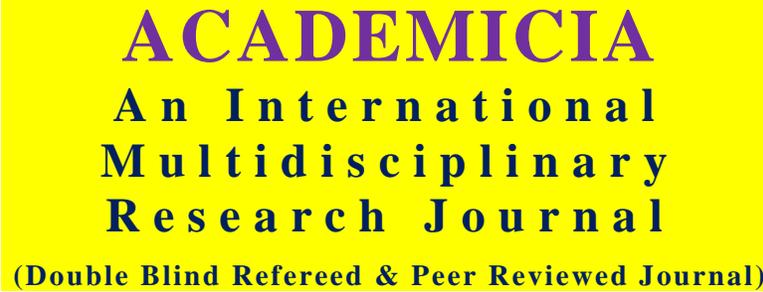

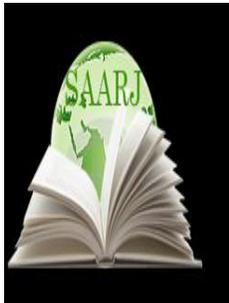

CONCLUSION

In general, I believe that role plays give students the opportunity to demonstrate how to use English in real-life situations and make them focus more on communication than on grammar. They will learn how to become more sociable in any position of our fast-paced life, become more attentive in any case, show on attitude fast, and have more effective speech. Role-plays are important in the communicative approach because they allow students to practice communicating in various social contexts.

ABSTRACT

This article is devoted to one of the most pressing problems of family pedagogy - the preparation of young people in the family for an independent family and their professional orientation. The article clearly shows the issues of preparing young people for independent family life on the basis of family traditions, taking into account the requirements of family upbringing, ways to achieve the correct organization of vocational training, first of all, to prepare for family life in family and educational institutions.

KEYWORDS: *Upbringing, Upbringing Of Boys, Spiritual And Moral Upbringing, Preparation For Family Life, Family Traditions, Customs, Values.*

INTRODUCTION

Preparing well-rounded, intellectually gifted young people for independent family life is becoming one of the urgent tasks of today. In order to fully fulfill such important tasks, our country has introduced the use of material and technical base and advanced forms of educational technology in accordance with world standards at all stages of the current education system. However, a deeper study of the laws of physical and psychological development of young people, the identification of future professional and intellectual potential of each of them in the form of abilities, talents and abilities, as well as individualization of educational processes based on these opportunities cannot be called modern requirements.

For everyone, the family is the beginning of life. After all, the family is an educational center that ensures the eternity of life, the continuity of generations, passing our national traditions and customs to future generations, as well as directly affecting their development as human beings.

THE MAIN FINDINGS AND RESULTS

Along with the mother, the role of the head of the family, that is, the father is great in the strength of the family, in its material support, in maintaining its socio-pedagogical, spiritual and spiritual balance, as well as in the upbringing of children. In particular, it is necessary to determine the role of vocational guidance in preparing young people for family life and increase the role of family and educational institutions in the effectiveness of the work done.

Establishment of psychological services in the education system is a tool for effective implementation of the educational process, creating a healthy socio-psychological environment in pedagogical communities, protecting the psychological health of students and teachers, ensuring the priority of personal interests of students in the process. It is safe to say that it stems from the need to prepare for family life. Therefore, in the course of lectures and practical classes on economics in secondary schools, thrift, entrepreneurship, business, financial management of the family, sex education in hygiene classes, the rules of cleanliness, spiritual and moral maturity in spiritual hours, respect for spouses, diligence, psychological maturity in psychology, In addition to the above disciplines, it is necessary to carry out professional orientation work in order to be alert, to behave in any situation, not to be overly emotional, to understand the role and place of himself and his family in the development of society, and to form such qualities. Because of the strong feelings of boys in grades 8-9 during adolescence and its effective effect on mental and emotional development, the height of feelings of justice and truth, their importance in the family and social environment, the desire for beauty and the need for aesthetic taste in future family life, self-management issues that he sees as the owner of his chosen profession are of particular importance.

Today, based on the requirements of the National Training Program, it is expedient to carry out large-scale reforms aimed at further improving the education system, inculcating national values and traditions in the content of continuing education, especially secondary special, vocational education. The issue of invaluable spiritual heritage created by our ancestors over the centuries, the restoration of forgotten values, the understanding of national identity has risen to the level of state policy. As a result of the re-establishment of national traditions and values, pedagogical activity in vocational education is aimed not only at equipping future highly qualified specialists with knowledge, skills and abilities on the basics of science, but also at meaningful organization of leisure time outside the classroom. should be involved in professional work, taking into account the presence of Indeed, the concept of "Family, educational institution and society" is invaluable in educating a person ready for a high level of independent family life. In preparing modern youth for family life on the basis of this concept, it is noteworthy to revitalize the close, sincere, rational relationship of parents with a career-oriented educator. The concept is not only the exchange of information between the two subjects on preparation for independent family life, but also the conclusion: on the basis of what qualities and qualities to organize career guidance, how to apply the results in practice, what goals and ideas to practice, etc. in harmony with similar issues of spiritual and enlightenment education. Thus, in today's relationship between the family and educational institutions, the emphasis on the preparation of young people for family life in the right direction of vocational guidance is a unique and important feature. It is even a

special phenomenon that the focus is on the proper organization of work to prepare young people for independent family life and its further improvement - the spiritual maturity of future family owners.

In today's world, where global relations are developing and various ideas and opinions are rapidly gaining popularity, it is natural that the focus on professional development of young people is more important than ever, and modern pedagogy faces a number of challenges. Preparing young people for the family and all its functions, which are an important part of society, requires that they have a deep knowledge of the profession - in harmony with spiritual maturity. Family traditions play an important role in cultivating professional skills in young people, increasing their spiritual and enlightenment potential, research, creativity, in short, in the formation of a comprehensively mature personality. Another characteristic feature of family traditions is that it develops the child's self-confidence, accurate assessment of the situation and willpower, and most importantly, his social activity is under the control of parents. The greatest duty of every family is to prepare intelligent, intelligent and capable people for independent living who can make a worthy contribution to the development of the country. In order for every parent to fully prepare their children for independent family life so that they can find their place in the future, they must first have professional potential, spiritual maturity, a broad outlook and common sense. In the ancient family traditions, our ancestors not only gave guidance to their children, but also prepared them for independent living and allowed them to pass on their professional experience, abilities and skills from generation to generation. In career guidance, family traditions should be based on a specific program, plan, or manual. In this regard, the older generation of parents and parents in the process of education with young people should adhere to the following: - to equip young people with experience in accordance with the requirements of the times, the laws of society in the educational impact; - to teach to strive for a single goal, to see the future; - be able to have a positive impact on the psyche, spirituality of young people and be demanding in their place; - habit of self-respect and respect for others; - move forward with the goal of success; - establishing a positive feedback; - pay attention to the use of different methods of vocational training; - In the process of upbringing, the older generation and parents should be exemplary in all respects: spiritual, moral, professional; - to form a sense of duty, responsibility, responsibility, etc.

CONCLUSION

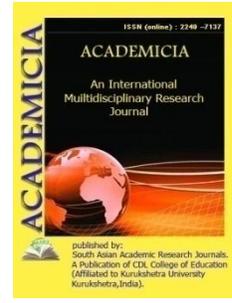

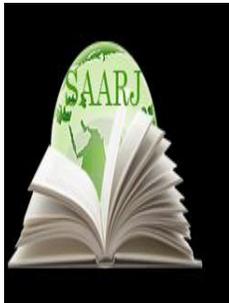

As noted above, the preparation of young people for independent family life on the basis of family traditions in career guidance will help to increase the effectiveness of education will provide the desired effect of preparing them for independent living. According to the ideas of pedagogical doctrine, practical skills and abilities are formed through direct training, ie the direct performance of a particular activity. Career guidance in preparing young people for independent family life in the family is important in that it creates a favorable environment for young people to work directly, to take into account their individual characteristics, to further develop their existing talents in the chosen profession or occupation. Such situations nurture young people not only a responsible approach to independent living, but also spiritual and moral qualities such as honest work, pride in the effectiveness of work. In the upbringing of children, special attention should be paid to the effective use of the national educational system of our people in the observance of the traditions, customs and morals of the ancient ancestors, and educators should not spare their strength and intelligence in this regard. From the above considerations, it is clear

that in the current environment of comprehensive democratic reforms, educating the next generation as a high-level future owner and owner who can contribute to the development of the country has become a requirement of the time. In this regard, the effective use of family traditions in the education system is important.

THE ROLE OF GAMING TECHNOLOGIES IN TEACHING STUDENTS AT THE MIDDLE STAGE

Rizayeva Zarnigor Ikramovna*

*Teacher of “Spanish and Italian languages” department,
Samarkand State Institute of Foreign Languages,
UZBEKISTAN

ABSTRACT

The modern education system provides teachers with many opportunities and resources to improve the effectiveness of the educational process. One of the more effective methods is gaming activity. In turn, it is also relevant in teaching students of higher educational institutions. Games stimulate interaction and successful communication of students and provide consistency to continue learning efforts, create conditions for meaningful use of language, reduce anxiety and allow students to study in a relaxed and pleasant atmosphere. Another advantage of using games in the process of learning a foreign language is the clarification of stressful moments.

KEYWORDS: *Gaming Activity, Gaming Technology, Business Game, Didactic Games, Role-Playing Game, Cognitive, Social And Creative Function Of The Game.*

INTRODUCTION

A stress-free environment should be provided in the atmosphere of language learning. At this stage, the games are very useful, because students do not feel any anxiety, their positive emotions are enhanced, and their self-confidence increases, because they are not afraid of punishment or criticism when they practice the language fluently. In many games, students have to cooperate to achieve a goal, and most students enjoy cooperation and social interaction. It is believed that when cooperation and interaction are combined with fun, successful learning becomes more possible. No matter how differently games are described, one should not underestimate their pedagogical value both in teaching and in learning a foreign language.

In the game, a person completely immerses himself in the role assigned to him and reveals all his possibilities. Therefore, gaming activity is given great importance in the system of teaching students. Game activity is recreated in the classroom with the help of game methods and conditions, which are called game technologies and are aimed at organizing the activities of

students. Game technology is a set of psychological and pedagogical methods, methods of teaching techniques, educational tools. The development of game technologies by a teacher is of great importance. Traditional education, first of all, concentrates on the transfer of knowledge of a basic theoretical nature and pays much less attention to applied ones. Students may have difficulties in social adaptation, delays in social development, perception of future social roles due to lack of knowledge and skills of applied and practical level. Unlike other technologies, it gives the student the right to be personally involved in the functioning of the phenomenon being studied, as well as the opportunity to live for some time in real life circumstances [1, 13-16].

However, in order to introduce game technology into the educational process, it is necessary to find out the following: what competencies need to be formed, what educational material it is desirable to study using game technology, how to connect the game with other methods of education and training, what game technology needs to be chosen for a specific topic of the lesson and how to find time in the curriculum for its implementation and implementation.

The educational process based on the game must be organized correctly. To do this, you need to know the following:

- The model of the learning process based on the game is the inclusion of students in the game modeling of the studied phenomena, their living a new experience in the game;
- game-based learning provides an opportunity for students to make decisions independently, involves students in modeling complex situations, makes learning very interesting, intense, sometimes even stressful;
- Students have role-playing activities;
- a game situation is introduced and a problem situation is created through it, which is lived by student participants in the form of a game, the basis of their activities is game modeling, part of the students' activities takes place in a conditional game plan;
- teach students act according to the rules of the game;
- The teacher performs several roles: organizer, assistant and partner in the overall process of the game;
- The game has two levels: substantive and socio-psychological.

Game technology is a holistic education that covers a certain part of the learning process and is united by a common content, plot, characters. Each teacher, in order to build an educational process based on a game, can make up various game technologies from individual games and elements. The implementation of gaming technology solves an important task: everyone who takes part in it must find a way to self-expression, get to know themselves, as well as other participants, so that everyone in the game is easy and comfortable. Not every teacher is a master at creating games. Naturally, there are teachers who use game teaching techniques, and often make mistakes and blunders in this. In order to apply various game technologies in their activities, the teacher must know the general techniques for organizing work with the group, the methodology of the game library, understand the importance of presentation, communication skills, dynamics in the game. The ability to build this game is also important. The teacher himself should be ready to play, involve, participate, help all other participants. There are an unimaginable number of different types of games. The business game is widely known to

everyone as a kind of role-playing game. A business game is a joint activity of a group of students and a teacher under his control.

This type of game makes it possible to evaluate the ability to analyze and solve typical professional tasks. The peculiarity of business games is the high emotional mood of its participants, they always have a healthy competitive spirit [4, 169-172].

The psychological and pedagogical principles of organizing a business game:

- the principle of simulation modeling of specific conditions;
- the principle of game modeling of the content and forms of activity;
- the principle of joint activity, through the involvement of several participants in cognitive activity, requires the developer to select and characterize roles, determine their powers, interests and means of activity;
- the principle of comprehensive collective discussion of educational material by students allows them to achieve a comprehensive presentation of professionally significant processes and activities;
- the principle of the problematic content of the simulation model and the process of its deployment in gaming activities.

The signs of a business game:

- activity is modeled, certain tasks, roles are performed, and ways to solve the problem are found as a result;
- the game is not limited to solving one problem, but requires a “chain of solutions”;
- roles are distributed among the participants of the game;
- role goals begin to differ when finding solutions that contribute to the emergence of contradictions between participants, conflicts of interest;
- there is a controlled emotional tension;
- participants interact, perform certain roles;
- there is a common game goal for the whole team;
- the whole team develops solutions;

There are many alternatives to solve the problem. The goals of the business game are diverse:

- it has a positive effect on the modeling of the problem and makes it possible to consider different solutions and find the most effective ways to solve them;
- conveys a holistic view of professional activity, taking into account emotional and personal perception;
- teaches collective thinking and practical work, forms skills and abilities of social interaction and communication, as well as skills of individual and joint decision-making;
- educates a responsible attitude to business, respect for social values and views of the collective and society as a whole.

The essence of the business game is the creative activity of participants who need to find a problem and ways to solve it. A business game is a kind of training used in an educational institution that helps to achieve a goal. When applying this active method, modern university education will "absorb" everything new and progressive that arises in pedagogical theory and practice in order to increase the cognitive activity of students [2, 190-192].

Didactic games in foreign language lessons are used primarily to consolidate the skills of listening, reading, speaking and writing. Didactic communicative game involves such an organization of joint communicative activity of the teacher and students, during which the peculiarities of the speech behavior of schoolchildren are simultaneously manifested and foreign language communicative skills are formed. Creative role-playing games are one of the ways to learn foreign languages. Concepts such as role-playing, simulation, drama and play are often used interchangeably, but in fact they have different meanings. The difference between role-playing games and simulations is the authenticity of the roles performed by students. When simulating, students play their natural role, in other words, the role they play in real life (for example, the role of a buyer or booking transport tickets). In a role-playing game, students play a role that they do not play in real life (for example, a popular actor, judge, prosecutor, director, etc. A role-playing game can be considered as one of the components or an element of simulation.

Thus, in a role-playing game, participants assign roles that they play out within the script. In the simulation, attention is focused on the interaction of one role with other roles, and not on playing individual roles. One way or another, role-playing prepares students for social interaction in a different social and cultural context. This game is a very flexible learning activity that has a wide range of possibilities for diversity and imagination. Various communicative techniques are widely used in role-playing games, thereby developing fluency in language, interaction in the classroom and increasing motivation [3]. Role-playing improves the conversational skills of students in any situation, because almost all the academic time in the role-playing game is devoted to speech practice, while not only the speaker, but also the listener is as active as possible, since he must understand and remember the partner's remark. As for shy students, role-playing helps by providing a mask with which students with communication difficulties are released. Also, it's fun, and most students will agree that fun leads to better learning. In turn, role-playing games can be classified as follows:

1. Short-term role-playing game, which is the simplest and fastest type of game lasting from 10 to 30 minutes. It can be built on the basis of text or dialogue. An example of this game can be presented in the form of an interview. Students are divided into pairs, after which they are given pictures depicting various problematic situations. One of the students takes the role of the interviewer, the other the role of the respondent. The task is to describe the problem and propose its solution. The game component consists in the fact that experts are also appointed among the students, whose task is to draw up a criterion for evaluation and subsequently evaluate all the speakers and point out the mistakes made. During this game, there is a high motivation and desire of students to show themselves, because one of the evaluation criteria may be artistry [3].
2. A full-fledged role-playing game in which students are given a description of the situation and their roles. The duration of this type of games takes an average of one or two lessons. As an example, consider verbal role-playing games. This archetype of games occurs through the verbal

interaction of participants describing the actions of their game characters, and a mentor, in whose role a teacher can act, describing the realities of the game world.

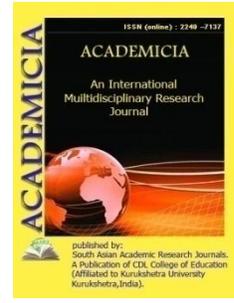

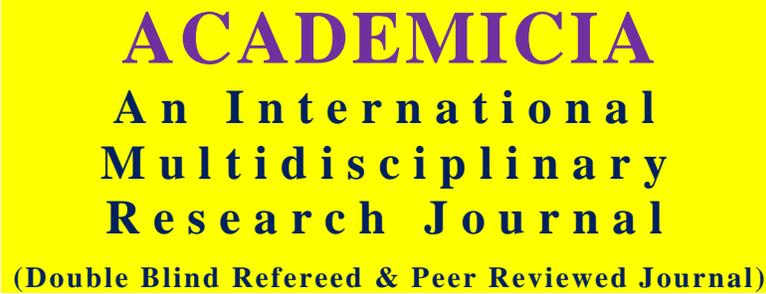

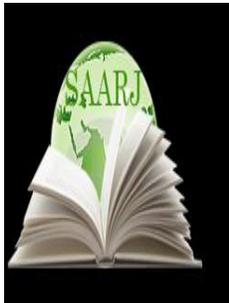

Game learning is a form of educational process in created conditional situations, which is aimed at recreating and assimilating social experience in knowledge, skills, abilities and emotional evaluation activities. It is important for the teacher to master game technologies and use them in the classroom, because the use of game technologies in the educational process helps prepare students for important social roles, gives them the opportunity to personally participate in the functioning of the phenomenon being studied, allows them to live for some time in “real” life conditions.

CONCLUSION

Thus, the article proves the role of a foreign language, which acts as a means of intercultural interaction in social and professional spheres, is increasing every year in the modern world. This explains the need to rethink not only the concept of higher professional education, but also language education in new conditions. The new pedagogical paradigm presupposes the creation of an education system focused on humanization, productivity, creative and developing nature of the pedagogical process, which determines the interest of researchers in the problem of constructing such a process of teaching foreign languages, in which the main emphasis would be on the development of professionally significant competencies among students and which could contribute to a high level of formation of the main significant personality qualities. In many ways, the conditions in which universities could ensure that graduates achieve new effective results in learning a foreign language are determined precisely by the choice of pedagogical technologies, active methods and forms of education that organize creative and independent activity of students, involving the inclusion of elements of problematic, scientific search in the educational process. One of the teaching technologies that is becoming more and more widespread in the pedagogical process of teaching a foreign language is the game.

METHODOLOGICAL PRINCIPLES OF DEVELOPING SPEAKING SKILLS AT DIFFERENT LEVELS OF TEACHING FOREIGN LANGUAGES

Stepanyan Albina Anatolyevna*

*Teacher,
Samarkand State Institute of Foreign Languages,
Samarkand, UZBEKISTAN

ABSTRACT

The article considers an urgent problem of modern methodology – the formation of speaking skills in a foreign language. Learning to speak a foreign language and the formation of speaking skills is the ultimate goal of teaching a foreign language. This is the relevance of the conducted research. The paper thoroughly examines the content of teaching speaking and examines the difficulties that arise in this complex and long process. The question of effective ways to overcome language barriers in the process of learning to speak a foreign language is interesting.

KEYWORDS: *Speaking, Teaching Process, Language Barrier, Formation, Difficulties, Facilities.*

INTRODUCTION

The main purpose of a foreign language as a subject area of education is seen in mastering the ability of students to communicate in a foreign language. We are talking about the formation of communicative competence, i.e. the ability and willingness to carry out both direct communication (speaking, listening comprehension) and indirect communication (reading with understanding of foreign texts, writing). The formation of communicative competence is the main and leading goal of training. Today it is especially popular. Experience shows that the greatest difficulties in foreign language communication a person experiences, perceiving speech by ear. However, oral communication, the role of which has now become especially significant, is impossible without understanding the interlocutor's speeches, since in the process of speech interaction everyone acts both as a speaker and as a listener. Speaking is an extremely multidimensional and complex phenomenon. Firstly, it performs the function of a means of communication in a person's life. Secondly, speaking is one of the types of human activity.

Thirdly, it is important to remember that as a result of the activity of speaking, its product arises - an utterance. Both as an activity and as a product, speaking has certain characteristics that serve as a guide in learning, because they suggest what conditions need to be created for the development of speaking, and are also criteria for evaluating learning outcomes.

Dialogue is considered to be one of the most effective means of developing and forming speaking skills in teaching foreign languages according to the rule. Many teachers have long appreciated the wide possibilities combined with minimal time and objectivity of results. A unique predisposition to speech, the plasticity of the natural mechanism of speech assimilation, as well as a certain independence of this mechanism from the action of hereditary factors related to belonging to a particular nationality - all this gives the learner the opportunity, under appropriate conditions, to successfully master a foreign language. With age, this ability gradually fades. Therefore, any attempts to teach a second foreign language (especially in isolation from the language environment) to older learners are usually associated with a number of difficulties.

The changes in social and economic life that have recently taken place in our country have led to radical transformations in various spheres, including in the education system and, in particular, in the field of teaching and learning foreign languages. The expansion of international contacts and cooperation at all levels, entry into the world educational space, set the school the task of organizing school education at such a level that students will be able to participate in intercultural communication in the language being studied and independently improve in the foreign language-speech activity they master. Therefore, the search for ways to improve the effectiveness of teaching foreign languages has become more active in the last decade. This is the shift of the beginning of education to school childhood (elementary grades), and the use of a number of intensive methods, and the introduction of new into the traditional, as well as the recognition of the need to take into account the individual psychological characteristics of schoolchildren, individualization and differentiation of learning.

The degree of knowledge of the problem. The above topic was studied by many leading methodologists, such as: Bim I.L., Biboletova M.Z., Galskova N.D., Nikitenko Z.N., Miruld R.P., Maksimova I.R., Rogova G.V., Firdman L.M. and many others. They studied the problem of the formation of speaking skills at any particular stage of training. In this paper, the problem was investigated at all stages of foreign language teaching, starting from kindergarten to higher education.

The aim of the article is to determine the scientific basis and methodology for the formation of speaking skills based on the analysis of methodological literature on this topic, to collect the necessary scientific data that are directly or indirectly related to the issue under study. In addition, it is important: 1) describe and analyze early achievements in the field of teaching speaking and skill development; 2) determine the degree of applicability of sample dialogues as one of the types of training exercises in the process of learning foreign languages at a specific stage; 3) to reveal the basic concepts of the terminology of the speaking skill and its criterion of automatization.

In the course of the work, the following research **methods are used**: 1) critical analysis of scientific and methodological literature on the problem; 2) study and generalization of positive experience of teachers; 3) observation of the supervising activities of teachers and students during pedagogical practice; 4) experimental verification of composite speech tasks.

Results and discussion

The oral speech of any literate person is quite different from written speech. It would be a mistake to think that the communicative method of learning English is intended only for a light small talk. Those who want to be a professional in a particular field regularly read publications on their subject in a foreign language. Having a large vocabulary, they easily navigate in a foreign text, but it costs them enormous efforts to maintain a conversation with a foreign colleague on the same topic.

The communicative method of learning English is designed, first of all, to remove the fear of communication. A person armed with a standard set of grammatical constructions and a vocabulary of 600-1000 words will easily find a common language in an unfamiliar country. The main purpose of this method of learning English is to teach the student to speak English fluently first, and then to think in it. It is also important that mechanical reproducing exercises are also absent: their place is taken by game situations, work with a partner, tasks for finding errors, comparisons and comparisons that connect not only memory, but also logic, the ability to think analytically and figuratively. English textbooks often contain excerpts from the English-English dictionary. The whole complex of techniques helps to create an English-speaking environment in which students should "function": read, communicate, participate in role-playing games, express their thoughts, draw conclusions in English. English is very closely intertwined with the cultural characteristics of the country, therefore, the courses certainly include a country-specific aspect. The British consider it necessary to give a person the opportunity to easily navigate the multicultural world, and this is easily done with the help of such a powerful unifying factor as English.

This is followed by work with the English text (the presentation characteristic of English textbooks is small numbered paragraphs), and reading is also diverse (scan reading, reading for gist, summary reading, etc.). Work on the text is usually preceded by classes in pairs, answers to questions in English, filling in tables. All this orients the student well to the perception of subsequent information, stimulates interest in reading in English. An English lesson usually ends with an audio part, which is also preceded by various exercises that make it easier to perceive new material.

So, if we summarize, or, to put it in English, make a summary, British methods of learning English have a number of distinctive features. Most of them are developed based on the integration of traditional and modern teaching methods. Differentiation by age groups and a multi-level approach make it possible to develop an individual human personality, affect its worldview, value system, self-identification, and ability to think. Simply put, the individual approach, which is now popular, is put at the forefront. Without exception, all British methods of learning English are aimed at developing four language skills: reading, writing, speaking and listening.

At the same time, great emphasis is placed on the use of audio, video and interactive resources. Due to the variety of methodological techniques, among which language technologies occupy one of the leading places, British English courses contribute to the formation of skills necessary for a person in modern business life (the ability to make a report, make presentations, conduct correspondence). The undeniable "advantages" of authentic material, great attention to stylistics,

the desire to teach "situational" and "live" English through "life" examples of semi-real characters.

Useful tips for the formation of speaking skills

Practice your language wherever you can. Any practice is good - whether to tell you who is a native English speaker or not.

It is important to build your trust. If possible, use simple sentence structures that you know are correct so that you can focus on your rightness.

Try experimenting with what you know. Use words and phrases that you know in new situations. Native English speakers are likely to correct you if you use words and grammar incorrectly. Experimenting with the dictionary is also a good way to get feedback.

Try to answer what people are telling you. You can often get a clue to what people are thinking by looking at their body language. React to them naturally.

Try not to translate in your native language. It will take too much time and make you more reserved.

If you have forgotten the words, try to get out of the situation and 'fill in' the conversation. This is better than maintaining complete silence.

Don't talk too fast! It is important to use a natural rhythm when speaking English, but if you speak too fast, it will be difficult.

Try to relax when you talk. When you speak English at a normal speed, you will discover the connection between the words, and it will happen automatically.

Try to speak more confidently. Don't be shy to say - the more you do it, the more confident you will become. Remember to be polite – use "please" and "thank you".

Speech-thinking activity - a single process of generating speech and thought - forms the material basis of communication. Mastering the basics of communication by students is the main practical goal of teaching foreign languages at school. This leads to the need for a deep study of speech thinking and the search for its possible implementation.

When teaching speaking at the initial stage, the teacher must clearly understand what the final result he wants to get. The final speech product of speaking will be a message about yourself, about your friend, your family. The speech situations created in the lessons help in this task.

The exercises of speech activity at the middle stage of training include educational situations, speech exercises, games, including role-playing, conversations on topics related to the interests of children, their life experience, and the immediate environment. The educational situation should be, if possible, adequate to the real situation of communication, extremely clear to students, should stimulate the motivation of learning, arouse students' interest in the task. The task of a foreign language teacher is to ensure the active activity of each student throughout the lesson, maximizing the speaking time of each student. The group form of work allows to realize this task. It also contributes to the formation of skills and abilities of independent work, students in mastering a foreign language.

Senior classes are a qualitatively new stage in mastering oral speech, which forces the use of new techniques aimed at the creative use of language material. These techniques are carried out on the basis of the existing teaching complex, with the involvement of additional materials: oral language manuals, adapted books for reading in English, magazines "Foreign languages at school", "Club", "Clockwork", "Class out".

Speaking is a speech activity, it has specific features.

1) Motivation - a person, as a rule, speaks because he has a motive for this. The basis of communicative motivation is the need of two types: the need for communication as such, characteristic of a person as a social being; the need to commit this particular speech act, the need to "intervene" in this speech situation. The first type can be called general communicative motivation, the second is situational motivation, the level of which is determined by how we teach, i.e. how we create speech situations, how we use material, techniques, etc.

2) Activity - speaking is always an active process, because it shows the attitude of the speakers to the surrounding reality, but not only when a person speaks, but also when listening to the interlocutor (internal activity). It is activity that ensures the initiative speech behavior of the interlocutor, which is so important to achieve the goal of communication.

3) Purposefulness - any statement pursues some goal: to convince the interlocutor, to support, to anger, etc. Such goals can be called communicative tasks. Behind each of the communicative tasks that arise in individual speech situations, there is a common goal of speaking as an activity: influencing the interlocutor in the sense of changing his behavior (verbal or non-verbal).

4) Connection with activity - speaking is largely dependent on the general activity of a person. Firstly, the content aspect of speaking is completely determined by the spheres of human activity. Secondly, the need, say, to convince someone arises only if the situation that caused such a task is a consequence or subject of events in which the interlocutor is involved.

5) Communication with the communicative function of thinking - mental activity is aimed at performing a speech act, subordinated to it.

6) Connection with personality - speaking is largely conditioned by the components of personality. Personality is always individual, and manifests itself in communication. The development of speaking should take place in conditions of maximum connection of all spheres of consciousness, all components of personality, which is what the communicative method strives for.

7) Situateness - it manifests itself in the correlation of speech units with the main components of the communication process. Thus, any speech unit uttered by one interlocutor can affect the further course of communication development, if it meaningfully "fits" into the context of the other interlocutor's activity. This speech unit can change the communicative task and influence motivation. When a speech unit is unable to "promote" a speech situation, it is non-situational, does not cause a reaction from the interlocutor.

8) Speech activity cannot be fully memorized and predicted. Such unpredictability is a heuristic. Communication situations are constantly changing, their options are numerous, and the speaker must be ready to work in such constantly changing conditions.

9) Independence.

10) Temp.

All the qualities of speaking as an activity provide the conditions for creating a speech product (utterance of any level), which also has certain qualities: structurality, logic, informativeness, expressiveness, productivity. The communicative method is based on the fact that the learning process is a model of the communication process. Like any model, the learning process is simplified in some aspects compared to the real communication process, but it is adequate to it in basic parameters. The methodological significance of this adequacy is explained by two main factors:

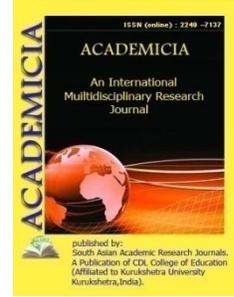

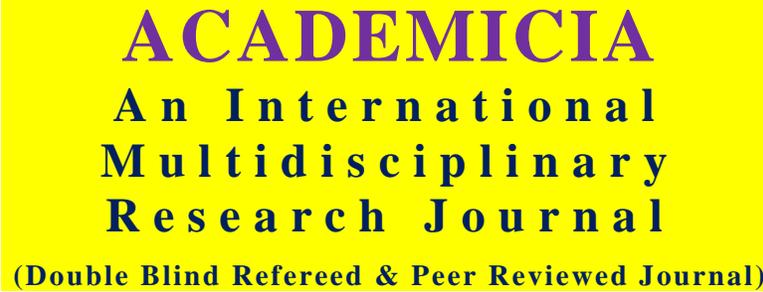

- 1) the phenomenon of transference, which is provided by awareness of the adequacy of learning conditions and conditions for the application of learning outcomes;
- 2) the phenomenon of motivation, which is provided by how fully the nature of communication is modeled in the learning process.

CONCLUSION

Everyone knows that there are 4 ways to learn a language, these are listening, speaking, reading and writing. All of them together allow the student to achieve good results in language learning. When learning English, listening (listening) can noticeably improve speaking skills. Despite the fact that this is the very first of the skills, it is neither the simplest nor meaningless. We must learn to hear different English and must listen to it constantly if we want to understand the language well and speak it correctly, fluently and meaningfully. It would be a mistake to think that the communicative method of learning English is intended only for light small talk. Those who want to be a professional in a particular field regularly read publications on their subject in English. Having a large vocabulary, they easily navigate the English text, but it costs them enormous efforts to maintain a conversation with a foreign colleague on the same topic. The communicative method of learning English is designed, first of all, to remove the fear of communication.

TERMINATION OF EMPLOYMENT AGREEMENT DUE TO LACK OF PROFESSIONAL QUALIFICATIONS

M.R. Toshov*

*Independent Researcher,
Academy of the Prosecutor General's Office,
Republic of UZBEKISTAN

ABSTRACT

In this article, the author, based on the analysis of national legislation and scientific literature, highlights the some issues of termination of the employment agreement due to lack of professional qualifications of employee. In particular, the concepts "lack of qualifications", "Non-performance of work duties" were given the definition of authorship and proposals were made to improve the Labor Code of the Republic of Uzbekistan.

KEYWORDS: *Termination Of Employment Agreement (Contract), Lack Of Qualifications, Qualification, Skill, Skill Level, Skill Specialization, Non-Performance Of Work Duties, Capability, Attestation,*

INTRODUCTION

According to Article 176 of the Labor Code of the Republic of Uzbekistan employees must perform their duties honestly and conscientiously. It should be mentioned that simply establishing this rule is insufficient to ensure the quality and completeness of the job performed in a given business. Employees must be educated, as well as have certain professional training, skills, and specialized knowledge, in order for an organization to achieve its objectives. Accordingly, labor law sets out the grounds for termination of an employment contract on the grounds that the employee is unfit for the job he or she is performing.

Article 100 (paragraph 2, part 2) of the Labor Code of the Republic of Uzbekistan stipulates that an employment contract may be terminated due to the state of health of the employee and in case of lack qualifications.

A comprehensive list of grounds for declaring an employee unfit for the job they perform is based on the above two reasons; broad interpretation is not permitted, that is, the employment

contract cannot be terminated on the grounds that the employee is unfit for the job he is performing for reasons other than these two.

Agreeing with the opinion of Russian scientists, we highlight that the dismissal on this basis is caused by reasons related to the personal aspects and qualities of the employee, and this determines the redundancy (uselessness) of the employee for the organization¹. We also note that this is not related to the employee's culpable behavior².

In this case, although the reason for the termination of the employment relations is the inability to perform labor duties, it is not the result of the employee's fault. This has been pointed out by many legal scholars, in particular, the legal scholar M.Yu.Ghasanov explains this situation as follows: "If non-performance or unsatisfactory performance of work obligations is not related to the misconduct, this occurred perhaps due to the inability to perform them properly or the employee's inability to do so, then it is not possible to assess it as a violation of labor duties by the employee, moreover, the employee cannot be held liable for disciplinary action. The employee's inability or incapacity to perform the work tasks assigned to him to the required level may be caused due to various circumstances. Such cases may occur as a result of the lack of the necessary conditions for the proper performance of their duties, the employee's lack of qualifications or the state of health that prevents the employee from performing the duties properly"³.

Let's look at the essence of the concept of "lack of qualifications".

ILO International Standards for the Classification of Occupations (ISCO-08) defines employee qualification (or skill) as "the ability to carry out the tasks and duties of a given job", and is divided into two groups: the level of qualification determined by the complexity and scope of duties and responsibilities (Skill level);

qualification in the field of required knowledge to work with the machines, tools and materials used in the work and the type of goods and services produced (Skill specialization)⁴.

So, we can say that, "Lack of qualification" means that an employee lacks the necessary knowledge, skills, preparedness, and other professional characteristics to accomplish their work obligations, or that they have been unable to learn new skills as job features have changed through time.

In addition, the employment contract concluded with the employee may be terminated on the grounds of insufficient qualification, if it does not have the labor characteristics (business qualities) required to perform labor duties in a quality and qualified manner, notwithstanding the employee has documents on education in the relevant specialty, and trying to perform work duties in a disciplined manner.

For example, an employee who has worked in an enterprise for several years has not been able to master the new software introduced at work and he could not develop the skills to work in this program, this circumstance may be the basis for declaring him unfit for the position for lack of qualifications.

"Non-performance of work duties" is a broader concept, regardless of whether the failure was due to the employee's misconduct or other circumstances (health condition, lack of skills, etc.), it refers to all cases which the labor tasks remained unfulfilled.

It is very important to understand the difference between the failure of the employee to perform work duties as a result of culpable actions (inaction) and the employee is unworthy of the position. It should be noted that failure to perform work duties as a result of irresponsibility, negligence is not a basis for finding an employee "unworthy for the position." Because, in these cases, it is only possible to talk about the unwillingness of the employee to do the job, which has nothing to do with his inability to execute the job. In this case, there is a violation of labor duties by the employee, and therefore the above cases should be considered as a violation of labor discipline. For this, it would be appropriate to apply disciplinary action to the offending employee.

Failure to perform work duties or failure to perform to the required extent is not related to the misconduct, but if they are not performed to the required extent or are due to the employee's lack of ability to do so, then it may not be assessed by the employee as a violation of work duties, moreover, it is not possible to bring him to disciplinary penalty.

Furthermore, only if the employee is unable to accomplish the task that he is obligated to undertake under the employment contract is it permissible to terminate the employee's employment relationship on the basis of incompetence. Because the employee's job is not specified in the employment contract, if an employee is temporarily unable to perform work without his consent due to the need for production or at the employer's initiative at the time of termination, the employment contract with him may not be terminated on the grounds of incapacity for work.

British labor law, as in many instances, establishes only the basic rules on the topic under consideration. In particular, according to Article 98 of the Employment Rights Act (ERA 1996), it is legal to dismiss in connection with an employee's ability or qualifications. In addition to this, both of these qualities must be relevant to the duties performed by the employee in the employment ("relates to the capability or qualifications of the employee for performing work of the kind which he was employed by the employer to do"). The third part of this article defines the concepts of "capability" and "qualification". "Capability" refers to a skill, ability (ability), state of health, physical or mental quality ("capability assessed by reference to skill, aptitude, health or any other physical or mental quality"). The term "qualification" refers to the suitability of a position for education, diploma or other scientific, technical or professional qualification ("any degree, diploma or other academic, technical or professional qualification relevant to the position which he held")⁵.

In this regard, when it comes to the legislation of the Republic of Uzbekistan, Paragraph 28 of the Resolution No. 12 of the Plenum of the Supreme Court of Uzbekistan "On the application by courts of the laws governing the termination of the employment contract" (17 April 1998) states that the incompetence of the employee must be substantiated by concrete facts (inspection reports, notification letter from the immediate supervisor, reports, certification documents and other documents confirming the low quality of work, production of defective products, workload and non-compliance with production standards, etc.) proving that the employee is unable to perform the work that must be performed (assigned), and incompetence according to the state of health must also be confirmed by a medical conclusion.

The traditional reasons why an employee is incompetent or unfit for the position he or she holds due to his or her health condition are still present in the legislation of the CIS countries. In

particular, pursuant to paragraphs 3 and 4 of Part 1 of Article 42 of the Labor Code of the Republic of Belarus, the employment contract may be terminated by the employer due to the employee's health condition or lack of qualifications⁶. Belarusian labor law does not require a medical or attestation report to substantiate the reasons for dismissal. The Plenum of the Supreme Court of the Republic of Belarus (No. 2 of March 29, 2001) filled the gap by the Resolution "On some issues of application of labor legislation by the courts". According to it, the condition that the employee is unable or unwilling to perform his duties due to his state of health must be confirmed by a medical report. In addition, the Resolution states that the conclusion of the attestation is one of the proofs that the qualification of the employee is insufficient, and it must be evaluated by the court on the basis of the sum of all the evidence in the case⁷.

Also in the legislation of Georgia⁸, Ukraine⁹ and Turkmenistan¹⁰ the procedure of dismissal of an employee unworthy of the position is determined in the same order. For many CIS countries, the grounds for dismissal were formulated in accordance with the labor legislation of the former USSR and the 1970 Union Republics.

Paragraph 3 of Part 1 of Article 81 of the Labor Code of the Russian Federation, and paragraph 4 of part 1 of Article 52 of the Labor Code of the Republic of Kazakhstan provide terms of termination of the employment contract at the initiative of the employer, if due to insufficient qualification confirmed by the results of attestation, the employee is found incompetent for the position held or the work performed. Article 81 of the Labor Code of the Russian Federation specifies that the procedure for certification should be established by labor legislation and other normative legal acts, including the norms of labor law, as well as local normative documents adopted through taking into account the opinion of the representative body of employees¹¹. Article 53 of the Labor Code of the Republic of Kazakhstan specifies that according to the results of the attestation, the dismissal of the employee is carried out in accordance with the decision of the attestation commission, which is attended by a representative of the employee, and the procedure, conditions and periodicity of attestation of employees are determined by the collective agreement or a document issued by the employer¹².

In conclusion, it should be highlighted that our national legislation does not provide an objective justification (types and mechanisms) for determining the "lack of qualification" in the termination of an employment contract due to insufficient qualifications of the employee.

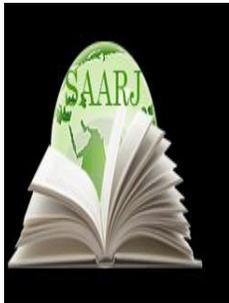

Given the importance of protecting the rights and interests of employees, it is also proposed to determine in the Labor Code of Uzbekistan the terms of the lack of qualifications of the employee through certification, and to include norms on the regulation of the attestation process by local documents.

In addition to the above, it is considered expedient to define in the text of the code the most important priority rules of the process of attestation of employees such as the concept, purpose, principles, types, terms of attestation, types of non-attested employees, rules on obligatory inclusion of a member of the employee representative body in the commission, bases of regular and non-regular attestation, attestation results, etc.

ABSTRACT

Mahabaleshwar regarded as a destination for tourist and is situated in Maharashtra, India's most beautiful and important tourist finish point, suffering frequent slope owing to heavy rain and complex geologic circumstances. The area's litho component is Deccan Trap Basalt, most notable consecutive basaltic flows to Tertiary during late Cretaceous era. The area is extremely susceptible to temperature, different degrees of alteration, soil formation, and presence of bole beds in between two successive basaltic flows. In this region, soil formation cycle is one of most significant reasons for slope disappointment. These deformed soils create instability on slopes, and eventually aggregate into collapses on the slope. During arena studies, petrographic analysis alongside X-ray deflection, five kinds of soils were discovered which show changes in composition and color variations. Geo mechanical characteristics viz. five kinds of soil samples were tested for bulk density, particle size inspection, Atterberg limit, uniaxial compressive power, cohesiveness in addition to internal friction angle; using help of numerical software Slide 6.0, the impacts of various soils on slope stability were shown based on limit equilibrium process.

1. INTRODUCTION

Highways in addition to roads in steep terrain are efficient methods of local transit besides linking from one location to the next. Highway planning in hilly regions is a real tough task. The impact of geo materials and organic heterogeneities includes on grade constancy. In general, a slope disappointment starts from mixes of effects such as mechanical discontinuities (circumstances besides orientations), withstanding besides geo material modifications, poor zone changes, litho logical disturbances, slope settings, heavy rains and considerably more. Geo material weathering and modification promotes litho logical disturbances and also aids in soil formation which adversely impacts stability of slopes. In addition, unanticipated highway projects in these ranges frequently present a major danger to human life, properties in addition resources, while an inventive field evaluation and suitable slope design will prevent loss of life, properties moreover potential unknown coincidences[1].

There are several conventional and numerical techniques used for determining safety factor (FoS) viz. Method of limiting equilibrium (LEM), system of finite elements (FEM), process of finite difference (FDM) and system of different elements (DEM). The current methods involve primarily kinematic analysis and ways of decreasing the equilibrium. LEM is the usual technique used on a daily basis for evaluating loose dirt etc., whereas translation or rotational motions occur when there is a clear failure. The conventional analyzes are performed to incorporate a set of shear asset parameters at failure either using a FoS or, via back-analysis. Over the past three decades, various methods for performing the two-dimensional (2-D) LEM of parts were suggested. Such techniques are (1) method by Fellenius, (2) fundamental method by Bishop, (3) simplified method by Janbu and (4) method by Spencer[2].

The Fellenius method is one of simplest ways of assessing short-term constancy of homogeneous slopes and is based on principles that an inflexible, cylindrical block may collapse by spinning around its center and that angle of friction is 0. So, it is thought that the shear strength is attributable entirely to cohesion. The shortened Bishop method is suggested which also utilizes similar slice technique to negotiate FoS for mass. The simplified Janbu system is a method of slicing non-circular slip exteriors. The system claimed that forces of inter slices were horizontal besides thus shear forces were 0. Two problems of security reckonings were planned, one with respect to moment symmetry and other with regard to straight balance of power. He created a continuous connection between inter-slice shear besides normal powers, and adjusted inter-slice shear-to-normal ratio through an iterative procedure until the two safety factors were the same. This version concerns with geo mechanical characterization of exposed soils along slopes of Maharashtra, India's state highway (SH)-72. Pertinent data were generated through field survey alongside laboratory study, utilizing the simplified Bishop slicing technique to mimic stability of grades using LEM using Slide 6.0 software package[3].

2. LITERATURE REVIEW

The stability of an unsaturated slope in natural terrain was assessed based on the change in the suction stress in the soil layer caused by rainfall. A field monitoring location where landslides have happened in the past was chosen as the research area. To apply the concept of slope stability analysis considering the suction stress in unsaturated soil, the Soil-Water Characteristic Curve (SWCC) and the Suction Stress Characteristic Curve (SSCC) of the unsaturated soil obtained from the study area were estimated using the van Genuchten (1980) model and the Lu

and Likos (2006) model, respectively. The phenomena of ground saturation caused by the penetration of rainwater into unsaturated soil is comparable to the wetting path of the SWCC. The curve-fit parameters obtained from the SWCC wetting route were thus utilized to quantify the matric suction and suction stress in the unsaturated soil. The quantity of rainfall and the volumetric water content of the soil were monitored using a rain gauge and time-domain reflectometer (TDR) sensors, respectively, at the monitoring location. An infinite slope was selected as indicative of the slope of the natural terrain in the research region because the slope length is extremely long yet the depth of the soil layer over the rock is quite shallow.

The stability of this unsaturated slope in natural terrain was assessed based on the safety factor of an infinite slope considering the suction stress in the unsaturated soil layer. The safety factor of the slope abruptly dropped during and shortly after a rainstorm and subsequently restored. Notably, the safety factor of this natural slope showed constant variations due of changes in the suction stress produced by the evaporation and infiltration of water in the unsaturated soil layer. The variation in the suction stress in unsaturated soil induced by rainfall can be estimated from the results of laboratory tests performed to estimate the wetting process based on the SWCC and SSCC in combination with field monitoring data collected by sensors to measure the volumetric water content or matric suction in the soil. Therefore, the infinite-slope stability of a slope in natural terrain may be assessed in real time by calculating the suction stress in the unsaturated soil owing to rainfall while the volumetric water content or matric suction in the soil is being observed in the field[4].

Shallow landslides often occur during brief rainfall infiltration and under partly wet circumstances. However, a thorough study of what causes them, especially in clayey soils, is frequently hampered by the absence of field data. It is rare, in fact, to record their presence in an instrumented natural slope. This article provides findings from an integrated field experiment tracking the soil-water and displacement variables that contribute to the development of a shallow landslide in partly saturated clays. The integration of a range of experimental methods allows for the study of interaction between soil hydrological and mechanical characteristics. This study also analyzes a slope stability model based on the suction stress idea. Since the model was applied after the occurrence of the landslide, the findings are regarded as a hind-casting method for model evaluation.

Nevertheless, the comprehensive field measurements collected during the monitoring activities and the occurrence of a landslide throughout the experiment gave important information on model parameters and data interpretation. The station offers remote satellite monitoring of data on meteorological factors, soil water content and soil suction. A time domain reflectometry wire was placed vertically to detect possible soil failure. The experimental region had a high chance of landslide occurrence. Indeed, slope collapse happened throughout the monitoring period, demonstrating the efficacy of the station in detecting the incidence, timing and depth of landslides. The landslide was caused in consequence of changes in suction stress. The failure plane occurred at a depth of 1.4 m, corresponding to the interface between a surface layers of greater permeability of 1 to 1.45 m thickness, sliding over a compacted substrate with lower permeability. The study allowed for verification of the validity of the model and the description of the triggering mechanisms of the observed shallow landslide under unsaturated circumstances, showing that oscillations in soil matric suction were the main factors causing soil failure[5].

3. METHODOLOGY

3.1. Survey Area:

SH-72(State highway) (State highway) Maharashtra is a thoroughfare selected for research region between Poladpur and Mahabaleshwar. Mahabaleshwar, positioned in Maharashtra district of Satara, is a famous hill resort, approximately 120 km from Pune and 295 km from Mumbai. Mahabaleshwar is regarded as excellent vacation destination in addition it offers various chances for leisure activities such as fishing, hiking plus boating. The most enticing characteristics of the hill station are beautiful lakes, slopes and waterfalls and this makes the area popular. It also attracts visitors due of its unique visual beauty as well as shrines, natural vistas then historically significant places[6].

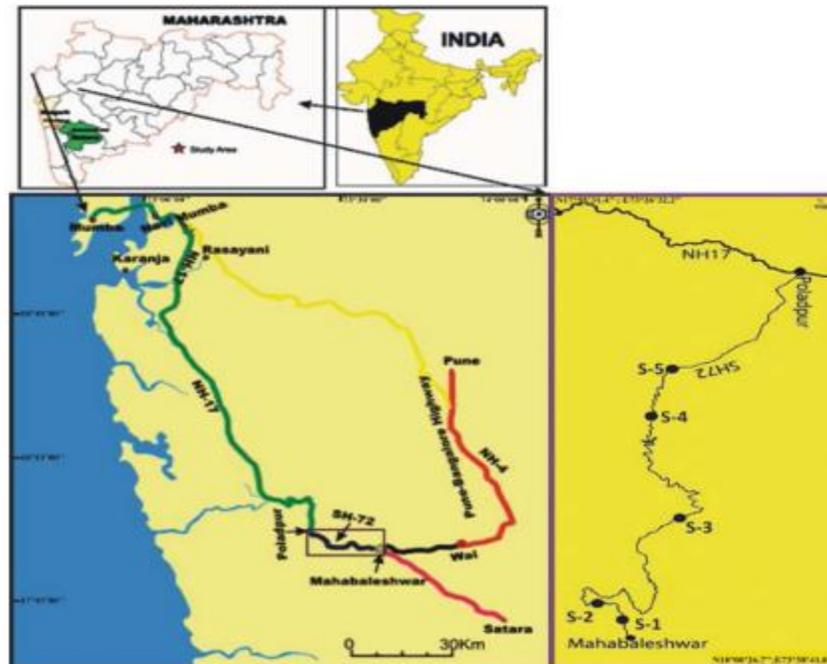

Fig.1 Location of the Study Area (Purple-Coloured Rectangle Shows Study Area)

The scope of study extends from latitude 17° 0' 0" to 18° 0' 0" to longitude 73° 26' 15" to 73° 41' 15". It lies under topo sheet no. 48G/9 NE, given by the Indian Survey. The highway, NH-27, provides an important connection with Mahabaleshwar connecting it to SH-71, subsequently expanding starting from Mumbai to Solapur and ultimately connected to Mahabaleshwar on the same route (Fig. 1).

3.2. Geology of area:

The scope of research extends to recorded, broad degree of volcanic eruptions documented as the Deccan Trap Basalt between both the late Cretaceous to Tertiary era. About 51,000 km² of Western states like Andhra Pradesh, Maharashtra in addition to parts of Central India had blown up extensively. The Deccan Trap Basalt is divided into several sub-groups in Maharashtra, namely. Kalsubai, in addition to Wai alongside Lonavala. The survey region consists of three lower Wai Subgroup formations viz. Poladpur, Ambenali and Mahabaleshwar. These formations

are characterized by minor changes in mineralogy, isotope ratios besides magnetic divergence (Table 1)[7].

Table 1. Simplified Stratigraphy of Deccan Trap Basalt with Formation Thickness

Deccan Trap Basalt	Subgroup	Formation	Thickness (m)	$^{87}\text{Sr}/^{86}\text{Sr}$	Magnetic polarity
	Wai	Desur	~100	0.7072–0.7080	Normal

The breadth of study defines two types of basalt based on textures, particularly glomeroporphyrite and plain olivine basalt. The basalt produced by Poladpur is glomeroporphyrite with vesicles, typically tarnished tops. These are combination of fine and course grained, typically grained plagioclase, or plagioclase olivine phenocrysts. Ambenali Development comprises of same kind of rock but low isotopic ratio that rests on Poladpur Formation and is covered by Mahabaleshwar Formation. The rocks of Mahabaleshwar Development in plagioclase laths are fine grained, characteristic unvarying circulation of olivine plus augite. All three types carry iron oxide dispersion uniformly, and nearly equally. The study location typically contains various soil types, usually on the top of the hills. Five kinds of dirt were identified during field survey based on colour and corporeal natures. Analysis of X-ray diffraction identifies minerals contemporaneous in such soils. The information represent differences in mineralogy soils, the presence of different solid components. The short descriptions for each kind of soil were examined using the Mansell soil color map, the soil colors are given. Samples were screened to classify soils furthermore data gathered was presented at log diagrams[8].

3.3. Field Investigations Besides Methodology:

Widespread field surveys were carried out to gather illustrative samples of soil moreover rock according to the code. Testing of dissimilar geoenvironmental possessions as per American Society for Testing and Materials (ASTM) specifications was conducted in the laboratory. Also, the method was described in full below. Methodology to resolve of geoenvironmental properties.

3.3.1. Preparation of samples:

Examples is ready according to the test requirement, in accordance with certain ASTM standards. The goods were air-dried moreover fractured into smaller possible pieces previous to the production of the test specimens, care being engaged not to sizes of distinct subdivisions.

3.3.2. Test procedures:

Subsequent checks viz. Parameters of density, sieve analyzes, Atterberg limitations, Uncontained Compressive Strength (UCS) and shaving strength have been computed on disturbed samples for each kind of soil.

3.3.3. Bulk Density:

Density is useful word for geotechnical impact and for assessing slope consistency. Bulk density was examined in this research, and is distinguished as oven-dry heaviness of a unit volume of soil including pore galaxies. A soil's bulk density is ever slighter than its subdivision density. When the texture of the soil gets finer it generally lowers.

3.3.4. Liquid limit determination:

Test of the soil passing through a sieve of 405 mm, weighing 210 g was mixed with aquatic to create a thin comparable paste. The glue was gathered using a groove created inside the apparatus cup of the Casagrande, and number of disappointments to shut it was recorded. In addition, moisture content of each sample checked for liquid limit has been intended[9].

3.3.5. Plastic limit:

Around 18 g of dirt is thoroughly combined, passing through a No. 45 sieve. The dirt is thrashed with the hand on a glass plate until it has a diameter of approximately 5 mm. This mixing in addition to rolling procedure is continued until the ground is exhibiting symptoms of dissolving. The water gratified is calculated from crumpled part of document[10].

4. RESULT AND DISCUSSION

4.1. Bulk density:

Bulk soil densities were determined under both dry besides saturated situations. The result (Fig. 2) indicates the density range for soil samples S-1, S-3 and S-5 about 1.72 and 1.94 g / cc in dry state and 1.82 in addition to 2.11 g / cc in wet condition. In dry and wet conditions, the average sample density S-4 was measured 2.27 g / cc and 2.15 g / cc, respectively.

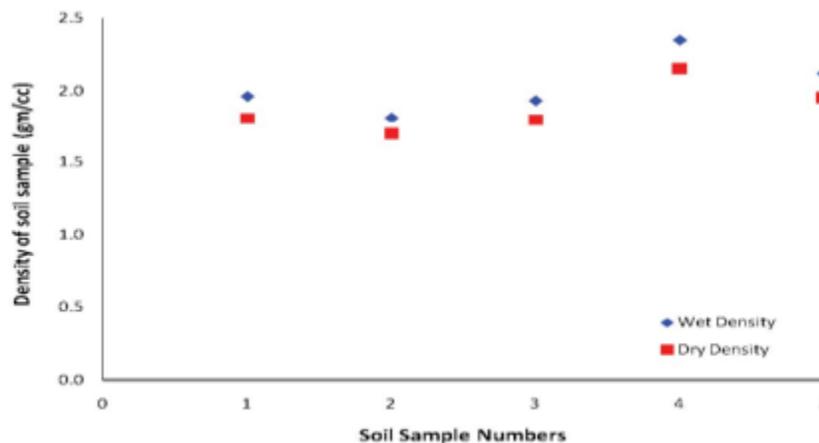

Fig.2 Bulk Density of Soil Samples

4.2. Particle Size Distribution:

For each soil type, uniformity coefficient (Cu) or curvature coefficient (Cc) were computed using plot among % finer versus grain sizes. Based on the test, Cc lies around 1 and 3 of each soil, which indicates that all dusts are marked. Cu of S-2 besides S-5 soil samples are classified as well-graded gravel, whereas S-1 are confidential as well graded clay. Example S-3 assessed as value of Cu less than 3.0 which indicates an unchanging soil delivery.

4.3. Atterberg limits:

The runny maximum worthof five soils varies from 24.27% to 42.03%, while malleable maximum was measured as 14.36% –23.31% (Fig. 3). The spectrum of PI ethics is calculated as 12.90–13.87 on different soils. Soil categorization according to Atterberg, example nos. S-4 alongside S-5 are medium plastic, while sample no. S-2 has a high elastic substance.

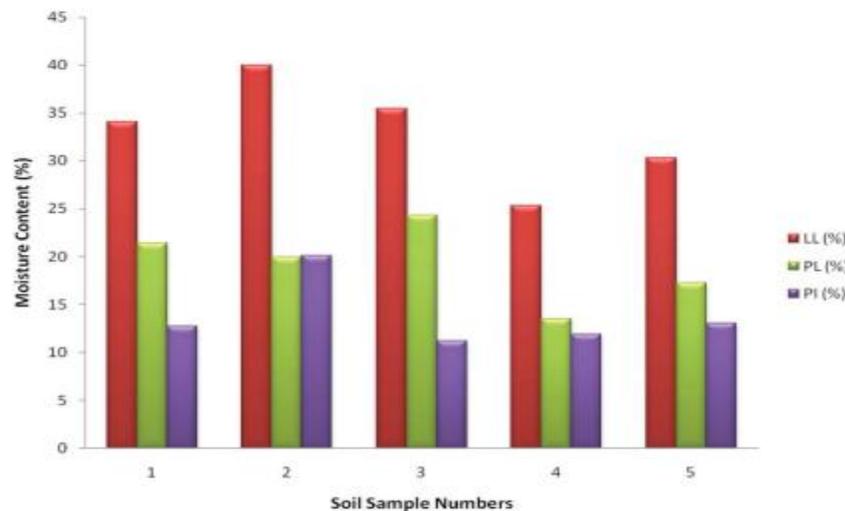

Fig. 3 Atterberg Limits For Different Types of Soil Samples

4.4. Slope stability analysis:

From Poladpur to Mahabaleshwar route hills of SH-72 are disrupting roadways owing to frequent landslides, rock falls among soil failures. High hill areas in specific are especially susceptible to failure at the slope plus their impacts are overpowering. This high hill regions are near to town of Mahabaleshwar and majority of hills blocked off by road have steep viewing hills. A rock fall study was conducted in hill slopes of similar location, and the major reason of rock fall in this region was due to heavy rainfall during rainy season and practically comparable joints to slope facing. The region problematic owing to basaltic soil growth, which causes slope collapse. Many sites wherever slope collapse happened owing to the development of different types of soils from basaltic shocks were discovered during field study. 2-D LEM was used to evaluate consistency of soil slopes that were exposed above basaltic foundation. Due to its forte for soil masses. The simulation utilized geoen지니어ing characteristics of different soils besides basaltic rocks. The possessions of entire rock samples were evaluated in workshop according to ISRM (Table 2). Using the Roc Lab method, the acquired things are transformed to battered and shattered rock.

Table 2. Geoengineering Properties of Intact Basaltic Rock for Dry and Saturated Condition

Sr. no.	Parameters	Dry	Saturated
1.	Average density (g/cc)	2.70	2.85
2.	Average cohesion (MPa)	11.65	8.43
3.	Average friction angle (°)	37	30
4.	Average Young's modulus (GPa)	40.12	36.32
5.	Average Poisson's ratio	0.24	0.22

5. CONCLUSION

This review is a study to investigate physical as well as engineering behavior of basaltic formations, besides its application in SH-72 slopes stability. It derived the following important findings.

- Land tests, petrographic studies and soil X- diffraction (XRD) analysis were breakthrough milestones in the distinction between individual soils.
- From geoengineering property, S-2 shows low forte, whereas S-4 displays tall asset among other kinds of soil. The activities of exceptional soils are essentially identical in addition to having about similar strength.
- Petro typically, S-2 is a relatively thin laterite soil, whereas S-4 is a rather robust, reddish-yellow loam soil. And in danger situation, laterite soil is poor in environment in addition to hazardous.

ABSTRACT

The management of population growth is a heated issue in different nations, since population increase has an impact on the availability of resources to the people. Population increase has not only restricted the utilization of existing resources, but it has also posed a threat to the country's overall development. Furthermore, it places additional strain on the country's agricultural industry. Many nations across the globe are experiencing fast population expansion, necessitating the immediate implementation of rules for food security. However, there are certain limitations that must be addressed before the rules for food security can be implemented. Aside from that, fast population expansion causes one nation to become reliant on another for food exports. This article was prepared to investigate the issue of food shortage as a result of population expansion as well as agricultural development in order to boost food production and make the nation self-sufficient in food resources.

KEYWORDS: *Agriculture, Employment, Population Growth, Rapid Growth, Scarcity of Food.*

1. INTRODUCTION

The world's population has not been constant, fluctuating by a little or large margin depending on the circumstances. These circumstances change from time to time. The population growth rate was not as great 20 to 30 years ago. Many years passed during which population growth was negative and the average number of births per year was fewer than the average number of deaths. The cause for this was the human race's technological exposure. In reality, medical facilities were not very adequate at the time, and more people died as a result of the absence of them.

Medical facilities have improved throughout time, and therapy for many incurable diseases has been discovered, which has shown to be beneficial in saving people's lives[1]–[3]. The realization that the world is on a reasonably smooth road to a near-stationary civilization has an impact on the debates over population, development, and sustainability. The notion that the trend toward ever-increasing population, termed "population explosion," presents a danger to our health and lives is losing hold with the general public. The implications of demographic shifts toward low fertility and population collapse have been a point of contention. These ideas are meant to be the most common developing flaws that will ultimately appear everywhere.

By raising the rate of food grain consumption, population expansion causes food grain shortage. This is an issue that has to be addressed with zeal. It is self-evident that steps should be taken to curb population expansion while also assisting farmers in increasing output in order to meet the impending food grain shortage. Leaving aside the broader topic, one may ask whether these worldwide demographic predictions indicate that agricultural issues linked to the "population boom" are losing a lot of their relevance. The rise in population and scarcity of food grains can be addressed by a concerted effort by various governments, as it is clear that the problem of agriculture and population growth is not a local issue, but rather a global one that requires collaborative action from various governments around the world. For a number of reasons, the basic response is that these issues are still extremely relevant. The idea that many civilizations, many of which have inadequate food intake levels, will be able to sustain rapidly growing populations for a long period is especially significant.

Figure 1: Cyclic Relationship between the Income, Food and Living Standard of an Individual

Figure 1 depicts the connection between a person's diet, income, and level of life. In many developing nations, the difficulties connected with population expansion will continue to

outweigh those associated with fertility declines below replacement levels. The nations impacted have a lot of control about how they cope with the reductions. Of course, it's also important to note the advantages to the nations affected by these reductions, as well as the environment as a whole, such as decreased environmental impact and urban congestion. Many of the nation's presently experiencing population growth have poor agricultural infrastructure or skills that are difficult to utilize because of geographical remoteness from population centers, insufficient infrastructure, high disease incidence, or other reasons. Agriculture plays an important role in their ecosystems, accounting for a substantial percentage of their GDP and exports, as well as a significant number of their population. Those countries will be doomed to a life of poverty if future population increases at the same pace as projected by demographic projections, and urbanization or mass migration to other countries provides no more outlets than indicated by demographic forecasts. The names of the nations considered for the review may be found in Table 1.

For the last 50 years, the 18 nations with the highest population growth rates have been studied. The average annual growth rate has been determined to be 1.8 percentage points or slightly higher. The 1.8 is regarded the limiting criterion for population growth, since growth rates more than 1.8 are considered large, while growth rates less than 1.8 are considered low. In addition to socioeconomic factors, the demographic features of the chosen nations have been linked to food security. According to historical statistics, at least 14 nations have failed to meet the goal of perceived food grain consumption in the previous four decades. A male's daily calorie need is 2500 kcal, whereas a female's requirement is 2200 kcal. Natural crop scarcity in some of these countries does not speak well for agriculture's capacity to reach its full potential and maintain even currently inadequate levels of nutrition. For example, a research finds that the food security situation in Ethiopia is likely to deteriorate despite their positive predictions, and that "the population environment agriculture nexus in Kenya seems to have fallen under the sustainability thresholds."

It is debatable if the projected population increase and ever-increasing rural population of these nations can be sustained. This implies that the assumptions behind the population forecasts (rates of change in fertility, mortality, and, in particular, internal and external migration) will need to be reviewed. There is a significant need to combine the demographic forecasts' theoretical assumptions with additional factors that show the difficulties many of these nations have in maintaining populations that are multiples of their present population size. The focus is on finding apparent discrepancies between demographic projections and improving agronomic potentials, which are essential for development [4]–[6].

2. Characteristics of Agriculture-Dependent Countries with High Rates of Population Growth

18 nations' demographics are projected to increase by a factor of at least 2.6 (Ethiopia, Iraq) and up to just over fivefold in the five decades running up to 2050. (Uganda). Naturally, not all of them are confronted with the prospect of having to depend on their own agriculture for food security and development. A country's capacity to develop is not limited by its ability to produce soil. Japan and many emerging nations with mineral riches are two examples of countries with low agricultural resources but sufficient food consumption and nutrition levels. Several countries in the Middle East and North Africa are among the latter, where oil is the basis for most of the

economic growth that has driven food consumption, as well as the resources to fund large increases in food imports to meet that need.

Yemen, a country with little natural resources and one of the world's fastest-growing populations, relied largely on emigrant remittances to finance huge increases in food imports. However, a case could be made for 12 of the 19 countries in the upper part of the graph that, at this stage in their development, they have insufficient choices and must rely solely on their individual agriculture to increase incomes, food supplies, and provide a foundation for their wider economic growth. Their dependence on agriculture for financial support surpasses 33% of GDP, which sets them apart from the rest of the world. Due to their wealth of natural resources, the other six nations are considerably less dependent on agriculture[7].

The following qualities may be found in these 12 countries:

- They had a high incidence of malnutrition and a low or extremely low per capita food consumption.
- They all score poorly on the Human Development Measure (HDI), a composite index that considers factors including income, life expectancy, and literacy.
- Non-agricultural assets, such as ores and reserves, as well as fuels, do not generate substantial rents.
- They are mostly landlocked, which is a big disadvantage when assessing growth possibilities and potentials.
- They are all classified as Least Developed Countries (LDCs) by the United Nations.
- Agriculture accounts for 30 to 56 percent of gross domestic output in these countries.
- A significant part of the population lives in rural regions. Furthermore, their rural populations are projected to grow, with the rural populations of certain nations more than tripling between 2000 and 2030. These two variables suggest that, barring unforeseen circumstances, the nations' total growth and poverty reduction will be heavily reliant on rural particularly agricultural development. As a consequence, in view of anticipated fast population increase, I consider whether their agricultural resources are sufficient to sustain output growth rates compatible with improved food security.

3. AGRICULTURE-RELATED CONSTRAINTS TO ATTAINING FOOD SECURITY

Examining the nations' water resources, which have the capacity to produce crops under both rainfall and irrigation circumstances, provides a preliminary look. Estimates of these possibilities are based on Food and Agriculture Organization (FAO) and Ecological Zones studies, as well as FAO's irrigation potentials. On a national basis, most nations are still a long way from reaching their agricultural boundaries. However, it's essential to note that national forecasts implying no increased resource scarcities may coexist with severe scarcities at the local level serving as effective development restrictions. Local scarcities are difficult to overcome even when resources from other areas of the nation are available. Chad and the Democratic Republic of Congo (DR Congo) both have ample land resources in relation to their current and projected populations. Despite the fact that a significant part of this land is covered in forest (closed forests comprise 50% of the nation's total land area), the latter country has classified 195 million

hectares (or 82 percent of its total land area) as suitable for producing rain fed crops in various degrees.

These findings suggest that, even if the Congo DR's population more than triples to 177 million by 2050, agricultural scarcity will not be a barrier to the country's severe food security problems. Demographic change will continue in agricultural growth when the capacity for doing so exists if it is consistently followed by poor possibilities for other sources of output, as has been the case in the past. The enormous mineral resources of the nation, of course, offer other development possibilities, decreasing the country's dependence on agriculture[8]. Countries with high rates of population growth and a high dependence on agriculture will have a distinct future. Burundi has the lowest land-to-population ratio. Niger's agricultural growth potential is similarly restricted, a situation that would rapidly deteriorate if the projected population increase of 2050 happens and no other sources of demographic pressure on agriculture are found. Only approximately 13 million hectares (12 percent of the country's total land area) are suitable for rain-fed agriculture, with 45 percent being moderately suitable.

Local agriculture will struggle to provide food, employment, and profits for such a large population while also encouraging general development due to Niger's low agrarian resources and severe agro-ecological environment. Alternative growth options, on the other hand, that would significantly reduce dependence on agriculture are rare, as the country's poverty-reduction plan acknowledges. Niger's uranium-producing industry aided expansion in the 1970s, but development stopped when export prices fell and agriculture was damaged by recurrent droughts. Niger is classified as a "Low-Income, Severely Indebted" country by the World Bank. We'd need a more accurate predictor if we were to use agro ecological capabilities as a proxy for assessing the compatibility between population predictions for nations on the list and the development potential of their natural crops. The closest we can come to such an estimate is to devote each country's land, apart from water contributions, toward future food crop growth. Because it comprises of culturally homogeneous food crops, the cereals group (wheat, coarse grains, and milled rice) lends itself to this role as a yardstick (grains).

Cereals are an essential component of an individual's diet; cereals are also the most significant food intake for children aged one and above, since their increasing age need more food and energy in addition to breast feeding. It has been showing the projected development of possible dairy products in 2050 based on two assumptions: (a) cereals will occupy the same percentage of total farmland suitable for agricultural production as they do now, and (b) crop harvests in 2050 will be double that of today. The development of these dependent characteristics over the past four decades may also be used to determine the validity of these theories. Only two of the 10 nations with data saw yields almost double, with the other seven seeing little to no increase and Niger seeing a decrease. As a consequence, although a doubling in the next 50 years is a bold forecast, it is well within the realm of technical feasibility based on present technology. The theoretical capacity of land available for grain production seems to be great in certain nations, moderate in others, and non-existent in others.

As a consequence, even the most optimistic forecasts show that four nations will not be able to maintain their present per capita production levels in 2050. Given the significance of cereals in their diets, this inability presents a serious danger to Afghan and Niger grain output. In Burundi and Uganda, where vegetables account for just 22–26% of calories while cassava, sweet potatoes, plantains, and mushrooms account for the bulk of the remainder, it may be less

important. The other seven nations, on the other hand, have the potential for higher per capita demand, which is likely to be far above any potential per capita consumption in 2055. It's astonishing to see how much manufacturing potential exists in nations where food security is a problem and agriculture is mainly semi-arid and susceptible to weather fluctuations. This result supports a more in-depth examination of the data, in addition to the assumptions that were used to estimate production potential.

Naturally, many nations' inability to improve land productivity in the past does not preclude them from doing so in the future. The agriculture sector's cornerstone has been yield development, which has resulted in increased agricultural output in most countries that have completed this evolution, particularly those with significant land limitations. Supportive policies, particularly those that supported the age group and technical advances, as well as laws or other circumstances that provided economic incentives for their adoption, seem to be at the core of such achievements. The availability of agro-ecological circumstances (e.g., the capacity to expand irrigation) that enabled for the genetic potential of high yielding crops arising from agricultural progress to be utilized was, of course, a worthy contender.

It is unclear because any kind of synthetic or endogenous "Bose up consequence" of maintainable intensification will play a major role throughout levitation agricultural output at rates directly associated with the challenge posed by fast-growing populations in the absence of substantial even use and agro ecological potentials. The data, particularly from the literature, is divided when it comes to resource depletion and soil deterioration as a consequence of economic pressures in rural regions. Existing research indicates that a plethora of other factors, such as infrastructure development, marketplace access conditions, and supportive policies, play a role in determining whether or not increasing population pressure is related to long-term increases in land production success or disappointment.

Johnson referred to a "political Bose effect." Apart from policy-supported deepening, this provides as a connection between the ideas of endogenous and policy-supported deepening. He argued that rising population densities prompt politicians to place a greater emphasis on agricultural research, with the outcomes leading to better agricultural production. It was attempted to verify this hypothesis, and it was found that rural population numbers and national agricultural research system investments in plant breeding had very positive correlations. His findings for Sub-Saharan Africa, on the other hand, apply to the whole continent. Given the significant difficulties in creating yield-increasing genetic innovations appropriate for dryland agriculture in areas with sometimes low and variable rainfall, it's impossible to say if they'd apply equally to the agro-ecological conditions of most of the nations examined here. It's no wonder that crops suited to these conditions are often referred to as orphan crops owing to the lack of attention they've received via traditional farmer support networks. This isn't to argue that properly focused plant breeding efforts can't assist impoverished regions achieve significant improvements in food security. In Nigeria and Ghana, the effectiveness of enhanced high yielding cassava cultivars in increasing food consumption is instructive. At the same time, the ability of contemporary biotechnology to overcome agro-ecological limitations is well acknowledged.

Concerning property, significant concerns have been expressed that the land area identified in the FAO/IIASA research as having rainfall-fed agricultural production potential is overstated and/or will not be able to be farmed in the near future. It has been suggested that land having agronomic

promise but not yet under cultivation is being systematically exaggerated. As the severe difficulties with settlement and transmigration systems in Ethiopia and elsewhere have demonstrated, land accessibility, illness prevalence, and socio-political variables are possibly more important concerns. The widespread cultivation of moderately suitable and crop failure regions in Ethiopia, as well as recurrent food shortages even during boom crop years, would lead one to assume that the issue is mainly caused by a severe national land scarcity. In the lowlands, however, there remain huge swaths of unused land that may be developed. "There are places where basic infrastructure is missing, presenting significant health risks". Extreme land shortages on a local level, as previously documented, are difficult to address[9]–[11].

4. DISCUSSION

Because of the very restricted development potential offered by their agricultural resource endowments, population projections for almost all of the republics examined here predict increased issues with insufficiency in addition to food insecurity. The assumption that agriculture must be a major mover in overall development for nations with a high reliance on agriculture lies at the core of the alleged incompatibility between demographic purpose and agricultural capital. It was discovered that there is widespread consensus in underdeveloped nations that this is a good concept. The issue of agrarian resource capabilities, which will sustain such an agricultural stance, is often overlooked in both underlying research. It comes to the conclusion that, at the very least in roughly countries with rapid population growth, reserve scarcities may offer significant obstacles to farming's capacity to perform such a role.

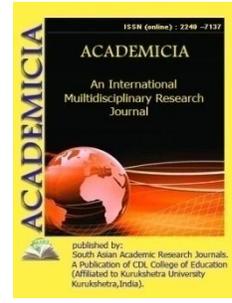

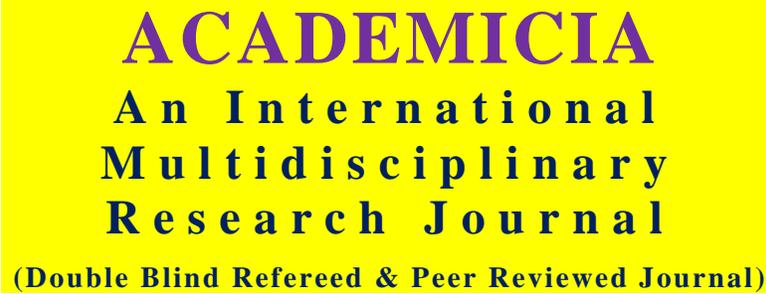

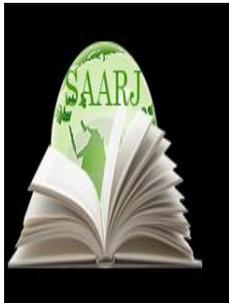

5. CONCLUSION

Agriculture's contribution to growth, in any scenario, is dependent on its capacity to produce revenue rather than simply providing food essentials. Any tree cash crop may potentially fill the gap. The issue with these other tropical cash and export harvests is that they consume only a portion of the market's destructive marketing potential: coffee and cocoa, for example, are primarily consumed in manufacturing republics with limited growing potential due to virtually stagnant populations and current resource consumption levels. Palm oil, on the other hand, has been a standout performer in global markets, thanks to rising demand from other emerging nations. As a result, a wide viewpoint is required when choosing crop pattern methods that are compatible with the issue of food shortage while also providing enough income to farmers to sustain them in their daily lives.

ABSTRACT

In the conditions of saline lands of the Republic of Karakalpakstan, field experiments were carried out in 2017 and 2018 for the improvement of saline lands based on the use of local mineral fertilizers. By experience, the study of various rates of organic fertilizers and from local mineral fertilizers glauconite. The results of the study have established a positive effect of the combined use of organic fertilizers at the rate of 20 t / ha and glauconite 1.5-2.0 t / ha on the growth and development of cotton. At the same time, the water-physical properties, nutritional and salt regimes of the soil have significantly improved.

KEYWORDS: *Local Mineral Fertilizer, Glauconite, Improvement, Saline Soils, Organic Fertilization, Cotton Growth And Development, Nutrient And Salt Regimes Of The Soil.*

INTRODUCTION

The main task of agriculture is to constantly increase the production of agricultural products, improve their quality, preservation, and processing.

The intensification of agricultural production, like cotton growing, requires an increase in yields based on the effective use of mineral fertilizers. In addition to the well-known nitrogen, phosphorus and potassium fertilizers, the use of microelement containing (Fe, Cu, Cn, Mo, B, Zn, Co) fertilizers is of great importance, which enhance plant growth, increase the efficiency of

enzymes that contribute to the intensity of photosynthesis, and therefore increase plant productivity by drought, cold and some diseases.

Scientific institutions are required to develop new methods for the production and use of effective mineral fertilizers, as well as the development of technology for their application.

In this, much attention is paid to the problem of the development and use of unconventional fertilizers obtained on the basis of local natural raw materials, which include glauconite, containing up to 15 different microelements.

The use of glauconite sands directly as fertilizer and on the basis of them the preparation of mixed microelements containing fertilizers is of great economic importance for our region, as it leads to a decrease in the cost of mineral fertilizers.

Research methodology

The experiment consists of 10 options, the plot area is 392 m² (2.4x40 m). The area under the experiment is 5760 m², the total area of the site is 1.5 hectares. Cotton variety C-4727.

Scheme of the experiment

Number of variants	Variants
1.	Leaching and pre-sowing treatment in production conditions
2.	Autumn leaching after plowing, pre-sowing glauconite application 1 t / ha
3.	Autumn leaching after plowing, pre-sowing glauconite application 1 t / ha
4.	Autumn leaching after plowing, pre-sowing glauconite application 2.0 t / ha
5.	Autumn leaching after plowing, pre-sowing application of 1.0 t of glauconite +10 tons of manure
6.	Autumn leaching after plowing, pre-sowing application of 1.5 tons of glauconite + 10 tons of manure
7.	Autumn leaching after plowing, pre-sowing application of 2.0 tons of glauconite + 10 tons of manure
8.	Autumn leaching after plowing, pre-sowing introduction of 1.0 tons of glauconite + 20 tons of manure
9.	Autumn leaching after plowing, pre-sowing application of 1.5 tons of glauconite + 20 tons of manure
10.	Autumn leaching after plowing, pre-sowing application of 2.0 tons of glauconite + 20 tons of manure

Note: in variant 1 the norm is N250, P175, K125 kg / ha in variants 2, 3 and 4 without NPK in variants 5, 6, 7, 8, 9, 10 the norm is N185, P130, K90 kg / ha

RESULTS AND ITS DISCUSSION

To determine the effect of various norms of organic fertilizers and glauconite on the growth and development of cotton, we carried out phenological observations on July 1, August 1, and September 1. The height of the main stem, the number of fruit branches and the number of bolls were taken into account.

When taking into account the growth of cotton development on September 1 (tables 1 and 2), it was found that in all variants there were no significant differences in the height of the main stem

and the number of sympodial branches, which was on August 1. The number of bolls has increased. In terms of the number of bolls, variants 2, 3 and 4 (4.8-5.6 pieces) have comparatively low rates where only glauconite was introduced without organic and mineral fertilizers. When applying mineral fertilizers with the rate of N250 P175 K125 kg / ha (variant 1), the number of bolls was 7.6 pcs.

The use of organic fertilizers with glauconite (version 5-10) increased the number of bolls by 2.2-3.8 pcs. The largest number of bolls is observed in variants 7, 8 and 9, where organic fertilizer with glauconite was applied - 8.0-8.3 pcs. The increase in the rate of glauconite did not contribute to the increase in the number of bolls. The increase in the rate of glauconite to 2000 kg / ha, the number of bolls remained almost at the same level with variant 8.

Thus, for the normal growth and development of cotton, a more favorable nutritional regime is created with the combined use of organic, mineral fertilizers and glauconite. Increasing the rate of glauconite is not beneficial, since there is no significant difference in the number of bolls.

TABLE 1 GROWTH AND DEVELOPMENT OF COTTON ON 1.IX

Number of variants	Height of the main stem, cm		Number of sympodial branches, piece		Amount of bolls, piece	
	2017	2018	2017	2018	2017	2018
1	71,5	67,0	10,5	11,1	7,6	8,9
2	60,0	55,0	7,4	7,8	5,1	6,6
3	59,8	58,6	7,9	7,0	4,8	6,7
4	57,6	64,0	7,8	7,8	5,6	6,8
5	70,5	67,5	8,0	9,4	7,0	8,6
6	70,5	66,3	8,0	10,0	7,2	8,3
7	67,1	74,3	9,6	10,0	7,7	8,5
8	75,5	79,8	10,5	11,5	8,0	9,2
9	73,5	77,2	11,6	12,9	8,8	9,8
10	77,5	78,0	11,7	12,0	8,3	9,6

For normal growth and development of cotton, it is necessary to jointly apply mineral (reduced rates by 25%), organic fertilizers (20 t / ha) and glauconite at the rate of 1.5-2.0 t / ha.

TABLE 2 GROWTH AND DEVELOPMENT OF COTTON ON 1.IX (AVERAGE OVER 2 YEARS)

Number of variants	Height of the main stem, cm	Number of sympodial branches, piece	Amount of bolls, piece
1	69,3	10,8	8,2
2	57,5	7,6	5,8
3	59,2	7,4	5,2
4	60,8	7,8	6,2
5	69,0	8,7	7,8
6	68,4	9,0	7,8
7	70,7	9,8	8,1
8	77,7	11,0	8,6

9	75,4	12,2	9,6
10	77,8	11,8	8,0

The nutrient regime of the soil in a particular world affects the growth and development of cotton. When determining the onset of 50% of cotton flowering, it was found that the dynamics of cotton flowering is more intensive in those variants where cotton is provided in sufficient quantities of macro and microelements.

As the data in Tables 3 and 4 show, in terms of the dynamics of cotton flowering, variants 2, 3 and 4 are leading, where only glauconite was used, i.e. by July 11, they amounted to 58.5-61.0, and in other variants 50.0-54.0%. The dynamics of cotton flowering by the last date of observation amounted to 50.0-61.0%. In the variants where organic, mineral fertilizers and glauconite were applied, a more favorable nutritional regime is created. Therefore, the development of plants is slow in those variants (variants 2, 3 and 4) where these elements are insufficient.

TABLE 3 DYNAMICS OF COTTON FLOWERING, 2017.%

Number of variants	Dates of observation					
	1.VII	3.VII	5.VII	7.VII	9.VII	11.VII
1	-	7,5	19,0	36,5	44,0	53,5
2	1,5	11,0	21,0	39,5	47,0	61,0
3	3,0	13,0	24,0	41,0	46,0	60,0
4	1,5	11,0	23,0	40,0	47,0	58,5
5	1,5	6,5	17,5	32,5	37,0	52,0
6	-	5,5	18,0	33,0	41,0	53,0
7	-	7,5	17,0	33,0	39,0	54,0
8	-	7,0	17,0	34,0	39,0	52,0
9	-	7,0	17,0	33,0	38,0	51,0
10	-	7,0	17,0	32,0	37,0	50,0

The obtained data on the dynamics of cotton flowering in 2018 confirm the data of 2017 (table 4).

TABLE 4 DYNAMICS OF FLOWERING OF COTTON VARIETIES S-4727, 2018, %

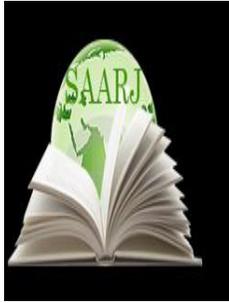

Number of variants	Dates of observation					
	2.VII	4.VII	6.VII	8.VII	10.VII	12.VII
1	-	2,5	9,0	24,5	39,0	50,0
2	2,0	5,5	18,5	37,5	47,5	60,0
3	2,0	5,0	17,5	33,5	47,5	56,5
4	1,5	5,5	20,5	37,0	42,0	58,0
5	0,5	2,5	16,0	32,5	39,5	50,0
6	-	3,5	15,5	32,5	40,0	50,5
7	-	3,0	15,0	33,0	38,0	48,5
8	-	4,5	15,5	32,0	41,0	50,5
9	-	3,0	16,0	32,5	39,5	52,0
10	-	3,0	16,0	33,5	39,5	49,5

CONCLUSIONS

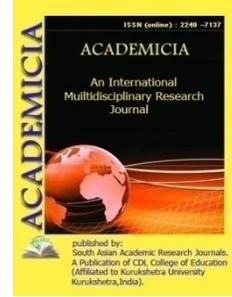

In saline lands, the use of organic fertilizers at the rate of 20 t / ha, mineral fertilizers N185 P130 K90 kg / ha and glauconite 1.5-2.0 t / ha have a positive effect on the growth and development of cotton. At the same time, the water-physical properties, nutrient and salt regimes of the soil are improved.

ABSTRACT

Vibration is a set of mechanical movements of elastic bodies, machines, machine tools, mechanisms and devices, repeated at regular intervals and spreading to building structures through supports, floors, etc. Vibration is characterized by amplitude, frequency, speed, and acceleration. These parameters determine the impact of vibration on humans, equipment, and building structures.

KEYWORDS: *Vibration, Determine, Humans, Equipment, Building Structures.*

1. INTRODUCTION

The human body is considered as a combination of masses with elastic elements having natural frequencies, which for the shoulder girdle, hips and head relative to the supporting surface ("standing" position) are 4 ~ 6 Hz, the head relative to the shoulders ("sitting" position) - 25-30 Hz. For most internal organs, natural frequencies are in the range of 6-9 Hz. General vibration with a frequency of less than 0.7 Hz, defined as rolling, although unpleasant, does not lead to vibration sickness. The consequence of this vibration is motion sickness caused by disruption of the normal activity of the vestibular apparatus due to resonance phenomena.[1-9]

When the vibration frequency of workplaces is close to the natural frequencies of internal organs, mechanical damage or even ruptures are possible. The systematic impact of general vibrations, characterized by a high level of vibration velocity, leads to vibration disease, which is characterized by disturbances in the physiological functions of the body associated with damage to the central nervous system. These disorders cause headaches, dizziness, sleep disturbances, decreased performance, deterioration in well-being, and cardiac dysfunctions.

Local vibration of low intensity can have a beneficial effect on the human body, restore trophic changes, improve the functional state of the central nervous system, accelerate wound healing, etc.[10-15]

2. METHODS AND MATERIALS

With an increase in the intensity of vibrations and the duration of their impact, changes occur, leading in some cases to the development of occupational pathology - vibration disease.

Hand-held machines, the vibration of which has maximum energy levels at low frequencies (up to 35 Hz), cause vibration pathology with a predominant lesion of the neuromuscular and musculoskeletal system. When working with hand-held machines, the vibration of which has a maximum energy level in the high-frequency region of the spectrum (above 125 Hz), vascular disorders occur with a tendency to spasm of peripheral vessels. When exposed to low-frequency vibration, the disease occurs after 8-10 years, when exposed to high-frequency vibration - after 5 years or less.

Distinguish between hygienic and technical regulation of vibrations. Hygienic - they limit the parameters of vibration of workplaces and the surface of contact with the hands of workers based on physiological requirements that exclude the possibility of a vibration disease. Technical - limit vibration parameters not only taking into account the specified requirements, but also based on the vibration level achievable for this type of equipment today. Regulatory documents have been developed that establish permissible values and methods for assessing vibration characteristics, which include a special GOST SSBT (Occupational Safety Standards System).[16-22]

The assessment of the degree of harmfulness of vibration of hand-held machines is carried out according to the spectrum of vibration velocity in the frequency range of 11-2800 Hz. For each octave band within the specified frequencies, the maximum permissible values of the root-mean-square value of the vibration velocity and its levels are set relative to the threshold value equal to $5 \cdot 10^{-8} \text{ m/s}$.

The mass of vibrating equipment or parts thereof, held by hands, should not exceed 10 kg, and the pressure force should not exceed 20 kg.

General vibration is normalized taking into account the properties of the source of its occurrence and is subdivided into vibration:

- Transport, which arises as a result of the movement of cars on the ground and roads;
- transport and technological, which occurs during the operation of machines performing a technological operation in a stationary position, as well as when moving around a specially prepared part of the production facility, industrial site or at wholesale depots;
- Technological, which arises during the operation of stationary machines or is transferred to workplaces that do not have sources of vibration

3. RESULTS AND DISCUSSING

High demands are made in the regulation of technological vibrations in rooms for mental labor (management, control room, accounting, etc.). The hygienic vibration standards are established for a working day lasting 8 hours (Table 1).

TABLE 1. INFLUENCE OF VIBRATION ON THE HUMAN BODY

Vibration amplitude, mm	Vibration frequency, Hz	Impact result
До 0,015	different	Does not affect the body
0,016-0,050	40-50	Nervous excitement with depression
0,051-0,100	40-50	Changes in the central nervous system, heart and hearing organs
0,101-0,300	50-150	Possible disease
0,101-0,300	150-250	Causes vibro-disease

The given rates are the same for horizontal and vertical vibrations. The continuity of their impact should not exceed 10-15% of the working time. The amplitude of oscillations, the speed and acceleration of oscillatory movements can be increased no more than three times. Sanitary standards establish the maximum permissible vibration values in the production premises of enterprises (Table 2).

TABLE 2. PERMISSIBLE VALUES OF VIBRATION IN INDUSTRIAL PREMISES OF ENTERPRISES

Vibration amplitude, mm	Vibration frequency, Hz	Oscillatory speed, cm / s	Acceleration of oscillatory movements, cm / c ²
0,6-0,4	До 3	1,12-0,76	22-14
0,4-0,15	3-5	0,76-0,46	14-15
0,15-0,05	5-8	0,46-0,25	15-13
0,05-0,03	8-15	0,25-0,28	13-27
0,03-0,009	15-30	0,28-0,17	27-32
0,009-0,007	30-50	0,17-0,22	32-70
0,007-0,005	50-75	0,22-0,23	70-112
0,005-0,003	75-100	0,23-0,19	112-120
1,5-2	45-55	1,5-2,5	25-40

To reduce the impact of vibrating machines and equipment on the human body, the following measures and means are applied:

- Replacement of tools or equipment with vibrating working bodies for non-vibrating ones in processes, where possible (for example, replacing electromechanical cash registers with electronic ones);
- The use of vibration isolation of vibrating machines relatively basic
- The use of remote control in technological processes (for example, the use of telecommunications to control a vibratory conveyor from an adjacent room);
- Use of automation in technological processes where vibrating machines operate (for example, control according to a given program);
- Use of hand tools with vibration-proof handles, special shoes and gloves.

In addition to technical means and methods to reduce the impact of vibration on a person, it is necessary to carry out hygienic and treatment-and-prophylactic measures. In accordance with the

regulation on the working regime of workers in vibration-hazardous professions, the total time of contact with vibrating machines, the vibration of which complies with sanitary standards, should not exceed 2/3 of the working day. Production operations should be distributed among workers so that the duration of continuous exposure to vibration, including micropause, does not exceed 15-20 minutes. At the same time, two regulated breaks are recommended (for active recreation, industrial gymnastics according to a special complex of hydro procedures): 20 minutes - 1-2 hours after the start of the shift and 30 minutes - 2 hours after the lunch break [23-28]

Persons who are at least 18 years of age, who have received the appropriate qualifications, who have passed the technical minimum according to safety rules and who have passed a medical examination, are allowed to work with vibrating machines and equipment.

Working with vibrating equipment, as a rule, should be carried out in heated rooms with an air temperature of at least 16 ° C, with a humidity of 40-60% and an air speed of no more than 0.3 m / s. If it is impossible to create such conditions (work in the open air, underground work, etc.) for periodic heating, special heated rooms with an air temperature of at least 22 ° C, a relative humidity of 40-60% and an air speed of 0.3 m / s.

4. CONSOLATION

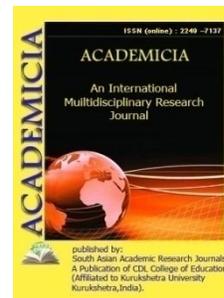

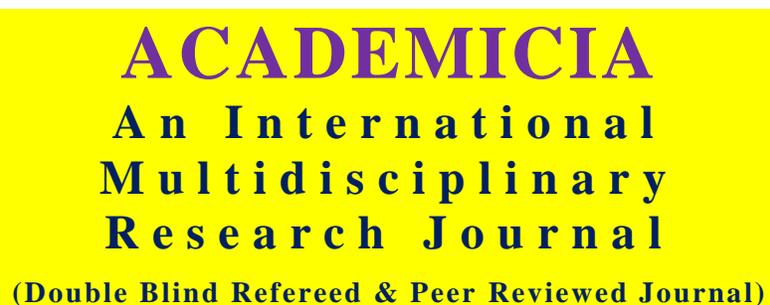

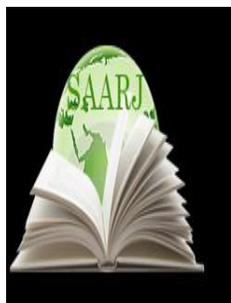

To increase the protective properties of the body, working capacity and labor activity, special complexes of industrial gymnastics, vitamin prophylaxis (2 times a year a complex of vitamins B, C, nicotinic acid), special food should be used. It is also advisable to carry out in the middle or at the end of the working day, 5-10-minute hydrotherapy, combining baths at a water temperature of 38 ° C and self-massage of the upper extremities.

ABSTRACT

Mushrooms are a nutrient-dense, environmentally friendly crop with many therapeutic properties. Edible mushroom production is very important in today's world, given the globe's rapidly growing population and severe environmental pressures. However, when compared to other crops, progress in mushroom breeding and production is relatively restricted. This may be owing to a lack of prior understanding of the crop's genetics and breeding system. Due to this fungus's mainly secondarily homothallic life cycle, traditional mushroom breeding has proven challenging. As a result, the genetic diversity of the grown strains is restricted. In addition, establishing an effective genetic transformation method and disease resistance in mushrooms is a difficult job. Knowledge about the gene organization and functions will be accessible when the mushroom genome is sequenced, which will aid in the development of better marker aided

selection breeding systems. This will result in better strains, which, along with improved growing methods, will lead to increased production and quality.

KEYWORDS: *Breeding System, Cultivation, Disease Resistance, Mushrooms, Transgenic Breeding.*

1. INTRODUCTION

Mushrooms have been grown for their nutritional benefits and flavor in far eastern nations since ancient times[1]. Mushrooms have less protein than mammals, but considerably more than other plants. They are low in fat, rich in fiber, and contain all necessary amino acids, as well as all critical minerals (except iron). Mushrooms generate significant quantities of vitamin D when exposed to UV radiation, which is difficult to get from a typical diet. Given the rising rates of cancer in today's society, it's past time for people to become aware of the health benefits of mushrooms and to take advantage of their cancer-fighting properties[2].

This low-cost vegetable is not only high in nutrients like vitamin D, but it also possesses anti-cancer, anti-HIV-1, and anti-AIDS characteristics. It is a low-cost, low-resource, low-area crop that can be produced anywhere over the globe and at any time of year using low-cost starting ingredients. Growing a highly nutritious meal with great flavor from readily available and inexpensive substrates has enormous promise and appeal. It is also extremely environmentally beneficial, since it can transform lignocellulosic waste into food, feed, and fertilizers. Mushroom consumption and output, on the other hand, are low in contrast to other crops, and the mushroom sector receives little investment. The mushrooms have the highest gross value of all protected crops produced in the globe in terms of area grown, but the overall gross value of all protected crops is just a third of the value of the wheat crop. Mushroom research is a relatively young field of study, and the mushroom business is still tiny in comparison to other crops, thus funding is restricted[3], [4].

1.1 Common Cultivated Mushrooms:

Only a few species of mushrooms and similar fleshy basidiomycetes are economically grown, despite the fact that there are over 300 genera of these fungi. This may be because many of them are mycorrhizal, meaning they won't sporulate without the host. Many saprophytic plants, on the other hand, have shown to be cultivable. The button mushroom, *Agaricus bisporus*, was widely cultivated in Europe before being exported to North America by the settlers; the Shiitake mushroom (*Lentinusedodes*), which has been grown in China and other oriental countries for centuries; and the oyster mushroom (*Pleurotus ostreatus*), which was collected as wild specimens from forests in Flanders. The oriental Enoki or velvet stem mushroom (*Flammulina velutipes*), which is mostly cultivated in Japan, as well as the paddy straw mushroom (*Volvarellae volvaca*) and the ear fungus (*Auricularia auricula*), are also farmed[5]. Other cultivated mushrooms include the Reishi mushroom (*Ganoderma lucidum*), which is used as an alternative medicine and a flavoring agent in Japan; the Nameko (*Pholiota nameko*), which is grown in the Orient; and Tremella fuciformis, or white jelly fungi, which is grown in Taiwan for use as food supplements. Commercially produced *A. bisporus* varieties include the crimini and portabello. Truffles (*Tuber* species) are mycorrhizal plants that dwell in close proximity to the roots of certain trees. They are considered a delicacy and are among the world's most costly natural foods. Figure 1 illustrates the different types of mushrooms[6].

Figure 1: The above Diagram shows different types of mushroom[7]

1.2 Medicinal Uses of Mushrooms:

Mushrooms include a number of chemical substances that are said to have therapeutic properties. Anti-tumor or immuno-stimulating polysaccharides have been found in 651 mushroom species spanning 185 taxa, inhibiting tumorigenesis. There is evidence that the -D-glycans cause a physiologic response in immune effector cells by attaching to the membrane complement receptor. The anti-tumour effect of a chemical discovered in the lipid component of *Agaricus* was subsequently identified as ergosterol. Similarly, *Grifola*'s lipid fraction has antioxidant properties and inhibits enzymes that cause a variety of chronic illnesses, including cancer. The mushroom components not only slow disease development by causing direct cytotoxicity in tumor cells, but they also upregulate non-immune suppressive mechanisms. These compounds contain cytostatic chemicals that cause apoptosis in leukemia cells, and isolates from mushroom cells have cytostatic compounds that induce apoptosis in leukemia cells. The compounds generated by *Ganoderma* species have antibacterial effects and have been proven to stop germs like *Staphylococcus* from growing. They produce steroid hormones that are active against a wide range of gram negative and gram positive bacteria[8]. *Lentinula* mycelial extracts have antiprotozoal properties against *Paramecium*. Mushrooms also have antiviral capabilities, and many substances identified from *Ganoderma* are potent against HIV-1, as well as influenza virus type 1. Only a few accounts have been included here among the many therapeutic applications of mushrooms.

1.3 Mushroom Breeding Strategies:

Mushrooms have a reputation for being tough to deal with, and it is generally recognized that the *Agaricus bisporus* mushroom, in particular, is difficult to control via breeding. The natural breeding system was not well understood during early efforts at genetic improvement in the farmed fungus *A. bisporus*. The mushroom is currently classified as a "secondarily homothallic" species with just one multiallelic mating type component. This knowledge may be used to assess

past breeding techniques and propose alternatives. Strain selection based on single spores, multispores, or tissue culture may provide short-term benefits, but it is not as successful as techniques involving controlled crossover. Hybrids may be created by crossing viable strains, although they can be difficult to see. Because only hybrids bear fruit, it is preferable to utilize nonfertile isolates. Markers that can only be produced in hybrid cultures may be used to identify hybrids early, and the inclusion of a genetic resistance characteristic is particularly helpful for this[9].

1.4 Mushroom Breeding Goals:

The main objectives of mushroom breeders and mushroom research are to increase crop production and quality, as well as disease resistance. Other objectives include lowering manufacturing costs and maximizing the usage of compost for plant development. Some of the techniques used for this aim include mass selection based on natural chance mutation and planned mutation using ionizing radiations such as γ -rays, X-rays, and chemicals, as well as cross breeding and transgenic breeding. Cross and transgenic breeding, on the other hand, are more effective and have showed more promise and development in recent decades. Problems related with cultivation, distribution, and storage, as well as senescence-induced browning and disease resistance, are all areas of study for mushroom breeding. Another goal of mushroom breeding is to integrate different enhanced crop-growing characteristics, such as shorter growth cycle and spore avoidance. Traditionally, mushrooms release billions of spores into the air, causing health issues including lung allergies and fever episodes. Spores can cause climatic installations to be blocked, resulting in increased energy bills.

1.5 Breeding for Disease Resistance:

The output and productivity of commercial mushroom cultivation may be severely harmed by disease outbreaks. Benzimidazole fungicides are resistant to many mushroom diseases, although prochloraz tolerance is common. Over the years, new diseases including *Trichoderma aggressivum*, *Cladobotryum mycophilum*, and the mushroom virus X have appeared at regular intervals. Pesticides that have been approved have been drastically decreased in Europe owing to consumer and environmental concerns. Furthermore, since the mushroom is a fungus, many fungal infections are difficult to manage. Controlling disease outbreaks in mushrooms is more difficult due to this confluence of factors. Effective hygiene and sanitation are crucial for disease prevention. Growers may get insight into how diseases are transmitted and disseminated by understanding their disease cycle and epidemiology. Controlling the growing environment by controlling temperature and relative humidity has allowed certain airborne fungal infections to be contained without the use of genetic resistance or fungicides. However, the emergence of fungicide-resistant strains as well as pesticide-use restrictions has boosted the need for resistant cultivars.

1.6 Hybrid Breeding:

The hybrid mushroom strains developed in the 1980s were highly accepted and popular, but they restricted the range of production characteristics and environmental and cultural stress tolerance. Since 1983, hybrids of the *Lentinula*, *Pleurotus*, and *Agaricus* mushrooms have been created via cross breeding. Hybrid strains have not only provided mushrooms with disease and pest resistance, but they have also decreased the reliance on and hazards associated with environmental and cultural stressors. Hybrids created by crossing monosporic cultures are grown

and RAPD and RFLP analyses are performed to assess production characteristics. Mushroom breeding requires a significant financial commitment as well as patience on the part of both the breeder and the grower[10]. For the last 30 years, a variety of specialized industry standards have been established to cultivate strains accessible to the general population. For a new strain to succeed, certain changes in growing conditions are necessary for optimum development. To maximize strain performance, farmers have traditionally had to alter growing systems to suit cultural requirements, such as changing flushing regimes, watering schedules, and harvesting methods. For future strain growth to be effective, cultural practices like as watering frequency and timing must be changed.

1.7 *Transgenic Breeding:*

There are currently no commercially marketed transgenic mushroom strains, although many research groups are making excellent progress in this area. The use of recombinant DNA technology to produce transgenic mushrooms has opened up a world of possibilities. Importing genes from unrelated sources is now feasible, and the hunt for favorable genes is no longer limited to inside the species. Other filamentous fungus transformation methods are being developed for the mushroom. DNA has been incorporated into protoplasts, mycelium, and basidiospores using a variety of methods including polyethylene glycol, electroporation, and particle bombardment.

1.8 *Marker Assisted Selection Breeding (MAS) in Mushrooms:*

Breeders now utilize DNA molecular markers to find better characteristics by identifying and selecting particular genes. PCR-based approaches and RAPD methods both utilize repetitive DNA sequences to produce markers. To create genetic maps from experimental data, computer software is employed. For monogenic characteristics that segregate into discrete phenotypes in mushrooms, using genetic markers is simpler. Previously, white and off-white mushroom strains dominated the market, each with its own set of favorable and unfavorable characteristics. The off white strains were superior for mechanical harvesting but discolored when sliced and canned, while the white strains were less prolific but did not discolor when sliced and canned.

1.9 *Agrobacterium-Based Transformation:*

While many other transformation methods are unreliable and unstable, using the soil bacteria *Agrobacterium tumefaciens* for transformation is said to produce stable transformants. Both homokaryons and heterokaryons can be transformed using the *Agrobacterium* system, and both karyotypes of a heterokaryon may be transmitted at the same time. In *Agaricus bisporus*, the utilization of *A. tumefaciens* for effective transformation and activation of its virulence gene using the plant hormone acetosyringone was first attempted. However, this technique had drawbacks in that it was not repeatable, produced false positives, had a poor degree of integration, and required DNA modification after integration. It's also crucial to include redundant DNA in the transformation vector, which serves no use in *Agaricus* but is required for gene transfer alone. Infecting the fruiting gill tissue with *Agrobacterium* strains containing the gene construct of interest and using a vector with homologous promoter resulted in a successful *Agrobacterium*-mediated transformation. In most instances, the multinuclear structure of mushroom mycelia has limited genetic breeding's ability to produce significantly enhanced characteristics. Many transgenic mushroom modifications will need the transfer of the gene to both parental lines, with the progeny bearing double copies of the gene to imitate the normal

inheritance process. In certain cases, a single copy of the gene is enough, although the resultant transgenic line may need to be further screened before being released as commercial strains. Importing cry genes from *Bacillus thuringiensis* for insect resistance and synthetase resistance from *Agrobacterium* for glyphosphate herbicide resistance are two examples of transgenic breeding potential.

2. DISCUSSION

Mushrooms have been eaten since the dawn of time. The term "mushroom" comes from the French words "fungus" and "mould." Mushrooms are a popular nutritious meal nowadays since they are low in calories, carbohydrate, fat, salt, and cholesterol. Mushroom also contains essential nutrients such as selenium, potassium, riboflavin, niacin, Vitamin D, proteins, and fiber. All of this comes with a lengthy history of use as a food source. Mushrooms are valued in traditional medicine for their therapeutic abilities and qualities. It has been shown to have positive benefits on health and the treatment of certain diseases. Mushroom has a variety of nutraceutical benefits, including cancer and anticancer capabilities. Mushrooms have antimicrobial, immune-boosting, and cholesterol-lowering properties. They are also a significant source of bioactive chemicals.

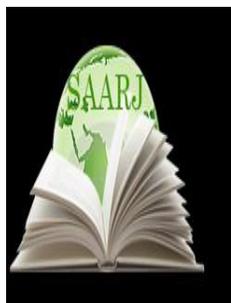

3. CONCLUSION

Mushrooms are a nutrient-dense, environmentally friendly crop with many therapeutic properties. Edible mushroom production is very important in today's world, given the globe's rapidly growing population and severe environmental pressures. However, when compared to other crops, progress in mushroom breeding and production is relatively restricted. Economic considerations linked to need and resources will influence the application of genetic engineering in the mushroom business. Mushrooms are lagging behind other crops in terms of molecular biotechnology development due to financial limitations. Acceptance of genetically engineered foods and increased mushroom consumption may boost research efforts. Single-gene traits like virus and insect resistance, as well as resistance to fungal and bacterial diseases and herbicides, may be targeted initially since they are easier to combat. Complex characteristics like as yield, size, color, shelf-life, and physical stress that are regulated by many genes may be studied in the future thanks to the mapping of the mushroom genome and knowledge of functional genomics in mushrooms. Mushrooms may also be used as bioreactors in the pharmaceutical and biotech industries to synthesize proteins and other chemicals. In a safe confinement facility with the possibility of automation and mechanical harvesting, a greater biomass of mushrooms may be grown on low-cost waste materials. In humans, the proteins generated by mushrooms will have greater specific biological activity than those produced by plants.

ABSTRACT

The global rise in human population poses a serious danger to each person's food security, since agricultural land is restricted and, in some cases, disappearing. As a result, agricultural production must be substantially increased during the next several decades to satisfy the enormous food demand of the growing population. Not to mention that a heavy reliance on chemical fertilizers for increased output ultimately harms both the environment and human health. Because of its wide potentiality in improving crop productivity and food safety, using microorganisms as biofertilizers is seen as a potential alternative to chemical fertilizers in the agricultural industry. In the agricultural sector, certain microorganisms such as plant growth boosting bacteria, fungus, Cyanobacteria, and others have been found to exhibit biofertilizer-like properties. Extensive research on biofertilizers has shown that they are capable of delivering necessary nutrients to the crop in adequate quantities, resulting in an increase in crop production. The current study elucidates the many methods by which biofertilizers enhance plant development while also providing protection against several plant diseases. The goal of this study is to examine the critical functions and uses of biofertilizers in many industries, such as agriculture, bioremediation, and ecology.

KEYWORDS: *Biofertilizer, Crop Production, Ecosystem, Sustainable Agriculture.*

1. INTRODUCTION

At the moment, the world's population is estimated to be about 7 billion people, with this figure projected to grow to roughly 8 billion by 2020. As the world's population grows, so does the environmental harm caused by fast industrialisation and urbanization. Furthermore, feeding the current huge population, which will surely grow with time, is a major problem. Regardless, the extensive use of chemical fertilizers in agriculture helps the nation self-sufficient in terms of food supply, but it also significantly harms the environment and has negative effects on living creatures[1]–[4]. Chemical fertilizer is used indiscriminately, posing a serious danger to the environment by contaminating the air, water, and soil. Because these dangerous compounds cannot be absorbed by plants, they accumulate in ground water, and some of them are also responsible for eutrophication of water bodies. These compounds have a negative impact on soil in terms of water holding capacity, soil fertility, increased salinity, and nutrient disparity. Organic farming has arisen as a powerful alternative sector in terms of the increasing need for healthy food supply, long-term sustainability, and worries about environmental contamination, given all of the negative consequences of extended usage of chemical fertilizers. Although the use of chemical fertilizers is necessary in order to satisfy the world's growing food demand, organic farming offers possibilities for some crops and specialized regions to thrive.

1.1 Bio-fertilizers:

A biofertilizer is a product that includes live microorganisms that colonize the rhizosphere or inside of plants and stimulate plant development by increasing the availability of nutrients to the host plant when applied to seeds, plants, or soil. Biofertilizers are commonly used to speed up microbial activities that increase the availability of nutrients that plants may readily absorb. They enhance soil fertility by fixing atmospheric nitrogen and solubilizing insoluble phosphates, as well as producing soil-based plant growth promoters. Figure 1 shows use of biofertilizers in plants.

Figure 1: The above diagram shows use of biofertilizers in plants[5]

1.2 *Plant growth-promoting bacteria:*

Free-living bacteria that establish specialized symbiotic relationships with plants, bacterial endophytes that may colonize at certain parts of plant tissue, and Cyanobacteria are all examples of plant growth-promoting bacteria (PGPB). Despite the fact that each bacterium differs in certain aspects, they all have the same methods for encouraging bacterial development. They may stimulate growth both directly and indirectly by decreasing the inhibitory effects of different pathogenic agents on plant growth and development. Rhizobium, Bradyrhizobium, Sinorhizobium, Azospirillum, Nostoc, Anabaena, Acetobacter, Bacillus megaterium, Azolla, Bacillus polymyxa, and other bacteria that promote crop production and overall plant development are all common plant growthpromoting microorganisms[6].

1.3 *Rhizobium:*

The Rhizobiaceae (-proteobacteria) family of symbiotic N₂-fixing rhizobacteria infect and form a symbiotic connection with the roots of leguminous plants. This involves a complicated interaction between the host and the parasite, which culminates in the development of nodules in which Rhizobia colonize as intracellular symbionts. Rhizobia includes the bacteria Rhizobium, Bradyrhizobium, Sinorhizobium, Azorhizobium, and Mesorhizobium. Diazotrophs are non-symbiontrhizobacteria that fix nitrogen in non-leguminous plants and are capable of establishing a non-obligate relationship with the host plants. The complex enzyme structure nitrogenase, which comprises of dinitrogenasereductase with iron (Fe) as its cofactor and dinitrogenase with iron (Fe) and molybdenum (Mo) as its cofactor, is responsible for nitrogen fixation.

1.4 *Azospirillum:*

They are gram-negative, aerobic nitrogen-fixing bacteria that do not form nodules and belong to the Spirilaceae family. Although there are numerous species in this genus, such as Azospirillumamazonense, Azospirillumhalopraeferens, and Azospirillumbrasilense, Azospirillumlipoferum and A. brasilense are the most helpful. Because they develop and fix nitrogen on the organic salts of malic and aspartic acid, Azospirillum establishes associative symbiosis with many plants, especially those with the C₄ dicarboxylic route (Hatch-Slack pathway) of photosynthesis. As a result, it is mostly suggested for maize, sugarcane, sorghum, pearl millet, and other crops. They generate growth promoters (IAA, gibberellins, and cytokinin) and improve root development and N, P, and K absorption in plants. Inoculation with Azospirillum has a significant impact on root growth and exudation[7].

1.5 *Blue-green algae (Cyanobacteria) and Azolla:*

They are photographic in nature and belong to eight distinct families. They stimulate plant development by generating auxin, indole acetic acid, and gibberillic acid, and they fix approximately 20–30 kg nitrogen per hectare in submerged rice fields, where they are plentiful[8], [9]. For low-land rice cultivation, nitrogen is one of the most important nutrients in significant amounts. Soil nitrogen and biological nitrogen fixation (BNF) by related microorganisms are the two main sources of nitrogen. Fungi, liverworts, ferns, and flowering plants establish symbiotic relationships with blue-green algae.

1.6 Role of biofertilizer in photosynthesis:

Because almost 90% of plant biomass is generated from CO₂ absorption via photosynthesis, higher photosynthesis indicates greater plant development. In comparison to the uninoculated control, biofertilizers *R. leguminosarum*, *Rhizobium* sp. IRBG 74, and *Bradyrhizobium* sp. IRBG 271 enhanced the single-leaf photosynthetic rate of the plant. When compared to the uninoculated control plant, the IRBG strain exhibited the greatest increase in photosynthetic activity (14%) of the three candidates examined. Certain *Rhizobia* test strains were found to significantly increase the surface, areas of plant leaves, net photosynthetic rate of plants, stomatal conductance, and water utilization efficiency of rice, implying that rhizobial inoculation of rice can significantly increase the plant's photosynthetic capacity. Water stress produces a number of reactive oxygen species, which damages the plant's photosynthetic machinery.

1.7 Effect of biofertilizer in amino acid synthesis:

The rhizosphere is the zone of soil surrounding the root system, and "rhizobacteria" refers to a group of rhizosphere bacteria capable of colonizing the root environment[10]. Plant roots produce and release a broad range of chemicals, including amino acids, in addition to providing mechanical support and enabling water and nutrient absorption. The substances released into the soil by roots are known as "root exudates". Chemical attractants for a large variety of heterogeneous and extremely varied microbial populations are produced by plant roots. Exudation of various chemical compounds changes the physicochemical characteristics of soil, affecting the organization of the soil microbial community in the immediate vicinity of the root surface. The kind of amino acids, as well as the composition of root exudates produced by the plant, is therefore determined by the plant's species and accompanying microbes. As a result, the kind of amino acids secreted by the plant changes greatly depending on the adhering PGPR microbial population.

1.8 Role of biofertilizer in remediation of pesticides:

To prevent or suppress plant diseases, insecticides, fungicides, herbicides, and nematicides are employed. Pesticides are an essential part of contemporary agriculture since they are required for cost-effective pest control. However, since pesticides may readily penetrate into the tissues of living creatures and cause bioaccumulation, they are harmful to the environment and pose a potential danger to the plant kingdom as well as humans. Nonetheless, owing to their eco-friendliness, cost-effectiveness, and possible removal from the environment, bioremediation methods for treating pesticide contamination have gotten a lot of attention. Furthermore, research on pesticide-degrading bacteria strains is developing as a potential alternative for combating pesticides' negative effects. Numerous studies have been conducted on PGPR, emphasizing on its critical function in agriculture, horticulture, forestry, and environmental protection. As a result, a number of studies have been conducted on the function of PGPR in pesticide bioremediation. Microorganisms such as *Azospirillum*, *Azotobacter*, *Bacillus*, *Enterobacter*, *Gordonia*, *Klebsiella*, *Paenibacillus*, *Pseudomonas*, *Serratia*, and others have been found to have the potential to decrease pesticide toxicity.

1.9 Effect of biofertilizers on ecosystem:

Despite the fact that biofertilizers have been extensively employed in agriculture for many decades, information on their colonization and ecology is lacking. Furthermore, the process

behind their interactions with plants and the local microbial population continues to pique people's interest. The presence of indigenous microflora in the rhizosphere is one of the main variables that determines the effectiveness of a biofertilizer in a natural system. The biofertilizer's survival and plant growth-promoting qualities may be harmed by this highly competitive population of different organisms in the rhizosphere. Furthermore, bacterization of seeds and seedlings or soil additions may alter the structure of native microflora, which must be taken into account when determining the safety of introducing bacteria into the environment. Finally, the non-target impact of microbial biofertilizers on species other than target pathogens, the influence on biogeochemical cycles, the effect on soil texture, soil characteristics such as water-retaining capacity, porosity, and fertility, and erosion avoidance should all be carefully addressed. As a result, before releasing biofertilizers into the environment, it is critical to assess their non-target impacts on resident microflora populations and, as a result, on ecosystems, as well as a thorough study of the effects of biofertilizers before changing agricultural methods.

1.10 Types of biofertilizer formulation:

Biofertilizers are live microbial cells in a viable condition that are used to improve soil fertility. They are made in such a manner that they are both viable and capable of increasing soil fertility, productivity, and plant development at the same time. The biofertilizers are made in multistep procedures that mix several strains with specific chemicals that preserve the cells during storage. Peat, liquid, granules, and freeze-dried powders are the four main kinds of formulation that have been utilized widely so far.

1.10.1 Peat formulations:

Peat is made up of decomposed plants that have collected over time. It offers a nutrient-rich and safe habitat for a broad variety of microorganisms that may grow and form micro colonies on the surface of particles as well as in cervices. The main characteristics of peat formulation are that it must be nontoxic, extremely adsorptive, and easy to sterilize, have a high organic matter content and water holding capacity, and be readily accessible at a reasonable cost. Peat is an ill-defined and complicated substance made up of many sources with varying capacities for supporting cell development and survival.

1.10.2 Liquid formulations:

Aqueous (broth cultures), mineral or organic oils, oil in water, or polymer-based suspensions are all used in liquid formulations. Liquid biofertilizers have grown in popularity due to their ease of use and application on seedlings or in soil. They usually have high cell concentrations and allow for the application of a less amount for the same effectiveness. Furthermore, unlike solid carrier-based biofertilizers, liquid formulation provides for sufficient quantities of nutrients and cell protectants to enhance performance. Furthermore, as compared to peat-based formulations, they are said to have no contamination, a longer shelf life for certain formulations, better protection against environmental stressors, and improved field effectiveness.

1.10.3 Granules:

Peat prill or tiny marble, calcite, or silica grains are wetted with an adhesive and combined with powder-type inoculums to make granules. The target microorganisms are coated or impregnated into the grains. The size of the granules varies, but there is a clear link between the density of the

mother culture population and the quality of the final result. The higher the quality of the mother culture, the higher the quality of the final output.

1.10.4 Freeze-dried powders:

In certain instances, dry biofertilizers made from soil, organic, or inert carriers have been employed.

2. DISCUSSION

Consumer views about the usage of bio fertilisers and food produced acceptability and manufacturing safety for human well-being are quite important. The consequences of chemical fertilisers on the public, the land and the ecosystem are deteriorating. However, development, marketing and their technique of application are under the authority of major businesses and genetic committees. Bio fertilize agro-industrial issues can be solved in a very specific manner. Chemical fertilisers in contemporary farming have decreased soil fertility, rendering it inadequate for the cultivation of crops. Furthermore, these inputs' extensive usage has resulted in serious health and environmental threats such as soil erosion, pollution of the water, pesticide poisoning, decreasing groundwater table, water logging and biodiversity depletion. Bio fertilisers naturally activate the soil's inexpensive, efficient and environmental friendly microorganisms and, as a result, promote plant growth and restore the natural fertility of the soil from drought or soil disease. Further research and development are needed to understand the mechnures to act for different biofertilizer and find more competent rhizobacterial strains and carrier materials to make agriculture more sustainable and economical. The success of biofertilizer technology requires further research and development. Farmers should be instructed on the environmental and other major favourable impacts on the farming system of biofertilizers to make them more popular among farmers.

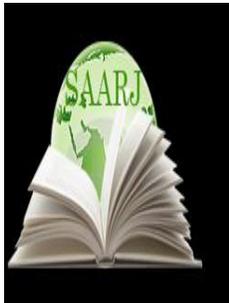

3. CONCLUSION

Environmental stressors are becoming a significant issue, and as a result of their negative impact, agricultural production is decreasing at an unprecedented pace. Because of our over-reliance on chemical fertilizers and pesticides to meet the increasing demand for food, companies have been pushed to develop life-threatening substances as pesticides or fertilizers. These substances are not only harmful to human health, but they also have a negative impact on the environment's ecological equilibrium. In this difficult scenario, biofertilizer may provide a viable alternative that will not only feed the growing population but will also protect agriculture from the effects of different environmental stressors. As a result, it is necessary to comprehend the many essential and advantageous features of biofertilizers, as well as the execution of their use in contemporary agriculture. Extensive study into the development of efficient, temperature-tolerant strains is a must for long-term success in this new sector. The most essential and difficult aspect of the study is that, in addition to identifying different biofertilizer strains and their characteristics, it is also necessary to address the real mechanism of biofertilizers for their effectiveness in sustainable agricultural development.

PROSPECTS FOR DEVELOPMENT OF INVESTMENT LIFE INSURANCE IN UZBEKISTAN

Yuldashev Obiddin Toshmurzaevich*

*Associate Professor, Ph.D.
 Department of "Insurance and Pension affairs",
 Tashkent Institute of Finance,
 UZBEKISTAN

ABSTRACT

The article discusses the main components of investment life insurance in order to identify competitive advantages, features and disadvantages that allow assessing the current state and predicting the prospects for its development. Based on the analysis of periodicals, the main advantages and disadvantages of investment life insurance have been identified; the features that should be taken into account in the process of introducing this product on the insurance market have been identified.

KEYWORDS: *Life Insurance, Investment Products, Accumulated Insurance, Mutual Investment Fund, Investment, Profitability.*

INTRODUCTION

Life insurance is of great social and economic importance. On the one hand, it protects the population from the consequences of social risks and serves as an instrument of accumulation, and on the other hand, it acts as a source of long-term investment in the national economy. The growth of the life insurance segment has become more active due to the confident development of investment life insurance - a direction that has become widespread due to the decrease in rates on bank deposits and low demand for them.

Currently, the investment life insurance market is actively developing. Investment life insurance is one of the fastest growing segments of the insurance market. Investment life insurance is one of the types of life insurance, which is a structured product that includes an insurance and investment component.

Investment life insurance is a hybrid financial product that combines accumulative life insurance and a financial instrument that allows you to receive income by investing an insurance premium

in various financial assets offered by the insurer. For the insurance part of the product, the client receives traditional insurance coverage, and for the investment part - the opportunity to receive a sufficiently high expected income with limited risk. Thus, for clients, investment life insurance becomes an attractive investment instrument with a unique combination of insurance and investment guarantees.

The main differences between investment life insurance and endowment life insurance:

1. The ability of policyholders to participate in the investment income of insurers, while taking on part of the risks from investment. If the insurer disposes of the client's funds in the endowment life insurance programs, then in the investment life insurance programs the client assumes all the risks and chooses the directions for investing his funds, or delegates to carry out investments on his own behalf by a professional asset manager.

2. The policyholder knows in advance that the profitability of the contract will be determined only by the price of the acquired shares. In investment life insurance policies, the final amount of savings can only be assumed.

Therefore, it is always better to open these programs for long periods of time - from 10 years. Over such long periods of time, a significant growth in the stock market, where funds are invested, is practically guaranteed.

3. The client can control his investment portfolio on his own (if he understands the basics of investment) or through his financial advisor.

4. The investment portfolio can be revised once, maximum twice a year. Information about the change in funds and the state of the personal investment portfolio can be obtained both on the website of the insurance company and from independent sources.

An investment life insurance program should be part of everyone's financial planning. Investment life insurance programs are suitable for those who are ready to understand the principles of investing and pay more attention to the financial planning of their lives.

This insurance product has a number of other advantages:

1. Special legal status of investments (they are not property and, therefore, are not subject to confiscation, seizure, division; they cannot be penalized by third parties).

2. If the insurance contract establishes beneficiaries in case of death, the insurance payment is not included in the inheritance and is made to the person indicated as the beneficiary within the terms established by the insurance contract (usually 30 days). Thus, this is a way of long-term transfer of capital to someone close to you or relatives, because life insurance is a very secure investment.

TABLE 1. ADVANTAGES AND DISADVANTAGES OF INVESTMENT LIFE INSURANCE

Advantages	Disadvantages
Use of preferential rates when calculating tax liabilities	Low liquidity
Modeling a system for investing insurance premiums	Obligatory long term investment

Preserving your money in the event of a divorce (i.e., when funds are withdrawn, investments are saved for a long time)	Large penalties for early withdrawal of funds
Reliable protection in the event of insured events related to human health	Strictly limited list of available financial assets

Taking into account the considered features, it is possible to assess the relevance of investment life insurance and highlight three main reasons for its popularity:

- 1) Insurers offered the market a “boxed” product that does not require underwriting and can be easily sold through a bank channel.
- 2) In the face of a decrease in their interest income, banks have relied on the sale of investment life insurance policies as a source of additional fee and commission income. About 90% of insurance premiums for investment life insurances come through the banking channel.
- 3) Clients see investment life insurance as an alternative savings instrument to deposits, combining a capital return guarantee and access to various investment products. Each product has its own merits and demerits.

Thanks to investment life insurance, the client gets the opportunity to:

- 1) invest money in the stock market without the risk of losing investments;
- 2) additionally increase and preserve your capital with the help of tax incentives and legal privileges (in particular, funds invested in the insurance program are not subject to confiscation, collection, division in case of divorce);
- 3) receive reliable insurance coverage in case of unforeseen circumstances related to life and health.

However, despite the merits of investment life insurance, there are a number of problems.

First, aggressive sales by banks. Bank employees often impose this product on customers, exaggerate its possible profitability, advertise it as an analogue of a deposit, hiding its specific features.

Secondly, this product is aimed at a consumer with high financial literacy, and in our country it is still insufficient in general.

Third, there must be strict financial discipline on the part of the customer with the installment product. You need to carefully assess your financial capabilities, otherwise there may be losses in case of early termination of the contract. Investment life insurance is aimed at the middle class. Currently, most of the insured under the investment life insurance have an age of 45 and older.

Fourth, there is a risk of loss of investments in the event of the insurer's bankruptcy. After all, guarantees are valid only in relation to deposits, and insurance contracts do not apply. And banks and insurers do not provide such information to customers.

Fifth, insufficient legal regulation. To date, there is no normative legal act in which the term "investment life insurance" would appear, and this does not provide an opportunity for effective control over the mechanism and implementation of the investigated product.

Despite all the problems described above, it would be completely inappropriate to abandon the investment life insurance, bearing in mind its enormous economic and social significance. At this stage of the development of the insurance market, investment life insurance is in demand and contributes to the growth of the life insurance segment, having a positive effect on the development of the country's economy. Subject to a number of conditions, this financial product is able to provide insurance protection and generate income for the owner, which requires a search for a compromise of interests of all parties interested in its development.

For the further development of investment life insurance, a number of measures are needed.

It is necessary to legislatively define the concept of "investment life insurance", keep statistics and reform control over life insurance to identify prospects and development trends.

Measures are needed to clarify the specifics of investment life insurance. It is important to form and develop an effective infrastructure of the insurance market. Due to the complexity of this insurance product, it is necessary to develop training for managers of banks and insurance companies.

It is necessary to develop a plan of measures to improve the qualifications of personnel. Despite the existing problems, investment life insurance in the financial market has a high potential. Its development is a priority, since investment life insurance has a number of advantages - a guarantee of capital safety, investment income and insurance protection.

The growth of investment life insurance is due to the provision of tax benefits, stabilization of the securities market, and an increase in citizens' awareness. Investment insurance contracts guarantee a likely higher level of income than other financial insurance products.

CONCLUSION

Thus, examining the current stage of development of investment life insurance, we came to the conclusion that investment life insurance is a fairly new type of insurance that has not yet been fully studied and is not entirely clear for the population, which has certain advantages and disadvantages.

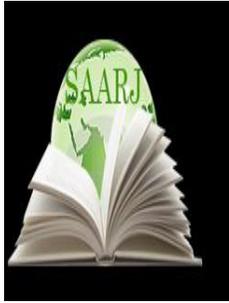

The growth in sales of investment life insurance products is due to the stabilization of the securities market, the development of tax incentives for income under investment life insurance contracts, and the impact on increasing citizens' awareness of the possibilities of obtaining investment income.

Investment life insurance contracts guarantee a probable and higher level of income than other financial products. The upcoming development of investment life insurance is closely related to the trend of expanding the range of banking and insurance products, which will lead to an increase in sales of investment life insurance products through banking organizations. These circumstances will serve as a growth stimulus for the socio-economic consequences of the introduction of investment and insurance products, the growth of the volume of investment life insurance contracts.

THE SPECIFIC ACTIVITY OF THE TEACHER OF TECHNOLOGY EDUCATION

Doniev Bahodir Boshmanovich*

*Training of Public Educators,
 Samarkand Regional Center for Retraining and Advanced,
 UZBEKISTAN
 Email id: bdoniyev@umail.uz

ABSTRACT

The article gives information about the specifics of the work of a teacher of technology education and the organization of technology education and its role in the development of society. The teacher of technology education is distinguished from the teachers of other sciences by its very distinctive features: in terms of professional education and skills, level of preparation, working conditions and content. Such teachers are required to retrain their pedagogical, psychological, methodological, general-technical and ideological skills, to improve their professional skills to the level of higher education requirements.

KEYWORDS: *The Specific Activity Of Technology Education's Teacher. Education And Upbringing. Educational Events The Outside Of Classroom And School.*

INTRODUCTION

A technology education teacher is a leading professional who ensures the continuous practical application of technology education in a particular educational system. The teacher of technology education is the head unit, which ensures the education of students in this field and receives information, carries out class-lesson activities, various educational activities in this field. Currently, teachers of technology education prepared in secondary schools in the following directions operate:

1. Pedagogical institutes, universities, pedagogical colleges, such as "Physics and Technology", "Industrial Pedagogy", "Nature and Labor Education", "General Technical Sciences and Labor", "Vocational Education and Labor Education" of the named faculties in this specialty successfully completed the sections of "Teaching general technical sciences", "Teaching agricultural machinery and drawing", "Engineer-pedagogue" and "Technology education",

leading specialist teachers of the same subject with higher pedagogy, general technical training, education;

2. Graduated from institutes in various fields of national economy (mechanics, agriculture, construction, machinery, transport, etc.), has a degree in non-pedagogical specialties, engineers-technical specialists who teach in different directions, forms of technology education. This sphere requires retraining of people from pedagogical, psychological, methodological point of view.
3. Graduated from faculties, departments of pedagogical institutes, universities, pedagogical technical schools and colleges, educational institutions in other directions than technology education, pedagogical personnel who does not have a special education from technology education, but are now taking the lessons of technology education in addition to the basic lessons. Such teachers will need to be retrained in modern production, new techniques, modern technology and also general technical and technological skills in the field of folk crafts.
4. Personnel with secondary special education, who have graduated from various educational institutions, training courses, have a high level of practical production skills, but do not have higher education. Such teachers are required to retrain their pedagogical, psychological, methodological, general-technical and ideological skills, to improve their professional skills to the level of higher education requirements.

With a worthy assessment of the position of technology education in the development of society, the educational process in secondary schools is offered by masters of folk art, and if the basics are developed the educational, pedagogical, psychological, methodological, organizational, etc. of the teacher-student system, this important aspect of pedagogy would be further enriched, and these activities would also increase the effectiveness of the educational process.

The teacher of technology education is distinguished from the teachers of other sciences by its very distinctive features: in terms of professional education and skills, level of preparation, working conditions and content. Due to the peculiarities of the teaching method of Technology Education Science, from the admission of entrance examinations of higher educational institutions, which prepare specialists from technology education, to the graduation of a higher educational institution, it is necessary to radically reconsider the pedagogical technology, the process of training specialists before passing the state exam, to focus on the content and form to reflect the identity of the field and to update it in all its aspects. At the present time, it is a natural necessity to radically update the attention of public, private, personal enterprises, administrations, authorities, ministries and other management organizations to the work of training teachers in technology education, vocational education and to plan their solution to this problem, to implement leadership in their mutual cooperation.

In the preparation of the teacher in general secondary schools and practical pedagogical activity, the problems that they will solve, the tasks that they will perform, their knowledge, qualifications and skills and it is important to improve the tools they use, their knowledge and skills, and the ways and means, that is, the content and structure of the pedagogical activity of reading.

The system of current problems to be solved in the activity of a teacher of technology education is as follows:

1. Problems related to socio-economic changes.
2. Features of labor in society and the basics of its knowledge.
3. The purposefulness of the organization of educational events.
4. Problems related to the joint implementation of moral, national, technological, physical, environmental, economic, sophisticated, sexual, computer education of students in the educational process and others.

The types of activities of a technology education teacher in different contexts should include: Creating, organizing, interacting i.e. communicating with people, informing, developing, targeting, mobilization (in the implementation of a pedagogical activity), research, technical and technological, production activities and others.

A technology education teacher differs from other subject teachers in that he or she has a wide range of knowledge, qualification, and worldviews:

1. The scope of ideological and also political - ideological knowledge.
2. Psychological knowledge.
3. Pedagogical and methodological knowledge.
4. Natural-scientific knowledge.
5. Mathematical knowledge.
6. Technical and technological knowledge.
7. Economic knowledge.
8. Demographic and ethnographic knowledge.
9. Natural-biological knowledge.
10. Ecological knowledge.
11. Legal knowledge.
12. Perceptions of sophistication.
13. General cultural knowledge.
14. Information technology.
15. Organizational knowledge.
16. Knowledge of foreign languages, etc.

In order to conduct effective and complete technology education in general secondary schools, a teacher must have the following practical skills and competencies: mental, spiritual, intellectual, pedagogical, methodical, general, special, professional, computational, measurement, drawing and composing, various devices, tools, ability to control devices and also equipments, skills and competencies in dealing directly with the objects of labor, objects, weapons, and other areas.

The content of the pedagogical activity of a teacher of technology education in the organization of educational activities: In the main stage of the system of continuing education (grades 5-9

incomplete secondary school), the process of labor training of students involves the following objectives:

- to get acquainted with the spheres of production;
- to get acquainted with the technical means and technological processes used in production;
- productive forces and their types;
- carrying out of various technical calculations, performance of labor operations;
- participation in the productive process;
- to get acquainted with different professions and prepare for them;
- preparing students for work, profession and life;

Extracurricular and out-of-class educational activities, including labor education classes, play an important role in achieving the goals and objectives of labor training.

Extracurricular and out-of-school educational activities involving technology education aim to bring students closer together with the following key factors:

- ✓ tools of labor – objects of labor, weapons of labor, mechanisms, machinery, apparatus, equipment, tools and others;
- ✓ technological processes - physical and chemical effects on the means of labor and their transformation into a necessary product;
- ✓ labor effects - a set of human actions in the implementation of the technological process through the means of labor;
- ✓ product of labor - the product of a purposeful technological process of production;
- ✓ manual processes – it is a set of purposeful actions performed by people (workers and employees) without various mechanisms, without electrified means (For instance: manual processing of materials, manual painting, preparation of mixtures and others);
- ✓ mechanized processes - processing of labor objects using various mechanisms, machines and devices (For example: machining of materials using machines, transportation of goods and others);
- ✓ automated processes - processing of labor objects using machines and mechanisms under the supervision of workers (For example: smelting and placing metals in special furnaces, production of various chemicals in chemical plants and others);
- ✓ ancillary processes are the effects of labor that help to carry out a technological process (For example: preparation for operation, repair and maintenance of machinery and equipment, maintenance and inspection and others);
- ✓ the process of productive labor is the production of purposeful goods in which the product of labor has a commodity value as a result of exposure to the objects of labor by means of labor and tools.

In addition to technology education classes, extracurricular and out-of-school educational activities organized by technology education also play an important role in acquainting students with the above-mentioned processes and factors.

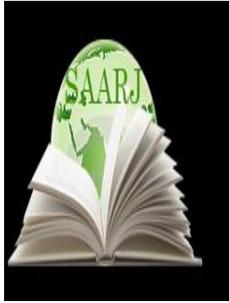

Extracurricular and out-of-school educational activities for technology education are in line with the general goals and objectives, form and content of school work training and have the following aspects. At school:

1. Practical training in workshops.
2. Practical tests on the training site.
3. Organize and look after a “live corner” at school.
4. Organize self-service work.
5. Participation of youth and students in labor events and Saturdays.
6. Participate in various technology education clubs.
7. Trips to manufacturing factories.
8. Out of school (on the basis of paternity or support enterprise).
9. As a successor to the dynasty of craftsmen in folk crafts.
10. Participate in the repair and maintenance of various items (classrooms, home, business and school) and etc.
11. Meetings with Labor Veterans and Advanced.
12. Participate in the repair and maintenance of various items (classrooms, home, business, school).

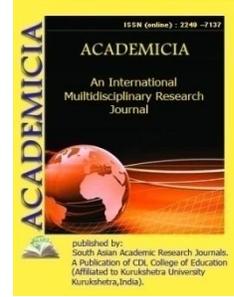

However, the role of the teacher of technology education is invaluable in the search for and implementation of educational activities rich in such educational opportunities, different views, national, local, ethnographic features.

AN OVERVIEW ON SETS IN MATHEMATICS

Mr. Rahul Tomer*¹; Sunil Kumar Gupta²**

^{1,2}School of Education,
 Shobhit Institute of Engineering and Technology,
 (Deemed to be University), Meerut, INDIA

Email id: Rahul.tomar@shobhituniversity.ac.in, ²sunil.gupta@shobhituniversity.ac.in

ABSTRACT

Mathematics is a comprehensive discipline that covers a wide range of ideas such as numbers, sets, relations, functions, algebra, and many more. It's a fascinating topic that's entirely dependent on logic, mathematics, fundamentals, and practice. In recent decades, students have regarded mathematics as one of the most difficult subjects in comparison to other subjects. As a result, the author chooses to create this review problem in order for students to understand the principles of sets more simply. Sets, Types of Sets, Operations of Sets, Venn diagram, Laws of Algebra of Sets, and Real-Life Examples of Sets are all covered in this article. The theory of sets is essential since the rest of mathematics is based on them. Sets are collections of items, objects, and components that have similar characteristics. People organize their books on the basis of various topics, thus sets may be utilized in real life. The authors also addressed set algebra rules such as identity laws, associative laws, and others in this article. This paper, according to the author, aids students in comprehending sets in mathematics. Mathematics also offers a wide range of career options, including lecturer, professor, finance manager, and mathematician. As a result, sets in mathematics have a bright future since they improve abilities and knowledge.

KEYWORDS: *Elements, Laws, Mathematics, Sets, Venn diagram.*

1. INTRODUCTION

Mathematics encompasses a wide range of subjects, including Sets, Relations, Geometry, Trigonometry, Graphs, and many more. The author has addressed Sets in mathematics in this article. A set is a classification of components, entities, or objects that have similar properties. People, alphabets, and numbers are examples of the kind of items that may make up a set. There are numerous instances of sets being utilized in real life, such as in the kitchen, where people

maintain their kitchen clean and well-organized, with plates kept separate from other utensils such as bowls, cups, and glasses. As a result, sets are defined as related objects that are maintained apart[1], [2].

1.1 Sets:

A set is a category of components, objects, and things that have similar properties. Upper letters are used to indicate a set, which are surrounded by curly brackets { }. The elements in the sets are non-repeatable.

Figure 1: The above diagram shows collection of clothes which is an example of sets

The example of sets is shown in Figure 1 as the Collection of clothes like hat, shirt, jeans, pants etc. have common property that people wear these clothes. A set is often described in two forms which are listed below:

- I. *Roster or Tabular form:* A roster form is a form in which all the elements are separated by commas and enlisted within braces { }[3]. For ex- Sets of five numbers can be written as {1, 2, 3, 4, 5}.
- II. *Set-builder form:* A set-builder form is a form which describes the things of a set instead of listing the elements. For ex- the set {1, 2, 3, 4, 5, 6, 7, 8, 9} list the elements but in set-builder form, it can be written as {x/x is a counting no. less than 10}.

1.2 Categories of sets:

- *Empty Set:* An Empty set is a set that doesn't involve any elements. Also known as null or void sets and it is denoted by ϕ . For ex- If the set is $\{x \in \mathbb{R}: X^2 = -2\}$ then the result is empty.
- *Singleton Set:* Singleton set can be defined as a set which involves only one element. The set of the first English letter can be written as {a} which is an example of Singleton set[4].
- *Finite Set:* A finite set is a set which is either null, zero or anyone can count its elements. For ex- A set of prime numbers from 2 to 50.
- *Infinite Set:* An Infinite set can be defined as a set in which elements cannot be counted. For ex- A set of whole numbers.
- *Equivalent Sets:* Two sets can be equivalent if their processing numbers are same in both sets i.e. $m(a) = m(b)$.

- *Equal Sets:* Two sets can be equal if every element of P is an element of Q and vice-versa. For ex- Two sets such that $P=\{10, 11, 15\}$ and $Q=\{15,11,10\}$ then $P=Q$ as Q contain every elements of P.
- *Subset:* A set is said to be subset of another set if each element of that particular set are present in another set. Each set is always is a subset for itself. An empty set is considered as a subset for each existing set. For example, if $A=\{1, 2\}$ and $B =\{4,1,5,2,3\}$ then here A is subset of B as every element of A is present in B. It is denoted as $P\subseteq Q$.
- *Universal Set:* Universal set can be defined as a set which involves all the possible values related to given context. For ex- $R= \{5, 7\}$, $S= \{9, 0\}$ and $T= \{3, 4, 6\}$ then A as a Universal set written as $\{0, 3, 4, 5, 6, 7, 9\}$.
- *Power Set:*Power set for any given set is a collection of all subsets of any given set and denoted by $P(X)$ where $X=$ any set. For example power set of $\{ 12,13,11\}$ will be $\{\{11\},\{12\},\{13\},\{11,12\},\{11,13\},\{12,13\},\{11,12,13\},\emptyset\}$.

1.3 Venn Diagrams:

A Venn diagram is a diagram in which all the possible values is represented within a rectangle and its subset is represented by circles within the given rectangle[5]. For ex- Suppose a set B is a subset of a set A then the circle representing A is drawn inside the circle representing B as shown in Figure 2[6].

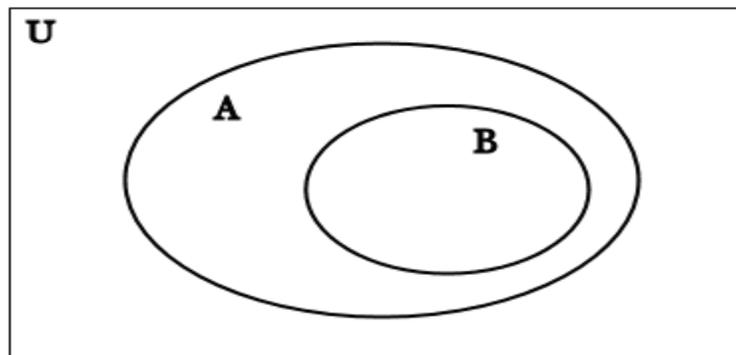

Figure 2: The above diagram shows the representation of Venn Diagram

1.4 Operations on Sets:

In this part, the author has discussed about some operations on sets which are stated below:

1. *Union of sets:* Union of sets can be defined as the set of all possible values which either belongs to two different sets or both sets. Sets union can be represented by 'U' symbols. Figure 3 shows the example of combination of two sets A and B.

$$A = \{1,2,3\}$$

$$B = \{3,4,5\}$$

$$A \cup B = \{1,2,3,4,5\}$$

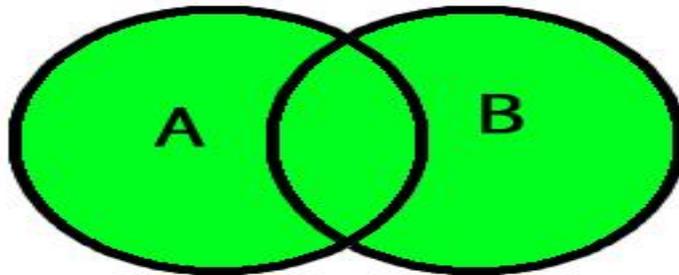

Figure 3: The above diagram shows the Fusion of two sets A and B

2. *Intersection of sets:* For any two sets, let's say P & Q. The intersection of P and Q is the set of those values that are common in P and Q. It can be represented as ' \cap ' symbol. For ex- If we have two sets such as A and B & $A = \{1,3,4,5\}$ and $B = \{2,1,4\}$ then $A \cap B = \{1,4\}$ as 1 and 4 is common to both A and B. If any pair of set does not have anything in common then, their intersection set contains \emptyset as it represents null value. Figure 4 represents the Venn diagram of intersection of two sets A and B[7].

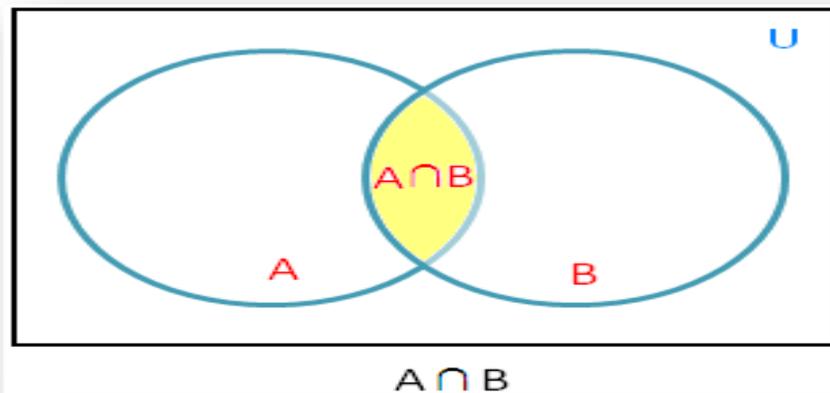

Figure 4: The above diagram shows the Venn diagram of intersection of two sets A and B

3. *Disjoint sets:* Disjoint sets for any two sets can be defined as sets which don't have any common elements. If disjoint sets have common values then they are said to be intersecting or overlapping sets. For ex- $X = \{1,2,3,4\}$, $Y = \{9,10,11\}$ and $C = \{1,2,3\}$ then X and Y is called disjoint sets as X and Y doesn't have any mutual values & A and C are said to be overlapping sets as they have common values[8]. Figure 5 represents the Venn diagram of disjoint sets X and Y.

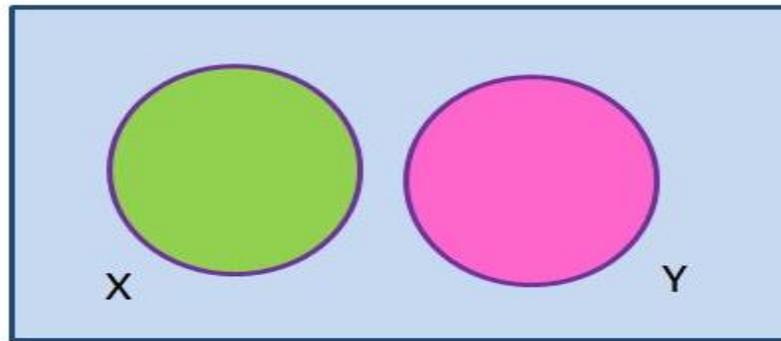

Figure 5: The above diagram shows the Venn diagram of two disjoint sets of X and Y

4. *Sets difference:* Suppose if take sets X and Y then sets difference is the removal of all the elements of X which is not involved in Y[9]. It can be written as $X - Y$. For ex- Suppose sets X and Y such as $X = \{5, 6, 7\}$ and $Y = \{6\}$ then $X - Y = \{5, 7\}$. The difference of sets is represented in Figure 6.

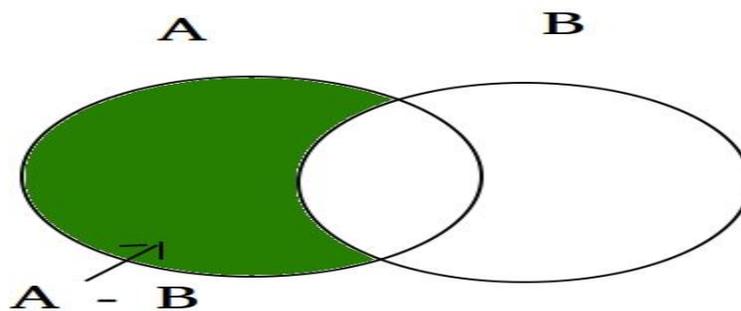

Figure 6: The above diagram shows the Venn diagram of difference in two sets

5. *Symmetric Differences:* Symmetric difference of two sets is the set of $(A - B) \cup (B - A)$ and It is denoted by $A \Delta B$.
6. *Complement of a set:* Sets Complement can be defined as all the values involved in A does not belongs to A' . It is denoted by X' where X is any set. Figure 7 represents the Complement of A. The coloured area is the complement of A.

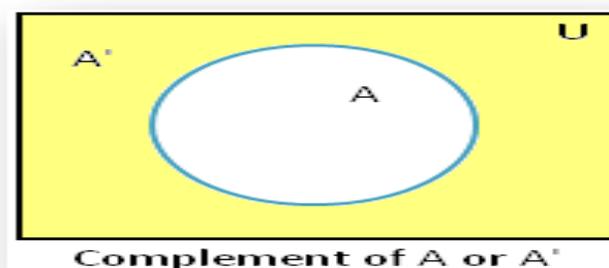

Figure 7: The above diagram shows the diagram of Complement of a set A

1.5 Laws of sets of algebra:

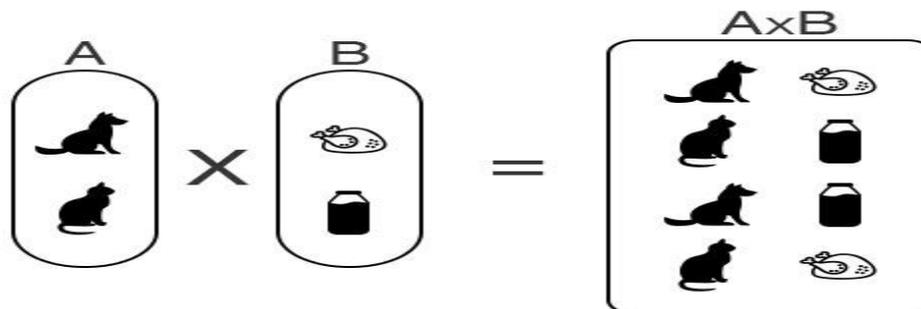

Table 1 represents the laws of sets of algebra.

TABLE 1: LAWS OF SETS OF ALGEBRA

Idempotent laws:	(1a) $A \cup A = A$	(1b) $A \cap A = A$
Associative laws:	(2a) $(A \cup B) \cup C = A \cup (B \cup C)$	(2b) $(A \cap B) \cap C = A \cap (B \cap C)$
Commutative laws:	(3a) $A \cup B = B \cup A$	(3b) $A \cap B = B \cap A$
Distributive laws:	(4a) $A \cup (B \cap C) = (A \cup B) \cap (A \cup C)$	(4b) $A \cap (B \cup C) = (A \cap B) \cup (A \cap C)$
Identity laws:	(5a) $A \cup \emptyset = A$	(5b) $A \cap U = A$
	(6a) $A \cup U = U$	(6b) $A \cap \emptyset = \emptyset$
Involution laws:	(7) $(A^c)^c = A$	
Complement laws:	(8a) $A \cup A^c = U$	(8b) $A \cap A^c = \emptyset$
	(9a) $U^c = \emptyset$	(9b) $\emptyset^c = U$
DeMorgan's laws:	(10a) $(A \cup B)^c = A^c \cap B^c$	(10b) $(A \cap B)^c = A^c \cup B^c$

1.6 Cartesian Product of sets:

Cartesian Products of two set P and Q is basically the sets of all involved pair (p, q). It is denoted as $P \times Q$. Example if we have , if $P=\{1,2,3\}$ and $Q=\{5,6\}$ then product Cartesian of P and Q will be $P \times Q = \{(1,5),(1,6),(2,5),(2,6),(3,5),(3,6)\}$. It can also be represented in set builder form as $P \times Q = \{(p, q): p \in P \text{ and } q \in Q\}$. Figure 8 represents the Cartesian product of sets.

Cartesian Product of Two Sets.

Figure 8: The above diagram shows the Cartesian products of two set

1.7 Examples of sets in real life[10]:

- Playlists as an example People have smart phones and laptops, and they can build playlists based on genres. As a result, a playlist is an example of a set.
- There are numerous galaxies in our universe, all of which are separated from one another by a significant distance. As a result, this is likewise a set example.
- The kitchen is maintained in order by the people, and dishes and bowls are kept separate. As a result, the kitchen is an example of a set.

2. DISCUSSION

Mathematics is a vast topic with many sub-disciplines. The majority of mathematical progress has been practical. Logic and numbers are the foundations of all mathematical ideas. There are a

number of initiatives that are entirely based on mathematical ideas. In the area of mathematics, there are many career possibilities such as teacher, professor, mathematician, and finance manager. Sets, Relations, Functions, Sequence & Series (which includes arithmetic and geometric progression), Trigonometry, Exponents, Logarithms, Algebraic Equations (such as Linear equations, Polynomial equations, and Cubic equations), and Algebraic Equations (such as Linear equations, Polynomial equations, and Cubic equations) are some of the topics covered in mathematics. Sets, types of sets, operations of sets, rules of algebra of sets, and real-life examples are covered in this review article. This review article was written by the author in order for students or others to get a better knowledge of sets in mathematics. As a result, the future of sets in mathematics looks bright, as people's understanding grows.

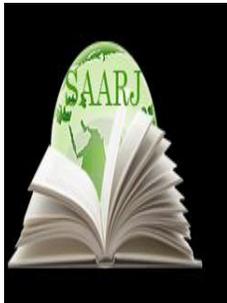

3. CONCLUSION

The theory of sets is significant because it underpins the rest of mathematics, and sets offer a variety of applications to the rest of mathematics. Sets are defined as a group of objects or components that have a similar characteristic. In recent decades, students have regarded mathematics as one of the most difficult subjects in comparison to other subjects. As a result, the author decided to create this review problem in order for students to understand the principles of sets more simply. Sets, Types of Sets, Operations of Sets, Venn Diagram, Laws of Algebra of Sets, and Real-Life Examples of Sets are all covered in this article. Because mathematics is a discipline based only on fundamentals and formulas, anybody who understands the fundamental ideas and formulae may be a competent mathematician. When it comes to employment possibilities, mathematics is a popular choice since there are many options such as finance manager, professor, teacher, and many more. As a result, the future of mathematical ideas is bright for individuals who want to improve their abilities and careers.

ABSTRACT

There are a variety of mathematical ideas that are often utilized in real-world applications. Trigonometry is one such idea that is now widely utilized in a variety of tasks, including the construction of dams, bridges, and buildings. When it comes to solving real-world issues, trigonometric calculations have shown to be dependable and helpful. Working on it is both simple and enjoyable. In general, students find it difficult to grasp its ideas at first, but once they do, solving trigonometric problems becomes very interesting and enjoyable. Angles and sides are the focus of trigonometry. All trigonometric calculations and formulas are based entirely on triangle angles and sides. There are a number of trigonometric identities that may be used to assist solve trigonometric issues. This article has covered all of the ideas related to trigonometry, including identities, formulas, and graphical representations of trigonometric functions. This article describes how trigonometry is used in real-life situations. It discusses the future of trigonometry and the need of pupils fully understanding trigonometric principles.

KEYWORDS: Angle, Mathematics, Side, Sine, Trigonometry.

1. INTRODUCTION

Mathematics is the subject that students believe to be the most difficult. It's all about numbers in mathematics. The numbers 0 to 9 are the foundation of all mathematics. Math is entirely dependent on computations and logic[1]. Mathematicians employ a variety of theorems and rules to solve a variety of issues. In this article, a few of these theorems, rules, and ideas are briefly described.

1.1 Trigonometry:

Angles are the foundation of trigonometry. Cosecant, tangent, cosine, secant, sine, and cotangent are the six major functions in it. These may be expressed as cot, cos, cosec, tan, sec, and sin in abbreviated form, respectively[2], [3]. The inverse relationship between sin and cosec may be expressed as $\sin=1/\text{cosec}$ or vice versa. In the same way, cos and sec have an inverse relationship that may be expressed as $\cos =1/\text{sec}$ or vice versa. Tan and cot have the same inverse relationship, which is expressed as $\tan=1/\text{cot}$ or vice versa. Trigonometry is entirely dependent on the use of right-angled triangles to accomplish different functions. All of these elements are needed to calculate the sides and angles of triangles. The sign “°” is used to indicate angles. There are a number of formulas that link these elements to triangle sides and angles.

1.2 Trigonometric Functions:

Sin,cos,sec,cosine,tan and cot are six important functions in trigonometry which form base of trigonometry.

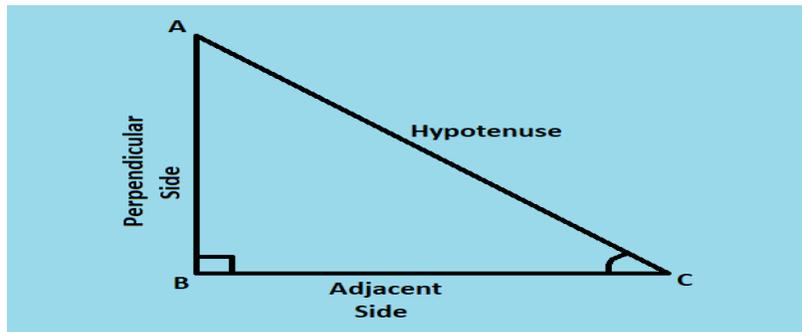

Figure 1: Triangle representing all three sides with respect to angle θ [4].

Figure 1 shows a triangle which represents all three sides with respect to angle θ .

$\sin \theta = \text{side opposite to angle}/\text{Hypotenuse of triangle}$

$\cos \theta = \text{side adjacent to angle}/\text{Hypotenuse of triangle}$

$\tan \theta = \text{side opposite to angle} / \text{side adjacent to angle}$

$\text{Cosec } \theta = \text{Hypotenuse of triangle}/\text{side opposite to angle}$

$\text{Sec } \theta = \text{Hypotenuse of triangle} / \text{side adjacent to angle}$

$\text{Cot } \theta = \text{Base}/\text{Perpendicular}$

There are various formulae which establish a relation between these components and can be used to find out solution of trigonometric problems[5]. These are called as Pythagorean identities. These are:

$$\cot^2\theta + 1 = \operatorname{cosec}^2\theta$$

$$\sin^2\theta + \cos^2\theta = 1$$

$$\tan 2\theta = 2 \tan \theta / (1 - \tan^2\theta)$$

$$\cos 2\theta = 2\cos^2\theta - 1$$

$$\cot 2\theta = (\cot^2\theta - 1) / 2 \cot\theta$$

$$\cos 2\theta = 1 - 2\sin^2\theta$$

$$\tan^2\theta = 1 + \cot^2\theta$$

$$\sin 2\theta = 2 \sin\theta \cos\theta$$

There are various formula for finding out sum and difference between two or more angles. These are called as difference and sum identities[6]. For two angles r and s these formula can be demonstrated as

$$\sin(r + s) = \sin(r)\cos(s) + \cos(r)\sin(s)$$

$$\tan(r+s) = \tan(r) + \tan(s)/(1 - \tan(r) \tan(s))$$

$$\sin(r - s) = \sin(r)\cos(s) - \cos(r)\sin(s)$$

$$\tan(r - s) = \tan(r) - \tan(s)/(1 + \tan(r) \tan(s))$$

$$\cos(r - s) = \cos(r)\cos(s) + \sin(r)\sin(s)$$

$$\cos(r + s) = \cos(r)\cos(s) - \sin(r)\sin(s)$$

For any three angles x, y, z and three sides X, Y, Z of a triangle there are Sine and Cosine laws which gives following relation:

1.2.1 Sine Laws:

$$x/\sin X = y/\sin Y = z/\sin Z$$

1.2.2 Cosine Laws:

$$z^2 = x^2 + y^2 - 2xy \cos Z$$

$$x^2 = y^2 + z^2 - 2yz \cos X$$

$$y^2 = x^2 + z^2 - 2zx \cos Y$$

There are Euler's formula in trigonometric which are used to find out exponential expressions. These are:

$$e^{ix} = \cos x + i \sin x$$

Where x = angle and i = imaginary number.

$$\tan x = (e^{ix} - e^{-ix})/i(e^{ix} + e^{-ix})$$

$$\sin x = (e^{ix} - e^{-ix})/2i$$

$$\text{Cos}x = (e^{ix} + e^{-ix})/2i$$

1.3 Trigonometry Table:

Trigonometric table contains the most commonly used values of different functions[7].

TABLE 1: TABLE OF MOSTLY USED VALUES OF TRIGONOMETRIC FUNCTIONS AT DIFFERENT ANGLES

Angle	0	30	45	60	90
Cosec θ	∞	2	$\sqrt{2}$	$2/\sqrt{3}$	1
Cot θ	∞	$\sqrt{3}$	1	$1/\sqrt{3}$	0
Sec θ	1	$2/\sqrt{3}$	$\sqrt{2}$	2	∞
Cos θ	1	$\sqrt{3}/2$	$1/\sqrt{2}$	$1/2$	0
Sin θ	0	$1/2$	$1/\sqrt{2}$	$\sqrt{3}/2$	1
Tan θ	0	$1/\sqrt{3}$	1	$\sqrt{3}$	∞

Table 1 represents the mostly used values of Trigonometric Functions at different angles such as 0, 30, 45, 60, 90 and rest other values can be find out using these values with the help of trigonometric identities and relation between the functions.

1.4 Circular Representation using Unit Circle:

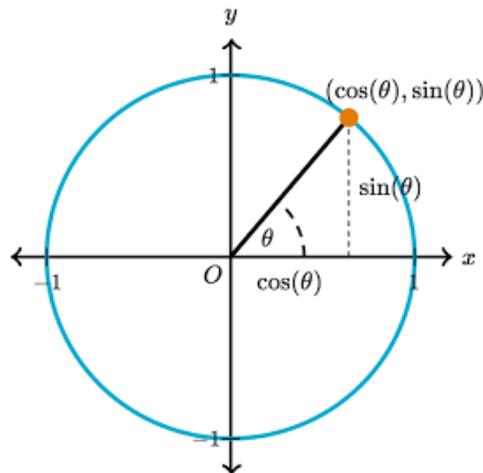

Figure 2: Circular representation of angle θ in triangle using Unit Circle[8].

In Unit Circle, Figure 2 displays a circular depiction of a triangle with sin and cos indicating its location coordinates. Because the circle's centre is at the origin, resulting in a radius of 1, it aids

individuals in directly measuring the angles of tan, sin, and cos. The base of the triangle is p , and the perpendicular is q . The Hypotenuse will have the same length as the circle's radius, which is 1. Trigonometric ratios in a unit circle are as follows:

1.5 Angle of Elevation:

It's the angle formed when someone looks up horizontally from the ground. It is the angle that exists between the horizontal plane and the observer's eye. For example, if a woman stares at a tower from the ground, an angle is created that is inclined towards the tower from the woman's eye. Using trigonometric functions, this angle of elevation may be used to measure distances and heights of bridges, buildings, and other structures.

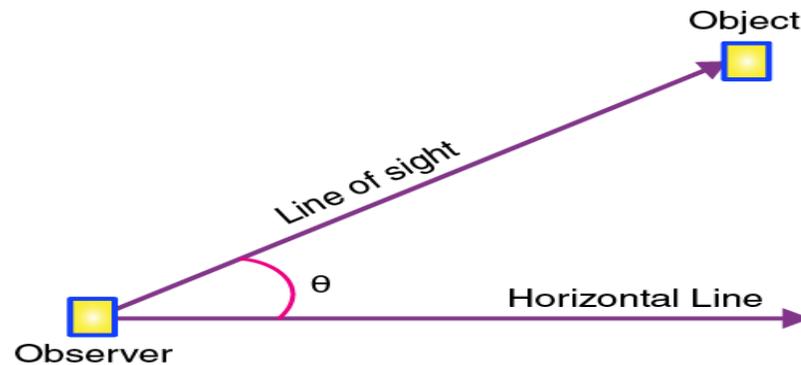

Figure 3: Angle of elevation from ground to an object higher than ground[9].

Figure 3 shows the Angle of elevation from ground to an object higher than ground with respect to the observer.

Formula to find out angle of elevation is:

$$\tan \theta = \text{Side Opposite to angle} / \text{Side Adjacent to angle}$$

1.6 Angle of Depression:

It's the angle formed when someone stares horizontally downwards from somewhere above ground level. It is the angle formed between the horizontal plane and the observer's eye when the observer is at a higher level than what he is looking at. For example, if a lady stares at a ball from terris, an angle is created that is slanted downward towards the ball from the woman's eye. Using trigonometric functions, this angle of depression is extremely helpful for calculating distances and heights of bridges, buildings, and other structures.

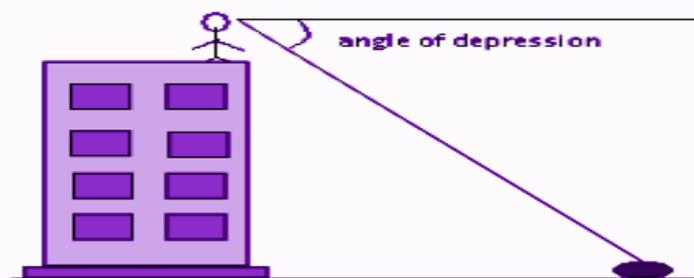

Figure 4: Woman staring from terris of building on the ball kept at ground resulting in formation of angle of depression[9].

Figure 4 shows a woman staring from terris of building on theball kept at ground resulting in formation of angle of depression.

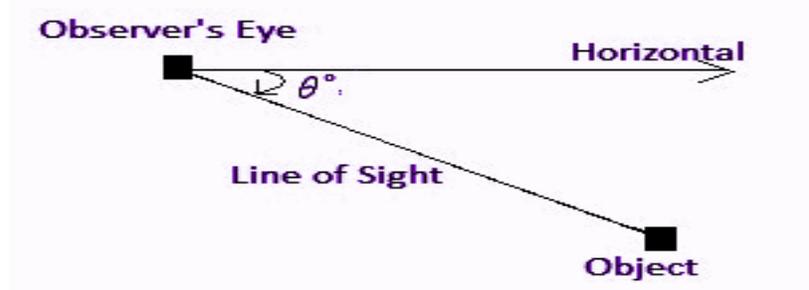

Figure 5: General representation of formation of angle of depression[9].

Figure 5 shows general representation of formation of angle of depression when someone looks at something kept at a lower level than the observer.

Formula to find out angle of depression cab be written as:

$$\tan \theta = \text{Side Opposite to angle} / \text{Side Adjacent to angle}$$

1.7 Graphical representation of Trigonometric Functions:

Trigonometric functions can be represented in form of waves.

1.7.1 Sine wave:

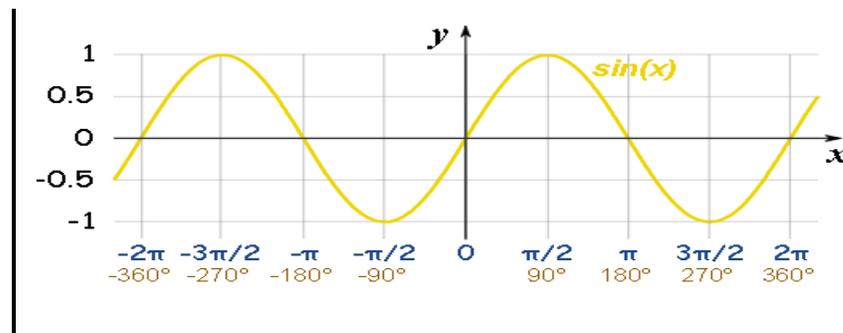

Figure 6: Graphical representation of Sine Function[10].

Figure 6 shows graphical representation of Sine function. In it X axis represent the values of function and Y axis represent angle. Sine function is continuous and passes through origin.

1.7.2 Cosine wave:

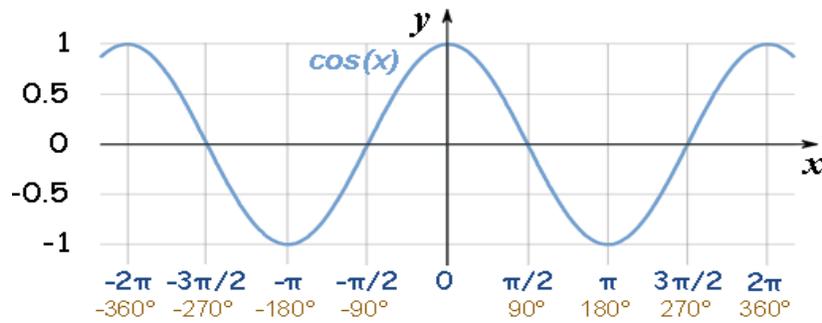

Figure 7: Graphical representation of Cosine Function[10].

The Cosine function is graphically shown in Figure 7. The X axis represents function values, whereas the Y axis represents angle. The sine function is a continuous function that does not go through the origin.

1.7.3 Tangent wave:

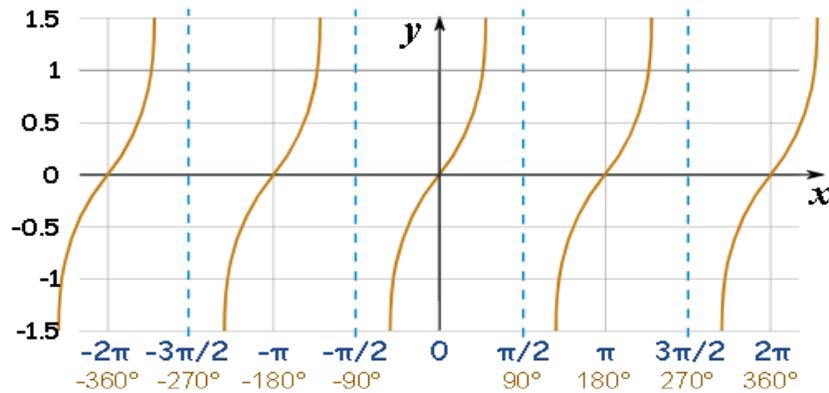

Figure 8: Graphical representation of Tangent Function[10]

The Tangent function is shown graphically in Figure 8. The X axis represents function values, whereas the Y axis represents angle. Tangent waves are not continuous waves that travel through the origin.

2. DISCUSSION

Mathematics is a discipline that studies numbers and the operations that may be done on them. It's a fascinating topic focused entirely on numbers, computations, and logic. It's a fascinating topic in which there's no need to memorize anything as in other courses; all that's required is attention and concentration when performing calculations. It offers a wide range of employment possibilities, which is why many students and parents choose Math as their primary subject in senior secondary school. Mathematics is built on a number of different ideas. Trigonometry is one of them, and it's a fascinating and entertaining subject with real-world applications. The many features and functions of trigonometry are explained in this article. It contains all of the trigonometric formulas that may be used to real-world situations and solved. It teaches how to depict different trigonometric functions graphically. This article shows how mathematics may

lead to a variety of employment possibilities, which can improve students' futures. In addition to all of this, the future scope of mathematics was addressed in this article.

3. CONCLUSION

Mathematics is a huge topic with a lot of different ideas to learn. The majority of mathematical progress has been practical. Mathematics is built on the foundation of numbers. Logic and numbers are the foundations of all mathematical theories. There are a number of initiatives that are entirely based on mathematical ideas. In the area of mathematics, there are many career possibilities such as speaker, professor, teacher, statistician, mathematician, operations research analyst, and many more. Sequences and Progressions, which include Arithmetic Progression, Harmonic Progression, and Geometric Progression, Trigonometry, Principle of Mathematical Induction, Binomial Equations, Differential Equation, Calculus, Differentiation and Integration, Probability, and more, are all concepts in mathematics. Geometry, which includes concepts such as the shapes, sizes, areas, and volumes of Triangles, Squares, Spheres, Cones, Cylinders, and many other geometrical figures, Complex Numbers, Sets, and many other concepts in mathematics, are used in real-life applications in areas such as building construction, bridge construction, and many other tasks.

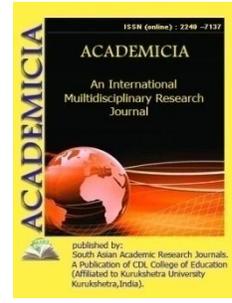

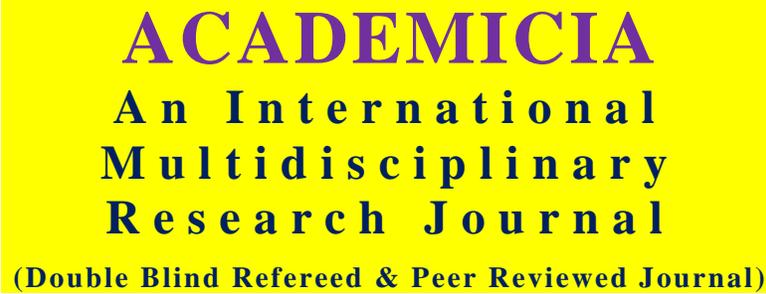

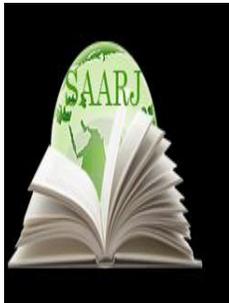

Trigonometry is one such idea that is extensively utilized in real-world applications such as dam construction, bridge construction, building construction, road construction, and so on. In the construction of structures, the angle of elevation and depression are very significant. To determine the sides and angles of triangles with one 90-degree angle, trigonometry functions such as cosine, tangent, secant, sine, cosecant, and cotangent are employed. All of these formulas for finding sides and angles are covered in this article. In this article, many trigonometric identities and rules are explored. Mathematics is regarded as a topic that offers both students and instructors with many possibilities. As a result, mathematics has a bright future ahead of it, with numerous chances for students and instructors to demonstrate their abilities and acquire experience and knowledge.

THE ROLE OF CLUSTER IN CONSTRUCTION MATERIALS INDUSTRY

Salohiddin Ochilovich Ibragimov*

*Senior Teacher,
Department of Economics and Real Estate Management,
Tashkent Institute of Architecture and Civil Engineering,
UZBEKISTAN

ABSTRACT

This article analyzes the construction materials industry of the Republic of Uzbekistan, its importance and provides recommendations for improvement on the basis of an innovation cluster. Strategic approaches are produced only in the separated regions. That's why it is important to form strategic approaches for development of innovational construction materials. The experience of developed countries shows that there is no single unified mechanism for creating, developing and stimulating clusters. As noted in the Address of the President of the Republic of Uzbekistan ShavkatMirziyoyev to the Oliy Majlis on December 29, 2020: "From now on, each village or mahalla will be developed based on its direction and growth points.

KEYWORDS: *Construction Materials Industry, Material, Cluster, Investment, Capital, Commercial Bank, Interest Rate, Draft.*

INTRODUCTION

The most prior issues of these days are reducing the participation of the country in economics, increasing the efficiency of ruling system in construction materials industry, promoting the organizations that are dealing with recycling local materials, diversification of locally produced materials and expanding the export and attracting investment to our network. By this, the purpose of extending the proportion of construction industry in the country's economy and building materials industry is stated. As noted in the Address of the President of the Republic of Uzbekistan ShavkatMirziyoyev to the Oliy Majlis on December 29, 2020: "From now on, each village or mahalla will be developed based on its direction and growth points. To this end, I propose to create a regional infrastructure development fund worth 3 trillion Uzbek sum on the next year. The fund will be used to co-finance infrastructure projects based on suggestions from local councils. Furthermore, 100 techno parks, small industrial zones, regional clusters and

logistics centers will be established in 84 districts and cities to further increase the industrial potential” [2].

Construction materials industry is one of the big fields of country's economy and it contains a number of fields and it is the main part of construction fund, the price of construction materials organizes the costs of construction manufacture. Additionally, delay in innovational development of construction materials industry leads to quiescency of the whole construction complex, the reason of the case is using old materials technologies and the cost of buying them.

Nowadays, there is no single policy in developing construction materials, more specifically innovational construction materials. Strategic approaches are produced only in the separated regions. That's why it is important to form strategic approaches for development of innovational construction materials. Organizing construction clusters in areas make way for linking this field with the policy of the country and the benefits of other participants of construction complex and scientific base.

By the information provided above, economic subjects, science, infrastructure and organized forms that are new to the field of construction – there evolves a chance to do with clusters.

Analysis of the theme-relating materials

The scientific works of local and foreign authors are being used as theoretical and methodical base of scientific approaches in usage of innovational clusters in production of construction materials.

M. Porter is the person who is the author of theory of developing and improving cluster and his works deal with the competitiveness of clusters. T. Anderson, K. Ketels, O. Solvell, M. Storper and some other scientists contributed to the development of clusters. Russian scientists, namely L.M. Dadayev, L.V. Ivanenko, C. Klyosova, E.A. Monastirniy, E.I. Robinshtein, T.V. Pogodina are the ones who also dealt with this problem.

Additionally, the Russian scientists who studied the role of cluster are also A.A. Ugryumov, A.A. Voronin, LS. Markova, L.V. Ivanenko, V.P. Tretyanka, V.V. Matitsina, L.N. Asaul and others. Despite this, the style of construction clusters is not fully developed yet. The problems of using clusters in territorial construction materials industry are yet to be solved.

Analysis and results

As we can see from the experiences of developed countries, innovational activities will develop if there are enough clusters. Scientific researches reveal that, at the place where attraction of innovational activities and innovational atmosphere is high, there you can see advanced clusters or vice versa.

The situation that covered the company can also be the reason for upgrading innovational activities as well as the results of construction companies. So, a company working in the field of construction materials industry can be the only one who attracted innovation or a partner with other companies like that and both can be efficient and beneficial for the company.

M. Porter is the person who used the term of cluster for the first time in science. He described cluster as general and common group of companies working in the same field of industry and collaborating with each other, and a group that is geographically situated side by side [2].

The effects of clusters' activities can be in the degree of elements, or in the economy of a region or a country. Some issues can be counted as factors of development with clusters in construction materials industry.

Internal factors:

1. Manipulating the size of manufacture and broadening activities range.
2. Separating costs and risks
3. Upgrading the ability of overcoming difficulties.
4. Flexibility and efficiency
5. Fast reaction to changes in demands of market.
6. Efficiency of attracting investments
7. Manipulating efficiency and flexibility of actions.
8. Improving stability and durability of market place.
9. Shortening the price of purchasing and spreading intellectual properties.

External effects are counted as results that are evolved inside the cluster. Some of them are;

1. Increase of money came from taxes.
2. Rising of employment rate.
3. Expansion of investment attraction.

As a result of the establishment and development of innovative clusters in the building materials industry, the optimal development of industry in the country will contribute to the growth of investment and economic recovery of the country [4]. This will create the conditions for the organization of constructive solutions through the transition to new housing systems and a more economical, prudent approach to resources, the formation of a different pricing policy to ensure the ability to manage buildings designed to meet the needs of the population.

The experience of developed countries shows that there is no single unified mechanism for creating, developing and stimulating clusters. Therefore, in order to carry out modernization on the basis of cluster principles, it is necessary to develop a state policy on the formation and support of clusters. Public cluster policy should include:

- supporting clusters in the budget, tax, finance and credit sectors
- Stimulation of their investment attractiveness;
- creating conditions for the development of innovative activities
- encouraging the development of infrastructure

Growth rates of production of some construction materials in the country in 2019-2020 *

№	Name of raw material results	Unit of measurement	Production volumes		Dynamics in 2020 compared to 2019 (In percent)
			2019	2020	
1	Limestone	Thousand tons	11 219,70	16 268,60	1,45

2	Soil components	Thousand tons	1 216,70	1 581,70	1,30
3	Quartz sand	Thousand tons	287,9	374,3	1,30
4	Sand and gravel materials	Thousand cubic meters	7 029,20	8 083,60	1,15
5	Brick raw material	Thousand cubic meters	2 092,40	2 406,30	1,15
6	basalt	Thousand tons	162,7	195,2	1,20
7	Gypsum stone	Thousand tons	1 292,00	1 679,60	1,3

***Source:** Based on data from the State Statistics Committee of the Republic of Uzbekistan

Table 1 shows that in 2019-2020, the volume of construction materials production increased in 2020 compared to 2019, while the share of total industrial output in the country and its regions increased. At the same time, many enterprises operating in the industry are operating at high efficiency. Its products meet the requirements of international quality standards.

Research shows that the peculiarities of the formation of regional branch clusters of the construction materials industry include:

- High investment and innovation potential of the industry, which creates conditions for the creation of a cluster of innovative types;
- Enterprises are connected to the location of resources, not to customers;
- The dependence of the construction industry as a supplier of the construction industry on all sectors of material production, which allows to expand the markets for the sale of these products;
- The need to take into account the areas of activity of enterprises of the construction industry in the formation of cluster links;
- Market orientation of the construction materials industry;
- High level of technical interchangeability of network products, the high level of competition, which allows to expand the range of clusters through the involvement of small business;
- The focus of cluster products on local markets due to the high cost of delivery to remote destinations.

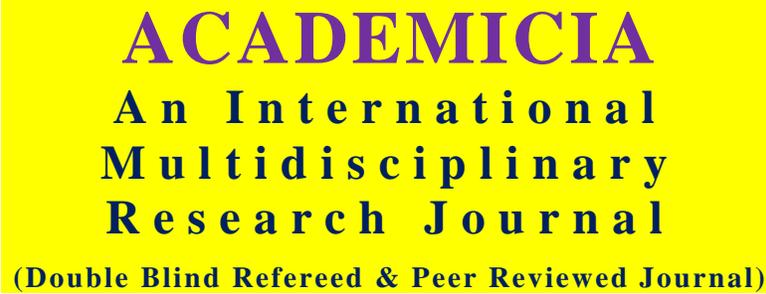

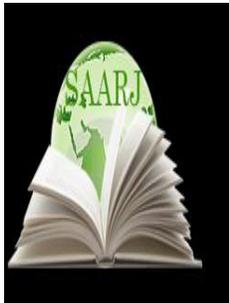

CONCLUSION AND SUGGESTIONS

In short, the development of a cluster is largely determined by the development of the industry in which it operates. In this regard, before making a decision on the formation of a cluster, it is necessary to conduct an analysis of the economic environment in which it operates, its level of innovation. Based on this conclusion, we propose the following:

- Developing a cluster approach to innovation management
- On the basis of the construction materials industry of Tashkent region establishing a construction cluster; effective operation style;
- To form a style for effective usage of cluster in construction.

VERSATILITY IN THE STORIES OF GAFUR GULAM

Gulbakhar Muratova*

Independent Researcher,
Nukus State Pedagogical Institute named after Ajiniyaz,
UZBEKISTAN

ABSTRACT

The stories of well-known Uzbek writer Gafur Gulam are discussed in this article. The short stories "Kizalok" ("The girl"), "Shoshilinch telegramma" ("Urgent telegram"), and "Gazna" ("The treasury") are used to investigate the peculiarity of his writing talent. The writer's heroic spiritual experiences, as well as the richness of the vision of human nature's uniqueness are discussed. They are discouraged by the suitors coming to the young man. Mukarrama, who leaves her father's house with her boyfriend, thinks: "If only my father and mother weren't upset". In the story, the young man not only makes the ceiling and floor in the room where he and his wife live, but he also makes a brick stove on one side. He decorates the hotel separately. But when he comes to the old woman's room, he uses things like stool, mat, numdah, jug.

KEYWORDS: *Hero, Prose, Story, Image, Artistic Expression, Originality, Artistic Craftsmanship.*

INTRODUCTION

Gafur Gulam is well-known figure in Uzbek literature from the twentieth century. We have inherited a significant creative heritage from him as a poet, prose writer, translator and literary critic. Gulam's efforts are crucial in molding today's youngsters into people who are flawless in every manner.

We know that the artist was orphaned when he was a child and had to take care of numerous home tasks. He recalls his existence in the whirlwind of life, his adventures, in a variety of poems and stories.

In the 1920s, Gafur Gulam joined the Turkestan Commissariat of Education's drive to collect orphans. He works as a director-educator at "Urfon" school, boarding school (orphanage) for 150 students. Even if he perceived a certain resonance and likeness in his life, he could not be

obvious to the fate of orphans and their plight. The poet's first poem was likewise inspired by incidents that occurred in an orphanage. The poet, on the other hand, was dissatisfied and did not believe it important to publish.

G. Gulom pays special attention to the problems of children who have lost their breadwinner in his publicist articles. He encourages all comrades to gather orphans, encouraging good and honorable activities, in his piece "Let Us Not Forget Our Brothers".

Literary critic S. Mamajonov, who spoke about Gafur Gulam's short prose, quotes Oybek as follows: « *Gafur describes the image of people well in his stories. He can get into the psychology of his little characters. It clarifies their views, attitudes, goals and aspirations*» (2.50).

In writer's story "The Girl" (1928), the fate of Mukarrama and Ibai, who aspire to a free life, is decided by the girl's parents: uncle Shokir and aunt Zulaikho. They are discouraged by the suitors coming to the young man. Mukarrama, who leaves her father's house with her boyfriend, thinks: "If only my father and mother weren't upset". Although she lives peacefully in Andijan, she misses her parents. She embarrassed and apologizes for such a thing what she did. Especially impressive was the kindness of the parents who accepted Mukarrama's letter and knew that their child was healthy and happy. When Shokir uncle said: "May God give white road", aunt Zulaikho said, "...I see all three souls in good health".

Apparently, the girl's heart is full of remorse and her parents' feelings are full of compassion. Verses 23-24 of Surah al-Israh in the Qur'an state that honoring one's parents throughout life is one of the basic duties of every person(6). A child who wants to honor his parents must first love his mother. After all, "Paradise beneath the feet of mothers". Ms. Annemarie Schimmel, a German Islamic scholar, notes that many scholars, mothers of perfect people, were educated women who set an example for their children with their impeccable lives (1.84).

Indeed, a mother's role in Muslim life and responsibility for raising a child is extremely high. That is why our writers and poets pay special attention to the image of the mother in their works. In the stories and narratives of Gafur Gulam there are many interpretations of the image of the mother, which clearly demonstrates the skill of the writer. In the aforementioned story, "Kizalok" ("The girl"), the writer's artistry in this regard is even more evident. Writer makes a lyrical digression in the story and talks excitedly about his mother's love:

«No care can compare to the grace of a mother giving white milk. Mothers are respected for their hard work to grow and procure. All mothers are creators of the future, all mothers are "goddesses" of society...» (10. 16). If you pay attention, it is not only the main characters of the story, but also "all mothers," that is, the female race. It is also the cry of the writer's unkind heart toward his mother, who passed away at the age of only 36.

In the story "Urgent Telegram" ("Shoshilinch telegramma") (1931), based on a life story caused by a misunderstanding, postal workers confuse both the address of the telegram and the names of the senders. However, the tragic news throws the main character Mirmulomiddin into a whirlpool of endless sadness and suffering. In order to get rid of anxious, he cries until «...*the summer robe becomes wet* ». «*A hiccup caught in his throat and his body shuddered*»: «- *My mother, my dear mother, the cradle shook in the morning, the white milk, the wagon of my existence, died ... What a train wreck, what a tragedy. Fog filled the world, and tears flowed*

from my eyes» (10. 107). Although this story was written in 1931, there is no doubt that it also shows the traces of young Gafur Gulam's suffering in 1917 when he lost his mother.

The writer can lift this sad situation from the middle with a laugh in the story. That the date given in the name of Mirmulomiddin, who recalled his mother's death in Tashkent in 1918, corresponds to a prosaic biography, also confirms our opinion. The hero's humor by nature is also very close to the character of Gafur Gulam. The author also skillfully uses the appearance of letters to reveal the spiritual world of the main character. Contrasting situations exacerbate a funny situation. In the case of the telegram he said: *"The letters caught fire, and they began to burn me. "Every "alif " stabbed me in the stomach, every "sukun" squeezed my shoulder like fur, every" wow "dragged a poisonous dragon behind me" .(10. 107)*

When he saw the telegram as a joke, he said: "Every "alif "was a humorous finger under his arm, every "sukun" began to tickle his face like a mouth, every "wow"began to tickle his ears like a wet heap of girls. Or, if we look at examples like "I signed like a duck tail," it becomes clear that we are right.

A balanced set of expressive means in the work of Gafur Gulam - the palette of images is very diverse. The above examples are somewhat similar to Cholpon's novel. In his novel "Kecha va kunduz " ("Night and Day") Cholpon speaks with bitter sarcasm in her description of the trial transcript. Let's look at the tone of the quote: *"To be fair: the minutes are written in very beautiful writing. On a piece of paper, it goes straight, like a railroad track.. See the letters "d" and "b" above everything else! You will be amazed! Where "b" occurs, the tail is turned to the left; where "d" occurs, the tail is turned to the right. They both have high tails: both have their tails twisted like snakes! Not the protocol,show!Show!» (10. 255).*

While Cholpon exposed the tsarist regime in more depth, Gafur Gulam laughed at the chaos in the Soviet office. In this respect, the goal of the authors is to converge. However, it should not be overlooked that the story of Gafur Gulam was written in 1931, the novel Cholpon in 1935, and that these works differ in genre. Of course, one cannot say that Cholpon learned from the works of Gafur Gulam. However, the fact that the story was published at the time the novel was written suggests that Cholpon was familiar with it. It is worth noting that both authors were influenced by Russian literature, particularly the work of Gogol, in expanding the possibilities of artistic imagery.

The main character in Gafur Gulam's story "Gazna"("The treasury ")(1935) - "I" also connects the voice of the narrator. The exceptional confidence in the main character of the story is evident not only in his actions, but also in his words and actions, in his way of thinking.

Gafur Gulam cannot separate this character from the national soil, Uzbek traditions and culture, and Muslim psychology. The fact that the national basis of history is essentially compelling is also one of the factors that has ensured its survival. It tells the story of a young man who moves into a new home and arranges it in his own way: *« We carved a stool out of the upper part of the room of the second house, put a mat on the bottom, numdah on it, and entered the old woman with pleasure. (Whatever parents do, on the one hand they want joy and say, but on the other hand they want to please the ghost of the father).Anyway a jug ablution water with a sip of lenten soup is ready » (10. 131)*

In the story, the young man not only makes the ceiling and floor in the room where he and his wife live, but he also makes a brick stove on one side. He decorates the hotel separately. But when he comes to the old woman's room, he uses things like stool, mat, numdah, jug. This is not entirely accidental. He respects his mother's character, traditions, psychology, beliefs. This is the secret of "decorating" the room to the old woman's taste. In addition, as a Muslim child, he wants to conquer the hearts of his mother and fulfill his childhood responsibilities according to Islamic morality.

It is worth noting that in the story "Gazna" ("The treasury") in which the narrator uses the form of speech "I," one also hears Gafur Gulam's own voice, typical of his attitude toward his mother. In it the image of the conditional narrator is much closer to the author. It is not difficult to understand the tasks performed by the narrator by paying attention to the fact that the author's voice is absorbed by the voice of the main character.

While the "Gazna" ("The treasury")'s main character's misunderstanding of technical novelty is the story's novelty, tradition seems to be in the narrator's mind, in his heart the prevalence of Islamic enlightenment, in his practical activities, and in his faithful servant of God. Therefore, he cannot be called an uneducated man. After all, he is a man who deeply feels the duty of childhood, who seeks peace in the family, who has noble feelings. Writer emphasized the complexity of human nature, demonstrating the multifaceted nature inherent in the protagonist's character, as required by the situation.

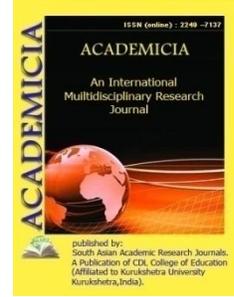

In general, Gafur Gulam made a balanced use of colorful imagery, which ensured the popularity of his stories. Writer describes human nature and spiritual experience according to the lifestyles of the main characters. His stories have a special significance as an example of high art.

ABSTRACT

In a variety of topics and educational contexts, the development of additive manufacturing and 3D printing technology is creating industrial skills shortages and possibilities for innovative teaching methods. As a result, research on these behaviors is developing across a broad variety of education fields, although frequently without reference to other disciplines' research. To address this issue, this article brings together disparate sources of research to offer a current literature overview of where and how 3D printing is being utilized in education. Six use categories are identified and described as a result of research into the application of 3D printing in schools, universities, libraries, and special education settings: (1) to teach students about 3D printing; (2) to teach educators about 3D printing; (3) as a support technology during teaching; (4) to produce artefacts that aid learning; (5) to create assistive technologies; and (6) to support students. Although evidence of 3D printing-based teaching methods can be discovered in each of these six areas, adoption is still in its early stages, and suggestions for future study and education policy are offered.

KEYWORDS: 3D Printing, Education, School, Student, University.

1. INTRODUCTION

As you may be aware, additive manufacturing is becoming more popular in a variety of sectors. To utilize 3D printing, you must first comprehend it. It is no longer necessary to demonstrate the significance of 3D printing in professional degrees. 3D printing has a wide range of applications, and it is currently utilized in a wide range of sectors for product development, manufacturing, tooling, and prototyping. Additive manufacturing will be present in increasingly more sectors in the near future, and education's job will be to educate students for future professions. Furthermore, 3D modeling and 3D printers can readily bring any educational topic to life, and 3D printing helps students develop strong practical skills such as coding and design thinking. There are a slew of benefits to using 3D printing in schools[1]. 3D printing and its close cousin, additive manufacturing, are digital fabrication technologies that are slowly but steadily challenging the industrial sector. While 3DP is still useful for fast prototyping and tooling, it is its use as a direct production technique that is causing widespread systemic upheaval. This disruption is taking place as 3DP gains momentum in areas where its present degree of technical complexity aligns with market requirements. Improvements in productivity and quality are being made, but a number of studies and reports looking into 3DP and digital fabrication have warned that a lack of 3DP education and skills is a major barrier to wider adoption.

As a result, it is essential to look at the present state of research on the implementation of 3DP in the educational system. The education system is defined as elementary and secondary schools, as well as institutions of further and higher education, for the sake of this analysis[2]. It examines the use of 3DP for instructional reasons rather than research. Furthermore, this study does not examine the use of 3DP for instructional objectives in an industrial setting. Prior research on 3DP has focused on how students learn about the technology, how educators learn about the technology, how design skills and methods for creativity are taught, and how learning may be facilitated via the creation of artefacts, according to a review of previous studies[3]. Across the K-12 spectrum and in colleges, as well as in libraries, makespaces, and special education settings, such activities are taking place. Before delving into these issues in depth, we'll give you a quick primer on 3DP and the use of digital fabrication technology in education[4]. In contrast to other general-purpose technologies, 3DP refers to a group of technologies that use additive layer-by-layer digital fabrication to create three-dimensional things. "Additive manufacturing" (AM) is described as "a technique of connecting materials to create things from 3D model data, typically layer by layer, as opposed to subtractive manufacturing methodologies" in its official nomenclature.

ASTM recognizes seven kinds of additive manufacturing, and a broad variety of goods based on these types are available on the market. Fused deposition modeling (FDM), stereolithography (SLA), selective laser sintering (SLS), selective laser melting (SLM), and digital light processing (DLP) are some of the most commonly used 3DP technologies, although new additive processes are still being researched and commercialized[5]. While polymers were first utilized in 3DP for prototyping, a considerably broader range of polymers, metal alloys, composites, and ceramics have since been created for use in digital manufacturing, with the kind of 3DP method used and the intended application dictating their usage. In comparison to other subtractive and transformational manufacturing methods, 3DP is an additive manufacturing process. In comparison to these methods, 3DP has a lot of benefits. However, being an emergent technology, it is still in its early stages of development; it has yet to reach its full potential, and there are extra

socioeconomic obstacles to overcome due to the technology's novelty. Table 1 provides an overview of these benefits and difficulties. The main firms in the 3DP sector are presently Stratasys and 3D Systems. They may be traced back to the initial 3DP patents filed in the mid-1980s, and they've evolved from being only focused on the use of 3DP in fast prototyping to a broader use in digital manufacturing. New entrants in both the professional and consumer sectors have been lured by the sector's development. The latter has attracted the bulk of newcomers. The RepRap project, an open source effort to build a self-replicating robot, was the catalyst for the consumer 3DP boom. Members of the Maker movement all around the world were very interested in this project. This initiative, along with the development of crowd funding sites like Kickstarter and Indiegogo, has allowed a slew of new businesses to enter the market. The 3D printer is just a small part of the broader 3DP business ecosystem. The 3DP ecosystem comprises businesses that create 3D scanning technology, CAD software, and materials, as well as service bureaus and online distribution platforms, in addition to equipment makers.

1.1 Ways of 3D printing being utilized in education

The purpose of this review is to describe how 3DP is utilized in the educational system. The parts that follow provide a summary of the information. There are four major educational settings where 3DP is used: Schools, colleges, libraries, and special education settings are the four types of educational environments. Each of these sections provides a brief explanation of how 3DP is implemented. utilized in these situations

- The use of 3D printing in schools: 3DP in schools and children's environments. From basic through secondary school, education encompasses the whole range, from elementary to middle school, for secondary/high school students, as well as combinations of the three. However, since there are few publications that explicitly address elementary and middle school, they are grouped together. For the sake of this debate, secondary and high school are used. Physical prototyping, such as 3DP, may help students get a better grasp of science and arithmetic. The bulk of the articles in this body of work support this viewpoint, providing instances of how 3DP is being utilized in schools to enhance STEM teaching. In the sciences, for example, 3DP was utilized to teach atomic structure to Grade 10 chemistry students, with a favorable connection discovered. between the incorporation of technology into the classroom and student learning. Japanese high school pupils, on the other hand, studied about By producing 3D printed police whistles, audio frequency may be increased. In Students were exposed to 3D printer building, computational thinking via a mix of Minecraft and 3DP, and design thinking through a 3D printer. Kaysville, a printed city planning game. Other research focuses on design explained how pupils learned to be creative. Product design and development, as well as technical drawing. In elementary schools and high schools, students are developing prosthetic hands. A project-based learning study of a trans media book project It was discovered that utilizing 3DP enhanced students' mathematical performance, as well as their knowledge of geometry. Via the creation of three-dimensional forms STEM The use of 3DP in K-12 education has been used to achieve integration. Students learnt about the enormous extinct shark in paleontology. 3D printed replicas of the teeth of Carcharocles megalodon. Furthermore, 3DP is being utilized in a number of STEM-related projects. School-based outreach initiatives. With the capacity to rotate 10 times, visualizations may help with spatial instruction. Year-old boys are especially well-served. Many of the benefits of 3D printing are shown in the examples above. They enable self-

directed creation and capability for autonomous and introverted labor, as opposed to virtual, screen-based artefacts. in addition to increasing physical tactility and observability. Created physical artefacts Incorporating 3DP into school curriculum is also beneficial from a pedagogical standpoint, since it may offer chances for collaboration. Various learning methods, including experiential learning, will be practiced. As well as failure. It was discovered in a study of two Greek high schools that. The usage of 3DP allowed for the exercise of various learning methods, including “We have found that this is especially helpful in engaging specific students: When given the appropriate motivation and resources, students who were otherwise uninterested in their project class (according to them and their instructors) may select what they want to study via inquiry Then students may proudly share their findings with others while gaining knowledge. rather than dry knowledge from textbooks.

- Universities that use 3D printing: Universities are the most likely to use 3DP in tertiary education. Moreover, there are just a few accounts of the technology's acceptance in the United States. additional institutes of higher education and continuing education Within Articles on the usage of 3DP at universities may be found in the literature. The usage of 3DP systems, scientific models, and test models; the development of 3DP systems, scientific models, and test models 3DP during project-based learning; incorporating 3DP skill development into the curriculum by incorporating it into current curricula courses, as well as new course introductions; and external involvement outside of the university This section contains short descriptions of each in the series. Turn. There are many stories of how open source was created. Engineering courses are including RepRap 3D printers. A mechatronics design's main point is their construction. Jordan is working on a senior capstone project at Philadelphia University, which is funded by the Princeton / Central Jersey Section .The Institute of Electrical and Electronics Engineers' (IEEE) Professional Committee on Joint Standards (PCJS) (IEEE)and is utilized at the University of Applied Sciences Offenburg to teach 3DP to industrial engineering and business masters students. In this instance, students constructed the 3D printer first, then downloaded and printed 3D models. The sciences, where 3D printing is used extensively at institutions, are one of the most important applications of 3DP.In the lab or in the classroom, models are developed to aid student learning. This use of 3DP to create visual models In a similar spirit, This also contains test specimens for determining the mechanical characteristics of various materials.
- Materials test models made of 3D printed polymer have been shown to be acceptable in engineering courses for this purpose, and Mechanical testing have been integrated into an undergraduate capstone research course at the University of Johannesburg's Mechanical Engineering Science Department. MSc graduate students at the University of Toronto's Faculty of Mechanical Engineering. During the fan and turbo compressor development, Belgrade utilized 3D printed components. Fourth-year aeronautical engineering students at Technion – Israel Institute of Technology created several experiments.3D modeling was used to test various wing spoiler configurations and their effects. Wind tunnels using printed models.3DP has also become a popular teaching tool in robotics. Being a low-cost method of promoting educational development haptic devices and robotics. For the chassis, a 3D printed chassis was used. Students may alter low-cost open source robotic systems. Robot, as well as to disseminate these changes to other students .3DP may be used to support project-based

learning and other types of learning. Numerous articles have been written on the usage of 3DP in projects [6]. The University of Michigan is one example. Second-year mechanical engineering students in Modena and Reggio Emilia. Undergraduates utilized 3DP to design and build an app as part of a project. The State University of New York's eye-tracking system, and The incorporation of 3DP into the classroom increased student involvement. a semester-long design program called "Introduction to MEMS". During It was a master's degree in mechanical engineering at Politecnico di Torino. The use of 3DP in a project-based learning setting was shown to enhance student attitudes toward mechanical engineering. Specifically, it was discovered that using 3DP resulted in favorable student response. Motivation, comprehension, interest, and education of students[7].

- 3D printing in libraries: Libraries at schools , universities , and community colleges , as well as public libraries, medical libraries , and libraries in general , are all mentioned in studies that view the library as a site where 3DP happens. The use of 3DP in libraries is part of a broader discussion regarding the role of libraries in the digital age. Those opposed to 3DP in libraries claim that it is a "exotic cutting-edge technology-based service" that is "a simple luxury or a needless expenditure for what may only be a limited number of customers". According to the sample of publications examined here, this is a minority viewpoint, with the majority of articles expressing support for 3DP integration within library services. "In most companies, the library is a natural option to store technology that has many potential users," says a more representative statement. Libraries can provide a significant service to their organizations by offering space and expertise for 3D printing while also increasing awareness of the other services they provide". Libraries, as a physical place, facilitate cooperation and knowledge sharing among library users, librarians, and educators, as well as lowering obstacles to participation. As a result of this accessibility, maker spaces inside libraries have emerged as creative spaces where library users may use 3D printers and other digital fabrication technologies, with such places promoting innovation and experimentation.
- While the majority of maker spaces are formed inside libraries, there are many examples of maker spaces that are developed outside of libraries[8].The neutral, non-departmental area at universities enables for contacts between students from other faculties as well as extracurricular usage. "The library is frequently viewed as a non-disciplinary or cross-disciplinary place on campus, where all users have access to the resources and services," Van Epps et al. write. By integrating 3D printing into our libraries, we are able to expand access to 3D printers from a select few to everyone". While access to non-traditional library services such as 3DP may be enhanced, their adoption in university libraries may be limited. Running basic 3DP workshops and pop-up maker technology workshops may help increase awareness, as can finding local champions like design professors, 3D visual researchers, and design-oriented student organization. Groenendyk and Gallant describe how the library wanted to "take the knowledge-sharing, innovation-driven principles of hacker spaces and integrate them into an academic library setting" in their 3D printing and scanning pilot projects at Dalhousie University Library[3]. The library wanted to make 3DP available to students who weren't previously familiar with it, such as those studying engineering and architecture. The 3D printing and scanning technologies were chosen for their low cost and ease of use. The librarians also anticipated that the 3D scanner would allow them to digitize and preserve different scientific and cultural items online. "By establishing this collection,

the Libraries will contribute to providing online visibility for both student and faculty work, as well as ensuring that the 3D material gathered is maintained and publicly available”. Librarians play an important role in the integration of 3DP into a school or institution. “School libraries may act as test beds,” said Mark Ray, Chief Digital Officer of Vancouver Public Schools[9]. As others follow our example, teacher librarians may play an important role in assisting educators who are dealing with change and uncertainty in this brave new world”. Library personnel, as a central resource, not only assist people who come into the library, but also educators who want to integrate 3DP into their teaching practice. A partnership between a librarian and an instructor at LaGuardia Community College resulted in the creation of a biological model for in-class instruction. While librarians' time and skill in delivering such services is a limiting issue, providing them with training in the use of 3DP technologies may help them overcome their lack of knowledge and discomfort when dealing with library customers. Such fundamental training is required to offer student instruction, as well as to guarantee that library personnel can maintain 3DP equipment and resolve problems. Librarianship abilities will need to develop in tandem with technological advancements.

- The use of 3D printing in special education: For individuals with visual, motor, and cognitive disabilities, 3DP is being utilized in special education settings. Within these contexts, students with visual motor and cognitive impairments, as well as combinations of the three, have utilized 3DP[9]. The use of 3DP in these contexts allows for the development of customized adaptive devices and instructional aids, as well as increased student engagement in STEM topics, the use of 3DP to build assistive devices is explored in more depth. As detailed in Buehler et al two-year 's study into its uses using 3DP in special education settings has significant difficulties. Students with cognitive impairments were given lessons on how to use Tinkercad software before being invited to build their own 3D creations in one of their studies. However, due to the complexity of the job and the short time available, most students chose to print or alter designs from open-source websites rather than develop their own[7]. Due to the difficulty of utilizing the program, students' enthusiasm in creating unique designs seemed to wane, with problems noted in changing perspectives and manipulating items. Furthermore, students with high assistance requirements found it especially difficult to create in three dimensions. Other adoption issues developed as a result of the students' occupational therapists[8]. While excited about 3DP's potential, they were worried about the time and effort needed to learn how to use the program “they presently view 3D design and printing as someone else's job, and see themselves as consumers of that work[10].”

2. DISCUSSION

3D printing, also known as additive manufacturing, has been called the next big thing, with the potential to be as widely used as the cellular phone industry. 3D printers convert a digital blueprint into a real three-dimensional item. Plastic, metal, nylon, and over a hundred more materials are used in the printing process, which is done layer by layer (additive manufacturing). Manufacturing, industrial design, jewelry, footwear, architecture, engineering and construction, automotive, aerospace, dentistry and medical industries, education, geographic information systems, civil engineering, and many more fields have found 3D printing to be beneficial. In every area of application, it has shown to be a quick and cost-effective solution. 3D printing's

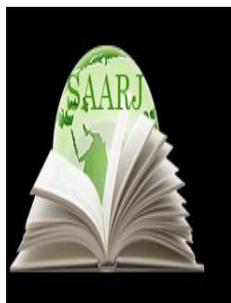

uses are growing all the time, and it's proving to be a really interesting technology to keep an eye on. We will look at how it works as well as present and prospective uses of 3D printing in this article.

3. CONCLUSION

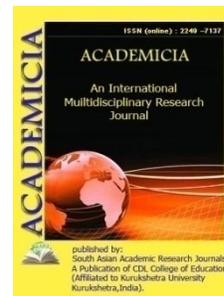

The current research on the use of 3DP in the school system has been summarized in this article. This state-of-the-art study offers a better picture of where and how 3DP is being utilized in the educational system by synthesising a varied and fragmented literature of 280 articles. Table 6 contains a high-level overview. Given its history as a fast prototyping technique, it's no surprise that 3DP is most often used in university engineering and design programs, with specific 3DP courses developing from these fields. However, it is clear from this study that 3DP has grown beyond its origins; it is now being actively integrated into a number of different topics and is being utilized to create learning artifacts. Other STEM fields are the most visible users of 3DP outside of engineering and design, and they are starting to show how 3DP may establish cross-linkages across different topics. There are presently just a few recorded instances of 3d printers being used during in-class instruction in non-STEM disciplines.

ABSTRACT

From approximately 3.6 percent in 1985–1995 to less than 2 percent in 1995–2005, India's agricultural growth has slowed. This is far below the agriculture sector's goal of 4% annual growth by 2020. Food grain production is the main source of worry. Nanotechnology (NT) has been recognized as a promising technology for revitalizing the agricultural and food industries, as well as improving the life of the poor. Nanotechnology may help a variety of industries, including health care, materials, textiles, information and communication technology (ITC), and energy. Nanotechnology is used in crop production, food processing and packaging, food security and water purification, environmental remediation, crop enhancement, and plant protection in the agricultural industry. Agricultural production may be increased by using nanomaterials to create genetically better animals and plants, site-specific medication and gene delivery at the cellular/molecular level in animals and plants, and Nano array-based genetic alteration in animals and plants under stress. Nanotechnology has the potential to improve disease resistance, plant growth, and nutrient utilization by allowing precise administration of agrochemicals. Nano encapsulated solutions demonstrate the capacity to utilize pesticides, insecticides, and herbicides more effectively and site-specifically in an environmentally benign and greener manner. It has been effectively utilized in postharvest to preserve the freshness, quality, and shelf life of stored products while also avoiding disease outbreaks in a relatively

safe manner. Nanomaterials are a relatively new technology in agriculture, and further study is needed. Nanotechnology's application in agriculture has social and ethical implications that must be addressed. The toxicity of nanomaterials must be assessed before they can be commercialized and used in the field.

KEYWORDS: *Agriculture, Climate, Fertility, Nanotechnology Soil.*

1. INTRODUCTION

In the period 2004–2015, India's agricultural growth was 3.59 percent (Ministry of Finance, Government of India 2014), which is lower than the goal of 4% annual growth in the agricultural sector by 2020. Food grain production is the main source of worry. Annual per capita food grain output has decreased from 207 kg in 1991- 1995 to just 179 kg in 2014 (Ministry of Agriculture, Government of India 2017–2018), posing a threat to food and nutritional security. With limited water and land resources, focused agricultural development may be achieved through careful application of modern technology to increase per unit natural resource productivity and farm revenue[1]. During the green revolution, potential yields and agricultural earnings were multiplied by utilizing short-duration modified high-yielding cultivars, extensive fertilizer usage, irrigation, and pesticides, while failing to utilize natural resources sustainably and efficiently. Farm production and earnings have been steadily declining in recent years. Stabilization of agricultural output is essential to sustain overall national growth, since agriculture is the source of livelihood for 60% of India's people.

Degradation of natural resources such as soil, climate, and water hastens the issues[2]. "Technology fatigue" is a term used to describe the tough condition in Indian agriculture. Focusing on innovations that may improve agricultural output, resource usage efficiency, and product quality is the need of the hour to overcome "technology weariness." Nanotechnology (NT) has been recognized as one of the promising technologies that may revitalize the agricultural and food industries and enhance the life of impoverished people. Nanotechnology is one of six "Key Enabling Technologies" recognized by the European Commission as having a significant role to play in the long-term development of many sectors (EC 2012). Norio Taniguchi coined the phrase "nanotechnology" in 1974. Nanotechnology is a field of science concerned with the study of materials at nanoscale scales (1–100 nm) (US EPA). Individual atoms, molecules, and molecular clusters are manipulated into new structures with new or completely different characteristics. At the nanoscale level, it includes a variety of applications such as the construction, control, and structuring of devices and materials of different natures such as chemical, physical, and biological. In 2001, the US Federal Government launched the National Nanotechnology Initiative (NNI) to promote nanotechnology[3].

Nanotechnology, according to the NNI, is the reorganization of matter with at least one dimension ranging from 1 to 100 nanometers. In general, the novel physical and/or chemical characteristics of nanoscale devices and materials offer significant roles in health, electronics, biotechnology, energy, and materials science. Nanotechnology, as a tool, can address the world's most pressing water, energy, health, agricultural, and biodiversity (WEHAB) issues. The United Nations Johannesburg Summit on Sustainable Development in 2002 highlighted these five key topics. According to a UN survey, increasing agricultural production via nanotechnology in poor countries is the second most significant factor in attaining Millennium Development Goals,

behind energy conversion and storage. Water treatment is the third most important use of nanotechnology. However, nanotechnology's use in the agricultural sector and food systems is still in its early stages both globally and in India, and its final success will be determined by stakeholder acceptability. The use of nanotechnology in agriculture necessitates the development of efficient regulatory and governance processes and systems involving all groups of stakeholders. As a result, nanotechnology has the potential to bring about a much-needed second green revolution in India's agricultural sector, with a focus on sustainable output. The following sections go through the many uses of nanotechnology in depth.

Agriculture benefits from many technical advances like as hybrid varieties, synthetic fertilizers, and pesticides throughout time. Now, agricultural experts are recognizing that smart innovation, such as nanotechnology, is critical for agricultural development in order to address global food security and climate change problems. Nanotechnology applications in agriculture have just recently gained prominence, although research on the subject began more than half a century ago. Nanomaterials are needed for increasing fertilization (or fertilizer) efficiency, yields, and reducing pesticide use; rapid and early pathogen and toxic chemical detection in food; smart pesticide and fertilizer delivery systems; smart food packaging and processing systems; and regulating agricultural food security. Agricultural productivity can be increased by using nanomaterial-induced genetically improved animals and plants, site-specific drug and gene delivery of molecules at the cellular/molecular level in animals and plants, and nano-array-based genetic modification in animals and plants under stress. Existing contaminants may be degraded and reduced using nanofilters or nanocatalysts, resulting in less pollution. Nanotechnology can be used in agriculture to make slow-release nanofertilizers for plant fertilizer; nanoparticles encapsulated pesticides for controlled and on-demand release; site-specific drug and nutrient delivery in fisheries and livestock; nanoparticles, Nano brushes, and Nano membranes for water and soil treatment; cleaning and maintenance of fishponds; and Nano sensors for a variety of applications.

1. Application of Nanotechnology in Agriculture

- *Soil Fertility Management:* Fertilizers are needed to preserve soil fertility and produce high-quality food and crops, especially with the introduction of high-yielding, hybrid, and fertilizer responsive cultivars. Leaching, drifting, runoff water, evaporation, soil moisture-driven hydrolysis, and microbial and photolytic degradation are all losses caused by traditional fertilizer delivery techniques (such as spraying and broadcasting). As a result, relatively little concentration reaches the intended location. Conventionally applied fertilizers lose 40–70 percent nitrogen, 80–90 percent phosphorus, and 50–90 percent potassium in the environment, necessitating recurrent fertilizer and pesticide treatments. However, excessive fertilizer and pesticide usage pollutes the environment, degrades natural resources, develops pesticide resistance in pests and diseases, reduces soil microflora and nitrogen fixation, and produces pesticide bioaccumulation. As a result, the best use of chemical/synthetic fertilizer based on the nutritional needs of the crop and the least amount of pollution are critical. This may be accomplished by using Nano fertilizers. Nano fertilizers, also known as smart fertilizers, are nanomaterials (NMs) that provide single or multiple nutrients to plants, thereby improving crop development and yield, or those that attach, polymeric shell encapsulation, polymeric nanoparticles entrapment, and nutrient-rich nanoparticle synthesis. When coupled with Nano

devices for synchronized release of N and P fertilizer, Nano fertilizers minimize undesired nutrient losses to the environment.

Nano fertilizers exhibit regulated chemical release, site-specific delivery, decreased toxicity, and improved nutrient absorption, Nano sized mineral micronutrient formulations can improve solubility as well as dispersion of micronutrients in soil, reduce absorption as well as fixation, improve bioavailability, which leads to increased NUE, and conserve fertilizer resources while complementing the better performance of conventional synthetic fertilizers (Liu and Lal 2015). A Nano fertilizer is a nanometre-sized product that delivers nutrients to particular target locations, improving nutrient usage efficiency (NUE) and reducing environmental degradation. Nutrients are encapsulated in nonporous materials, coated with thin film polymer, or supplied as nanoparticles or nanoemulsions in one of three ways: (a) encapsulated in nonporous materials, (b) coated with thin film polymer, or (c) delivered as nanoparticles or Nano emulsions (Rai et al. 2012). Because of the high surface tension, nanomaterial encapsulation on fertilizer bonds the material more firmly. High solubility, controlled and timed release, stability, efficacy, enhanced targeted action by providing appropriate concentration, and decreased toxicity with simple, safe distribution and disposal are all features of the fertilizer Nano formulation.

- *Environmental Remediation:* Pollutant degradation and sequestration are two types of environmental clean-up. The use of nanomaterials for remediation, i.e. Nano remediation, would be more efficient and cost-effective. Nano remediation (the use of nanoparticles for environmental remediation) may be used to clean ground and surface water, wastewater, soil, sediment, or other contaminants, as well as to reduce air pollution. Reactive nanomaterials are employed in Nano remediation to detoxify and convert contaminants. Reactive nanoparticles are injected into a polluted aquifer through an injection well in this procedure. The reactive nanoparticles are transported to the polluted location by groundwater. When nanoparticles come into touch with pollutants, they may bind to them, immobilize them, and breakdown them into less harmful and mobile molecules via adsorption or complexation. The cost of drilling and packing a well is high. Direct push wells are less expensive than drilled wells and are the most used technique for nano-iron clean-up. For site-specific areas, a nanoparticle slurry is also utilized[3]. Many reactive nanoparticles' performance has been assessed. For environmental remediation, nanoscale zeolites, noble metals, carbon nanotubes (CNT), metal oxides, and titanium dioxide are employed. Because of its large surface area and reaction rate, nanoscale zerovalent iron is the most appealing and often utilized material for environmental clean-up. with particle diameters ranging from 10 to 100 nm are injected into polluted sites to degrade them by forming a nanoparticle "wall" that cleans water as pollutants pass through it, or by employing mobile nanoparticles tiny enough to flow through soil pores. When nZVI is utilized to clean up a polluted location, it produces fewer harmful compounds throughout the cleanup process. In Nano remediation, bimetallic nanoparticles (BNP) are also utilized. BNP is made up of iron or other metal components that have been conjugated with metal catalysts such as platinum (Pt), nickel (Ni), gold (Au), and palladium. TCE (trichloroethane) elimination is usually done using palladium and iron BNPs[4]. Carbon nanotubes (CNTs) have recently become more popular due to their unique characteristics. Single walled carbon nanotubes (SWNT) and multiwall carbon nanotubes (MWNT) are two types of carbon nanotubes that are rolled into tubes (MWNTs). They are used to remove heavy metals such as Cr^{3+} , Pb^{2+} , and Zn^{2+} , metalloids such as arsenic compounds and persistent organic pollutants (POPs) such as dioxin. The use of nanomaterials

such as carbon nanotubes (CNTs) and titanium dioxide (TiO₂) has the potential to purify, sterilize, and desalinate surface water. Heavy metals, organic pollutants, and pathogens are all common contaminants found in surface waters. Nanoparticles may be employed as sorbents or reactive agents in surface water treatment. Nanoparticles are also utilized in Nano filtration membranes. Air pollution can be controlled using nanoparticle-based filtering methods[5]. Nano filters in automobile tailpipes and industrial smokestacks will be able to separate pollutants and prevent their entrance into the atmosphere. Even at very low concentrations, Nano sensors can detect hazardous gas leaks.

- *Crop Improvement:* Scientists have been enticed by nanotechnology to think in new ways. It has been able to change the genetic composition of the crops, which would not have been feasible otherwise. A nanotech research project in Thailand sought to alter the atomic properties of indigenous rice varieties, including the well-known jasmine rice. It is a goal to eliminate the debate over genetically modified organisms (GMOs), since nanobiotechnology aids agriculture in avoiding the GMO debate and progressing to the next level - atomically modified organisms (AMOs). According to BIOTHA, scientists from Chiang Mai University's nuclear physics lab have successfully used nanotechnology to change the colour of an indigenous rice cultivar. The cultivar is renowned for its purple stem, leaves, and grains, and the name "Kam" means "deep purple." The purple hue of the cultivar's stems and leaves has been transformed from purple to green thanks to nanotechnology. The research group's next goal, according to its scientists, is to deal with jasmine rice[6]. They want to develop a modified jasmine cultivar that is photo-insensitive, can be grown all year, and has smaller stems and superior grain colour. Mutation breeding is being used by Chiang Mai researchers. They're attempting to figure out the best way to get a nanoparticle through a plant's cell wall and membrane so that it can enter the cell and cause a specific change in the genetic makeup without interfering with other cell wall and membrane activities. Crop enhancement via mutation breeding and nuclear physics is a well-known technique, and the Vienna-based UN Food and Agriculture Organization/International Atomic Energy Agency program has made major contributions in this area since the technology's beginnings. Scientists have been using X-rays, beta rays, and gamma rays to alter the genetic composition of agricultural plants from the beginning[7].

- *Crop Protection:* Pesticides are used extensively throughout the globe to fight pests and diseases in order to satisfy the increasing population's food needs. Alternative methods of limiting pesticide usage are urgently needed. Only around 0.1 percent of pesticides reach target locations, and the rest is lost to the environment due to runoff, spray dispersion, off-target deposition, and photodegradation, resulting in higher environmental and application costs. Nanomaterials, one of the most recent advances in agricultural sciences, serve a critical role in plant protection due to their unique physical and chemical properties. The use of nanotechnology in plant pathology has provided fresh insights into crop protection[8]. Nanoparticles cling to the pathogen cell wall, causing deformity and eventually death because to increased energy transfer. Nanomaterials achieve two critical elements of disease management: first, efficiency with little environmental impact and decreased human health toxicity. Plant protection may be achieved via the controlled release of encapsulated pesticides against pests and pathogens, as well as the early detection of plant diseases and pollutants from pesticide residues using Nano sensors. Kuma and Virage (2006) found that nanomaterials may be utilized to safely administer insecticides, herbicides, and fertilizers at lower dosages to cover large plant surfaces and thousands of

plants[9]. Nano pesticide formulations assist in the slow release of less soluble active compounds by increasing their solubility. Pesticides are packed into nanoparticles and released in stages, depending on the requirement. Because nanoscale products are more reactive than bulk materials, crop protection is enhanced with a little quantity of nanopesticides. The chemical is properly absorbed by plants after being Nano encapsulated for measured and effective release to a particular host plant for pest control. When creating a Nano product, the method by which nanomaterials are absorbed by plants and their subsequent mobility through plant tissues and organs is critical. The formulation changes depending on whether the active component is absorbed via the leaves or roots of the plant. The root can readily absorb nanopesticides; however the nanomaterial will be absorbed more efficiently if it is ingested via the leaves[10].

1.2 Nanotechnology in Pesticides and Fertilizers

Agriculture that is both sustainable and profitable is required these days. It may be seen as presenting a long-term ecological strategy. Excessive tilling of the soil, which leads to erosion, and irrigation without proper drainage are two practices that may harm soil in the long run. Salinization will result as a result of this. This is to meet the requirements of humans for food, animal feed, and fibre. Long-term experiments are needed to demonstrate the impact of various methods on soil characteristics that are critical to long-term sustainability and to provide critical data for this goal. Nano-chemicals have emerged as potential agents for plant growth and pest control in the United States, according to a government body. Fertilizers are necessary for plant development. Nanomaterials that serve as fertilizers may have characteristics like crop enhancement and reduced environmental toxicity. Plants may provide an important pathway for bioaccumulation of contaminants into the food chain. The use of NPs for more effective and safe chemical usage in plants has been a recent breakthrough in agriculture. Several researchers have studied the effects of different NPs on plant growth and phytotoxicity, including magnetite (Fe_3O_4) nanoparticles and plant growth, alumina, zinc, and zinc oxide on seed germination and root growth of five higher plant species: radish, rape, lettuce, corn, and cucumber, silver nanoparticles and wheat seedling growth, sulfur nanoparticles on tomato, zinc oxide on tomato, and zinc oxide on Wheat growth and yield may be aided by silver nanoparticles. Wheat growth and production were significantly boosted by 25 ppm SNPs added to the soil. Zinc has long been regarded an important element for plant metabolic processes, despite the fact that it is only needed in minimal quantities. Zinc was discovered to have a key function in the control of reactive oxygen species and the protection of plant cells from oxidative stress. Zinc plays an essential role in the metabolic processes that lead to the production of chlorophyll and carbohydrates, as well as the synthesis of auxin or indole acetic acid (IAA) from tryptophan. Zn shortage may have an impact on agricultural production and product quality. Insecticide resistance in pest insects is becoming a bigger issue for agriculture and public health. Magnesium oxide is a common inorganic substance that has a wide range of applications, including adsorbents, fire retardants, improved ceramics, hazardous waste remediation, and photo electronic materials. As a result, different Mop synthesis methods and pathways have been described. Green techniques were used to make Mg OH, which included nontoxic neem leaf extract, Citrus lemon leaf extract, and acacia gum.

- *Pest control for plants:* Fusarium wilt is a devastating disease of tomato and lettuce in many regions owing to significant production losses, fungal survival in the soil for extended periods of time, and the development of resistant races. With the use of resistant cultivars and

pesticides, the disease may be controlled to some degree. However, the emergence and development of new pathogenic races is a persistent issue, and chemical treatment is both costly and ineffective. In recent years, nanoparticles have been proposed as a potential option for controlling plant diseases. produced magnesium oxide nanoparticles and investigated the impact of various concentrations on the green peach aphid (GPA) in a greenhouse setting.

- *Potential for Nano insecticidal action:* Copper oxide nanoparticles may be made in a variety of ways, including precipitation and chemical reduction . Citrus lemon juice and carob leaves [are two examples of plant aqueous extracts that have been documented. Many researchers have developed various methods for synthesizing ZnONPs, including chemical, precipitation, hydrolysis in polar organic solvents, and microwave synthesis.
- *Antimicrobial activity:* Several nanomaterials, including silver nanoparticles, are employed as antibacterial agents in food packaging. This is due to its extensive usage. Titanium dioxide (TiO₂), zinc oxide, silicon oxide (SiO₂), magnesium oxide, gold, and silver are some of the other nanoparticles presently in use. Each has its own set of features and activities; for example, zinc nanocrystal has antibacterial and antifungal properties. Silver was utilized by NASA and the Russian Space Station to cleanse and sterilize water, silver zeolite, and silver. Gold has excellent antifungal and antibacterial properties against 150 different microorganisms, as well as great temperature stability and minimal volatility.

2. DISCUSSION

As a consequence of dangerous nanoparticles, researchers have a wide range of risk perceptions. Nanoparticles may enter the human body via eating, cutaneous exposure, and inhalation, and they can penetrate the circulation, blood–brain barrier, and digestive system owing to their high bioavailability. It's important to remember that nanoparticles have different chemical characteristics than their bulk equivalents while developing regulations. When it comes to agriculture, nanoparticles may help poisons penetrate deeper into the soil. Nanoparticles may bind with other contaminants due to their greater surface area. To identify possible dangers, possibilities of exposure, and the risks that nanomaterials pose to people and other animals, risk assessment is needed. There is a requirement to assess the degree of potential hazards and environmental consequences. Nanomaterials should be thoroughly described and evaluated for mammalian and ecological safety. Although many studies have found no toxic effect of nanoparticles on soil microbial community, interpretations about potential risk should be based on scientific evidence rather than speculations. They carry them through the soil, resulting in Nano-pollutants to be adsorbed and absorbed deeper and faster than normal. Furthermore, nanoparticles are often reactive and may accelerate physical or chemical interactions with contaminants, potentially resulting in the formation of new hazardous substances. It's still unclear if the various alternative methods are effective at the nanoscale, or how many have been validated for nanomaterials thus far. Before any regulatory action is implemented, several fundamental questions about the issue problem should be asked: is the current regulatory framework adequate? If not, where should the focus of effort for nanotechnology regulation be? As a result, appropriate risk assessment and safety measures must be implemented. Science-based policy choices will aid in the formulation of a suitable risk assessment methodology throughout this process. Science assists in making informed policy choices by providing risk and benefit information about a technology or a product produced from it.

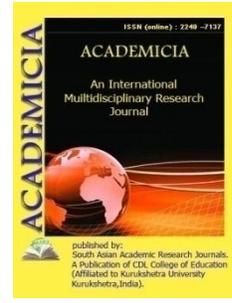

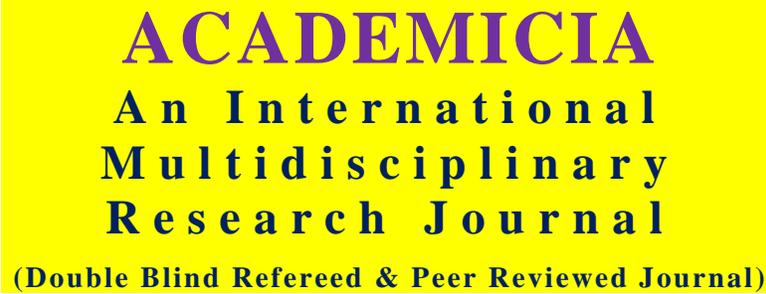

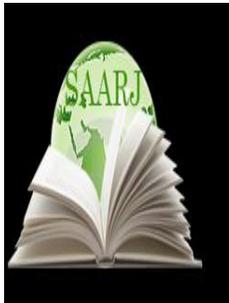

3. CONCLUSION

Agriculture, food processing and packaging, food security and water purification, environmental remediation, crop development, and plant protection all benefit from nanotechnology. Nanotechnology has the potential to improve disease resistance, plant growth, and nutrient utilization by allowing precise administration of agrochemicals. Nano encapsulated solutions demonstrate the capacity to apply pesticides, insecticides, and herbicides more effectively and site-specifically in an environmentally benign, greener manner. It has been effectively utilized in postharvest to preserve the freshness, quality, and shelf life of stored products, as well as to prevent disease outbreaks in a relatively safe manner. Nanomaterials are a relatively new technology in agriculture, and further study is needed. Nanotechnology's application in agriculture has social and ethical implications that must be addressed. The toxicity of nanomaterials must be assessed before they can be commercialized and used in the field. Nanomaterials have the potential to harm the ecosystem, the environment, and human health. According to experts, the potential dangers associated with nanoparticles discharged into the environment are very hazy. Consumer and commercial goods discharge a large quantity of engineered nanoparticles into the environment as technology advances. The current critical limitation in agricultural use is production scale and cost. Nanomaterials will be mass-produced in large quantities, and their effective application in agriculture will drastically decrease costs. Nanomaterials' potential use in many agricultural applications necessitates further study into their synthesis, toxicity, and successful application in the field. There are still many opportunities to explore with new Nano products and methods in the area of agriculture.

Despite the potential benefits of nanotechnology, agricultural applications are limited in comparison to other industries. The academic sector is mainly responsible for agricultural success. For it to succeed on the ground, public opinion and appropriate regulatory mechanisms are essential. In order to evaluate safety, several regulatory agencies should be engaged. The proper labelling of Nano products may give a new technology a bad connotation. When consumers read labelling on Nano products, they may reject them. Some consumer preference surveys revealed a generally unfavourable public perception of nanotechnology. Agriculture remains a borderline area for nanotechnology, as pioneering agro-nanotech products struggle to find a market. This is due to high manufacturing costs of nanotechnology-based goods, which are needed in large quantities in the agriculture sector, unclear technological profitability, regulatory concerns, and public opinion. However, the research and development prospects are extremely promising, and the possibilities provided by nanotechnology in a variety of agricultural applications are being thoroughly investigated. In addition, nanotechnology is rapidly evolving in other fields. Information gained in other emerging areas, such as energy and packaging, may be used to agricultural purposes, or may have spillover effects. Precision farming becomes highly advanced and accurate when we use a synergistic approach that includes smart Nano sensors, wireless sensor networks with smart dust sensors, ambient intelligence and other technologies that help farmers make better decisions by providing precise information. The issue of enabling Nano sensor communication is yet unsolved. To overcome the difficulties and actualize this new paradigm, additional research on network size, energy harvesting, channel modelling, routing algorithm, and improved MAC protocol is required.

State University of World Languages,
UZBEKISTAN

ABSTRACT

Requests for changes in teaching at all educational levels are normal consequences because of the rapid technological development and today's dynamic and complex reality. To improve educational achievements and students vocational training at the university, it is required to use alternative methods and procedures of teaching, blended in a combination of original strategies that promote active learning. This article indicates that the method of lecturing is the dominant one on the respondents' studies, but with a frequent use of guided conversations and discussions, which indicates a gradual reorganization of higher education. Results obtained in this paper do not demonstrate a continuing willingness of students towards intellectual and emotional involvement in the learning process and taking responsibility for learning on their own.

KEYWORDS: *Higher Education, Teacher, Student, Teaching Strategies, Methods and Procedures, Active Learning and Teaching.*

INTRODUCTION

The consequence of the ever more important role of knowledge for the economic and social prosperity and of the focus on the active role of individuals in the building of his knowledge is the tendency to implement the new guidelines in the organization of the teaching process where the teaching – learning relationship is more flexible, students are encouraged to take an active role in instruction processes and the teaching outcomes must include the acquisition of knowledge but also the gaining of competences. The goals of education defined through the learning outcomes or development of competences cannot be realized by sheer usage of traditional didactic strategies, approaches and methods, and more efficient form of teaching and learning are required. The goal of this paper is to direct the attention to strategies of teaching at the higher educational level, in particular the strategies which foster active learning and

acquisition not only of new knowledge but also skills and attitudes in answer to the requirements of the rapid technological development and contemporary labor market.

Teaching has been changing under the influence of social changes which require the university education to answer the requirements of the dynamic and complex reality by organizing a learning process able to train students to operate in professional practice (Apel, 2003, 32). The first step in the changes is to shift the emphasis from the teacher as knowledge provider to the student as the knowledge and skill acquirer. The student is no longer a passive recipient but becomes an active searcher in the process of knowledge building and application of knowledge and skills. This results in a more efficient education of young people, able to take their position in society. An American author, Prince (2004), considers that active learning can be achieved by any method of teaching which actively involves students into the process of authentic learning. Naturally, this mode of learning supersedes sheer memorizing and repetition of what the professor had said or done. The essence of such learning is in constant intellectual participation in the learning process. An Italian author, Zanchin (2002), also thinks that active teaching implies involvement of students in the teaching of curriculum contents, which fosters development of their procedural knowledge and its integration with declarative and metacognitive knowledge. Strategies of active teaching must possess the following characteristics: • integrate thought and practical activities; • enable varied learning styles; • enable a methodologically correct teaching of curriculum contents regarding single disciplines; • promote cognitive interaction with the others, whether adults or peers; • develop higher-level cognitive processes; • foster reflection and metacognitive activity; • support readiness to carry out tasks and motivation to learn; • enable observation and monitoring of students (e.g. their pre knowledge and learning styles). Lecture has so far remained the dominant form of academic teaching in spite of continued attacks, critiques and intentions to suppress it and replace it with more efficient methods and procedures (Apel, 2003, 27-37). In the effort to introduce changes in the approach to teaching at university, numerous researches have been carried out. These researches show that direct teaching is efficient in the transfer of knowledge, but is not sufficient for deeper understanding, problem solving, creative work and similar. (Terhart, 2001, Vizek Vidović, Vlahović-Štetić, Rijavec, Miljković, 2003, Apel, 2003). Academic education is broadened by learning with the help of the new media, but personal interaction in social situations remains important in the learning process. New methods which will encourage students to participate in the teaching process, in a written or spoken form or actively, are therefore being researched

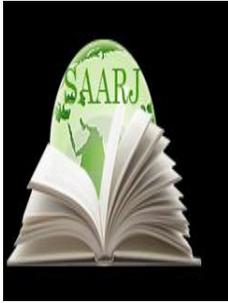

Authors Vizek Vidović, Vlahović-Štetić, Rijavec and Miljković (2003, 335- 375) do not use the term strategy, but a much narrower term: teaching methods or methods of teaching, defined as the learnt generalised form of behaviour which can be systematically applied in various teaching fields in order to facilitate and improve the learning outcome. Teaching techniques i.e. specific actions which are developed for the purpose of teaching a particular type of content, are an even narrower form of behaviour. The authors classify the teaching methods in accordance with the level of activation of students and teachers during teaching, and in accordance with the number of people taught. The extremes considering these two criteria are the maximum activity of teachers teaching in a numerous class vs. one student learning independently with occasional consultations with the teacher. Between these two extremes the authors included the following basic teaching forms: direct teaching, teaching based on guided discovery and discussion and

independent learning regulated by feedback from the teacher on learning success. Direct teaching thus comprises the lecturing technique and the technique of display and modelling for the purpose of acquiring skills and procedural knowledge. The teaching based on guided discovery method comprises techniques of total and guided discovery, dialogue and discussion. The authors consider that independent learning requires development of skills for following the teaching process and skills of independent learning such as: organisation and elaboration of course-book texts, problem solving, revision, exercising, critical thinking and metacognitive skills. The above described overview of methods was amended by the authors (2003, 473-498) in the chapter of humanistic approach to education based on the following principles: student oriented instruction, teacher as the facilitator, assistant and partner in the process of learning, contents is not the goal but the means to realize educational goals, learning is best encouraged in a cooperative environment. The best known forms of humanist education in practice are the open education, learning through research, learning through discovery and group discussion

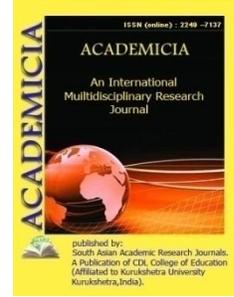

Turbulent social processes require a flexible and dynamic university ready to change and accept the fact that it is no longer the exclusive place where information is gathered and knowledge acquired. Any demand for a change involves innovative approaches to teaching and learning as a response to the challenges set by new media and learning theories, such as cognitivism and social constructivism. An especially important role is played by active teaching methods and procedures which recognize different needs of individual students, asking them to assume liability for personal learning and promoting critical thinking and independent learning. The leader of these changes is the teacher who must be able to implement various different teaching methods and procedures and to alternate them strategically encouraging creativity, problem solving, experience-based learning and metacognition. The fact that working methods and procedures, such as guided conversation, participation of student in discussions and debates, are being used on a more frequent basis, indicates a positive movement in the reorganization of university teaching process. Nevertheless, our research indicates the still predominant position of the oral lecture method and the need for a more varied usage of teaching methods and procedures enabling students to be more active and to assume greater liability in their own educational process.

ABSTRACT

This article covers the social life of European and Central Asian peoples in the Middle Ages. There are theoretical ideas about the level of development of education, culture and art. The article also compares the methods of education and training on the two continents.

KEYWORDS: *Medieval Social Life, Education, Literary Life, 15th Century Schools, Church Schools, High Schools, Madrassas, Secular And Religious Education.*

INTRODUCTION

For a long time in Western Europe, only church ministers were literate. They had to read church books and know the prayers.

Large churches and monasteries had schools to train priests. Students memorized many prayers, learned to read, write, count, and sing church songs. In arithmetic classes, they calculated how many days a particular religious holiday would come. The knowledge needed to build church buildings was taught through geometry.

School science was hard and arduous. Both the French and the Germans and the English were taught in Latin, which was a foreign language for them. Books and prayers were written in that language at that time. Often there was only one book for the whole school, and the teacher would show it to the students in turn. Children did not try to arouse interest in knowledge, and depression prevailed in the teaching. Knowledge was taught to students with sticks. It was said of an educated person that he "grew up under the staff of his Master."

He graduated semi-literate people from church schools. Many could only read the Latin text without understanding the meaning of what they were reading. In the Middle Ages, the school was completely in the hands of the clergy.

With the growth of cities, more literate people were required. It was necessary to calculate the proceeds from the sale, to operate in the city councils and in the courts. In the Middle Ages, city schools began to appear in Europe, not church schools. They taught writing and arithmetic better than the clergy, and gave some knowledge of the natural sciences.

In the Middle Ages, man had very little knowledge, and science could explain almost nothing. The priests were convinced that the evidence of the scholars did not contradict the teachings of the church. The Church emphasizes that man cannot enter the mysteries of nature because everything in the world happens by the will of God. Therefore, medieval scientists learned little about nature. Often, their eyes were fixed on the yellowed pages of church books, looking for ready answers to all the questions in them.

During the Middle Ages, such disciplines as astrology and alchemy flourished in Western Europe. Astrologers have suggested that the future can be determined by the stars. Kings, generals, and travelers consulted astrologers before doing any work. Alchemists have wasted their efforts in the search for a mysterious substance that can turn all metals into gold.

But the development of economics has led to the birth of true scientific knowledge. Farmers improved tillage, observing animals and plants. Craftsmen tested the properties of metals and stones in their small workshops, making paint and glass.

With the growth of trade, the geographical knowledge of Europeans also expanded.

In the early 16th century, nomadic Uzbeks came to power in Movarounnahr, and the Timurid dynasty became part of the Mongol Empire in India. Initially, these phenomena led to a certain degree of isolation of these regions from each other and an increase in local features in the Persian literature. Nevertheless, cultural ties are almost unbroken and their intensity gradually increases.

By the 16th century, Central Asia was experiencing a renaissance in science, education, and social life in general. The political process has, of course, paved the way for changes in public life. In the second half of the 16th century, Movarounnahr became a strong centralized state, and the period of Sahibquran Timur and the first Timurid rulers left its mark in history as a period when science, culture and education began to flourish again. That is why the second Renaissance in the East took place in these centuries. Academician M. According to Khairullaev, the second half of the 14th century marked the beginning of the second phase of the Eastern Renaissance in the 15th century. With the establishment of the great centralized state of Timur, science, culture and education began to flourish again in Movarounnahr. The culture of this period is considered to be the culture of the IX-XII centuries in terms of its principles, direction, economic basis. The role of Sahibkiron Amir Timur in the development of science, culture, art, literature, architecture, economic and cultural relations and the creation of a social environment is unique.

In the 15th century, economics, architecture, literature, and culture flourished in Central Asia, and by the time of the Great Patriotic War, mathematics, astronomy, and medicine flourished. The cities of Samarkand and Herat had become cultural centers. During this period, education was closely linked to religion, and madrassas gained the status of higher education. Three

madrassas were built in Bukhara, Samarkand and Ginduvan, which served as a scientific center for the development of science. The following inscriptions could be seen on the roof of the madrasah in Bukhara: "It is obligatory for every Muslim to strive for knowledge" [2, 157]. Madrassas specialized in, for example, the training of management staff in the Muhammad Sultan Madrasa, the training of personnel for religious institutions in the madrasah of MawlanaQutbiddin Sadr, the training of general specialists, ie intellectuals, imams, scholars, schoolteachers, Idigu Temur, Saroymulkhanim madrassahs [3, 134]. But in their bar, the Qur'an, Hadith, and jurisprudence were studied.

One of the peculiarities of the madrasas of this period was the strong emphasis on the teaching of Arabic grammar in all madrasas. In addition, classes in madrassas were conducted in Arabic, Persian and Turkish.

During this period, the Uzbek literary environment also changed. In the XIV-XV centuries there was a significant shift in Uzbek literature, and valuable works were created by Atoi, Sakoki, HaydarKharozimi, Durbek, Lutfi. Many works in Arabic and Persian had been translated into Uzbek.

One of the most important changes in the society was to increase the literacy of the population, to create opportunities for the education of children. Private schools were established, and some officials hired teachers to provide home-based education. During this period, schooling began at the age of six. At school, they began with reading and writing, and later, after graduating, they were educated in madrassas and acquired both religious and secular knowledge.

In the Middle Ages, literature was a dominant form of "cultural work" in Iran and Central Asia, and included other forms of cultural activity. All the different professions could belong to the same literary circle, so there was a great need for literary education during this period. The love of literature united educated people by the middle of the 15th century, and in the education system of those years, knowledge of poetry was mandatory. At the time, literature was both a means of propaganda and an expression of ideas and feelings. In this regard, the study of the activities of literary circles was an important step in the reconstruction of the historical and psychological portrait of the society of the chosen period Movaraunnahr.

In the first half of the 16th-17th centuries, Movaraunnahr served as a center for the reorganization of literary circles. There are three sources that reveal this period - Hasan Nisari's "Muzakkir-iahbob" (for the first half of the century), "Tazkirat ash-shuaro" (for the second half of the XVI century) and MutribiSamarkandi's "Tarih-iJahangiri" (XVI century - The first third of the seventeenth century). These sources cite more than six hundred writers who took part in the literary life of Movaraunnahr in one way or another. A study of Katy Harawi's anthology Majma ash-shuara-yiJahangirshahi has shown that this work provides information about the poets of Movarounnahr who left for India. The latest anthology is of great importance in the study of Iranian-Indian literary relations.

The role of poetry has not changed over the centuries. And although the brightest and most detailed pictures depicting them are taken from pre-Mongol sources, all of them are reflected in the literary work almost unchanged.

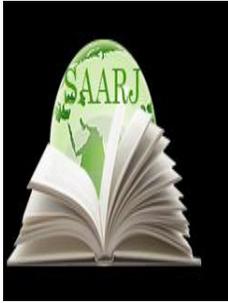

The main features of the literary life of the period under consideration were the desire to write "artificial" poetry and the spread of poetry among the lower strata of society. It also became

famous for his Sufi poems, which were quickly recognizable for their unique composition and limited imagery, ranging from ghazal to ghazal. It was impossible not to mention the bilingualism that existed at that time: many poets wrote poetry fluently in Persian and Turkish.

In conclusion, the level of Western education was inseparable from that of Central Asia. Areas of science that were abstract, especially for Europeans, were studied in detail by Asians in the 15th century: examples of such sciences were architecture, astronomy, geography, and medicine. Literary views also differed greatly between the West and the East. The feudal system also dominated Western literature in the 15th century.

ABSTRACT

In a wireless communication system, the antenna is the most essential component. Electrical signals are converted into radio waves via antennas, and vice versa. Antennas come in a variety of shapes and sizes, each with its own set of characteristics based on the signal transmission and reception requirements. In this article, we compare and contrast different kinds of antennas based on their forms, materials utilized, signal bandwidth, transmission range, and other factors. Our primary goal is to sort these antennas into categories based on their intended use. Antennas are the fundamental requirements for wireless communications in the contemporary age, since they are needed for quick and efficient transmission. This document will assist the design architect in selecting the best antenna for the job.

KEYWORDS: Applications, Antenna, Dipole, Communications, Signal Transmission.

1. INTRODUCTION

Antennas are one of the most basic components of any electric system. It connects the open space with the transmitter or the free space with the receiver. Antennas are devices that convert RF or electrical signals. It is also used to convert a signal into an electromagnetic or wave signal. Receiving an electromagnetic pulse and converting it to an electrical signal. Antennas are the devices that are used to transmit data. Information in the form of a signal emitted by an electromagnetic wave converse in an unguided or wireless manner. In a radiating antenna. If it had a high radiating resistance, it would impair its efficiency. The antenna's efficiency will be

high due to its resistance. Antennas are a helpful method of communication in a variety of situations. Antennas are utilized to transmit in the form of sound, graphical video as a result of their significance in communication. Antennas are developed on a regular basis to meet the needs of the market. Antennas are designed for a variety of applications. For improved communication, materials and structures are required. They really are. Radio, television, satellite, broadcasting, and design communications, cellular system, etc. It also took into account necessary for determining the characteristics of a system[1]. There are antennas in operation.

Different systems have several types of. They have antennas attached to them. Directionality is used in certain systems. The operating characteristics of the antennas are developed around them. The antennas, on the other hand, are just the system's features. Used to transfer omnidirectional electromagnetic energy. It may be utilized in certain other systems or in other systems for point-to-point communication where the gain and range are increased. Wave impedance must be reduced. As far as antennas and their applications are concerned, is very low, thus this analysis is critical for identifying. Antennas of various types and their uses in diverse systems[2]. This article provides a comprehensive overview of different antenna types. It evolved to fulfill an important communication job in A variety of communication network fields are discussed. An antenna or aerial, used with a transmitter or receiver, is the contact between radio waves traveling across space and electric currents flowing through metal conductors. When transmitting, a radio transmitter sends an electric current to the antenna's terminals, which the antenna then emits as electromagnetic waves. An antenna receives part of the strength of a radio wave and converts it to an electric current at its terminals, which is then transferred to a receiver to be amplified[3]. Antennas are an important part of any radio system[4]. An antenna is a collection of conductors (elements) that are electrically linked to the receiver or transmitter. Antennas may be constructed to transmit and receive radio waves in all horizontal directions equally (omnidirectional antennas) or to broadcast and receive radio waves preferentially in one direction (directional, high-gain, or "beam" antennas). An antenna may include non-transmitter components such as parabolic reflectors, horns, or parasitic devices that guide radio waves into a beam or other desired radiation pattern. Heinrich Hertz, a German scientist, constructed the first antennas in 1888 as part of his pioneering experiments to establish the reality of waves anticipated by James Clerk Maxwell's electromagnetic theory. For both transmitting and receiving, Hertz used dipole antennas at the focal point of parabolic reflectors[5]. Guglielmo Marconi, who won the Nobel Prize for his work on antennas for long-distance wireless telegraphy, started developing them in 1895[6].

1.1 Types of Antenna:

- *Biconical Dipole Antenna:* An infinite constant-impedance transmission line has no limit on data transfer capacity, but any realistic implementation of the biconical dipole has limited extension appendages that create an open-circuit stub in the same way that a resonant dipole does. In the case of transmission, the loss caused by radiation from the biconical transmission line reduces the wave reflected by the open circuit end, and if the conical surface was long enough, the far end would be rendered electrically "invisible" at the terminals. At higher frequencies, its behavior resembles that of a true biconical transmission line, with the maximum limit determined mostly by the precision with which the 'near-coincident apices' can be implemented. Between these two extremes, a worthwhile return loss may be achieved

across an octave or more, depending on what defines "sufficient" for the anticipated use, such as 10dB. Despite these limitations, this is nevertheless one of the most basic genuinely[7].

- *Antenna with a Left-Handed Dipole:* Left handed dipole antennas are a novel kind of antenna that gets its name from the fact that its transmission is left-handed. Shunt inductors and capacitors are used in the antenna design. The capacitor is placed on one side of the line, causing currents of varying amplitude on both sides. Because the eliminate currents are of varying adequacy, they do not completely cross out in the far field, and so it transmits. With a shorter wavelength, the frequency of the left-handed transmission line decreased. In free space, the 0.18 wavelength receiving antenna has a gain of 3.9 dB and a transmission capacity of 1.7 percent .
- *Antenna with a Folded Dipole:* Folded dipole antennas are simple, low-cost, have a smaller footprint, are cheap to manufacture, and are simple to install. The folded dipole antenna is made up of two folded wires with the folded ends of the dipole antenna left open. The folded dipole antennas have a broad loop configuration. In Xin, there is more flexibility in adjusting the impedance design, which is critical. The impedance is determined by the geometric parameters rather than the strip thickness. The radiation patterns are identical to those of a dipole antenna.
- *Dipole Antenna:* When a dipole antenna has half wave length at output, it is called a half-wave dipole antenna. The resonant frequency of a half-wave dipole antenna causes size fluctuation. The suggested antenna operates at a full frequency of 1.995 GHz, making it suitable for GSM technology. The frequency range of a half-wave dipole antenna is 1.877 GHz to 2.1199 GHz. The proposed dipole antenna is a radio antenna that is constructed using wire and a center-fed portion. Two wires are placed in line in a half-wave dipole antenna, with a tiny gap between them. The center of both wires is connected to the voltage[8]. If a half wave dipole occurs, the length of the dipole should be half the wavelength, however in practice it is computed as 0.45 wavelength time. Current flows between the two poles of a half-wave dipole antenna. The radio signal is emitted by the passage of current and voltages in the suggested antenna.
- *L-loop Antenna:* L-loop antennas take the least amount of effort, are geometrically smaller, and have a radio effective structure, which is needed in ultra-wideband applications (UWB). It's a unique printed loop antenna since the arms include an L-shaped section. Antennas in UWB systems offer excellent performance for lower band frequencies ranging from 3.1 GHz to 5.1 GHz. The antenna has a 10dB return misfortune transmission speed throughout the whole frequency range. The L part of the loop antenna selects the lower frequency band, while the decrease transmission line determines the upper frequency limit [5]. The shape of the antenna is dependent on FR4 substrate and FED with 50 ohms linked reduced transmission line. The construction of an L-loop antenna[5]. The entire length of the square loop's outer boundary The construction of the L-Loop antenna. The whole length of the square circle antenna's exterior breaking point should be one wavelength, with the aim of having direct focused radiation. A helical antenna is a kind of antenna that has a helical shape. The helical antenna was invented by John Kraus in 1964. These antennas have been around for a long time. All things considered, unifilarhelix antennas are made up of a single wire or restricted tape wrapped like a right or left hand screw, self-supporting or spun on a

dielectric cylinder . Such antennas have been widely used for many years because to their practical emission and ease of usage. Furthermore, owing to their remarkable and exceptional characteristics, these antennas are frequently employed to get microwaves from VHF[9]. Because high gain is needed in satellite communication, helical antennas are employed. Because a greater gain is required in a parabolic dish, a helical antenna was built for this purpose. The proposed antenna has a very broad bandwidth. The helical antenna. The geometry of this kind of antenna model design was fed via a 50 Ohm coaxial connection. It is made up of a single empty dielectric chamber with a relative permittivity of 2.1 and a cross-sectional area of 61.33mm. The antenna was aided by the generator located at the base, between the antenna and the ground plane. The feed is at the bottom of this section[10].

- *Yagi-uda Antennas*: The suggested antenna is referred to as a yagi antenna or simply a yagi. The yagi antenna is a guided path with a dipole and additional strongly linked parasitic components, such as reflectors and directors. Reflectors, a dipole, and directors make up the yagi antenna's construction. UHF/VHF radars, phased Doppler radars, and wind profiler systems all utilize these antennas. The performance of the reflector dipole or feeder, as well as the director, is determined by these components. The construction of the yagi-uda antenna.
- *Spiral Antenna*: High bandwidth is required in wireless communication systems, necessitating the use of wideband antennas. In comparison to other antenna, the proposed antenna has a better spectral competency. Spiral antennas have the advantages of being easy to manufacture, low cost, extended life, and better emission performance. Ultra-wideband radio (UWB) operates in the frequency range of 3.1 to 10.6 GHz. In comparison to other planer antennas, the spiral has a high spectrum efficiency, which means a fast transmission rate. It is based on Archimedes' spiral guideline and comes in a variety of forms based on outlining goals. Theoretically, a spiral antenna apparatus with an infinite number of turns and perfect arm splitting possesses indefinite spectral proficiency and transfer speed. For all intents and purposes, we must cope with the fact that the unfathomable vastness is impractical, and the addition turns cannot be too close to one another without dread.
- *Antenna for Beverage*: Antennas for beverages are widely utilized in a variety of applications. It can receive signals in the frequency range of 2 MHz to 30 MHz and utilize them for direction finding. On a low height, these antennas have a high directivity. Beverage antennas are low-cost and have a straightforward design. A high frequency signal is received by the current detecting terminal, which modulates a laser diode. The high-frequency signal is then demodulated after passing via optical fiber to the receiver. The demodulated signal was measured using a Hewlett-Packard 8753B network. In a high-frequency antenna system, the laser output remained constant to prevent heat-dependent fluctuation, and optical-fiber offered significant benefits over co-axial cable. The construction of the beverage antenna.
- *Reflector with a Parabolic Shape*: There are two types of antennas in this category. One is a right cylinder, whereas the other is a paraboloid. To feed a cylinder type linear dipole, a linear array, a slotted waveguide, and so on are utilized. On the other hand, with a paraboloid, feeding is done in a conical or pyramidal shape. The suggested antenna's radiation field pattern is based on the feed component's radiation pattern, as well as the reflector material and measurements. It's found on parabolic reflectors, which collect and

focus parallel incoming radio wave beams, focusing them into the real antenna at its focal point on focus. The construction of the parabolic reflector.

- *Antenna with a Corner Reflector:* These antennas are easy to use, efficient, and effective. The suggested antenna consists of a dipole element, and it should be a low-cost, small-size, and reliable wireless system. The planer inverted-f antenna has a low profile, is small in size, has a wide bandwidth, and has a high gain. It covers the DCS-1800 and PCS1900 frequency bands. A square planer element suspends the dielectric FR4. The substrate's plane is at the ground's base. The dimensions of the proposed antenna. Planer inverted-f antennas are used in smartphones because of their features. The planer inverted-f antenna is a low-profile, high-efficiency antenna used in portable devices. Because of their properties, they are utilized in a variety of technologies. The device's operating qualities are better if it's simple to make, the signal emission is high, the covered area is small, and the impedance matching is low. The planer inverted-f-antenna (PIFA) is formed as a parallel portion from a wire to a plate with the inverted-f adjusted to it. These antennas reverberate construction with completely resistive burden impedance at the frequency of operation. The antenna's electrical execution is affected by the radiator's height, feed separation and area, and length variation, among other factors.

The construction of the planer inverted-f-antenna.

- *Antennas with a Bow Tie:* Dense, effective, and low-cost devices have become more important in communication network systems. The similar feature is needed in multi-band applications. The current communication network necessitated antennas that were light in weight, cheap in cost, dense, mobile, and simple to operate. Two mirrors are needed in the manufacture of the proposed antenna and are positioned on a rectangular patch. Lumped port is utilized for Coplanar Wave Guide (CPW). The proposed antenna's output is limited by its location, distance, and alignment. Mobile communication networks and wireless systems are effective uses of these antennas.
- *Periodic Log Antenna:* In telecommunication, a log periodic antenna is a broadband, multi-component, tight pillar, directional antenna with radiations and impedance characteristics that repeat periodically as a logarithmic function of the frequency excitation. A logarithmic rise in element length and space occurs from one terminal to the other in a log periodic antenna. This kind of antenna, with its directionality and modest gain, is ideal for an area that needs a wider frequency range. These antennas were created with a broad bandwidth in mind for a particular application. The antenna is made up of a series of dipoles that are alternately connected by a balanced transmission line known as a feeder. To induce end-case radiation to go in a shorter direction, these closely spaced elements are linked oppositely form element and cancel the broadside radiation. A short coaxial cable was utilized. The antenna's own balun is created by connecting the feeder to the conductor of the coaxial wire.
- *Log Periodic Dipole Antenna:* If there are any wideband applications, the suggested antenna will come in useful. The VHF frequency range for the log periodic array antenna is 30 MHz to 300 MHz. Independent antennas with a bandwidth larger than 10:1 are classified as log periodic antennas. Raymond Duhamel was the first to come up with the idea of a log periodic array structure. Is bell invented the log periodic dipole array in the 1960s. The input impedance, gain, radiation, and other characteristics of the proposed antenna change

periodically in the logarithm of the frequency space. A log periodic array is what this is called. The construction of the log periodic dipole array antenna.

- *Log Periodic Fractal Koch Antenna:* The suggested antenna, the log periodic fractal koch antenna (LPFKA), is used in devices that operate in the ultra-high frequency (UHF) band. The fractal Koch method may reduce the antenna size by up to 27% without affecting the antenna radiation or reception performance. Antennas are now created in tiny sizes with less covered area and greater bandwidth, thus they are manufactured in a variety of directions and shapes. Koch bend is a good example of a self-comparable space-filling fractal that may be used to make a wideband, multiband, or scaled-down antenna. The antenna aids in breaking free from imprisonment. The log periodic fractal koch antenna.
- *Horn Antenna:* Jagadis Chandra Bose invented the proposed antenna in 1897, which was a pyramidal horn antenna. The characteristics of a horn antenna are straightforward: it can be stimulated by wavelength. The suggested antenna is known as a principle feed reflector antenna. Because these losses are so small, we estimate the suggested antenna's gain to be the same as its directivity. The horn antenna served as both an antenna and a reflector. They aren't waveguide-matched properly. When compared to waveguide and high directivity, the horn antenna radiates a constant phase front and sends a larger aperture. Horn radiation gain is related to the square of the wavelength and the area A of the flared open flange. Horn radiation is the impedance transition between free space and waveguide impedance provided by a tapered termination with a length equal to a waveguide. Horn radiators serve as both reflector antennas illuminators and antennas in and of themselves. These antennas aren't the greatest fit for the waveguide, but they can still achieve standing wave proportions of 1.5:1 or less. The flared open rib area corresponds to the rise of a horn radiator, and the square of the wavelength corresponds to the decrease. The construction of the horn antenna.
- *Wearable Antenna:* Wearable is the term given to the planned wearable antenna since it may be worn on the human body. These antennas are embedded in clothing and provide functions such as tracking and navigation, remote computing, and human safety. In wireless communication, body-centric communication has become more important. Smaller, lighter, less costly, long-lasting, and easy-to-install antennas are in more demand these days. The antennas suggested are utilized in medical emergencies, firefighting, and military applications. They may be used to keep track of athletes. The antenna radiator of a wearable antenna is rectangular, with a width of W and a length of L . The patch radiator has a minor impact on the radiation pattern but a large effect on the input impedance and operating band. The radiation powers, as well as the bandwidth and antenna performance, rise as the radiator width grows.

2. DISCUSSION

Antennas are found in a wide range of wireless systems, from IoT devices to microwave and millimeter-wave imaging systems like radio telescopes. Antennas are the essential component of a wireless system because they transform electron flow into electromagnetic radiation in a symmetric and well-designed way. An antenna's precise behavior is determined by the geometry of the conductors and dielectrics in its construction, and there are many different antennas to meet different application needs. Radiation parameters and network parameters are the two major types of antenna behavior. Typically, these characteristics are only provided for the

frequencies that fall inside an antenna's bandwidth. An antenna's bandwidth is simply the frequency range that the manufacturer has specified. Broadband behavior is common in antennas, and it may extend beyond the antenna's bandwidth. Radiation parameters explain how the antenna works when it transfers electromagnetic energy to electronics and back. The behavior of an antennae interconnects and ports, which link it to transmitters, receivers, interconnect, and measurement equipment, is described by network parameters.

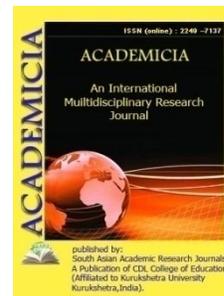

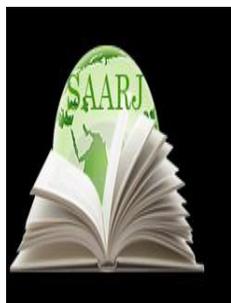

3. CONCLUSION

The study's conclusion provides a wealth of information on various antenna types. With the assistance of this study paper, we can choose the optimal antenna to meet the requirements for the needed wireless communication system. The applications and functions of antennas are examined in this article based on their groupings. One of the most important and least understood aspects of any radio communication platform is the antenna system. The antenna system serves as a link between the radio system and the outside world. Antennas at the transmitter and receiver are required for wireless communication systems to function correctly. Antenna design and placement may make or break a wireless system, and many poor-performing systems can be traced back to antennas that were incorrectly installed or positioned. A single antenna at the base station and one at the mobile station may make up the antenna system. The antenna is primarily used by the base station and the mobile phone to establish and maintain communication links. Antennas come in a variety of shapes and sizes, each of which serves a particular purpose depending on the application. The antenna that a system operator uses.

ABSTRACT

For a wide variety of Li-ion battery electrodes, this overview covers important technical advances and scientific difficulties. Many families of appropriate materials are compared using a periodic table and potential/capacity graphs. Commercial intercalation materials such as lithium cobalt oxide (LCO), lithium nickel cobalt manganese oxide (NCM), lithium nickel cobalt aluminum oxide (NCA), lithium iron phosphate (LFP), lithium titanium oxide (LTO), and others are compared to conversion materials such as alloying anodes in terms of performance, current limitations, and recent breakthroughs (F, Cl, Br, I). There's also talk of new polyanion cathode materials. Each kind of electrode material is discussed in terms of cost, abundance, safety, Li and electron transfer, volumetric expansion, material dissolution, and surface reactions. The study covers and categorizes both basic and particular methods for overcoming current problems.

KEYWORD: Anodes, Cathodes, Electrodes, Li-Ion Battery.

1. INTRODUCTION

Li-ion batteries offer an unrivaled mix of energy and power density, making them the preferred technology for portable gadgets, power tools, and hybrid/full electric cars. Li-ion batteries will substantially decrease greenhouse gas emissions if electric vehicles (EVs) replace the bulk of gasoline-powered transportation. Li-ion batteries' high energy efficiency may allow them to be used in a variety of electric grid applications, such as improving the quality of energy harvested from wind, solar, geo-thermal, and other renewable sources, allowing for more widespread use and the development of an energy-sustainable economy. As a result, both business and

government funding organizations are interested in Li-ion batteries, and research in this area has exploded in recent years[1].

However, many people believe that Li-ion batteries will not be able to meet the world's requirements for portable energy storage in the long term. Li-ion batteries are presently expensive for certain uses (such as transportation and grid), and a shortage of Li and some of the transition metals now used in Li-ion batteries may become a problem in the future. Li-ion batteries, on the other hand, offer certain basic benefits over other chemistries. To begin with, Li has the lowest reduction potential of any element, enabling Li-based batteries to achieve the greatest cell potential conceivable. Li is also the lightest element, with one of the lowest ionic radii of any single charged ion. Li-ion batteries have a high gravimetric and volumetric capacity, as well as a high power density, due to these reasons. Finally, although multivalent cations have a larger charge capacity per ion, the extra charge decreases their mobility considerably. Given that ionic diffusion in solid electrodes is often the rate-limiting element for battery power output, developing alternative chemistries poses a significant challenge[2]–[4].

In the foreseeable future, there is unlikely to be a major shortage of Li. Similar predictions about peak oil have been made, but they have failed to materialize as global oil stocks and resources continue to increase as prices rise and exploration and mining technology advance. The quantity of Li present in the Earth's crust is sufficient to power a worldwide fleet of cars in absolute terms. Rising costs, on the other hand, may be an issue for Li-ion batteries, since cost is a significant barrier to their adoption in renewable energy applications. Despite this, Li does not yet play a significant role in the cost of Li-ion batteries. The cathode and electrolyte include lithium, which accounts for just a tiny percentage of the total cost. The cost of processing and the cost of cobalt in cathodes are the main contributing variables within these components. Li-ion batteries will very certainly continue to dominate portable electrochemical energy storage for many years to come, owing to its basic advantages.

Because Li-ion batteries are the most common type of portable electrochemical energy storage, lowering their cost and increasing their performance may significantly extend their applications and allow new energy-related technologies. Electrode materials have gotten a lot of attention in Li-ion battery research so far. Electrodes with greater rate capability, charge capacity, and (for cathodes) adequate high voltage may increase the energy and power densities of Li batteries, allowing them to be smaller and less expensive. However, this is only true if the material isn't prohibitively costly or uncommon[5], [6].

1.1. Cathodes:

1.1.1. Materials for intercalation cathodes:

A solid host network that may store guest ions is known as an intercalation cathode. The guest ions may be reversibly added and deleted from the host network. Li^+ is the guest ion in a Li-ion battery, whereas metal chalcogenides, transition metal oxides, and polyanion compounds make up the host network. There are various crystal forms for intercalation compounds, including layered, spinel, olivine, and tavorite. For the cathode materials in Li-ion batteries, the layered structure is the oldest type of intercalation compounds. Metal chalcogenides, such as TiS_3 and NbSe_3 , have long been investigated as potential intercalating cathode materials. While TiS_3 only had limited reversibility owing to the irreversible structural shift from trigonal prismatic to octahedral coordination after lithiation, NbSe_3 had reversible electrochemical activity. LiTiS_2

(LTS) was extensively researched among many other kinds of chalcogenides owing to its high gravimetric energy density coupled with extended cycle life (1000+ cycles) and was ultimately commercialized by Exxon. However, owing to their greater operating voltage and consequent better energy storage capacity, most current intercalation cathode research is focused on transition metal oxide and polyanion compounds[7].

1.1.2. Transition metal oxide:

Goodenough's LiCoO_2 (LCO) was the first and most commercially viable kind of layered transition metal oxide cathode. SONY was the first to market it, and it is still utilized in the majority of commercial Li-ion batteries today. Co and Li occupy alternate layers in octahedral sites, forming a hexagonal symmetry. Because of its comparatively high theoretical specific capacity of 274 mAh g^{-1} , high theoretical volumetric capacity of 1363 mAh cm^{-3} , low self-discharge, high discharge voltage, and excellent cycle behavior, LCO is a highly appealing cathode material.

1.1.3. Polyanion compounds:

Researchers have discovered a new class of chemicals known as polyanions while researching novel cathode materials. Large $(\text{XO}_4)^{3-}$ polyanions ($\text{X} = \text{S, P, Si, As, Mo, W}$) occupy lattice sites and enhance cathode redox potential while maintaining its structure. The typical material for the olivine structure is LiFePO_4 (LFP), which is renowned for its thermal stability and high power capacity. In a slightly deformed hexagonal close-packed (HCP) oxygen array, Li^+ and Fe_2^+ occupy octahedral sites, whereas P is found in tetrahedral sites in LFP. The LiFePO_4 cathode has many flaws, including a low average potential and poor electrical and ionic conductivity. Over the past decade, intensive research has resulted in substantial advances in both LFP performance and mechanistic knowledge. The use of carbon coating and cationic doping in conjunction with particle size reduction was shown to be beneficial in improving rate performance. It's worth noting that if particles are uniformly nano-sized and conductive nano-carbons are utilized in the cathodes, excellent electrochemical performance may be obtained without carbon coating. For example, a virus-templated amorphous anhydrous FP/ CNT composite showed encouraging results. A curved one-dimensional lithium diffusion route via the $[0\ 1\ 0]$ direction has been suggested as a possible explanation for the easy redox reaction in non-conducting LFP. However, the energy density of LFP cells is limited by the low density of nanostructured LFP electrodes and their low average potential. A new non-olivine alluaudite LFP with fundamentally different electrochemical properties than olivine LFP was recently discovered.

1.1.4. Compounds of fluorine and chlorine:

Due to their intermediate operating voltages and high theoretical specific and volumetric capacities, metal fluorides (MF) and chlorides (MCl) have lately been extensively studied. However, MF and MCl have weak conductivity, high voltage hysteresis, volume expansion, undesirable side reactions, and active material dissolution. Because of the wide band gap produced by the highly ionic nature of the metal-halogen interaction, most MF, notably FeF_3 and FeF_2 , are renowned for their low electrical conductivity. Their open architecture, on the other hand, may enable excellent ionic conduction. Because of the same reason, chlorides have low electrical conductivity. For factors such as low electronic conductivity and ion mobility, all of the reported MF and MCl materials have very significant voltage hysteresis.

1.1.5. Sulfur and lithium sulfide:

Sulfur has a very high theoretical capacity of 1675 mAh g^{-1} , is inexpensive, and is plentiful in the Earth's crust. S-based cathodes, on the other hand, have a low potential compared to Li/Li^+ , poor electrical conductivity, solubility of intermediate reaction intermediates (polysulfides) in the electrolyte, and (in the case of pure S) a very low vaporization temperature, which causes S loss during vacuum drying. Sulfur also has an 80% volume change, which may cause the electrical contact in typical carbon composite electrodes to be destroyed. S may be enclosed in a hollow structure with extra internal empty space to minimize the effects of both dissolution and volume expansion. Sulfur was impregnated into polyvinyl pyrrolidone polymer, carbon, and TiO_2 capsules via infiltration and chemical precipitation. These materials have a cycle life of up to 1000 cycles when tested in half cells with thin electrode designs.

1.1.6. Selenium with tellurium:

Se and Te have recently gotten a lot of interest since they have greater electrical conductivities than S and potential volumetric capacities of 1630 mAh cm^{-3} and 1280 mAh cm^{-3} in the completely lithiated form, respectively. Se and Te have better active material usage and rate capacity than S due to their higher electronic conductivity. Similar to S, high order polyselenides dissolve in Se-based cathodes, leading in rapid capacity loss, poor cycle performance, and low coulombic efficiency. Polytelluride dissolution has not been documented thus far.

1.1.7. Iodine:

The lithium-iodine primary battery, which utilizes LiI as a solid electrolyte ($10^{-9} \text{ S cm}^{-1}$), has a low self-discharge rate and a high energy density, and is a popular power source for implanted cardiac pacemakers. During discharge, the cathodic I is reduced first to the tri-iodide ion (I_3^-), then to the iodide ion (I^-). However, because of its limited power capacity, this chemical is troublesome for use in most other applications. Furthermore, iodine, triiodide, and lithium iodide are all soluble in typical organic electrolytes. Due to LiI 's great solubility in organic solvents, iodine ions have been proposed as a replacement for LiI in lithium-flow batteries. Due to the low melting point of I (113° C), active iodine was recently absorbed into the pores of porous carbon. The increased electronic conductivity and reduced active material dissolution resulted in a high discharge voltage plateau, excellent cycle performance, and high rate capability for the as-produced iodine-conductive carbon black composite.

1.2. Anode

Because Li metal develops dendrites, which may cause short circuiting, a thermal run-away reaction on the cathode, and a fire, anode materials are required in Li-ion batteries. Li metal, on the other hand, has a short cycle life. Others have examined the main attempts to enable Li metal anodes, therefore this subject will not be discussed here. Rather, this section gives a quick rundown of secondary anode materials. We suggest reading more in-depth evaluations on carbon lithium titanium oxide (LTO) and Type A and Type B conversion anode materials for additional research[8], [9].

1.2.1. Graphitic and hard carbons:

Carbon anodes were the first to make the Li-ion battery economically feasible over 20 years ago, and they are still the preferred anode material today. The intercalation of Li between the

graphene planes, which provides excellent 2D mechanical stability, electrical conductivity, and Li transport, causes electrochemical activity in carbon. This method can store up to 1 Li atom every 6 C. Low cost, plentiful availability, little delithiation potential versus Li, high Li diffusivity, strong electrical conductivity, and very low volume change during lithiation/delithiation are all characteristics of carbon. When compared to alternative intercalation-type anode materials, carbon offers an appealing balance of cheap cost, abundance, moderate energy density, power density, and cycle life. Although carbon has a greater gravimetric capacity than most cathode materials, commercial graphite electrodes have a low volumetric capacity (330–430 mAh cm⁻³).

Carbon anodes for commercial use may be classified into two categories. Graphitic carbons contain big graphite grains and have a charge capacity that is near to theoretical. Graphitic carbons, on the other hand, do not mix well with a PC-based electrolyte, which is favored owing to its low melting point and rapid Li transfer. Between the graphitic planes, PC intercalates with Li⁺, causing the graphite to exfoliate and lose capacity. Li intercalation happens at the basal planes even without solvent intercalation, thus the SEI preferentially develops on these planes as well. Single crystalline graphitic particles experience uniaxial 10% strain along the edge planes during Li intercalation. Such a high level of stress may harm the SEI and shorten the cell's cycle life. To shield the susceptible edge planes from electrolyte and achieve high coulombic efficiency, graphitic carbons have recently been covered with a thin coating of amorphous carbon[10].

1.2.2. *Lithium titanium oxide (LiTiO₂):*

Despite the greater cost of Ti, the decreased cell voltage, and lesser capacity, LTO has been successfully marketed because it enables the combination of better thermal stability, high rate, relatively high volumetric capacity, and long cycle life (175 mAh g⁻¹ & 600 mAh cm⁻³ theoretical). A “zero strain” intercalation process in conjunction with a high lithiation potential results in a high rate and stability. Because the phase shift produced by lithiation/delithiation only results in a little (0.2 percent) change in volume, LTO is termed “zero strain.” This shows up electrochemically as a tiny volt-age hysteresis in the charge discharge curve. Furthermore, because of the high equilibrium potential (1.555 V vs. Li/Li⁺), LTO may be operated in a potential window above 1 V, substantially avoiding the development and expansion of the anode SEI, which can delay Li insertion and generate Li losses in graphite anodes. The absence of volume fluctuation improves the SEI's stability even after it has been created. LTO nanoparticles, comparable to intercalation cathode material, may be utilized since SEI impedance is not a problem, resulting in better rate performance at the cost of reduced volumetric capacity. LTO is also very safe since its high potential inhibits the production of Li dendrites, even at high rates. As a result, despite its poor Li diffusivity and electrical conductivity, LTO is an excellent material for low-energy, high-power, long-cycle-life Li-ion batteries.

1.2.3. *Alloying materials – conversion materials (Type B):*

At low potentials, ‘alloying materials’ refer to elements that electrochemically alloy and produce compound phases with Li (preferably below 1 V). Alloying materials may have very high volumetric and gravimetric capacity, yet they're known for their massive volume shift when lithiated, swelling too many times their original volume. Particles may shatter and lose electrical contact as a result of this. Anodes' SEI protective layer may be destroyed by volume changes,

leading in continual electrolyte breakdown, Li inventory loss, and increased cell impedance. Due to the loss of active material and increased cell impedance, alloying anodes have a limited cycle life, particularly at large mass loadings. The most effective approach has been to make a carbon composite with alloying material particles that are tiny enough for mechanical stability, electron transport, and Li transport while preserving Li diffusion pathways inside the electrode. The active material may be encased in a carbon shell with enough empty space to allow for volume expansion to stabilize the SEI. In theory, this should stabilize the SEI and prevent particles from sintering into bigger particles, allowing for long cycle times even at high mass loadings. If a carbon shell is not employed, electrolyte additives may help to further stabilize the SEI and extend the cycle life, while binders that attach to the active material, have a high stiffness, and expand little in electrolytes can help to give further mechanical stability. Even yet, in complete Li-ion battery cells, high mass loading electrodes with high volumetric capacity ($>800 \text{ mAh cm}^{-3}$) and extended cycle life (10^3+ cycles) have yet to be proven. Furthermore, nanoparticles have a large surface area by definition, resulting in significant amounts of SEI generation and irreversible capacity loss during the first cycles.

1.2.4. Other conversion materials (Type A):

Using oxides in which Li_2O is generated during the first charging of the battery was formerly a common method of creating conversion materials. The Li_2O serves as a "glue" to hold alloying material (such as Si or Sn) particles together while also decreasing overall volume change inside the particles. However, since Li_2O has a poor electrical conductivity, this method always results in a high irreversible capacity and a significant voltage hysteresis, which persists even at very slow speeds. If the voltage range is substantially extended, Li_2O itself may be utilized as an active material, allowing non-alloying transition metals to be employed. This lowers first-cycle capacity loss and improves charge capacity, but it also reduces the potential difference between the cathode and the anode. If the Li_2O phase is depleted, active alloying materials' nanoparticles may sinter into bigger particles, increasing resistance. Furthermore, the procedure usually results in a significant volume change, which may cause problems comparable to alloying anodes.

MgH_2 and MgC_{12} are two of the most common Type A conversion anode materials. Both $\text{Li}_{1.07}\text{V}_{0.93}\text{O}_2$ and $\text{Li}_{1.07}\text{V}_{0.93}\text{O}_2$ are intriguing in that they exhibit modest voltage hysteresis and delithiation potentials, although at low rates. However, no research has proven that these electrodes are feasible at greater rates, and the cycle life shown is very limited. Similarly, certain phosphide and nitride electrodes have been found to exhibit minimal voltage hysteresis over many cycles, but only at modest charge/discharge rates.

2. DISCUSSION

Lithium-ion technology is all the rage in the battery world. They are now a popular source of power in a variety of daily goods, including computers, cell phones, power tools, and even automobiles. The significance of dependable portable power is enormous and constantly increasing as technology develops, concentrating on speed, large data, and mobility. Rechargeable lithium-ion (Li-ion) batteries are becoming more common as a power source for both small and big cleaning equipment at Tennant. Maintenance, lifespan, charging speed, safety, and simplicity of charging are the five areas in which they excel.

2.1. What is the difference between lithium and lithium-ion batteries?

Most lithium batteries are not rechargeable, while lithium-ion batteries are. Li-ion batteries are more stable and can be recharged hundreds of times. Compared to conventional rechargeable batteries, they feature a greater energy density, voltage capacity, and lower self-discharge rate. Because a single cell has a longer charge retention than other battery types, this results in higher power efficiency.

3. CONCLUSION

The Li-ion battery has obvious basic benefits and has been evolved into the high energy density, long cycle life, and high efficiency battery that it is today thanks to decades of study. New electrode materials are still being developed to push the limits of cost, energy density, power density, cycle life, and safety. There are a number of promising anode and cathode materials on the market, but many of them have poor electrical conductivity, sluggish Li transport, dissolution or other undesirable interactions with the electrolyte, low thermal stability, excessive volume expansion, and mechanical brittleness. Various approaches have been tried to overcome these obstacles; various intercalation cathodes have been commercialized, and conversion material technology is steadily approaching broad use. In the area of Li-ion battery electrode materials, the past two decades have been an exciting period for research. Li-ion batteries will undoubtedly have a larger effect on our lives in the years to come as new materials and methods are discovered.

WRITING SKILLS AT THE LEARNING LANGUAGE

Nizamova Feruza Alimullaevna*

* Associate Professor candidate of philological sciences,
 International Islamic Academy of Uzbekistan,
 "Uzbek language and classical oriental literature"
 Tashkent, UZBEKISTAN

ABSTRACT

In the next article we will talk about the advantages of writing skills, as well as the fact that in the activities mentioned in it, the language learner not only gains various language skills for communication, but also expresses opinions about increasing interest in the language, a positive attitude to the language, the emergence of a sense of learning, because of its naturalness and usefulness.

KEYWORDS: *Skill, Writing, Reading, Foreign Language, Exercise, Dictation, Lesson, Text.*

INTRODUCTION

In the framework of reforms aimed at building a new society based on the priority of democratic principles, we pay great attention to educational work in the country. In particular, the Law of the Republic of Uzbekistan "On Education" and the National Training Program are the primary factors ensuring the socio-economic and cultural development of the country. Besides implementing their needs, the basics of training competitively, they have identified highly qualified specialists.

Language learning expands the world to man because the resources written in every language are the source of a universe of truths. A person who learns a language discovers a world of new truths. Perhaps one of the reasons why Ahmad Yugnaki, Mahmud Kashgari, Zamakhshari, Imam Bukhari and hundreds of other scholars of ours conquered such high peaks of science is that they mastered Persian and Arabic, which were the international languages of the time. Good knowledge of the language led to the sources written in these languages, on the one hand, and on the other hand, their works written in Arabic and Persian were immediately known and popular all over the world.

METHODS

Persian has been studied in Uzbekistan since ancient times. A large part of our cultural heritage of the past was written in Persian. Modern Persian is the state and literary language of Iran. The basic dialect of the Persian literary language is the Tehran dialect. Each period had its own grammatical features, lexical changes, and a certain writing system. Persian attracts poets and scholars from many countries due to its melody, the richness of synonyms and eloquence of words. . It is known that many Uzbek poets wrote their poems and works in Persian as well as in Uzbek until the end of the 19th century.

RESULTS AND CONSIDERATIONS

Thousands of medical, mathematical, astronomical, historical, philosophical, legal, linguistic and literary manuscripts written in Persian by thousands of Iranians, Tajiks, Uzbeks, Indians, Azerbaijanis and other peoples of the East are preserved in the Manuscripts Fund of the Institute of Oriental Studies of the Academy of Sciences of Uzbekistan. the devons and tazkirs of the poets can be proof of our opinion. The vocabulary of modern Persian is rich in Arabic words and Arabic elements. In addition, some Arabic grammatical and graphic elements have entered the Persian language. All this is used in accordance with the grammatical rules of the Persian language.

Currently, Persian is studied in Uzbekistan for scientific and practical purposes. At a time when the social, political, cultural and economic ties of our country with foreign countries of the East are strengthening, one of the urgent issues of the day is to cultivate talented philologists, translators, simultaneous translators who are fluent in foreign languages, including Oriental languages. At the same time, it is important to introduce international educational standards for foreign language teaching in the system of continuing education in Uzbekistan and to base it on the level of "pan-European competencies in foreign language acquisition: learning, teaching, assessment."

The use of modern teaching methods in the educational process leads to high results in the teaching process. The choice of teaching methods based on the didactic task of each lesson is considered expedient. While maintaining the traditional form of the lesson, enriching it with a variety of modern methods will ensure that the level of mastery of the learners will increase. This requires a rational organization of the teaching process, constant stimulation of students' interest in the learning process by the teacher, the use of interactive methods to break down the content of the material into small pieces and encourage students to perform mass exercises independently. When these methods are used, the educator encourages the learner to actively participate.

The position of our independent republic in the world community is growing, international relations, trade, tourism and cultural and economic ties between the countries are developing. One of the important tasks of today is to teach Oriental languages to young people who will create the future of our country, to develop their oral and written language in this language. Now let's explain a little about writing skills. I did teaching writing in a foreign language for two purposes, just like teaching reading: the first is to express in writing the words and grammatical rules that language learners have learned through listening or reading, and the second is to communicate. Only in the latter case is it necessary to cultivate the skill of writing, which includes specific rules and subtleties.

From the moment a language learner becomes acquainted with the ability to read and understand the interrelationships of letters and the difference in sound, we can begin to practice writing the letters of the language alphabet if we take the example of Persian. Language learners who use Latin letters in their native language should practice hand-to-hand writing from right to left. They have to learn to write each letter separately and how to put them together, just as an artist teaches a student to hold a hand. After exercises dedicated to learning letters, the language learner becomes familiar with writing individual words and phrases. It should be noted that it is not necessary to know all the letters from "alif" to "yo" from the beginning of reading. For example, a teacher can practice words such as دوزر with language learners after teaching only the four letters of "درد، زرد، زور، روز" and even record dictation. Then, by teaching one or two letters in each lesson, language learners can practice the words they have learned by "hearing or reading" in the texts and construct a sentence with those words and conduct the dictation at the speech level.

After learning to write letters and words, language learners can copy the texts they have learned in listening, reading, and conversation lessons, and also complete the exercises in writing. After this step, writing exercises can be done at the paragraph level. Thus, using the word and grammar rules memorized in listening and reading lessons, a one-paragraph material can be prepared and language learners can be asked to change a view of the grammatical rule and copy the sentences in the paragraph. For example, the pronoun "من" in the first sentence is written by changing "ما" and "انها" to "او". Thus, language learners not only copy the sentence, but also rewrite the text.

We call it the ability to write for communication. In extracurricular social life, we practice writing a speech for a variety of purposes, some of which include:

Record a message given over the phone, correspond with friends and offices, write a shopping list or invitation, greeting card, daily memoirs, article, story and other literary works, etc. Of course, in today's developed society, they use hearing, reading, and speaking more than writing to communicate. But often our language learners who are determined to continue their studies or learn Persian for research need to write in order to carry out their educational work. They need to write a report on their research work, take an exam, take notes of what they have read or heard, write down what the teacher has said, and write down a lot of their work in the learning process.

For a language learner to acquire writing skills, he or she needs to know what kind of person or persons the interviewee is; must be familiar with the content of the text, possess the words and phrases used to express his intention, so that, depending on the situation of the speaker, he can express his intentions through written speech using appropriate words and phrases. In order to obtain such information, the following exercises are performed in the lesson.

The language learner is given one sentence, on the basis of which he composes similar sentences, using words he knows; the language learner is given a text (a paragraph) in which he writes some words (verb, noun, adjective, adverb) in the desired form; based on a given table, map, project, picture, and so on, the language learner makes sentences that are worthy of each other; compound and complex sentences are formed on the basis of a given simple sentence; the sentences of a text are given in a chaotic manner, the language learner must arrange the sentences correctly, relying on the knowledge in his mind; the text is given and answers the

questions asked about it and writes the answers in the form of a coherent text; an incomplete story is given for reading, the language learner must fill in the blanks in it.

The following exercises are recommended to prepare the content of the text:

1. Divide the language learners into groups of two, and both are given the same texts written in Persian. Each of the two people in the group is asked to focus on the written text and to identify the similarities and differences between the two texts in terms of art and style. Each group is then asked to share the results of their observations with their classmates and to record the statements made by all group members.
2. We give each language learner a letter (or some text) from the salespeople. Please read the letter and write a synopsis. You will then be asked to write a sales letter based on the abstract you have written and compare what you have written with the original letter to determine how much information you have received to reflect in the letter.
3. Write a topic on the board. For example, "Is wealth good or science?" language learners are then asked to write their thoughts one by one. The views of language learners are written on the board. We ask each of them the reason why they expressed such an opinion. In this way, we encourage all group members to debate for a while. We then ask language learners to write an article on the board based on the discussion in the lesson.

Research shows that a teacher should help a language learner to prepare spiritually for the topic to be written in a spiritual way as outlined in paragraph "B". The teacher should not ask language learners to write down what they know about the topic and then submit it to the teacher for evaluation but should help language learners in their thinking strategy and writing down what they have in their hearts and organize what they want to write, and finally in the writing process.

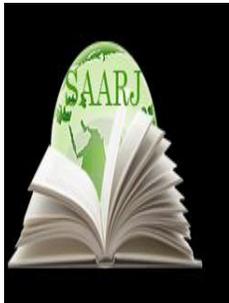

CONCLUSION

Finally, with the help of the language teacher, the learner should be aware that each text is written for a specific purpose and that there is a specific purpose in writing it, and that appropriate grammatical structures and logical sentences are used to make such a connection. In the activities mentioned above, the language learner not only uses different language skills to communicate but also because they are natural and all language learners in the class feel a sense of reliance on each other, there is an increased interest in language, a positive attitude to language, a sense of learning.

ABSTRACT

The article presents teratomas of rare localization in children according to the authors' observations from 2003 to 2015. During this period, 69 children were examined and treated at the Department of Hospital Pediatric Surgery of Tashkent Pediatric medical institute. Sacro-coccygeal teratomas were detected in 52 (75.4%), teratomas of rare localization in 17 (24.6%) children aged from 1 month to 14 years old. Among the observed children the girls were 42 (60.9%), the boys - 27 (39.1%). For diagnostic purposes, in addition to generally accepted clinical and laboratory studies, the children underwent ultrasound, MSCT, rectoromanoscopy, irrigology, excretory urography examinations. Considering that the teratomas are mixed tumors of a complex structure, capable of malignancy, the details of the clinical course, diagnosis and results of treatment of children with the presented pathology were studied in this research. Based on the analysis of the described observations, the authors came to the conclusion that there is a need for an early surgical intervention, which has no alternative in treating children with teratomas, regardless of their type, localization and extent of the process, in order to avoid the risk of developing severe complications.

KEYWORDS: *Teratomas, Malignancy, Localization, Children*

INTRODUCTION

Teratomas are mixed tumors of a complex structure. Tissues arising from 2-3 germinal leaves can be found in them. Their presence is unusual in the organs and anatomical areas in which the tumor develops. It is known that the occurrence of teratoma is a consequence of a violation of the embryo morphogenesis. Teratoid tumors constitute 5.9% of tumors in children, and 22.4% of

cases in newborns and infants. The frequency is 1 in 35,000 live births [1, 2, 20]. According to the localization, mature or benign teratomas and immature (malignant) or teratoblastomas of gonadal and extragonadal area, are distinguished [1, 3,4,5,6,8,19]. The frequency of malignancy of the tumor is directly proportional to the age. The risk of malignancy in newborns does not exceed 5%, in children under 1 year old it constitutes more than 60%, in children over 1 year old — 75%. Malignant teratomas (teratoblastomas) are multicomponent formations, the tissues of which reach different degrees of differentiation with the presence of malignant elements. The morphology of teratomas is extremely diverse and fully justifies its name "miraculous tumors." The presence of immature embryonic tissues in them serves as a basis for treating them as tumors [2,3,6,7,9]. According to their course, they can be regarded as a malformation. Associated anomalies are observed in 20% of cases. Teratoid tumors are found in various body cavities, in almost any organ and body tissues [3, 4, 5,8,14]. The diagnosis of extracavitary teratomas is not difficult. Such formations can be established before the birth of the child. In some cases, their removal is recommended in the antenatal period [4,10,11]. Diagnostics and tactics of treatment of germ cell tumors with rare localization teratomas are not well understood yet.

The aim of the work is to analyze the clinical course, diagnosis and the results of surgical treatment of children with teratomas of rare localization based on clinic materials.

Materials and Methods

From 2003 to 2015, 69 children with teratomas of various localization were treated at the Department of Hospital Pediatric Surgery of Tashkent Pediatric medical institute: sacro-coccygeal teratomas (SCT) - 52 (75.4%); teratomas of rare localization - 17 (24.6%). The age of the patients was from 1 month to 14 years old. There were 42 girls (60.9%) and 27 boys (39.1%). In the diagnosis, in addition to the generally accepted clinical and laboratory methods, ultrasound (US), multispiral computed tomography (MSCT), rectoromanoscopy, irrigology and excretory urography were used.

RESULTS AND DISCUSSION

The size, shape and localization of teratomas were noted in children of different age groups (Table 1).

TABLE 1 THE DISTRIBUTION OF PATIENTS BY AGE AND LOCALIZATION OF TERATOMAS (N = 69)

Patients' age		1-3mont hs	4-6mont hs	7-12mont hs	1-4 years	> 4 year s	Total :
Distribution of teratomas according to the localization							
Sacro-coccygeal	External type	5	6	4	—	—	15 (21,8 %)
	Internal type	—	5	6	—	—	11 (15,9 %)
	Mixed type	7	11	8	—	—	26 (37,7 %)

							(%)
Teratomas of abdominal cavity	Abdomen	-	-	-	2	-	2 (2,9%)
	Mesentery of the intestine	-	1	2		-	3 (4,3%)
Genital teratomas	Ovary	-	1	-	1	2	4 (5,8%)
	Testicle	-	-	-	2	1	3 (4,3%)
Chest teratomas		-	-	2	2	-	4 (5,8%)
Retroperitoneal teratomas		-	-	-	-	1	1 (1,5%)
Total:		12 (17,4%)	24 (34,8%)	22 (31,9%)	7 (10,1%)	4 (5,8%)	69 (100%)

As can be seen from the table, sacro-coccygeal teratomas (SCT) of various localization and depth, are most often observed. In other areas and organs of the body, teratomas are rarely observed, which correlates with the literature data. The internal type of SCT localization - presacral teratoma - is also considered as a rare pathology variant by some authors.

As a rule, teratomas of external localizations are found from birth. Sometimes formations reach a very large size and make the childbirth difficult. Methods of diagnosis of teratoid tumors depend on their localization. Screening and informative diagnostic method is ultrasound. During the ultrasound, the location, size, structure of the formation and belonging of the organ are determined [12,16,17,18]. As an additional method in the diagnosis X-ray and CT studies, allowing to find out the connection of the tumor with the surrounding tissues and associated malformations, can be used. Currently, CT has practically become the leading diagnostic method for teratomas of any localization. Based on CT examination data, in 22 (31.9%) of 69 patients were found to have associated developmental defects: coccyx hypoplasia - 10 (14.5%); connection of teratoma with spinal hernia - 7 (10.1%); ureterohydronephrosis - 2 (2.9%); anomalies of the development of the ribs - 2 (2.9%); incomplete doubling of the kidneys - 1 (1.5%).

The clinical manifestations of teratomas are diverse and are largely determined by their localization. Abdominal teratoma localization was noted in 5 (7.2%) cases of our observations. According to the literature, gastric teratoma is rare and accounts for about 1% of tumors of this localization. Gastric teratomas in newborns and infants are often observed among boys and have a low propensity for malignancy [1,4,5,12,18,20]. Teratoma can be detected in a child in any

organ or in the abdominal cavity in the form of formation of various sizes. The small size of the tumor remains unnoticed for a long time due to the absence of pain and symptoms of obstruction. With the increasing of the teratoma, vomiting, bouts of pain, constipation periodically appear. A careful examination of the abdomen, in such cases, reveals its asymmetry to some extent due to bulging on the side of education. Palpation is determined sedentary painless education with smooth or uneven contours. In our observations, stomach teratomas were detected in 2 children aged 3 years, which constituted up to 2.9% of the patients with teratoid tumors. The disease was manifested by the palpable formation in the epigastric region, the symptoms of partial high intestinal obstruction and a body mass deficit of up to 20-30%.

Contrast studies of the gastrointestinal tract showed partial obstruction on the stomach level; with ultrasound and MSCT, an increase in the organ was established due to the intimately adjacent formation of a heterogeneous structure (Fig.1).

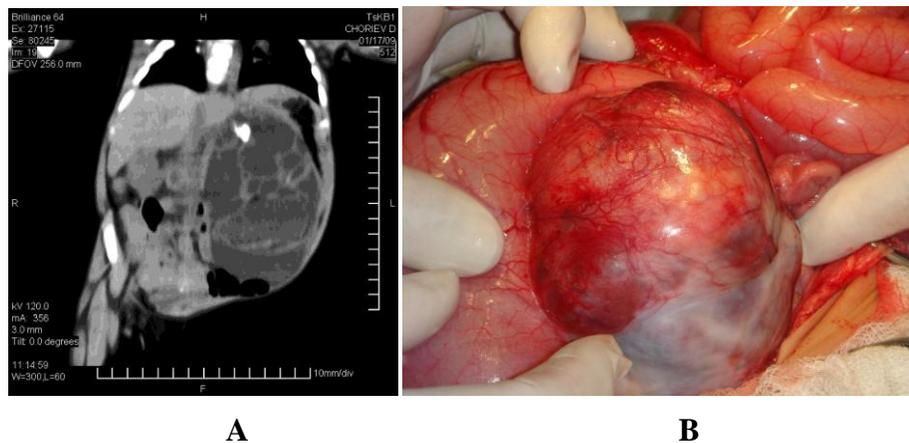

Fig.1 Stomach teratoma: A) CT scan - heterogeneous formation in the projection of the stomach; B) the view of tumor during surgery.

Patients are operated with the suspect of doubling of the stomach. During the operation, it was possible to completely separate the formation from the body of the stomach that was situated along the greater curvature. The macroscopic structure was heterogeneous, had solid cystic character with mucus-like contents and heterogeneous inclusions (hair and cartilage plates) that made it possible to regard the pathology as teratoma of the stomach. The diagnosis was confirmed by histomorphological examination of the removed tumor. The postoperative period was uneventful. Patients were discharged in satisfactory condition.

Teratoid tumors of the mesentery of the large intestine were diagnosed in 3 children. The patients were operated on with the diagnosis of “abdominal tumor”, since “palpable tumor syndrome” in the abdominal cavity was revealed via the main clinical manifestation and auxiliary examinations. The formation was located along the mesenteric edge of the colon within the ascending and descending colon (Fig.2-A). In 2 patients, the formation was spread in the mesentery and consisted of numerous nodes of different size with solid structure and heterogeneous content, and enveloped in a capsule (Fig.2-B). It was separated from the adjacent section of the colon. In one child, the formation of the structure mentioned above, engulfed over 10 cm of the descending colon in the form of a coupling with intimate soldering to the wall. In this case, along with the removal of the tumor-like formation, the resection of the corresponding

section of the large intestine with the imposition of an end-to-end anastomosis was required. The histological findings in these observations became the basis for the diagnosis of teratoma of the specified localization.

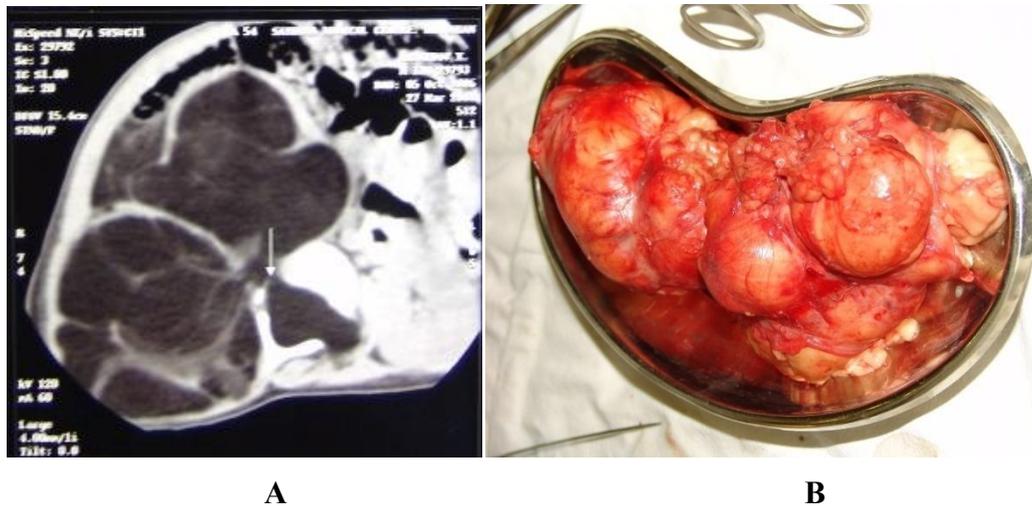

Fig.2 Teratoid tumor of the mesentery of the large intestine: A) CT scan of the abdominal cavity - a giant formation of heterogeneous structure; B) macro-preparate of the removed tumor.

Of the 52 patients with SCT, 11 (21.1%) were diagnosed with an internal type of tumor localization. 11 children with presacral localization of the SCT were hospitalized with complications of the disease in the form of a difficult act of defecation and/or urination, abdominal pain. Two had the symptoms of general intoxication: pale skin, weight loss, physical development lag, vomiting, fever. A finger study of the rectum revealed a presacally located tumor-like mass. These ultrasound and MSCT allowed to establish the correct diagnosis. Impaired pelvic function and dysuria in these patients were due to compression of the rectum and ureter by a tumor-like formation; intoxication phenomena in two patients - due to the malignancy. Complications are usually manifested by bright symptoms and deterioration of the child's general condition. By the time of birth, a tumor can squeeze or displace the rectum so much that from the first days of life a child has intestinal obstruction. When a bladder is pressed, the complication is manifested by urinary retention; the urine is separated by drops, the bladder is stretched, the child is worried when urinating, and retches. Catheterization is difficult. The compression of a rectum or urethra by a tumor in some patients was observed at the age of 2-3 months; in one child - at an older age. The compression of the ureter in two patients led to the development of secondary ureterohydronephrosis.

Gonadal teratomas in 7 children were presented in the form of ovarian teratomas in girls and testicular teratomas in boys. Four girls were observed with ovarian teratoma. The main clinical signs were the presence of volumetric formation and abdominal pain. Two girls were hospitalized in an emergency due to increased pain syndrome with irradiation to the perineum, the appearance of a delayed stool and painful urination. An objective examination drew attention to the paleness of the skin, increased heart rate, massively spread pain and active muscle tension during palpation of the abdomen. In 2 cases, the main symptom was palpation of the tumor-like formation without pain and disorders of defecation and diuresis. The data of clinical examination

and auxiliary examination methods before the operation found twisted ovarian cyst in 2, and mesentery cyst in 1 patient. In 1 child, a possible pathological process associated with ovarian tumor, was suggested. After careful examination, all patients were operated on. The final volume of surgery, as a rule, was determined during the operation. In two girls, teratoma was represented by a unilateral tumor formation sized 7x8x6cm having cystic and solid structures and heterogeneous inclusions, covered with a single thick sheath that had grown into the ovarian tissue, containing more than 12 different sizes. In this case, the operation was completed by removing the tumor and ovarian tissue (Fig.3-A). In the second girl, the tumor capsule adhered to the ovarian tissue without macroscopic changes. The tumor was accepted as benign. The volume of operation was sparing, and limited to the removal of the tumor with preservation of the ovarian tissue. In two girls, the formation consisted of multi-chamber nodes represented by solid tissue structures and many components of heterogeneous inclusions with diffuse growth of the capsule in the infiltrated ovarian tissue. The surface of the tumor had a hilly character, the size exceeding 12 cm in diameter. The changes are regarded as ovarian teratoblastoma without spreading to the second ovary and lymph nodes. The operation is completed by removing the tumor and the ovary as a single unit (Fig.3-B).

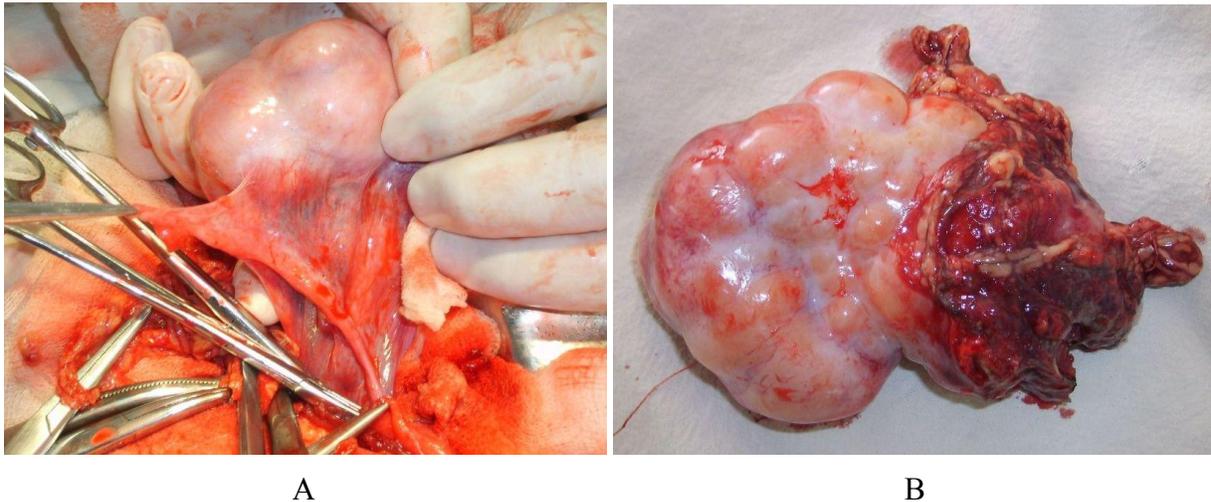

Fig.3 Teratoma of the ovary: a) the view during operation, b) macropreparate of the removed tumor.

Testicular teratomas are more common in children under the age of 2 years, and are often detected from birth. Teratomas are benign as opposed to adults whose ovarian teratomas are malignant. The cases of malignant teratoma in boys 15-16 years of flat keratinizing epithelium, mucous glands, undifferentiated epithelial tissue have been described [1,2,4].

In our observations, teratoid tumors of the testes were detected in 3 children. In patients who were under observation due to the "tense dropsy," there was an increase and a sharp induration of one of the testicles. An ultrasound showed an increase in the affected testicles due to an inhomogeneous solid structure. Orchofuniculectomy was performed. On the section of the macropreparation, heterogeneous tissue and hair were revealed (Fig.4).

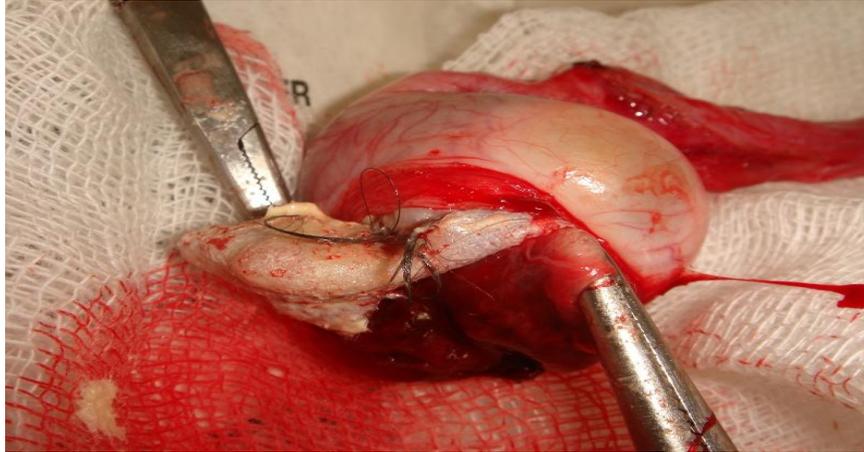

Fig.4 Testicular teratoma: adipose tissue and hair are determined in the incision

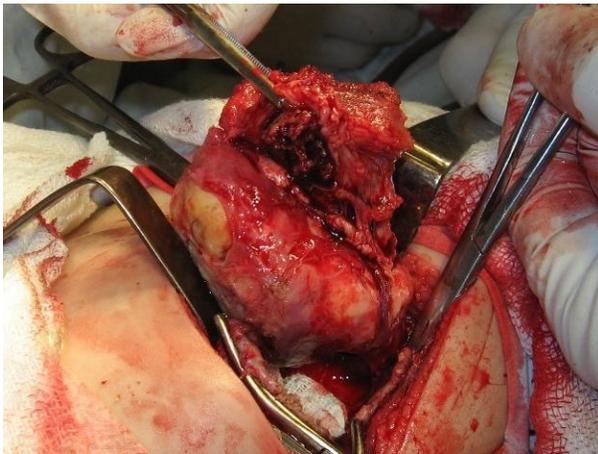

Teratoid tumors of the chest were found in 4 patients: with the localization of the process in the anterior mediastinum - 3, and in the lung parenchyma - 1. All children were monitored and treated by pediatricians with suspected pneumonia, bronchitis, pleurisy. Like other benign tumors of the chest, teratoma is manifested by respiratory symptoms associated with compression of the respiratory tract. Most often it is noisy, sometimes stridor breath. Rapid breathing may be due to the compression of the pulmonary parenchyma by the formation of large sizes. In the early stages, the tumor may be asymptomatic in the form of tachypnea during exercise. In 2 patients, due to the significant size of the tumor, the asymmetry of the chest was clearly defined. In one child, chest teratoma was detected on a roentgen as a random finding. On X-ray the teratoma is characterized as a formation with fuzzy contours, containing calcifications or bone inclusions. CT scan is more informative for diagnosis (Fig.5).

Patients with chest teratomas underwent surgery. Three patients underwent the resection of the tumor from the anterior mediastinum; one patient from the lobe of the lung bearing teratoid formation. Patients were discharged from the hospital in a satisfactory condition. In a child who underwent a resection of the lung, metastases are found in other organs in six months after the operation. Three patients after the removal of teratomas from the mediastinum are under observation, and developing according to their age.

In one patient, a teratoid tumor emanating from the retroperitoneal space was noted. Palpation revealed the formation of a dense consistency with a bumpy surface, limited mobility. CT scan showed a multi-chamber formation of a cystic and solid structure (Fig.6). The child was operated on. The bulk of the huge formation sized 15x17-20 cm consisted of adipose tissue in the form of nodes of various sizes, having a separate capsule, containing atheromatous nodes with hair and cartilage inclusions in some areas. The postoperative course is without complications. The patient is under observation.

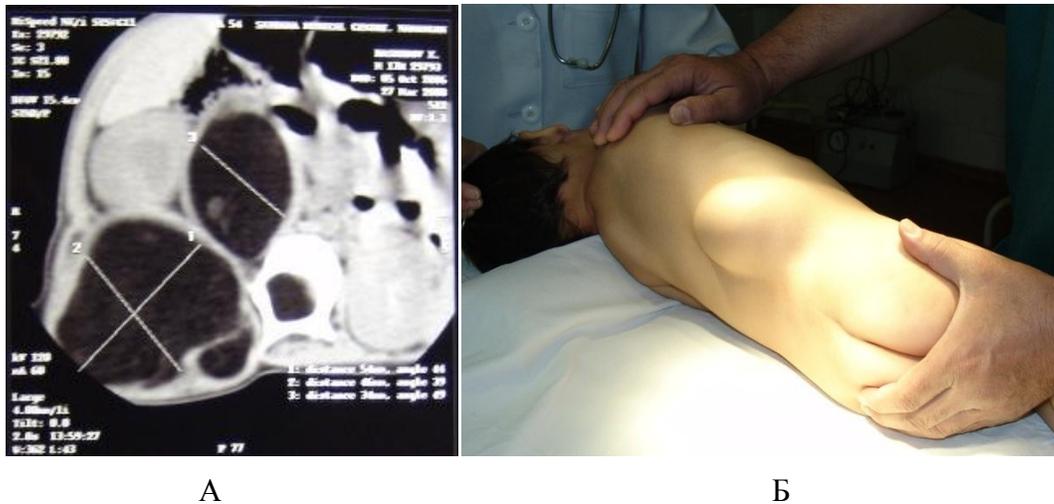

Fig. 6. Retroperitoneal teratoma: A) multi-chamber cystic formations are determined at CT; B) the view of the patient

The need for the early surgical intervention in teratomas is undoubted and is supported by many authors. Like most other authors, we believe that teratomas, regardless of their localization, are subject to surgical removal as soon as possible after their detection. This prevents their excessive growth and the development of various complications. Indications for urgent surgical intervention are: compression of a rectum or urethra by a tumor, observed during internal localization of the SCT; suspected malignant degeneration. The rapid growth of the tumor, if it does not lead to squeezing of the organs of the perineum, should still be regarded as an indication for emergency surgery because of the risk of malignant degeneration.

In other locations, a rupture or dramatic thinning of the membranes during ulceration or necrosis of the skin, suppuration of individual cystic cavities, also serve as indications for the urgent operation. The nature and duration of preoperative preparation depend on the type of complications.

The postoperative period was uneventful in all patients. Our clinical observations show that if a tumor consists of benign mature tissue, then the removal of teratoma is the method of choice and provides good long-term results. With teratoblastomas, the long-term results of treatment were worse. In 2 (2.9%) patients the metastasis of the tumor and death were observed. Patients died within the first 4-6 months because of the tumor recurrence with generalization of the process and progressive tumor intoxication, anemia, cachexia. All patients recovered after surgery, complications were not observed. In all cases, the diagnosis of teratoma is confirmed by histomorphological examinations.

CONCLUSIONS

Our clinical data correlate with the literature data that the peculiarity of teratomas in children is their benign course and rare metastasis into the nearby anatomical structures and organs. In most cases, teratomas have the character of multi-chamber cysts of various sizes or solid growths consisting of mature tissues, between which sometimes there are fields of solid growths of undifferentiated embryonic character. Most teratomas are organoid, composed of structures resembling organs and various tissues, rudiments of limbs.

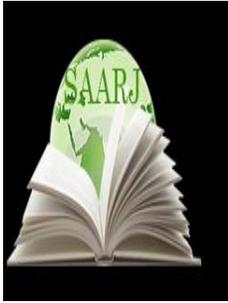

Benign teratomas tend to grow aggressively, but they do not grow into nearby anatomical structures, and malignant teratomas are characterized by aggressive growth and metastases into the nearby organs and other parts of the body. Cases of immature teratomas increase with age. This confirms the necessity of an early diagnosis and timely surgical intervention.

With teratomas of any localization, oncological alertness is a decisive factor in preventing their malignancy and other complications.

ABSTRACT

A remarkable increase in the field of broadband communication has paved the way for a wide range of micro strip antenna research and applications. Micro strip antennas' flexibility brought a new dimension to it. The introduction and overview of the Micro strip antenna are presented in this research paper. The benefits, disadvantages, and limits of various feeding methods are also addressed. The techniques for modeling a micro strip antenna are also discussed. It also gives a notion of how antennas are classified. patch antenna with microstrips. A patch antenna's design and analytical techniques have been explored. Various patch shapes have been used and explored in relation to the applications. Despite the fact that much work has been done on micro strip antennas, there is still much more to be done. Microwave and millimeter wave technology have advanced to the point that systems can now be miniaturized.

KEYWORDS: *Antenna, Electromagnetic, Microstrip, Probe, Feeding.*

1. INTRODUCTION

A patch antenna (also known as a microstrip antenna) is one of the most recent antenna and electromagnetic applications technologies. Because of its ease of usage and compatibility with printed circuit technology, it is currently extensively utilized in wireless communication systems. In the 1950s, electromagnetic wave-radiating microstrip geometries were first proposed. In 1953, Deschamps [3] presented the idea of a microstrip antenna for the first time. The microstrip was patented by Gutton and Baissinot in 1955. Microstrip lines and radiators were first created in labs

as specialized equipment. During this time period, there were no commercially accessible printed circuit boards with controlled dielectric constants. As a result, it wasn't until the 1970s, when Robert E. Munson improved it that this antenna became viable. The availability of low-loss tangent substrate materials sped up development throughout this decade, thanks to the efforts of other researchers. Enhanced photolithographic methods, improved theoretical modeling, and appealing thermal and mechanical characteristics of the substrate are among the other reasons driving the advancement. Munson [6] and Howell [7] were the first to create a workable antenna.

Microstrip antennas and their arrays have seen a wide range of applications since then, thanks to considerable research and development. With the advances in printed circuit technology, microstrip or printed patch antennas are now utilized in virtually all wireless systems. Microstrip or patch antennas are used in wireless communication applications to emit and receive electromagnetic radiation in the microwave range. The geometry of the printed patch [8] as well as the material properties of the substrate onto which the antenna is printed determine the performance and functioning of a microstrip antenna. Microstrip antennas are a recent innovation. It was created to make it easier to combine an antenna and other communication system driving circuits on a single printed circuit board or semiconductor chip (Carver and Mink, 1981; Pozar, 1992). Aside from the aforementioned benefits, the antenna manufacturing using integrated-circuit technology allows for great dimensional precision, which was previously impossible to accomplish using conventional fabrication techniques. A microstrip antenna's geometry is made up of a dielectric substrate with a thickness of d , full metalization on one side, and a metal "patch" on the other. In most cases, the substrate is thin. The metal patch on the front surface may take many different forms, but the rectangular shape is the most typical. Various ways of energizing the antenna are available. One popular method is to feed from a microstrip line by attaching the microstrip antenna to one of its edges near the center. The microstrip line may be directly fed by connecting a signal source between the microstrip line and the ground plane, or it can be supplied via a feeding circuit. The broadside (perpendicular to the substrate) of the microstrip antenna generates the most radiation, while the end-fire (along the substrate's surface) produces the least. The antenna's size is typically chosen such that it resonates at the working frequency, resulting in a real input impedance. This necessitates a rectangular microstrip antenna with a length of approximately half a wavelength in the dielectric medium.

On the other side, the width of the antenna, W , affects the input impedance level. A rectangular chamber with open sides is what a microstrip antenna looks like [1]. The radiation is caused by the fringing fields that pass through the open sidewalls. The structure, however, is mostly a resonant cavity with relatively little fringing radiation. As a result, the radiation's bandwidth is low when compared to the bandwidth of the antennas mentioned previously. The limited bandwidth, on the other hand, is sufficient for a wide range of communication applications. For some analytical modeling of a microstrip antenna, see Balanis (1997) and Carver and Mink (1981). Rectangular and circular patches are the most frequently utilized microstrip antennas. These patches are suitable for both basic and complex applications. Dual-frequency operations, circular and dual polarizations, wide bandwidth, beam scanning, and other features may be readily achieved with these patches. By initially applying any new numerical or analytical method to these geometries, any new numerical or analytical approach is standardized. The rectangular microstrip patch antenna is without a doubt the most basic microstrip antenna design [2]. As a result, this article is on rectangular microstrip antennas. A Microstrip patch

antenna in its most basic form comprises a radiating patch on one side of a dielectric substrate and a ground plane on the other, as.

A microstrip antenna is a dielectric substrate panel wedged between two conductors in its most basic form. Ground plane refers to the bottom conductor, whereas patch refers to the top conductor. Microstrip antennas are often employed at frequencies ranging from 1 GHz to 100 GHz[3]. The patch has been chosen to be very thin. Patches are often made of gold or copper and come in a variety of forms. Because of their low resistivity, resilience to oxidation, simplicity of soldering, and ability to attach effectively to substrates, these conducting metals are the most popular. On the dielectric substrate, the feed line and radiating patch are etched. The radiating patch may be designed in a variety of forms depending on the required features, but owing to their simplicity of manufacturing and analysis, circular, square, and rectangular designs are the most popular. Despite the differences in geometrical form, their radiation properties are identical because they function like a dipole. Surface waves and spurious feed radiation rise as the thickness of the dielectric substrate increases, reducing the antenna's bandwidth. Unwanted cross-polarized radiation is also produced by the feed radiation. The fringing fields between the patch's borders and the ground plane are what cause microstrip patch antennas to emit. For improved performance, a thick dielectric substrate with a low dielectric constant is preferred. This will increase efficiency and reduce radiation[4]. However, this feature has a tendency to increase the antenna's size. The substrate dielectric constants should be high in order to create a compact form. Such a design, on the other hand, will be less efficient and have a smaller bandwidth. Impedance matching between the antenna and the feed line is needed to guarantee maximum energy transmission from the source to the radiating components[5]. The antenna and feed line will be matched at a port position that is roughly chosen. After decades of study, it was discovered that the geometry of the printed patch and the material properties on which the antenna is printed control the performance and operating of a microstrip antenna[4]. Although rectangular patches are the most common, square, circular, and triangular patches are all conceivable. The radiating element may be square, rectangular, triangular, elliptical, or circular in form, depending on the properties of the transmitted electromagnetic radiation, and must be distanced from the ground plane by a defined distance. Between these two conducting layers is a strip of dielectric substrate.

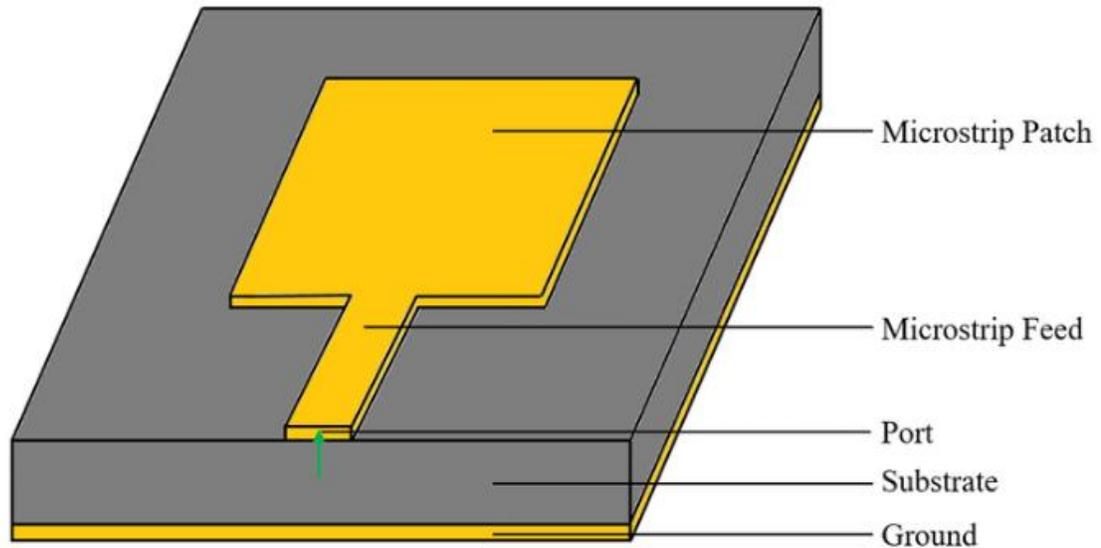

Figure 1: Diagrammatic Representation of [PROFILE]

1.1 Application of Microstrip Antenna

The usage of micro strip or printed patch antennas may meet a variety of commercial needs. Rectangular shaped patch antennas are the most often used antennas out of a variety of forms. Micro strip patch antennas meet the majority of criteria for mobile and satellite communication systems, and several different types of micro strip antennas are available. Other common uses include aircraft, spacecraft, satellites, and missiles, all of which benefit from the micro strip antenna's size, weight, cost, performance, simplicity of installation, and low-profile design. In the field of mobile radio and wireless communications, there are many additional government and commercial uses where this antenna is appropriate. These antennas are used to meet a wide range of business requirements [6]. The omnipresent Global Positioning System (GPS), ZigBee, Bluetooth, WiMAX, Wireless Fidelity (Wi-Fi), and wireless communication technologies are among the many applications. Antennas are in high demand for navigational applications such as automotive asset tracking and maritime applications. In the fields of industry, transportation, and medicine, it is widely used in radio frequency identification (RFID) and radar systems. In summary, micro strip antennas meet the needs of a lightweight, flexible antenna system.

In recent years, satellite digital audio radio services have used printed monopole micro strip antennas as an alternative to audio commercial broadcasts in cars. The benefits of utilizing antennas in communication systems will continue to drive the development of new applications that rely on them[7]. They are the gadget that allows all of the wireless technologies that have grown so common in our culture to function. In many contemporary communication systems, the material costs of cable infrastructure also promote the usage of antennas. The number of applications will continue to expand as people become more aware of the capabilities of Microstrip antennas, especially owing to their radiation mechanism and functional performance[8]. Certain applications in communications, electronic support and countermeasures, radar, and radiometry require a large bandwidth.

Some common application of Microstrip antenna:

- Satellite Communication Direct Broadcast Service.
- Mobile Communication Systems
- Radars such as Doppler and others
- Missiles and telemetry are the fourth and last items on the list.
- Environmental Instrumentation and Remote Sensing
- Receivers for satellite navigation.
- A radio altimeter is a device that measures the altitude of an object.
- Intruder Alarms and Biomedical Radiators
- Wireless Communication Systems and Services for Individuals.

1.2 Feeding Techniques for Microstrip Antenna:

The feed transports electromagnetic energy from the source to the patched area. Some of this energy escapes the patch's confines and is radiated into space. A number of techniques are used to feed the signal in micro strip patch antennas. Feeding techniques are divided into two categories: contacting and non-contacting. The input radio frequency power is supplied directly to the patch via a connecting device such as a micro strip line in the contacting technique. Electromagnetic field coupling is used in the non-contacting method, which is also known as the indirect scheme, to transmit power between the micro strip line and the radiating patch. Micro strip line feed, coaxial feed, aperture coupling feed, proximity coupled micro strip feed, and coplanar waveguide feed are the four most common feeding methods[9]. The bandwidth, radiation pattern, polarization, gain, and impedance of an antenna are all influenced by the feeding technique. The coaxial and micro strip feeds are the most frequently utilized feeding methods in practice. Because the antenna and feed lines' input impedances vary from the standard 50-ohm line impedance, matching is typically needed. The antenna and its feed line will be matched if the port position is chosen correctly. The section below gives a short explanation of each of these feeding techniques[10].

- *Micro strip Line Feed:* Micro strip Line Feed is a kind of micro strip line that is used to A conducting strip is linked directly to the edge of the Microstrip patch in this kind of feed method. In comparison to the patch's size, the conducting strip is narrower. Because the feeding system and radiating patch may be printed on the same dielectric substrate, this technique is the simplest to implement. This configuration creates a flat structure. Edge-fed patches may be used to build huge arrays because of this benefit. The disadvantage is that the feed line radiation causes a rise in the crosspolar level. Furthermore, in the millimeter wave area of the spectrum, the feed line dimension is equal to the patch size dimension, resulting in increased unwanted radiation. An inset incision in the patch may be part of the feed arrangement to the patch. The inset cut in the patch's function is to match the feed line's impedance to the patch without the need of any extra matching elements. This is accomplished by carefully managing the inset position. This is a simple feeding system

because it allows for straightforward manufacturing, modeling simplicity, and impedance matching.

- *Feeding of the Coaxial Probe:* The most popular method for feeding printed patch antennas is the coaxial feed or probe feed. To accomplish impedance matching, this feed may be supplied at any desired position inside the patch. The inner conductor of the coaxial connection is soldered to the radiating patch via the dielectric, while the outer conductor is attached to the ground plane. Low radiation loss is achieved using the coaxial or probe feed technique. The primary benefit of this feed is that it may be positioned anywhere inside the patch to match its input impedance. This feed technique is simple to make and emits little spurious radiation. However, since a hole must be drilled into the dielectric substrate, it has a significant disadvantage in terms of bandwidth and is difficult to utilize. The hole in the substrate must also be bored, and the connection must extend beyond the bottom ground plane. It is not entirely flat, and the asymmetry of the structure is due to the feeding system. Increased coaxial feed or probe feed length for thicker dielectric substrates makes the input impedance more inductive, causing impedance matching issues. Both of the aforementioned techniques of direct feeding the microstrip antenna have issues with thick substrates, which are often used to produce wide band. Increased probe length makes the input impedance more inductive in a coaxial feed, causing the matching issue. An increase in substrate thickness increases the width of the microstrip feed, which increases the unwanted feed radiation. Microstrip line and coaxial feeds suffer from probe reactance and surface wave excitation issues on high thickness dielectric substrates. These issues are solved by the indirect feed, which is described further below.
- *Microstrip Feed with Aperture;* The field is linked from the feed line to the resonating patch via a slit in the ground structure that is positioned between the two substrates in an aperture coupling. There is a feed line on the bottom substrate and a radiating patch on the top substrate. The field is coupled from the microstrip line feed to the radiating patch via an electrically tiny aperture or slot created in the ground plane in the aperture coupled microstrip antenna design. Under the patch, the coupling aperture is usually centered. Because of the configuration symmetry, this helps to reduce cross-polarization. The form, size, and placement of the aperture determine the degree of coupling from the feed line to the patch. There are two types of slot apertures: resonant and non-resonant. The resonant slot adds additional resonance to the patch resonance, thus boosting bandwidth, albeit at the expense of increased back radiation. As a consequence, non-resonant apertures are often used.
- *Proximity-Related Microstrip Feeding Method:* a non-contacting microstrip feed arrangement utilized a two-layer substrate with the microstrip line on the bottom layer and the patch antenna on the top layer. This feeding technique has two dielectric layers, one of which is a radiating patch layer and the other of which is a feed line with a ground plane on the reverse side. A common ground plane separates the two substrates. Through a slot aperture on the common ground plane, the patch is electromagnetically linked to the microstrip feed line on the bottom substrate. These settings may be utilized to increase bandwidth regardless of the shape or size of the slot. Because of the shielding effect of the ground plane, radiation from the open end of the feed line does not interfere with the patch's radiation pattern. This feature also enhances the purity of the polarization. Due to the symmetry of the arrangement, the coupling aperture is typically centered beneath the patch, resulting in

reduced cross polarization. To maximize patch radiation, a thick, low dielectric constant material is utilized for the bottom substrate and a thin, high dielectric constant material is used for the top substrate. Wider bandwidth is a noteworthy characteristic of this feed arrangement, which is mainly due to an increase in the thickness of the micro strip patch antenna. This method allows you to use a different substrate for the patch and the feed line in order to get the best results. The main disadvantage of this technique is the difficulty in manufacturing owing to the numerous layers that must be aligned properly. The antenna thickness rises in this technique as well.

- *Feeding using a Coplanar Wave Guide (CPW)*; The Micro strip antenna has also been excited using the coplanar waveguide feed. The coplanar waveguide is printed on the ground surface of the patch in this manner, as illustrated in Figure 6. A coaxial feed excites the line, which is terminated by a slot that is almost a fourth of the slot wavelength long. Because of its numerous advantages, such as broad band width, simple construction, a single metallic layer, fewer soldering points, and compatibility with other circuits, this feeding technique is extensively employed for wireless communications. The major drawback of this technique is that it produces a lot more radiation due to the larger slot. This may be improved by shrinking the slot dimension and reshaping it into a loop.

2. DISCUSSION

A micro strip antenna (also known as a printed antenna) is an antenna that is manufactured on a printed circuit board using photolithographic methods (PCB). It functions as an internal antenna. Microwave frequencies are where they're most often utilized. An individual micro strip antenna is made up of a patch of metal foil in different forms on the surface of a PCB (printed circuit board) and a metal foil ground plane on the opposite side. The majority of micro strip antennas are made up of numerous patches arranged in a two-dimensional array. Foil micro strip transmission lines are used to link the antenna to the transmitter or receiver. Between the antenna and the ground plane, a radio frequency current is delivered (or, in receiving antennas, a received signal is generated). Due to their thin planar profile, which can be incorporated into the surfaces of consumer products, aircraft, and missiles; their ease of fabrication using printed circuit techniques; the ease of integrating the antenna on the same board as the rest of the circuit; and the possibility of adding active devices such as microwave integrators, micro strip antennas have become very popular in recent decades. Patch antennas are by far the most popular kind of micro strip antenna. Patch antennas may also be used as constituent components in an array. A patch antenna is a narrowband, wide-beam antenna made by etching the antenna element pattern in metal trace attached to an insulating dielectric substrate, such as a printed circuit board, with a continuous metal layer connected to the other side of the substrate that serves as a ground plane. Square, rectangular, circular, and elliptical micro strip antennas are common, although any continuous form is conceivable.

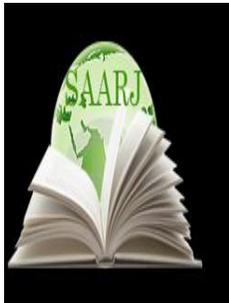

3. CONCLUSION

The article provides a succinct overview of antennas in general and micro strip antennas in particular. It concisely explains the benefits and drawbacks of micro strip antennas, as well as the different methods utilized in source feeding. A short comment about the analytical procedure is included with the explanation of the feeding methodology. patch antenna with micro strips. A patch antenna's design and analytical techniques have been explored. Various patch shapes have

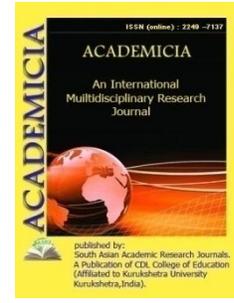

been used and explored in relation to the applications. Despite the fact that much work has been done on microstrip antennas, there is still much more to be done. Microwave and millimeter wave technology have advanced to the point that systems can now be miniaturized.

ABSTRACT

In recent years, India has seen an increase in study on different elements of women's lives, with early emphasis on social aspects of their status giving way to studies of women's place in the economic realm, a change spurred by the worrying decrease in female involvement. While farm pressure groups and protests have long been a part of Indian history as a result of deep-rooted structural problems such as colonial extraction, manipulative cropping patterns, corporatization of agriculture, and low investments, recent farmer protests have seen a historical trend emerge: the participation of female laborers, women farmers, farm widows, and the consequent viability of agriculture. This article examines the academic literature on women in agriculture, identifying gaps and suggesting topics for further research.

KEYWORDS: Agriculture, Farming, Indian Women, Women in Farming.

INTRODUCTION

In recent years, women's role in social production has been the subject of extensive research. The proclamation of the women's decade, and thus governmental acknowledgment of the significance of researching different aspects of women's involvement in production/reproduction, sparked a worldwide boom in theoretical/empirical literature of India, between 1975 and 1985, there was a boom in study on different elements of women's lives[1]. Though the study initially focused on the social elements of women's status, the worrisome decrease in women's involvement highlighted in the Committee on the Status of Women's report turned emphasis to women's role in economic output. Studies on the participation rate have primarily focused on attempting to (a)

explain the long-term decline in female employment, (b) measure the extent of the decline, (c) comprehend the factors underlying the striking regional variations in female work participation rate, (d) assess the adequacy of existing modes of data collection on women's work, and (e) develop alternate methods of capturing women's work. Despite the agricultural sector's overwhelming significance for female employment, research on women in agriculture is a relatively recent topic of interest[2]. The existing research on female involvement in agriculture has mostly focused on the paradox of a growing proportion of female farm laborers in the female workforce despite a decreasing overall participation rate. Inter-regional differences in the prevalence of female agricultural laborers, as well as the potential consequences, have been studied. In the context of the Green Revolution plan, technological development and its effect on female employment in agriculture has become an important topic of research.

Micro-level empirical studies aiming to evaluate the employment impact on labor-use per acre have dominated research in this field. Only a few have attempted to combine the different aspects of technical change's effect on salaries and earnings, access to productive resources, and general changes in women's status as assessed by nutritional levels, mortality rates, and other factors[3]. The description, to some degree, of the gendered division of labor in agriculture has been an important part of this literature on technological development. There has been no effort to develop techniques to quantify the intensity and productivity of women's labor, to evaluate the complementarity of women's work to men's work, or to evaluate the relationship between women's work and the production structure. So yet, the findings of different research have not been knitted together into a cohesive whole. The difference between sex-sequential and sex-segregated tasks is an important typology that has emerged from the literature on African women's position in the industrial system and may be effectively integrated into the studies in India. Rural development programs have been a key approach for reducing the escalating conflicts that have resulted from the introduction of new technologies[4]. Women have had a minor role in the majority of these programs. On the other hand, programs aimed specifically at women were created due to a lack of awareness of the specific aspects of women's involvement in agriculture.

Furthermore, such programs are founded on an uncritical acceptance of patriarchal ideology's societal standards towards women. In such a scenario, collective action is the only feasible option for protecting the interests of landless women. The role of women has been largely overlooked in studies on the process of organizing the landless. There has been a rise of battles in the agricultural sector since the 1970s, with women playing a major part[5]. What effect does this involvement have on women's lives? Has women's involvement in the fight resulted in changes in the movement's slogans and style? What function do women's organizations play? What ties do they have to other social groups? All of these are crucial issues that have yet to be addressed. (a) Women's lower participation rate in the Indian economy is one of the most noticeable characteristics of their involvement. In India, a combination of class/caste hierarchy and patriarchal ideology determines the amount of female involvement in production. The amount and types of women's productive labor would be determined by a family's position in the caste/class hierarchy in a hierarchical society based on households. It's worth noting that, although the Sanskritisation process women's retreat from physical labor is significant, the difference between the taboos against 'out-door' and 'inside' labor is much more important. Aside from the extremely wealthy landowners' families, physical labor linked to agriculture and

processing is an important component of the job done by women in rural households. The majority of pre- and post-harvest labor is done in the house complex rather than in the field, and most peasant women perform a significant part of it.

While women from impoverished peasant families may also help out in the field, ladies from upper-class households would never do so. The significance of this distinction between 'outside' and 'inside' labor is clearly shown by enumeration of agricultural activities. She outlines the distances involved in these jobs, the distances permitted for women, and the boundaries beyond which the labor becomes 'outside' employment and therefore not suitable for women. The significance of this difference for the Narsapur lace-makers, for whom it translates into never-ending individual battles to preserve social status[6]. Most macro-level research on the determinants of female labor participation have failed to find any obvious relationships that women enter the labor because they need a certain level of money. The supply curve for female labor is thought to be goes on to say that a substantial decrease in family income is required before women may be attracted into the labor due to hefty household duties. This raises the issue of domestic labor: what are the activities, how are they categorized, and how much work is there? (i.e., number of hours). Despite the fact that it is well accepted that a poor woman's working day in India may last anywhere from 12 to 16 hours, there are few comprehensive studies on how women divide their time between different tasks. One thorough research was, who surveyed 127 families in three villages in Rajasthan and West Bengal over the course of a year[7].

Women in the age ranges 19-34, 34-44, and 44-70 spend more time than males in a variety of activities, according to this data. In Rajasthan, women are more likely to engage in 'visible' labor such as grass cutting, cow grazing, and milking, while in Bengal, women's employment is more homebound, with rural Bengali women spending more than half of their time on non-agricultural activities such as patchwork, weaving, and begging. In Bengal, cooking is a more time-consuming procedure than it is in Rajasthan approximately 3.5 hours' compared to 2.23 hours. In Himachal Pradesh the critical role of women in animal care women spend 3.07 hours per day on this activity, compared to 2.87 by males[8]. Women are important to subsistence production, according to the same research, since they dominate the activities of transplantation, weeding, and harvesting in their own farm labor. In a research conducted in Karnataka the significance of women's collecting activities, such as gathering fuel, which takes almost two hours per day—in fact, women spend 56% of their time on survival chores, compared to 31% for males. Women in Andhra's arid villages participate in a variety of tasks for the family's survival. Certain activities, such as collecting fuel and vegetables, are so intertwined with other chores that males are unaware of them, despite the fact that they are essential to the family's survival. This 'invisibility' of women's labor, household duties, and other responsibilities stems from a cultural ideological framework that prioritizes males as the main breadwinner[9]. It may also be a holdover from a previous societal structure in which women were mainly responsible for sustenance, thus their contribution to the family's material reproduction is not regarded as economically significant. Controlling women's mobility (i.e., sexuality) is an important part of the Indian economy's property system, and it disproportionately impacts women from rural communities. As a result, the social norms of purdah limit the possibilities of outside wage-work for these women, as well as peasant families' willingness to recognize women as wage workers when they are pushed into such wage-work[10].

DISCUSSION ON THE PARTICIPATION OF INDIAN WOMEN IN FARMING

In other words, a woman was only recorded as a worker if the product of her duties made it into the trade network. As "in an economy that is only partially monetized, there is analytically no meaningful difference between domestic labor and agricultural activity whose output is consumed inside the house" this is just a reflection of cultural prejudice. In this context, propose that NSS's domestic labor activity code be replaced with three more specific activities: child care, cooking and washing, and fuel and water collection. This may not be enough to address the issue of undercounting or non-inclusion, since many activities' output is consumed and sold in different ways. Furthermore, how should one factor in the preparation of a mid-day lunch for agricultural workers or the cleaning of cow sheds? Surprisingly, no thorough analytical tying up" of the home economy to non-domestic social production has been done, which is necessary for any meaningful evaluation of the effect of development on women's life. As the preceding discussion demonstrates, the literature has focused on the issue of distinguishing between housework and the spectrum of activities that make up 'productive' labor. One tangible consequence of the discussion has been a heightened awareness among data collecting organizations in the nation namely, the NSS and census to give more attention to evolving ideas and methods of collection that would net in as many women workers as feasible. This is reflected in the instructions to census enumerators, as well as the more comprehensive enumeration of jobs performed by women who identify themselves as housewives in the.

NSS 32 round. When women involved in household duties i.e. activities such as fuel, feed, and water gathering are added to women who identify themselves as workers, the participation percentage of women increases. This involvement percentage is considerably higher than the men's average of 63.66 percent. More interestingly, the coefficient of variation in the female labor force participation rate across states falls from 0.452 to 0.124, leading to the conclusion that "the observed variation in female labor force participation rates across states is an artifact created by the unjustified exclusion of a considerable range of women's tasks from so-called "economic activity". Another significant result is that the percentage of women involved in poultry, dairy, and kitchen-gardening all activities indicating access to resources has a substantial negative association with the traditionally defined labor force participation rate. Unfortunately, the NSS data does not include time disposition information, which is critical for assessing these women's availability for paid employment.

Due to time and cost constraints, large-scale time disposition studies by national statistical organizations are impossible, and there is a pressing need for more region-by-region micro-studies on the model of the Jain and Chand study to better understand (a) the nature of India's domestic economy, (b) regional variations, and (c) the stresses and strains on the economy. Another feature of the participation rate is the downward tendency seen throughout censuses. One point of contention in the discussion over the reported decreasing trend is the degree to which the decrease is fictitious and just a reflection of definitional changes. Variations in women's participation rates are mainly due to definitional changes, and that there is no decrease between the 1931 and 1961 censuses, which are similar in terms of concepts and therefore coverage. Even with the post-1971 Census survey estimates, claims that the 1961 and 1971 censuses, particularly with regard to women, are not comparable. A comparison of the 1961 census estimate with NSS estimates for 1972-73 and 1977-78 shows that the participation rate of rural females did not decrease. Women had to battle hard inside the organization for their rights

to own property when land was seized for redistribution. Despite the fact that their right to land had been recognized, the state refused to give it to women. Women from various villages got 150 acres of the 800 acres re-distributed after a long battle with district authorities. A subsequent battle revealed that these women's access to a fundamental productive resource provided them with the strength to fight for their identity. "Didi, previously we had tongues but couldn't talk, we had feet but couldn't walk," one lady said eloquently. We have the power to talk and move now that we have the land.

So far, the debate has focused on certain kinds of technical developments in the agricultural industry. It should be noted that the majority of the current research has focused on the effect on agricultural production employment. There has been few research on the other impacts of technological development that we discussed at the beginning of this article. Furthermore, most of the data presented so far has been in terms of labor time, with no discussion of the implications for the quantity of agricultural laborers or the stock of agricultural laborers. The total effect of new technology on female employment would be mainly determined by the degree to which it is adopted, the pace of production growth, and the new technology's employment elasticity. We discussed the class and caste aspects of female involvement in the previous section, but most of the research on technical development has been done in isolation from these factors. We'll try to tie these threads together in this section. Since the mid-nineteenth century, when the commercialization process began, there have been major changes in the social organization of production.

Many of these developments, as well as their consequences, have been the subject of the now-famous 'modes of production' discussion for an overview of the problems involved. Changes in agricultural relationships have intensified with the introduction of HYV technology. In India, for example, evictions of tenants and landlords' resumption of personal agriculture have been extensively documented. In the regions of HYV technology, there has also been an increase in the concentration of land, assets, and incomes. Overall, these changes in the agrarian system have resulted in a massive rise of agricultural laborers, which has been extensively reported. As previously stated, between 1961 and 1981, the proportion of female agricultural laborers quadrupled, while the absolute number of female agricultural laborers rose from 13.8 million to approximately 30 million. When considering the HYV technology's effect on employment, it's important to note that its use has mainly been restricted to the wheat bowls of Punjab, Haryana, and Uttar Pradesh, as well as portions of Andhra Pradesh, Tamil Nadu, and perhaps Gujarat. The highly unequal pattern of agricultural development reflects the geographical narrowness of this technology for the most recent data. Furthermore, technological development has been extensive and has only been applied in the case of a few crops, notably rice and wheat, and to a lesser degree cotton. The semi-arid regions' essential food crops have been largely unaffected.

As a result, these cautions must be considered in the discussion of the effect of HYV technology on per capita employment that follows. In contrast to the supply-side flooding of the rural labor market, available data suggests that there has been no concurrent rise in labor demand. Between 1964-65 and 1974-75, the average number of full days worked in agricultural activities decreased for all age groups: men, women, and children the respective figures being 208 to 186 for men, 138 to 129 for women and 167 to 145 for children. Only the 1983 figures suggest a slight increase or at the very least no deterioration in overall agricultural employment for women. Until more comprehensive research is available, the focus must be on patterns from the 1970s. In

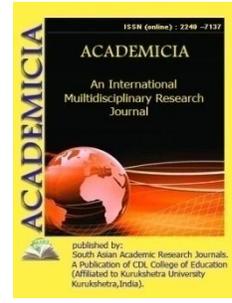

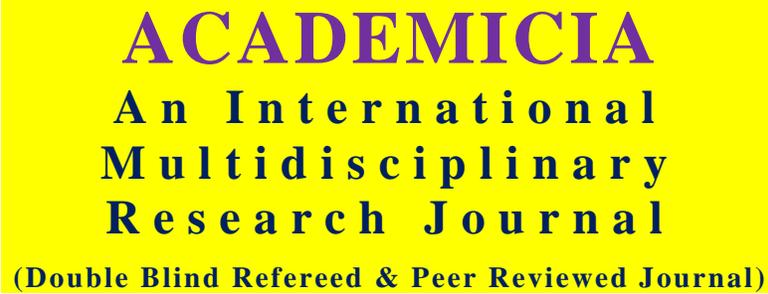

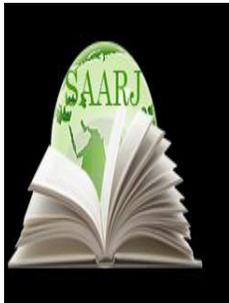

addition to decreasing employment, RLE data show that the average number of days not worked owing to a lack of job involuntary unemployment has increased for men, women, and children, with women seeing the greatest rise 91 to 119 days in the case of females whereas the comparative figures for men and children were 47 to 74 and 51 to 72 respectively. One disadvantage of using RLE data is that it only includes employees whose primary source of income is agricultural wage-work, so we aren't obtaining the true overall demand for casual labor. The displacement of traditional wage-laborers by intermittent wage-workers from farming families may be contributing to the increase in involuntary unemployment. Given spotty evidence of landlords intentionally favoring own caste laborers who may also own land in some circumstances, this is a topic that needs to be investigated further. As previously stated, the HYV technology increases labor demand in some agricultural activities. This is supported by records from the Royal Labor Enquiry, which show that both women and men worked more days in transplanting, weeding, and harvesting, with women working more days. The increase of male and female labor days was not in 'gender-specific' activities. Even though weeding is a female-specific activity with the greatest increase in female labor days, male labor days grew even faster 136 per cent for female labor days compared to 143 per cent for male labor days. Similarly, in male-specific tasks such as planting and harvesting, female labor days increased faster than male labor days.

CONCLUSION AND IMPLICATION

Though not exhaustive, the preceding survey of literature on women in agriculture has shown several gaps in the current literature and indicates to potential future research areas: (1) The current literature's most noticeable characteristic is its narrow emphasis on certain areas and crops. The literature has mostly focused on the Green Revolution regions of Punjab, Haryana, and the delta areas of Tamil Nadu and Andhra Pradesh. However, rain-fed agriculture continues to dominate nearly two-thirds of Indian agriculture, largely unaffected by the Green Revolution. As a result, we know very little about the role of women in dry-land agriculture, or even tribal agriculture with the exception of the Telangana area. This is especially significant since these areas are among the poorest in the nation, and we know that poverty is a key factor in women being forced to work in agriculture. If we want to get an understanding for the nation as a whole, we will need to conduct studies on the women in these areas. Insofar as rain-fed agriculture is geared more towards subsistence production, such research would also offer a baseline for evaluating the effect of commercial agriculture. Men tended to take over the agricultural production cycle that had traditionally been the domain of women after a crop entered the market nexus, according to a Latin American research. Despite the extensive literature on the effect of the Green Revolution on women, there are still areas that need to be researched more and more thoroughly. One such area is the issue of mechanization's effect. Studies have shown the disparities between mechanized and non-mechanized farms. It is undeniable that agricultural mechanization in India has grown significantly during the last two decades. However, not only are some key types of mechanization such as combine harvesters mainly confined in Green Revolution regions, but they are also limited to pockets within those areas. As a result, if we want a complete understanding of mechanization, we must examine the degree to which different kinds of mechanization are used. Only then will we be able to determine the degree to which conventional work patterns have been disrupted.

ABSTRACT

The article presents the results of a study of the impact of the running systems of tractors and working bodies of tillage machines on the development of the root system of farmland and on productivity. It has been established that the presence of a compacted layer in the subsoil leads to the suppression of microbiological processes and depletes the soil in nutrients. Additional loosening of the subsoil horizon contributes to increased crop yields.

KEYWORDS: *MTA Running Systems, Impacts, Compaction, Loosening, Crop Yield.*

INTRODUCTION

With the intensification of agricultural production processes, the problem of the compacting effect of machine-tractor units (MTA) on the soil arose. Multiple passes through the field of tractors, combines and other mobile equipment led to the spraying of the upper and compaction of the lower layers of the soil, which negatively affected its fertility and crop productivity.

Studies [1] found that during agricultural work, the MTA running systems cover with tracks from 40 to 80% of the field surface, and the headlands are exposed to 8-10 times impact. Due to the increase in the mass of tractors and agricultural machines, not only the arable, but also the subsurface horizons are compacted. As a result of compaction, erosion processes intensify, soil density and its resistance to processing increase by 1.5-2 and 1.3-1.9 times, respectively, and the total and capillary porosity of the fertile layer decreases.

Studies [2] also found that an increase in soil density and hardness leads to a decrease in the vital activity of soil microflora and, as a result, to a shortage of 20-40% of the crop. In connection

with the excessive use of moldboard plows and other working bodies, the so-called "plow bottom" is formed, which prevents the penetration of irrigation water, precipitation into the underlying layers and the evaporation of excess moisture from the lower horizons. This contributes to the development of water erosion on sloping lands, and on the plains and lowlands - the formation of wet "saucers" in which melt and rainwater stagnate. All of the above negative factors led to the degradation of the fertile soil layer and the expansion of the area of erosion processes. The fight against over consolidation is closely related to both the ecological stability of arable land and the ecology of the environment in general. Therefore, according to the authors of [3], the ecological assessment of the state of arable land, as well as various technologies of mechanical soil cultivation, in the future should prevail over all others.

Soil compaction is highly dependent on the farming system. In primitive agriculture, the soil can experience only small loads with multiple passes of agricultural implements, while with a high degree of mechanization, it is accompanied by large loads on the soil.

In cotton cultivation, the soil profile consists of arable and subsoil layers. The periodically cultivated topsoil covers the subsoil, which is loosened much less frequently or not at all. This leads to dramatic changes in bulk density in the soil profile.

Compaction of the soil can reach a depth of 30-60 cm. The soil is compacted when the wheels of tractors act on it to the depth of the arable layer. All researchers point out that the greatest compaction from the tractors' passes is exposed to the surface layers of the soil from 0 to 20 cm, subsequent passes through the field cause a weak compaction in the upper layers compared to the previous one and an increase in density in the deeper ones.

It has been established that the compacting effect of the running systems of tractors and machines on the soil depends, on the one hand, on the humus content of the soils, their particle size distribution, structure, moisture and other physical properties, the nature of agricultural use and, on the other hand, on the design of the tractor and its running system, on its mass, specific pressure, axle load, slippage, travel speed, tire brand or track and suspension structure. The greatest soil compaction occurs most often in two cases: with excessive moisture and when machines are moving on freshly worked soil. It has also been established [4] when the soil is compacted, the filtration coefficient drops sharply due to a decrease in the number of non-capillary pores, aeration deteriorates and the concentration of carbon dioxide in the soil air increases. According to the authors of [5], an increase in soil density leads to a decrease in the moisture available for plants in the moisture content of a stable set.

By numerous passes of agricultural machines in the soil, the root system of plants develops poorly, the rate of root elongation decreases, the roots are strongly deformed, bent and have less branching. Compaction of the soil reduces the germination of seeds, increases the duration of germination and ultimately lengthens the growing season of plants.

At present, the study of the impact of running systems in the field on changes in physical, mechanical and technological characteristics, soil fertility and crop productivity is carried out mainly by three methods: "continuous rolling", "on the track outside the track" and "general assessment". The methods developed [4] for determining the characteristics of the processes occurring in the propeller-soil system made it possible to establish that the running systems of the tractor, by compacting the soil, as a result, affect the yield. It was found that with an increase

in the compaction effect on the soil, the yield of agricultural crops decreases. These data were obtained using the “continuous rolling” technique.

In medium loamy soils, the influence of the running systems of tractors on the agrophysical properties and productivity of agricultural crops was studied by the author of works [6]. He found that the compaction deformation extends to a depth of 40 cm and the plow layer deforms to a greater extent than the sub-plow layer, and its main compaction is noted during the first pass of the tractor. In the subsoil, permanent deformation accumulates. The increase in density in a layer of 20-40 cm after 10 passes of tractors for 5 years, even on physically ripe soil, is from 0.05 to 0.13 g / cm³.

The researcher also notes the deterioration of the soil conditions of plant life after the passage of tractors: the development of spring crops also deteriorates, the growth rate of plants slows down, the passage of development phases lengthens, and the accumulation of organic matter is slower.

This article studied the negative impact of the running systems of tractors and working bodies of tillage machines on the development of the root system of cotton and the cotton harvest. It has been established that the presence of a compacted layer in the subsoil leads to the suppression of microbiological processes and depletes the soil in nutrients.

Studies have found that most researchers propose measures that limit the compacting effect of the running systems of agricultural machines on the soil. They believe that the fight against soil overconsolidation should be carried out by improving the physical conditions of soil fertility, i.e. the cultivation of soil layers, the improvement of the technology of cultivation of agricultural crops and the design of machine-tractor units.

Studies have also established that so far the permissible loads on the soil have not been determined, and the properties of the soil when calculating the propellers are taken into account in terms of the limit of the bearing capacity without limiting the degree of its compaction and the requirements of crops for the physical conditions of fertility.

Therefore, the study of the harmful compacting effect of agricultural machinery on the soil, on the basis of which the development of methods and techniques for reducing the mechanical impact is the most important national economic task.

In laboratory-field experiments carried out on the takyr soils of the Karaulbazar massif, with an average soil hardness of 3.5-4.0 MPa, absolute moisture content of 12-13%, the traction resistance of the two-story plow PYa-3-35 was more than 30 kN. The increase in traction resistance is due to the formation of a compacted core on the plow blade and solid blocks. At the same time, the movement of the layer cut by the share on the dump becomes difficult, the soil deformation occurs with a compacted core. Taking this into account, in the subsoil, where the soil density is, as a rule, overestimated, working bodies should be used that exclude the formation of a compacted soil core.

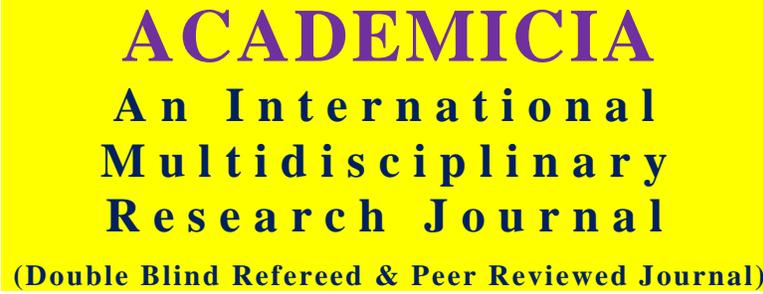

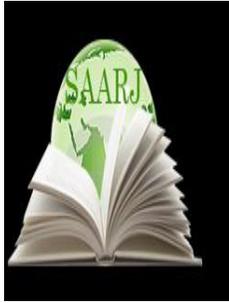

Studies have established that the formation of a compacted soil core was found in front of the subsoiler strut and the soil-dredging share in the working area of the plow sole. To exclude this phenomenon, we used knives-rippers with an opening angle of 45° as a working body of the soil deepener .

It was also found that additional loosening of the subsoil horizon contributes to an increase in cotton yield by 2.3-4.5 c / ha. An increased soil compaction of headlands was established, where its hardness reaches 1.95-2.80 MPa.

ABSTRACT

This article describes the morphological changes of the verb phrase. In particular, changes in person-number suffixes are explained when auxiliary words in the conditional mood come with a verb. We also covered the semantic features of the auxiliary words that lead to the conditional tense. We have studied the morphological and semantic features of these auxiliary words based on Abu Yaqub Sakkoki's Miftahu-l-ulum. Sakkoki's approach to this is evidenced by the views of linguists before and after him.

KEYWORDS: Sakkokiy, "Miftahu-L-Ulum", Verb, Conditional, Loading, Spending (Morphology), Meaning, Person-Number.

INTRODUCTION

A set of auxiliary words serves to connect the noun and the verb. Coming before the verb, it certainly has a certain syntactic effect on it. When these letters are connected, certain changes occur in the verbs, and this, of course, affects the meaning of the verb. Auxiliary words that cause the fall of the noun in the second person, the plural II and III in the verb, the singular muannas II, the change of the last consonant to the syllable, the fall of the faulty letter are called "jazm letters" (الحروف الجازمة). The word 'jazm' means 'to cut', 'to separate', 'to jazm', in the term 'to put the verb in the conditional tense'.

Saqqaqi narrated these letters under a separate subject, and in Miftahu-l-Ulum he called them "the letters that bring the verb after him in jazm (الحروف الجازمة)" [1: 42a]. The scientist carried out the coverage of the subject on the basis of a separate system. This logic-based system makes it easy for the reader to assimilate the information. Sakkoki also covered the subject in detail, covering complex aspects.

Starting with the number of letters that make up the subject: “The letters that make up the next verb are five and are divided into two types. The first type requires the verb to be present tense, and the number of such letters is four” [1:42a].

According to Sakkoki's peculiar logic-based method, it is distributed according to which form of the verb comes after the consonant letters. Also, the second aspect of the division, following Mahmoud Zamakhshari, took a group of words that were originally letters and were conditional. Mahmud Zamakhshari also divided the conditionals into two, one being the original letter and the other being the noun [11: 205]. Citing the verb that comes after him in jazm, stating that the number of letters that require it to come in the present tense is four:

He wrote, "The first of these is the infinitive load of the verb لم, which brings it in the conditional tense," and gave the following example: زيدا ألم أضرب [1: 42a].

Muhammad Khayr Halvani divided the jazm letters into two: "One comes before the present tense verb and does not give the conditional meaning, the other gives the conditional meaning and brings the two verbs in the conditional tense" [7: 102-105]. This scholar divided in terms of form and meaning and included in the second group the words that give the conditional meaning of the original noun.

The letter لم, first quoted by Sakkoki, represents absolute negation [1: 42b]. Completed in the past tense, it means a non-continuity that does not last at all in the present tense. For example: لم يلد ولم يولد (He is unborn and unborn. Surat al-Ikhlās, 3).

Ali Jasim Salman gives the following verse as an example, stating that the verb that comes after this letter is dropped and that the dropped verb is explained from the meaning of the verb throughout the sentence:

ظننت فقيرا ذا غنى ثم نلته فلم ذا رجاء ألقه غير واهب

(As the owner of wealth, I considered myself poor, then I gained wealth, other than the giver, please did not meet the owner) [10: 193].

Linguists such as Saqqaqi, Zamakhshari, and Ibn Sarraj, who have an influential position in Arabic linguistics, say that words that are conditional are not letters. Ibn Sarraj described the peculiarities of these letters: “Even if we desire it to drop, we cannot drop it,” he wrote [6: 156]. Without denying the evidence presented by Ali Jasim, the views of Sakkoki, Zamakhshari, Ibn Sarraj are strong. The evidence cited by Ali Jassim is a very rare case in Arabic poetry. If it was more expressive, other linguists would have quoted it as well.

About subsequent downloads that require conditional inclination: « لا [infinitive of the verb in the imperative mood] (return) and brings it in the conditional mood », about the next download: “The fourth is لام الأمر - [the third person, the letter added to the imperative verbs denoting the first person]. Its function is to indicate that the verb is in the imperative mood” [1:42b].

The next conditional tenses are prepositions that are written in conjunction with the verb to which it is attached. Although these prepositions formally require the verb to be conditional, they express the command in the sense. Sakkoki is content with the above as these downloads are simple, with no complexity.

If the 'lām' representing the command is from the largest to the smallest, it is called the 'lām' (اللام الدعائية) representing the command. When it is from small to large, it is called "lām" (اللام الدعائية), which represents prayer [9:53]. All the "lam" in the prayers in the Qur'an is a supplication to Allah.

If the first round brings a conditional tense, requiring that one verb after it be in the present tense form, the load of the second type, which expresses the conditional meaning, brings two verbs after it in the conditional tense, without conditioning the tense form. Sakkoki's statement on this subject is concise from the views of other scholars, the method of expression is understandable and covers complex features. Regarding the second type, the scholar wrote: "The second type is the conditional load of the verb, which requires a more modern form, and it is إن -- (if) for the condition and its answer", citing the following as an example: إن تضرب أضرب (agar ursang uraman); إن ضربت أضرب (agar ursang uraman) [1: 42b].

Sakkoki describes this load as a separate type because the load إن (if) affects two verbs. One of the differences of this load from the previous ones is that the verb comes after this load in past and present tense forms (وَإِنْ كَانَتْ لَكَبِيرَةً - although it is heavy. From Surat al-Baqara, 143; إِنَّ تَنْصُرُوا اللَّهَ يَنْصُرْكُمْ - If you help Allah, Allah will help you. Muhammad, verse 7). Above, Sakkoki also pointed out with examples that this load comes with the past tense verb. Ibn Hajib wrote that although the past participle comes in the form of a verb, its meaning will be in the future tense [3: 218]. Ibn Ya'ish, taking these features into account, called this load "the mother of the conditional loads" (أم حروف الشرط) [2: 264].

This load comes as a response to the second verb if the first verb is in the conditional sense, while the second verb is in the conditional mood. All linguists point out that both verbs that come after this load come in the conditional tense [4:44]. Abduqahir Jurjani wrote that after this loading, one verb in a sentence can be in the past tense, the second verb in the present tense, and the second verb can be replaced by a definite adjective derived from it [8:10].

Regarding the fall of the main load representing the condition, Sakkoki enumerated the places of the fall, following his predecessors, including Mahmud Zamakhshari [11: 208] [see 1: 42b].

This load is reflected in the sense, even if it falls.

The second verb, which comes after "lām" (لام النهي), which represents the negation of the command, has a conditional meaning and comes in the conditional mood without the load of إن . For example: لا تجهل تفز (don't be ignorant, [if you don't] you will succeed). In the semantic form لا تجهل، إن لا تجهل تفز .

According to the above case, Sakkoki: "When the letter of the condition is dropped, the verb comes in the conditional tense. The dropped letter must be in reversible mode. In the event of a discrepancy elsewhere in the above, the letter shall not be omitted. Example: لا تدن من الأسد يأكلك is not considered correct if it is in the form of load (do not approach the lion, if you do not approach it, it will eat you)" [1:42b].

From the above opinion of Sakkoki it can be understood that such a form should not be used if the content of the sentence is distorted in places where it is not semantically correct. The sentence cited as an example above is well-known among linguists, Ibn Ya'ish states: "The form of لا تدن من الأسد، إن لا تدن من الأسد يأكلك is incorrect, the form of meaning is لا تدن من الأسد يأكلك (do not approach the lion, do not approach). it will not happen" [2: 274]. Therefore, Sakkoki wrote,

"No one implies a condition where there is a mismatch between non-existence and a condition" [1: 42b]. Sakkoki cites the correct form of this sentence, which is as follows: "True [variant]: لا تدن من الأسد فإنه يأكلك is in the form of load" [1: 42b]. The meaning of the sentence is: "Do not approach the lion, [if you approach] he will eat you." In order to express this meaning, according to Ibn Ya'ish, it can be given in the following two forms: one is لا تدن من الأسد يأكلك and the other is [2:274] لا تدن من الأسد فيأكلك [2:27 :2]

As for Sakkoki's sentence "After the word meaning desire," the following is an example:

لعل فاطمة وأمينة تكبران تقرأ لنا القرآن (perhaps Fatima and Amina will recite the Qur'an to us when they are older). In this sentence, the verb in the first part of the meaning of desire is in the form of a message, but it is in the form of a conditional wish. Although the verb in the second part is in the conditional mood, the message is in the mood. According to Sakkoki, the presence of the second verb in the conditional tense is due to the omitted إن load.

Sakkoki enumerated above that when the first part of speech contains a word denoting a question, the next verb contains the meaning of a condition, and comes in the form of this inclination without a conditional load. An example of this is: أين أبوك أزره (I will visit wherever your father is).

If there are prepositions in the sentence that reflect the meanings of the urge, then the second verb that comes after them is in the conditional mood, which is a sign of Sakkoki's idea "after the prepositions that reflect the meaning of the urge". An example of this is: ألا تبرون والديكم تكونوا مسرورين في الدارين (hey, be kind to your parents, you will be happy in both worlds).

Taking into account the omitted load in the above places, the conditional citation of the verb is calculated from the fact that there is a condition in the original sense. Therefore, even if there is no load, the condition comes when the verb comes in five places. Sakkoki listed them in his own concise style.

Continuing Sakkoki's view, he said: Therefore: : إن احمر البسر كان كذا - (if the date is red, it will be like this, it is not acceptable to say it in the form), and gives the following examples: إن طلعت الشمس أنك إلا في اليوم المغيم if the sun rises, I will come to you, except on a cloudy day

إن مات فلان كان كذا (if so-and-so dies, so be it)" [see 1: 42b].

Regarding the inaccuracy of such conditions, Sakkoki wrote: "These forms must be questioned, and it is not clear what the exact time is" [1: 42b].

Sakkoki describes a somewhat complicated situation: "In these places, the verb is in the way of expressing the unseen load, for the meaning of the conditional answer, while the second sentence is called قطع - (cut), استئناف - (new beginning)" [1: 42b].

Sakkoki is arguing here that a conditional participle is present, a conditional participle that follows a conditional participle. For example: وَإِنْ تُبْدُوا مَا فِي أَنْفُسِكُمْ أَوْ تُخْفُوهُ يُحَاسِبْكُمْ بِهِ اللَّهُ فَيَغْفِرْ لِمَنْ يَشَاءُ (Whether you reveal what is inside you or conceal it, Allah will call you to account, and will forgive whom He wills. (Surat al-Baqara, 284)

This verse has the characteristics of Sakkoki enumerated in the above description, and the فيغفر لمن يشاء (And forgives whomever He wills) part is called, as Sakkoki points out, "a sentence that begins anew (جملة استئنافية)." Continuing Sakkoki's opinion, he stated an important rule: "The

second [then the message] is called صفة-(adjective), if it is definite, حال-- (case)" and "in this case the word becomes only marfu" [see : 1: 42b].

Ibn Hisham Ansari فَهَبْ لِي مِنْ لَدُنْكَ وَلِيًّا. يَرِثُنِي (so give me a guardian from your Lord. Let him inherit me. Surah Maryam, verses 4-5) He said that the word يرثني (He is my heir) is the quality of "guardian" [5: 84]. That is why Sakkoki wrote above that "the second [then the message that comes in the message] is صفة— (adjective)" [1: 42b].

Sakkoki enumerated these places above and emphasized an important rule: "in this case the word becomes only marfu" [1: 42b]. In both cases the verb comes after the conditional tense, but instead of the conditional tense it comes in the message tense (marfu '). This is in terms of meaning, because in the first example the adjective has been adjective, and in the second the message has come in the form of a conditional answer without expressing the condition of the executor of the action. In such cases, non-compliance is not against the rule.

Sakkoki writes about important information that has been overlooked by most scholars: "If in these forms the horse is considered to be the possessor of a cut-off speech, then the second part is in the following forms:

فأنا أخلع عليك، وأنا أضربك، ثم أنا أضربك

[the message is inclined] "[1:42b]. The first part comes in the main consonant because it comes in the beginning, and if it is muftado (possessive), the second verb comes in the raf (the inclination of the message) because it comes in place of the message.

Sakkoki comments on ف - ("fā"), which is widely used in conjunction with conditional pronouns:

"One of the features of ف - "fā" in the connecting function is that it comes in the second part of the condition [the condition follows the main part of the sentence]" [1: 42b]. This conjunction comes after the preposition: "As mentioned above, the verb in the second part is in the past tense, imperative, or past participle form, and if the second part does not mean the future tense, the second part is a participle or a noun." the second part comes at the beginning, "said Sakkoki [1:42b].

In his opinion above, Sakkoki lists when this load will come. If this preposition is a response to a conditional sentence in the form of a preposition, then of course this preposition precedes the preposition. For example: ان تالمك سايا فهو الم (if he teaches you something, he knows it). That is why Sakkoki said, "If the second part is a horse-cut speech" [1:42b].

If the preposition begins with a verb with the same form (الفعل الجامد), the same load is added to it. For example: ان تزن أنا أقل منك مالا وولدا. فعسى ربي أن يؤتيني خيرا من جنتك (If you consider me inferior in terms of wealth and children, perhaps my Lord will give me something better than your garden. (Surat al-Kahf, 39-40). Since the second sentence in this verse begins with a verb, this load precedes it.

Pointing to the fact that this proposition is also placed when the preposition begins with a command verb, Sakkoki writes, "If the verb is a command [if]." For example: قل إن كنتم تحبون الله قل إن كنتم تحبون الله فأتبعوني يحبكم الله (if you love Allah, follow me, [then] Allah loves you. Surah Al 'Imran, verse 31).

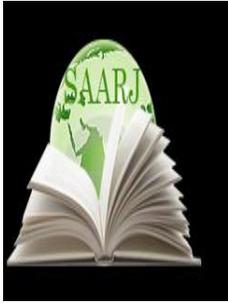

It would be easier to understand Sakkoki's phrase "if there is a return (absence of command) verb" with the following example. He said: **إِنْ لَا تَفْعَلْ خَيْرًا فَلَا تَفْعَلْ شَرًّا** (if you do not do good, do not do evil). In this example, because the second verb comes with a preposition, this prefix is added before it.

Even if the verb in the preposition is in the past tense form, the sentence "if it is in the past tense" can be added. For example: **إِنْ يَسْرِقْ فَقَدْ سَرَقَ أَخٌ لَهُ مِنْ قَبْلُ** (if he stole it, his brother had also stolen it before. Surah Yusuf, verse 77). In this verse, the word **سَرَقَ** (stolen) is a past tense form of the verb, so this load precedes it.

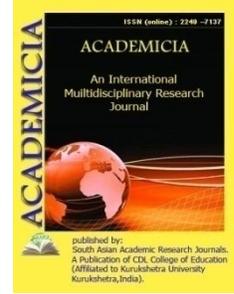

Sakkoki described the subject in a unique way, with a logical system that was considered difficult to observe by other scholars. He covered these downloads based on the views of his predecessors. He cited examples from Arabic poetry where he considered it necessary to cite evidence. Analyzing the subject in a unique way based on logic is an achievement of Sakkoki, an advantage that distinguishes him from other linguists.

ABSTRACT

Electric machines with permanent magnets are now being used in an increasing number of design methods. It is most importantly related to the development of novel long-lasting magnet materials (for example, Nd-Fe-B, a unique anisotropic combination) with high attractive exhibitions and relative ease of use. This research looks at contemporary permanent magnets. The attractive, warm, and mechanical characteristics of everlasting magnets, as well as their usefulness, are discussed in this article. This article also looks at places where everlasting magnets are used in many design fields.

KEYWORDS: *Permanent Magnet, Magnetic Materials, Alloys, Sm-Co, Nd-Fe-B, Magnetic Parameters, Magnetic Properties.*

INTRODUCTION

Magnetic materials are necessary for the world's people to have a good quality of life. Many of the gadgets we take for granted are made possible by them. The rising quality of life of people all over the world is posing raw material supply problems and spurring industrial innovation. We'll go through the basics of magnetic materials and how powder metallurgy plays a role. To

comprehend the fascination with magnets, it's essential to go back at their history and identify what makes one magnet superior to another. We'll take a brief look at the series of events that led to the discovery of rare earth magnets, the most powerful magnets presently accessible. Then we'll go through a few magnet-related applications and why they're so essential to our economy, our way of life, and the fundamental foundations of our technology. Finally, we'll discuss the difficulty of producing enough of these strong magnets, as well as research into even better materials.

Future technologies for an electric and sustainable society will need a high level of material awareness. Several materials are thought to be essential for long-term sustainability. The effect of the rare earth element (REE) business on the environment may be seen at many stages of the process, including mining and refining. In the mining sector, the effect of other minerals found in the same deposit locations may be more important than the REEs themselves. Emissions may occur during milling, separation, or subsequent stages of processing the material into an usable metal.

Line 1 depicts the dynamic evolution of material characteristics of ferrite magnets used in latches.

Line 2 consists of magnetic Alnico alloys (Al-Ni), which are used in radio and television equipment.

Lines 3 and 4 relate to new types of magnetic materials that have been created using rare-earth metals: Sm-Co line 3 and Nd-Fe-B line 4[1].

Figure 1 shows that the magnetic energy of samarium magnets is six to ten times greater than that of ferrite magnets. In reality, this implies that neodymium magnets with size comparable to an egg may cause finger shattering. That is the mechanical forces that are produced. Power, coercive power, heated solidity (up to 200 °C), and anti-consumption solidity Sintered magnets have a thickness of up to 8.5 gran/centimeter and a progress temperature of 700 'C. These characteristics indicate that Sm-Co is suitable for use in high-temperature or high-consumption environments.

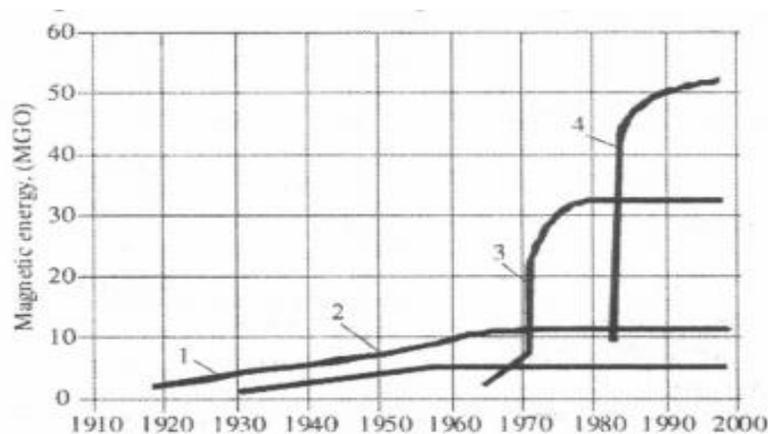

Fig 1: Shows That Behavior of Permanent Magnets Has Revolution Changes at Last Years

Direct alloying of initial components in a vacuum enlistment stove yields appealing mixtures with his characteristics [3]. Bullions bucks and smashes to a micron's worth of material. Magnets are ejected from a given residue in a variety of forms. Cakes made from stock material are baked at temperatures ranging from 1000 to 1200 degrees Celsius. The next item is mechanical handling, which includes hammering. Next, consider the benefits and disadvantages of various types of appealing materials. Strong mechanical strength, appealing characteristics strength across a broad temperature range, and high immersion force are the main areas of interest for alnico. These magnets, however, have very low coercive force. Ferrite materials have a strong coercive power, but they are also short and difficult to prepare. Similarly, a temperature has an effect on the attracting characteristics of such magnets [4].

As shown in Figure 1, there is a current focus in the area of PM research to bridge the performance gap between ferrite and RE magnets. It is proposed that a new magnet with an acceptable price/performance ratio of not more than approximately 1 \$/J would be economically efficient. A material with such characteristics may improve the performance and reduce the weight of existing ferrites-based devices, as well as lower the cost of RE magnet-based systems. Currently, bonded RE magnets, which are composites with PM powder incorporated in a plastic matrix, may cover the gap to some extent but at a significant cost. One way to bridge the gap between ferrites and NdFeB is to substitute less costly components for Nd. The cost-to-performance ratios of Ce-substituted NdFeB and SmCo compounds and alloys have been studied, and they show promise. Ce is a rare earth metal that makes up 66 parts per million of the earth's crust, compared to 41 parts per million for Nd. Uncommon earth magnets dependent on Sm-Co composites have great attractive qualities (high immersion power and coercive power), warm strength and insusceptibility of consumption, moreover. The fundamental impediments are significant expense of a samarium and cobalt and thusly wide application of Sm-Co magnets is badly arranged. As of now, the most viewpoint sintered lasting magnets is Nd-Fe-B.

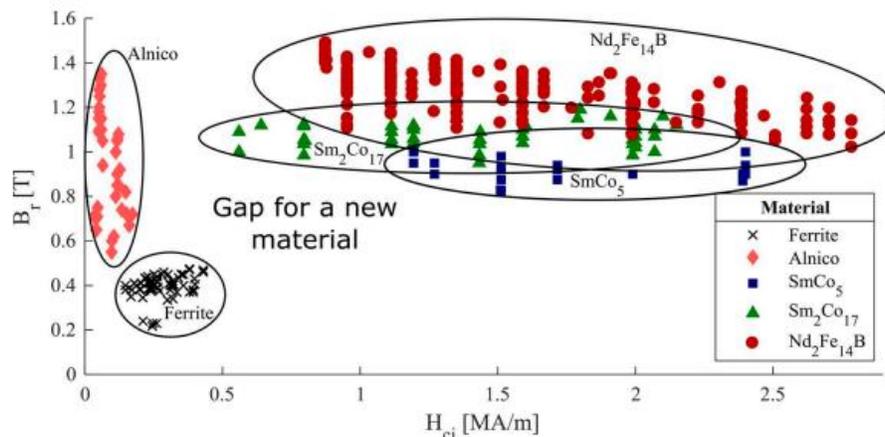

Figure 2. Different PM Materials Available On the Market and Their Properties, Illustrating the Gap between Ferrites and Rare-Earth (RE) Magnet.

To begin with, these magnets have most noteworthy BHmax and this worth don't reach limit.

Lasting magnets, compares powers, normally for regular machines and components (for example handfuls and hundred kilograms). At present in our nation, creation of uncommon earth magnets leaves out a research center stage and this creation are grown quick rate on premise of a

adaptable innovation in a years ago. These days, such magnets are accessible for clients. Information of 000 "Chimcomplect" shows that lasting magnets Nd-Fe-B has special boundaries of qualities/cost. This clarify quickly a development of creation and presentation in different zones of designing such magnets[5].

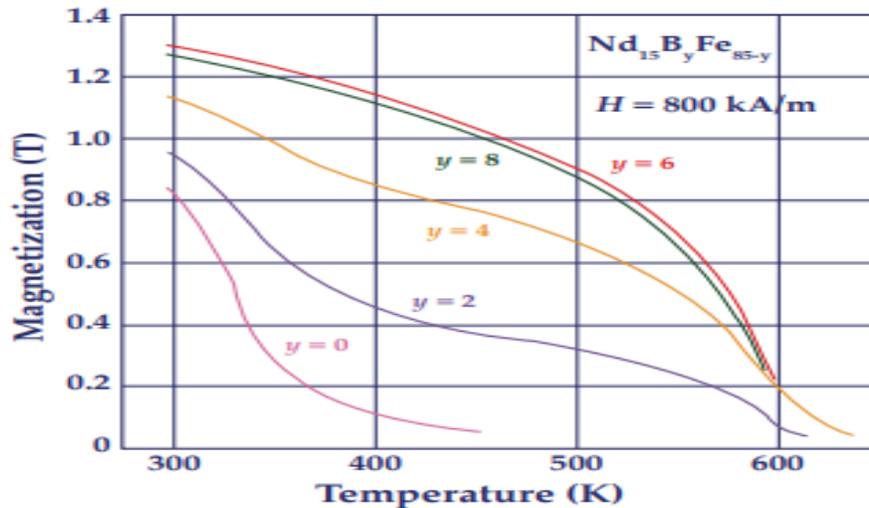

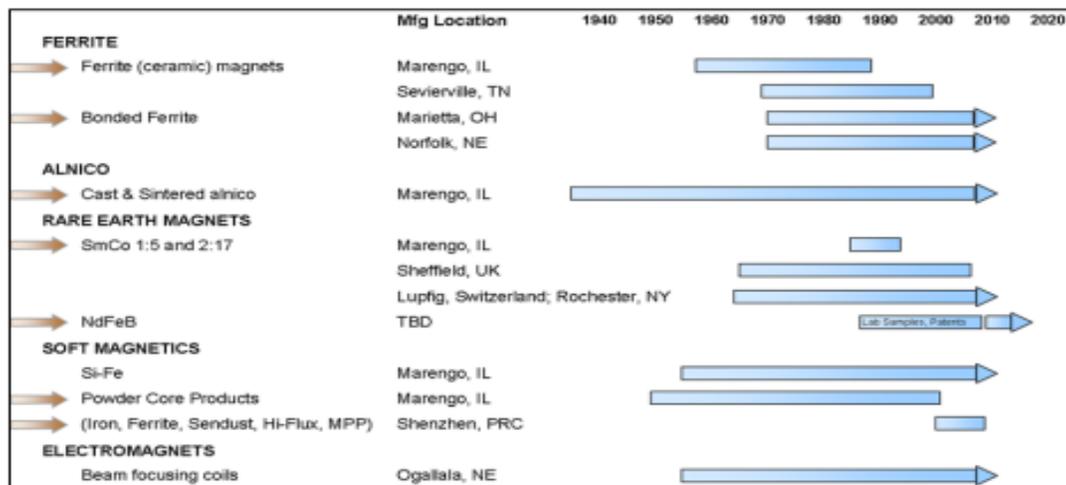

Figure 3: Magnetization vs temperature curves for $H = 800 \text{ kA/m}$ on five alloys containing different percentages of boron in $\text{Nd}_{15}\text{B}_y\text{Fe}_{85-y}$ system.

The magnetization versus temperature graphs for $\text{Nd}_{15}\text{B}_y\text{Fe}_{85-y}$ with $y = 08$ are shown in Figure 2. With rising temperature, the magnetization of the $\text{Nd}_{15}\text{Fe}_{85}$ binary alloy, which has around 0.8 T at room temperature, falls to a very tiny value at about 400 K. The Curie temperature of the NdFe alloy was predicted to be about 310 K based on a low field experiment. The alloy's magnetization rises as the amount of B added increases, peaking at approximately 6 atoms B. The development of a tetragonal phase with a high Curie temperature causes this rise. The Curie temperature of this phase was found to be 585 K using low field measurements. Arnold has amassed a vast knowledge base in a variety of materials over the past 70 years, including but not limited to those shown in Figure 1. Powder metallurgical manufacture is used to make the goods with tan arrows to the left. (Keep an eye out for these arrows; they'll be used throughout the text.) Arnold's product line-up and production sites have evolved as goods and markets have changed. Arnold has a unique insight and perspective on the magnetics sector because to his vast knowledge base.

REVIEW OF LITERATURE

Among all the papers published in the area of permanent magnet materials, Sergey Lutz discusses the use of unusual earth magnets to create tiny size and amazing devices with enduring magnets in a paper titled "a review of modern materials of permanent magnets by Boris Bochenkov." The demand for long-lasting Nd-Fe-B magnets from Russian manufacturers is consistently increasing by 25-30%. In comparison to conventional ferrites, alnico, and other materials, the fundamental piece of leeway of magnets Nd-Fe-B and Sm-Co consists in great attractiveness of material characteristics at small scales. New types of magnets have more appealing characteristics while maintaining their size. It's worth noting that force power or tractive effort boosts recruiting appeal. On the other hand, it reduces measurement and weight while maintaining the force of the hardware. Using extraordinary magnets may sometimes result in a significant reduction in energy consumption. It's worth noting that force power or tractive effort increases the appeal of enlisting. On the other hand, it reduces measurement and weight while maintaining the force of the hardware. The use of ground-breaking magnets may sometimes result in a reduction in energy consumption. In the year 1970, an Alloy Sm-Co broad appears on the market. Sm-Co has a high immersion rate these days. Quite likely the most advantageous position consists of such materials in comparison to other appealing materials with relatively little effort. These materials also have a high appealing progress temperature, ranging from 160 to 170 degrees Celsius. Nonetheless, Nd-Fe-B magnets with an operating temperature of 200 °C are now available. This allows them to be used in electric engines with long-lasting magnets [6].

DISCUSSION

This paper discusses about the mechanical forces that are generated Power, coercive power, heated solidity (up to 200 °C), and anti-consumption solidity are all characteristics of this material. Sintered magnets may be up to 8.5 gran/centimeter thick and have a progress temperature of 700°C. Sm-Co is suited for usage in high-temperature or high-consumption settings based on these properties. In a vacuum enlistment stove, direct alloying of starting components produces attractive mixes with his properties. Bullions bucks and crushes material down to a micron's value. Magnets are expelled in a number of ways from a given residue. Temperatures ranging from 1000 to 1200 degrees Celsius are used to bake cakes manufactured

from stock material. Mechanical handling, which includes hammering, is the third item on the list. Next, think about the pros and drawbacks of different attractive materials. The primary areas of interest for alnico are its high mechanical strength, attractive features strength over a wide temperature range, and strong immersion force. These magnets, on the other hand, have a very weak coercive force. Ferrite materials have a high coercive strength, but they're also short and tough to work with. Similarly, the attracting properties of such magnets are affected by temperature.

Uncommon earth magnets based on Sm-Co composites offer a lot of appeal (high immersion and coercive power), as well as warm strength and resistance to consumption. The main obstacles are the high costs of samarium and cobalt, which makes widespread use of Sm-Co magnets difficult. Nd-Fe-B is now the most widely used sintered long-lasting magnet. To begin with, these magnets have the highest BHmax, and this value does not exceed a certain limit. Magnets that last, compare powers, and are often used in ordinary machinery and components (for example handfals and hundred kilograms). Currently, in our country, the production of rare earth magnets does not take place in a research center, and this production has expanded at a rapid pace as a result of a flexible invention a few years ago. Clients may now get their hands on such magnets. The data from 000 "Chimcomplect" reveals that long-lasting magnets Nd-Fe-B have unique quality/cost limits. This clarifies the evolution of invention and presentation in many design zones, such as magnets, rapidly.

CONCLUSION

After considering attractive, warm, and mechanical characteristics, it is reasonable to conclude that magnets made of rare earth elements are usually appealing. High-energy sintered magnets Nd-Fe-B are now being considered for use in the rotor of an electric motor. Furthermore, this study demonstrates that Sm-Co is suitable for use in high-temperature or high-consumption environments. Currently, take notice of the automobile industry's capacity to create expansions. The underlying problem in the automobile business is the ineffective presentation of new materials and technological advances. As a result, a requirement direction entails using today's appealing elements and advances. To begin with, it is linked to a large number of electromagnetic devices (ranging from 50 to 100). Controllability, economy, comfort, and various machine limits are all characteristics of this device. It's also worth noting the increase in power from 2 kW to 20-50 kW, which allows for the use of new amazing devices for supply management and monitoring. In this vein, global manufacturers are switching to a two-level voltage system (14 and 42V or 12 and 36V). Increased control requests for new appealing materials and new innovations of appealing materials (for instance: the multifunction starter, generator and so forth).

ABSTRACT

The term "revolutions in military affairs" is arbitrary, but some inflection points in technological change are larger than others: for example, the gunpowder revolution in early modern Europe, the nineteenth-century industrial revolution, the early twentieth-century second industrial revolution, and the nuclear revolution in the middle of the last century. We may also include the information revolution in this century, which has resulted in today's very fast development of cyberspace. Earlier information technology revolutions, such as Gutenberg's printing press, had significant political consequences, but the present revolution can be traced back to Moore's law and the thousand-fold reduction in computing power prices that happened in the final part of the twentieth century. Political leaders and experts are just now starting to understand the implications of this game-changing technology. Cyber security has mainly been the province of computer professionals and specialists until recently. This tiny group was like a virtual village of individuals who knew each other when the Internet was established 40 years ago, and they built an open system with no regard for security. While the Internet is not new, the commercial Web is just a few decades old, with a user base that has grown from a few million in the early 1990s to more than two billion now. This growing interconnectedness has generated both tremendous possibilities and significant weaknesses, which strategists are now grappling.

KEYWORDS: *Cyber War, Cyber Crime, Nuclear Reactor, Nuclear War, Space Technology.*

INTRODUCTION

The term "cyber" refers to computer and electromagnetic spectrum-related activity. The Internet of networked computers is part of the cyber domain, as are intranets, cellular technology, fiber-optic cables, and space-based communications. A physical infrastructure layer exists in cyberspace that adheres to the economic rules of competing resources as well as the political laws of sovereign authority and control[1]. This element of the Internet isn't a "commons" in the conventional sense. It also contains a virtual or informational layer, which is characterized by growing economic rewards on scale and political behaviors that make jurisdictional control difficult. Attacks may be launched from the informational domain, where costs are cheap, against the physical domain, where resources are limited and costly. Control of the physical layer, on the other hand, may have territorial and extraterritorial implications for the informational layer. Within cyberspace or in other areas outside of cyberspace, cyber power may generate desired results. Sea power, by analogy, refers to the capacity to utilize ocean resources to win naval battles on the seas, but it also relates to the ability to use the waters to influence wars, trade, and public opinion on land. The similar analogy may be used to describe airpower[2]. A complicated man-made environment is the cyber realm. Human enemies, unlike atoms, are sentient and deliberate.

Mountains and seas are difficult to shift, but cyberspace can be switched on and off with the flick of a switch. Moving electrons around the globe is less expensive and faster than moving big ships over vast distances via salt ocean friction[3]. The expenses of building multiple carrier task forces and submarine fleets create huge obstacles to entry, allowing the United States to claim naval supremacy. Nonstate actors and tiny nations, on the other hand, may play major roles in the cyber realm since the entrance hurdles are so low. One of the major power changes of this century, according to *The Future of Power*, is the dispersion of power away from governments. This larger tendency is shown by cyberspace. The biggest nations are unlikely to be able to exert as much control over this area as they have over others such as the sea, air, or space[4]. They have more resources, but they also have more weaknesses, and at this point in the technology's evolution, attack outnumbers defense in cyberspace. Although the United States, Russia, the United Kingdom, France, and China have more capability than other state and nonstate entities, it is difficult to talk about cyberspace supremacy. In fact, relying on sophisticated cyber systems to support military and commercial operations exposes big nations to new vulnerabilities that may be exploited by nonstate actors. The Pentagon invented the Internet four decades ago, and by most measures, the United States is still the top nation in both military and civilian usage. At the same time, the United States is more susceptible to assault than many other nations due to its higher reliance on networked computers and communication, and the cyber domain has become a significant source of insecurity. The phrase "cyber-attack" refers to a broad range of activities, including basic probes, website defacing, denial of service, espionage, and destruction[5].

Similarly, the phrase "cyber war" is loosely used to a broad variety of activities. It follows dictionary definitions of war, which vary from military combat to any antagonistic dispute (for example, "war between the sexes" or "war on poverty"). On the other hand, some people define cyber war as a "bloodless war" between nations that solely involves fighting in the virtual realm of cyberspace[6]. However, this sidesteps key problems like the interconnectedness of cyberspace's physical and virtual levels, which we addressed before. Hostile acts in cyberspace that have consequences that magnify or are comparable to significant kinetic violence are a more

appropriate definition of cyber war. Governments having a near monopoly on large-scale use of force in the physical world, the defense has a thorough understanding of the terrain, and assaults terminate due to attrition or fatigue. Resources and movement are both expensive. Actors in the virtual world are varied, sometimes nameless, physical distance is irrelevant, and offense is often inexpensive. The attack presently has the upper hand over the defense since the Internet was built for ease of use rather than security. This may not be the case in the long run as technology advances, including attempts to "reengineer" certain systems for increased security, but it is at this time[7].

The bigger party's capacity to disarm or kill the adversary, occupy territory, or employ counterforce tactics successfully is restricted. The most spectacular of the possible dangers is cyber war, which is still in its early stages. Cyber assaults on military and civilian targets may theoretically cause enormous disruption as well as physical damage if carried out by major nations with extensive technological and human resources. Interstate deterrence (but not traditional nuclear deterrence), offensive capabilities, and plans for network and infrastructure resilience if deterrence fails are among the responses to cyber war. It may be feasible to strengthen these processes with some basic standards in the future, but the world is still in the early stages of such a process[8]. If hacktivism is seen as mostly a nuisance at this point, there are four primary types of cyber risks to national security, each with a distinct time horizon and (in theory) various solutions: States are primarily linked with cyber war and economic espionage, whereas nonstate actors are usually associated with cybercrime and cyber terrorism. For the United States, the greatest expenses are now incurred via espionage and crime, but war and terrorism may become bigger risks in the next decade or two. Furthermore, as various players' affiliations and strategies develop, the categories may become increasingly entwined. "Sooner or later, terror organizations will acquire cyber-sophistication," says ADM Mike McConnell. It's similar to nuclear proliferation, but far less difficult." We're just now seeing glimpses of cyber war, such as an add-on to certain conventional assaults, such as the denial-of-service attacks that followed the conventional war in Georgia. Can we learn anything about the present cyber change from the nuclear revolution in military operations seven decades ago? The answer seems to be no at first sight[9]. The disparities in technology are just too big. Differences in the threshold for action and attribution are cited by the National Research Council—nuclear explosions are unmistakable, whereas cyber intrusions that plant logic bombs in the infrastructure may go unnoticed for long periods of time before being used, and even then, can be difficult to trace. The sheer destructiveness of nuclear technology is much more striking.

Cyber does not represent an existential danger, unlike nuclear weapons. As points out, the destruction or disconnection of cyber networks may return us to the 1990s economy, resulting in a massive loss of GDP, while a catastrophic nuclear conflict could send us back to the Stone Age. 10 Comparisons of cyber with biological and chemical weapons may be more appropriate in this and other aspects. Furthermore, cyber devastation may be disaggregated, allowing for the delivery of tiny doses of damage over time. While there are various degrees of nuclear devastation, they are always above a critical point or firebreak. Furthermore, although civilian and military nuclear technology overlap, nuclear technology was developed for use in war, and the distinctions in its use are more obvious than in cyber, where the Web has grown in popularity in the civilian sector[10]. The "dot mil" domain name, for example, is just a tiny portion of the

Internet, and 90 percent of military phone and Internet connections are routed via civilian networks.

Finally, nonstate actors have much reduced obstacles to entrance into cyberspace due to economic dominance and cheap costs. While nuclear terrorism is a significant threat, the hurdles to non-state actors getting access to nuclear materials remain high; hiring a botnet to cause havoc on the Internet is simple and inexpensive. However, ignoring the past would be a mistake, as long as we realize that metaphors and analogies are never flawless. "History never repeats itself, but it rhymes sometimes," as Mark Twain famously said. There are some important nuclear-cyber strategic rhymes, such as the superiority of offense over defense, the potential use of weapons for both tactical and strategic purposes, the possibility of first-and second-use scenarios, the ability to create automated responses when time is limited, the likelihood of unintended consequences and cascading effects when a technology is new and poorly understood, and the likelihood of unintended consequences and cascading effects when a technology is new and poorly understood. Even more significant than these technological and political parallels is the learning process that governments and corporate players go through as they attempt to comprehend disruptive technology and develop strategies to deal with it. Although official studies on computer and Internet vulnerabilities date back to 1991, and the Pentagon just published a new plan, few experts believe the country has established an effective national cyber security strategy.

DISCUSSION ON THE CYBER WAR

The uneven and slow history of nuclear learning should serve as a warning to some of the dangers and possibilities that lie ahead in the cyber realm. In the first half-decade after World War II, Ernest May characterized US military policy and the development of nuclear strategy as chaotic. He'd probably use the same phrase to describe the current state of cyberspace. Nuclear energy was first harnessed for military reasons, but it soon became apparent that it had significant civilian applications as well. During the early stages of nuclear energy research, it was predicted that electricity would become ubiquitous. Too inexpensive to meter" and an atomic reactor would provide a year's worth of fuel for vehicles The size of a vitamin pill pellet. The engineers' enthusiasm for their new invention is contagious. A political goal to encourage civilian applications of technology bolstered technology of nuclear power Fearful of anti-war and anti-nuclear protests. The government of Dwight D. Eisenhower sponsored an Atoms for Peace initiative. Volunteered to help promote nuclear energy throughout the globe. Other several nations took part. As a result, a strong local and international presence was established.

A global campaign for nuclear energy promotion that aided in the provision of materials required for India's nuclear explosion in 1974, France justified the sale of a reprocessing facility to Pakistan and the sale of a reprocessing plant to Germany. Enrichment technique was first introduced to Brazil in the mid-1970s. The Atomic Energy Commission and the Joint Atomic Energy Committee were established to provide civilian control of nuclear technology, but both became instances of regulatory capture over time. Strong economic interests, who are more concerned with marketing than with the truth security and regulation Late in Ford's presidency. The group was dissolved. However, after the 1974 oil crisis, it became an article. Nuclear power would be the energy of the future; that uranium would be the fuel of choice. It would be required to build reactors. Following the Carter administration, the non-governmental Ford-Mitre Report's suggestions, which were attempted in 1977, it hit a roadblock in its efforts to halt the growth of

the plutonium economy. Not just from outside, but also from the nuclear sector, there has been a whirlwind of response. Its domestic supporters in Congress. As previously said, the civilian sector plays an even greater role in the conflict. The issue of creating a national security policy is further complicated by the cyber realm. The Internet has evolved into a far more powerful tool. Nuclear energy has never been a major contribution to GDP. The personal than a policy restriction, the sector is at the core of the activity. That policy is intended to safeguard. Risk is unavoidable, and redundancy and backup plans are essential.

A plan must include resilience after an assault. The private sector owns and operates the infrastructure, while the government owns and operates the land. There are just a few little levers to operate. Proposals to establish a central agency in the executive branch as well as a joint committee on cyber security in Congress may be considered. It's important to be aware of the risks of regulatory capture and the formation of a cyber "iron triangle" including the executive branch, Congress, and business. In the cyber realm, there is a mismatch of economic incentives from a security standpoint. Up to a degree, businesses have a motivation to provide for their own security, but product price competition restricts that point. Furthermore, businesses have a financial interest to keep incursions that might undermine public trust in their goods and stock prices hidden. "The public (and, in many cases, the industry) awareness of this major national security danger is essentially negligible owing to the extremely small number of voluntary disclosures by victims of intrusion activity," according to a McAfee white paper. As a consequence, there is a scarcity of accurate data and a lack of national security investment. Furthermore, antitrust rules limit private-sector collaboration, and the complexity of determining responsibility in sophisticated software restricts the involvement of the insurance market. Different views and distrust hinder public-private cooperation. Something terrible will have to happen before markets begin to reprice security, as one attendee at a recent cyber security conference observed. Without collaboration, learning may lead to belief convergence. Governments operate in the best interests of their countries, but they may also act in the best interests of their citizens. How they define their passions, both in terms of how they describe their passions and how they define their passions.

It was unrealistic to believe that exports would stay entirely quiet. The instability of the weapons race, as well as the costs and dangers it involved, was a fourth area of general knowledge. These points of view evolved separately and in tandem, and it took more than two decades for them to come together in a formal way. Harmony would result from perfect agreement of views, which is very uncommon in global politics. Cooperation in the nuclear field arose from certain shared ideas as well as real and expected conflict. The linked cyber realm necessitates a degree of collaboration and governments being aware of the issue by its very nature. Some commentators compare internet to the wild west, however unlike the early days of nuclear power, cyberspace includes a variety of private and public governance sectors. Certain technical Internet protocol standards are established (or not) by agreement among engineers in the nonprofit Internet Engineering Task Force. Despite the existence of certain cooperative frameworks, such as the European Convention on Cyber Crime, they are still weak, and governments continue to concentrate on the zero-sum rather than positive-sum aspects of these games.

Simultaneously, some of these problems may be undergoing some autonomous learning. For example, Russia and China have refused to join the Cybercrime Convention and have sheltered behind plausible deniability by encouraging "patriotic hackers" to get into their systems.

However, if the costs outweigh the advantages, their views may shift. "Russian cyber-criminals no longer obey hands-off regulations when it comes to homeland targets, and Russian authorities are starting to abandon the laissez-faire attitude, and China is suffering increasing cyber-crime expenses on its own," for example. Independent learning, as in the nuclear realm, may lay the basis for subsequent active collaboration. Crises aren't the only way to learn, of course. Players may learn the importance of collaboration in maximizing their payoffs over time by playing iterated games of prisoner's dilemma in circumstances with a long shadow of the future. Early steps in nuclear cooperation paved the way for subsequent steps without necessitating a shift in the overall relationship's competitive character. Informal "Track Two" discussions, such as the Pugwash Conferences, bolstered these government actions. There have been no significant cyber-crises to far, but denial-of-service assaults on Estonia and Georgia, as well as the Stuxnet strike on Iran, hint to what is to come. As previously said, some experts believe that markets will not adequately price security in the private sector unless there is a visible catastrophe. Other types of learning, however, are possible. In the case of industrial espionage, for example, China has little incentives to limit its conduct since the advantages greatly outweigh the risks. Spying has been practiced since the dawn of time and does not contravene any specific rules of international law. Nonetheless, governments have created rules of the road to restrict espionage and participated in tit-for-tat retribution patterns to provide an incentive for collaboration. While binding treaties prohibiting governments from engaging in espionage are impossible to conceive, a process of iterations (tit for tat) that establishes rules of the road that minimize harm in practice is feasible.

To prevent "defection lock-in," which may lead to unintended escalation, it's helpful to participate in conversations that might lead to shared views of redlines, if not completely accepted standards, as happened during the Cuban missile crisis. Discussion helps to put particular distinctions into a larger perspective a shadow of the future. Concerns about crisis management and accidents prompted the establishment of the hotline, as well as the early 1970s Accidents Measures and Incidents at Sea seminars. Similarly, the two sides found a shared interest and started cooperating on nonproliferation problems in the mid-1960s, long before bilateral arms control agreements on matters of arms race stability in the 1970s. Nuclear learning and agreements progressed at various speeds in different sectors, contrary to the popular belief that nothing is resolved in a contract until everything is settled. It's probable that the cyber domain will be similar. As we've seen, there are already certain agreements and organizations in place that deal with the fundamentals of Internet operation, such as technical standards and names and addresses, as well as the beginnings of a normative framework for cybercrime.

However, it is probable that agreement on difficult topics like as cyber incursions for espionage and war preparation would take longer. Nonetheless, the inability to envision a broad consensus does not have to stymie progress on specific problems. Indeed, breaking down word assaults into individual acts that may be handled independently may provide the greatest chance of success. As previously stated, the military may be under civilian authority while maintaining its own operational culture. It is tasked with entertaining worst-case scenarios due to its nature and purpose. It does not necessarily learn the same lessons as its civilian counterparts at the same pace. Early in the SALT negotiations, Soviet military officials protested about the Americans' practice of sharing classified military material in front of the Soviet delegation's civilian members. The exercise resulted in increased communication on the Soviet side. At the same

time, Soviet military commanders lacked a basic grasp of American institutions and the function of Congress in relation to nuclear matters. Their participation in armament negotiations aided in the development of a more sophisticated generation of younger leaders. "It's difficult to address the topic with the military," Foreign Minister Andrei Gromyko said, "but the more interaction they have with the Americans, the simpler it will be to transform our troops into something more than martinets."

CONCLUSION AND IMPLICATION

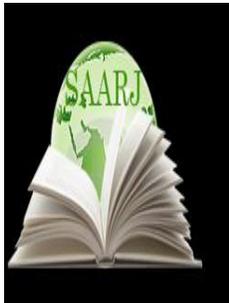

If taken too literally, historical parallels may be hazardous, because the distinctions between nuclear and cyber technology are vast. Cyberspace is fresh and dynamic; much as nuclear technology was when it was first developed. When we consider how lengthy and difficult it was to create a nuclear strategy, much alone worldwide nuclear cooperation, it may assist to put the challenges of creating a cyber-security strategy into perspective, especially the element of state collaboration. Nuclear education was sluggish, halting, and insufficient. The intellectual and political rivalry between the United States and the Soviet Union was much more intense than it is now between the United States and Russia or the United States and China. The partnership has much fewer positive threads of dependency. Despite the intensity of the zero-sum game, rules of the road and cooperative agreements were developed to assist maintain the parallel positive-sum game. The good news is that this is the case. The bad news is that cyber technology provides nonstate actors much more power than nuclear technology, and the dangers they represent are certain to grow. The cyber domain's transnational, multifactor games raise a new set of issues about what national security means. National and unilateral security responses, focusing on cleanliness, redundancy, and resilience, are some of the most significant security responses. However, it is probable that major countries will eventually realize that cooperation against nonstate actors' insecurity would need a higher priority in attention. At this point in cyber technological development, the globe is a long way from such a reaction. However, such reactions did not emerge until the third decade of the nuclear age. The World Wide Web has only been around for two decades.

METHODS OF STUDYING THE MEDIA TEXT

Gazieva Dilfuza Mukhamedkadirovna*

*Lecturer of the Department of Primary Education Methodology,
 Fergana State University,
 UZBEKISTAN

ABSTRACT

Thus, with a discursive approach, each specific text is viewed through the prism of socio-ideological connections, taking into account the social interests and political views of participants in mass communication, the people who created and perceive it. The ultimate goal of discourse analysis is to identify and describe the connections between language, power and ideology that are usually hidden for a mass audience. The method of critical linguistics— a relatively new direction in linguistics is quite close to the method of discourse analysis. The purpose of the method of critical linguistics is to detect and study ideologically colored components of the text. At the same time, special attention is paid to the analysis of mass media texts as texts that are deeply ideologies by nature.

KEYWORDS: *Unemployment, Employed, Labor Force, Job Market, Trade Union, Minimum Wage.*

INTRODUCTION

Media texts are fundamentally interdisciplinary in nature and are the object of study of a variety of sciences: linguistics, sociology, psychology, stylistics, cultural studies, political science, and intercultural communication. Among the most effective and common methods of studying media texts are the following.

Methods of linguistic analysis are a group of methods of semantic, stylistic, morphological, syntactic analysis, traditional for the linguistics of the text, the material for which are media texts. These methods allow us to identify the patterns of organization of each level of the media text, the stable compatibility of units characteristic of different genres and media topics, the features of various tropes and stylistic techniques from the point of view of the implementation of the general communicative perspective of the media text. The use of these methods of media text research has a long and fruitful tradition.

The method of content analysis, or content analysis (from English content – content) is "a research method aimed at a systematic, objective, quantitative data-based study of the content of communication", its purpose is to "identify and count the cases of the use of selected text units, and then on this basis to study the messages, images and representations contained in media texts in a broader social context" (B. Berelson). Based on the statistical calculation of specially selected text units (and not only verbal ones), the content analysis method provides the researcher of mass communication with the widest range of possibilities.

There are several classical studies that are still a reference point for researchers. For example, Berelson and Salter, after analyzing 198 short articles in the issues of the most famous, studied the nationality and role of their heroes, the attitude towards them. According to the results, American minorities are theorized much less and described much more negatively.

In the history of content analysis, it is also known that during the Second World War, Lasvel and Leets conducted a study of the intentions (intentions) of the editorial office of the newspaper "True American", which became the main argument for accusing the newspaper of pro-fascist sympathies and contributed to its closure in court. The authors took the slogans of Hitler's agitation as a unit of analysis and calculated whether the accused newspaper actually confirmed or refuted them.⁴⁴

Content analysis of texts about Russia in the English-language press of 2006-7 allows us to conclude that negative trends are increasing in the perception of the image of Russia and its leader in the West, which is manifested in an increase in the total number of text fragments containing references to the KGB, FSB, Lubyanka, Stalinism, totalitarian regime, Bolshevism and other anti-democratic symbols.

A content analysis of the media texts of V. Putin and D. Medvedev revealed that both politicians use the words "us", "our", "we" (about 90 uses of Putin), "Russia", "people", "about the new", "state", "countries", "development", "crisis" equally actively, and this, of course, may be a consequence of the Medvedev-Putin tandem. However, in Putin's speech, the rating of the use of the word "I" (47 uses) is significantly higher than that of Medvedev, he often says "must" (48 uses) and almost never "should" (during his last direct line-2009, he never used it). A similar analysis of President Medvedev's speeches revealed a high rating of the use of "must" (86 – in the president's message and other speeches), that is, according to psychologists; there is a certain psychological complex of must-.

The method of discursive analysis (discourse analysis).The concept of discourse and the method of discourse analysis developed on its basis allows us to focus not only on the external formal features of the text, but, and this is especially important, on a number of extra linguistic factors accompanying its production and actualization. "Discourse (from the French discourse - speech) is a coherent text in combination with extra linguistic - pragmatic, socio-cultural, psychological, etc.

factors: text taken in the event aspect; speech, considered as a purposeful social action, as a component involved in the interaction of people and the mechanisms of their consciousness (cognitive processes). Discourse is speech immersed in life."

The concept of discourse significantly expands the possibilities of describing the text, emphasizing the importance of studying extra linguistic factors accompanying communication.

"Discourse is not limited only to the framework of language. He also studies the entire content of communication: who communicates, with whom, why, in what social status and socio-historical situation, through what channels, how do I interact with the various types of communication involved in the act of communication".

Media discourse, thus, has a normalizing, regulatory effect on communicative situations: this or that discursive space of mass media is a kind of field of what can or should be said or understood, as well as "said" and "understood": not only the topic chosen by the author determines the content and method of its description in the media text - the very choice of the topic is predetermined by media discourse as a "mode of knowledge production".

Thus, the study of the media text as a "node in the network" (M. Foucault) of mass communication makes it possible to understand not only the principles of its internal organization, but also the conditions of its appearance, the rules for the formation of certain meanings and the specifics of the effectiveness of specific mass messages.

One of the classic examples of using the method of discourse analysis of media text is the works of the famous Dutch scientist T. van Dijk: "Analysis of news as discourse" and "The structure of news in the press". Considering news as a special kind of discourse, Vol. van Dijk formulates an important conclusion regarding the entire corpus of mass communication texts: "the structures of media texts can be adequately understood only in one case: if we analyze them as a result of the cognitive and social activity of journalists in the production of texts and their meanings, as a result of the interpretation of texts by newspaper readers and television viewers, produced on the basis of their experience of communication with the media".

Thus, with a discursive approach, each specific text is viewed through the prism of socio-ideological connections, taking into account the social interests and political views of participants in mass communication, the people who created and perceive it. The ultimate goal of discourse analysis is to identify and describe the connections between language, power and ideology that are usually hidden for a mass audience.

The method of critical linguistics – a relatively new direction in linguistics is quite close to the method of discourse analysis. The purpose of the method of critical linguistics is to detect and study ideologically colored components of the text. At the same time, special attention is paid to the analysis of mass media texts as texts that are deeply ideologies by nature.

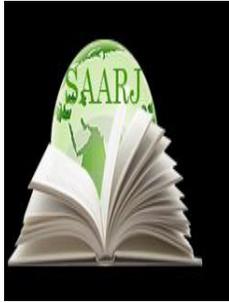

The founder of the media educational theory of the development of critical thinking, British scientist L. Masterman, believes that there are four areas of critical study of media products: 1) who is responsible for the creation of media texts, who owns and controls the media? 2) how is the desired effect achieved? 3) what are the value orientations of the world created in this way? 4) how does the audience perceive it?

SPECIFIC WAYS TO IMPROVE MATHEMATICAL LITERACY IN THE PROCESS OF SENDING STUDENTS TO HIGHER EDUCATION

Saidakhon Raxmonberdiyeva* ; Sodiqova Moxlaroy Shavkatjonqizi**

*Teacher,
 Ferghana State University,
 UZBEKISTAN

**Student,
 Ferghana State University,
 UZBEKISTAN

ABSTRACT

This article describes specific and convenient ways for entrants to solve math assignments in higher education entrance exams.

KEYWORDS: *Mathematical Ability, Mathematical Literacy, Problem, Perpendicular, Intersection, Mathematical Forms, Theorem, Polynomial, Equation, Inequality.*

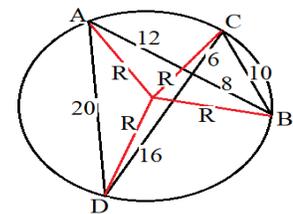

INTRODUCTION

Today, the capacity building of knowledge, skills and abilities in the preparation of students for higher education institutions requires adequate training. To do this, we need to pay more attention to solving complex examples and problems in tests, which is important for the work to be effective.

Below are comments on solving some examples that have raised many questions by applicants.

1 -Problem. The two vertices of a circle are perpendicular to each other, and one of them divides from the point of intersection into 8 and 12 pieces, and the other into 6 and 16 pieces. Find the radius of this circle.

Solution: We get an AB vatar in a circle and a CD vatar perpendicular to it. Let point E be the point of intersection of them and point O be the center of the circle. and a right-angled triangle is formed. According to the Pythagorean theorem, $CB = 10$ and $AD = 20$ is derived. $\triangle CEB \triangle AED$

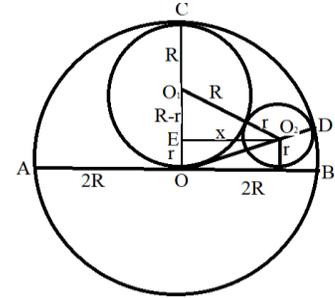

$AO = OD = CO = OB = R$ According to the theorem on intersecting waters, $\widehat{AD} = \angle AOD = \alpha$
 $\widehat{CB} = \angle COB = \beta$

we create. It follows that. . We apply the theorems of cosines to DAOD and DCOB and add them step by step. In that case It turns out that $\angle AED = \angle CED = \frac{\widehat{AD} + \widehat{CB}}{2} = 90^\circ = \frac{\alpha + \beta}{2} \alpha + \beta = 180^\circ \beta = 180^\circ - \alpha$
 $4R^2 = 500R = 5\sqrt{5}$

2 - Problem. AB is the diameter of the intersecting circle, the center of which is drawn in the middle of the circle and the second circle striking the arc of the circle.

Solution: If we define the radius of the second circle as R, then the radius of the first circle is equal to 2R. we draw a section EO2 passing through the center of the third circle and parallel to AB,

where EO1O2 formed a right triangle. $r = \sqrt{\frac{2}{\pi}}$

We apply the Pythagorean theorem:

$$O_1O_2 = R + r \quad O_1E = R - r \quad EO_2 = x \quad x^2 = 4Rr \quad x = 2\sqrt{Rr}$$

Now we apply the Pythagorean theorem to e.OEO2

$OD = 2R$ we find we equate the xs found above. hence we send to The surface of the second circle is equal. $O_2D = r \quad OO_2 = 2R - r \quad OE = x \quad x^2 = 4Rr \quad 4R^2 - 4Rr = 4Rr \quad R^2 - Rr = R - r$
 $2R = RS = \pi R^2 = \pi(2r)^2 = 4\pi r^2 \quad r^2 = \frac{2}{\pi} \quad \text{So, Answer: } 8S = 4\pi r^2 = 4\pi \frac{2}{\pi} = 8$

3 - Example. Polynomial: if given $P(x) = ax^3 + bx^2 + cx + d$

$$\text{if } P(1) = P(2) = P(3) = 0, P(4) = 2a = ?$$

Solution: $ax^3 + bx^2 + cx + d = a(x - x_1)(x - x_2)(x - x_3)$

$$P(x) = a(x - 1)(x - 2)(x - 3)$$

$$P(1) = P(2) = P(3) = 0 \quad P(4) = 22 = a(3)(2)(1)6a = 2a = 1/3$$

4 - Example. $(1 + tg7^0)(1 + tg8^0)(1 + tg37^0)(1 + tg38^0) = ?$ Calculate

$$\begin{aligned} & (1 + tg7^0)(1 + tg8^0)(1 + tg37^0)(1 + tg38^0) \\ &= (1 + tg7^0)(1 + tg8^0)(1 + tg(45^0 - 8^0))(1 + tg(45^0 - 7^0)) \\ &= (1 + tg7^0)(1 + tg8^0) \left(1 + \frac{1 - tg8^0}{1 + tg8^0}\right) \left(1 + \frac{1 - tg7^0}{1 + tg7^0}\right) \\ &= (1 + tg7^0)(1 + tg8^0) \left(\frac{1 + tg8^0 + 1 - tg8^0}{1 + tg8^0}\right) \left(\frac{1 + tg7^0 + 1 - tg7^0}{1 + tg7^0}\right) = 4 \end{aligned}$$

5 - Example. 72010-52010 find the remainder when the expression is 24.

Solution: We use comparisons and their properties:

$$7^2 \equiv 1 \pmod{24} \quad 7^{2010} \equiv 1 \pmod{24} \quad 5^2 \equiv 1 \pmod{24} \quad 5^{2010} \equiv 1 \pmod{24}$$

$$- \begin{cases} 7^{2010} \equiv 1 \pmod{24} \\ 5^{2010} \equiv 1 \pmod{24} \end{cases} \quad 7^{2010} \cdot 5^{2010} \equiv 0 \pmod{24} \text{ Answer: residual 0}$$

6 - Example. if $xy + \sqrt{(1+x^2)(1+y^2)} = \sqrt{5}$

$x\sqrt{(1+y^2)} + y\sqrt{(1+x^2)} = ?$ find.

Solution: We define the second equation as z

$$xy + \sqrt{(1+x^2)(1+y^2)} = \sqrt{5}$$

$x\sqrt{(1+y^2)} + y\sqrt{(1+x^2)} = z$ We square both equations:

$$(xy)^2 + (1+x^2)(1+y^2) + 2xy\sqrt{(1+x^2)(1+y^2)} = 5$$

$$x^2(1+y^2) + y^2(1+x^2) + 2xy\sqrt{(1+x^2)(1+y^2)} = z^2$$

$$(xy)^2 + 1 + x^2 + y^2 + x^2y^2 + 2xy\sqrt{(1+x^2)(1+y^2)} = 5$$

$$x^2 + x^2y^2 + y^2 + x^2y^2 + 2xy\sqrt{(1+x^2)(1+y^2)} = z^2$$

From the above equation we separate the following equation:

$$1 = 5 + z^2z^2 = 4 \quad z = \pm 2 \quad \text{Check: So } z > 0 \quad z = 2$$

7 - For example.. Arithmetic progression The sum of all three consecutive terms is $40. a_1 a_2 a_3 \dots a_6 a_7 a_8 a_3 = 6a_1 + a_8 = ?$

Solution: Similarly $a_1 + a_2 + a_3 = 40a_3 = 6a_1 + a_2 = 34a_2 + a_4 = 34$

$$- \begin{cases} a_1 + a_2 = 34 \\ a_2 + a_4 = 34 \end{cases} = a_1 - a_4 = 0 \quad a_4 + a_5 = 34$$

$$+ \begin{cases} a_1 - a_4 = 0 \\ a_4 + a_5 = 34 \end{cases} = a_1 + a_5 = 34 \quad a_5 + a_6 + a_7 = 40$$

$$- \begin{cases} a_1 + a_5 = 34 \\ a_5 + a_6 + a_7 = 40 \end{cases} = a_1 - a_6 - a_7 = -6a_6 + a_7 + a_8 = 40$$

$$+ \begin{cases} a_1 - a_6 - a_7 = -6 \\ a_6 + a_7 + a_8 = 40 \end{cases} = a_1 + a_8 = 34 \text{ Answer: 34}$$

8- Example. $f(x) = 2f(\text{ctgx}) = ?$ A) $2\sin x \cdot \text{tgx}$ B) tgx C) $\cos x$ D) $2\cos x \cdot \text{ctgx} \frac{x^2}{\sqrt{1+x^2}} \frac{1}{2}$

Solution: $2f(\text{ctgx}) = 2 \cdot \frac{\text{ctg}^2 x}{\sqrt{1+\text{ctg}^2 x}} = \frac{2 \cdot \text{ctg}^2 x}{\sqrt{1+\frac{\cos^2 x}{\sin^2 x}}} = \frac{2 \cdot \text{ctgx} \cdot \text{ctgx} \cdot \sin x}{\sqrt{\sin^2 x + \cos^2 x}} = \frac{2 \cdot \cos x \cdot \text{ctg}^2 x}{\sqrt{1}} = 2\cos x \cdot \text{ctgx}$

9 - For example. If so, find the value of the expression. $n = \log_{1,4} 3 \frac{7^{2n} - 5^{2n}}{7^{2n+2} \cdot 7^{2n} \cdot 5^{2n+5} \cdot 2n}$

Solution: We potentiate the function, that is, we convert it from a logarithmic expression to an exponential expression.

Now let's simplify the expression: $n = \log_{1,4} 3 \cdot 1,4^n =$

$$3 \left(\frac{14}{10}\right)^n = 3 \left(\frac{7}{5}\right)^n = 3 \frac{7^n}{5^n} = 37^n = 3 \cdot 5^n$$

$$\begin{aligned} \frac{7^{2n} - 5^{2n}}{7^{2n} + 2 \cdot 7^{2n} \cdot 5^{2n} + 5^{2n}} &= \frac{(7^n - 5^n)(7^n + 5^n)}{(7^n + 5^n)^2} = \frac{(7^n - 5^n)(7^n + 5^n)}{(7^n + 5^n)(7^n + 5^n)} = \frac{7^n - 5^n}{7^n + 5^n} \\ &= \frac{3 \cdot 5^n - 5^n}{3 \cdot 5^n + 5^n} = \frac{2 \cdot 5^n}{4 \cdot 5^n} = \frac{2}{4} = 0,5 \end{aligned}$$

10 - Example. find the product of the function. $y = \ln x^{\ln x^{\ln x}}$

$$\text{Solution: } y = \ln x^{\ln x^{\ln x}} = \ln x^{\ln x \cdot \ln x} = \ln x \cdot \ln x \cdot \ln x = \ln^3 x$$

$$y' = 3 \ln^2 x \cdot \frac{1}{x} = \frac{3 \ln^2 x}{x}$$

11 - Example. $x^2 + y^2 + |z - 2xy| - 2x + 4y - 5$ If the expression reaches the smallest value, find xyz .

$$\text{Solution: } x^2 - 2x + 1 - 1 + y^2 + 4y + 4 - 4 + |z - 2xy| - 5 = (x - 1)^2 + (y + 2)^2 - 10 + |z - 2xy|$$

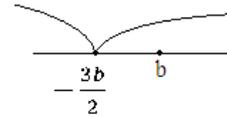

In the resulting expression always takes a positive value when the numbers are squared, which means that the smallest value of these numbers is 0. Equating the square numbers to 0, we find the values of x and y : $(x-1)^2 = 0$ Now the expression looks like this: $(x - 1)^2 + (y + 2)^2 - 10 + |z - 2xy|$
 $(x - 1)^2 + (y + 2)^2 - 10 + |z - 2xy| = 0 + 0 - 10 + |z - 2xy| = -10 + |z - 2xy|$
 $0 = -10 + |z - 2xy| \Rightarrow |z - 2xy| = 10$
 $z - 2xy = 10 \Rightarrow z = 2xy + 10 = 2 \cdot 1 \cdot (-2) + 10 = -4 + 10 = 6$
 $xyz = 1 \cdot (-2) \cdot 6 = -12$

Given that the value of the expression under the module is always positive, its smallest value is 0, in which case it is the smallest value of the expression. $(x - 1)^2 + (y + 2)^2 - 10 + |z - 2xy| = 0 + 0 - 10 + |z - 2xy| = -10 + |z - 2xy|$
 $0 = -10 + |z - 2xy| \Rightarrow |z - 2xy| = 10$
 $z - 2xy = 10 \Rightarrow z = 2xy + 10 = 2 \cdot 1 \cdot (-2) + 10 = -4 + 10 = 6$
 $xyz = 1 \cdot (-2) \cdot 6 = -12$

12 - Example. If a and b are real numbers and, then find the largest integer value of the product ab . $a^2 + 3ab + 5b^2 = 80$

$$\text{Solution: } a^2 + 3ab + 5b^2 = 80, a, b \in \mathbb{R} \quad ab_{\max} = ?$$

$$y = a^2 + 3ab + 5b^2 - 80 \quad y'_a = 0$$

here it is not necessary to check the signs, because as a result of derivation a single point is found, at which point the expression reaches either max or min. Substituting the found value into the expression we find the value of b .

$$y'_a = 2a + 3b = 0 \Rightarrow 2a = -3b \Rightarrow a = -\frac{3b}{2}$$

$$\frac{9b^2}{4} - \frac{9b^2}{2} + 5b^2 = 80 \Rightarrow \frac{11b^2}{4} = 80 \Rightarrow 11b^2 = 320 \Rightarrow b^2 = \frac{320}{11}$$

$$ab_{\max} = -\frac{3b}{2} \cdot b = -\frac{3b^2}{2} = -\frac{3}{2} \cdot \frac{320}{11}$$

13 - Example. Find the face of the painted sphere, drawn inside a quarter circle on a square whose side is equal to 1 unit.

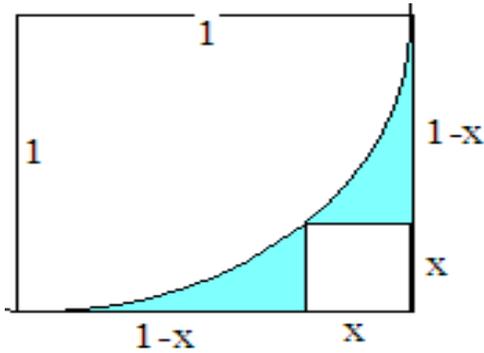

Figure 1

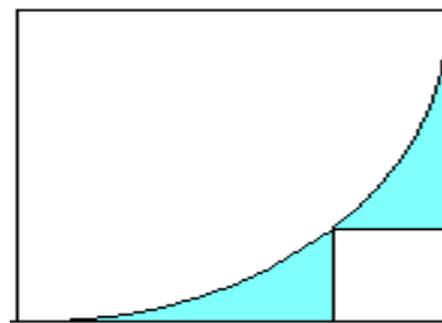

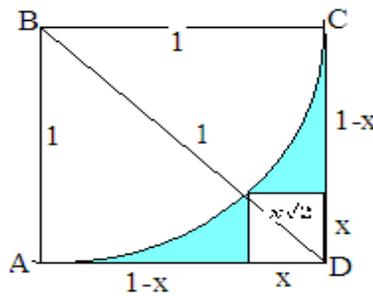

Figure 2

Solution:

$$S_{soxa} = S_{kvadrat} - S_{sektor} - x^2 S_{soxa} = 1 - \frac{\pi}{4} - x^2$$

We apply the Pythagorean theorem to a right triangle ABD or BCD:

$$1^2 + 1^2 = (1 + x\sqrt{2})^2 = 1 + 2x\sqrt{2} + 2x^2$$

$$2x^2 + 2x\sqrt{2} - 1 = 0 \Rightarrow x = \frac{2 - \sqrt{2}}{2} = \frac{3}{2} - \sqrt{2}$$

$$S_{soxa} = 1 - \frac{\pi}{4} - \left(\frac{3}{2} - \sqrt{2}\right)^2 = \frac{4\sqrt{2} - 2 - \pi}{4}$$

14 - Example. ABCD trapezoid $AB \parallel DC$. $\angle ABC = 2 \angle ADC$, $|AB| = 4$, $|BC| = 13$. Find the length of the base.

Solution: We use the sine theorem:

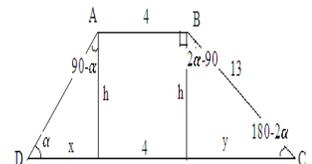

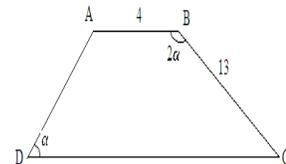

$$\text{from: } \frac{x}{\cos \alpha} = \frac{h}{\sin \alpha} = \frac{h}{\sin 2\alpha} = \frac{13}{1} =$$

$$\frac{y}{\sin(2\alpha - 90^\circ)}$$

$y = -13 \cos 2\alpha$ it follows that we reduce the resulting equations to the 1st proportion. from which we find x: $h = 13 \sin 2\alpha \frac{x}{\cos \alpha} =$

$$\frac{13 \cdot 2 \sin \alpha \cos \alpha}{\sin \alpha} x = 26 \cos^2 \alpha = 26 \cdot \frac{1 + \cos 2\alpha}{2}$$

$$x = 13 + 13 \cos 2\alpha \text{ we replace: } x = 13 - yx + y = 13DC = x + y + 4DC = 17$$

15 - Example. In an equilateral ABCD trapezoid, the AC is perpendicular to the diagonal CD. If, find. $AD = 4|AB|^2 + |BC|^2 = 11 |AB|$

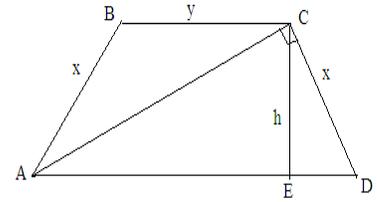

Solution: $AE = \frac{4+y}{2} ED = \frac{4-y}{2} x^2 + y^2 = 11$

$$x^2 - \left(\frac{4-y}{2}\right)^2 = h^2 h^2 = \frac{4+y}{2} \cdot \frac{4-y}{2}$$

$$x^2 = \frac{16-y^2}{4} + \frac{(16-8y+y^2)}{4} = \frac{32-8y}{4} = 8-2y$$

$$11-y^2 = 8-2yy^2 - 2y - 3 = 0$$

$$y = \pm 3y = -1x^2 + 9 = 11x = \sqrt{2}$$

16- Example. Two circles with radii 9 and 4 try from the outside. Find the radius of the circle that is trying to be their arcs and their total effort.

Solution:

$$16 - 8r + r^2 + x^2 = 16 + 8r + r^2$$

$$81 - 18r + r^2 + (12-x)^2 = 81 + 18r + r^2$$

$$x^2 = 16r(12-x)^2 = 36r144 - 24x + 16r = 36r$$

$$144 - 24x = 20r36 - 6x = 5r$$

$$x = \frac{36-5r}{6} x^2 = \frac{(36-5r)^2}{36}$$

$$x^2 = 16rx^2 = \frac{(36-5r)^2}{36} = 16r$$

$$36^2 - 360r + 25r^2 = 16r \cdot 36$$

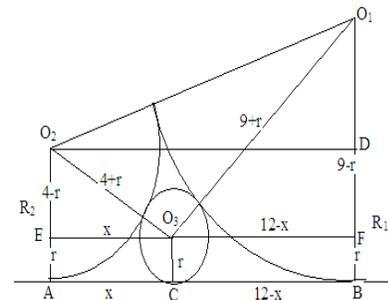

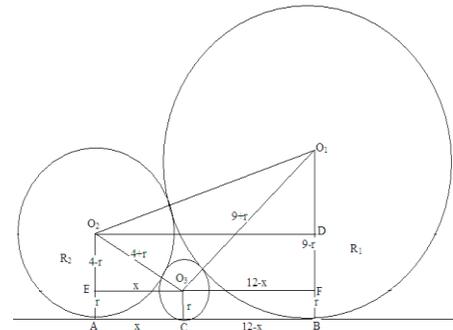

$$25r^2 - 360r + 1296 - 576r = 0$$

$$25r^2 - 936r + 1296 = 0$$

$$D = 876096 - 129600 = 746496 = 864^2$$

$$r_{1,2} = \frac{936 \pm 864}{50}$$

$$r_1 = 36r_2 = 1,44$$

17 - Example. $\begin{cases} x^2 + y^2 - 2x - 4y \leq -1 \\ 3x - 2y + 1 \geq 0 \end{cases}$ Calculate the area of the sphere formed by the set of points (x y) satisfying the system of inequalities.

Solution: Substituting the given system of inequalities, we make it as follows.

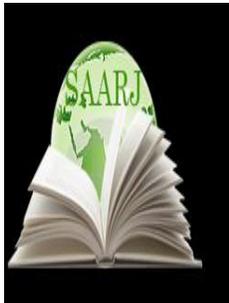

$$\begin{cases} x^2 - 2x + 1 + y^2 - 4y + 4 \leq -1 + 1 + 4 \\ 2y \leq 3x + 1 \end{cases} \quad \begin{cases} (x-1)^2 + (y-2)^2 \leq 2 \\ y \leq \frac{3x+1}{2} \end{cases} \quad \text{The radius of}$$

inequality 1 in the system gives the surface of a circle of radius 2, and inequality 2 gives us a straight line that divides the circle into two equal parts and does not exceed the intersection. This means that the area formed is a semicircle with radius 2. And his face,

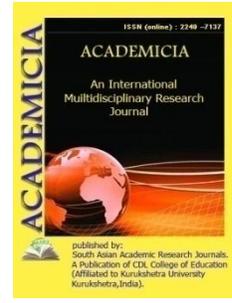

$$S = \frac{\pi R^2}{2} = \frac{4\pi}{2} = 2\pi \text{ ga teng.}$$

ABSTRACT

Climate change is caused by the exponential increase of CO₂ and other greenhouse gases in the atmosphere. Agriculture, biodiversity, forestry, people's health, snow cover, and aquatic and mountainous ecosystems all suffer as a result. Climate changes such as temperature, solar radiation, or precipitation have the ability to affect agricultural output. Despite many attempts to mitigate the effects of climate change, Nepalese agriculture continues to face challenges. The nation saw a 1.8° C increase in temperature from 1975 to 2006, with an average of 0.06° C/yea. Climate change has caused Nepal to suffer regular droughts, catastrophic floods, landslides, and a variety of impacts on agricultural products. According to a study conducted at Khumaltar on CO₂ enrichment technology, rice and wheat yields rose by 26.6 percent and 18.4 percent, respectively, owing to double CO₂, 17.1 percent and 8.6 percent due to temperature rise. A crop simulation model used to investigate the impacts of CO₂, temperature, and rain on rice and wheat yields in NARC found a favourable effect in all areas, but a negative effect in maize, particularly in Terai. In Nepalese agriculture, the time has come for authorities to devise adaptive strategies to minimize the impacts of recent unpredictable weather patterns in order to prevent incalculable natural catastrophes and sufferings.

KEYWORDS: Agriculture, Climate, Greenhouse, Yield.

1. INTRODUCTION

Climate change is occurring. Climate change is a phenomenon brought on by greenhouse gas emissions from fuel combustion, deforestation, industrialization and urbanization, which results in changes in solar energy, temperature, and precipitation. It poses a serious threat to people's lives all over the world, affecting water resources, agricultural production, coastal areas, fresh water, vegetation, including forests, snow cover and melting, geological processes such as landslides, desertification, and flooding, as well as food security and human health in the long run[1].

Instead of agriculture, greenhouse gas emissions are the focus. Water vapor, nitrous oxide (N₂O), carbon dioxide, methane (CH₄), and chlorofluorocarbons are the primary gases that contribute to greenhouse. The three major greenhouse gases, CO₂, CH₄, or N₂O, are responsible for about 88 percent of global warming. Harrison and Aiyer identified the potential of CH₄ emissions from rice fields as early as 1913. The concentration of CH₄ gas in the atmosphere is currently increasing at a rate of 3% each year. By 2100, methane levels are projected to rise by 3.0 to 4.0 ppm, potentially causing significant climate change. According to a research performed at the Nepal Agricultural Research Council in Khumaltar, the average seasonal methane emission from rice fields under rain-fed circumstances was 28 kg/ha/season. In rice fields with 50 percent nitrogen and 15 cm stubble, the maximum average methane gas was 49.03 kg/ha. A minimum of 7.7 kg/ha of methane gas was found in the control fields. More research on GHGs in different eco-zones is required to more precisely quantify and verify their effect on agriculture[2].

Thailand or India, respectively, released 49 and 45 kg/ha of methane. Nepal has fewer emissions than developed countries due to a lack of irrigation infrastructure as well as fertilizer usage. The greatest methane emission from rice was measured at 367 kg in Korea. It may be because of increasing chemical fertilizer usage and better irrigation system.

1.1. Agriculture, as well as the weather, are both important factors.

Weather is an atmospheric condition that has an impact on agriculture on a surface timescale of minutes to weeks. During the monsoon season, which lasts from June to September, Nepal receives more than 80% of its annual precipitation. The effects of increasing temperatures and unpredictably wet weather on crops have a direct influence on agriculture and food production. The quantity of rain that the monsoon brings has an effect on production. Agriculture is susceptible to short-term weather changes, which have an impact on crop yield. Droughts are caused by a lack of rain and increasing temperatures, while heavy rain in a short period of time reduces ground water recharge by accelerating runoff and causing floods. Both of these factors have a negative effect on agriculture. Regular weather patterns are also disrupted by climate change, causing monsoon intensity and duration to fluctuate[3].

1.2. The impact on Nepal's agriculture industry Nepal's economy is based on agriculture:

Increasing temperatures and CO₂ emissions help important crops grow to some extent. Improved photosynthetic processes, water use efficiency, physiologic period shortening, or soil microbial activity, for example, may result in increased agricultural production. Negative effects include increased respiration, fertilizer use efficiency, shift in agricultural zone, increase in insect pest population, desertification, increased soil erosion, evapo-transpiration, and malnutrition in a world overflowing with food due to reduced protein and mineral nutrients content in various

crops. A decrease in fertile land in some places and an increase in others has an effect on agriculture. As a consequence, the world is confronted with a tough problem. Increased CO₂ aids plant development, and yields will improve by 40% if CO₂ levels are doubled. With rising CO₂ concentrations, Annex 1 reveals some promising outcomes[4].

1.3. Climate Change Evidence in Nepal and Nepalese Agriculture:

1.3.1. General:

- The twelve hottest years between 1975 and 2007 (e.g. 2006 was the warmest year)
- Excessive runoff and poor groundwater recharge were caused by late or pre-monsoon precipitation, atypical precipitation, fewer wet days, and strong rainfall events.
- In the terai areas, extreme fog conditions have lately been recorded.
- In Kathmandu, the traditional rainfalls of Jestha and Ashar (mid-July) have been moved to Shrawan and Bhadra. It has had a detrimental impact on paddy output.
- Due to a rise in air temperature in the alpine environment, precipitation is decreasing and glaciers are receding (AX010 tiny glacier mountain is disappearing at an alarming pace).
- The number of frost days in the KTM valley is reducing, winter has arrived a month later than usual, and snow has fallen in Kathmandu.
- An unexpected snowfall in the Darchula region of the nation recently hampered the gathering of valuable medicinal plants Yarsagumba.
- Mosquitoes from the Terai and the Mid-Hill may live in the highlands.

1.3.2. Agriculture:

Early monsoon caused a rain shortfall in the Eastern Terai in 2005/06, reducing agricultural output by 12.5 percent on a national scale. Due to a lack of rain, almost 10% of agricultural land was left fallow, although the midwestern Terai saw severe rain and floods, reducing output by 30% in the year. Early crop maturation as a result of rising temperatures may allow for more crops in the same agricultural cycle (NARC annual report). There has been a shift in climatic zones throughout the nation. Natural vegetation extinction was also documented, including native basmati rice types, some local wheat, maize, and other agricultural crops. • The cold wave in Nepal in 1997/98 had a significant effect on agricultural output, with decreases in potato, toria, sarson, rayo, lentil, and chickpea production of 27.8, 36.5, 11.2, 30, 37.6, and 38 percent, respectively[5].

1.3.3. Objectives:

- To familiarize students with the idea of climate change and its implications for agriculture.
- Assisting policymakers in developing solutions for dealing with climate change and its effects

1.4. Climate Change's Impact On Agricultural Lands and Agro-Ecozones:

Plains, hills, mid hills, high hills, and mountains are some of Nepal's agricultural zones. Changes in agri-zones result in changes in the zone's cropping pattern. Climatic variables have the ability

to alter the distribution of agricultural crops ecologically. The loss of biodiversity might be catastrophic if climatic zones shifted quickly as a result of climate change. Cold-water fish, plants, pasturelands, tree lines (apple trees), and cattle are all affected (Chauri). Temperature rises in the Terai area inflict greater harm to agricultural sectors, whereas in the hills and mountains, it is more beneficial for agriculture. Cropping patterns, as well as vector-borne diseases of humans and animals, are anticipated to change in higher eco zones as temperatures rise. Some lands that are currently unsuitable due to weather conditions may become desirable in the near future. Maize, chilli, tomato, and cucumber, for example, are now widely used in the country's Mustang region[6].

Fertility of the soil and water availability with more CO₂ as a natural fertilizer, more food can be produced. Increased CO₂ availability may decrease the minerals available in soil, resulting in more robust development of food crops. Increased warmth may decrease soil organic carbon, soil micronutrients, and accelerate decomposition by stimulating the soil's microbial community. The four largest rivers coming from the Himalayas. Crops, cattle, and horticulture are all heavily reliant on the available water resources in the nation. Changes in temperature and weather are a significant cause of changes in soil moisture availability. Increased evapo-transpiration owing to rising temperatures will need more water to alleviate drought. The physiological active phase and crop output are governed by water availability. Monthly temperature rises of +2o C and +4o C disrupted evapo-transpiration and evaporation, according to research. Reduced watertable, increased evapotranspiration, soil erosion, landslides, floods, flooding of standing crops, and reduced soil fertility are all possible vulnerabilities as air temperatures rise.

1.5. Climate Change Impacts on Major Crops and Livestock:

1.5.1. Rice:

Rice is the world's second most significant crop, with 525 million tons produced from 148 million hectares. It is grown at an elevation of 300-2300 meters above sea level. Rice output in South Asia must quadruple by the year 2020. Raised CO₂ and temperature in the NARC at Khumaltar resulted in increases in rice production of 17.07 and 26.58 percent, respectively, even when the temperature in the chamber was increased by 6.2o C and 7.36o C. (Annex 2 and The greenhouse effect caused by doubling carbon dioxide was measured at 1.16o C, resulting in plots that were 9.51 percent higher than the ambient plots. The nitrogen content of rice grew by 16.3 percent as the temperature rose, but dropped by 9.8 percent when CO₂ levels doubled. Due to the rise in temperature, panicle initiation, blooming, heading, milking stage, and crop maturity time have all reduced by 7,4,4,4, and 6 days, respectively[6].

1.5.2. Wheat

Wheat is the world's most significant crop, and Nepal's third. It covers 20% of the entire cereal land and accounts for 18.8% of the country's total cereal output. Wheat growth and production are heavily influenced by climatic factors such as rain and temperature. Even with a temperature rise of 6.94o C and a doubling of CO₂, an experiment performed in an Open Top Chamber at Khumaltar showed an increase in wheat production of 8.63 and 9.74 percent (Annex 4 and 5). The greenhouse effect caused by doubling CO₂ was just 0.18o C and resulted in plots that were 9.74 percent higher than the ambient plots. Due to the rise in temperature, physiological development phases such as panicle initiation, heading, blooming, milking, and physiological

maturity reduced by 14, 5, 9, 6 and 14 days, respectively. Increased CO₂ levels in the C₃ pathway in rice and wheat contributed to higher yields[7].

Under high CO₂, wheat output rose by 41.5 percent in the Terai plain, 24.4 percent in the hill, and 21.2 percent in the mountain. The yield dropped by 1.8 percent in the Terai, but increased by 5.3 percent in the hill and 33.3 percent in the mountain when the temperature rose by 4 degrees Celsius under irrigated conditions. According to a research performed in India, there would be a modest reduction in potential yield of 1.5-5.8% in the subtropical zone, but a 17-18% decrease in the tropical zone. In a climate change scenario, it seems that rainfed wheat production would suffer more in Terai than in the mid-hill environment. At all degrees of temperature increase, the extra rains had a positive effect on wheat production.

1.5.3. Maize:

Maize is Nepal's second most important crop, although it is the main crop in the hills. The planting date of maize is determined by the availability of soil moisture during the pre-monsoon period. In the hills, relaying or mixed cropping are typical techniques to guarantee crop harvest. At mid-altitude, millet and soybean are extensively relayed, while peanuts and beans are also utilized as maize relay crops. Because it uses the C₄ photosynthetic pathway, its grain production is less affected by rising CO₂ levels in the atmosphere. In the terai, maize output rose by 9.0%, 4.9 percent in the hills, and 15.5 percent in the mountains. However, the yield fell by 26.4 percent in the terai, -9.3 percent in the hills, but climbed to 26.8% in the mountains as the temperature rose by 4 degrees. As a result, temperature response to maize crop is better in the highlands than in the terai and hills[8].

1.6. Crops for horticulture:

On 255 thousand hectares, fruits and vegetables are produced. In the current scenario, the impacts of climate change on horticulture crops are quickly becoming a concern. Tropical fruits (banana, mango, papaya) and other crops such as croton have been adopted in the mid hills, while off-season blooming has been recorded in high altitude crops such as peach, pear, and apple. The reaction of temperature and CO₂ in tomatoes was studied using an open top chamber, which revealed that increasing CO₂ boosted tomato output by 279 percent and fruit number by 205 percent when compared to field conditions. According to several studies performed in other countries, increasing CO₂ in potatoes reduced the amount of components such as iron, zinc, manganese, and sulphur. The concentration of oleic acid in soybean seeds increased as the temperature rose, whereas the concentration of linolenic acid dropped (Thomas et al., 2003). In strawberries, for example, ascorbic acid and glutathione rose by 13 as well as 171 percent from ambient to ambient + 600 ppm CO₂ conditions, respectively (Agriculture Research Service). When compared to plants cultivated in ambient air. The sourness of oranges rose by 75% when the CO₂ concentration of the air was increased. Because of the rise in carbon dioxide gas, vitamin C (antioxidant) levels have increased by around 5%. (Kimball and Mitchell, 1981). The quantity of important vitamins in fruits and vegetables increases when CO₂ levels rise in the environment, which helps to enhance human health[9].

1.7. Diseases and pests Parameters of climate change:

The growth and spread of pests and illnesses are influenced by temperature, rainfall patterns, and humidity. In the presence of a host plant, a rise in temperature or CO₂ will result in an increase

in pest population and disease severity. It accelerates the insect and pest reproductive cycle. As bug populations grow, there is a greater need for pesticides, which unwittingly harms both the environment and human civilization. Climate change will exacerbate the spread of pests and illnesses in tropical areas. Plain environment pests and diseases may eventually migrate to hills and mountains. Some diseases of key Terai crops (such as rust and foliar blight) have evolved in the hills and mid-hills, posing a threat to agricultural output[10].

1.8. Research On Nepalese Agriculture's Ability To Adapt To Changing Climate:

- Increased heat, drought, and insect resistance in crops.
- Increased irrigation efficiency via the use of drip and sprinkler irrigation.
- Water and nutrient management research in different agro-ecologies to address climate change.
- Green manuring crops including cover crops are being studied in order to maintain soil moisture, organic matter, and micronutrients.
- Models for climate prediction and its application are being researched.
- New technologies for a low-carbon economy are being researched.
- Land utilize planning, watersheds, vulnerability assessment, or resource management are all areas of research.
- Research into yield gap analysis to better understand the variables that cause climate change.

1.9. Improvements in Agricultural Productions Strategies:

- Encourage rural populations that rely on agriculture to attend seminars, workshops, training, and general education.
- Identifying current climate change problems affecting agricultural industries.
- Strengthen the Agricultural Research Station and commodities program in order to conduct effective climate change research.
- Interactive communication to farmers on climate change and its effects on agriculture in order to transfer technology.
- Preserving genetic resources to prevent biodiversity extinction.
- Crop insurance policies for social and food security.
- A shift in national policy in favour of farmer incentives, such as agricultural input subsidies and agricultural investment.

1.10. Recommendations:

The following key policy suggestions should be given top priority:

- Build irrigation infrastructure to mitigate drought risks.
- Develop minimal tillage and zero-tillage rice, wheat, and maize crops to minimize soil carbon and water loss.

- Develop heat- and drought-resistant kinds and breeds, as well as insect pest-resistant cultivars, and improve IPM mechanisms (integrated pest management).
- Develop safe agrochemicals to reduce agricultural pest and disease damage.
- To deal with weaknesses, develop collaboration and coordination among neighbouring countries.
- Create a climate-forecasting system to mitigate risks.

2. DISSCUSSION

The exponential rise of CO₂ and other greenhouse gases in the atmosphere causes climate change. As a consequence, forestry agriculture, biodiversity, human health, snow cover, including aquatic and mountainous ecosystems all suffer. Temperature, solar radiation, and precipitation all have the potential to influence agricultural production. Despite many efforts to minimize climate change's impacts, Nepalese agriculture continues to confront difficulties. Between 1975 and 2006, the country's temperature rose by 1.8 degrees Celsius, with an average annual rise of 0.06 degrees Celsius. Droughts, severe floods, landslides, and a range of effects on agricultural goods have all been induced by climate change in Nepal. Because climate change is real and happening now, there is a need to identify and adapt to its effects in order to deal with the agricultural sector's vulnerabilities. Nepal, as a developing nation, is becoming more susceptible as a result of climate change. However, other study results from other nations indicated that grain or food quality had deteriorated. Increases in temperature or CO₂ levels are also threatening to cause a hidden-hunger issue in humans by reducing the necessary nutritional content of food crops. The total effect of climate change on agricultural sectors is expected to be detrimental in the long term, according to the findings.

3. CONCLUSION

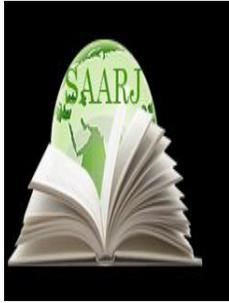

Climate change is real and underway, so there is a need of impact identification and adoption to cope with vulnerabilities in agricultural sector. Nepal being a least developed country, it is moving towards vulnerable situation due to climate change. As it is known, its effects cannot be completely controlled but effective planning and change in human habit towards a low carbon economy can slower down possible disasters. Enriched CO₂ has shown positive impact on yield of major crops in all geographical zones. However, some research findings from other countries showed reduction in grain and food quality. Increase in temperature and CO₂ levels is also threatening to bring hidden-hunger problem in human by lowering essential nutrients contents in food crops. It is concluded that overall impact of climate change in agricultural sectors will have negative impacts in the long run.

ABSTRACT

This article examines the topic of artificial intelligence, with an emphasis on embodied AI. It also examines artificial consciousness models, agent-based artificial intelligence, and artificial intelligence philosophical commentary. It concludes that there is virtually no agreement or formalism in the area, and that the field's accomplishments are limited. The large percentage of recommended plans versus suggestions that have been implemented in the literature is an unusual characteristic. For a number of reasons, including cost and a lack of knowledge in the area, professionals in the field are reluctant to build robots. Because of its skills in the image and semantic domains, AI has many potential applications in medical imaging. As a result, the major issues facing AI in radiology include improving healthcare safety and quality (personalized and participatory radiology), improving workflow (and therefore medical imaging accessibility), and developing medical imaging for screening and public health (predictive and preventive radiology).

KEYWORDS: *Artificial, Consciousness, Embodied Intelligence, Intelligence, Machine Intelligence*

1. INTRODUCTION

There have been numerous literature surveys during the fifty years that artificial intelligence (AI) has been a recognized and active subject. However, encapsulating the field chronologically or

conceptually is very challenging. The reason for this, we believe, is that there has never been a groundswell of effort that has resulted in a recognized accomplishment. Nonetheless, the novice must learn a substantial body of material before trying to deal with what has so far shown to be a hydra-headed monster. This review tries to organize the literature in a comprehensible manner. Figure 1 shows the global Artificial Intelligence[1]–[6].

Figure 1: The above figure shows the global Artificial Intelligence [weforum].

A historical narrative is presented, followed by a discussion of various apparent themes. For general AI, two methods were developed: the “top down” approach, which began with higher-level functions and implemented them, and the “bottom up” approach, which began at the neuron level and worked its way up to higher-level functions. Allen Newell created the "Logic Theorist," a theorem-proving software, in 1956.

Artificial intelligence (AI) is changing service by performing a variety of activities, posing a significant source of innovation while also posing a danger to human employment. To address this double-edged effect, we propose a theory of AI job substitution. The idea identifies four intelligences that are needed for service activities—mechanical, analytical, intuitive, and empathetic—and explains how businesses should choose between people and robots to do those duties. Mechanical intelligence comes before analytical intelligence, analytical intelligence comes before intuitive intelligence, and intuitive intelligence comes before empathic intelligence, in a predictable sequence. According to the hypothesis, AI job replacement happens at the task level rather than at the job level, and that it happens first for "lower" (easier for AI) intelligence tasks. AI replaces part of a service job's duties at first, a step known as augmentation, and then proceeds to completely replacing human labor once it has the capacity to do so. As AI replaces lower-level intelligences with higher-level intelligences, the relative relevance of intelligences for service workers changes over time. An significant consequence of our hypothesis is that, as

AI takes over more analytical jobs, analytical abilities will become less essential, emphasizing the need of "softer" intuitive and empathic skills for service workers[7]–[10].

AI will eventually be capable of executing intuitive and empathic activities, allowing for new forms of human–machine collaboration in service delivery but simultaneously posing a serious threat to human employment. By the 1980s, AI researchers had realized that developing artificial intelligence was much more difficult than they had anticipated. As a result, Brooks came to think that the way ahead in consciousness was for researchers to concentrate on developing separate modules based on various elements of the human brain, such as a planning module, a memory module, and so on, which could then be integrated to produce intelligence. With the advancement of computer and robotics technology in recent years, there has been a widespread effort to create embodied intelligences. However, because to the unique nature of this area, the many efforts are nearly completely unrelated. Because creating actual robots is difficult and unsuccessful, there has been a trend toward computer simulation, dubbed "Artificial General Intelligence," in which virtual agents in a virtual reality environment try to attain intelligent behavior.

Artificial intelligence (AI) refers to intelligence shown by machines rather than natural intelligence expressed by people or animals. Leading AI textbooks describe AI as the study of "intelligent agents," or systems that understand their surroundings and take actions that increase their chances of accomplishing their objectives. However, most AI researchers reject this definition, which uses the term "artificial intelligence" to denote computers that imitate "cognitive" activities that people identify with the human mind, such as "learning" and "problem solving." Advanced online search engines (such as Google), recommendation systems (like YouTube, Amazon, and Netflix), comprehending human speech (like Siri or Alexa), self-driving vehicles (like Tesla), and competing at the top level in strategic gaming systems are all examples of AI uses (such as chess and Go). The AI effect is a phenomenon that occurs when computers grow more competent and activities thought to need "intelligence" are frequently eliminated from the concept of AI. Optical character recognition, for example, is often left out of AI discussions despite the fact that it has become a commonplace technique.

Since its inception as an academic field in 1956, artificial intelligence has gone through many waves of optimism, disappointment, and funding cuts (known as an "AI winter"), followed by new methods, success, and renewed investment. Throughout its history, AI research has attempted and rejected a variety of methods, including replicating the brain, modelling human problem solving, formal logic, huge knowledge libraries, and copying animal behavior. Extremely mathematical statistical machine learning dominated the area in the early decades of the twenty-first century, and this approach has proven highly effective, helping to tackle many difficult issues in business and academics.

The different sub-fields of AI research are focused on specific objectives and the application of certain technologies. Reasoning, knowledge representation, planning, learning, natural language processing, vision, and the capacity to move and control things are all classic AI research objectives. One of the field's long-term objectives is general intelligence (the capacity to solve any issue). AI researchers utilize search and mathematical optimization, formal logic, artificial neural networks, and techniques based on statistics, probability, and economics to address these issues. Computer science, psychology, linguistics, philosophy, and a variety of other disciplines are all used in AI.

1.1 Models of Consciousness:

It is impossible to examine this subject and abstract a narrative thread since there have been many suggestions for a structure of consciousness/control, nearly all of which have not been realized and are completely unconnected. As a result, there is no overarching organizational theme, and we are left to report on specific concepts. We accomplish this in a methodical and unobtrusive manner, despite the fact that many of them push the boundaries of plausibility and even believability. The rare instances when a simulation has been programmed will be noted. There is no evidence that the ideas will result in embodied intelligence. The challenge is to get a robot to think about the essential outcomes of actions without making it think about all the irrelevant outcomes.

Minsky, in his landmark work "Society of Mind," published in 1988 (with a nod to Brookes op. cit.), thinks that consciousness is the product of numerous tiny modules, which he refers to as agents. Each agent has no significant intellect on its own, but when they collaborate at various levels, they form a cognitive system. The Global Workspace Theory was originally suggested in 1988, and it is often characterized in terms of a theatre. A spotlight shines on one part of the stage in this metaphor, but numerous activities take place in the background outside the spotlighted region. This relates to awareness focusing on just one item at a time, while numerous other things are running in the background. Many other researchers have used this idea. This is one of the rare innovations that has gained widespread acceptance rather than fading into oblivion. Block (1994) tried to categorize several forms of awareness. The two most important distinctions are between Phenomenal Consciousness, which is concerned with our feelings and experiences, and Access Consciousness, which is concerned with information processing and behavioural control.

Chalmers (1995) distinguished between the "hard issue," namely, raw emotion, and the difficulty in implementing it, and the "easy problem," namely, the functional regions of consciousness such as planning, remembering, and so on.

Kitamura, Otsuka, and Nakao proposed an eight-level hierarchical model in 1995. Consciousness occurs at a level when activity at a lower level is blocked, allowing the higher-level job to be completed. This model's simulations are said to exhibit animal-like behavior.

CBA (Conscious Based Architecture) is a method for determining at what level an autonomous robot can function without the need to learn. CBD is divided into five levels, each of which corresponds to the various degrees of consciousness observed in living things ranging from single-celled organisms to primates. He got to the conclusion that at level three, learning ability becomes a necessity. The distinction between the narrative self and the minimum self the minimal self is solely concerned with what is going on right now, while the narrative self-needs memories of the past and is capable of planning.

1.2 How AI works:

Vendors have been rushing to advertise how their goods and services utilize AI as the buzz surrounding AI has grown. What they call AI is often only one component of AI, such as machine learning. For developing and training machine learning algorithms, AI needs a foundation of specialized hardware and software. Although no one programming language is associated with AI, a handful stand out, including Python, R, and Java. AI systems, in general,

operate by consuming vast quantities of labelled training data, evaluating the data for correlations and patterns, and then utilizing these patterns to forecast future states. By analyzing millions of instances, a chatbots given examples of text conversations may learn to create realistic interactions with humans, and an image recognition program can learn to recognize and describe things in pictures.

1.3 Deep learning in medical imaging:

Deep neural networks are a kind of learning algorithm that has led to significant improvements in task performance, particularly in the area of medical imaging. Until recently, traditional pattern recognition learning systems were made up of two parts: a feature extractor that was hand-programmed and a machine-learning algorithm that classified the picture. The automated classification of a lung nodule as benign or malignant is a good example. The feature extraction step entails

- Segmenting the nodule.
- Choosing and extracting nodule characteristics such as borders, density, enhancement, roughness.

Entropy that are important for distinguishing between a benign and malignant tumour. These characteristics are organized into vectors. The machine-learning method for analyzing these vectors is chosen in the following step in order to properly identify the nodule. Image segmentation and the selection of essential features for extraction are very difficult processes that may lead to mistakes. It is almost difficult to demonstrate that the best characteristics for addressing the issue have been chosen. Convolutional neural networks are critical for overcoming this barrier because they combine the two stages, i.e., extracting the features and categorizing the picture, drastically changing the paradigm. To enable future categorization, the image features do not need to be extracted initially. Deep learning networks take the pixels in an image or an area of an image as input and convert them into a judgment or classification through many processing layers (thus the term "deep"). The intermediate, or hidden, layers are in charge of extracting visual characteristics that were not explicitly coded by the network designer but learnt by the network via an examination of the handlabeled data given during the training phase. The procedure is carried out from start to finish, from raw data analysis to picture classification, with the network handling the intermediate stages. Figure 2 shows the Classical steps of machine learning.

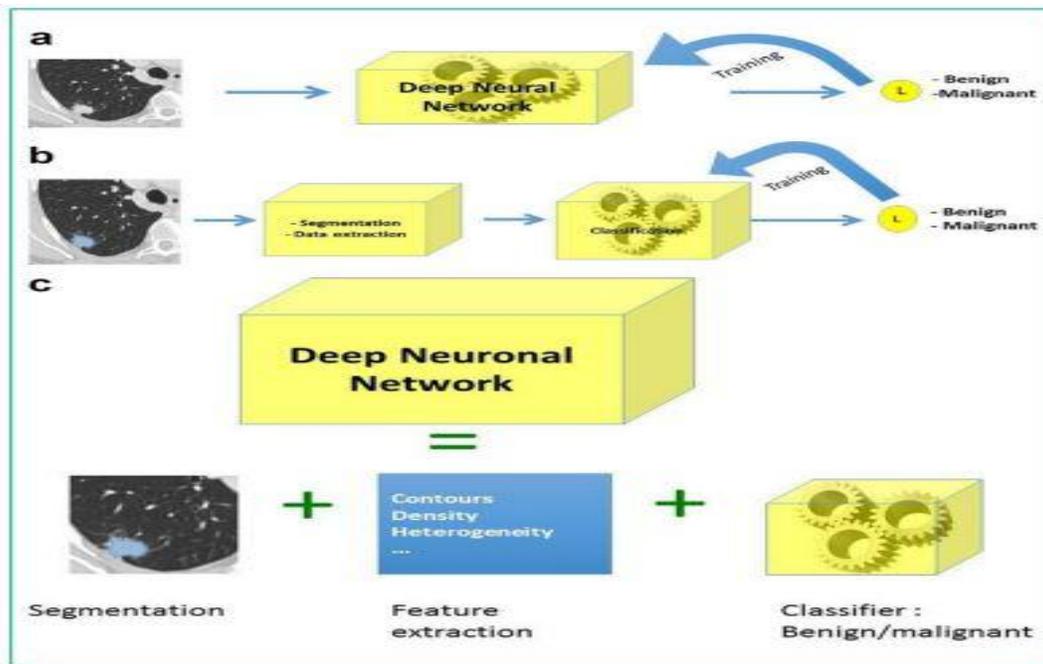

Figure 2: The above figure shows the Classical steps of machine learning.

1.4 Applications and future prospects:

Because of its skills in the image and semantic domains, AI has a lot of promise in medical imaging. As a result, healthcare safety and quality improvement (personalized and participatory radiology), workflow optimization (and therefore medical imaging accessibility), and the development of medical imaging for screening and public health are the major issues addressed by AI in radiology (predictive and preventive radiology).

2. DISCUSSION

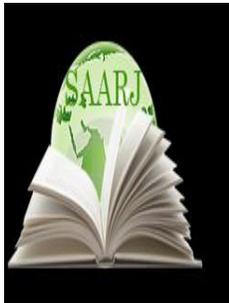

Artificial intelligence (AI) is changing service by performing a variety of activities, becoming a significant source of innovation while also posing a danger to human employment. To address this double-edged effect, we propose a theory of AI job substitution. Mechanical, analytical, intuitive, and empathic intelligences are needed for service activities, according to the idea, and businesses should choose between people and robots to do those duties. Mechanical intelligence comes before analytical intelligence, analytical intelligence comes before intuitive intelligence, and intuitive intelligence comes before empathic intelligence. According to the idea, AI job replacement happens at the task level rather than at the job level, and that it occurs first for “lower” (easier for AI) intelligence tasks. AI replaces part of the duties of a service job at first, a stage known as augmentation, and then proceeds to completely replacing human labor once it has the capacity to take over all of the tasks of a job. As AI replaces lower-level intelligences with higher-level intelligences, the relative relevance of the intelligences for service workers changes over time. A significant consequence of our hypothesis is that as AI takes over more analytical jobs, analytical abilities will become less essential, emphasizing the need of “softer” intuitive and empathic skills for service workers. AI will eventually be capable of executing even intuitive and empathic activities, allowing for new forms of human–machine collaboration in service delivery but simultaneously posing a serious threat to human employment.

3. CONCLUSION

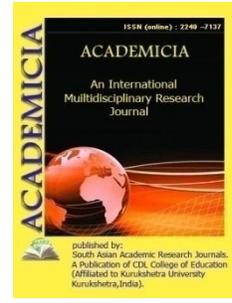

The author has discussed about the artificial intelligence, it focuses on the most of the work, especially in the field of embodied AI. The World of Warcraft is an example of a large field of agent-based systems, many of which are commercial. This has not been touched in a long time. The fragmented character of the claimed effort makes it difficult to comprehend, or maybe useless to comprehend. Perhaps the only two ideas that academics have agreed on are Baar's Global Workspace Theory, Brooks, and Minsky's agent-based model, which were developed separately. A peculiar feature of the literature is the high proportion of suggested plans versus proposals that have been executed. Practitioners in the field are hesitant to construct robots for a variety of reasons, including expense and a lack of competence in the subject. After digesting all of these documented attempts, two fundamental conclusions must be drawn: first, the researcher is free to move ahead unfettered since there is no existing formalism in the area; second, the researcher is free to go on unfettered because there is no existing formalism in the field. Second, despite a 33 million-fold (Moore's law) increase in computing, the area's accomplishments are disappointing - the industry is still a long way from creating a robot with the intelligence and functionality of a cockroach.

IN THE DRAMA "HAMLET" AND "ABULFAYZKHON"
TRAGIK PAFOS

Shodiev Shahobiddin Sharofiddinovich*

*Teacher of the Department of Foreign Languages,
 Bukhara State Medical Institute,
 UZBEKISTAN

ABSTRACT

This article is a comparative study of the use of tragic pathos in the tragedies "Hamlet" and "Abulfayzkhon", the synthesis of this concept with conflict and drama, and its peculiarities. Paphos is the backbone of a work of art, in other words, the backbone, as a criterion that determines the genre and essence of any tragic work. The article analyzes pathos from this perspective.

KEYWORDS: *Tragedy, Pathos, Psychology Of Heroes, Aesthetic Category, Tragic Character, Philosophical Thinking, Renaissance, Personality Tragedy, Conflict, Internal Monologue.*

INTRODUCTION

Aristotle argues that Paphos is a heroic tragedy, manifested through mental anguish and evokes similar feelings in the viewer [1; 219]. Later, especially since the Renaissance, pathos began to be understood not as a feature of the human heart, but as a feature of the work to evoke certain emotions, so it was used more in connection with concepts such as style, heroism, upliftment, tragedy.

While Gegel interprets pathos in connection with the "family, homeland, church, glory, friendship, pride, honor, love" inherent in the characters of the work, according to V. Belinsky, it is an "idea-passion" associated with the creative personality. the world comes from the senses of perceiving the world. G

G. Pospelov interprets it as one of the important members of the artistic content. In the Dictionary of Literary Criticism: "If, in the Aristotle-Gegel tradition, pathos was associated with more characters, starting with Belinsky, with the creator (subject), now the term art modes encompassing the subject-object-addressee trinity has become more active." interpreted as [1; 220]

Literary critic I. Ganiev thinks about the main criteria that define the genre of dramatic work, what criteria should be used in defining the genre in ancient and modern literature: "... Such a criterion cannot be the basis for the description of all types of works "[2; 27]. The scholar argues that his focus is on the formal aspect, without denying the differences in content in the genre classification of the lyrical work. He tries to prove his point on the example of the types of musammat based on the structure of the band, as well as the genres of rubai and fard. He also explains why some experts include Abulfayzkhan in the genre of drama and some in the genre of tragedy, and recalls that Aristotle founded the rule that pathos is the main criterion in the genre classification of dramatic works.

It is well known that when Aristotle speaks of the internal division of tragedy, he distinguishes three situations: "Passion ... is an act of destruction or suffering." The genre of tragedy is based on a sharp turn, a sudden knowledge, a passion. it has to change because of a mistake. " From the above, it can be said that the backbone of tragedy is tragic pathos, and if there is no pathos, none of the evils like death, murder can be a tragedy.

A. Karyagini: "In drama (in dramatic works in general - emphasis ours - Sh.Sh.) everything is related to conflict. Everything that does not depend on it is superfluous. Conflict determines the whole structure of a dramatic movement, not its moment "[3; 155]. So, since everything in a drama is closely related to conflict, since conflict defines the whole structure of a dramatic work, first of all, tragic, dramatic, or comic pathos must be reflected in that conflict. The main conflict in Abulfayzkhan seems to be two dynasties, in Hamlet two brothers, or more precisely, close relatives: a disagreement between an uncle and a nephew. is in the middle of development. It is this objective development that has condemned these two dynasties and their close relatives to destruction from the very beginning. and admits that it is low, in which case a strong tragic pathos blows. Such a conflict can be described as a catastrophic conflict.

At the time of Hamlet's creation, Shakespeare was 37 years old. The tragedy was staged in 1601 and published in 1603. A year later, the first edition was seriously edited and expanded. Shakespearean A. Anikst points out that in the second edition the philosophical essence of the tragedy was deepened, the image of the protagonist Hamlet was changed, his concept of man as a human being was shown in all its complexity. At that time, the author was 40 years old, and his creative maturity was at its peak. As many admit, Hamlet is the pinnacle of Shakespeare's literary legacy. The world literature still does not know a second work that can occupy this height. Indeed, Hamlet is the guardian of the family, the devotee of society, the faithful and conscientious citizen of the state, the leader of honor and dignity, the faith, the hope of the declining country, the heir to the throne, who bleeds from betrayal. It embodies all the virtues of a true human being, and that is why it is still loved and revered in the hearts of the peoples of the world, in different climatic zones, even after centuries.

The similarity between "Hamlet" and "Abulfayzkhan's tragedies" is reflected in the psychology of the heroes, their pain and inner feelings. In Hamlet, Claudius secretly kills his brother, Hamlet's father, and seizes his throne, continuing his humiliation and marrying his brother's wife. Both Claudius and even Abulfayzkhan, who became the killer of his seven children, create their own tragedy.

Tragedy, understood as an aesthetic category, has a tragic meaning in the full sense of the word, a contradiction that is inevitable in a particular dramatic situation. A tragic situation is an

irreconcilable contradiction, a tragic situation that cannot be resolved positively. When we say solution, we mean the hero's own tragedy, his own confession, his own confession, his own destruction.

When Hamlet thinks about what is happening, he has doubts and suspicions, and there seems to be "some mystery." A thousand and one fantasies tell Hamlet, who lives in agony, that his friends have seen his father's ghost. He meets his father's ghost and learns the truth. His father enters and tells the details of his death.

Claudius, who was a wicked, hypocritical slave to the ghost Hamlet, was able to flatter the princess with flattery, his love was like heaven, he broke his covenant on the day of his marriage, he fell into the arms of an infidel who was many times lower than himself, and his brother put him in the garden. He says that he killed a bullet in his ear while he was asleep and bequeathed it to his son:

Oh, that horror, horror, horror! Nomusila or
If it doesn't burn your heart out, the attempt is futile.
The bed where the kings of Denmark slept
Don't let prostitution serve shame.
Almighty revenge no matter what
You keep your soul pure, don't touch your mother.
A fair judge to him, his worthy answer -
Tangritaolo-yu, again a pang of conscience. [4; 242].

Hamlet is shaken by the words spoken by his father's ghost. The feeling of hatred that arose in his heart was so great that those around him thought he was insane. He then asks the actors to perform the story of his father's death on stage, and during the show, he watches the actions of his uncle, Claudius, now King of Denmark and mother of her husband. When he admits that what he has heard is a bitter truth, he shouts, "Denmark is a prison."

The universal popularity of the tragedy is due to the strong pathos in it, and the inner monologues of the protagonists in the play are expressed in a very touching, truthful, objective way. There is no doubt that Hamlet's painful words and insulting words towards his mother ignite feelings of pity and hatred in the psyche of the reader and the spectator.

In the tragedy Hamlet, Hamlet's friends are told, "Oh my God! Put me in a pistachio shell and I still feel like a master universe. Just save me from these oppressive fantasies "[3; 265], in his words embodies the cry of the awake Person, the groan of the heart, who deeply understands the essence of the universe and man, what life and death are. Hamlet's friends are overwhelmed by the mysterious death of his father, the loss of all his joy and enthusiasm for training after learning of his mother's betrayal. But when he explains that the reason for this is completely different, how much Hamlet is crushed inwardly, how a thousand and one uncontrollable fantasies run through his mind, and how the desire for revenge pervades his whole soul, takes on an entirely different form.

In Hamlet, King Claudius appears to be unable to forgive himself in the scene of his self-immolation. As he tries to pray, he struggles, explaining that he has fallen into a grave sin and will not be forgiven: "I have fallen, I have fallen to get up, but, Well, it is permissible to beg here." Claudius lives in two appearances, two I. One of them justifies himself, the other sharply condemns. Claudius tries to repent, but now he decides for himself that even the doors of repentance are closed. At the same time, it is clear that his conscience is not yet completely dead.

If my guilt is used against me,
The seal of disbelief and reproach on my forehead:
My brotherhood! Flashing only,
I strive, I can't but pray.
I know that this sin is unforgivable,
I'm ugly, I don't know where to start,
It is my job to live in such a miserable state [4; 307].

In Claudius' view, in order to pray, to repent, he must return what he has taken, but he cannot dare to do so, turning away from the crown, the kingdom, the princess, the glory, and returning to himself. In the scene of his attempt to pray, he said, "It is said that the answer is the power of repentance, but what if the path of repentance is completely closed? Suffering, suffering! My heart is black with death. My soul is sinking in the mud!" his words actually sound like a verdict against him. He realizes what he has done, regrets what he has done, tries to apologize, and even orders a quick bend to his knees. He also knows that when he does so, the lead in his heart will melt and he will be as soft as a baby. If he had been able to stand firm in those thoughts, the tragedy probably would not have happened. However, the difference and uniqueness of the tragedy from other genres also decides the end of the tragedy in a small moment.

In the tragedy "Abulfayzkhan", when Khan was alone, he said to himself: "... I will kill, I will kill. I will shed blood until I have no enemy left in the world. Ulfat's word is true. The kingdom is a tree irrigated with blood," he said, and his speech clarifies his policy, worldview, and spiritual world. Just like King Claudius in Hamlet, he is dissatisfied with himself, anxious, skeptical and afraid of everything. At the same time, he knows and feels his actions, and therefore his sense of fear increases. He wanders in the whirlpool of events leading to his own tragedy, seeking salvation, looking for a way out, but unable to find the right path. Because he has no desire to return to the right path. The mood of the khan, who is forced to embrace his own tragedy, worsens as events unfold, which he constantly takes with him. Between the two grasses, between good and evil. "I'm tired of shedding blood," he said. I killed my brother. I killed a lot of my friends. I saw my father, Farhod, who cared for me like a father, under his feet. (Holding his eyes) Ugh ... my eyes are full of blood. I can't sleep at night. My eyes are soft, all the dead, all that I have killed will turn me around, pass me by in a daze. They scare me, they laugh at me!" [5; 137] He reveals himself, confessing the conflicting feelings in his psyche, the excruciating pain, the exhaustion without the torment of suffering. But like Claudius, instead of acknowledging the truth, he tries to avoid it, and thus draws closer to his own unhappiness, becoming a victim of his own behavior.

Farhod, who supported him, executed his father at Ulfat's word. As in Hamlet, the khan is surrounded by flatterers, cowards and hypocrites who put their own interests above all else. The first scene of the tragedy begins with the chess game of QaziNizam and Mirvafa. In the short dialogue between Abulfayzkhan and Ulfat, who entered the circle, the khan's household's slyness, cunning and flattery are clearly visible:

“Abulfayzkhan. Where, who is stronger?

Ulfat. Both of Haqqani's slaves play well.

Abulfayzxon. Which side are you on?

Ulfat. I applaud and watch, we have nowhere to go.” [5; 130].

All the words and actions in the text are symbolic, that QaziNizam and Mirvafa are good "players" in life, and that the salt of life is like a game of chess. Ulfat Khan becomes an "impartial spectator" because he does not know which side he is on. Reminiscent of Polonius in Hamlet, this character is ready to do anything to please his master. Ulfat and Poloni are extremely cunning, cunning, meticulous people, but they have no personality. At the end of the tragedy, as they say, both of them perish.

Abulfayzkhan, like Claudius, is evil and pursues his own interests in everything. The king tries to kill his nephew, his nephew, and achieves his goal through Laert, and the khan also kills his sons. Farhod, the most just and popular man next to him, beheads his father with Ulfat's hand.

If Claudius is married to the Princess, Abulfayzkhan, in his own words, will try to force the daughter of a "close father-like" relative. However, the father went against his wishes and refused: “We sacrificed ourselves to the khan. Let them not want our honor anymore” [5; 132]. The khan, ignorant, cowardly, and revengeful of praise, thus loses his strong, trustworthy, wise counselor.

Considering that tragedy is a means of aesthetic analogy, it is worth remembering that the Canadian scholar Northrop Frye applied the term to literature, explaining the author's attitude to the protagonist of the work of art under the concept of "modus". However, he did not draw any definite line between general aesthetic views of art and literary genres. Russian scholar V. Tyupa, on the other hand, sees the same concept as the author's ideological and emotional assessment. Uzbek literary critic D. Kuronov explains the mode not only as an ideological-emotional relationship or the author's emotionality, but also as a peculiar manifestation of the typology of the protagonist [1; 57]. Indeed, it is impossible to draw a convincing conclusion about the characteristics of a particular novel without determining how the author's reality and approach to the protagonist emerge. The famous English writer, playwright and critic Somerset Maugham (1874–1965), speaking of prose writers, said: "They should pay more attention to the perfection of the essence of the world." In this sense, based on our observations of the literary process, it is safe to say that Uzbek prose writers now pay special attention to the modes of satire, tragedy, satire, drama in the expression of self-awareness and self-expression. It can be said that these ideas also apply directly to the work of Fitrat.

It should be noted that Shakespeare's translators G. Gulom, M. Shaykhzoda, J. Kamol also showed their positive results in the creative world in such areas as artistic mastery, philosophical and social pathos.

In the system of literary connection, tradition and innovation, literary commonality, "literary similarity", terminology, commonality in the events of works, ideological pathos, that is, the concept measured by the essence of harmony, closeness to each other. For example, works in harmony with each other in the ideological direction, such as freedom, liberty, good-evil, good-evil; plot similarity in the reality of the work: ChingizAitmatov's story "Face to face", V. Rasputin's story "Live and forget", S. Ahmad's interpretation of events related to the fate of war refugees in the novel "Horizon"; such commonalities and similarities can be seen in countless examples. Representatives of the world system of comparative studies (communication) (Zhirmunsky, Veselovsky, Zhupokaeva, Konrad, Khromchenko, D. Dyurshin, A. Dima) and well-known representatives of Uzbek literature M. Kushjanov, I. Sultanov, U. Normatov, O. Sharofiddinov, E. Karimov and others promote the criteria for the study and evaluation of bilateral works on the basis of freedom and mutual equality. At the same time, the next follower of a great writer (such as Firdavsi or Navoi, Pushkin or Tolstoy, Gorky or Aitmatov) completely rejects the obligation and worship of the creators. For example, A. Aripov's pen is not the first Dante, but the inspiration of many other great artists of the East and West: Yassavi, Navoi, Makhtumkuli, Pushkin, Lermontov, Byron, Aitmatov, Khamzatov, I. Kuliev and a number of other great philosophers. .

The purpose of diligently identifying the phenomena of literary creativity and comparative study of the works of two or more writers and poets is to determine whether the originality of the creators, whether their originality has remained in the state of imitation, to generalize unique literary achievements.

The tragic character of Hamlet, Claudius, Abulfayzkhan, Farhod is a multifaceted complex personality of the father, who cannot give up the inner contradictions, conflicting views, thoughts and passions of his character. Their self-struggle, their inner self-contention, their passionate suffering, are universal, and this is the essence of their individual character. As a tragic protagonist, Hamlet is able to look straight at the realities of life, and although his heart is broken after hearing the ominous news, the child and the man are tormented to the extreme between the two. He thinks of fulfilling his father's will, of taking revenge on his uncle. Claudius refrains from murder and revenge, even if he has the opportunity to kill him while he is praying. Shakespeare showed the concept of man in Hamlet's heart through the same episode.

Is it revenge for the killer to die?
 At the time of prostration, when one is free from sins,
 What if he was on a long journey?
 No!
 Back to the sword, until a terrible opportunity.
 Either when he is angry or when he is drunk,
 In sleep or in unclean peace, in the bosom of pleasure
 Or a frantic asnozib "[4; 130].

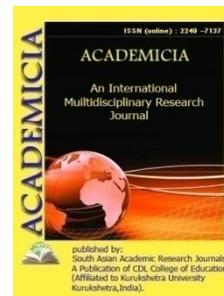

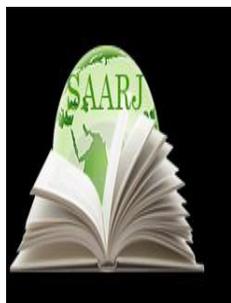

In this situation, the nobleness of Hamlet's nature, in a confusing and complicated situation, seems to exaggerate the feeling that kept him from revenge. The Crown Prince lives with the most original, the most glorious idea, and at the same time becomes the cause of his own destruction by not killing Claudius. Hamlet, who can look straight into the eyes of death,

survives Claudius' planned plot to commit suicide, then returns to his own tragedy, to the palace. Unlike Claudius, he obeys the dictates of his heart, not his desires. Even though Claudius sometimes thinks about how dangerous he is going, even though he knows that he is going downhill, he cannot find the strength, the will, to turn from evil.

The fact that tragedy is a complex and contradictory unity within a single event develops step by step in the image of Hamlet, Claudius, Abulfayzkhan and reaches its culmination. There is no excuse for Hamlet's killing of Polonius, the insanity and drowning of his lover Ophelia, leading to Laert's death. But it is also unfair to condemn him for any of these things. What sets him to this tune is lofty purpose, steadfast faith, honor, and pride. VG Belinsky described the tragic heroes as "innocent culprits". In "Hamlet" and "Abulfayzkhan" good and evil, love and betrayal, happiness and tragedy, nobility and humility go hand in hand.

UZBEKISTAN

ABSTRACT

The article deals with the social reality of two writers (George Orwell and Murad Muhammad Dost) who lived and worked in two different historical periods, in two different national-cultural contexts, and whose creative credo and style are close to each other. Thought about the problems of originality. The concept of society, which is a very important and global problem for the development of society and fiction, as well as the dialectic of multi-layered imagery in the artistic interpretation of this topic are summarized in the example of English and Uzbek literature.

KEYWORDS: *social content, multi-layered metaphor, personality and society, artistic mode, socio-moral character, reality of social life, philosophical thinking, personality tragedy, subconscious layer, time and space, conflict. Authoritarian system, human freedom, divine truth, nature and society.*

INTRODUCTION

George Orwell's conception of the individual and society, the historical reality of the period in which he lived, the various situations and contradictions, the authoritarian regime and its oppression of human freedom, rights, prohibitions, apostasy, the dramatic shift in the balance between nature and society, in order to perceive the truths you want to express, you need to be aware of the political and social system, spiritual and moral views, different literary currents and schools, literary processes in England (in the West in general) in the first half of the twentieth century.

Naturally, a writer like George Orwell, who was able to philosophically and figuratively express universal problems in the status of art, did not appear on the ground. His life and work have been studied, and his books have been translated into various languages. The fact that J. Orwell's non-

fiction novel "1984" and the story "The Barn" were written during the most difficult period of history - the years of World War II - encourages any reader or researcher to think deeply. It can be said that the events of both works took place during the former Soviet period.

A person who reads or analyzes a work, interprets familiar scenes, the socio-political situation, ideological pressures, the violation of human rights and freedoms, authoritarianism, chaos, treachery, fraud, a group of violent people who want to change history for their own nefarious purposes. society is manifested. From the course of events described in the two plays, from the struggles to dominate each other in the form of animals, it is clear that the ultimate goal is the greed for power. This disgusting oppression is used as a tool to disguise the feeling of violence and the pursuit of freedom. It is as if in the Barn, humanity - the rescued animals - has achieved equality and freedom. In short, the play explores the dictatorship of animals (metaphor), the totalitarian, atheistic system of the former Soviet Union that has ruled for nearly 70 years.

According to the famous Romanian conservative A. Dima, the main purpose of comparative literature is to study three types of phenomena: a) direct inter-literary relations - translation, influence, assimilation; b) genetic similarities that are not in a genetic brotherhood, but are manifested in the study of a particular subject, myth, image, genre, or similar literary current; (the theoretical basis that is most important for our research is exactly this second phenomenon); c) peculiarities of national literature. [1; 121]

aspects. [1; 121]

A. The analysis and interpretation of samples of English and Uzbek literature on the basis of mutual typological similarities, which are not in the genetic brotherhood, as noted by Dima, but based on similarities in subject, myth, image, genre and idea, plot, are likely to give new conclusions for national literature. To do this, we first need to look at the history of complex literary works of the early twentieth century, which added to the treasury of world literature, the literary currents of the early twentieth century, which is a natural basis for the formation of George Orwell's worldview, philosophical concept and multi-layered style.

One of the most famous artists in the Western world in the early twentieth century was James Joyce (1882-1941). His "Ulysses" is a famous philosophical-social, psychological novel with a complex style, the fame of which was one of the beginnings of a new era in world literature, such as Marcel Proust (France), Franz Kafka (Austria-Hungary). James Joyce is also one of the pioneers of a new trend called the "stream of consciousness" with his work. J. Orwell, one of the leading intellectuals of his time, could not be without the works of these famous people.

Second, the literature of the early twentieth century is more complex, rich in paradoxes, belonging to different national cultures, such as Germany, Austria, the Czech Republic, Switzerland. The influence of Kafka's novels such as "America" (1911-1916), "Castle" (1922), "Process" (1915-1918) on the works of J. Orwell can be felt.

One of the most famous in the Western literary world in the early twentieth century was Herman Hesse (1877-1962), who exaggerated the problem of human rights and values in intellectual novels. His novel *The Desert Wolf* became popular at the beginning of the last century. The spiritual crises of humanity are discussed. Since this also falls into the category of stylistically complex works, we observe that it is essentially close to the works of J. Orwell.

Another master of world literature of the twentieth century is the Nobel Laureate E. Hemingway (1899-1961). His "Goodbye, gun!" and *The Old Man and the Sea*, which were very popular at the time, have not lost their popularity. The author's philosophical conception of "Man can be crushed, but he cannot be defeated" is in line with the idea of J. Orwell's works.

A. Camus (1915-1960) is one of the writers who was contemporary with J. Orwell and had a worthy place in the treasury of world literature, which was close in style. Camus's philosophical work *Caligula*, known as the Drama of Ideas and the Study of the Concept of the Absurd, was also very popular in its time. If you want to be a philosopher, you have to write novels," he said. It is impossible not to be unaware of the work of this famous contemporary of J. Orwell.

J. Orwell writes in his diaries that one of the representatives of another world literature, the French writer Jules Verne, loved his works and even read them over and over again up to eight times. It is known that J. Verne (1828-1905) was one of the founders of the science fiction novel genre. »(1867-68)," 20,000 kilometers under water "(1869-70)," Fifteen-year-old Captain "(1878)," Floating Island "(1895), more than 65 science fiction, adventure and author of socio-critical novels, short stories and short stories

In his novel *Claudius Bombarnak*, J. Verne, who has never been to Central Asia, describes his history, geographical location and climate, and the customs of the indigenous peoples in a way that is close to reality. From the language of the protagonist, the work focuses on the image of Tashkent, Samarkand, Bukhara, describes Bukhara as "Rome of Turkestan", describes the historical monuments, streets and neighborhoods of Samarkand, gardens and people [2; 436]. The author's "Mysterious Island" (1941), "Children of Captain Grant" (1957), "Wonderful and strange adventures of Uncle Antifer" (1969), "20,000 kilometers under water" (1973). While hundreds of prophecies in adventures such as Conflicts between parents and children, kinship, friendships, surrogacy, drug addiction, the technocratization of the times, authoritarianism, deprivation of the past - mancuration. The confirmation of these prophecies in the XX century can be seen in ChingizAitmatov's novel "Day of the Century". Universal problems such as the suppression of human dignity and rights, the intensification of ideological struggles, the growing threat of war, the attempt of humanity to change the wheel of history, the weakening of human relations.

J. Orwell's novel "The Barn" and "1984" novels, which are the object of our research, are ideologically similar to the English dystopian novels of his time, V. Golding's "Lord of the Flies" and O. Huxley's "Brave New World". Especially in world literature. Russian scholars have carried out fundamental work on the study of the influence and poetics of J. Orwell's works "1984", "Cattle" on world literature.

J. Orwell was a unique talent and a multifaceted activity, he worked in several jobs simultaneously until mid-1945: as a literary critic, writer, poet, screenwriter, journalist, essensis, VVS employee and reporter, I. Sylone, A. France, a skilled storyteller in radio games based on the works of H. Wells, GH He is a punctuation and punctuation commentator on the plays of Andersen and Shakespeare and O. Wilde, as well as a member of the leading poetic magazine *The Voice*, which consists of 6 parts.

Orwell's work had a very strong influence on the literature of the twentieth century. Although his work was banned in the former USSR for not conforming to Soviet ideology, it also had a major impact on Russian literature. The most influential writers of Western literature, who had a

significant impact on the work of M. Bulgakov, E. Zamyatin, A. Platonov, A. Akhmatova, who were persecuted by the Red Censorship, were J. Joyce, F. Kafka, T. Literary influence plays an important role in the work of word artists such as Mann M. Proust.

“I am convinced,” wrote A. Coestler in an article published in *The Observer* on January 29, 1950, that future literary scholars see Orwell as the connecting link between Swift and Kafka. Life in the context of super-totalitarianism — Orwell’s horror. Life itself is the horror of Kafka. So, perhaps (I hope), in the twentieth century, people read Kafka, and Orwell is left to literary critics. But today he is more important than Kafka. ” Indeed, true writers have been with humanity for thousands of years because in their works there are more eternal problems than time, conflicts between the individual and society, human dignity and rights, the eternal paradox between right and wrong, oppression, betrayal and hypocrisy, faith. and the struggle between unbelief, goodness, and hatred is fully reflected in philosophy and wisdom in high art.

Half a century after the death of George Orwell's books, it took third place in world rankings: the Bible, Marx, Orwell's works. Orwell chief expert Victoria Chalikova said six months before her death: "Honestly, I wouldn't want us to understand Orwell to the end. This can only happen when society believes in alternative, an alternative to totalitarianism that society's ideological vanguard offers today, it is not humanistic, it does not give the common man what he wants ... ”[3; 4]. It is difficult to fully comprehend the bitter bitter truth of life hidden in the core of these words of a selfless scholar who has devoted his entire life to the study of the life and work of the writer, to the study of his works. The reason is that Orwell’s work is brutal, a reflection of a totalitarian face that considers itself an absolute ruler, the most powerful of all, and can almost convince others of it as well.

This mirror reflects the truth, the most abominable, black deeds of tyranny, the masks are completely exposed. One can see the original image of the Red Empire, which deceived the peoples with the slogans of freedom, peace, equality, friendship, separated them from themselves, and enslaved the working people with endless sweet promises.

In the works of Orwell and M.M. Dost, the theme of war, the complications he left behind, and the losses he suffered as a result are widely covered. The fate of the heroes depends on the war or the policy of the Communist Party, which is the case in all their works. The incurable wound left in the human heart due to war, the suppression of human freedom by totalitarian ideology, the violation of human rights are manifested in a variety of situations. Wars are usually either for the homeland, or for the wealth, territory, wealth of other people. Orwell predicted the threat of war as early as 1931, and by 1936 he had predicted the inevitability of war. “It was a strange war. When the first bullets were heard in 1936, all the anti-fascists in Europe breathed hope. Finally, a country emerged that was at war with fascism. The Japanese ruled over Manchuria, Hitler wiped out his rivals in Germany, Mussolini bombed the Abyssinians ... But when the Franco coup against the moderate left government in Spain began, the world shook. Moreover, the war against Franco almost turned into a revolution. The people rose up both to be free from it and against the legitimate government capitalism that Franco defended. The world in Spain is not divided into two - into four. ” [3; 4]. Political unrest led to the outbreak of war. As mentioned above, many countries of the world are on fire, the lives of nations have been disrupted, causing the deaths of so many innocent people, young people, minors. Orwell's predictions were confirmed in practice, but the writer resisted the war as much as possible, highlighting the

tragedies caused by the war in his works. These were the first moves on the eve of the start of the next World War II. The movement soon spread throughout the world.

World War II also brought together volunteers from all over the world: intellectuals, artists, philosophers. In the trenches of bloody battles, patriotic writers such as Exupery and M. Sholokhov fought side by side for the freedom of mankind. Among them was J. Orwell. He saw with his own eyes all the horrors of war, and bitterly cursed those who aspired to domination.

Any artist, first of all, is a child of his time. During Orwell's time, the British Empire was losing one of its colonies and losing its dominance in the world. The writer understood the situation in the country very well, and the reasons for this are unique. Firstly, his ancestors were Indian missionaries, secondly his profession was a journalist and finally the third writer was educated at the famous Ketono Science Furnace where he grew up with over 50 ministers. The national idea and mission needed to be reconsidered at a time when mistakes in Britain's foreign and domestic policies were leading to the country's loss of its former dominance in the world. These issues were discussed directly in journalism, and Orwell, Priestley, Auden, and McNeys led the debate. It is natural that this problem is indirectly reflected in the literature of that period. An artistic interpretation of the same problem can be seen in the works of Huxley, Green, Powell, Isherwood, Orwell, and Vo Lewis. In the USSR, when the Red Empire began to stand on its own two feet and began to exert its influence on the world, unrest reigned in Britain, Italy, and a number of other Western countries. Orwell's work has kept pace with the times, leading other writers to become more interested in his work. This reason has two bases, both negative and positive. On the downside, the working people in Europe believed in an equal and free life in the USSR, more precisely, they were convinced that Orwell's works seemed ideologically wrong to some artists of the same profession.

One of the problems facing fiction and the state was to reconstruct public consciousness, how to act in a dangerous situation, how to react to news. It is a historical fact that socialist ideas have influenced Western countries. Remember M. Bulgakov's "Seeds of Kasofat". As shown in *The Barn*, Orwell was able to see the truth as the animals outside the farm began to acknowledge the violence of life, and revealed to the world the mystery and details of those horrific crimes described in the story. This is the reason why his books have not been published for some time, even in England and America.

In the typology of English prose of the thirties there is an interrelationship between genres, an internal balance. Essays, travels, autobiographies, biographies, and inter-genre typologies of the novel typical of English literature have shown that genres develop under the influence of the general spiritual and intellectual climate of the period, a climate of traditional European liberalism in the 1930s closely related to the processes of deep thinking about the danger of the onset of totalitarianism. In English literature, classical genres gave way to new literary forms and ideas. At the same time, Uzbek literature, more precisely for 30 years, our national literature took a completely new path. Classical literary genres have been replaced by entirely different forms. The emergence of the dramatic genre, the reflection of the most important socio-political problems in the novel genre, instead of didactic, intimate, religious literature, modern literature developed rapidly, fiction was reformed in both form and content. The occurrence of this phenomenon, of course, has a certain internal and external basis. Based on the above, it can be concluded that the main reason for the change in form and content in English and Uzbek literature is related to the socio-political system, the dominant ideology.

It is acknowledged in world literature that Orwell's work has influenced many representatives of world literature, and the views, ideas, and imagery methods he has put forward have inspired writers of different nationalities. X. Norburn, U Lamberts, R. Bradbury, C. Vonnegut, T. (USA); Lynchon, I. Vough, K. Fitzgibbon, L. Hartley, K. Segal, E. Vergess, A. and T. Clarkov, in England, M. Kunder (Czech Republic, Slovakia, Poland) T. Konwicki (Hungary); The influence of J. Orwell is clearly felt in the works of D. Dalos, B. Pekic (Yugoslavia).

In addition, among the representatives of various spheres of cultural and social life (animators, film and television cinematographers, artists, musicians, historians, psychologists, political scientists, sociologists, cultural scientists) there is a lot of work dedicated to the works of J. Orwell. Also, the author's works have been studied by philosophers, literary critics, linguists, critics, writers, while translators have translated the author's works of various genres into 65 languages of the world. All this is the basis for determining the place of Orwell's work in world literature, proving once again that his works are widely popular.

While Orwell's works became popular in the West in the 1940s, in the former USSR, despite pressure and persecution, they began to spread secretly among the free-thinking intelligentsia only after the 1980s. In our country, only after independence, or more precisely in the 20s of the new century, the work of J. Orwell spread. Thanks to the hard work of translator Karim Bahriev, the author's novel "1984" and the story "Molkhona" were published in Uzbek for the first time in book form. For almost 80 years since the creation of these works, our nation has been unaware of these masterpieces of art related to its past and destiny. Repressed with accusations of being an enemy of the Soviet government, an opposition writer, and anti-party, these works synthesized sciences such as philosophy, ethics, aesthetics, religion, science, and politics that enhanced human intellectual and political potential. Oruel's works in the field of science play an important role in building a free civil society and educating the younger generation in the spirit of national ideology.

As we noted above in this chapter, when we observe similar (close or common) literary currents that are not genetically related, but similar in subject, idea, image, genre, metaphor, the multi-layered imagery characteristic of J. Orwell's complex style is also seen in Uzbek national literature.

For example, in OmonMukhtor's works such as "Man in the Mirror", "A Thousand and One Images", "Plato", "Fuu", "Ruin on the Hill" KhurshidDostmuhammad's novels Bazar and Donishmand Sisyphus, short stories such as Nigoh, Panoh, Oromkursi, Chayongul, and the story of Jajman are mythological. and artistic synthesis in the context of metaphors. One of the main principles of the writer's work is the strengthening of the plot dynamics of the play's drama and the wrapping of its philosophical concept into symbolism, various myths in the synthesis of social allusions, and the problems of Islamic spirituality are expressed symbolically. This reminds us of the qualities characteristic of George Orwell's intricate style.

In UlugbekHamdam's novels "Balance", "Rebellion and Obedience", "Sabo and Samandar" divine truths, Islamic values are described in the context of social philosophical, moral content of the time and the bitter truths of the hero. In this sense, it can be observed that in the work of the writer there is an artistic synthesis of world literature. Wrapped in symbolism and metaphor, the writer's ruthless approach to aggression against human freedom is reminiscent of the spirit and style of J. Orwell's works, a rebellious spirit against injustice and injustice.

People's writer of Uzbekistan ErkinAzam's works such as "Mother's apple", "Father's birthday", "Poet's wedding", "Days other than holidays", "Guli-Guli", "Noise", "Country of applause and applause" Looking through the eyes of the protagonists, social satire predominates. E.Azam pays special attention to the diversity of characters and the image of the psyche, depicts the changing image of the period through the fate of socio-moral problems of the heroes, instills in their minds, actions, basic ideas of character and worldview. In short, the ironic attitude to the reality of E.Azam's work is extremely strong.

Another modern Uzbek writer, ShoyimButaev, described the tragedies of the time and personality, the atrocities of the atheist and dictatorial regimes, and the ideological pressures in his short stories "Garden in the Sunflower", "Old Carriage", "People from the Soviet Union", and "One Day Guest". describes the abominable consequences of the totalitarian regime that gave rise to the psychology of muteness in the minds of our people. From this point of view, the works of Sh. Butaev are close to the works of M. Bulgakov, J. Orwell.

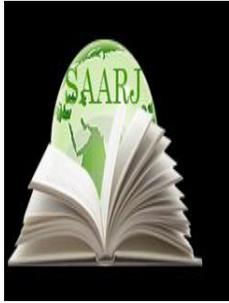

The story of the "Gift of Gift" takes place in the place where he was born and grew up, as in other works of the writer [4; 8-21]. A film based on this story was made and it is still one of the favorite films of our people. There is definitely a slight difference between the story in the story and the film script.

The end of MM Dost's novel "Lolazor" is a serious event in the new Uzbek literature, which is an important stage in the development of our national novel. This work has proved the limitless possibilities of the novel's thinking - the diversity of images and interpretations, the approach to man, the ways of its artistic rediscovery, "- said the literary critic RahmonKochkor in his concluding remarks [5; 559].

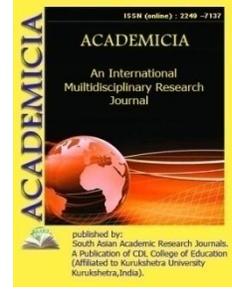

It can be said that while J. Orwell is the link that connects J. Swift and Kafka, the work of M. M. Dost is the bridge that connects the pre-independence and post-independence periods. Like the English writer, he reveals the realities of the time, the essence of the socio-political system, the evil purpose of totalitarian ideology, and the complications of the people's psyche left by the dictatorship through irony and metaphor. Where the divine criteria are violated, everything is derailed, the human psyche is tarnished, man is in decline, the state is in crisis.

ABSTRACT

Global pandemic COVID-19 has left many workers being unable to travel to work in order to limit the transmission of the virus. In fast-paced urban areas, both companies and workers are looking for alternate work options. Most, if not all, employees were forced to operate from home due to the epidemic. As a result, Work from home(WFH) has become a strategic concern for most firms. Companies and employees should be considered WFH while formulating plans. Even though working from home is now available, the current situation provides a unique look at how well the arrangement works. This information might be useful for future legislation that alters the present arrangement of working hours. Examining the problems that businesses and employees in India face requires the use of a SWOT analysis and an exploratory approach. Determining if this employment arrangement is temporary or permanent will also be considered.

KEYWORDS: Covid-19, Pandemic, Work from Home, Work Arrangement, Work Culture

INTRODUCTION

In the wake of the COVID-19 epidemic, people have had to rethink a variety of behaviors, from trade to pleasure to basic travel and daily activities. In terms of economics, this has affected not only people but also entire countries, halting a wide range of economic activities. Despite numerous predictions and warnings, including those from public health specialists, the situation remained a significant change that required planning, training, and facilitation on the part of all

involved. Despite this, the breadth and solution remained unfathomable and a massive undertaking. COVID-19 began to circulate among people in December of 2019. Due to the fact that respiratory droplets are the primary mode of infection, it is presently believed that this virus is disseminated through direct contact with other persons. Masks, social distance, and good hand washing are now the only measures available to combat viral transmission. (Centre for Health Protection [CHP] 2020a). At the end of January 2020, “the WHO designated COVID-19 an international public health emergency (World Health Organisation 2020). Since then, the virus has swiftly spread throughout the country”.

Too far, more than 60 million verified cases and more than one million confirmed fatalities have been documented (World Health Organisation 2020). Several governments have imposed and reinstated strict lockdowns in response to the COVID-19 epidemic, including the closure of non-essential businesses and the restriction of non-essential gatherings. Numerous countries urge their citizens to stay home whenever feasible in order to avoid face-to-face contact with one another.

There were a lot of questions and misunderstandings about how to balance work and life before the epidemic. In response to COVID-19, a large number of firms have opted to experiment with WFH. As of the end of May 2020, 35.2 percent of the U.S. workforce will be working from home, up from 8.2 percent in May 2018. According to WFH, 71.7% of the employees it assessed could do their duties effectively (Bick, Blandin, and Mertens 2020). To limit the spread of WFH, certain governments have set restrictions for government workers, while private firms have received warning notifications.

Before the pandemic, many people wanted to go for WFH, but it was considered unfeasible in India's heavily populated cities. Compact dwellings might be a problem for home workers who need a quiet, dedicated space to accomplish their jobs. Each individual in metro areas has an average living space of about 161 square feet, which is around 25 percent less than Tokyo and 60 percent less than Singapore (Ng 2018). Years have passed since city workers began to believe that they are required to be physically present at work in order to accomplish their responsibilities properly. In response to the epidemic, many WFH employees are now working remotely, and it's doing well. In a city with such a high population density, the possibility that WFH may serve as one of many future models is of great relevance. In this first-of-its-kind study, three criteria will be evaluated. For starters, WFH will be better understood via this study.

COVID-19 pandemic and work from home

To deal with and defend themselves against the COVID-19 epidemic, several places have adopted diverse methods, and India is no exception. COVID-19 was first detected in India on 27 January 2020. India has been infected multiple times so far. Current circumstances are causing a second wave. While its neighbors have dealt with the outbreak differently, India has not. It has also instituted restrictions on public gatherings, closed schools, and unique work arrangements that include WFH and remote working for urban employees in addition to the lockdown. In the beginning, India appeared to have been able to limit the disease's transmission and keep infection rates low. Rural residents were largely healthy until the second wave of illnesses. Eventually, after a high rate of infection, educational institutions reopened and social distance was relaxed. When it comes to controlling the spread of COVID-19, India was lauded as a success story. Some have credited the government's fast response to the COVID-19 situation. After a few

months, again widespread of COVID-19 bring the second wave in India which force several states to the government to force strict implementation of COVID-19 guidelines and restrictions. As a result of government rules, such as the suspension of dine-in dining services, there was a great deal of debate, especially among those who could not attend WFH owing to the nature of their employment, who complained about the inconvenience and lack of places to eat. Just one day after the new regulation went into effect, the government decided to restore daytime dine-in services. Towards the end of July, certain anti-epidemic efforts were relaxed, including a major vaccination push.

When asked about the worldwide employment trend for 2018, 85% of employees in large cities reported that they were expected to work within traditional office hours, with no flexible working choices given (Randstad Hong Kong, n.d.). Before the pandemic, WFH was only available to a small number of people. In a paper issued in the early 2000s, the government predicted that Indians would not readily embrace teleworking in the short to medium term (Planning Department 2002). Coronavirus has impacted the lives of many people. Publicly funded university staff and civil servants (excluding those providing emergency and critical public services) were the first employees in India to be authorized to engage in the WFH program as a tactic to assist in minimising viral transmission in the country. There were a few private companies that allowed their employees to join in the WFH mode.

After the epidemic, companies may want to pay more attention to the working alternative they choose. WFH looks to be the internet platform of choice for several different multinational corporations. In India, a second wave of the epidemic prompted a separate study, which revealed that most employees surveyed had experienced WFH for at least one day each week and that they anticipated continuing to endure WFH for at least one or two days per week following the pandemic. When working in a large metropolis, it is possible for a substantial part of the population to do so, which has led to renewed discussion over the feasibility of such work practices. Work-life balance (WLB) has been questioned by some, while others have argued that WFH not only improves employee productivity but also gives greater flexibility in working arrangements. Indians are assimilating WFH, which was launched in reaction to the epidemic, with ease, because of the high level of technological sophistication they enjoy.

Work from home: an overview

COVID-19 infection can be minimized by using WFH, a COVID-19 infection prevention option. Many schools of thought have been made aware of WFH for many years, but it's not a new concept by any means. Nilles (1988) first suggested the notion of WFH in 1973, calling it "telecommuting" or "telework". A variety of names have been used to describe WFH over the past four decades, including remote work and flexible workplaces. Employers who can work in flexible environments, especially from home, by utilizing technology to perform job tasks, are considered flexible workers. Gajendran and Harrison (2007) In particular, noted that telecommuting involves performing activities outside of the employee's primary or core offices for at least a portion of their workday utilizing electronic media to connect with people inside and outside the business.

The COVID-19 pandemic may affect 37 percent of U.S. occupations, including economic activity, corporate management, and professional and scientific services, according to recent research by Dingel & Neiman (2020). There are certain jobs that cannot be performed at home.

These include those in the health care, agricultural, and hospitality industries. Whilst WFH is gaining in popularity across the world, experts have segregated it into its advantages and disadvantages

Both employers and employees benefit from WFH. A few examples of the benefits include decreased time spent traveling, avoidance of office politics, and the use of less office area. Other benefits include greater enthusiasm, greater gender diversity (women and careers), and healthy workforces with lower absenteeism and turnover numbers. Caulfield (2015) Employees discovered ways to save commute time and the value of travel time. Research has shown that telework may reduce turnover while boosting employee productivity, workplace participation, and employee commitment, among other things. The same is true for e-working. It may increase productivity, adaptability, professional advancement, and work-life balance, as well as cut travel time. As a further benefit, Purwanto et al. (2020) claimed that WFH may give employees more flexibility in their work schedules and allow them to save money on their commutes to and from work.

While WFH does have its advantages, it also has its downsides. According to Purwanto et al. (2020), there are certain downsides to working from home, such as the fact that employees are responsible for their energy and internet bills. In their study, Collins and Moschler (2009) found that working from home separated workers from their peers and that managers were worried about productivity losses. Deterioration of colleague relationships might also result (Gajendran and Harrison 2007). As a result of the blurring lines between work and family life (Baruch 2000; Kazekami 2020), employees may become overworked (Grant et al. 2019). In a similar vein, Eddleston and Mulki (2017) found that WFH is related to remote employees' difficulty to disconnect from work.

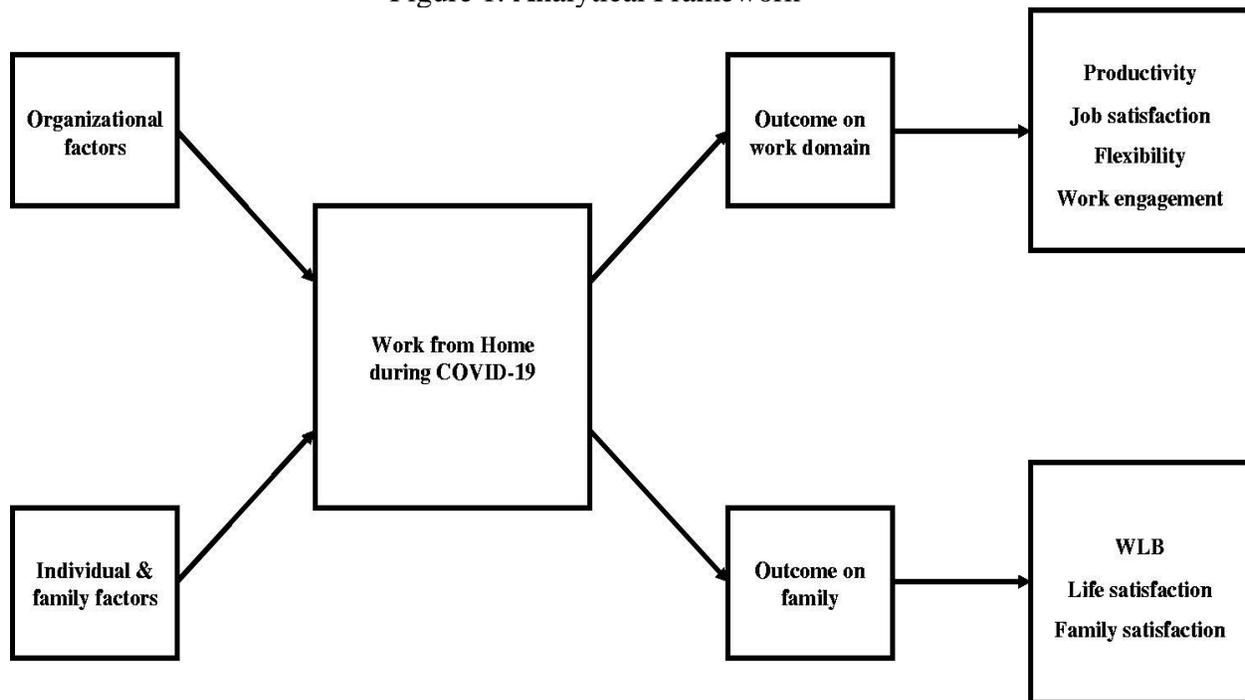

Working from home has been found to increase WLB. E-working would enhance WLB, and e-workers found it easy to merge work and non-work lives. E-workers found that e-working increased their productivity. Working from home increases workplace satisfaction. A favorable relationship exists between WFH and the contentment with one's family life.

Most countries have made WFH a policy priority in order to combat the epidemic. Employers and employees will both be influenced by these rules in some manner.

Work from home: a framework of investigation

Based on current research on WFH, telecommute, e-working, and flexible workplace practices (including remote work), the current study's program has been proposed. As soon as the COVID-19 pandemic breaks out, the WFH study will be led by a framework that evaluates whether or not the WFH setup will be temporary or permanent. According to the suggested paradigm, WFH is influenced by two factors: organizational and personal. To find out how these characteristics impacted WFH, the authors set out to investigate. As illustrated in Figure 1, the next section provides detailed explanations of the framework's parts.

Figure 1. Analytical Framework

As a result of working from home, workers must consider two primary considerations. Employees' work would first be affected by "organizational variables." The importance of organizational variables in WFH setups has been explored in many studies (e.g. Baker, Avery, and Crawford 2007; Grant et al. 2019). Employees' desires to work from home are only a few examples. There is also assistance for staff well-being and IT from the corporation, among other things (Baker, Avery, and Crawford 2007). Other organizational characteristics include the level of trust inside the organization and the level of trust held by management. WFH is associated with organizational trust and management trust, as established in prior studies. A culture of trust in an organization—trust among colleagues and managers—is required for teleworking or electronic working, according to Baruch's study from 2000 and Grant's study from 2019 as well as Baker, Avery, and Crawford's study from 2007. WFH and these variables are tightly linked, according to prior research.

SWOT analysis

Considering the availability of technology, India has the potential to make WFH considerably more prevalent. It is regarded to be one of the most technologically sophisticated cities, with 92 percent of its people using the internet (The World Bank Group 2020). Most urban residents already have the requisite technology, i.e. a stable internet connection, to participate in WFH. The majority of people, on the other hand, appear to have a hard time carving out a distinct workstation in their modest houses. Given that Hong Kong has just recently adopted WFH, it is important to evaluate the potential and drawbacks of WFH through the use of an analytical framework such as a SWOT analysis. WFH's strengths, limitations, opportunities, and dangers were analyzed, and the results are given in a self-explanatory report.

Figure 2.

SWOT analysis of the situation of Hong Kong		
	Work-from-Office	Work-from-Home
STRENGTHS	Networking opportunities/face-to-face interaction Opportunities for collaboration Prevent miscommunication/effective supervision Separation of work and personal life Greater sense of belonging Better onboarding for new employees A focused environment Greater access to technology No risk of information leaks	Flexible arrangement No office distractions (e.g. no office noise) Autonomy/freedom Cozy/Familiar environment (reduced stressed) Time saving / No commuting Money saving (e.g. spend less on renting office spaces) Work-life balance Reduce absenteeism
WEAKNESSES	Lack of flexibility Sedentary lifestyle Workplace conflict (e.g. office politics) Noisy workplace (e.g. loud conversations) Time wasted in unnecessary meetings Irrelevant side conversations Commuting expenses Higher operating costs (e.g. utility bills)	Distractions (e.g. family members, household duties) Uncomfortable environment (e.g. living in a small space) Lack of supervision Communication barriers Missing social interactions/loneliness Lack of hardware support Blurred lines between work and personal life Unhealthy lifestyle (e.g. lying on the sofa all day) Not favored by all employees Injustice
OPPORTUNITIES	Maintain a professional appearance (e.g. build lasting relationships with clients)	Hybrid models New talents from around the world
THREATS	Less workforce diversity (e.g. married women, & elderly) Traffic-related air pollution	Cybersecurity (e.g. data theft) Privacy (e.g. loss of corporate/employee/customer data) No WFH policies and regulations Extra expenses associated with home work High competition (e.g. job may be outsourced to cheap overseas labour)

DISCUSSION

People all around the world, especially in metropolitan areas where dual-family workers are on the rise, now have the opportunity to experience WFH with COVID-19. Having to take care of elderly parents and/or small children in addition to working in a difficult workplace has put the WLB of the workforce under scrutiny. WFH appears to have been well received by companies and employees in India, according to preliminary studies. A further study reveals that the present WFH framework is riddled with holes. As a result, there is more discontent with the absence of regulations for doing successful home working.

WFH must take into account the opinions of the people it serves in addition to the efficiency of its operations. Early on, an overwhelming majority of comments were favorable. More than 80 percent of workers, according to a survey done in April 2020, said they desired at least partial WFH measures to be in place, with percentages ranging as to how many days of the week that should be. Seventy-two percent of respondents strongly agreed that they had more time to rest, and sixty-eight percent strongly agreed that work-related stress had lessened (60.7 percent

strongly agree). In addition, 45 percent of respondents said that companies give enough assistance for implementing a WFH plan (Wong and Cheung 2020). This was the most common opinion, but not the majority, indicating that there was still space for improvement, even in the early days. In the same research, the majority of respondents agreed with all of the problems mentioned, including a lack of equipment, family disturbance, and poor communication with coworkers. In another research, almost 80 percent of workers reported feeling psychologically calm while working from home. 73 percent of workers favor and support WFH initiatives, while 83 percent support flextime, and 77 percent approve shortened working hours (Sun Life 2020).

Even while employees in Hong Kong first appeared to be in favor of WFH practices, it is obvious that several difficulties must be solved. Dissatisfaction with the core resources, such as restricted or no access to resources such as office papers, is highlighted in research (FastLane 2020). Considering that this is a novel work practice, both employers and employees are likely to be unprepared for this circumstance. A lack of flexibility and tolerance by companies has resulted from employees producing irregular or delayed work. The fact that just 32 percent of businesses have invested in new kinds of communication technology, and even fewer have done so in other areas, suggests that employers have been making some attempts (FastLane 2020). The peculiar working environment in Hong Kong, according to another study, makes WFH less advantageous for workers, who lack the separation between personal and professional areas. In addition to living in multigenerational households, people in this region have less space than their western counterparts, which leads to multiple distractions and an imbalance between work and home life, according to the poll. According to the same poll, 68 percent of workers said they missed going to work, as well as the personal connection, professional atmosphere, and face-to-face interaction for better cooperation (JLL 2020).

CONCLUSION

Many studies have shown that the WFH, which was formerly greatly sought, is not the best choice for most workers. WFH remains popular, although not in its present form. To regulate and make WFH possible, there need to be stronger government regulations and laws in place. In terms of policy, planning and execution are needed in order to successfully adapt to online work performed from a distance. The judgment did not specify how to end meetings and resume work in person. Because workers don't know what WFH is, they don't have access to software, formal papers, or appropriate workspace. Unless this technique becomes the new standard, it must be properly trained. After the epidemic, when WFH is no longer a mandate, but a flexible choice, the working balance may become apparent

ABSTRACT

Due to a rising need for applications in medicine, Magnetic Resonance (MR)—compatible sensors based on various methods have been developed during the past several decades. There are a number of technical options for creating MR-compatible sensors, but the one based on optical fibers has a number of advantages. The high elasticity and small size allow miniaturized fiber optic sensors (FOS) to be designed with metrological characteristics (e.g., accuracy, sensitivity, zero drift, and frequency response) suitable for most common medical applications; the immunity to electromagnetic interference and the lack of an electrical connection to the patient make FOS suitable for use in high electromagnetic fields. These two characteristics increased the potential function of FOS in medicine, making them particularly appealing for use in MRI. This article gives an overview of MR-compatible FOS, with an emphasis on the sensors used in medicine to measure physical characteristics (i.e., temperature, force, torque, strain, and position). The operating principles of the most promising FOS are examined in terms of their respective benefits and drawbacks, as well as their medical applications.

KEYWORDS: *Fiber Optic Sensors, Fiber Bragg Grating MR-Compatibility, MRI Interferometry, Sensor.*

1. INTRODUCTION

Magnetic resonance imaging (MRI) is a radiological imaging method that creates images of the body's architecture and physiological processes. Strong magnetic fields, magnetic field gradients, and radio waves are used in MRI scanners to create pictures of the body's organs. MRI scans do not utilize X-rays or ionizing radiation, which sets them apart from CT and PET scans. MRI is a kind of nuclear magnetic resonance (NMR) imaging technique that may also be utilized in other NMR applications, such as NMR spectroscopy. For medical diagnosis, staging, and follow-up of illness, MRI is extensively utilized in hospitals and clinics[1]. MRI pictures of soft-tissues, such as the brain or belly, have greater contrast than CT images. However, since the measures are typically longer and noisier with the subject in a long, restricting tube, it may be regarded as less pleasant by patients. Implants and other non-removable metal in the body may also represent a danger, preventing certain individuals from successfully having an MRI scan[2].

Historically, the earliest use of optical fibers in medicine was for the lighting of interior organs during endoscopic operations. Over time, the same technology has been used to accomplish various activities, including laser treatments and the development of transducers for monitoring parameters of interest for both therapeutic and diagnostic reasons. Despite the fact that Fiber Optic Sensors (FOS) have been around for forty years and have certain benefits over other established technologies, their market has only expanded significantly in the past decade, owing to improvements in essential optical components and lower prices[1]. FOS is now used to monitor a variety of chemical and physical characteristics of medical relevance. Intrinsic sensors, in which the optical fiber acts as a medium for conveying light whose characteristics (e.g. intensity, frequency, phase) are modulated by the measurand extrinsic sensors, in which the optical fiber acts as a medium for conveying light whose characteristics (e.g., intensity, frequency, phase) are modulated by the measurand [3]. The fundamental components of FOS (e.g., light source, photo detector) may be deployed distant from the sensing element in this second class of sensors, allowing for the development of compact sensors and hybrid systems. FOS is attractive for a variety of applications that take place inside or near the magnetic resonance scanner, in addition to the well-established applications in industrial and medical fields. Immunity from electromagnetic interferences, combined with good metrological characteristics and small size, make FOS attractive for a variety of applications that take place inside or near the magnetic resonance scanner[2].

Magnetic Resonance Imaging (MRI) has grown in significance in clinical imaging since its debut in the early 1970s, exceeding even the most hopeful expectations of researchers. The increasing number of exams based on this method, as well as the introduction of novel procedures in clinical practice that are conducted under MRI supervision, has prompted research into new sensors that may be used in this situation. FOS is one of the MR-compatible applications that may be used to enhance surgical operation results as well as patient monitoring. The temperature of patients undergoing MRI-guided hyperthermia treatments, the evaluation of deflection and force on needles during MRI-guided operations and the estimate of physiological parameters (e.g., heart rate and breathing monitoring) are all examples of those uses. There are many applications for such sensors in research procedures. The ASTM standard F2503 addresses MR safety issues including the usage of equipment in the MR environment. There are three categories in the standard: "MR safe," "MR conditional," and "MR unsafe." "MR-safe" refers to an item that poses no known hazards in all MR environments; "MR-conditional" refers to an

item that has been shown to pose no known hazards in a specific MR environment under specific use conditions; and “MR-unsafe” refers to an item that poses known hazards in all MR environments. Despite the fact that the ASTM F04.15.11 MR Standards subcommittee agreed to drop the phrase “MR compatible,” it is still widely used in medical and technical practice. It is critical to distinguish between the phrases “MR-safety” and “MR-compatibility”[3]. MR compatible means that a gadget is “MR safe” when used in an MR environment and has been tested. It has not been shown to have a major impact on the quality of diagnostic information, nor has it been shown to have a substantial impact on the quality of diagnostic information. The MR device has an impact on operations.

Fiber optic technology is especially well suited to developing “MR-compatible” sensors in this light. Because of its tolerance to electromagnetic forces, it can: (1) be safe; (2) not degrade picture quality. (3) Ensuring that the sensors' functionality is not harmed. Furthermore, the material that was utilized to construct the. Magnetic fields within the MR-scanner are not perturbed by optical fibers, which is a critical element for the scanner's performance. The preservation of diagnostic information's quality. This article gives an overview of “MR-compatible” FOS, with a particular emphasis on sensors. Used to measure temperature, force, torque, strain, and position throughout a variety of medical procedures procedures[4]. Throughout the article, we provide a critical assessment of the most promising and widely used technologies. techniques. We divided them into three categories for clarity's sake: I Fiber-based FOS Bragg on grating technology; (ii) FOS based on intensity; (iii) FOS based on interferometric methods. Moreover, the fundamentals of measurement, potential medical uses, and benefits and disadvantages of each technique are discussed.

1.1 Working Principle:

Temperature and strain may be sensed using MR-compatible sensors based on fiber Bragg grating (FBG) technology, which have been developed in a variety of configurations. Hill et al. utilized electromagnetic waves to locally alter the refractive index of the optical fiber core, which led to the development of the FBG in the area of thermal and mechanical measurements. Meltz et alwork, [5]. published 10 years later, aided the spread of FBGs by describing a more successful, holographic method for grating creation. FBGs have been used in a variety of areas, including telecommunications and the design of FOS, because to the features of photosensitivity technology and its natural compatibility with optical fibers. Despite the FBG sensors' many advantages, their widespread use was hampered by their high cost and production challenges, which were finally solved in the 1990s. Several research groups have developed sensors based on FBG in the past decade. Different studies provide detailed descriptions of the properties of these sensors, their manufacturing method, and their medical uses[6]. The working concept of an FBG is based on radiation reflection produced by the Bragg grating: when a fiber optic containing an FBG is probed with polychromatic radiation, the FBG only reflects a limited range of wavelengths. As a function of the effective refraction index of the core (n_{eff}) and the spatial period of the grating, the center wavelength of such a range, termed Bragg wavelength, may be written as follows: Temperature and strain affect n_{eff} , allowing sensors to be designed to detect temperature and strain, as well as other physical characteristics linked to them (e.g., pressure, force, vibrations, and flow).

For FBG-based transducers, certain solutions may be used to make them selectively responsive to strain or temperature. A reference FBG is usually added to the primary sensor to reduce the

impact of unwanted effects and improve the measuring system's repeatability. Sensors with excellent metrological properties, such as good precision, wide bandwidth, big dynamic range, and high strain and temperature sensitivity (typical values range from 0.64 pm/ to 1.2 pm/°C, and 6.8 pm/°C to 13 pm/°C, respectively) may be developed using FBG technology. Furthermore, since several gratings with different Bragg wavelengths may be written on a single fiber, this technique allows for multiplexing. On the other hand, in order to prevent a reduction in performance (e.g., resolution and accuracy), the measurement chain should use a costly equipment to identify the wavelength of reflected light (i.e., an optical spectrum analyzer). Finally, interferometric methods such as the Sagnac, Fabry-Perot, and Michelson interferometers may be used to implement Fiber Optical Fiber (FOS) . Both intrinsic and extrinsic FOS may be developed using these methods. In the first instance, the fiber serves as a conduit for radiation that is modulated by a detecting device at the fiber's tip. In the second, the fiber itself acts as a sensor element, causing interferences that are modified by the measurand. Fabry-Perot interferometry is the most frequent interferometric configuration used to create FOS. Its sensing method is based on two semi-reflective mirrors that partly transmit and partially reflect the light that travels through the fiber.

Electromagnetic waves interact constructively and destructively with themselves and generate fringes as a result of numerous reflections. The optical path, which is linked to the distance between the mirrors, determines the intensity of these fringes. As a result, these FOS may be utilized as supplementary elements to measure the factors that affect the distance between the two mirrors.

1.2 Medical Applications

Biocompatibility, broad bandwidth, and compact size are the key features that make FBG technology especially suited for medical applications. Furthermore, fiber optics' resilience to electromagnetic fields and low interference with the electromagnetic fields utilized in MRI make this technology appealing for creating "MR-compatible" sensors. Some research groups have suggested FBG-based sensors for monitoring temperature in MRI, which is critical for a variety of applications: for example, Rao and colleagues created a cardiac output estimate measurement chain with a resolution of 0.2 °C and an accuracy of 0.8 °C. During MRI-guided hyperthermia treatments, this technique is also used to monitor tissue temperature. Temperature does play an important role during hyperthermia, and monitoring it may aid the physician in adjusting the heat exposure. The metrological performance of widely used temperature sensors, on the other hand, is influenced by the electromagnetic fields employed during the process to produce hyperthermia. To address this issue, Webb and colleagues developed a five-FBG measuring system that enables them to take temperature readings during hyperthermia therapy of the kidney and liver in live rabbits.

Other researchers investigated the possibility of employing FBGs to monitor temperature in hyperthermic swine pancreatic tissue. In a subsequent study, the same authors measured tissue temperature using 12 small size FBGs (1 mm length) in an attempt to improve spatial resolution, and used an ad hoc designed MR-compatible polymethylmethacrylate (PMMA) mask to precisely arrange the optical applicator and the FBGs inside the tissue. This technique has also been utilized to monitor temperature during prostate cryosurgery and liver cryosurgery, where the MRI compatibility was tested experimentally. The monitoring of strain and other associated parameters is the second use of FBGs in MRI. Several research has focused on using FBG

sensors to measure ventilatory movement and respiratory rate during the past decade. Witt and Colleagues suggested a system with various FOS and an FBG-based sensor to detect thorax circumference changes for monitoring respiratory motions. De Jonckheere and colleagues developed two MR-compatible sensors for capturing thoracic and abdominal motions in sedated patients during MRI examinations for a similar purpose. Because of their great sensitivity to strain, they used an FBG-based sensor implanted in an elastic bandage to monitor thoracic motions. Grillet et al. developed three sensors for respiratory monitoring in an MRI setting, one of which is based on FBG. Silva et al., who used FBG sensors to monitor both respiratory and heart rate. who evaluated the feasibility of employing FBG sensors for respiratory monitoring and cardiac activity within a 1.5 T MRI scanner , used a similar method[7]. Large amounts of study have recently been dedicated to the use of FBG sensors in minimally invasive surgery. The FBG sensors are helpful in this situation to give feedback on the force exerted to the patient's tissue in order to prevent injuring tissues during the application of surgical knots.

With a resolution of 0.1 N, a measurement error of less than 0.1 N, and a measurement range of up to 10 N, Song and colleagues created a flexible and sterilizable FBG force sensor system for minimally invasive robotic surgery[8]. Iordachita and colleagues developed a force measuring system for retinal microsurgery that allows for 0.25 mN resolution in estimating contact forces at the tool tip. reported the development of a small FBG sensor (15 mm in diameter and 20 mm in height) to give force/torque feedback during robot-assisted prostate surgery. This can measure axial force with 0.1 N precision ranging from 20 N to 20 N, and torque with 1 Nmm resolution ranging from 200 NM to 200 NM. Three FBG sensors were used by Park and colleagues to detect needle deflection during MRI-guided operations.

2. LITERATURE REVIEW

J. Ballato[3]Propose that The goal of this article is to examine the current state of the art in optical fiber pressure sensors for medical applications. Because of their compact size, electromagnetic interference immunity, and adaptability for remote monitoring and multiplexing, optical fibers offer intrinsic benefits. Optical fiber-based pressure sensors are minimally invasive for many medical applications, as well as lightweight and flexible, making them ideal for in vivo monitoring. This implies that the sensor may be put directly within a patient for purposes such as urodynamic and cardiovascular monitoring. With specific reference to these application areas, this article provides an overview of current advances in optical fiber-based pressure measurements.

K. Kong[9] Propose that Raman spectroscopy is an optical method that uses inelastic light scattering by vibrating molecules to identify chemical fingerprints in cells, tissues, and biofluids. The ability to use advanced optical technologies in the visible or near-infrared spectral range (lasers, microscopes, fiber-optics) has recently led to an increase in medical diagnostic applications of Raman spectroscopy due to its high chemical specificity, minimal or no sample preparation, and the ability to use advanced optical technologies in the visible or near-infrared spectral range (lasers, microscopes, fiber-optics). Raman spectroscopy can identify and quantify molecular changes in cells, tissues, or biofluids that are either the cause or the consequence of illnesses, according to the central premise of this area. Multivariate calibration and classification models based on Raman spectra may also be built on huge "training" datasets and then used to fresh patient samples to achieve quantitative and objective diagnosis. Spontaneous Raman

spectroscopy has a reputation for being a low-signal method that requires lengthy acquisition periods.

T. Abitbol[10] Propose that Because of its renewable nature, anisotropic form, outstanding mechanical characteristics, high biocompatibility, tailorable surface chemistry, and intriguing optical features, nanocellulose is gaining popularity in the areas of material science and biomedical engineering. Photonics, films and foams, surface alterations, nanocomposites, and medical devices are some of the major topics of nanocellulose research discussed. Nanocellulose fibers offer enormous promise in a variety of applications, ranging from flexible optoelectronics to tissue regeneration scaffolds. We want to share some of the current enthusiasm around nanocellulose research, which stems from the green nature of the particles, their intriguing physical and chemical characteristics, and the wide range of applications that this material may influence.

3. DISCUSSION

The advent of magnetic resonance imaging (MRI) is without a doubt the greatest significant milestone in biomedical research and treatment during the past two decades. To give you a sense of the social and economic consequences, the Organization for Economic Co-operation and Development (OECD) health data show that there are more than 20,000 MR scanners in OECD nations, and demand for high-field equipment (7 Tesla or higher) is growing globally. MRI has become a "can't do without tool" in medical disciplines such as cardiology, surgery, orthopedics, and neurology, owing to its capacity to examine and distinguish soft tissues. Furthermore, MRI's great spatial resolution, along with its ability to acquire functional characteristics of the investigated tissue indirectly, make it essential for investigating organ functions and imaging-guided invasive treatment. In the aforementioned situation, the need for "MR-compatible" sensors that can monitor physical parameters within the scanner and offer real-time feedback on the patient's condition and/or the impact surgical operations have on tissue is rapidly increasing. We evaluated the most promising work concepts used to develop "MR-compatible" sensors using optical fiber technology in this article. Transducers created for measuring temperature, force, torque, strain, and position received specific attention, with an emphasis on their operating principles, benefits and disadvantages, and medical applications. We divided the "MR-compatible" sensors into three groups based on their operating principle, using a variety of categorization criteria.

FBG sensors, intensity-based sensors, and interferometry-based sensors are the three types of sensors. For two primary objectives, "MR-compatible" sensors based on FBG technology have been used. For starters, they provide real-time monitoring of critical parameters during therapeutic invasive operations, resulting in better procedure results. Examples of such applications include: (i) tissue temperature assessment and control during hyperthermia or cryoablation done under MRI guidance; and (ii) monitoring of needle deflection and/or force used during MRI-guided treatments. Second, FBG has been used to track physiological characteristics that are of interest (e.g., respiration and heart rate). For comparable purposes, interferometric and intensity-based FOS have been used. Intensity-based FOS have several drawbacks, including undesired drift caused by variations in light intensity and bending losses; on the other hand, their measurement chain is simple and inexpensive. As a result, they are appropriate for a variety of medical applications that do not need precise metrology, such as respiration rate monitoring. The usage of FBG sensors provides for improved sensitivity and

resolution, as well as multipoint measurements, and they are unaffected by variations in input light intensity, despite the fact that they need an optical spectrum analyzer, which is a costly and large instrument. As a result, when high performance is critical to improving the operation outcome, FBG technology is suggested (e.g., needle deflection in microsurgery). The lack of an electrical connection with the patient, and the small diameter of fiber optics are significant advantages over conventional transducers that drive the market growth of this technology (for example, FISO Technologies Inc. and Camino Laboratories Inc. manufacture pressure and temperature sensors for medical applications). FOS is also an excellent option for meeting the increasing need for MR-compatible sensors because of its resilience to electromagnetic fields. Ad hoc developed FOS for medical applications has been commercially accessible in recent years; for example, Micron Optics Inc. and Opsense Inc. provide MR-compatible FOS for displacement, temperature, and pressure monitoring.

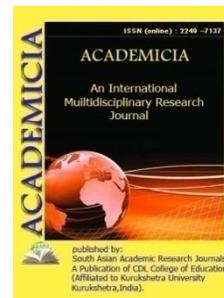

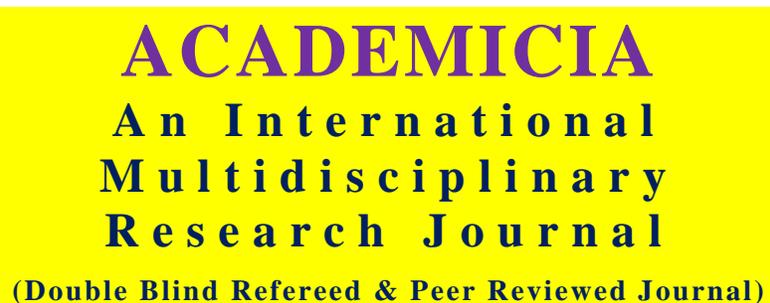

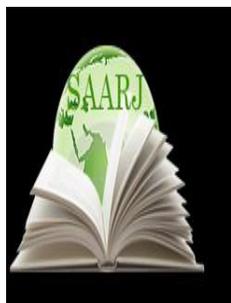

4. CONCLUSION

Finally, fiber optic sensor technology is a critical enabler for the creation of MRI-safe motion control systems, which are essential for modern medical research. Magnetic fields have no effect on fiber optic sensors since they are passive. Between the MRI Scanner (Zone 4) and the MRI Control/Equipment Rooms, optical fiber offers an excellent all-dielectric communication medium. MRI safe fiber optic sensors, made from the right materials, offer electromagnetic transparency for safe usage in and near the MRI Scanner's high electromagnetic field intensity. Even when utilized within the MRI bore, they are durable, simple to install, and do not produce artifacts or adversely impact imaging findings.

IMPROVEMENT OF METHODOLOGICAL PEDAGOGICAL SKILLS OF DEVELOPING CREATIVE ACTIVITY OF PRIMARY SCHOOL STUDENTS

Sharofutdinova Ranoxon Shavkatovna*

*Lecturer,

Department of Primary Education Methodology of Fergana State University,
UZBEKISTAN

ABSTRACT

Today, the teacher requires the use of advanced pedagogical and new information technologies in the educational process. Proceeding from the above, based on our experience, we will describe our thoughts on the ways of teaching and learning through the use of interactive techniques in the lessons. We think that it will provide practical assistance to our colleagues in increasing the effectiveness of training. It also becomes one of their close assistants in the performance of a responsible task, such as the selection of students for their direction and the formation of skills in preparation for an independent life. Below we give recommendations on the application of modern methods of teaching on the basis of some topics in the cross-section of classes.

KEYWORDS: *Collaborative Activity Of The Teacher And Students, Knowledge, Skills And Skills To The Students Through Training*

INTRODUCTION

Education is a collaborative activity of the teacher and students, in the process of which the development of the individual, his / her knowledge and upbringing are also carried out. In the lessons, the teacher achieves his knowledge, skills and skills to the students through training, while the students will have the ability to use it as a result of their assimilation. In the process of learning, students use different forms of assimilation, that is, they rely on specific discrepancies in the perception, processing and application of the assimilated information. In the educational process, issues of education and training in the form of interaction of teachers and students at the time of classes, independent performance of students, extracurricular work are solved.

The purpose of education is formed in accordance with the need of society. Therefore, the purpose of education should be appropriate and proportionate. It was noted that the purpose of education in the scientific literature is to create the right, accurate, appropriate use of the opportunities, skills and skills, develop logical and creative thinking, increase communicative literacy, integrate the National idea, form shargona education, the expression of spiritual enrichment of a person. On the basis of educational purpose, the culture of their communication is improved by independent thinking, increasing oral and written literacy, developing logical thinking. On the basis of educational purpose, spiritual, ideological, spiritual education is provided. In the process of language learning, it becomes possible to approach the cultural and moral values of the people.

One of the great wise." as long as you live with the anxiety of the future, give your children good knowledge, read". It would not be a mistake if we say that the reforms carried out in the educational system of our country in the real sense were not a work aimed at achieving efficiency in a two-year or short period, but a change in the real sense for several hundred years. This shows that the wise policy lies at the time of the idea that all the children of our country – my children, they should be stronger, educated and of course happy than us, worrying about the future of our president, our future generation.

It is known that the introduction of advanced pedagogical and new information technologies in education not only increases the effectiveness of training, but also plays an important role in the upbringing of an independent and logical thinking, comprehensively high spiritual person by applying the achievements of Science in practice.

Currently, interest in the application of interactive methods and information technologies in the educational process is increasing day by day. One of the reasons why this happens is that by this time, in traditional education, students are taught to acquire only ready-made knowledge, while the use of modern technologies teaches them to search for the knowledge they possess, independently study and think, analyze, and even draw the final conclusions themselves. The teacher in this process creates conditions for the development, formation, acquisition and education of the individual and at the same time performs the function of management, directing.

It gives a positive result if used in the lessons of repetition or strengthening of the game-tasks in the training. The choice of what kind of a game task should depend on the type of lesson, the level at which students are taught to perform the game tasks, their level of knowledge, the possibilities of independent creative work, the ability to quickly restore the learned in memory, the extent to which creativity is also formed.

In education, attention is paid to the issue of thinking the personality of the reader, understanding the thoughts of other people and teaching this idea to make literate statements in oral and written form, the main role is played by the perfection of an independent thinking, speech culture developed literate person. The lifestyle, cultural creativity of the nation is studied on the basis of its rich historical heritage.

MATERIALS AND METHODS

Today, the teacher requires the use of advanced pedagogical and new information technologies in the educational process. Proceeding from the above, based on our experience, we will describe our thoughts on the ways of teaching and learning through the use of interactive techniques in the

lessons. We think that it will provide practical assistance to our colleagues in increasing the effectiveness of training. It also becomes one of their close assistants in the performance of a responsible task, such as the selection of students for their direction and the formation of skills in preparation for an independent life. Below we give recommendations on the application of modern methods of teaching on the basis of some topics in the cross-section of classes. You use it with a creative approach, and in response to the thoughts of our first president: "let's look for answers to the question of what we are doing today, in order to arouse pride and pride in our children, a sense of loyalty to our sacred Mother Earth; we hope that you will add your own sense of achievement.

The use of interactive techniques and educational games, modern information and communication technologies in primary classes will help students to think independently, expand their creative search and logical thinking circles, as well as connect with life what they have learned in the lessons, increase their interest. Effective use of the conditions created on the basis of such modern requirements of teachers, organization of lessons on the basis of advanced pedagogical and Information Communication Technologies guarantees the quality of the educational process.

It will give a positive result if it is used in the lessons of repetition or strengthening of the game-tasks during the lessons. The choice of what kind of a game task should depend on the type of lesson, the level at which students are taught to perform the game tasks, their level of knowledge, the possibilities of independent creative work, the ability to quickly restore the learned in memory, the extent to which creativity is also formed.

In education, attention is paid to the issue of thinking the personality of the reader, understanding the thoughts of other people and teaching this idea to make literate statements in oral and written form, the main role is played by the perfection of an independent thinking, speech culture developed literate person. The lifestyle, cultural creativity of the nation is studied on the basis of its rich historical heritage.

CONCLUSION

In our opinion, the main requirements for educational games are as follows:

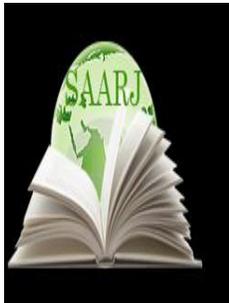

1. Educational games should be suitable for the age of students;
2. The games should be in proportion to the essence of the subject matter under consideration;
3. The timing of educational games must be clearly defined;
4. Educational games should have both educational and educational significance;
5. The purpose, significance of educational games should be determined.

As long as the above requirements are met, the effectiveness of the lesson will increase, and modern technologies will serve the effectiveness of Education.

ABSTRACT

The construction industry is a work environment that poses many dangers to workers, with many hidden factors that affect work awareness. Construction companies need to ensure a balance between productivity and safety in the work environment. The purpose of this study was to identify relationships between the feeling of safety in the work environment, proactive work behaviour, job satisfaction, work skills, team performance, and health risk indicators, such as heart rate, among construction workers of different ages. Based on previous research, we examined the hypothetical perception model.

KEYWORDS: *Construction Worker; Age; Heart Rate; Body Mass Index (BMI); Structural Equation Modelling.*

INTRODUCTION

Productivity is an indicator of the economic efficiency of employees. The concept of labour efficiency is broader than the concept of productivity, which includes not only economic aspects (actually labour productivity), but also psychophysiological and social aspects. If the following requirements are not met, the growth rate of labour productivity will inevitably decrease unfavourable sanitary-hygienic and harmful working conditions for human health; waste of working time due to illness; reduction of the most active period of human labour; additional leave, etc. In a market economy, it is more important to calculate productivity by the volume of goods sold, because the increase in work in progress and the accumulation of unsold products

have no positive economic significance. Many factors affect the level of labour productivity and its dynamics. Factors are the driving forces and causes that affect changes in labour productivity. Some of them contribute to the increase in labour productivity, others may lead to a decrease in productivity: the first group of factors increases labour-power, the organization of labour and production, the improvement of social conditions of workers, the second group adversely affects the organization of production and labour. Deficiencies in development include the negative impact of negative elements in social conditions.

Some enterprise or organization level factors can be divided into internal and external types. Internal factors include the level of technical equipment of the enterprise, the efficiency of the technology used, the level of energy supply of labour and production, the effectiveness of the incentive systems, training and retraining of personnel, improving the staff and the team, as well as everything related to its leaders. External factors include changes in product types and their level of labour due to changes in government orders and market demand, as well as supply, socio-economic changes in society and regions, the degree of cooperation with other enterprises, the maturity of logistics, natural conditions, etc. It is accepted to combine all factors into three main groups according to their internal content and essence: Material and technical factors of increasing labour productivity (including increasing the technical and energy supply of labour based on continuous development of science and technology), organizational factors (their implementation (impact) is related to the fact that the development of science and technology acquisition, provision of the material base of production (equipment, technology) and implementation of various, and in many cases more complex organizational measures do not happen by themselves, but only by participants in social production. occurs only as a result of the active labour activity of the victims). Labour productivity reserves are the opportunity to make fuller use of all the factors of productivity growth, including labour productivity, through the improvement of equipment, technology, production, labour and management organization. Reserves are closely linked to factors that increase labour productivity. There are several classifications of labour productivity reserves, all of which are divided into two major groups: reserves for improving the use of live labour (labour) (organization of labour, working conditions, improving the working capacity of workers, staffing and their placement) [1].

Issues related to the creation of organizational conditions for continuous work, as well as ensuring a high material and moral interest of employees in the results of work) reserves for more efficient use of fixed and revolving funds (fixed assets (machinery, mechanisms, apparatus, etc.) include better use reserves in terms of power and time, as well as more economical and full use of raw materials, supplies, components, fuel, energy and other revolving funds). Reserves are divided into reserve reserves and perishable reserves on the basis of usability. For example, equipment is not fully deployed in terms of capacity and work shifts, and labour reserves that have been studied but have not yet been implemented are reserve reserves. Waste of working time includes the production of unsuitable products, excessive consumption of fuel is included in the reserves of destruction.

The concept of reserves is the waste of time in production (including idle time during shifts and during the day, delays in work and absences from work not planned), the non-production of labour (tools and labour) irrational use of materials, as well as unplanned overuse of labour due to disruption of established technological processes). Reserves are divided into current and future reserves depending on the period of use. Current reserves will be realized without significant

changes in the technological process and without additional capital investment, the reorganization of production of future reserves will require the installation of more sophisticated equipment, capital investment and more time for preparatory work. Reserves are divided into economic, sectoral and domestic production reserves, depending on the location of identification and use. National economic reserves include, first of all, rich natural resources, their comprehensive use, and so on. Network reserves include reserves, the use of which, in general, increases the productivity of employees in the network (specialization of enterprises, concentration and combination of production, improvement of equipment and technology, etc.). Domestic production reserves are important in increasing labour productivity because ultimately, they are all identified and implemented directly in enterprises.

Productivity indicators and ways to increase it. A system of general, specific and auxiliary indicators is used to assess the level of labour productivity. Aggregate indicators include the value of the average annual, average monthly, average daily, and average hourly output produced by a single worker. Specific measures are the time taken to produce a unit of a particular type of product or the time a person spends per day or per person per hour to produce a particular type of product in kind. Auxiliary indicators describe the time spent per unit of a particular type of work or the volume of work performed per unit of time. The aggregate indicator of labour productivity depends not only on the average annual output of one employee but also on the share of their total number of industrial production workers, as well as on the number of days they worked and the length (duration) of the working day. There are several ways to increase productivity:

- a) increase production by making full use of the production capacity of the enterprise, because when production increases, only the variable part of the consumption of working time increases, while the constant remains unchanged. As a result, the time spent on product production is reduced;
- b) intensification of production, improvement of its quality, the introduction of complex mechanization and automation of production, application of advanced equipment and production technology, organization of production, logistics and other factors in accordance with the plan of organizational and technical measures reduction of labour costs in the production of goods by reducing the waste of time at the expense of improvement. The construction industry is labour intensive compared to other industries, and many construction workers face workloads that exceed their individual physical capabilities. Many construction sites are characterized by poor work environments, such as poor scaffolding, working from heights, high temperatures, and humidity. Long-term physical workloads can lead to chronic fatigue, injuries, illness, and health risks, which may, in turn, reduce on-site productivity. The US Bureau of Labour Statistics reported that over 43,000 workers experienced fatal occupational injuries on construction sites between 2003 and 2010. In addition, studies have shown that 37.9% of US workers experience severe fatigue, leading to fatal consequences related to worker safety, health, and productivity. These strict work conditions are in a similar environment at construction sites around the world. According to a survey by the Ministry of Health, Labour and Welfare, 323 workers died from work-related accidents in the Japanese construction industry in 2017; these accounted for more than 30% of all industry deaths in Japan [2]. Moreover, the most frequent cause of death was falls/descent (N = 135) that occurred during construction work on buildings and houses. Construction is one of the most dangerous industries, given the high frequency of occupational deaths and accidents.

While occupational health and safety is a priority in the industry, it has been pointed out that Japanese construction practices do not comply with sustainability policies.

The construction industry serves as the industrial base in every country and is considered the biggest contributor to national economies. Therefore, it is imperative for the entire construction industry to ensure the expected productivity, in consideration of working conditions and the working environment for workers, and to ensure workers' good health and safety. The primary causes of occupational accidents depend on the nature of the work, workers' behaviour, and on-site dangers in the working environment. Moreover, safety management at construction sites may be difficult to implement on a broad scale. Safety measures in the working environment and workers' awareness of occupational safety are important countermeasures against occupational accidents. Given the relationship between construction workers' age and safety, with older workers shown to be more conscious of safety and to have more professional knowledge and experience compared to young workers, studies have shown that young workers are at a higher risk of accidents than are old workers. Careful concentration on work can reduce unforeseen events. In this study, we conducted a questionnaire survey on safety awareness in construction work among workers from two age groups in a Japanese construction company. The health risks associated with a high resting heart rate among young and older workers have been shown to have a negative effect on workplace productivity and safety awareness in construction work. In particular, regular monitoring of biological information, such as heart rate, and physical information, such as BMI, can help facilitate an enduring work relationship between construction companies and workers by fostering a sense of awareness among older workers. Our study found that health risk indicators, the feeling of safety, job satisfaction, awareness of work skills, and proactive work behaviours in the workplace are suggested to affect workplace productivity. By having a quantitative understanding of workers' health risks and awareness, construction companies can improve workers' Quality of Work (QoW) and well-being. Construction projects involve several daily business problems, and therefore HRM is important in building sustainable development projects. At the construction site, the workforce experiences changes as the project progresses, and the different skills, experiences, and health and safety risks of several workers must be managed. Previous studies on these workers have conducted interviews and questionnaire surveys and created research reports based on HRM, but few have analyzed biological information and physical characteristics. Further research on this can facilitate the management of construction site productivity through teamwork by gaining an awareness of workers. The findings of this study have several limitations. First, the study used a self-reporting method that could result in differences between workers' provided and actual resting heart rate, height, and weight. Future research should seek to include observable data to better understand the potential consequences for workers. Second, the study focused on workers at a Japanese construction company and infers causality in their awareness.

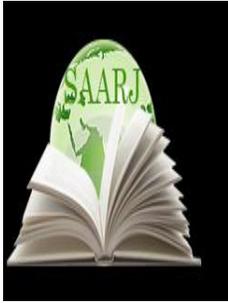

CONCLUSION

Organizational activities at Japanese construction sites are characterized by high levels of worker empowerment, continuous improvement through teamwork, and a positive attitude towards quality and safety. Including these strong points of the Japanese construction industry, future studies may need to investigate more construction workers, including factors such as organizational culture, job engagement, and job crafting behaviour, to confirm the reported results. Third, worker perceptions are very complex because they are influenced by factors other

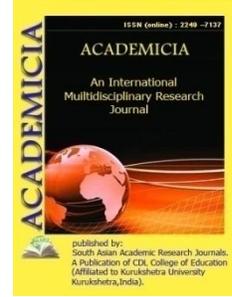

than age, such as previous experience, physical characteristics, and private situations, which further research should address. Last, the model hypothesis used in this study is diverse, with many side effects and adverse effects, as well as endogenous problems. The suggested results possibly depend on a case study of workers in a Japanese construction company, and the extent of the generality of the results needs further discussion.

ABSTRACT

Deep learning technologies has been a significant study area in the field of machine learning with the advent of big data, and it has been extensively used in image processing, natural language processing, voice recognition, and online advertising, among other applications. This paper covers various aspects of deep learning techniques, such as common deep learning models and optimization methods, commonly used open source frameworks, existing problems, and future research directions. To begin, we'll go through some of the applications of deep learning; Second, we go through several popular deep learning models and optimization techniques. Finally, we go through several popular deep learning frameworks and platforms. Finally, we emphasize deep learning's future development by introducing the most recent deep learning acceleration technology.

KEYWORDS: *Deep Learning ,Data Corporation, Image Processing , Natural Language Processing Recognition Of Speech*

1. INTRODUCTION

The rise of different applications in the Internet area has led to the exponential expansion of data scale, owing to the fast development of technologies such as cloud computing, Big data, and Internet of things. According to the International Data Center's study, According to the International Data Corporation (IDC), worldwide total data would be 22 times more in 2012 than it was in 2011[1]. By 2020, the amount of ZB will have increased to 35.2. Big data has a lot of

promise and has a lot of value. Human civilization is undergoing change and growth, but it is also encountering severe issues[2]. "Overload" is a term used to describe a situation where How can I get useful information from a website fast and efficiently. Managing a wide range of complicated data has become a significant problem. Deep learning has made significant progress in recent years. advances in image processing, voice recognition, and natural language comprehension Deep learning can map because of the fast advancement of deep learning technologies. by automatically learning features from diverse data in the same hidden space. Obtains a consistent data representation from multi-source heterogeneous data[3]. This document was written by examines many elements of deep learning methods, such as typical deep learning models. learning and optimization techniques, widely used frameworks, actual issues, and so on. path of future research The rest of this document is laid out as follows: The second section delves further into the topic. Deep learning has many uses. The typical models of deep learning. The optimization techniques. We introduce frequently.

Deep learning systems and frameworks that are open source were utilized. The sixth section contains information on Deep learning acceleration technology The difficulties and possibilities are discussed. learning to the depths Section 8 brings our study to a close and suggests areas for further research[4]. Deep learning is a form of machine learning that is entirely based on artificial neural networks. Because neural networks are designed to imitate the human brain, deep learning is likewise a human brain mimic[5]. We don't have to explicitly program anything in deep learning. Deep learning is not a new idea. It has been around for quite some time. It's all the rage these days since we don't have nearly as much processing power or as much data as we have today[6]. As processing power has increased rapidly over the past 20 years, deep learning and machine learning have entered the scene. This is a depiction of a solitary neuron in the human brain, which has about 100 billion neurons[7]. Each neuron is linked to thousands of its neighbors. The issue is, how can these neurons be recreated in a computer. As a result, we construct an artificial neural network, which consists of nodes or neurons[8]. We have neurons for input and output values, and in the hidden layer, there may be a large number of neurons linked.

1.1 Application of Deep Learning:

- **Image Processing:** Deep learning's first use was image recognition. Using deep convolutional neural networks to learn the end-to-end mapping connection between low-resolution and high-resolution pictures for image identification for the first time in 2014. DenKer obtained the greatest results at the time by using a convolutional neural network to identify handwritten digital. Using a deep convolutional neural network, developed the Faster R-CNN object identification technique. For image identification, incorporated sparse priors into deep convolutional neural networks in 2015. Autoencoder to categorize pictures, and support vector machines were trained for image classification. In the 2016 ImageNet Competition, deep learning accuracy surpassed 97 percent for image recognition, developed CNNH (Convolutional Neural Network Hashing), a supervised depth hashing method.
- **Recognition of Speech:** Deep learning technology has been used in voice recognition in recent years. At the end of 2016, Baidu, HKUST, and SOGOU all claimed that their accuracy of Chinese voice recognition based on deep learning had surpassed 97 percent. Microsoft's research on deep neural network-based voice recognition has totally altered the basic technological

foundation of speech recognition. The deep neural network model has resulted in significant improvements in speech recognition accuracy. Deep neural network models are being utilized in voice recognition algorithms used by well-known Internet businesses (Baidu, HKUST, and SOGOU). They used a convolutional neural network (CNN) to extract voice features in [12]. developed a multilayer perceptron-based voice synthesis model for speech recognition. They utilized the LSTM technique to extract voice characteristics , which significantly increases feature efficiency. G. E. Hinton replaced the Gaussian mixture model (GMM) in the conventional model with DBN in 2012, and the findings indicated that the error rate on the TIMIT core test set fell to 20.7 percent, a considerable improvement. Recently, Google developed a speech recognition system based on the feedforward sequential memory network, which employs a high number of convolutional layers to directly model the whole sentence speech signal and better convey long-term speech relevance. Baidu used deep convolutional neural networks to improve speech recognition by combining visual geometry group networks with deep convolutional neural networks. As a result, the recognition error rate has decreased significantly[9].

- Natural Language Processing (NLP): Deep learning is also used for natural language processing. Recurrent neural network (RNN)-based vector constant length representation model for machine translation. In natural language processing, artificial neural networks have gotten a lot of attention. Similar models were employed in statistical machine translation tasks, who assessed them using the bilingual assessment understudy rating method[10]. For common natural language processing problems like semantic role labeling, Karlen used embedding and multi-layered one-dimensional convolutional architectures. Investigated the neural network model further and discovered that adding many recursive layers improves performance. Using embedding techniques to map words into a vector representation space, and then representing the language model using nonlinear neural networks. A RNN search model for Machine Translation. Part-of-speech tagging, dependency grammar analysis , naming body identification , semantic role tagging , and Twitter sentiment analysis are just a few of the tasks that deep learning methods have been applied to in the area of natural language processing. Sentiment analysis of Chinese microblogs, machine translation , question answering , dialogue system , and so forth.

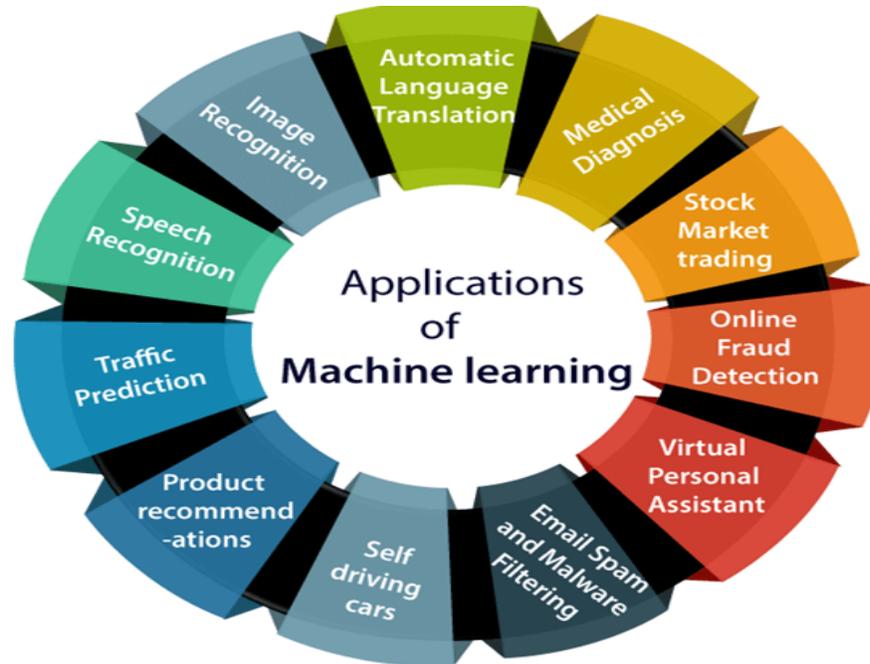

Figure 1: Diagrammatic Representation of Application Deep Learning [JAVATPOINT]

1.2 Model of Deep Learning:

- Auto encoder: Auto encoder is a backpropagation-based unsupervised learning method that sets the target values to be identical to the inputs. The auto encoder (AE) concept in 1986 and used it to process high-dimensional complex data. By rebuilding the input data to create the output data, the auto encoder may extract the hidden feature. The fundamental construction of an auto encoder is a three-layer neural network, with input layer x , hidden layer h , and output layer y , with the output layer and input layer having the same size, as. The input and output layers of auto encoders contain the same neurons, while the intermediate layer has more than the input layer. The output layer reconstructs the input data by training the network, then maximizing the similarity between the input and output data. The similarity is represented by the training error. Assuming that the input signal is x , the signal transforms to z when it reaches the hidden layer, which can be represented using the following formula:

$$z = g(Wx + b)$$

The sigmoid function and the rectified linear unit function, which are also known as active functions, are frequently employed when $g()$ is a nonlinear function. W is the input layer's link weight to the hidden layer, and b is the hidden layer's bias. The decoding layer decodes the signal y and sends it to the output layer, where it is converted to z :

$$y = f(W' z + b')$$

Where W' is the hidden layer's link weight to the output layer, and b' is the output layer's bias. y is regarded as an x prediction. The weight matrix W' is, in general, restricted to the transpose of the weight matrix W : $W' = W^T$. The reconstruction error is typically described as mean square error or cross entropy, depending on the kind of data.

- Boltzmann Machine with Restrictions: In 1986, Hinton and Sejnowski proposed the Boltzmann Machine (BM). The Boltzmann Machine is a kind of feedback neural network that is made up of random neural networks. The Boltzmann Machine is made up of visible units (visible variables, i.e. data samples) and hidden units (hidden variables), with each visible unit connected to all hidden units. The visible variables and hidden variables are binary variables with states of 0 or 1, with 0 representing a suppressed neuron and 1 representing an active neuron. In addition, Boltzmann machine (RBM). The visible layer V and the hidden layer H are shown in Fig. 2, which is a schematic representation of RBM. Input the training data to the visible layer, then the hidden layer identifies the input data's characteristics; the neurons are disconnected within the same layer but completely linked between the two layers. The combined probability distribution of two layers is represented by equation. Restricted Boltzmann machine training is quicker than Autoencoder training. Using the stochastic gradient descent technique, presented a more efficient optimization algorithm in. RBM's conventional training technique requires a large number of sample steps, resulting in a low training efficiency. Hinton's suggested contrastive divergence addressed the issue. Deep deconvolution network to learn hierarchical structural characteristics from the bottom layer to the top layer directly from the global picture by concatenating several convolutional sparse Autoencoder and maximum pooling layers.

Many expansion models based on the limited Boltzmann machine have been proposed by certain academics. suggested incorporating discriminative learning into the RBM's generative learning algorithm so that it could be better used to discriminative tasks like categorization. The RBM model is immediately cascaded into a multi-layer structure in, which is referred to as a deep Boltzmann machine. For learning the latent characteristics of picture pixel blocks Deep SparseAuto encoder model. The restricted Boltzmann machine may be cascaded to create a deep neural network, which can be optimized using the layer-by-layer training technique used convolution operations to expand the deep belief network, allowing the model to learn possible feature representations straight from the initial 2D picture.

There are various hierarchical generation models than the RBM-based deep structure. To create a deep belief network, a multi-layered directed sigmoid belief network was cascaded with RBM in. By adding a Gaussian kernel in, Restricted As input signals, the Boltzmann machine accepts continuous variables. By changing the structure of the RBM or probability distribution, the restricted Boltzmann machine may be expanded to tackle increasingly complicated problems. In these models, a more complicated energy function is typically specified, which reduces the efficiency of learning and inference.

- Deep Neural Network: The input and output layers, as well as numerous hidden layers, make up deep neural networks (DNN).DNNs can solve linear and non-linear problems by calculating the probability of each output layer by layer using an activation function that is suitable for the issue. DNNs are often used in image interpretation and voice recognition, among other applications. DNNs are full-connected neural networks in essence. Multi-layer perceptron is another name for a deep neural network (MLP). The hidden layer transforms the input feature vectors, which subsequently reach the output layer, where the classification result is obtained. It was a two-category linear classification model that was primarily used for linear classification and had poor classification performance. Because early discrete transfer functions have some limitations for multiplayer perceptrons, we may overcome this issue by

using continuous functions like the tanh or sigmoid functions. The number of neurons and hidden layers may be increased to create DNNs.

- Convolutional Neural Networks (CNNs): Except for the input and output layers, Convolutional Neural Networks (CNNs) include convolutional, pooling, and fully-connected layers. CNNs may decrease complexity and parameters by sharing weights, which improves the generalization ability of the neural network, and by pooling neurons to make the network more resilient. CNNs have been used to analyze multi-dimensional data for picture comprehension in recent years. When using a CNN to analyze a multi-dimensional picture, the image is immediately fed into the network, bypassing the time-consuming feature extraction and data reconstruction procedure that conventional image processing methods need. To generate two-dimensional feature maps, a convolutional neural network must learn a collection of two-dimensional filtering templates and perform a convolution operation with the feature map x . The previous layer's feature map is convoluted with a convolution kernel in the convolutional layer, and the output of the convolution result after the activation function forms the neurons of the next layer of the feature map, resulting in the next layer corresponding to a specific feature map of the features. Convolution, nonlinear activation function, and maximum pooling are the three processes in each convolutional layer. Various convolution kernels may be used to extract different characteristics from the preceding layer of feature maps using convolution.

2. DISCUSSION

Deep learning (also known as deep structured learning) is a kind of machine learning technique that uses artificial neural networks to learn representations. There are three types of learning: supervised, semi-supervised, and unsupervised. Deep-learning architectures like deep neural networks, deep belief networks, deep reinforcement learning, recurrent neural networks, and convolutional neural networks have been used in areas like computer vision, speech recognition, natural language processing, machine translation, bioinformatics, drug design, medical image analysis, material inspection, and board game programs. Information processing and dispersed communication nodes in biological systems inspired artificial neural networks (ANNs). ANNs vary from biological brains in a number of ways. In particular, neural networks are static and symbolic, while most live creatures' organic brains are dynamic (plastic) and analogue. In deep learning, the term "deep" refers to the usage of many layers in the network. A linear perceptron cannot be a universal classifier, but a network with a no polynomial activation function and one hidden layer of unlimited width may, according to early research. Deep learning is a more recent version that has an unlimited number of layers of bounded size, allowing for practical application and optimization while maintaining theoretical universality under moderate circumstances. For the purposes of efficiency, trainability, and understandability, deep learning layers are also allowed to be heterogeneous and vary significantly from physiologically informed connectionist models, thus the "structured" component.

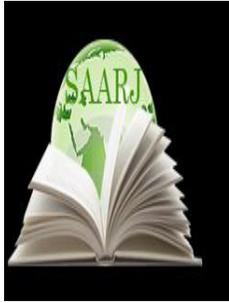

3. CONCLUSION

Deep learning, as a major machine learning research path, heralds the beginning of artificial intelligence research. We carefully presented the current advances in deep learning due to the fast changes in the field. To begin, we presented many widely used deep learning neural network models, evaluated two widely used parallel deep learning training models, and compared the

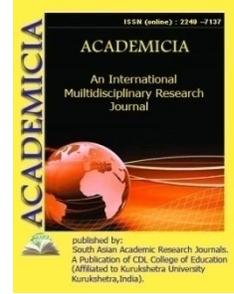

benefits and drawbacks of the two models' training techniques. Then we looked at some of the most popular deep learning open source frameworks, compared their application capabilities, and looked at a few industrial research platforms. Finally, we focused on current neural network hardware accelerator research. Deep learning technology's future growth is still full with possibilities and difficulties, yet it is very promising. Deep learning models such as Deep Feedforward Neural Networks (D-FFNN), Convolutional Neural Networks (CNNs), Deep Belief Networks (DBNs), Auto encoders (AE), and Long Short-Term Memory networks are all examples of deep learning models (LSTMs). These models may be thought of as the basic architectures of deep learning today. We also spoke about related ideas like Restricted Boltzmann Machines and robust back propagation, which are important for a technical grasp of these models. Given the versatility of network topologies, which allows for "Lego-like" model creation, an infinite number of neural network models may be built using the basic architectural building blocks described in this study. As a result, a fundamental knowledge of these components is essential for being prepared for future AI advancements.

ABSTRACT

In the residential sector, traditional indoor climate comfort systems account for a significant portion of energy usage. Passive design is a method of lowering building energy demand by reducing the amount of electricity used by mechanical systems. Solar chimneys are an unique passive architecture that uses solar energy to build up stack pressure as natural draught components. The installation of a solar chimney increases the efficiency of domestic space heating and cooling while also lowering greenhouse gas emissions. This article gives a summary of current developments in the field of solar chimney research. To enhance the degree of thermal comfort, the building industry has a propensity to use integrated solar chimney designs. The most frequent solar chimney-based integrated setups were summarized in this article. In addition, each system's difficult elements and suggestions were discussed. Combined energy systems based on solar chimneys have long been considered as effective green building design solutions. Each system has its own set of advantages and disadvantages, and there is no universal standard for ranking these systems in order of performance. More trials are needed to address issues that may arise in their commercial uses. More research is needed in order to create optimization methods and control systems. A desired control system reacts to residents'

demands in an unobtrusive manner, allowing them to alter a state if it is deemed thermally unpleasant, and provides quick feedback.

KEYWORDS: *Solar Chimney Earth-Air Heat Exchanger Phase Change Material (PCM) Cooling Cavity Water Spraying System Trombe Wall.*

1. INTRODUCTION

Buildings account for a significant portion of global and regional energy consumption. Heating and cooling account for a broad range of percentages of total building energy consumption, ranging from 18 percent to 73 percent globally. Researchers were worried about new methods for decreasing energy consumption in building design a few decades ago. Bioclimatic design, for example, entails the use of energy-saving methods in building construction in conjunction with the use of renewable energy sources such as solar energy [1]. One difficult issue is achieving thermal comfort via bioclimatic architecture. It has a large overall environmental effect and may contribute considerably to climate change. All structures were naturally ventilated until the advent of modern mechanical systems. Since energy and the environment have become two major concerns in building design, scientists have taken a keen interest in reviving old architecture. The solar chimney (SC) is one of the earliest passive ventilation techniques. It has been used for millennia, most notably by the Persians in the Middle East and the Romans in Europe. It is a new design that maximizes ventilation effect by generating a significant temperature increase in the chimney in order to allow solar radiation to pass through Solar chimneys, Trombe walls, and double-skin facades all work in the same way because they are open chambers that use insolation to induce air flow. The Trombe wall is a huge structure that is primarily used to heat the building.

However, with the right adjustments, cooling may be accomplished as well. Solar chimneys are mostly used to improve night ventilation, although they may also be utilized during the day. They may be connected to the building's walls or placed on the roof. The most frequent chimney design is vertical. However, it has a detrimental effect on the building's aesthetics. As a result, laying the collector along the roof slope is both less expensive and less visible. The use of a solar chimney is not restricted to residential or commercial structures. For livestock housing, Rahman and Chu suggested a natural draft chimney instead of artificial ventilation. Reduced ventilation costs resulted in increased chicken production efficiency and profitability. Industrial locations have distinct design elements and comfort criteria, which are outside the scope of this article. According to the literature review, there is a substantial amount of literature on SC. There has been a rising interest in implementing new methods that take use of solar chimney integrated systems in recent years. Integrated space heating/cooling systems have been the subject of a few studies. As a result, the goal of this paper is to contribute to recent advancements in solar chimney use for building ventilation.

Furthermore, it demonstrates the potential and efficacy of future solar chimney-based integrated systems [2]. The section is organized in a logical order, beginning with an overview of the analytical and numerical advances of solar chimneys and ending with references to experimental research in the area. Section 3.1 contains a detailed description of the EAHX-SC system; Section 3.2 discusses PCM-enhanced solar chimneys; discusses water consuming systems based on SCs; and Section 3.4 concludes with a brief report on PV-based solar chimneys. . Solar chimney

independent building applications. The use of wind or sun energy for ventilation became outdated in the twentieth century as mechanical ventilation systems became more widely available and people's lifestyles changed. As a consequence, prior to the 1980s, solar chimney research and development was rather restricted. The issue of decreasing greenhouse gas emissions and the necessity for effective ventilation has reawakened interest in solar chimneys in recent decades. Many current studies focus on model experiments and theoretical examinations to investigate the effects of solar chimney design, orientation, and climatic factors on ventilation performance. The primary goal of most solar chimney research was to improve natural ventilation by using various design factors. The breadth of the chimney, stack height, chimney orientation, and absorber materials, for example, were all of practical concern. According to Khanal and Lei's study, the majority of works in this field were based on pure experiments or an experimental method combined with numerical modeling. The experimental findings of Afonso and Oliveira revealed that the breadth of the chimney had a greater impact on ventilation rate than its height.

According to Mather and Mathura the optimal absorber inclination angle ranges between 40° and 60° depending on the location latitude. While Hamdy and Fikry discovered that the optimal tilt angle of a solar collector needed to give the greatest ventilation efficiency for their experimental model was 60° , Mathur and Mathur showed that this inclination angle was about 45° . For winter applications, the optimal tilt angle results in a small increase in chimney air flow rate, thus it may not be worth the risk of building instability. The increased ventilation rate during the summer months, on the other hand, is noteworthy, and choices must be taken with care. Ong [10] created a mathematical model of a wall-type solar chimney that was stable. The model anticipated the solar chimney's thermal performance as well as the velocity of air flow down the chimney. For chimneys with a gap-to-height ratio smaller than 1:10, analytical modeling of velocity and temperature profiles in the chimney demonstrated excellent agreement with previous tests. It seems that obtaining steady state radiation is challenging due to the variable nature of solar irradiation. Mart and HerasCelemin developed a dynamic model for assessing the solar chimney's performance using real-time meteorological data. The SC's potential for providing nighttime ventilation in Mediterranean regions was also discussed. Lee and Strand investigated the effects of chimney height, absorber wall solar absorption, glass cover solar transmittance, and air gap width under various climate conditions. Among the four input factors, it found out that the air gap width had the least effect on ventilation improvement. A tiny solar chimney with an absorber length smaller than 1 m was proposed by Mathur and Bansal. Because it could be integrated in a normal window without requiring significant structural changes, the system installation took precedence over the previous designs. Their thorough study also showed that when the air gap was expanded, the airflow rate rose. The air volume supplied to or withdrawn from a place (usually a room or home) divided by the volume of the space is measured in air change per hour (ACH). The temperature would approach the ambient if the amount of air supplied to the interior areas was adequate. Natural ventilation offers thermal comfort for occupancy at an ambient temperature of $20\text{--}26^\circ\text{C}$ [3]. There is no universal formula for determining the ideal ACH for a naturally ventilated home. The fact that ACH is dependent on a variety of architectural factors such as building layout, resident count, and building purpose makes it a difficult component to manage. The majority of the research [did not use an optimum number to calculate its value.

Computational fluid dynamic (CFD) techniques grew in popularity in solar chimney research as rapid numerical systems were developed. In most cases, CFD gives all essential flow statistics throughout the whole area of interest. Pressure fluctuations and heat distribution in the chimney are of practical relevance in the case of a solar chimney. Laminar flow algorithms were created to model airflow and heat transfer in the solar chimney before the introduction of commercial software packages. The solar chimney's flow characteristics are more akin to a turbulent flow regime. The accurate description of turbulence modeling in the literature is given special attention. $k - \epsilon$ models are believed to present more accurate forecasts of velocity and temperature profiles as reported by experiments. The $k - \epsilon$ models outperformed the other models for boundary layer flows under unfavorable pressure gradients, according to this study. As a result, they have become the primary research technique in solar chimney studies. In contrast to a one-dimensional approach, a multi-dimensional analysis supported by the CFD technique can capture prevailing flow phenomena like reverseflow. When air entrainment happens at the chimney outlet and air penetrates lower into the chimney, reverse flow occurs. Reverse flow through the solar chimney should be avoided because it reduces the flow rate, which is undesirable for ventilation. Khanal and developed an inclined passive wall solar chimney design with an inclined passive wall (glazing) and a vertical active wall (absorber) to avoid reverse flow (IPWSC). The research confirmed that there is an optimal chimney height-to-gap ratio for suppressing reverse flow and inducing maximum ventilation rate [3].

2. DISCUSSION

2.1. APPLICATION:

Solar chimney, in contrast to natural stack ventilation methods that may result in a poor stack effect, is clearly more promising. because it enhances the temperature differential between inside and outside Increasing solar gain is one way to do this. One of the most significant advantages of a SC is that it may be utilized forth need for cooling and the supply of cooling in space is referred to as space cooling. The insulation is in full swing. Solar chimneys are usually thought to be inappropriate for residential use. areas with low levels of solar radiation or hot, dry climates However, by combining a wall and a roof solar chimney, AboulNaga and Abdrabboh [enhanced the chimney night ventilation efficiency. The air flow rate was three times higher than that of a normal person. Rooftop solar chimney on its own The system was placed on a single home in the United States. Al-Ain is a city in the United Arab Emirates. The height of the ideal wall chimney in relation to the with an intake height of 3.45 m, the maximum air flow rate (almost 2.3 m/s³) was achieved. a distance of 0.15 m for a flat volume, an ACH number of up to 26 was obtained. It is sufficient to overcome the significant cooling load for aim a hot environment, construction is necessary. Rachapradit Khedari, Rachapradit Kediri, Rachapradit Kediri, Rachapradit Khedari, Rachapradit Khedari, in a single-room home (25 m³) with an air conditioner (AC), there is a chimney. Bangkok is the capital of Thailand. The home with the solar chimney had a lower average temperature. Compared to a standard AC, an AC consumes 10–20 percent less electricity. House. The size of the solar chimney aperture was utilized to regulate the ventilation rate. An experimental study revealed that a 5 cm² opening for When used with an air conditioner, the SC unit was the most efficient. A SC was built on the top of a 12 m³ cabin room by Imran, Jalil. Iraq. The chimney was 2 m wide and long, with three distinct airflows. 50, 100, and 150 mm gap thicknesses The ideal inclination angle into get the greatest air flow rate, the angle was set to 60°. The system has the potential to cause This area requires 4–35 air changes each hour. It

may be put to good use as a storage area. Mechanical ventilation is not required for cooling. Figure 1 shows the Structure of double pass roof solar collector. 2.2. ADVANTAGE:

Solar chimney, in contrast to natural stack ventilation methods that may result in a poor stack effect, is clearly more promising. because it enhances the temperature differential between inside and outside Increasing solar gain is one way to do this. One of the most significant advantages of a SC is that it may be utilized forth need for cooling and the supply of cooling in space is referred to as space cooling. The insulation is in full swing. Solar chimneys are usually thought to be inappropriate for residential use. Areas with low levels of solar radiation or hot, dry climates However, By combining a wall and a roof solar chimney, AboulNaga and Abdrabboh enhanced the chimney night ventilation efficiency. TheThe air flow rate was three times higher than that of a normal person. Rooftop solar chimney on its own The system was placed on a single home in the United States. Al-Ain is a city in the United Arab Emirates[5]. The height of the ideal wall chimney in relation with an intake height of 3.45 m, the maximum air flow rate (almost 2.3 m /s 3) was achieved. a distance of 0.15 m. For a flat volume, an ACH number of up to 26 was obtained.(321 meters)3 It is sufficient to overcome the significant cooling load for aIn

a hot environment, construction is necessary. Rachapradit Khedari, Rachapradit Kediri, Rachapradit [6] Khedari, Rachapradit Kediri, Rachapradit Khedari, In a single-room home (25 m³) with an air conditioner (AC), there is a chimney. Bangkok is the capital of Thailand. The home with the solar chimney had a lower average temperature. Compared to a standard AC, an AC consumes 10–20 percent less electricity house. The size of the solar chimney aperture was utilized to regulate the ventilation rate. An experimental study revealed that a 5 cm² opening for When used with an air conditioner, the SC unit was the most efficient. A SC was built on the top of a 12 m³ cabin room by Imran, chimney was 2 m wide and long, with three distinct airflows. 50, 100, and 150 mm gap thicknesses. The ideal inclination angle is To get the greatest air flow rate, the angle was set to 60°. The system has the potential to cause This area requires 4–35 air changes each hour. It may be put to good use as a storage area. Mechanical ventilation is not required for cooling [7].

2.3. WORKING:

According to the studies described above, the bulk of solar chimney research focused on passive cooling. However, in certain areas, space heating is more important than natural cooling, particularly during the winter. Because SC works better for space cooling, there are few SC applications for space heating in the literature. The use of a solar chimney for space heating was shown by Haghghi and Maerefat. They demonstrated a computer simulation of natural convection in a 2D chamber with a chilly exterior environment. The numerical modeling was compared to previous experimental and numerical studies published in the literature. A parametric analysis was also conducted to obtain a better understanding of the factors that affect ACH and room air temperature. The findings indicated that optimizing the air gap, inlet, and outlet sizes resulted in a maximum ACH of 0.2 m for a space measuring 4.0 m 4.0 m 3.125 m without air in filtering. The effect of ambient air temperature on ACH is likewise shown to be insignificant. Furthermore, the system seemed to be capable of delivering a pleasant interior environment despite a low solar intensity of 215 W/m² and a low ambient temperature of 5 °C. The SC systems previously described were just cooling or heating devices. The use of SC for both space heating and cooling is a unique design. Zhai, Dai [28] proposed a feasible configuration that may decrease heating and cooling demand throughout the year without adding complexity to the system. They looked at a single-pass roof solar collector and a double-pass roof solar collector that were both placed on a single typical Chinese common home. Roof solar collectors were solar air collectors with a single or double pass that were placed on the building's roof. The double pass roof solar collector, which was created by combining a double pass solar air collector with the building's southern roof. Dampers 1, 2, 3, and 4 were placed to transition between space heating and natural ventilation in the winter and summer, respectively. Indoor air may enter air channel 1 (AC1) via tube II, acquiring heat from sun radiation, by shutting dampers 1 and 2 and then opening dampers 3 and 4. Then it goes into air channel 2 (AC2), where the absorber plate heats it up. It pours into the air duct once tube I am closed. The heated air is blown into the room by the fan via tube III. The space is naturally ventilated thanks to the reverse cycle. Indoor air enters air channels 1 and 2 via tubes I and II, respectively, by shutting dampers 3 and 4 and opening dampers 1 and 2. Because the air in the channel heats up and rises, the stack effect will ultimately appear. The findings revealed that a two pass roof solar collector performed better for both room heating and natural ventilation. It has a 10 percent better immediate efficiency than a single pass roof solar collector. A number of papers in the literature

have been examined. Various research techniques to handle different elements of a SC design may be found in the literature.

Application for Author Location Methodology is a key argument. Performance at high inclination degrees and gap widths (major findings/observations) Thailand • In a hot humid environment, a comparison of air velocity and temperature distribution in the SC with dry air and wet air Modeling of CFD numerically[8] • With the exception of a slight increase in air temperature, increasing the air relative humidity reduces air velocity at the inlet and outlet of the chimney • The air temperature distribution is relatively similar to the dry-air model • A small opening height-to-gap ratio of 0.25 is recommended for SCs with moist air hang, he Cooling of the space To explore SC airflow rate, a plume model based on energy balances and thermal boundary layer theory is being developed. Modeling and analysis • Unlike previous analytical models, the plume model considers both vertical and horizontal density changes throughout the chimney. Six experimental data sets were selected for plume model validation. For reasonably high velocity circumstances, a turbulent boundary layer may be added to the plume model to enhance it even further. The plume model produced encouraging results in terms of forecasting SC air flow rate and indicating the presence of the ideal chimney gap width. The model's inability to anticipate complex flow phenomena such as reverse flow is one of its limitations. Solar chimney independent building applications as space heating or cooling methods were discussed in the preceding introduction. For at least two reasons, the effectiveness of a natural ventilation system is directly dependent on the residents. First and foremost, the inhabitants must be warm and comfortable. Second, they are likely to have some influence over the system. Integration of solar chimney with other technologies is recommended to significantly improve its performance for the aim of increasing interior thermal comfort. The goal of this article is to go through the most popular solar chimney-based integrated systems.

In most cases, integrated systems were followed by a consideration of their basic features and suggestions for improving the system in order to create a more sustainable future. Pipes placed several meters under the earth, using soil as a natural consistent temperature source, are an innovative way to circulate air throughout the structure. The earth's undisturbed temperature refers to the temperature of the soil 2–3 meters under the surface, which is mostly stable. In the winter, this temperature is greater than the surface temperature, and in the summer, it is lower. An earth air heat exchanger (EAHX)[9] is a technology that may be used to improve ventilation via a cooling or heating effect. Mihalakakou and Santamouris proposed a comprehensive numerical model for predicting EAHX thermal performance. Their model was created in the TRNSYS environment and could be used for future study with ease. The pipe length, pipe radius, air velocity, soil depth, and the temperature differential between ambient air and soil all have a significant influence on EAHX performance. The heat transfer capacity may be increased by increasing the burial depth and length of the pipes, as well as lowering the airflow rate. According to Bansal and Misra, the material of underground pipes had no effect on EAHX performance, thus a less expensive piping material is acceptable. To simulate the EAHX, Ramirez-Dávila and created a three-dimensional finite volume CFD algorithm. Three climatic conditions were studied: one with severe heat in the summer and low temperatures in the winter (Ciudad Juárez, Chihuahua), another with moderate weather (Mexico City), and the third with hot weather (Merida, Yucatán). For the cities of Cads. Juárez, México City, and Mérida, simulations were performed for sand, silt, and clay soil textures, respectively. According to them,

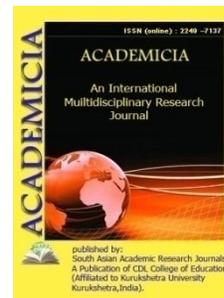

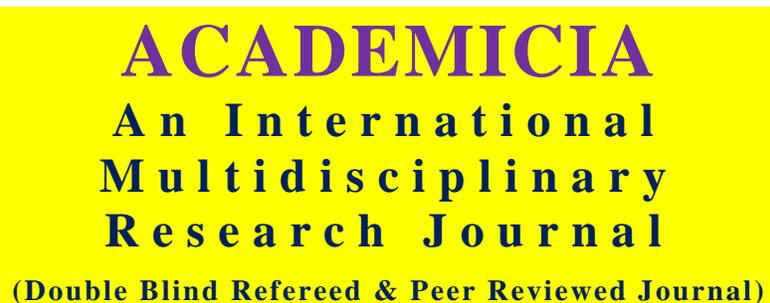

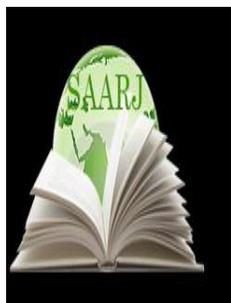

for PCM-technology. The study on incorporating PCM with a solar chimney was discussed in this article. PCM's ability to minimize temperature variations, particularly peak temperatures, makes it a good choice for solar chimney construction. The incorporation of PCM in SC is the simplest and most cost-effective of the suggested setups. Further study on the selection of the appropriate PCM for the system is needed. Because appropriate ventilation is a top priority, the designer is keen to develop a situation in which an EAHXSC system is equipped with PCM in future study. It should be emphasized that in order to convince building users, the performance of a PCM-enhanced SC should be evaluated in real-world scenarios. As a result, it seems that further research in this area is required.

Solar chimney-based water-consumption systems are best suited to areas with a hot and dry environment. The system may be configured in a variety of ways. Water-consuming systems substantially improve the solar chimney's thermal efficiency. The absence of adequate accessible water resources to satisfy water demands within an area is the most significant drawback for broad public usage of the linked system. As a result, designing the least-water-consuming and most-optimized system is a difficult task. In the literature, hybrid photovoltaic-thermal (PV/T) systems have received a lot of attention. Combining photovoltaic panels with a roof solar chimney is a novel concept. The system's capacity to improve ventilation while also generating energy makes it a suitable design. The suggested systems' architecture includes uncontrollable factors such as weather and local attitudes. Physical processes are involved, and they are complex. Furthermore, key factors like as wind pressures, interior temperatures, and building leaks may all be subject to significant error. The first law of thermodynamics or energy analysis was used to examine all of the aforementioned integrated systems. Energy efficiencies, on the other hand, are unable to tell us how close a system's performance is to perfection. Energy analysis reveals the possibility of better matching the energy supply and demand. N. Monghasemi, A. Vadiiee Renewable and Sustainable Energy Reviews Exergy may also be thought of as a meeting point for energy, the environment, and the economy. This may be a good chance for research to compare SC integrated systems based on energy analysis. The investigation of these systems is still under progress. As a result, there is no strict judgment at this level to determine which system is better. It is determined that each system has its own set of advantages and disadvantages that may be appropriate for one area but not for another.

ABSTRACT

The new quality of education is determined by the maturity of new educational results, and the modeling of educational systems allows us to take into account the conditions that ensure the achievement of these results. The article describes a model of the education system that ensures the modern quality of generations education is modeled in the context of students achieving new educational results with the help of information and communication technologies, management activities of teachers to create conditions for the implementation of requirements for the development of basic educational programs of general education in the conditions of functioning of the school information and educational environment.

KEYWORDS: *Education System, Modern Quality Of General Education, New Educational Results, State Educational Standards, Modeling*

INTRODUCTION

The Decree of the President of the Republic of Uzbekistan "On the strategy of action for the further development of the Republic of Uzbekistan" outlines the important tasks of developing education and science, significantly improving the quality of general secondary education, in-depth study at a high level of foreign languages, computer science and mathematics, physics, chemistry and biology.

Modern approaches to the learning process, fundamental reforms carried out today in the teaching of all academic subjects are inextricably linked with the use of modern innovations and interactive means in the educational process, the professional competence of teachers, and the intellectual potential of students.

Based on the goal and objectives of teaching biology in secondary educational institutions, it is required to create a modern informatized educational environment that provides for the targeted use, along with educational and methodological complexes, electronic resources aimed at developing basic and subject competencies in biology among students, developing skills in using information technologies and competencies for working with information.

Teaching subjects in all institutions of the continuing education system, in particular biology, is due to the fact that throughout the study of biology, materials are prepared for presentation on each topic, and the most suitable means are used in the educational process.

The general requirements for the development of educational and methodological complexes of a new generation in general subjects are reflected in the State educational standards for general secondary and secondary specialized, vocational education: "Multimedia applications to textbooks include video, audio sources, animation, tables, texts and dictionaries, covering materials on academic subjects using information and communication technologies in accordance with state educational standards and curricula, contributing to the effective assimilation of the content of academic disciplines and the development of self-education skills, helping to control knowledge and consolidate it, enriching the main content of the academic subject. " The above emphasizes the need to use electronic educational resources in all general education subjects.

Visual aids that serve to increase the effectiveness of teaching scientific disciplines are created on the basis of specific practical programs. Teachers are required to prepare such software and master the competencies of their implementation; in this matter, there is a need to involve programmers directly. In many cases, electronic means are created that combine scientific sources on an integration basis in two scientific disciplines. If each student is able to independently use a computer, then the opportunities to introduce him to the world of inventions and research are expanding. Modern education is mainly based on teaching programs, visual presentation techniques, computational operations using a computer and mobile means. In any study, it is impossible to do without electronic educational resources, electronic means and technologies for their use, therefore, an informatized learning environment is considered as an effective scientific and practical tool.

The use of high-quality electronic means and the correct connection to the educational process create optimal conditions for students to accept the necessary information, process it, master basic and subject competencies, control them, develop creative abilities, introduce additions and changes in the educational process, and continuously check the results of education. In addition, opportunities are created for diagnosing and predicting student activities, developing recommendations for designing future lessons, determining the order of educational and cognitive activities of students aimed at consolidating certain information.

This article reflects the issues of using electronic educational resources in biology lessons, existing electronic educational tools in general education schools, organizing the activities of a biology teacher in an informatized educational environment, problems of computerization of the science of biology, information obtained through answers to the questionnaire, conclusions on their analysis ...

Efficiency in biology lessons in most cases is achieved through adherence to didactic laws and the purposeful introduction of scientifically grounded forms, methods and techniques into the

educational process. Acquaintance of students with the world of animals, their way of life, reproduction and development occurs through obtaining scientific information from a textbook and teaching aids.

The activation of the educational process is implemented on the basis of innovative approaches in the education system, through the use of modern technologies and programmed teaching aids, tests and other non-traditional teaching aids. Electronic learning tools also help to increase student engagement in many academic disciplines.

The use of electronic means in biology lessons is associated with new methods of their implementation. The use of electronic educational resources in biology is associated with the fulfillment of certain conditions:

clarity and variety of information presented (color illustrations, audio-video recordings, animation and other types);

implementation of feedback (a system of tests to determine the degree of assimilation, ensuring quick control);

self-control skills training with the aim of active and accelerated assimilation of educational materials;

constant "maintenance" of teaching aids and enrichment of new information, that is, the purpose of electronic teaching aids is to synthesize the main educational material with additional new information with the prospect of its possible use in the future.

The use of electronic educational resources in teaching biology also provides a solution to educational problems. With the help of electronic educational resources, the effectiveness of assimilation of educational material in biology, the development and consolidation of vital skills and abilities is achieved:

- 1) the clarity and accessibility of the presentation of the most difficult topics and concepts is ensured, for example, familiarization with the external and internal processes occurring in the body of animals, it becomes possible to visually observe and track them (through the monitor);
- 2) specific methods of studying the structure and location of organs in animal organisms are organized;
- 3) the use of CD and DVD consoles with the display of short popular science films directly related to the habitat of animals, helps to form students' notions about the lifestyle of animals, their distribution area, animal species, interaction and relationship with nature;
- 4) the integration of electronic resources into the educational process contributes to the development of skills for independent acquisition of knowledge.

On the basis of the research results, a didactic model of the effective use of electronic educational resources and its implementation in the educational process was created.

The level of development of knowledge and skills of students within the framework of the studied topic depends on how the quality and quantity of visual aids corresponds to the requirements and objectives of teaching biology at a particular stage. Thanks to electronic resources, it is possible to present a color image of animals, their external and internal structure, functioning systems, a variety of species of the animal world, and more.

The prepared electronic educational resources were introduced into the educational process in biology in 7 grades of secondary schools. Particular attention was paid to the choice of topics in accordance with the SES, the program and the textbook, the use of resources was carried out taking into account the competence-based approach and focusing on international standards in assessing the quality of education. On the basis of the developed didactic model, a methodological system was created, aimed at increasing the efficiency of using electronic educational resources in biology.

When choosing the elements of the didactic system used in teaching technology, it is necessary to take into account the nature and orientation of the educational and cognitive activity of students. Practice shows that, as a rule, 7-8 minutes of a lesson is devoted to the theoretical part, followed by a discussion, work in small groups is organized in order to consolidate knowledge. In the first 7-8 minutes, the highest assimilation efficiency is observed, then the motivation for cognition weakens (over the next 15 minutes). It becomes necessary to keep the attention of students as long as possible.

It was noted above that the reasonable quality and quantity of visualization involved will help maintain the attention and cognitive activity of students at the level necessary for effective assimilation. These can be drawings of animals in color, diagrams of their external and internal structure, images of functioning systems, habitats and other visual materials.

Large sections of zoology were selected for the study: Protozoa, Mollusks, Worms, Amphibians, Reptiles, Mammals (by class) and electronic resources prepared in the form of animation with a dynamic effect in the Makromedia Flash program.

The main difference between this program and the main ones is that it includes a complex of materials in multimedia format on all topics of the section - about morphological and physiological processes in the body of animals, presented in a series of animations, videos, drawings, infographic information.

For independent study in the educational resource posted "Red Book" of Uzbekistan in PDF form. In biology lessons, additional material is interesting information about the classes of animals or individual animals in the block for biology lessons in grade 7 "The World of Amazing Animals". These materials can be consulted when organizing extracurricular activities in biology. The resources include photos of excursions and videos.

It should be admitted that the created program aimed at increasing the effectiveness of biology lessons is not without some shortcomings. Along with the widespread introduction of technological elements into the modern educational process, one should also remember about innovative methods of increasing the effectiveness of biological education.

As for extracurricular and extracurricular work in biology, its main content is the presentation of additional information about the morphological and anatomical structure of animals, the functioning of life support systems. Extracurricular activities are aimed at consolidating theoretical knowledge and practical skills and abilities.

In the process of extracurricular work, it is advisable to organize short-term observations of the development of animals at different stages of their life. For example, the breeding period (by observing the fish in the aquarium, or the moment the egg is opened and a canary chick or chick is "born", the development and growth of a kitten or puppy). Students can use living examples to

follow the behavior and development of animals in different periods, such observations will help form in schoolchildren a feeling of love for nature and a desire to protect and preserve the animal and plant world. Electronic educational resources are an effective means of innovative orientation, helping to enrich the theoretical knowledge and practical skills of 7th grade students, to form their research skills.

In order to prepare students for the international knowledge assessment system in educational institutions of the secondary education system, one should focus on the parameters of the PISA, TIMSS systems, where it is proposed to use a set of computerized test tasks in several academic subjects.

In this regard, there is a need to develop a didactic system for using computerized non-standard tests in biology in grade 7 for lessons, extracurricular and extracurricular activities. We have prepared blocks of test items on 10 topics from the section "Mammals". These are mainly self-assessment tests. Working with non-standard tests requires some explanation.

A program for editing tests in the process of computerizing non-standard tasks has also been created. When using them, teachers are advised to use an editor program. This creates the ability to update test material, enter new information, and change test questions as needed.

In the pedagogical literature, the thesis that the new quality of education is determined by the formation of new educational results is increasingly heard. In this context, the processes of modeling educational systems are of fundamental importance, since this makes it possible to take into account the maximum possible number of conditions that ensure the achievement of the planned results. One of such conditions, in our opinion, is the use of information and communication technologies.

We only note that the structure of the model is made up of four interrelated and interdependent blocks (target, organizational and content, diagnostic and effective and functional). Let us dwell in detail on the diagnostic-resultant component, since, in our opinion, it is of interest from a procedural point of view.

The selection of criteria and indicators of this component is due to the need to assess both the effectiveness of the activities of a general education institution and the quality of education of students.

The criteria were: the presence of mechanisms for identifying the educational needs of participants in the educational process in the organization of the educational process based on ICT, which is a toolkit for studying the social order for training using ICT on the part of the participants in the educational process;

- the formation of a set of conditions for achieving new educational results through ICT, associated with the degree of development of the telecommunications infrastructure, the ability to receive, transmit information and data through various channels;

- the formation of the system of advanced training of teachers and executives in the field of ICT, represented by elements that characterize the elaboration of a set of measures to study the needs of teachers in professional development in terms of mastering ICT and the possibilities of an educational institution for in-house advanced training;

- the development of the organizational mechanisms for the use of ICT tools in the educational process, characterized by the presence of an information (electronic) representation of the educational process management system and the information and educational environment, which makes it possible to judge
- the effectiveness of the management decisions taken;
- the availability of mechanisms for information and methodological support for the achievement of new educational results by students when using ICT in the educational process, allowing to assess the completeness and quality of the provision of information necessary for the implementation of interaction
- between different actors of the information society;
- the development of monitoring of the use of informatization means in an educational institution, ensuring the achievement of new educational results by students, which makes it possible to judge the degree of effectiveness of the use of informatization means and the variety of educational, teaching and methodological and other resources used;
- the effectiveness of the use of informatization means in the educational process for the achievement of new educational results by students, represented by the results of achieving subject, metasubject results through reliance on the educational environment, its subject aspects.

Each of the selected criteria has its own content, indicators that make it possible to judge the formation of the information and educational environment, focused on the achievement of new educational results.

The criterion characterizing the presence of mechanisms for identifying the educational needs of participants in the educational process in organizing the educational process based on ICT is represented by three indicators, namely:

the existence of regulations for studying the needs of participants in the educational process in training using ICT;

taking into account the results of surveys, questionnaires in the development program of an educational institution, in the content of a part of the curriculum formed by the participants of the educational process, the plan of extracurricular activities and other local regulations of the educational institution;

the presence of the practice of studying the level of satisfaction of participants in the educational process with the use of ICT when achieving new educational results.

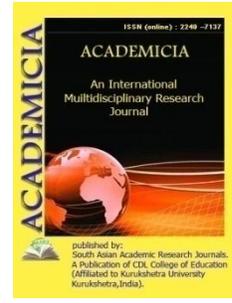

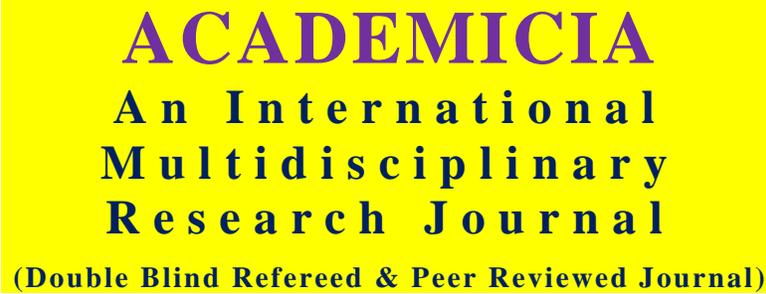

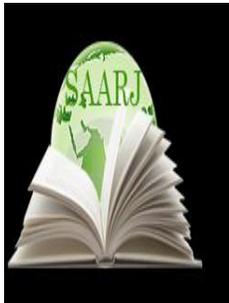

It is possible to talk about the formation of a complex of conditions for achieving new educational results through ICT if an educational institution has.

It is obvious that the conditions we have identified contribute to the adequate selection and substantiation of criteria and indicators of the effectiveness of the functioning of the educational system in the aspect of students achieving new educational results through information and communication technologies. At the same time, within the framework of the model under consideration, the managerial activity of pedagogical workers of a general educational institution is associated with the creation of conditions conducive to the implementation of the requirements

for the results of mastering the basic educational programs of general education in the conditions of the functioning of the information and educational environment of the school.

EFFECTIVENESS OF INDEPENDENT WORK IN THE EDUCATIONAL PROCESS

Ibodova Mahfuza Namozovna*

*Acting Associate Professor,
Navoi State Pedagogical Institute, Department of Biology,
UZBEKISTAN

ABSTRACT

Organizing and directing independent work is a responsible and difficult task for every teacher. Fostering student activism and independence should be seen as a necessary part of the whole educational process. This is one of the most important tasks facing any teacher. Independent work serves as a tool that encourages students to acquire deep and solid knowledge, logical thinking, creative research, and self-assessment.

INTRODUCTION

Organizing and managing students' independent learning processes is a responsible and complex pedagogical activity for every teacher. The formation of activity and independence is important in developing students' independent thinking. This is an important issue for every teacher.

When thinking about the formation of independence in students, it is necessary to pay attention to two interrelated aspects. First, to strengthen students' desire to learn; while the independent acquisition of knowledge consists of teaching to form one's own worldview, and the second consists of teaching one to apply the acquired knowledge in practical training and independent activity.

The demand of our society for modern schools is that they can solve scientific, social, industrial problems creatively, think critically, defend their views and beliefs, systematize their knowledge through independent study. It is the development of a person who is constantly replenishing and renewing his skills and is able to apply them in life.

The teacher should be a guiding star, showing students the methods of learning, guidance, which is the scientific organization of students' mental work, that is, setting the desired goal. acquisition, the ability to choose ways and means to achieve a goal, and the development of skills and abilities to allocate time correctly. In the formation of a well-rounded person, it is necessary to systematically start independent work, which should become a problem-solving activity with the help of special learning tasks - independent work.

In accordance with the requirements of the "National Program of Personnel Training" and the "Law on Education", the development of educational institutions of the republic is carried out on a large scale. Due to the main objectives of education, special attention is paid to the high level of development of all disciplines, including biology.

Organizing and directing independent work is a responsible and difficult task for every teacher. Fostering student activism and independence should be seen as a necessary part of the whole educational process. This is one of the most important tasks facing any teacher.

In the formation of students' independent learning and comprehension activities in the educational process, firstly, to teach students to acquire independent knowledge in order to develop independence in learning and comprehension activities, and secondly, to apply their knowledge independently in teaching and practice should be taught.

Independent work serves as a tool that encourages students to acquire deep and solid knowledge, logical thinking, creative research, self-assessment.

On the basis of biological science the levels of structure of life (cell, tissue, organ, organism, species, population, biocenosis, biosphere) are studied. Knowledge is given about the structure and life activities of living organisms, their changes in the process of individual and historical development, the need for rational use and protection of natural resources.

Together with pedagogical theorists, philosophers, psychologists, sociologists and physiologists, they theoretically substantiate this aspect of the problem in terms of the main personal qualities of the modern man, studying the main quality of modern development - initiative, independence, creative activity.

Theoretically, the study of the essence of independent work can develop independent learning: learning, practical and organizational-technical BP Esipov (60s) justified the role, place, tasks of independent work in the learning process. The one-way verbal teaching method remains ineffective in shaping students' knowledge, skills, and competencies. Students' independent activity grows due to changes in the purpose of education, knowledge, skills, focus on creativity, as well as the computerization of education.

In the process of in-depth study of the nature of living natural phenomena, the formation of students' scientific outlook, their ecological and hygienic education, behavior in nature, orientation of young people to agriculture, medicine, plant growing, It is planned to train them in practical work on animal care, as well as to prepare them for higher education.

Students are taught a wide range of general biological knowledge on the basis of teaching botany, zoology, human and human health, as well as various branches of general biology.

Independent work helps students to consolidate the knowledge and skills they have acquired in the classroom. It takes a lot of work and a lot of repetition. It develops students' ability to memorize knowledge for a long time and play an important role in using it when needed.

Students develop activism, initiative and creativity through independent work. Independent work develops students' ability to systematically complete tasks in various subjects, to complete the work begun, to do independent work consciously, to cultivate in students a desire to learn. Most importantly, they become accustomed to the right approach to learning, which is a student's duty.

Well-known educator KDUshinisky said: He is a slave. ” The teacher should act as an organizer in the classroom and in extracurricular activities, and skillfully use methods that ensure students' learning activities, especially independent work activities.

Independent work encourages students to apply their knowledge to life experiences. Develops a tendency to mental activity, cultivates a love of work. Independent learning requires an individual approach to students. Independent work develops students' psychological abilities - attention, memory, thinking. Wise qualities, such as perseverance in achieving one's goals, are nurtured and will not be forgotten for a long time, and knowledge will be of high quality. Therefore, in the pedagogical process, one of the most complex and urgent issues is the formation of conscious work, mental abilities, independent work skills of students.

In the process of preparing an independent lesson, the student develops the skills to perform the task in an orderly manner, to distinguish important aspects of the material being studied, to think about the content of the material, to relate to previous topics, to compare.

Tasks given to students for independent training should be meaningful, interesting, cultivate the quality of will of students (endurance, perseverance, completion of the work begun).

The teacher should not rush to help students in any case, teach them to overcome difficulties themselves. The task of the teacher in the organization of independent lessons should be to teach students to feel responsible, to have a conscious attitude to work.

At school, the student spends two and a half hours of his daily work on independent work in clubs, sports, newspapers, additional literature, news, the Internet, computers, e-mail, world events and current developments. learns and independently develops and acquires the necessary knowledge and skills in his chosen profession, specialty.

At the beginning of the year, teachers introduce students to an independent work plan and recommend that they complete it in the following ways:

- Independent study of the topic with the help of electronic textbooks;
- Presentations at scientific and practical conferences, seminars and events;
- work with the textbook, independent reading, study of materials on the subject;
- Writing abstracts, creative works;
- creation of exhibitions, booklets, tables, models, forms, models;
- preparation of drawings, diagrams, schemes;

- answering questions, exercises, solving problems and examples, checking the correctness of the answers;
- An interesting issue in the study of each subject, taking into account its characteristics - examples, the organization of all kinds of didactic games;
- written and oral control;
- Perform practical tasks, laboratory work;
- create interactive methods, crossword puzzles, rebuses and other interesting games;
- organization of targeted trips;
- Historical records (bibliography);
- Development of tests on topics (on at least 4-5 topics).

The student chooses to do independent work independently. The teacher, on the other hand, assists him with tips, guidelines, and instructions, and records the student's independent work assessments in the group journal as a current control during the consultation.

We recommend the following for the teacher's role in organizing and managing independent work:

- To teach students to work independently in theoretical and practical classes, extracurricular activities in special subjects;
- organization of independent work with a group of students or individually;
- Development of guidelines and handouts for independent work and assignments, assistance and advice to students;
- Monitoring and evaluation of independent work.

Karshi Pedagogical College has developed a schedule for independent work planning for teachers, and work is being done on the basis of this schedule.

Independent work planning schedule (In the amount of hours allocated according to the curriculum)

	Independent work topics	Form of execution	Contents (introduction, main part, conclusion), publications	Size (how many pages)	Deadline for receipt and completion of the assignment		Points for the work done
					Deadline for receipt of the assignment	Term of completion of the assignment	

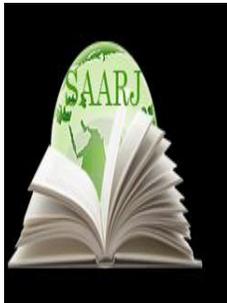

The best way to ensure that students are not indifferent to learning is to develop in them the skills to work independently from an early age, from the first day of school, to pursue independent work in the subjects taught in colleges and lyceums and to pursue their chosen profession. is to send.

Independence is one of the most important human qualities. Students develop the ability to apply the acquired quality knowledge and skills in life and practice. Today's quality knowledge is tomorrow's high efficiency.

In conclusion, when using modular educational technologies in biology lessons, students need to understand the instructions on the tasks to be performed, the organization of learning activities, independent learning, serves for quality performance of educational tasks, finding answers to questions, overcoming problematic situations, active participation in educational debates, questions and answers, discussions and mental attacks

ABSTRACT

With a significant number of successful examples in image processing, voice recognition, object identification, and other areas, deep learning has shown to be an advanced technique for big data analysis. It's also being used in food science and engineering recently. This is the first review in the food realm that we are aware of. We gave a short introduction to deep learning in this article, as well as comprehensive descriptions of the structure of several common deep neural network designs and training methods. We looked at hundreds of papers that utilized deep learning as a data analysis technique to address issues and difficulties in the food domain, such as food identification, calorie estimate, fruit, vegetable, meat, and aquatic product quality detection, food supply chain, and food contamination. Each study looked at the particular issues, datasets, preprocessing techniques, networks and frameworks utilized, performance obtained, and comparisons with other popular solutions. We also looked at the possibility of using deep learning as an enhanced data mining technique in food sensory and consumption studies. Deep learning surpasses other techniques such as manual feature extractors, traditional machine learning algorithms, and deep learning as a potential tool in food quality and safety inspection, according to the results of our study. Deep learning's promising achievements in classification

and regression issues will spur further study into using deep learning to the area of food in the future.

KEYWORDS: *Computer Vision, Deep Learning, Food Quality, Food Recognition, Spectroscopy.*

1. INTRODUCTION

Human health depends on a balanced diet natural goods have long been used as food, and they may be treated to suit customer demand. Types, compositions, nutrients, and processing methods of food (both natural and processed) are all important considerations for a balanced diet. It is true that people from various parts of the world eat in different ways. It is critical to understand food characteristics (types, compositions, nutrients, and processing methods, for example) in order to check food quality and safety for consumers all over the globe. The ability to determine food characteristics quickly, accurately, and automatically is a practical need in everyday living [1]. Food characteristics have been detected using modern methods such as electronic noses, computer vision, spectroscopy and spectral imaging, and so on. These methods can collect a significant quantity of digital data on food characteristics. The importance of data analysis in these methods is critical since the huge quantity of data contains a lot of redundant and unnecessary information. How to deal with such a huge quantity of data and extract valuable characteristics from it is a pressing and essential problem, as well as a difficulty when it comes to putting these methods into practice (APP).

To deal with the large amount of data, many data analysis methods have been developed, including partial least squares (PLS), artificial neural network (ANN), support vector machine (SVM), random forest (Bossard, Guillaumin, Principal component analysis (PCA), wavelet transform (WT) (Ma, 2017), independent component correlation algorithm (ICA), scale-invariant feature transform, and speedup Various techniques have shown to be very useful in dealing with these types of data [2]. Deep learning has been widely studied as an effective machine learning algorithm and is now attracting more attention from a variety of fields, including remote sensing, agriculture production, medical science, robotics, and healthcare (Miot Deep learning has shown substantial benefits in automatically learning data representations (even for multidomain feature extraction), transfer learning, handling huge amounts of data, and achieving improved performance and accuracy. In majority of the examined papers, convolutional neural networks (CNNs) and its derivative algorithms have been identified as important techniques for automatically learning deep characteristics of input digital material for future classification or regression tasks. CNN can effectively handle the vast quantity of data produced by food quality and safety assessment equipment (spectroscopy, electronic nose, digital cameras, and so on). CNN has been shown to be successful in picture analysis (two-dimensional data), and has since been extended to one-dimensional and three-dimensional data to handle more varied data formats [3].

Deep learning is now being used in the food industry to analyze RGB and spectra pictures of food. However, since comprehending and implementing deep learning is a tough task for academics and employees in the food sector, researchers are working on it. The goal of this study is to give a thorough review of recent research development in the APP of deep learning in the food sector, as well as to provide advice to researchers and employees in this field. A brief

overview of deep learning Machine learning has been used in a variety of areas as a useful tool for data processing. Traditional machine learning methods are typically complemented with a human feature extraction method due to the inability to evaluate raw natural data [4]. Machine learning capabilities may be enhanced by adding more sophisticated structures to accomplish deep data representation as hardware processing and storage capabilities improve. For detection, classification, or regression, a computer may use representation learning to extract features from raw data. Deep learning is a kind of representation-learning technique that uses a deep ANN comprised of many layers of neurons to improve multilayer representation (nonlinear modules).

Many difficult issues can be addressed quickly and effectively because to the deep learning method's high feature learning capabilities. Deep learning models show impressive skills in classification and regression problems when sufficient data support is given that accurately reflects the issue. Deep learning is beginning to be used in the area of food science, mostly for food category identification, fruit and vegetable quality detection, food calorie estimate, and so on, thanks to its great capacity of automated feature learning. In the section "Deep learning applications in food," we'll go over everything in depth. CNN, which consists of a number of components (convolutional layers, pooling layers, fully connected layers, and so on), is one of the most widely used machine intelligence models for large data analysis in a variety of fields. Figure 1 shows a typical CNN model design for classification tasks. Convolution operations are carried out by traversing input matrices using convolution kernels, which may be thought of as feature extraction filters [5]. Unlike filters used in traditional image processing methods, where the parameters must be manually specified, the parameters within the kernel may be learned automatically using deep learning. Convolutional layers are made up of a collection of convolution kernels, each of which has its own set of parameters (channels, kernel size, strides, padding, activation, and so on) that should be adjusted and optimized for the specific issue at hand. Pooling layers subsample the calculated output from the convolutional layer. High-level features representing the original input may be learned using a set of chained convolutional layers and pooling layers. The fully connected network (FNN) block, which is made up of completely connected neural units, is often employed as a classifier or to produce numerical output for regression problems that utilize the learnt feature map.

1.1 Application of Deep Learning In Food

Diets and eating habits may have an impact on human health. Diabetics, allergic individuals, and others, in particular, should keep a close eye on and manage their eating habits. Food categorization and identification are essential tasks that assist humans in keeping track of their regular meals. Food images are one of the most significant sources of information on the qualities of food. Furthermore, for food appearance analysis, image sensing is a very simple and low-cost information collection method. The vast differences in food form, volume, texture, color, and components make food identification a difficult job for natural goods like food and processed food. Food identification and categorization are also affected by the backdrop and arrangement of food items. Image analysis is now the most often utilized pattern in food identification and classification, because to the widespread usage of CNN. *Calorie Calculation for Food:* Dietary health has become more important as living conditions have improved. Many individuals are interested in keeping track of their daily diet in order to better regulate nutrient intake, reduce weight, manage diabetes or food allergies, and improve dietary habits in order to stay healthy [6]. One of the most worried indices is food calorie. Many smartphone APPs have

been created for tracking daily meals, which include not only item names but also calorie information created calories, a smartphone app that estimates food calories from pictures. The system's functioning may be broken down into five stages., the CNN models and training procedures for each component are detailed. To begin, a fine-tuned Google Net CNN model was used to determine whether or not the picture recorded was food. Second, to identify the meal, a fine-tuned Google Net architecture was used.

- *Vegetable Quality Detection:* Because vegetables are high in vital nutrients, they are an important component of a balanced diet. Vegetables are susceptible to pests, infections, mechanical damage, and other impacts during production, transit, storage, and sales, all of which decrease their economic worth and may harm customers' health. Used the SAE technique (2018). They created a classification method for cucumber flaw identification based on hyperspectral imaging that integrated the stacked sparse autoencoder with CNN. The size and color variety of cucumber surface imperfections complicates the identification technique based on the average spectrum of the whole sample. As a result, using a search window spanning the whole picture, a CNN model was initially utilized to filter out the defective areas based on the image in RGB channels. The mean spectra of the defected area were input into a stacked sparse autoencoder (SSAE) for deep feature representation and classification if the region within the search window was deemed to be defected. The mean spectra of the whole spectrum picture, on the other hand, were utilized. With 91.1 percent accuracy, the proposed CNN-SSAE model beat the single SSAE system, which used the mean spectra of the whole defective cucumber as the input.
- *Fruit Quality Detection:* Fruit, like vegetables, is an essential source of nutrition for humans. Fruit production and sales face the same issues as vegetable production and sales, such as pests, illness, bruises, and so on. Additionally, fruit is a high-value agricultural commodity. Fruit freshness, nutritional content, and safety assurance are additional factors to consider. Fruit and vegetable quality detection is a popular and difficult research topic right now. Deep learning combined with image processing or spectral sensing has been extensively utilized as an effective and nondestructive fruit quality detection technique to address issues including variety categorization, nutritional content prediction, illness, and damage detection in recent years. Rodriguez, Garcia, Pardo, Chavez, and Luque-Baena (2018) utilized deep learning technology to discriminate amongst plum types (Black Splendor, OwentT, and Angelino) at early maturity stages. To create the dataset, photographs of samples of various kinds and maturities were taken. The suggested approach split the pictures first to eliminate the undesirable backdrop, and then used CNN to classify the images based on the recorded images. As a CNN model, the Alex Net architecture was selected. In various gathered datasets, the categorization accuracy varies from 91 percent to 97 percent.
- *Meat and Aquatic Product Quality Detection:* For protein provision, aquatic items (such as fish, shrimp, and so on) and meat (such as pig, mutton, beef, and so on) have become significant parts of the human diet. Multiple chemical makers may be used to monitor food safety in the aquatic manufacturing process. For fast nondestructive quality detection of aquatic goods (for example, chemical characteristics of fish muscle prediction), spectral sensing and machine intelligence have been extensively utilized in recent years Data analysis techniques such as partial least squares regression (PLSR), SVM, LR, and others may be used to estimate quality, freshness, and nutritional content of samples using spectral data [7]. Deep

learning techniques have recently been brought into this field to replace conventional machine learning methods, thanks to adequate proof of excellent feature learning and data analysis capacity. A deep learning model for predicting shrimp freshness using visible/near-infrared hyperspectral data. The deep characteristics of the samples were generated using the SAE model, and logistic regression was used to identify the freshness grade of shrimp using the deep features acquired. For shrimp freshness grade categorization, the suggested approach yielded positive results (96.55 percent and 93.97 percent in calibration and prediction sets, respectively).

- *Contamination of Food:* Food may be contaminated with toxic and harmful chemicals as a result of the environment or human factors affecting food throughout any phase of planting or feeding, growth, harvesting or slaughtering, processing, storage, transportation, and sale, among others, before consumption. Food contamination may cause gastrointestinal infectious illnesses and damage to human health, and as a result, it is gaining worldwide attention. Song, Zheng, Xue, Sheng, and Zhao used DNN to develop an evolving approach for forecasting gastrointestinal infection morbidity caused by food contamination. The study was designed to predict the morbidity of gastrointestinal infectious diseases using a large amount of contaminant-related data (from 227 types of contaminants in various concentrations and 119 types of commonly consumed foods in the investigated region) collected in the previous week, as well as previously recorded morbidity data. The dataset's large data of contaminant indexes was given by food safety departments in the target area in central China, while the morbidity data was provided by gastrointestinal departments at hospitals in the corresponding studied region. To extract hidden features for contamination indices, a deep demisingauto encoder, which is a structure similar to SAE with several hidden layers, was built, and the recovered representation was utilized for supervised learning to predict morbidity. With a mean average percentage error of 21.16 percent and a success rate of 58.50 percent, the proposed ecogeography-based optimization (EBO)-based approach for the calibration of the DDAE model outperformed conventional ANN and deep demisingauto encoder trained by other methods. The authors came to the conclusion that the deep learning model has significant skills in dealing with partial and defective data. More possible contamination characteristics will need to be considered in the future [8].
- *Food categorization and recognition:* Diets and eating habits may have an impact on human health. Diabetics, allergic individuals, and others, in particular, should keep a close eye on and manage their eating habits. Food categorization and identification are essential tasks that assist humans in keeping track of their regular meals. Food images are one of the most significant sources of information on the qualities of food. Furthermore, for food appearance analysis, image sensing is a very simple and low-cost information collection method [9]. The vast differences in food form, volume, texture, color, and components make food identification a difficult job for natural goods like food and processed food. Food identification and categorization are also affected by the backdrop and arrangement of food items. Image analysis is now the most often utilized pattern in food identification and classification, because to the widespread usage of CNN.

2. DISCUSSION

Feature learning is the most important benefit of deep learning technology. Traditional machine learning methods deal with categorization problems based on hand-crafted features or utilize raw data as input. Deep learning techniques are more capable than conventional approaches in learning representational characteristics from a dataset during the training phase. Another feature of deep learning is the capacity to transmit knowledge. We discovered that the majority of the studies mentioned in the section "Food recognition and classification" used pertained CNN models based on large datasets (such as ImageNet) and fine-tuned the models on their target datasets, which could reduce the difficulty and time required to train a model (even if the dataset was much smaller). Furthermore, several authors used CNN features to train another classifier, such as SVM, in order to transfer information from the CNN model to the new classifier [10]. Deep learning technology, unlike traditional data analysis techniques, requires a more sophisticated model structure and computing effort, which has previously restricted its development and use. Many tools have developed to assist researchers get a fast start making a deep learning-based APP, owing to the worldwide focus on deep learning and the contributions of scientists. It seems that programming is tough.

Complicated neural network models, but we can rapidly construct the necessary network with the assistance of these existing frameworks. Model by calling several duplicate network structures and stacking them on top of each other encapsulated function interfaces encapsulated function interfaces. In terms of hardware, a graphics processing unit (GPU) in conjunction with a Compute Unified Device. The NVIDIA CUDA Deep Learning Toolkit and the NVIDIA CUDA Architecture Toolkit may offer. Deep learning computations may be accelerated using both hardware and software. These toolkits help popular deep learning frameworks run faster. as already stated Acceleration software and hardware are very useful. Reduce computation time and have the ability to fulfill deadlines real-time data processing needs. However, there is no denying that deep learning has flaws. Due to a lengthy training period and hardware limitations, Added to that, there's a lot of complexity and a lot of hyper parameters. The optimization efforts for the model would be very difficult. As well as time-consuming. GPUs for computer acceleration, as well as corresponding CPUs and other gear, are extremely costly. It will take considerably longer to train a DNN using just this method. The computing hardware is comprised of CPUs. In addition, deep learning

For training, large data is required, as is the collection of dependable big data. Another tough issue is the dataset. Data gathering and annotation will consume a significant amount of time and effort. a few public datasets for. The results of academic study and a challenge competition were gathered and analyzed. Experts or volunteers may hand-label items, or they may be directly labeled. Machines would download data from the Internet; as a result, there would be some errors are unavoidable. It should also be mentioned that the only the dataset's features can be understood by a trained network. Used as a training tool Incomplete datasets are described in certain published datasets.

3. CONCLUSION

We looked at a huge number of recent papers for this study. linked to the deep learning in food APP, detailed description of the. DNNs were used to process food picture, spectrum, text, and other data. The suggested structure, training techniques, and final evaluation result of DNNs

were used to process food image, spectrum, text, and other data. Information in each of the articles examined When it comes to performance, we compared deep learning to other widely used techniques and found that in the research we looked at, the deep learning method outperformed the others. We came to a conclusion. The benefits and drawbacks of deep learning techniques a thorough examination of the issues and prospects for the future in the field of food deep learning It is, to the best of the writers' knowledge, The first study of deep learning applications in the food industry. The goal of this review is to motivate scholars and professionals in the field. This area to conduct additional food-related studies using deep learning techniques, to offer accurate answers to classification or regression issues and to put them into operation for the benefit of the food industry. Inspection of the quality and safety of food for human consumption. Finally, we've arrived.

- The use of deep learning and multisource data fusion, including RGB pictures, spectra, smell, taste, and other sensory data
- The development of full-automatic information, and so on, would be examined to create a more complete evaluation of food. Acquisition equipment/systems for food with a steady signal output. Appropriate venues for exchanging global food data should be investigated in the future, since food-related big data is currently difficult to get by.

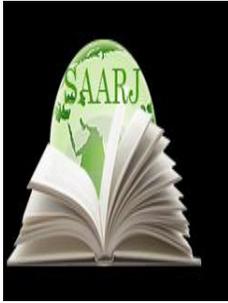

As a result of the use of automated or even manual data management and sharing technologies that aren't comprehensive

- the data science potential of deep learning technologies. Food-related sectors that are seldom investigated, such as mining, may be assessed. Sensory and consumption of food, food supply chain, and so forth, and
- Successful deep learning instances, such as in the food industry (for example, in the food industry).Picture recognition, a recipe suggestion app with intelligence, and fruit quality assessment system) may be converted into products that are useful.

ABSTRACT

This paper examines current developments in thermoelectric materials, modeling techniques, and applications. Thermoelectric cooling systems offer a number of benefits over traditional cooling technologies. There are no mechanical moving components, no working fluid, and the device is small, light, and reliable. Direct current is used, and the cooling and heating modes may be switched simply. In this research. The history of thermoelectric cooling has been briefly discussed initially. The development of thermoelectric materials was then discussed, as well as the accomplishments of the previous decade. Summarized. Modeling methods have been used to enhance the performance of thermoelectric cooling systems. Both thermo element modeling and thermoelectric cooler (TEC) modeling have been reported. includes one-dimensional and three-dimensional versions of the classic simple energy equilibrium model numerical compact model, and models. Thermoelectric cooling applications have now been completed. Household refrigeration, electronic cooling, scientific application, and automobiles were all examined. With summaries for commercially available thermoelectric modules and thermoelectric refrigerators, air conditioning and seat temperature control are covered. This research is anticipated to be helpful to Design, modeling, and analysis of thermoelectric cooling systems.

KEYWORDS: *Thermoelectric cooling Thermoelectric Material Modeling Application.*

1. INTRODUCTION

Thermoelectric cooling, also known as cooling technology using thermoelectric coolers (TECs), offers many benefits, including high dependability, the absence of mechanical moving parts, small size and weight, and the absence of a working fluid. It also has the benefit of being able to be powered by direct current (DC) electric sources such as photovoltaic (PV) cells, fuel cells, and automobile DC electric sources. The major drawbacks of thermoelectric cooling are its high cost and poor energy efficiency, which has limited its use to situations where energy availability, system dependability, and a quiet operating environment are more essential than system cost and energy efficiency. Though the thermoelectric cooling effect was discovered in the nineteenth century, it was not widely used until the 1950s, when the fundamental physics of thermoelectric materials was well established [1].

A thermoelectric module is a solid-state energy converter made up of a group of thermocouples connected electrically and thermally in series. When a voltage in the proper direction is supplied via the linked junction, a thermocouple is made up of two distinct semiconducting thermo elements that produce a thermoelectric cooling effect (PeltiereSeebeck effect). In order to improve heat transmission and system performance, thermoelectric modules often include two heat sinks connected to their hot and cold sides. Thermoelectric cooling is progressively becoming more integrated into people's everyday lives, in addition to its military, aeronautical, industrial, and scientific uses [2]. Thermoelectric cooling equipment, such as PC processors, portable food and beverage storage, temperature-control vehicle seats, and even thermoelectric air conditioners, are extensively utilized for electrical cooling. The scientific community has invested a significant amount of time and attention into thermoelectric cooling research. Modeling and analysis of thermoelectric modules, solar-based thermoelectric technologies, cooling, heating, producing electricity, and waste heat recovery are all excellent review articles on thermoelectric technology and uses. In 2004, Riffat and Ma published a review on COP improvement in thermoelectric cooling systems. Recent research suggests two possible paths to significant progress in thermoelectric cooling: 1) improving the intrinsic efficiencies of thermoelectric materials, and 2) improving the thermal design and optimization of thermoelectric cooling systems using currently available thermoelectric modules. The emphasis of this study is on the evolution of thermoelectric cooling over the last decade, with a focus on advancements in materials, modeling and optimization methods, and applications.

A good thermoelectric material should have a high Seebeck coefficient, high electrical conductivity (or high power factor), and low thermal conductivity, as indicated by the main criteria of merit $ZT = \frac{S^2 \sigma}{\kappa}$. However, since these three factors are linked, researchers must use the Wiedemann-Franz rule. S Seebeck coefficient, V/K σ ratio of Thomson heat to thermal conduction κ temperature differential between hot and cool sides, K emissivity, ZT dimensionless figure-of-merit Greek symbol electrical resistivity, ρ U m r density, kg/m^3 g combination heat transfer coefficient of radiation and convection in Eq. (8) $W/m^2 K$ σ ratio of Joule heating to thermal conduction) s electrical conductivity, S/m σ $5.67 \cdot 10^8 W/m^2 K^4$ s Thomson coefficient, V/K ϕ electric scalar potential, k_B Boltzmann constant n n-type thermo element p constant pressure p p-type thermo element N ambient c cold side κ conduction e thermo element h hot side m mean/average σ max maximum n n-type thermo element p constant

pressure p p-type thermo element N ambient Temperature value independent of the overheat obtain the best ZT , adjust these conflicting settings. To some degree, the ability to decrease material thermal conductivity, particularly lattice thermal conductivity, is essential for thermoelectric material performance optimization. Bulk alloy materials such as Bi_2Te_3 , PbTe , SiGe , and CoSb_3 are common thermoelectric materials, with Bi_2Te_3 being the most prevalent. A ZT value of less than one is typically processed. Increases in ZT were moderate from the 1960s through the 1990s. Theoretical predictions after the mid-1990s indicated that nanostructure engineering might significantly improve thermoelectric material efficiency.

Meanwhile, traditional bulk materials incorporating nanostructured constituents have been investigated and shown to reach excellent efficiency, thanks to current synthesis and characterisation methods. As a result, improvements in the ZT factor have come from two main methods in recent years: 1) bulk samples including nanoscale constituents, and 2) nanoscale materials themselves. Researchers have discovered that excellent thermoelectric materials are the so-called "phonon-glass electron-crystal (PGEC)" materials [3], in which high mobility electrons are free to transfer charge and heat but the phonons are disturbed at the atomic scale from transporting heat. Skutterudites, clathrates, and half-Heusler alloys are some of the most common bulk thermoelectric materials, and they're all made via doping. Low-dimensional materials, such as 2D quantum wells, 1D quantum wires, and 0D quantum dots, process the electron charge carriers' quantum confinement effect, potentially increasing the Seebeck coefficient and therefore the power factor. Furthermore, the many surfaces created will scatter phonons more efficiently than electrons, resulting in a reduction in thermal conductivity that is greater than the reduction in electrical conductivity. Recently shown a liquid-like behavior of copper ions surrounding a crystalline sub lattice of Se in Cu_2xSe , resulting in a lattice thermal conductivity that is inherently extremely low, allowing for high ZT in this basic semiconductor. The findings point to a new approach and direction for high-efficiency "phononliquid electron-crystal" thermoelectric materials, which involves investigating systems in which a crystalline sub lattice for electronic conduction is surrounded by liquid-like ions. ZT values of about 1.0 are presently seen in the finest commercial thermoelectric materials. According to Harman in 2005, the maximum ZT value in research is about 3. Table 1 shows that other best-reported thermoelectric materials have figure-of-merit values of 1.2e2.2 at temperatures between 600 and 800 K. Thermoelectric coolers with a ZT value of 1.0 are predicted to function at just 10% of Carnot efficiency. A device with a ZT value of 4 may achieve 30 percent Carnot efficiency (equivalent to home refrigeration). However, raising ZT to 4 has proven to be a difficult task. Bell has said that if the average ZT approaches 2, thermoelectric material-based residential and commercial solid-state heating, ventilation, and aircooling systems would be feasible [4].

2. DISCUSSION:

2.1. APPLICATION:

Three-dimensional modeling captures temperature distribution along and across the thermo element, resulting in higher performance than one-dimensional modeling. More computing work, on the other hand, is needed. Simply extending to three dimensions yields the governing equation for three-dimensional modeling. Thermoelectric material characteristics are sometimes regarded as constants to minimize computational costs. constructed a transient three-dimensional constant property model for a single thermocouple (two thermo elements) with mesh grid 3146, and found that the numerical and experimental results were in close agreement. A generic three-

dimensional temperature-dependent property thermo element model with temperature and electric potential field coupling was described by Temperature-dependent properties and heat losses to the environment have substantial impacts on cooling capacity and COP, according to the findings. Unstable nonlinear second-order partial differential equations must typically be solved in one-dimensional and three-dimensional models. Numerical techniques are widely used in research, and numerical analysis software tools including MATHEMATICA, COMSOL Metaphysics, and ANSYS have been used. Many studies have utilized and verified the simplified energy equilibrium model, which has a similar structure to, where a , R , and K are the Seebeck coefficient, electrical resistance, and thermal conductance of the thermoelectric module, respectively. Module cooling power output and COP may be estimated using this model after these temperature independent module characteristics are known. The producer of commercially accessible thermoelectric modules, on the other hand, may not disclose material specifications[5] for the thermoelectric module. Palacios et al. [50] developed an analytical method for extracting internal parameters from performance curves. Chen and Snyder also derived the following equations to get the thermo element Seebeck coefficient a , electrical resistivity r , and thermal conductivity k using operating parameters Q_{max} , DT_{max} , and $IMAX$. $a = \frac{1}{14} \frac{Q_{max} Th DT_{max}}{NT^2 h I_{max}}$ Thermoelectric modules a , R , and K are then computed using Eq. from the material's electrical resistivity and thermal conductivity. The second method to get thermoelectric module cooling capacity (Q_c) and electrical power input (P) is to utilize thermo element cooling capacity (q_c) and thermo element electrical power input and multiply with thermo element numbers. Because a thermoelectric cooler comprises of thermo elements, it is acceptable to numerically model each thermo element in a thermoelectric cooler for thermoelectric cooler modeling. Chen et al. published a three-dimensional numerical analysis for a small thermoelectric cooler with 8, 20, and 40 thermocouple pairs. Thermal and electrical conductivity were maintained constant whereas the Seebeck coefficient was regarded as temperature dependent. When thermocouples within a module are scaled down, the cooling power and COP of the module increase significantly, according to the forecast. However, since the mesh grids for simulating each p-type and n-type thermo element must be very tiny, this method is both computationally costly and complex. Additionally, thermal and electrical contact resistance will complicate the modeling procedure modeling the thermoelectric cooler as a single bulk is considerably simpler than modeling each thermo element separately [6].

2.2. ADVANTAGE:

Electronic equipment, such as PC CPUs, produce a significant quantity of heat during operation, posing a significant thermal management issue since electronic devices must operate at a consistent temperature. For reliable operation, the maximum electronic device junction temperature should be kept below 85 C in most instances [42,77]. A high-performance electronic package's maximal heat flow may be about 200 W, and it's still rising. Passive cooling technologies, such as the micro-channel sink, that use air or water as the working fluid cannot completely satisfy the heat dissipation requirement, and active cooling techniques must be used. Conventional bulk cooling systems are excessively large due to the restricted installation area in electronic packaging. Because of their compact size, excellent dependability, and lack of noise, thermoelectric coolers coupled with air or liquid cooling methods on the hot side have a lot of promise. Phelan et al. examined existing and prospective tiny refrigeration cooling methods for high-power microelectronics, concluding that only thermoelectric coolers are commercially

accessible in small sizes at this time. The thermal resistance between the cooler and the ambient air has a considerably greater impact on the thermoelectric cooler's performance than the thermal resistance between the chip and the cooler. Naphon and Wiriyasart tested liquid cooling in a mini-rectangular fin heat sink with and without a thermoelectric cooler for the CPU and discovered that the thermoelectric cooler had a significant impact. Thermoelectric coolers work better at lower thermal loads, such as 20 W, when coupled with an air cooling device for the hot side. Instead, a thermoelectric air cooling device may not be as effective as an air cooling heat sink for a high thermal load. Thermoelectric coolers, when used in conjunction with a water cooling system in electronic equipment, often operate better at a greater thermal load, such as 57 W. Chein and Huang investigated the use of thermoelectric coolers in electronic cooling for both air and liquid cooling methods in a theoretical study. In their research, the greatest cooling capacity was found to be 207 W. Nan fluids have showed promise for liquid cooling since they are a superior alternative to water and can improve cooling power output. R134a is presently used as a refrigerant in the majority of vehicle air conditioning systems. R-134a does not deplete the ozone layer, however it does contribute to global warming. The refrigerant leakage issue in cars is far worse than in stationary air conditioners. Compact size, no moving parts or working fluid, compatibility with vehicle electrical system voltage, and ease of switching between heating and cooling modes are all benefits of thermoelectric coolers. As a result, thermoelectric coolers seem to be particularly well suited to automobile applications. Yang and Stabler provided a review of thermoelectric materials in automotive applications. A new thermoelectric air-conditioner for a truck cab was proposed by Luo et al. The cooling system's COP was found to be 0.4e0.8 at temperatures ranging from 46 to 30 degrees Celsius. They also discovered that by improving system design and manufacturing technique, cooling performance may be enhanced much further. Researchers used a thermoelectric device to regulate the temperature of the vehicle seat in addition to the air conditioning system. Hyeung-Sik et al. Created a temperature-controlled carseat system that uses a thermoelectric device to cool or heat the vehicle. Experiments were used to verify the device's performance, which was built using a one-chip microcontroller. The Climate Control Seat (CCS), created by Gentherm (formerly Amerigon), is a thermoelectric device that provides thermal comfort to automobile and truck drivers. The automobile sector has already created a significant cooling device market for thermoelectric cooling devices, which will continue to grow in the next decades [7].

2.3. WORKING:

Using fine mesh and coarse mesh in various areas, these so-called compact models can solve the multistage problem. For thermoelectric coolers, Chen and Snyder devised a compact modeling method. It is shown that a significant amount of grid has been reduced and computational speed is about 100 times faster, with results almost as accurate as the physical model (numerical study includes all coupled thermoelectric as well as components that provide losses and other parasitic effects). Techniques for enhancing the cooling system's efficiency When designing a thermoelectric cooling system, one must consider both the system cooling power output and cooling COP, as well as the performance of the thermoelectric modules and the heat sink design. As a result, designing a thermoelectric cooling system involves a trade-off between cooling capacity and COP. There are three ways for improving the performance of thermoelectric cooling systems. The first is through the design and optimization of thermoelectric modules, such as thermo element length, number of thermocouples, thermo element length to cross-

sectional area ratio slenderness ratio, and thermo element with non-constant cross section area. The second approach relates to cooling system thermal design and optimization, which includes investigations of heat sink geometry, allocation of the heat transfer area and heat transfer coefficients of hot and cold side heat sinks, thermal and electrical contact resistances and interface layer analysis, and more effective heat sinks with the operating state of the thermoelectric cooling system heat sink coolant, and coolant mass flow.

A number of system optimization techniques have been used. Optimized thermo element physical parameters (length, cross-sectional area, and number of thermo elements) using evolutionary algorithms. Limekiln and Yaakov proposed a graphical method to the design of thermoelectric cooling systems that was user-friendly and intuitive. The temperature entropy analysis was given by Chakra borty et al. to show the cooling cycle of a thermo element. Instead of the widely used iterative method, Zhang proposed a generic simple approach for optimizing thermoelectric coolers. Several writers have used the dimensional less analysis approach, which has the benefit of lowering optimal design parameters. The dimensionless entropy production number based on thermal conductance was developed by Wang et al. to assess the external irreversibility in the thermoelectric cooling system, which takes into account both the first and second laws of thermodynamics. Lee created new dimensionless groups to express key thermoelectric device characteristics including the thermal conduction ratio, convection conduction ratio, and load resistance ratio. Summaries may be inferred as follows based on the research papers mentioned in this section: Many thermoelectric cooling applications, such as electronic device cooling and air conditioning, may be satisfied by the simplified energy equilibrium model for thermoelectric cooler. To better capture the system performance when thermoelectric modules are used with time-varying temperature distribution and cooling power output, 1D or 3D transient modeling is required [8].

For simplicity, thermoelectric thermo physical characteristics are often considered as independent of temperature in 3D models. Although the Seebeck coefficient, electrical conductivity, and thermal conductivity of p-type and n-type thermo elements vary in one thermoelectric module, these differences are insignificant in numerical studies. As a result, in the simulation, only one set of Seebeck coefficient, electrical, and thermal conductivity will be utilized. It's difficult and time-consuming to model temperature change in all thermo element to capture module performance. When modeling a system with heat sinks on both the hot and cold sides, an energy equilibrium model or compact model may be used to simplify the numerical research process. The temperature-dependent Seebeck coefficient is associated with the Thomson effect. The positive Thomson coefficient increases thermoelectric cooling performance by 57%, while the negative Thomson coefficient decreases cooling performance. The Thomson effect, on the other hand, is typically modest and insignificant in commercially available thermoelectric coolers. Snyder et al. proposed the 'Thomson cooler,' predicting that with comparable ZT, a greater hot/cold side temperature differential than the conventional Peltier cooler could be obtained. Both COP and cooling capacity are affected by thermo element length, and this effect becomes stronger as the length of the thermo element decreases [9].

3. CONCLUSION

This paper examines the evolution of thermoelectric cooling over the last decade in terms of material advancements, modeling methods, and applications. Nanotechnology allows for a substantial improvement in ZT factor thanks to advancements in thermoelectric materials. Bulk

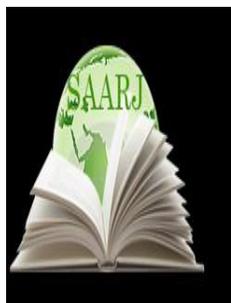

samples comprising nanoscale constituents and low-dimensional materials are the two main methods. New thermoelectric materials with higher ZT factor values may lead to breakthroughs in a variety of thermoelectric device applications. In this study, several thermoelectric modeling methods have been summarized. Implicated models save time and effort while sacrificing some modeling accuracy. Model selection is heavily influenced by the modeling objective. Thermoelectric cooling device performance may be improved in three ways: 1) via thermoelectric module design and optimization, 2) through cooling system thermal design and optimization, and 3) by improving the operating state of the thermoelectric cooling system. Domestic refrigeration, electronic cooling, scientific uses, and automotive applications are among the most common thermoelectric cooling applications. Thermoelectric home air conditioning systems are being developed by researchers in the hopes of competing with their vapor-compression equivalents. The performance of thermoelectric and conventional vapor compression air conditioners was compared by Riffat and Quid. The real COPs of vapor compression and thermoelectric air conditioners are in the range of 2.6e3.0 and 0.38e0.45, respectively, according to the findings.

Thermoelectric air conditioners, on the other hand, offer a number of advantages over their vapor-compression equivalents. They may, for example, be constructed into a planar construction that can be readily handled on walls and provide a quiet operating environment, making them ideal for home usage. An experimental and computational analysis of a thermoelectric air-cooling and air-heating system was reported by Cosnier et al. [47]. By providing an electrical intensity of 4 A and maintaining a 5 C temperature differential between the hot and cold sides, they were able to achieve a cooling power of 50 W per module with a COP of 1.5 to 2. Cheng et al. [104] developed a solar-powered thermoelectric generator. The temperature differential between the interior and exterior of the refrigerators is measured in degrees Fahrenheit (DT). *Applied Thermal Engineering* 66 (D. Zhao, G. Tan) (2014) 15e24. For green building applications, a 21 cooling module with a waste heat regeneration unit is available. The technology is capable of producing a temperature differential of 16.2 degrees Celsius between the ambient environment and the model home, according to the results. The thermoelectric device cooling COP, on the other hand, is modest, ranging from 0.2 to 1.2 in this research [10]. Thermoelectric cooling systems for small-scale space conditioning applications in buildings were explored. Under the input electrical current of 4.8 A, a thermoelectric cooling unit was constructed and produced up to 220 W cooling capacity with a maximum COP of 0.46 for each modul. Thermoelectric cooling applications, on the other hand, are not restricted to these fields. When high-quality thermoelectric materials are produced and thermoelectric cooling devices approach greater performance efficiency, more applications emerge.

SEMANTIC STRUCTURE OF PROVERBS

Djalilova Sarvaroy Mekhrojevna*

*Teacher of “Spanish and Italian languages” department,
 Samarkand State Institute of Foreign Languages,
 UZBEKISTAN

ABSTRACT

The proverbs are historical features of humanity. Most of the scientists agreed that the proverbs are folklore speech. Yes, of course, because the people established these proverbs. Where was not only the person's point of view but also general people's outlook is expressed. Proverbs and sayings play important role in language. They give emotionality, expressiveness to the speech.

KEYWORDS: *Linguistic Features, Sayings, Pragmatics, Concept, Morphosyntactic Constructions.*

INTRODUCTION

Proverbs have certain pure linguistic features that must always be taken into account in order to distinguish them from ordinary sentences. As **learning process**, transfer supports the learner's selection and remodeling of input structures as he progresses in the development of his interlanguage knowledge. As **production process**, transfer is involved in the learner's retrieval of this knowledge and in his efforts to bridge linguistically those gaps in his knowledge which cannot be side-stepped by avoidance [2, 22].

Proverbs are morphosyntactic constructions of different kinds, structures and functions, with their unique grammatical peculiarities. Translator ought to know the rules of translation, furthermore the history, slang, life, customs and traditions of the people. Especially in proverbs, we can mention the semantic, syntactic, lexical and grammatical features. As we know, the proverb is a brief saying that presents a truth or some bit of useful wisdom. It is usually based on common sense or practical experience. Because we can say the proverbs from our own life, from difficulties.

Proverbs and sayings include some certain features of historical development and the culture of people. With learning of national proverbs, we can have information about this or that people habits, traditions, culture its status in society.

As a rule proverbs also have semantic, syntactic, grammatical categories. The semantic sphere of proverbs is very wide and we cannot limit them. The proverbs describe the every branch of people's life: the economical, psychological, cultural and etc. The fact is that proverbs and sayings are similar in meaning in spite of their diversity in form and language. To prove they said above some examples:

A bird in hand is worth two in the bush.

Un tiens vaut mieux que deux tu'auras.

Un chien vivant vaut mieux qu'un lion mort.

Лучше синица в руках, чем журавль в небе.

Nasiya saryog'dan, naqd o'pka yaxshi.

Even if the form, the word structure and the stylistic structure of these proverbs are different they have the same meaning. The proverbs change their meaning and form very rare, they have long living features. The spreading of any proverb among people is implemented as slow as it is created. Proverbs are retest by geographic area which is going to admit it only after that the proverb can become its property. Many scholars tried to do the researches to show the differences between proverbs and sayings in order to point out their border of limit. One of the outstanding Russian scholars the author of "Dictionary of vivid Russian language" and "The proverbs of Russian nation" V.I. Dalwrote: "Saying is the bud and proverb is the fruit" [1, 183]. So from this point of view we can see that proverbs express the full finite meaning and saying is a phrase which expresses the figurative meaning. The sayings are considered to be the half part of the proverbs.

Proverbs and sayings are separate genres, which are different from each other. The meaning and explanation of these terms in Turkish language show that the semantically their meanings are various and this fact confirms our above given ideas. For example in the dictionary, "O'zbektiliningizohlilug'ati" there are given two meanings. The first meaning is that, it does not express complete meaning and it is emphatic phrase and wise words. This explanation can express the folk saying. Another meaning refers to Arab word "masal" that (in English means fable) was changed phonetically. The explanation can be used for emphatic phrase and incomplete meanings that is sayings [4].

There differences between proverbs and sayings:

- when there is tow logical counters became complete composition the brief summarizing thought appeared. That explains the lack of spare word or description.
- to express the idea straightly and logically proverbs are characterized by their features. Every proverb values or appreciates any event both positively and negatively. Such kind of features serves to make the proverbs popular among people.
- Proverbs express wise and complete idea and sayings express the description of something but do not give complete meanings. They consist of one compositional composition.
- Proverbs can be used in neutral figurative meaning. These features of proverbs widen the sphere of their usage thematically. That's why proverbs are famous among different nations and people. Sayings are characterized by limited usage in one or two nations who are near to each

other geographically and in non related languages. For example in Russian «заморитьчеловека» means to eat something has no equivalent or component in Uzbek or English languages and translated by analogy. The same way of translation is used while translating such sayings as “qovuntushurmoq”and etc.

- The sayings are the means of devices or pointing in speech the function of proverbs is to prove any event or situation.

We know that proverbs also have some functions in phraseology. Proverbs do not function as mere optical phrase mongering. As a rule, they are used for some practical, pragmatically purposes in various circumstances of everyday communication. With the aid of a proverb on poetic adornments of speech; neither are they used, normally, to meet man's needs for phi lose can aim to provide an endorsement to his statements and opinions, forecast something, express doubts, reproach someone with something, accuse someone of something, justify or excuse somebody, mock somebody, comfort somebody, jeer at somebody's misfortune, repent something, warn against something, advise something or interdict somebody from doing something, and so on, and so forth. It is unthinkable to consider the proverb apart from such pragmatic functions.

Unfortunately, paremiologists have so far only some vague ideas of the functions of proverbs. Moreover, the proverb lies just somewhere on the borderlands between language and folklore, and shares its functions with both of them, and one cannot say there is a notable agreement between the conceptionaries of different authors on the functions of language or folklore, neither is there a notable unity in the terminology used by different authors who have written on these matters. We accept here a simpler and widespread scale, namely the set of three degrees:

Statement→evaluation→prescription

We suppose, however, this scale should fit in with the nature of the proverb, and it has, incidentally, the virtues that it operates with concepts general enough, and allows to consider the set of its sub functions (or functional aspects) as a unified system. The functional aspects mentioned are in certain relationship with grammatical moods of the sentence. Hence the illusion may arise that proverbs can be classified functionally straight on the ground of their “superficial” grammatical moods, so that the proverbs with stating (designative, informative) function were represented with indicative sentences, and those with normative (prescriptive, evocative) function, respectively, with imperative sentences. This illusion, however, would be immediately shattered against two complications. Proverbs often have scatological and abusive references, reflecting the crude and uncouth pattern of life.

The proverbs in this sense function as important social documents. What is mirrored in these proverbs show how poor the common people were who these poor vulgar people were, how they struggled to survive in tough circumstances, and what their philosophy of life was. These are random selections from Korean proverbs which typically portray the life of the common people. They show a picture of a poor man, who does not like rich men, and who hates the noble, ruling' class. Although he is always victimized, he is secretly longing for the days when he can have his revenge. Meanwhile he has to be quiet and careful not to make mistakes. All he can do is to help educate his children for a future opportunity. As we mentioned that English proper nouns include people's names (Mary, Tony, Lucy), geographical names (Egypt, the Amu-Darya), names of institutions (the United Nations; the Art gallery), places in the city (Big Ben; Tenth Avenue),

historical and other events (the French Revolution; the Jazz Festival), nationalities (Chinese; Uzbek), weekdays (Thursday), months (March) and other notions, objects or places that are capitalized and used as names. These examples show how to differentiate the semantic category of phraseological units. But in history to show the time, place, addition we can use the proper nouns. As we know, proverb is a figurative saying, devoted on the level of conceptual thinking in the consciousness of the language collective and it is expressed in a stereotyped formula. By these notions we can mentioned the history or culture of this or that country. By the knowledge embedded in proverbs is the resource of the rational of a given ethnos, its ethno psychic basis, we can learn the physiological inner-world of the irrational form. That is why we can have difficulties to gain a deep insight into proverbs of a foreign language, to identify or to guess the main characteristic features or the relevant boundaries of the generalized meaning (sphere of use). This apparently shows to the specificity of the proverb structure and its structurally difficult semantic mechanism. If we analysis the semantic structure of a proverb it should be considered in the synthesis of three basic dimensions. They are: **logical**, **verbal** and **conceptual** thinking. **Theological thinking**, because there would be logical relations between objects and phenomena existing in the universe and in the **verbal**, a communicative unit, there is connection and is essentially linked with speech; and **conceptual**, the reasoning and conclusion given in it are based on conceptual operation.

The great linguist S. Levinson, defined goals and objectives of the theory of pragmatics, regards study of the nature of metaphor as he thought prerogative and object of research of a pragmatist. In his view, a pragmatist should find out how a metaphorical expression is constructed and recognized, whereas the task of psycholinguistics and psychology is the creation of an analogy-based theory of thinking. Because by the proverbs we can notice such an approach, in his opinion, will facilitate the approximation of the linguistic and extra linguistic spheres [3]. Here is example:

Every bird couples with the same species.

Every pot has its lid"

Every Jack has his Jill.

Everyone finds his/her match

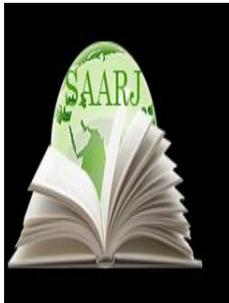

Let analyze the proverb as is clear, in order to create a similar semantic model (“*everyone finds his/her match*”), both ethnics offer identical as well as different metaphorical images. The information given on the surface level in each unit is the basis of the generalized meaning embedded on their deep level. It sometimes shows the result of the experience gained such as the observation (on the laws of nature, everyday objects, etc.) in the process of the cognition of the world, and in some cases - on the recording of proper names (sometimes historical persons). Each proverb united in the given semantic model, upon the actualization in a relevant context, expresses the identical concept coded in them, the wide meaning, by a different semantic coloring. In other words, the similar underlying meaning recorded in each on the implicit level has a different connotation (sometimes positive as well as negative, in other cases unequivocally positive or negative).

One of the ways of enriching English phraseology is the formation of new phraseological units from the existing ones, when a new phraseological unit arises in the language as a result of the

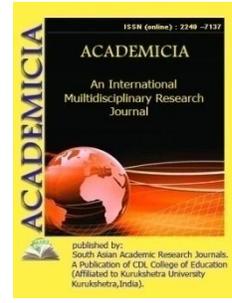

isolation of the components of the existing phraseological unit. Proverbs being phraseological units serve as a source of phraseological derivation, i.e. they give birth to new phraseological units. The number of the phraseological units formed from proverbs is rather large. We can prove our theory with examples: formation of new phraseological units by means of isolation of the final components of the proverb: “a silver lining” from the proverb “every cloud has a silver lining”; “wait for dead men's shoes” from the proverb “he goes long barefoot who waits for dead men's shoes”; “stand on one's own” from the proverb “every tub must stand on its own bottom”.

ABSTRACT

This article is devoted to the problem of combatting against corruption in activities of customs authorities, which emphasizes the need of consideration of social, psychological and occupational factors in prevention of corruption.

KEYWORDS: *Democratic Reforms, Corruption, Corrupt Behavior, Socio-Psychological Factors, Professional Ethics, Social Phenomenon, Corrupt Situation, Corrupt Mind And Worldview, Non-Corrupt Culture.*

INTRODUCTION

In the context of further deepening of democratic reforms in our country, combatting against corruption is one of the most pressing issues. However, true justice, honesty and legitimacy must prevail in all areas of building a strong civil society. Corruption, on the other hand, undermines the economic and administrative system of any state.

It is no coincidence that the President of Uzbekistan Sh. Mirziyoyev in his Address to the Oliy Majlis said: "...we cannot achieve the lofty goals we have set for ourselves unless all members of our society get vaccinated with the "honesty vaccine". We must move to prevent the consequences of corruption at an early stage." [1]

Customs is an integral part of the country's economic security system. The presence of corruption in the customs authorities primarily affects the economic situation of the state, as the replenishment of the country's budget depends on the extent to which the fiscal functions of the customs are fully fulfilled. Therefore, the issue of combating corruption is also a very important issue in the activities of national customs authorities.

At present, the customs authorities of Uzbekistan are actively working in the field of combating corruption in accordance with national and international law. In particular, Uzbekistan has joined the World Customs Organization's Arush Declaration, the UN Convention against Corruption and the Istanbul Action Plan.

In June 2003, the 101st Session of the Customs Cooperation Council of the World Customs Organization adopted an updated version of the Arush Declaration. It develops recommendations on anti-corruption measures and strategies for the customs administrations of the countries. According to this document, the practical basis of national customs programs should be as follows:

1. Leadership and commitment;
2. Actions based on the law;
3. Transparency;
4. Automation;
5. Reforms and modernization;
6. Inspections and inquiries;
7. Code of Ethics;
8. Personnel management;
9. Ethics and organizational culture;
10. Relations with the private sector.

According to the updated Arush Declaration, the main responsibility for preventing and combating corruption in the customs system should rest with the head of the Customs Administration and the executive management. It was also emphasized that the fight against corruption should be carried out at a high level and on a regular basis for a long time. [2]

Therefore, national and international law pays special attention to combating this problem, increasing the professional responsibility of civil servants and officials, the inevitability of punishment for corruption offenses, and creates a solid legal basis for criminal prosecution of such offenses.

However, corruption-related crimes are still being committed by government officials and law enforcement officials, and it is being transformed into other forms of corruption. So, we need to pay more attention to this issue. Clearly, corruption is a complex and multifaceted social phenomenon that is systematically organized and includes economic, legal, social, moral, psychological, and political factors.[3]

Therefore, the study of the causes and conditions that allow it to be based not only on legal mechanisms, but also on social, moral and psychological approaches - is becoming a requirement of our time.

It should be noted that in addition to increasing the effectiveness of operational and investigative measures to prevent and fight with corruption in customs authorities, there is a need for comprehensive and consistent research.

In this regard, it should be noted that in addressing the above issues, special attention is paid to research issues in the Law of the Republic of Uzbekistan "On Combating Corruption", adopted on January 3, 2017.

In particular, conducting research on anti-corruption issues, developing scientific methods and recommendations, their rational implementation, forecasting and scientific analysis of the effectiveness of forms and methods used in combating corruption, as well as government support for research in this area and incentives are guaranteed by this Law. [4]

In addition, in the State Program on Combating Corruption for 2019-2020, approved by the Decree of the President of the Republic of Uzbekistan dated May 27, 2019 No PF-5729 "On measures to further improve the anti-corruption system in the Republic of Uzbekistan" the attraction of grants for anti-corruption research is also provided for researchers of educational and research institutions.

The task to conduct social, scientific and other research on the state of corruption in the customs system, its scale, dynamics and trends, as well as the effectiveness of public policy in this area is set in chapter 5, paragraph 20 of the Action Plan of the State Customs Committee of the Republic of Uzbekistan dated August 8, 2019 "On raising the legal awareness and legal culture of the population and customs officers of the State Customs Committee, the formation of an intolerant attitude to corruption in the system".

Within the framework of practical innovative research, the causes of corruption offenses in the customs authorities will be thoroughly studied, scientifically analyzed; proposals and recommendations for the prevention of corruption will be developed.

In addition to economic factors, social, psychological and moral factors influence the occurrence and increase of corruption. Among them, we can pay special attention to factors related to the characteristics and conditions of service activities, behavior, character of employees, personal views on economic security, social thinking, as well as the current state of organizational and social control over service activities.

How important is it to take into account the socio-psychological aspects of corruption? To answer this question, it is important to analyze the cases of corruption in customs practice not only from a legal point of view, but also in a comprehensive way.

At the heart of the socio-psychological nature of corruption are immoral views and criminal acts that undermine the idea of an "honest society" in minds of mankind and undermine high moral values. Because the sole purpose of corruption is to satisfy the material interests of an official in any illegal way: through bribery or some other form of informal incentive.

There are many forms of corruption: bribery, robbery, favoritism, nepotism (for example, preference for relatives, acquaintances and friends rather than professional qualities in

employment), protectionism, lobbying (corruption is a manifestation of private interests over public interests), public resources and illegal distribution or redistribution of funds, misappropriation of state and public funds and property for personal gain, illegal privatization, provision of illegal services relying on acquaintances, etc.

Socio-psychological characteristics of a customs officer as a person play an important role in the abuse of official powers in pursuit of material interests and prevention of corruption. Such descriptions include negative moral qualities such as lust, greed, envy, careerism, impurity, repentance, and putting the interests associated with the pursuit of one's material goals above legitimacy. The presence of these qualities in a person means that he has a low level of non-corruption stagnation and tends to create corrupt situations by his own actions. From a psychological point of view, a person prone to committing corruption crimes is called a "corrupt" person, and in sociology his illegal actions are interpreted as a manifestation of deviant behavior, and in the nature of usual bribe-offender social defects can be found.

Psychological aspects of the phenomenon of corruption include:

- Psychology of corrupt behavior (bribe taker);
- Psychology of corrupt minds and worldviews, ie bribe-takers;
- Psychology of public opinion and attitudes towards corruption and its various manifestations;
- Socio-psychological factors, causes and conditions affecting corruption.[5]

The following factors may contribute to the above-mentioned defects in the personality of a customs officer as a civil servant:

- the employee's intention to use his / her official activities in the interests of selfish interests;
- the presence of employees who have achieved high economic well-being through illegal and criminal activities in the workforce;
- high economic security and a person's spiritual desire to live a luxurious life;
- not to feel remorse from the illegal acquisition of material wealth due to the weakness of spiritual and moral education or natural inclination;
- increased interest in expensive things and the habit of owning them;
- accustomed to the large expenses incurred for the material well-being of himself and his family, and desire to cover these expenses through bribery, misappropriation of state budget funds and other illegal income;
- dissatisfaction with the salary paid for the service, underestimation and miscalculation of expenses;
- not paying attention to savings or not knowing how to save, etc.

Ultimately, corruption undermines the values underlying the democratic political-administrative system, the harmony of state, society and human interests inherent in civil society, equality and freedom of citizens, transparency of political governance and public confidence in society.

Anti-corruption issues also play an important role in the personnel policy of the customs service. At the same time, great attention is paid to the moral qualities of candidates and current employees of the customs service, loyalty to their profession, quality and responsible performance of official duties, honesty of officials in the system, constant preventive measures to prevent corruption.

An analytical study of various factors related to the phenomenon of corruption revealed a number of conclusions:

- In our country, the fight against corruption in all spheres of governance, including the customs system, is being carried out on the basis of a comprehensive plan of targeted and concrete measures. However, corruption crimes, which cause great damage to the country's economic well-being, are still being committed.
- In order to effectively combat with corruption, it is necessary to know the nature of corruption. It is expedient not only to study corruption as an economic and legal category, but also to conduct a comprehensive interdisciplinary study on it.

The following proposals and recommendations for combating and preventing corruption in the customs service should be considered based on these findings:

It is necessary to comprehensively study the situation with the fight against corruption in the territorial departments of the State Customs Committee of the Republic of Uzbekistan. To do this, along with theoretical approaches, practical and experimental research have to be conducted, the results should be applied into the practice of customs authorities and its effectiveness should be monitored;

To pay special attention to the development of sociological and psychological scientific methods (questionnaires, trainings, test kits, analytical documents) on the prevention of corruption and crime, ethical skills related to the professional culture of the customs officer;

Along with the economic and legal measures taken in combatting against corruption, it is necessary to consider the individual-psychological and socio-psychological factors that contribute to corrupt behavior;

Formation of administrative-preventive mechanisms of combating corruption and taking into account psychological factors in their application in practice;

Developing clear socio-psychological and ethical standards in the formation of non-corrupt behavior among customs officers and increase the efficiency of this process;

To study the socio-psychological and moral phenomenon of corruption, as well as the formation of a system of non-corrupt culture and values among customs officials and participants in foreign economic activity;

Developing socio-psychological and ethical standards not only in the recruitment of personnel to the customs authorities, but also in diagnosing a person's propensity to corruption during his permanent service and, conversely, in determining the level of non-corrupt behavior and culture.

In order to carry out this practical research in a comprehensive manner, it is advisable to create automated programs of questionnaires, interviews, tests, experiments and indicators that determine the socio-psychological and professional-ethical aspects.

Based on the above conclusions, it should be noted that the following factors can prevent a customs officer of taking a bribe:

- High moral qualities and social responsibility of the customs officer, including personal intolerance of corruption;
- High and decent salary for a customs officer;
- Satisfaction with the benefits and social guarantees in the system (free medical care, free housing or affordable housing on a soft loan);
- Availability of a system of financial assistance and bonuses in addition to the basic salary;
- A sense of the inevitability of punishment for corruption, refraining from criminal prosecution and fear of punishment;
- The value of the position and profession, fear of losing a job and being fired;
- The fear that the customs officer will tarnish the reputation of himself, his colleagues and family members due to corruption.

The customs officer should have a high legal mind and legal culture.[6]

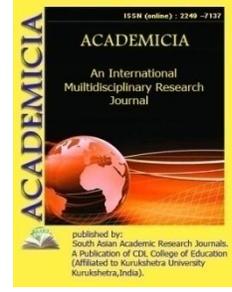

Moreover, the application of measures proposed in our analysis can not only increase the effectiveness of the anti-corruption strategy, but also help to combat it as firmly and systematically as possible.

PATANJALI YOGA SUTRAS AND ADOPTION PATTERNS

Dr. Anjana Lohan*

*Associate Professor,
 Head, Deptt. of Physical Education,
 S.D. Mahila Mahavidyalay, Narwana (Jind), INDIA

ABSTRACT

In many ways, the Yoga Sutras complement the Samkhya-notions of purusha and prakriti that underlie them. It shares certain vocabulary with Buddhism, with which it has a strong relationship. When compared to the Bhakti ritualism and Bhakti traditions that predominated at the time in India, Samkhya and Yoga may be considered distinct expressions of the same wide lineage of ascetic traditions. This is in contrast to the popular Vedic ritualism that predominated at the time. Most people know the Yoga Sutras as the text that introduced the concept of ashtanga, an eight-part practise culminating in samadhi, or the concentration of the mind on a meditational object. These practises include abstaining from certain foods, observing certain rules, practising yoga postures, controlling one's breath, and withdrawing one's senses (absorption). Purusha, the witness-conscious, is to be discerned as distinct from the cognitive apparatus (prakriti), and the defilements of prakriti are to be untangled. This collection of Patanjali's Yoga Sutras is made up of 195 (according to Vedas and Krishnamacharya) and 196 (according to Patanjali) aphorisms on yoga's theory and practise (according to other scholars including BKS Iyengar). Patanjali, an Indian sage who integrated and structured yoga knowledge from far earlier traditions, wrote the Yoga Sutras in the first century CE.

KEYWORDS: *Patanjali, Patanjali and Yoga, Patanjali and Sutras*

INTRODUCTION

The Yoga Sutras of Patanjali are revered in the modern Yoga tradition as a key book in the development of traditional Yoga philosophy. While many people believe the Yoga Sutras were appropriated, misappropriated, or both, David Gordon White argues that the text was lost for nearly 700 years between the 12th and 19th centuries before making a comeback around 1900

thanks to efforts by Swami Vivekananda and others, including members of the Theosophical Society. The 20th century saw it rise to classic status.

The authorship of the famous book on Sanskrit grammar known as Mahbhya, which is firmly dated to the second century BC, has been attributed to an author by the name of Patajali. As Louis Renou pointed out long ago, the two works are diametrically opposed in terms of subject matter and linguistic minutiae (such use of tenses and prepositions). Aside from Bhoja (the 11th century), no other document indicates that the writers were related.

In his study of Patajali's Ptajalayogastra, Philipp A. Maas determined that it was written around 400 CE, using synchronisms between Patajali's arguments and Vasubandhu's, as well as the history of the commentaries on it published in the first millennium CE, as well as the opinions of earlier Sanskrit commentators, manuscript colophons, and a review of the existing literature.

For the Ptajalayogastra, Woods made the date suggestion as early as 1914. Since then, historians of the history of Indian philosophical thought have generally agreed with Woods. In contrast, Edwin Bryant's translation of the Yoga Stras drew on the work of prominent commentators.

Figure 1 : Patañjali Statue (traditional form indicating kundalini or incarnation of Shesha)

Most academics date the book to the first or second century CE, although it has been dated as far back as many centuries before that, according to one expert. Consequently, Bryant came at the following conclusion: "However, a number of researchers have suggested that the Yoga Stras date from the fourth or fifth century CE. All of these justifications [for a later start date] are flawed."

Various dates have been ascribed to Yogasutra, spanning from 500 BCE to the 3rd century CE, with Michele Desmarais summarising the lack of evidence for any confidence about the dates. According to her, the book may have been produced at an earlier period because of the many hypotheses about when it was written, although academics generally accept the more recent dates.

"Eight limb yoga" (aga yoga) and action yoga, according to Feuerstein, are condensed in the Yoga Sutras (Kriya yoga). Sutras 1–27, chapter 3 except for sutra 54, and chapter 4 include the kriya yoga portion. In Chapter 2 Sutras 28–55, as well as Sutras 3 and 54 in Chapter 3, "eight limb yoga" may be found.

For example, according to Larson, there are many similarities between the ancient Samkhya, Yoga, and Abhidharma schools of thought, especially between the 2nd and 1st centuries CE. The Yoga Sutras of Patanjali may represent a synthesis of these three schools of thought. Its philosophical rationalism and its three epistemic techniques for obtaining trustworthy knowledge come from Hinduism's Samkhya school, which Yoga Sutras adopts. This "reflective discernment" (adhyavasaya) includes prakrti and purusa (dualism). According to Larson, the Yoga Sutras borrow the Buddhist concept of nirodhasamadhi from Abhidharma. Unlike Buddhism, which holds that there is no such thing as a "self" or "soul," Yoga, on the other hand, is physicalist and realist, like Samkhya. In addition to the yoga concepts found in writings dating back to the 1st century BCE, such as the Katha Upanishad, the Shvetashvatara Upanishad, and the Maitri Upanishad, Yoga Sutras incorporates the old ascetic traditions of seclusion, meditation, and introspection into its philosophy.

When it came time to write the Ptahjalayogastra, Patanjali drew on a variety of sources, including yoga from the Vedic and Jain traditions. Contributed his own explanation sections to the united work, which has been regarded the work of two individuals since 1100 CE. Ptajalayogastra is the collective name for Patanjali's sutras and Vyasabhasya's work.

According to Bryant, the goal of yoga is to free oneself from suffering via discriminative insight. To achieve "discriminative discernment," one must "uncouple purua from any connection with prakti and from all engagement with the citta." Ultimately, Patanjali says that the essence of yoga-practice is "meditative techniques that culminate in attainment of a condition where awareness is oblivious of any other object, that is solely aware of its own nature as consciousness unmixed with any other object," according to Bryant.

If you believe in the Samkhya school, knowledge alone will get you to moksha, but Patanjali believes that knowledge coupled with personal experimentation, along with the Samkhya school's approach to knowledge, will get you there.

Avidya, or ignorance, is the root of the five kleshas, which are responsible for suffering and sasa, according to Patanjali's teachings. This website's first page: Liberation, like many other schools, focuses on eradicating ignorance via critical thinking, in-depth study, and self-reflection. In the Yoga system, the treatise on how to do this is known as the Yoga Stras. This website's first page: In the opinion of Yoga academics, samdhi is the condition in which ecstatic consciousness develops, and it is from here that a person begins to become aware of Purusa and their real self, or It goes on to say that if a person achieves this state of consciousness, they will always be aware; this is known as moksha, or liberation, in Hinduism. This website's first page:

Patanjali devotes Book 3 of his Yogasutra to yoga's soteriological elements. According to Patanjali, in order to achieve self-awareness, independence, and liberation, one must practise all eight limbs of yoga. It is referred to as "discerning principle" and mastery of citta and "self-knowledge" in verse III.4 to III.5 when speaking about the last three limbs of yoga, which he names samyama in verses III.4 to III.5. Yogasutras III.12 states that this discriminating principle enables one to develop sant (tranquilly) and udita (reason) in one's mind and soul via intentness.

Eventually, one's capacity to distinguish between sabs (word), as well as the meaning and understanding they convey, would allow them to compassionately perceive the cries and utterances of all living things. This is called pratyaya (understanding). Having reached this condition, the yoga practitioner will have extraordinary abilities, intuition, and self-knowledge. They will also have more freedom and achieve kaivalya, their redemptive aim.

Epistemology

It is similar to the Smkhya school of Indian philosophy in that Patanjali's Yoga method uses three of the six Pramanas to acquire trustworthy knowledge. These were Pratyaka (perception), Anuma (inference), and Sabda (ptavacana, trustworthy sources' words/testimony). This school, along with the Samkhya school, believes that only the direct sensory experience of reality, inference, and the verbal testimony of the sages or shstras are acceptable methods of gaining knowledge or Praman, as Patanjali's philosophy does.

For example, unlike Advaita Vedanta, Yoga did not adhere to the three Pramanas of Upamaa, Arthpatti, or Anupalabdi ("non-perception, negative/cognitive evidence"), which are often found in Hinduism.

Some scholars have dubbed Patanjali's "personal, but basically passive, deity" or "personal god" in contrast to the Samkhya system, which is non-theistic/atheistic (Ishvara). Yoga school is referred to as "Samkya school with God" by Hindu intellectuals including the 8th-century Adi Sankara and many contemporary academics.

One may find the word Isvara in 11 different places in Patanjali's Yogasutras, from verses 23 to 29 as well as verses 1 and 2 of chapter 2. Hindu academics have discussed and remarked on who or what Isvara is ever since the publication of the Sutra? Commentaries on the Hindu scriptures have defined Isvara as anything from a "personal deity" to a "unique self." When it comes to yoga philosophy, Whicher says that although Patanjali's short lines may be understood both as religious and as nonreligious, the idea of Isvara in Patanjali's work serves as a "transformative catalyst or guide for helping the yogin on the road to spiritual liberation.". Isvara, the transcendental spirit, is unlike the yogin's purusa (real self), which is tethered to his material body and susceptible to the effects of karma and kleshas.

The verse 24, Patanjali describes Isvara (Sanskrit:) as "a unique Self/Spirit." *See also: *Note 3* As a result of this sutra, Isvara now has the characteristics of a unique Self/Spirit that is unaffected (aparamrsta) by one's obstacles/hardship (klesha), circumstances created by one's past or present actions (karma), and one's life's fruits (vipâka) as well as psychological disposition/intentions (ashaya).

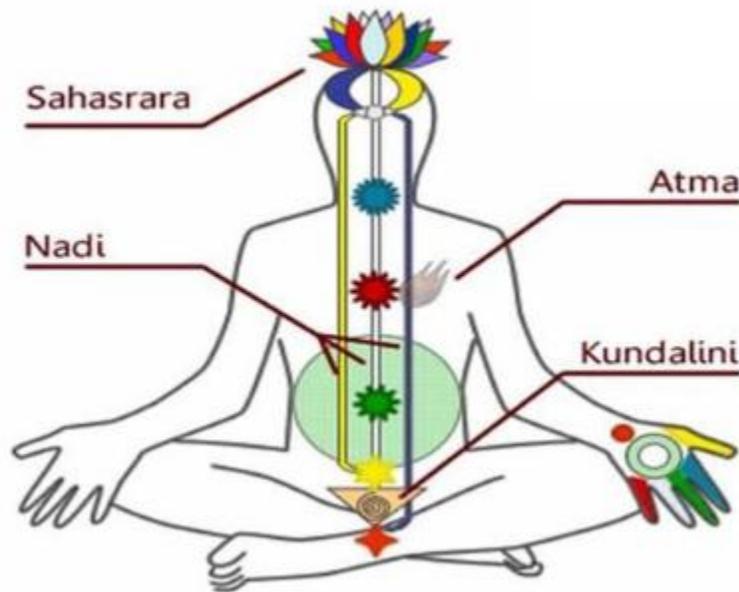

Figure 2 : Yoga Sutra of Patanjali

Historical and philosophical context

Samyama - the route to Kaivalya in the Yoga system – is the culmination of Dharana, Dhyana, and Samadhi. Yoga is a major topic of discussion (philosophy). The Yoga Sutras drew on a wide range of Indian intellectual traditions of the time to synthesise their ideas. Zimmer claims that Samkhya and Yoga are two of many philosophical systems that have their origins in India's pre-Aryan civilizations and customs. For those who don't know, For those keeping track (see footnote 5), In contrast to Bhakti and Vedic ritualism, which were also popular in ancient India, the traditional Hindu philosophies of Samkhya, Yoga, Vedanta, and the nontraditional Nastika systems of Jainism and Buddhism may all be viewed as reflecting one stream of spiritual activity. The Jnana marga, Bhakti marga, and Karma marga of the Bhagavad Gita correspond to the Vedanta-Sramana traditions, iconolatry, and Vedic rites, respectively.

Samkhya

According to the Yoga Sutras, Samkhya philosophy is used as a basis for Yoga, and Samkhya is the theory. There is a strong presence of Samkhya in the Sutras to the point that historian Surendranath Dasgupta refused to classify Patanjali's theory as such, instead naming it Patanjala Samkhya, in line with the Jain writer Haribhadra's commentary on Yoga, which referred to it as such. There are twenty-five tattvas or principles accepted by Patanjali's Yoga Sutras, one of which is Purusha, meaning Self or consciousness, the others being Prakriti (primal nature), Buddhi (intellect or will), Ahamkara (ego), Manas, five sensory capabilities, five action capabilities, and ten elements, according to the Samkhya school of philosophy. The Sadhana, the second section of the Sutras, also presents the Samkhya views on all observed action within the Sattva, Rajas, and Tamas Gunas (lethargy).

Sutra 1.23 - "Ivara pranidhnt v" is an example of how the Yoga Sutras deviate from early Samkhya in that it adds the principle of Isvara, or God, and this is taken as meaning that submission to God is one path to freedom.

"A separate Consciousness, unaffected by sufferings, deeds, fruitions or their residue," is how one definition of Isvara describes the concept. Yoga's ultimate aim is achieved via devotion to Isvara, symbolised by the esoteric word Om, as described in the sutras. There are many references to this sacred sound throughout Hinduism's Upanishads, beginning with the Chandogya and Brihadaranyaka Upanishads of ancient India and continuing through the Mandukya Upanishad of modern India.

While Samkhya believes that knowledge is the path to enlightenment, Patanjali's Yoga focuses on concentration and active effort as the way to enlightenment. As opposed to Samkhya's view, Yoga's goal is to liberate the person from the grips of matter, and it believes intellectual knowledge to be insufficient for this.

When Isvara was added to Patanjali's philosophy, the fundamental parallels between the two philosophies persisted. Max Müller noted that the two systems were referred to in common parlance as Samkhya with and Samkhya without the Lord.

One of Hinduism's most revered texts, the Bhagavad Gita, is said to be founded on the Samkhya-Yoga philosophy. Patanjali's Yoga Stras are a cornerstone of Hinduism's Yoga system of thought.

Buddhism

According to many scholars, Patanjali's Yoga Sutras and Buddhist scriptures have a complex connection. Karel Werner says in his article, "Without Buddhism, Patanjali's philosophy would not have existed. There is a lot in the Yoga Sutras' language that harkens back to Buddhist formulations from the Pali Canon, particularly the Sarvastivada Abhidharma and the Sautrantika school of Indian philosophy." Patanjali's Yoga sutras are more detailed and describe the real method of Yoga processes more precisely than the Buddhist explanation, according to him. Patanjali. Werner, on the other hand, claims "Despite the fact that he openly drew on the experiences he had previously acquired from different Yoga instructors of his day, the Buddha was the system's originator. Patanjali isn't a new movement's creator or leader; he's just a follower. ... The genius of Patanjali's accomplishment resides in the thoroughness and completeness with which all of the essential phases of Yoga practise and mental experiences are incorporated in his plan, and in their methodical presentation in a concise work." The Yogasutra's emphasis on "Self, Soul" and the presence of "no Self" differs from Buddhism's "no Self" precepts, according to Werner.

Jainism

The Yoga Sutras of Patanjali's five yamas, or restrictions, show an eerie similarity to Jainism's five main vows, suggesting Jainism's influence. Yoga also incorporates three other Jain teachings: the doctrine of "colours" in karma (lesya); the Telos of isolation (kevala in Jainism and Kaivalyam in Yoga); and the practise of nonviolence (ahimsa), though ahimsa first appeared in Hindu texts known as the Upanishads (the Chndogya Upaniad, dating to the 8th or 7th century BCE, has the earliest mention of the (a code of conduct). Violence against "all things" (sarvabhuta) is prohibited under Ahimsa, and those who follow it are considered to be liberated

from the cycle of rebirth and metempsychosis (CU 8.15.1). As one of the five fundamental qualities, Ahimsa is also mentioned.]

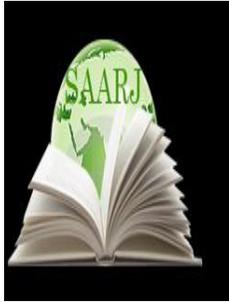

CONCLUSION

The Yoga Sutras of Patanjali are revered in the modern Yoga tradition as a key book in the development of traditional Yoga philosophy. However, David Gordon White has questioned the use and misuse of the Yoga Sutras, as well as their influence on later systematizations of yoga, arguing that the text was largely forgotten for nearly 700 years between the 12th and the 19th centuries before making a comeback in the late 19th century thanks to Swami Vivekananda and the Theosophical Society. The 20th century saw it rise to classic status. James Mallinson emphasised its importance. Prior to the 20th century, the mediaeval Indian yoga scene was dominated by other texts such as the Bhagavad Gita and the Yoga Vasistha, as well as literature on hatha yoga, tantric yoga, and Pashupata Shaivism rather than Patanjali's Yoga Sutras. These texts are attributed to Yajñavalkya and Hiranyagarbha. The Mahabharata's Mokadharma section has many references to yoga. Those who follow the Jaina religion do yoga according to their own set of scriptures, whereas Buddhists practise yoga according to pre-Patanjali sources. Between the ninth and sixteenth centuries, several important comments on the Yoga Sutras were written. There were few comments on Patanjali's Yoga theory after the twelfth century, when the school began to wane. Patanjali's Yoga theory had all but vanished by the fifteenth century. Few people had studied the Yoga Sutras, and it was seldom taught. As a result, the original manuscript was no longer copied. "miraculously restored" by Swami Vivekananda after being neglected for seven centuries, according to David Gordon White, the popularity of the Yoga Sutras is new. The Yoga Sutras first piqued Westerners' attention when they were rediscovered by a British Orientalist in the early 1800s. Swami Vivekananda, following Helena Blavatsky, president of the Theosophical Society, saw the practise of yoga according to the Yoga Sutras as a science and the "supreme meditative route to self-realization." This sparked widespread interest in the 19th century. According to White, "Big Yoga – the corporate yoga subculture" has made it a well-known book in the West.

ABSTRACT

The aim of this essay is a thorough examination of Fifth Generation mobile communication technology. Current technological effort is connected with Fifth Generation technology in mobile communication. Fifth Generation research involves developing the World Wide Web, the Dynamic Ad-hoc Wireless Networks, and Real Wireless Communications. Research has been done throughout the years. 802.11 wireless local area networks and 802.16 Wireless metropolitan area networks, ad-hoc wireless network people area networks, and Wireless digital communications networks are the most important technologies for Fifth Generation technologies. Fourth Generation technology will cover a variety of standards in a shared Third Generation similar environment with IEEE 802.xx integrated mobile wireless network from the outset. The primary input of this article are the key provisions of mobile communication technology of Fifth Generation. Mobile consumers have put greatest focus in Fifth Generation technology compared to others. Fifth Generation Technology represents mobile technology for the fifth generation. Fifth Generation technology is intended to make extremely high bandwidth utilization of mobile phones. The consumer never has the greatest technology of value as Fifth Generation. Fifth Generation technologies include all sorts of state-of-the-art features, making Fifth Generation technology the leader in the near future.

KEYWORDS: *Fifth Generation Mobile, Fifth Generation Technology, Architecture, Mobile Terminal, Wireless Networks.*

INTRODUCTION

Over the past several years, mobile and wireless networks have evolved significantly. Many mobile phones now include a Wi-Fi adapter as well. It may be expected that, in addition to their Third Generation, Second Generation, WLAN, and Bluetooth and so on, many mobile phones also include wax adapters. For both generations, we have expanded the study of integration with IP 2.5 Generation and the Third Generation Public Land Mobile Networks on the one hand and WLAN on the other. With respect to Fourth Generation, its goal is to integrate mobile phone network like GSM and Third Generation perfectly. Multi-mode consumer terminals are regarded to be Fourth Generation, although extra security measures and compatibility for specific wireless technologies continue to be a problem. However, integration across different wireless networks is still being done today in reality. Although multiple wireless networks from a single terminal are used, distinct wireless access techniques are not used for the same session. The anticipated OWA is intended to provide open baseband processing modules with open interface settings. The OWA is connected to future (Fourth Generation) mobile MAC/PHY layers. The Fifth Generation terminals have radio software and modulation techniques developed, and the Internet may download new error control systems. The improvement is seen as a focus on Fifth Generation mobile networks in consumer terminals. The Fifth Generation mobile terminals will concurrently have access to multiple wireless technologies. Special flows from various technologies should be integrated with the Fifth Generation mobile terminal. The network is trustworthy for user mobility management. The Fifth Generation terminal is the final option for a particular service by different mobile network access providers. The article offers the idea of a smart Internet telephone that mobile phones can prefer (see Fig. 1)[1].

Fig.1: What Is 5G Technology And How Must Businesses Prepare For It?

Challenges in Migration from Fourth Generation:

- With Fourth Generation, a single user terminal will have to be built to operate over multiple wireless networks and solve design challenges such as device size limitations, cost and power consumption. The radio technique can solve this issue.
- The unique characteristics and functions of each wireless system. The finest technology to select for a specific service at a certain place at a given time. This will be done by choosing the customer quality of service requirements according to the best possible fit.
- Reconfigurable, adaptable and lightweight protective methods should be developed.
- Integrating the existing non-IP and IP-based systems and delivering QoS guarantee for end-to-end services that involve various systems is a problem.
- It is challenging to collect, manage and aggregate the Consumers' account information from numerous service providers. In the same manner Consumers' billing is also a tough job.
- Software programs which will provide a new function to the customer but will start new problems.
- Spoofing involves false GPS signals being sent out, in which case the GPS receiver thinks that the signals comes from a satellite and computes the incorrect coordinates. Criminals may make advantage of such methods. Jamming happens when a transmitter putting out signals at the same frequency shifts a GPS signal.
- If a GPS receiver will connect with the main transmitter then the communication link between these two is not difficult to break and customer must utilize encrypted data.

Theoretical Framework:

- Fifth Generation Technology is a phrase for the next most important step in mobile communications standards beyond Fourth Generation standards used in various research papers and projects. Fifth Generation is presently not an official term used for any specific criteria. 3GPP version beyond Fourth Generation and LTE[2].

LITERATURE SURVEY

T. Janevski stated in the paper that with the 2.5 generation of mobile cellular networks, integration of mobile networks with the Internet has started. Today, internet traffic is globally dominant. For the development of future wireless networks, the need for higher data rates for data traffic and new IP-based services is essential. Even Third Generation with up to 2 Mbit/s could not provide data speeds used by Internet users utilizing fixed broadband or wired local area networks. In this situation, data rates were not provided. Wireless LAN was the solution to provide faster speeds in the wireless network, but was originally developed to extend the wired wireless LAN to the wireless domain. We propose a method for interoperability between the mobile cellular network and the WLAN in this post. This is a solution. Authentication, authorization, and accounts, i.e. AAA, for the integration of the two networks, cellular and WLAN, are carried out. For this goal, we have developed a Wi-Fi access controller and a Wi-Fi AAA gateway to provide gateway access control, charging and accounting capabilities for the Wi-Fi service. We have evaluated the current state of development of all network entities and

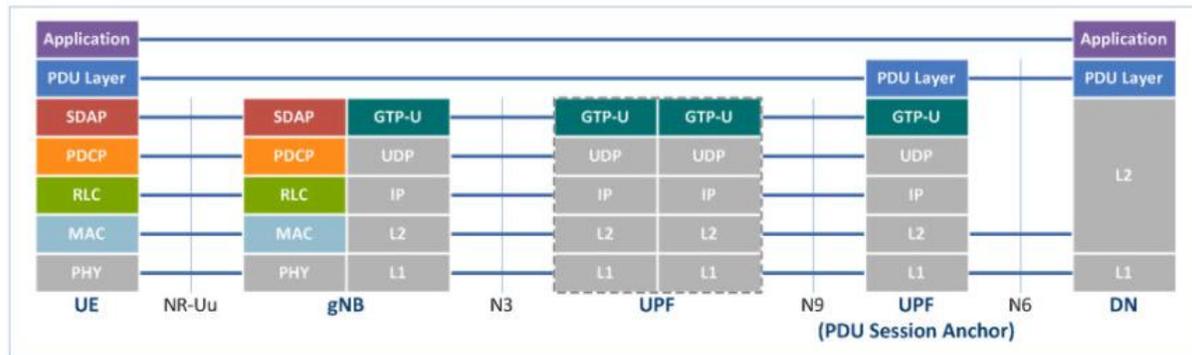

protocols required for the expansion of these components. The solution is an inexpensive and simple to use PLMN-WLAN Internetworking scenario[3].

J. McNair et al. stated in the paper that revolutionary Fourth Generation drivers include push-through seamless personal and end-station mobility towards ubiquitous wireless access and all-round computing. The creation of a vertical handoff protocol for users traveling between various kinds of networks is one of the major challenges for seamless mobility. Habits, policy metrics and radio link transfer processes historically used handoff detection policies cannot adapt or respond to changing user inputs and network accessibilities to dynamic handoff criteria. They cannot offer context-conscious services or provide interoperability for network operations. New methods are thus required to manage user mobility among different kinds of networks. This article provides a tutorial on design and vertical handoff performance issues in an envisioned fourth-generation multi-network system. Various Third Generation and beyond network topologies, such as wireless LANs, cellular, satellite and Mobile IPs are explored. In a diverse network context, the issue of vertical handoff is then explained. Finally, research efforts are being explored to solve remaining difficulties, including new methods for dynamic decision-making and algorithm identification and contextual transmission of radio connections[4].

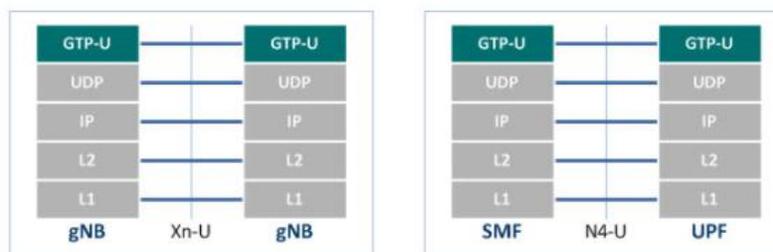

W. Lu presented in the article that this article presents a mobile terminal open-label wireless architecture, which concentrates on an open baseband processing platform, which supports various existing and future wireless communication standards by multi-dimensional open baseband processing modules and baseband management systems. The article provides a multi-layered open architecture platform for system flexibility to optimize and minimize terminal power consumption so that wireless and mobile terminal communication systems are integrated and convergent next-generation. For full openness and simplicity, the OWA platform is fully compatible with computer architecture and interface rather than system architecture based on transmission[5].

M. R. Bhalla et al. stated in the article wireless communication is the distant transfer of information without requiring upgraded electric conductors or cables. The distance may be a few of meters as on TV or millions of kilometers for radio communications) (thousands or millions of kilometers for radio communications. The term is usually shortened to 'wireless' when the context is clear. It comprises various types of two-way, fixed, mobile and mobile radio, cellular telephones, PDAs, and wireless networking. In this essay, we will highlight the history and development of mobile technology in consecutive generations and their significance and benefits across the globe. Mobile wireless technologies have experienced the technical revolution and development of 4 to 5 generations over the last several decades. Mobile wireless research is currently focused on improving Fourth Generation technology and Fifth Generation technology deployment. Fifth Generation term is not presently used officially. Fifth Generation research is being conducted on the development of the WWW, the Adhoc Wireless Networks Dynamics and the WWW[6].

DISCUSSION

PDU Layer: IP, Ethernet, etc.

DN : Data Network
 gNB : Next generation NodeB
 GTP-U : GPRS Tunneling Protocol User plane
 MAC : Medium Access Control
 PDCP : Packet Data Convergence Protocol
 PDU : Protocol Data Unit

RLC : Radio Link Control
 SDAP : Service Data Adaptation Protocol
 SMF : Session Management Function
 UE : User Equipment
 UPF : User Plane Function
 Xn-U : Xn User plane

Fig. 2: Concept of Fifth Generation Technology explaining protocol stack for Fifth Generation.

Fig. 2 establishes the wireless technology and the layers for physical and media access control, i.e. OSI Layers 1 and OSI Layers 2. The Fifth Generation mobile networks are presumably based on open wireless architecture for these two tiers.

The network layer will be IP, since there is no competition at that level currently. The worldwide IPv4 has many problems including limited address space, and no significant QoS support per flow. These issues are addressed with IPv6, but are exchanged with a considerably bigger packet header. Mobility is still a problem. The Mobile IP standard is available on one side as are different choices for small mobility. The mobile IP is used for all mobile networks at Fifth Generation, each mobile terminal being FA (foreign agent) and keeping the Care Of Address mapping (CoA) for the current wireless network between its fixed IPv6 and CoA Address. However, multiple mobile or wireless networks may concurrently be linked to a cellphone. In this case, separate IP addresses will be kept on each radio interface while the IP addresses of the FA installed on the mobile phone will be each CoA. Fifth Generation phone makers will incorporate the fixed IPv6 on the mobile phone. The Fifth Generation mobile telephone features a multi-wireless virtual network environment. The network layer should be split into two sublayers of Fifth Generation mobile devices for this purpose i.e. the lower network layer (for each interface) and the higher network layer (for the mobile terminal) (for the mobile terminal).

This is because the Internet was originally created and the entire routing is reliant on the IP addresses which in every IP network worldwide should be distinct. The Upper-Level-Network (Fig. 2) intermediary program must maintain the Upper Network Address Translation (IPv6) into different Lower Network IP Addresses (IPv4 or IPv6), and vice.

Mobile and wireless networks vary in terms of transport layer from wired networks. In all TCP versions it is believed that lost segments are the consequence of network connectivity, but in the event of network wireless losses due of higher radio interface bit error. TCP modifications and adaptations for mobile and wireless networks are thus suggested, which broadcast the missing or impacted TCP segments exclusively through the wireless channel. Mobile terminals for Fifth Generation are suitable for downloading and installing transport layers. The versions of those mobiles (e.g. the TCP, RTP and so on or the New Transportation Protocol) that are targeted at a particular wireless technology installed at base stations should be accessible for the download. This is called the Open Protocol to Transport[7].

The last requirement from the Fifth Generation mobile terminal is that intelligent QoS management be given over a variety of networks with respect to the apps. Today, customers choose the wireless interface for their specific Internet service manually on mobile phones without utilizing QoS history in order to buy the finest wireless connection for a given service. Fifth Generation telephone provides the ability to evaluate service quality and store measurement information in mobile terminal information bases. The QoS parameters, such as delay, jitter, losses, bandwidth, dependability, are maintained in a Fifth Generation mobile phone data base to make the best wireless connection with the required QoS and personal cost constraints accessible through sophisticated algorithms that work in a mobile terminal. 4G will be able to offer a range of new services and models. For their interaction with Fourth Generation systems design, these services and models need to be further explored. By the time Fourth Generation is deployed, the process of IPv4 Address Extension should be completed. IPv6 support for Fourth Generation is thus needed to handle a large number of wireless devices. By increasing the IP number, IPv6 removes the need of Network Address translation. A wide variety of novel coding methods may be developed for Fourth Generation units and applications, which may assist with the deployment of the Fourth Generation network and services with available space and addressing bits in IPv6. The fourth generation seeks to fulfill PCC's goal - a vision that provides high data speeds in all wireless networks affordably. There must be minimal implementation complexity and an efficient negotiation mechanism between end-users and the wireless infrastructure in future wireless networks. For mobile wireless users, the Internet promotes the increase of data rates and speed access. This drives a development of the basic mobile IP network[8].

The Fifth Generation mobile phone design is being developed to respond to the QoS and price needs of upcoming applications such as wireless broadband access and MMS, video chat, mobile television, HDTV content, Digital Video Broadcasting (DVB), minimum voice and data services and other bandwidth services. Fifth Generation has the concept of delivering a sufficient RF, more bits/Hz and linking all heterogeneous wireless networks to provide the user with a smooth, consistent telecoms experience[9]. Packet Core Evolved is an IP based core network for LTE and other access technologies developed by the 3GPP (Telecom Standard). The aim of the EPC is to allow simpler access to various services, such as those offered by the IMS, across all IP core network topologies (IP Multimedia Subsystem). EPC is essentially a Mobility Management Entity (MME) and user datagram's agnostic access portal for routing. EPC will be a completely

new wireless operator architecture which will mimic the IP data communication world rather than the voice-centered wireless world. The IP network theory is based on flat IP. IP architecture is flat.

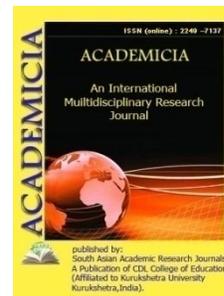

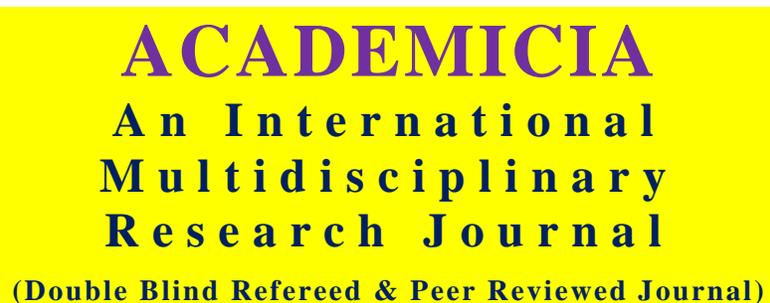

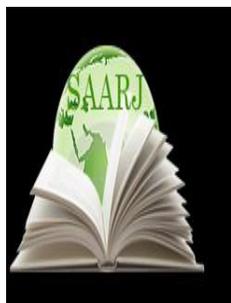

To this point, mobile networking for the circuit-changed voice has been developed. In order to aggregate, authenticate, control and steer conversations, wireless networks were hierarchically constructed. A BSC aggregates calls from multiple basic stations, allocates radio broadcasts, transfers from base stations to a more centralized mobile switching center. When the packet data networks were established the existing voice-centric architecture was overlaid, using the BSC to handle comparable mobility, the SGSN and GGSN were added for GSM/UMTS, and for CDMA, PDSN to route and manage the data and to connect to the Internet or correctly to the session. Due to the rapid growth in data traffic, this voice-centric architecture with too many network providers has grown noisy and difficult to manage. The flat network design eliminates the network's voice-centered structure. The independent and streamlined data architecture that removes many elements of the network chain may be used rather than overlaying a packet data core on a voice network. Both the BSC operations and the media gateway router are isolated. The base station interacts directly with a media gateway through WAN via the Third Generation Direct Tunnel Carrier Ethernet, MW, and DWDM etc. Certain duties of BSC/RNC, such as radio resource management, radio carrier control and resource dynamic distribution are performed on base stations, while features like paging messages distribution, security are handled in gateway routers by mobility managers. There are clear benefits to this approach. This will reduce Capex and Opex considerably, since there are little hopes and fewer network entities for the service provider. Data flows between endpoints faster by reducing the number of network hops, which substantially reduces network Latency to allow real-time applications like voice over IP, gaming and video-conferencing. WiMAX introduced flat IP designs, which will be flat by definition in future LTE networks[10].

CONCLUSION

We investigated Fifth Generation mobile communication technology in this research. The Fifth Generation technology is an open platform for various layers from the physical layer to the application. Presently, the present work is carried out in modules which provide one or more wireless technologies from one mobile Fifth Generation simultaneously the best operating system, with the lowest prices for a specified service. A new revolution in Fifth Generation technical development is scheduled to commence, because Fifth Generation technology will make it impossible to finish ordinary PCs and laptops that affect their market value. In the mobile communications industry, there are many advancements from First Generation, Second Generation, Third Generation, and Fourth Generation to Fifth Generation. The new Fifth Generation technology is put on the market at cheap costs, with high expectations, and excellent reliability. Fifth Generation mobile communications network technology will open up a new century. The Fifth Generation mobiles will have access to multiple wireless technologies at the same time, and various flows of different technologies may be combined between the terminals. For passionate mobile customers, Fifth Generation technology offers high-resolution options. Without any interruption, we may watch an HD TV channel on our mobile phones. A Tablet PC will be accessible on Fifth Generation mobile phones. There will be a lot of mobile technologies integrated.

ABSTRACT

The adolescent is serious because he believes what he's saying is true. As a result, every teacher and methodologist must pay close attention to this characteristic of adolescents and patiently cultivate a reading culture in them. The text is the main source not only for the study of the artistic features of the work, but also for the use of expressive, literary commentary or creative reading, comprehensive, comparative, problem-solving, research, non-traditional methods of analysis. Every word in it is meant to thicken the message, including the tone and the burning feeling. To put it another way, the poet is tasked with bringing his mind to the level of wisdom.

KEYWORDS: *Comprehensive, Comparative, Adolescent*

INTRODUCTION

Without understanding the stages of development of literary conceptions in students, a teacher cannot obtain effective outcomes in the application of approaches in teaching. According to psychologists, students go through many stages of development, ranging from childhood (10-12 years) to adulthood (13-14 years) to adolescence (13-14 years) (15-17 years). Reading in a specific classroom is also good for the development of pupils' literary understanding.

Students are separated into groups based on their stage of adolescence. Because spiritual growth and personal development are not mutually exclusive. His inner growth is influenced not only by his age, but also by the social and family context in which he was raised, as well as his personality traits. It is commonly known that students in every class master literary education at varying degrees; some students have a greater ability to master literary education than others, while some have a slower development. However, whether or not students of the same age or in

the same class have this quality, they share something else. First and foremost, if we analyze such characteristics in the context of young students, a young teenager's unique attribute is that he considers himself to be an adult.

Even though this childhood trait remains in his conduct, he perceives himself as an adult and seeks to act like one. They were interested in art, particularly movies and fiction, during this time. They are anxious to read books about fantastical characters, heroes, and brave, caring, and kind-hearted people.

Without having a thorough understanding of the core of art, students in grades 5-7 begin to feel attractive. They find that reading helps them relax. A reader who has never seen the sea or the forest, for example, can desire to express in his own words the concept that the poet, the writer, describes the sea, the event, or the hero by reading a book.

Students in grades 5-7 interpret the author's words as a vivid speech, as though wandering in the bosom of nature, of being. They frequently pay attention to the actions of one or two protagonists who have a great influence on them when reading a work, neglecting the protagonists' features. They don't realize that the heroes' challenges and emotional experiences are mirrored in their gestures and statements. The picture of adults producing misery and cruelty in youngsters has a powerful impact on young teenagers.

Everything should be straightforward and quick for students in grades 5-7. Then they'll exhibit indicators of being irritated. The adolescent is serious because he believes what he's saying is true. As a result, every teacher and methodologist must pay close attention to this characteristic of adolescents and patiently cultivate a reading culture in them. Adolescents must be able to accept work aesthetically, think about it, remember what they have read and mastered, and constantly improve their ability to think rationally, which is to say, to teach them to think creatively.

The uniqueness of each work in terms of genre features, age, knowledge, and skills of students is required for literary-aesthetic analysis. For example, in lower classes, the riddle is only grasped when the meaning of the proverbs is interpreted through real-life instances, and if the subject, the similarity between events, is mastered by comparison. Because young children are fascinated by the flow of events and adventures, but adults are fascinated by the characters' spiritual realm.

In grades 5-6, education continues through the examination of job events. Because youngsters at this age understand white in white, black in black, good in good, and bad in concrete, but not the complex interior world of a person. They are fully aware of the lion's courage, the fox's cunning, the rabbit's timidity, and the dog's loyalty based on personal experience. The deeds and statements of the protagonists of fairy tales and parables reflect these animal instincts vividly. However, they are not described in isolation, but rather through contrasts with other heroes. This, in turn, aids in the detection of interpersonal difficulties. The work of Alisher Navoi "Arba'n" in particular plays a significant role in the didactics of readers.

"How did a dog locate a buddy for its owner?" by Shukur Sadullayev, and "Why does a donkey growl?" by Qudrat Hikmat. In this light, Anvar Abidjan's fairy tale "A very intriguing story" is exemplary.

The fascinating aspect of this type of work is how human characteristics and vices are imitated, rather than how animals, birds, and even inanimate objects speak about it. The defects of fear,

boastfulness, and boastfulness, as well as the merits of courage and devotion, are all mentioned in these stories.

In analyzing the following works, the teacher should give special attention to this element of the problem. The readers are guided from the deeds of the literary heroes to the character, from the description of events to the meaning, by such a deep study based on the events of the work. The volume of hadiths in the work "Arbain" is believed to be large, with forty hadiths presented. This material should be used with the younger generation.

As a result, in grades 8-9, the emphasis is placed on the personal appraisal of the work, as well as the objectivity of the independent viewpoints voiced, taking into consideration this characteristic in students. Reading skills are cultivated in this way using theoretical and literary principles. Although the situation in grades 8-9 is pedagogically identical, students differ in their personalities. In these classes, the uniqueness of each student's personality is reflected in the feedback, knowledge levels, and interest in things and events about the works he or she reads. As a result, personal relationships with students are divided, with emphasis on developing the cultural speech of individual students, taking into account their personal experiences.

High school students are more interested in the character logic of the protagonists, the causal connections between the past and the present, the contradictions between the past and the present. Because of their interest in the spirituality of the protagonists, students gain a certain understanding of the light and dark aspects of life. This is how they develop a love of beauty and elegance and a hatred of evil.

"The Scorpion from the Altar" by Abdulla Qadiri, "The Thief" by Abdulla Qahhor, "Humoyun and Akbar" by Pirmkul Kadyrov, "King Edip" by Sophocles (7th grade), "Navoi" by Oybek, "Mirzo Ulugbek" by M. Shaykhzoda Sharof Boshbekov's "Iron Woman", Chingiz Aytmatov's "Day of the Century" (8th grade), Yusuf Khos Khojib's "Kutadg'u Bilig", Khorezmi's "Love Letter" (9th grade), A. Navoi's "Farhod and Shirin", A. Analysis of Qadiri's "Last Days", M. Behbudi's "Padarkush", Hamzan's "Poisonous Life or Victims of Love", Cholpon's "Night and Day", O. Yakubov's "Ulugbek's Treasure" makes it very convenient for the teacher to achieve such an educational goal.

Working on a literary text to develop students' literary and aesthetic analytical skills while also providing them with academic knowledge improves the effectiveness of teaching. Because the subtlety of the language can only be appreciated and mastered when the author's notion is examined in light of the work's genre characteristics. The examination of poetic works, for example, as a literary type of lyricism, necessitates work based on its distinctive traits and purposes. Every word in it is meant to thicken the message, including the tone and the burning feeling. To put it another way, the poet is tasked with bringing his mind to the level of wisdom. The text is the main source not only for the study of the artistic features of the work, but also for the use of expressive, literary commentary or creative reading, comprehensive, comparative, problem-solving, research, non-traditional methods of analysis. In particular, in the upper grades, the study of the plot, composition, and the image of the protagonists is carried out on the basis of various types of analysis on the text, which increases the creative activity of students and expands the scope of independent thinking.

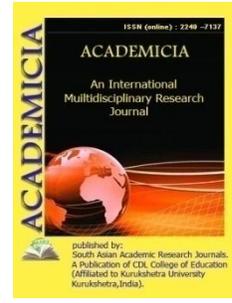

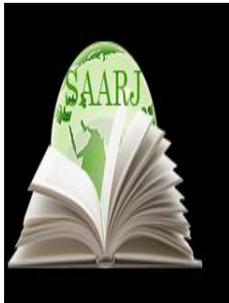

The development of such literary aesthetic analysis skills in students is critical to achieving a high level of success in the complex and serious mission of educating the younger generation as spiritually and ethically developed individuals.

Adolescence is a period of spiritual and physical growth. He creates a worldview, looks at each occurrence with confidence, awakens a sense of love, the level of approach to himself and others, the environment, art interest is stronger than in kids in grades 8-9, and regularity during this period. Students' attitudes toward art and literature as a model of beauty are strengthened during the early years of adolescence.

Throughout the literary course, adolescents' need to understand the surroundings and find their place in life is clear. High-quality works of art that assist students fulfill their ambitions and dreams are appealing to students of this age group. To sum up, it is vital to consider the activity of students, their degree of individual development, and their age in order to assure the efficiency of literary education on the road of human personality and spiritual growth. Today, in the educational process, it is an issue of enhancing students' independent creative activity, preparing them for independent information acquisition, and expanding their horizons. The process of school literary instruction should be designed to allow students to acquire knowledge consciously and to get to the heart of the issue they are studying.

SOME SOCIO-PSYCHOLOGICAL FEATURES OF EDUCATION IN UZBEK FAMILIES

Umarov Bakhridin Mengboevich*

Professor of the Department “Applied Psychology”,
 Doctor of psychological sciences,
 Tashkent State Pedagogical University, UZBEKISTAN
 Email id: baxriddin-umarov@mail.ru

ABSTRACT

The article examines the socio-psychological factors of family education, in particular, the process of raising children in the family and its psychological aspects, psychological issues of the educational impact on the child, psychological mechanisms and components of raising a harmonious personality in the family and their psychological aspects. The problems of family education in Uzbek families and the possibilities of their elimination are highlighted.

KEYWORDS: *Family, Family Upbringing, Social And Psychological Characteristics Of The Family, Upbringing In A Family Of A Harmonious Person, Problems Of Family Upbringing, Psychological Mechanisms Of Family Upbringing, The Main Social, Spiritual, Moral And Psychological Functions Of The Family.*

INTRODUCTION

If we look at the Chronicle of our independence, we will witness the rich practical work done in the social, economic, political and cultural spheres for a short 28 years in our country. The basis of these goals lies in improving the living conditions of people, citizens of our country, creating conditions and opportunities for their happy and prosperous living in families, educating the younger generation as healthy, spiritual and enlightened in all respects.

It is not surprising that today our country pays special attention to the issue of family, of course. Because the family, which is considered the main link of society, plays an important role in creating the bright future of our country.

The family is such a holy place, in which a person is formed that ensures the continuity of life, ethnic culture, traditions, moral and spiritual values are preserved, developed, the foundation of

economic and cultural life, which determines the development of society, is laid and strengthened.

If we briefly analyze the main social, spiritual, moral and psychological functions of the family, then all the emotional, psychological feelings that are formed in the child: kindness, endowment, responsiveness buds to himself and the surrounding nature are manifested in the family. In order for the family to carry out its duty to the extent that it is necessary, it will be necessary to assist it by carrying out appropriate educational and methodical armament, social, spiritual, events.

A spiritually mature family is the foundation of a spiritually high society. Family traditions, traditions, morals-the integration of spiritual values into the minds of children, the arming of each family member with professional skills is the basis of the upbringing of spiritual perfection.

Education can not remain within the framework of pure national criteria, even in any socio-economic conditions, without degrading the importance of national spiritual values, methods of National Education. The content and direction of education in all periods of the development of society is determined by the harmony of national and universal values. This theoretical rule is directly related to both social education and family education today.

Below we want to study and analyze the problems of raising children in the family, the mistakes made in upbringing, the violation of youth education and its prevention, and put forward our own scientific and vital conclusions that will respond to today's practice.

Serious changes are being made in the new socio-historical realities - family, family relations and Family Education, which are happening all over the world and especially in our country. It follows that the upbringing of children in the family in the spirit of independence, as a new-thinking person, taking into account the beginning of the family, is an important socio-pedagogical and socio-psychological necessity to review the content of family education again and further enrich it, to set its main directions and to identify goals and tasks, as well as ways

Due to this necessity, the issue of the use of national values in the upbringing of children in families in a moral and moral spirit plays a socio-political and cultural-educational role. Because the solution of these issues is rather complicated and contradictory, it requires an approach from the point of view of succession and historicity.

It is known that the current stage of the development of national independence reveals new criteria for the use of national values in family education. These criteria are expressed in such concepts as patriotism, national pride, national consciousness, national self-consciousness, national mentality, national upbringing, which ensure that the educational process is aimed at a specific style for the development of today.

When referring to the moral and moral upbringing of children in the family, it is necessary to reveal the peculiarity of national morality and upbringing.

In national morality and upbringing, the historical experiences of our ancestors, the lessons of life tested by periods, and the instructions to the ought are totals. Therefore, our national moral values have been passing from generation to generation for centuries.

Any moral virtue is an expression of the regulation of behavior in a person in this or that way, respect for a person means attention, affection, and it reflects the universal meaning. Already, since any person is a particle of Adam, then the essence of all mankind is embodied in it, and

therefore it belongs to all mankind. Accordingly, it is worthwhile for each parent to see the universal meaning and meaning in the upbringing of his child, in the upbringing of him as a harmonious person. The moral qualities of the child are dictated by a deep sense of responsibility in the upbringing of the children of parents who realize that the universal character becomes a universal value.

The spiritual and moral formation of a person in the family begins with the birth of a child, which includes the character of family relations, the pattern of parents, the level of general education in them, the level of general education, as well as how to organize a universal culture and family life. These factors constitute the content of the moral and moral upbringing of the child in the family, which includes a number of pedagogical and psychological characteristics. And taking these into account will help to know the essence, originality and significance of the use of national moral values in the upbringing of the child in a spiritual and moral spirit.

From our observations and sources it is known that a lot of valuable insights are put forward in the heritage of Eastern thinkers and Islamic teachings on the upbringing of children in the family in a spiritual and moral spirit.

If the idea that man is the greatest among all beings, that all things are created for him, constitutes the basis of Islamic spirituality, the foundation of Islamic education is to encourage people to be spiritually connected and to form noble qualities in them.

Islam is absorbed into the social life of the people, in particular, family relations, culture and national traditions, but this does not mean that the ancient, repeated culture of the Uzbek people, including family values, would not have existed without Islam. In the sources of Islamic spirituality, there is a system of views on Family, Family Relations and family education, it includes all aspects that are aimed at the formation, development and strengthening of the family. Although such views are put forward from the point of view of theology, they are also considered in accordance with the mind and daily marriage, since they are caused by the demand of people for their vital activities, lifestyles and social needs, finally family relations.

In Islam, the peculiarities of family education are indicated separately. These characteristics come from the requirements of Islam, which, in addition to the general idea of moral education of young people, serve to encourage the child to humanity and goodness, and have a universal meaning. Accordingly, today it is necessary for parents to break such a universal content of Islamic spirituality into the minds of children.

The fact that religious values serve as an important factor in the spiritual and moral upbringing of the family in the new historical conditions is explained by the fact that religious imaginations, the reason for the integration of rituals into the lifestyle of the nation, the vital activity of the people, the strong influence of religious consciousness on the human psyche. At present, it is the duty of parents to distinguish religious heresy with religious values in the process of family education and to prevent poisoning of the child's consciousness with religious superstitions.

The heritage of our great thinker ancestors is of great importance in the formation of a healthy lifestyle, a sense of respect for national and universal values in the hearts and minds of young people, and in the harmonious upbringing in all respects. After all, in the works of our scientists, who devoted their lives and potential to the realization of the true essence of life, a special place is given to issues related to the upbringing of a healthy generation.

In his works, eastern scientists paid attention to the problems of upbringing and education of children, leading him to enlightenment culture.

Great thinkers have pointed out that the upbringing of children is a high virtue that causes the human perfection of beautiful morality. In particular, the collection of Al-Adab Al-Mufrad hadiths by Imam Bukhari, Abu Lays was praised for the perfection of high human qualities in children in the works of "Tanbehul ghofili" by Samarkand.

The scholars of our country have emphasized that it is important that parents, who hope for the beautiful manners of their children in their works, regularly introduce them to the following aspects of the manners of treatment, which is the basis of husni behavior:

- pay attention to the fact that your child is sweet, gentle, capricious and humble in dealing with people;
- sharing the joy of people, grief, not betraying their property, calling for good and returning from evil are the qualities characteristic of the owners of husni behavior. Therefore, try to absorb these qualities to your child from childhood;
- know that it is also indecent to gossip to others during the treatment of your child with strangers, to ignore others, to show an attitude depending on his reputation, wealth or career;
- people of great age, who do not look at their eyes in circulation with their teachers, listen quietly to what they say, answer only questions, diligently carry out orders, also pay attention to CA children's hearts.

When talking about raising a child in the Uzbek family, it is important to remember the great thinkers of Central Asia, which left a rich legacy for the next generations. Their feedback has not lost its meaning even today.

Abu Ali Ibn Sina tried to explain the general foundations of Family Education. "If Aga makes the right use of the methods of family upbringing," wrote the scientist, "she will achieve happiness in her own life."

Ibn Sina said that regardless of the state of raising a child in the family, a person who considers it the main duty of the parents and eliminates his own shortcomings can educate others. Ibn Sina analyzed the factors that brought up the child, taught that the most correct of them – to be with the children and to talk separately, using positive examples, his self-esteem is unsatisfied. Ibn Sina gave kata importance to the expression of the father's role in tarbi. In his book "fasting" there is a chapter "The Father's attitude to children". In it, Ibn Sina says: "mothers are soft-hearted by their nature and, with their own manipulation, spoil the character of the child." According to Ibn Sina, the main educator in the family should be the father, he should be intimidated in time, sometimes give praise, sometimes reproach, sometimes encourage, sometimes punish the child in order to achieve the goal.

In the family there are wonderful thoughts of Alisher Navoi about the upbringing of a child. In his opinion, the most important thing in upbringing is to love children," to the child was a great poet, who said - from a small age it is necessary to give moral education, taking into account his age."

The well-known poet and pedagogue Abdulla Avlani also expressed wonderful thoughts about the upbringing of children in the family. As he wrote in his book “The native land and morality”, the health and happiness of the child depends primarily on his good upbringing, on the purity of his body, on the formation of religion, on the possession of good manners, on the warning of him from indecent behavior.

Thanks to Independence, new manifestations of family relations are being decided in our country. It has been leading to the destruction of old structures that have been in composition and anchored for many years. This requires the child to absorb into his mind a sense of inferiority, a spirit of ownership.

Such virtues as honesty, integrity, non-betrayal of others, philanthropy, generosity and generosity, austerity and extravagance, which are common in Uzbek families, were formed in the era of national and religious values, and as a result of family education, they passed from parents to their children and enriched their spiritual world.

Another of the important functions of the family is communication, the content of which is the interaction of family members, the provision of close communication between the mass media and family members, the perception of the surrounding nature, social environment.

In the following years, the mass media and the media have played a significant role in the comprehensive education of young people. Even when young people absorb what they see and hear, read, and draw appropriate conclusions, the family must act as intermediaries.

Effective organization of free time in the family is one of the main tasks of the family. Therefore, free time is one of the important social values of society. Active organization of leisure time in the family is an important means of ensuring family well-being, that is, reading, working, as well as organizing trips to museums, cinema, theater, concerts, historical monuments, shrines, etc.

It is also of particular importance to pay attention to beauty in family relationships and in marriage. If parents and adults in the family pay attention to beauty in their mutual relations, if there is harmony, sincerity, respect in family relations, moral qualities like above are found in the behavior of children brought up in the same family. So the aesthetic education in the family should begin with the correct attitude of parents and other older people towards each other.

Children observe the behavior, behavior of adults, how they talk with their neighbors, comrades. Therefore, it will be necessary to remember that it is absolutely a bad habit to boast before young children or gossip about others, which will have a negative impact on children.

If the father or mother of the child is rude, aggressive in relation to others, if he raises a grudge over trifle, he will break the anger of his own child, this situation will negatively affect the psyche of the child. In such conditions, there is no place for aesthetic education. In order to bring children to adulthood by making their aesthetic sense harmonious, the Katas themselves in the family should be people who fully adhere to the requirements of aesthetics.

In the family, the discipline is taught to teach children to order, freedom, to be careful of their own items and clothes.

It should be noted that the child carefully watches the clothes of the parents and adults, the feats. Therefore, parents should not be indifferent to this feature of children.

Some parents think that having less communication with their children will make them gain a reputation by carrying themselves narrowly. In their eyes, the less they meet with a fur child, the more reputation can be earned. This absolute misconception arises from the fact that the less the parents communicate with their child, the more alienation, indifference between them.

Some parents share a reputation with the child only through formality. Bunda they look for a furrow from the bristle, give the child a laziness, limit all his behavior, jerking and stroking to the olymas. It should not be forgotten that this does not lead to good.

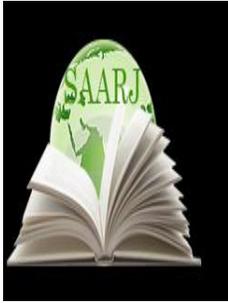

Showing the child guardianship and guardianship by parents and other members of the family also does not give a good result. If parents or older members of the family are in a relationship with children as a partner, friend instead of such a relationship, self-assessment in children will give impetus to the formation of a sense of responsibility for the given task.

In order to improve the quality of educational influence on children in the family, the requirements imposed on the child by parents and senior members of the family and the unity of work with the word in the educational influence on them give a good result. The absence of such unity in the family negatively affects the behavior of the child. It should be noted that in a relationship with children and adolescents, ignoring their sympathy, age characteristics, psychology, the attitude to be made on the basis of insulting each other in families, bullying and oppression leads to the formation of such qualities as cowardice, nervousness, infidelity, cruelty, rudeness, anxiety in children. Such adjectives create an opportunity for the occurrence of a violation of upbringing in children and adolescents.

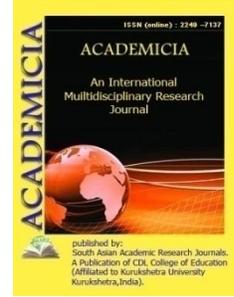

In conclusion, the family is the main educational institution that plays an important role in the upbringing of children as harmonious people in all respects.

ABSTRACT

Due to the enormous quantity of information in various forms, retrieving the most relevant papers from the web is challenging. The enormous quantity of data is tough for computers to comprehend, but it is simple for people to comprehend. The semantic web, often known as Network 3.0, is an online of data that allows competent computers to comprehend data on web pages. The Semantic Web is a technique for improving the precision of information retrieval systems. Online mining is the use of data mining methods to extract information from web data, such as web pages, connections between documents, and web site use records, among other things. Semantic web mining aims to bring the semantic web and web mining together. The primary goal is to use semantic web tools to convert unstructured data into machine comprehensible data so that machines can reply to human inquiries in less time and save tiresome effort, and to use web mining tools to automatically extract information buried in huge quantities of online data. The different Semantic-web methods and difficulties are the subject of this paper.

KEYWORDS: *Semantic Web Mining, Semantic Web Approaches, Semantic Web, Web 3.0, Web Mining.*

1. INTRODUCTION

Both the Semantic Web and Web Mining study fields build on the success of the World Wide Web. They work effectively together because they each handle a different aspect of a new problem presented by the current World Wide Web's (WWW) enormous success[1], [2]. The majority of data accessible on websites is unstructured, making it difficult for computers to comprehend, yet the volume of data is so large that it can only be handled effectively by machines. With Web information input, the World Wide Web has evolved into a new communication medium. This is reinforced by informational, cultural, social, and evidentiary values, to name a few. With the availability of different Search Engines such as Google, Yahoo, and others, people are increasingly turning to them to get information from Web sites. Existing search engines, on the other hand, are unable to differentiate between specific user requests. The semantic web tackles the first half of the problem by attempting to make data machine-understandable, while web mining tackles the second by automatically extracting valuable information from this data. Web mining necessitates the creative use of data mining and/or text mining methods, as well as unique approaches[3], [4]. Web data mining is one of the most difficult jobs in data mining. The goal of semantic web mining is to bring together the two fields of semantic web and web mining. Fig. 1 illustrates the layered structure of semantic web.

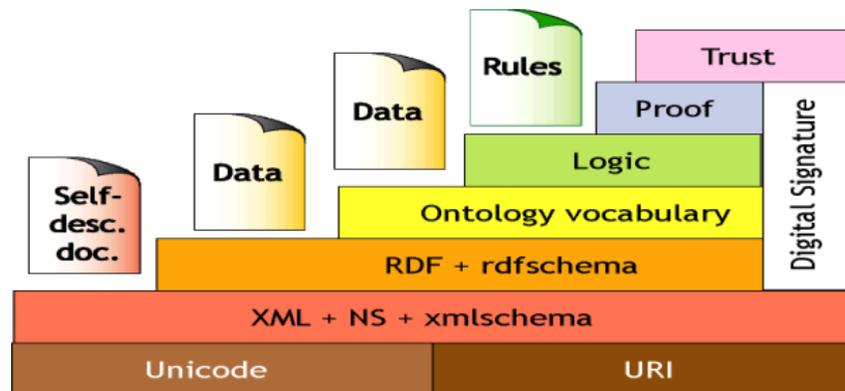

Fig. 1: Layer structure of semantic web[5].

1.1. Semantic Web:

Tim Berners-Lee, the creator of the World Wide Web, has a vision for the Semantic Web[6]. Semantics, in general, is concerned with the structure of sentences and what they really imply. When a user alters a sentence's pattern, the pattern changes, but the semantics stay the same. When a computer comprehends the semantics of a document, it does more than simply analyze the sequence of letters that make up that text; semantic web aids the machine in comprehending the meanings behind the web page. The present WWW contains a huge quantity of material that is frequently unorganized and comprehensible only by humans. The human brain, for example, employs logic:

- a. Ramesh is a father.
- b. A father is a parent.

As a result, Ramesh must be a parent, but machines are incapable of applying this reasoning. The Semantic Web attempts to solve this issue by giving machine-interpretable semantics, allowing

machines to better assist users. If a computer can recognize the meaning behind a web page, it may readily assist people in accessing knowledge rather than unstructured content, enabling knowledge to be handled automatically. A basic search engine cannot comprehend the connections between keywords, phrases, or parts of speech inside a search phrase, but a semantic search engine can, thanks to ontologies, understand the underlying meaning of the whole phrase. A detailed explanation of words and reasoning in a topic area is ontology. The usage of ontologies allows computers to provide meaningful results from semantic data. By making the message as plain as possible, a machine can comprehend or at the very least use it. A semantic search engine, for example, would be able to tell the difference between the following sentences, which are made up of the same keywords but have distinct meanings:

- a. By using java language semantic web mining.
- b. Semantic web mining by using java language.

The sentences in the example above are made up of the same keywords, but the subject connections have been inverted. Because the connections between the keywords or phrases are unknown in conventional online search, which is dependent on ranking algorithms, the engines would return similar or almost identical results, even if two totally distinct queries were asked. Additional issues with conventional online search occur when the terms are either too precise, resulting in few or no results, or too broad, resulting in irrelevant results.

The current web is about documents, while the semantic web is about objects on web pages, such as people, locations, organizations, and ideas.

2. DISCUSSION

2.1. *Semantic Web Architecture:*

For the Semantic Web, Berners-Lee proposed a layer structure. The Semantic Web is built in layers, one on top of the other, allowing for a more uniform development process[7].

2.1.1. *Uniform Resource Identifier (URI):*

The web's cornerstone is the URI, which binds the rest of the web together. The URI's goal is to clearly provide an identity that will be used to represent a resource in a consistent manner, identifying information representation structures such as classes, attributes, and people. It becomes easy to combine all data that relates to a particular resource since there is no ambiguity. A URI is just a description, not a location; it simply identifies something. For example, one individual's web page might be abcd.com, which can be used to identify that person. As a result, the object abcd is associated. A person may utilize his page, but it is only visible to other users. Users and software can understand precisely what they are being referred to since URIs are globally unique and each occurrence of the same identifier signifies the same thing.

2.1.2. *Unicode:*

Unicode is a character encoding system that allows all user languages to read and write on the web in a uniform format.

2.1.3. Extensible Markup Language (XML):

XML is a web-based data transmission and storage language. The purpose of XML is to transport and describe data, not to display it. User-defined tags may be found in XML documents. The structure of an XML document is described using an XML schema. In the semantic web, the XML namespace is used to prevent conflicting data or names. The purpose of the XML layer is to provide the fundamental syntax and structure of online data.

2.1.4. Resource Description Framework (RDF):

RDF is a format for storing and organizing data. RDF addresses the issue of data linkage. A resource is anything that has an identity, and URIs(Uniform Resource Identifiers) are used to identify it. The term "description" refers to a container that holds multiple assertions that describe the resource. To create and comprehend claims, you'll need a framework. The machine can analyze the query and come up with a response using RDF.

2.1.5. Resource Description Framework Schema (RDFS):

RDFs may be used to organize classes and attributes into generalization/specialization hierarchies. The purpose of RDF and RDFS is to give metadata to upper-layer technologies so that this information may be shared and reused across these technologies or between these technologies and other applications.

2.1.6. Web Ontology Language (OWL):

A precise explanation of words and reasoning in a topic area is known as ontology[8]. We may bring the semantic stuff using ontology. The web ontology language was created using description logics and web languages and may be used to define ontologies. OWL meets the semantic web's criteria for requiring little human input while still meeting software needs for a language with correct meaning. Ontologies are useful for clearly representing things and their relationships, which may be either direct or inverse.

2.1.7. Rules, Proof & Trust layer:

- *Proof Layer:*

The proof layer is used to validate that the findings generated by the agents can be trusted or to authenticate the agent's activity.

- *Rules Layer:*

The Rules Layer is intended to be used as a framework for developing new conclusions and expressing them for the deployment of the semantic web.

- *Trust Layer:*

The purpose of the trust layer is to offer a method for information providers and users to trust and be confident in each other.

2.2. Web Mining:

Online mining is the use of data mining methods to extract information from web data, such as web documents, hyperlinks between papers, and web site use records, among other things[9]. Thus, finding legitimate, previously unknown, and possibly valuable patterns in the enormous

quantity of online data, patterns that represent them in succinct form and manageable orders of magnitude, is a difficult task. Web mining, like other data mining applications, may benefit from data structure, but it can also be used on semi structured or unstructured data. Web mining aids the transition from human-understandable material to machine-understandable semantics in this way. Fig. 2 illustrates the categorization of web mining methods.

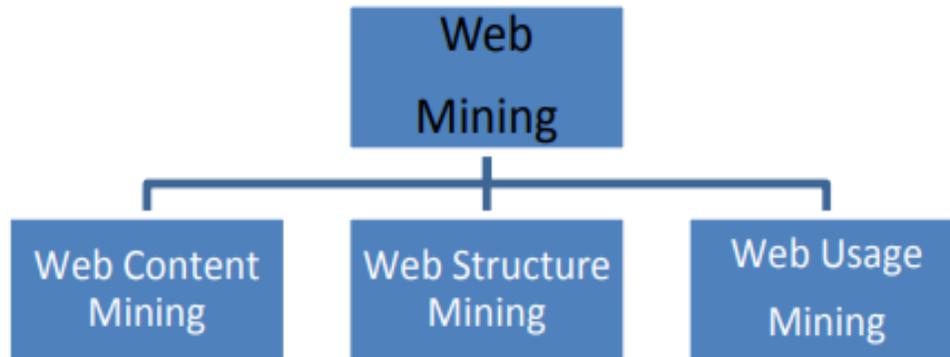

Fig. 2: Taxonomy of web mining[10].

2.2.1. *Web Content Mining:*

Web content mining is the technique of collecting information from the contents of Web pages by analyzing the content of web resources. It examines web page content as well as web searches. The study is mostly focused on text mining methods, although expansions to multimedia material are starting to appear. Textual, picture, audio, video, metadata, and hyperlinks are all examples of data kinds found in online content. Web content may be unstructured (plain text is often associated with unstructured data), semi-structured (HTML documents), or structured (XML documents) (extracted from databases into dynamic Web pages). Unstructured data is strongly linked with big data. Large datasets that are challenging to examine using conventional methods. As a result, NLP methods are used to retrieve information.

2.2.2. *Web Structure Mining:*

Online pages serve as nodes, while hyperlinks serve as edges linking related sites in a typical web graph. The technique of finding structural information from the web is known as web structure mining. We combine structure mining with the page rank algorithm to ensure that the material is relevant and of sufficient quality. Based on the kind of structural information utilized, this may be further split into two types.

Furthermore, a web page's content may be arranged in a tree-structured manner using the different HTML and XML elements on the page.

- *Hyperlink:*

A hyperlink is a structural element in web pages that connects one place to another, either inside the same page or on a separate page. An intra-document hyperlink leads to a different section of the same page, whereas an inter-document hyperlink connects two distinct pages.

- *Document Structure:*

According to the types of data to be mined, web mining may be classified into three categories. A broad variety of conventional data mining methods, including association rule discovery, clustering, classification, and sequence mining, are used and expanded in all three domains to reflect the unique structures of online resources and the unique issues presented in Web Mining.

2.2.3. Web Usage Mining:

Web usage mining is the use of data mining methods to find interesting usage patterns in web usage data or server logs in order to better understand and fulfill the requirements of web-based applications. It also analyzes user clicks from web server logs. The identity or origin of online users, as well as their browsing activity on a website, is captured by use data.

Directly addressing the issues connected with web log mining is a key aspect of the Web use mining method. It's all about detecting user surfing habits on the internet using information gleaned from web logs.

2.3. Semantic Web Approaches:

2.3.1. Ontology Approach:

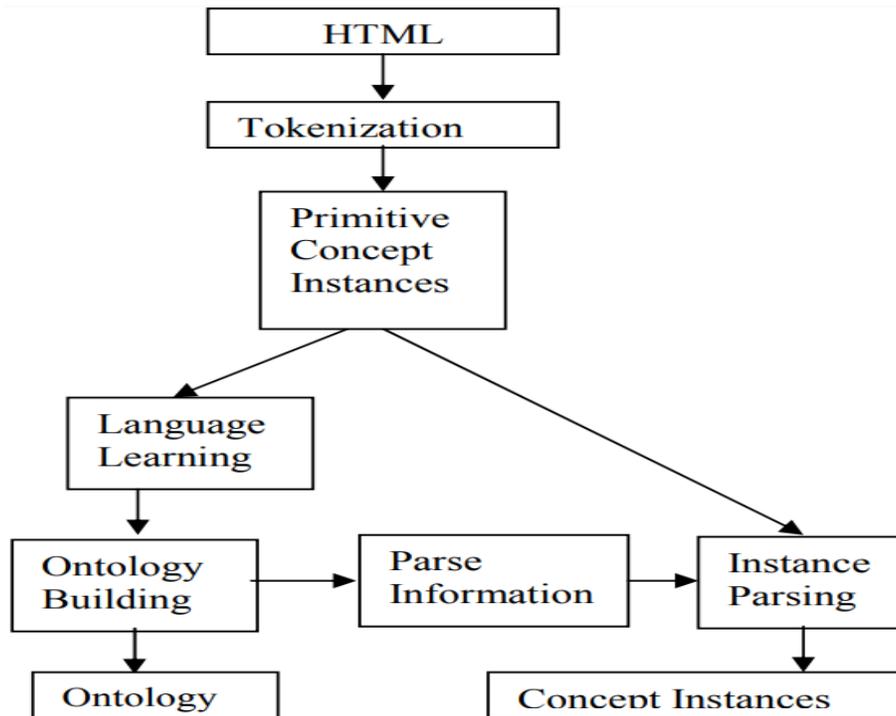

Fig. 3: Ontology learning process[11].

The semantic web's backbone is ontology. An ontology is a set of URIs having a meaning that is typically only obliquely explained. A formal ontology language is used to represent ontologies. Ontology is a collection of ideas and their interrelationships that are linked to a certain knowledge area. Ontology expertise is very helpful in defining the structure and scope of online content mining. Ontology is a collection of things, ideas, and other entities that exist in a given region, as well as the connections that exist between them. Getting an ontology from the internet is a difficult job. It is based on Web content mining techniques and blends machine learning techniques with approaches from areas such as information retrieval, using them to find and

make explicit the semantics in data. The methods generate interim findings that must be combined into a machine-readable format. Ontology learning process is illustrated in Fig. 3.

2.3.2. Semantic Based Web Mining:

Semantic-based web mining combines the semantic web with web mining, two rapidly evolving areas. It's also known as Semantic-Web Mining or Semantic Web-Mining. The semantic web attempts to solve this problem by making data intelligible to both machines and humans. Online mining, on the other hand, is concerned with automatically collecting valuable knowledge or information from vast amounts of data on web sites. Web pages are mined by the machine in semantic based web mining so that the machine can better comprehend the information on the web pages. It works by retrieving XML and RDF documents, as well as ontologies and metadata. Semantic web mining entails sifting through data sources and information pertaining to web-based information management systems. Web mining will lead to semantic web mining. The aim of semantic web mining is to make the web more accessible. Ontology, semantic web content, and web services are the three main categories of requirements for the semantic web.

2.4. Semantic Web Challenges:

2.4.1. Huge Quantity of Available Data:

Existing technology has not yet been able to predict all semantically duplicated words on the web, which includes vast amounts of data on billions of web pages.

2.4.2. Unclearness:

These are hypothetical terms like "young" or "tall." This is due to the ambiguity of user questions, the difficulty of matching queries to provider contents, and the difficulty of combining several knowledge bases with overlapping but carefully distinct ideas.

2.4.3. Term's Adaptability:

This is a set of exact ideas with varying values. A teacher, for example, could offer a set of test criteria that correlate to a number of different unique student abilities, each with a different likelihood.

2.4.4. Ontology Inconsistency:

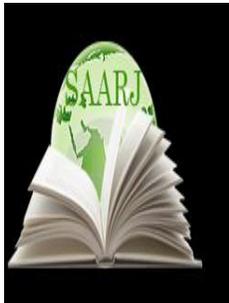

These are logical inconsistencies that will inevitably emerge with the creation of big ontologies and the merging of ontologies from different sources.

3. CONCLUSION

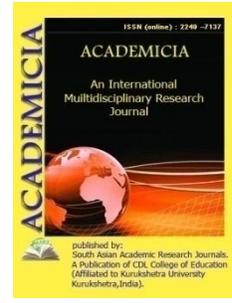

We looked at two rapidly emerging research topics in this paper: web mining and semantic web. Semantic Web Mining, as a unified field, provides new methods to enhance both fields. By using the new semantic structures on the Web, semantic-based web mining may enhance the outcomes of web mining. Because of the availability of background information, the Semantic Web may make Web mining more simpler, and Web mining can also create new semantic structures in the Web. Many industries benefit from the study, including e-commerce, health care, privacy and security, search engines, knowledge management, and information retrieval.

ABSTRACT

The increasing use of concrete has resulted from the growing demand for building throughout the globe. Conventional concrete-making materials, on the other hand, are not completely environmentally friendly, prompting research into greener concrete alternatives. Extensive study has been done in the past to use agricultural waste materials such as those from palm oil, coconut, sugarcane, and the paddy industry in concrete, and the results show that such resources may be used in concrete. Reusing agricultural waste materials in concrete may decrease reliance on traditional concrete-making resources while also reducing environmental impact, waste conservation, and waste disposal from these industries. A review of the use of developing alternative agricultural waste materials in concrete, such as bamboo, maize, wheat, olive, sisal, seashells, and other materials, is conducted in this article with the goal of evaluating the advantages and drawbacks of utilizing these materials. This study examines the use of agricultural waste materials in concrete in various forms, including partial cement and aggregate substitution, as well as fiber reinforcing. The paper's primary conclusion is that, although the use of agricultural waste materials reduced certain concrete characteristics, effective treatment techniques and waste material selection would allow for the manufacture of concrete with better performance. The summary and discussion in this article should offer fresh

information and expertise on a wider range of agricultural waste materials that may be utilized to make greener and more sustainable concrete.

KEYWORDS: *Agricultural Waste, Concrete, Fiber Reinforcing, Green Concrete, Soil.*

INTRODUCTION

There is a rising need for greener concrete due to the increased use of concrete in the building sector throughout the globe. The negative environmental effect of concrete-making ingredients such as aggregates and cement is one of the main causes behind this. Excessive use of aggregates depletes these natural resources, and irresponsible quarrying and mining operations to extract these materials may result in environmental problems such as landscape destruction and ecosystem disturbance, as well as pollution of water, soil, and air. Furthermore, cement production is an energy-intensive process that, most significantly, results in greenhouse gas emissions[1]. The cement sector alone is thought to be responsible for around 1.8 Gt of CO₂ emissions each year, accounting for about 5–7% of total anthropogenic CO₂ emissions. According to a life cycle study, the manufacturing of 1 t of cement emits approximately 0.8 t of CO₂. Researchers have looked at the potential of using industrial by-products and waste materials in concrete in an effort to protect the environment via the development of green concrete. Industrial by-products have long been utilized in a variety of applications throughout the globe[2]. While the use of industrial by-products in concrete is well-established, the integration of waste material for concrete production, particularly waste from the agricultural sector, is still very much in the research stage. Agriculture waste is often burned or dumped, resulting in pollution and poisoning of the environment. Recognizing the potential for environmental conservation, research has been carried out throughout the years to re-use agricultural waste from the agriculture sector to make concrete. For example, waste from the palm oil industry, such as waste oil palm shell and palm oil fuel ash, waste from the coconut industry, such as waste coconut shell and coconut fibers, and waste from the paddy industry, such as waste rice husk, are among the most well-known agricultural wastes for concrete production[3]. These agricultural waste products were utilized in concrete production as aggregate, fiber reinforcement, and supplemental cementitious material (SCM).

Alternative agricultural waste materials for concrete, such as those from agriculture (bamboo, banana, maize, wheat, sisal, grass, etc.) and aquaculture farming (oyster, cockle, clam, and periwinkle, for example), have recently become popular. Agricultural farming wastes have often been used as a partial cement replacement material in concrete by researchers. This is due to the fact that plants obtain various minerals and silicates from the earth during their growth process; inorganic materials, particularly silicates, are found to be higher in annually grown plants than in long-lived trees, allowing plant residues to be a potential source of cement replacement material with pozzolanic reactivity[4]. Another frequent use of agricultural wastes is as fiber reinforcement in concrete composites. Natural fibers have the potential to be used since they are: i) less expensive, ii) need less industrialization, iii) environmentally benign, and, most significantly, iv) natural fibers are as strong as synthetic fibers. Furthermore, in an attempt to decrease reliance on traditional aggregates such as granite, gravel, and natural mining, some of these agricultural waste materials were used as partial aggregate replacements in concrete in an effort to protect the environment. As a result, the emphasis of this study will be on collecting and

analyzing past results obtained when agricultural waste residues (from agriculture and aquaculture farming) were used in concrete[5].

Understanding the typical behaviors of such waste elements in concrete, such as their advantages and downsides, may serve as a foundation for the creation of an environmentally friendly concrete that includes agricultural waste materials. Agriculture farming is a significant worldwide business since the majority of produced agricultural goods are used to feed people all over the globe[6]. China, India, the United States, Brazil, and Nigeria are among the world's top producers of agricultural goods such as cereals, vegetables, and fruits. However, there are many waste elements left behind after harvesting and consumption of agricultural goods, such as leaf, straw, stalk, and ash. The majority of these agricultural wastes are dumped in the environment, with little effort made to recycle them. Researchers have recently started to use these wastes as a partial substitute for traditional concrete-making ingredients and have discovered some intriguing results. While the use of farm wastes in concrete, such as those from the palm oil, coconut, sugarcane, and paddy industries, has long been recorded, this section examines new research on other agriculture leftovers, such as those from bamboo, wheat, olive, and other agricultural sectors.

Bamboo is the world's fastest-growing and highest-yielding natural resource and building material. Bamboo has been recognized as a potential option for building material by experts during the past two decades owing to its favorable mechanical characteristics, high flexibility, and cheap cost. Bamboo has been proven to be suitable for structural elements such as beams, columns, and slabs. Bamboo output is estimated to be about 20 million tons per year worldwide, mostly in Asia and Latin America, resulting in a large quantity of agricultural waste from the bamboo industry[7]. These agricultural wastes are often burnt in open landfills, polluting the environment. While bamboo is often used as reinforcement, the re-use of waste products such as bamboo leaf ash and fiber in concrete is gaining popularity in recent years. WSA's potential as an SCM in concrete was shown by a 25 percent improvement in mortar compressive strength when WSA was used at a 20 percent cement replacement level. On the other hand, it was discovered that when 8% WSA was applied, the compressive strength required 180 days to achieve the compressive strength of control concrete without WSA, which was ascribed to the delayed pozzolanic response. In the presence of up to 16 percent WSA, however, concrete's 28-day flexural strength was shown to be enhanced. Because concrete durability is so important, researchers also looked at the durability characteristics of concrete that utilized WSA as a partial cement substitute. When concrete was exposed to a sodium sulphate solution, WSA substitution up to 24 percent increased compressive strength, while WSA replacement up to 8 percent improved performance of concrete subjected to a magnesium sulphate solution. WSA-blended concrete had greater freeze-thaw resistance than control concrete, and increasing the WSA replacement amount from 5% to 15% improved the freeze-thaw resistance of the concrete.

Furthermore, as compared to control concrete without WSA, the resistance of WSA-blended concrete to alkali-silica reaction degradation was higher, and increasing WSA concentration to 15% resulted in better resistance to alkali-silica reaction. WSA's anti-alkali-silica degradation effects were shown to be stronger in concrete mixtures with a lower water-to-binder (w/b) ratio[8]. The pozzolanic reaction and filler effect of WSA, which refined the capillary pores within the cement matrix, were ascribed to the increased durability of concrete containing WSA against freeze-thaw and alkali-silica reaction. WSA may potentially be used as a partial

substitute for fine aggregate in concrete, according to the researchers. The workability of new concrete was decreased when WSA was utilized as a partial replacement by up to 10.9 percent owing to the greater fineness of WSA, which increased the water demand to wet the surface of the WSA particles. Furthermore, in the presence of WSA at a fine aggregate replacement level of 10.9 percent, the setting time of new concrete was extended by up to 92 percent. The use of up to 10.9 percent WSA increased the compressive, tensile, and flexural strengths of autoclaved concrete by up to 87 percent, 67 percent, and 71 percent, respectively, when combined with limestone fine aggregate. The compressive strength of WSA concrete (up to 6% fine aggregate replacement) was greater than that of control concrete after 28 days, despite the fact that the 7-day compressive strength was comparable. Based on the studied durability characteristics of WSA concrete, using WSA as a partial fine aggregate replacement of up to 6% resulted in outstanding concrete durability[9].

Due to the denser pore structure of the concrete system when the WSA filled the pores in the concrete system, the sulphate resistance, resistance to water penetration, and abrasion resistance were all improved when the WSA was applied. When concrete was exposed to heat cycling, the WSA concrete showed a smaller decrease in compressive strength than control concrete, indicating a superior reaction to thermal cycling, particularly when the WSA fine aggregate replacement level was raised to 15%. In the presence of WSA, fractures induced by thermal cycling appeared considerably later in the concrete, and the greater electrical resistivity of the WSA-blended concrete explained the concrete's improved resistance to raised temperature. The use of wheat straw as a concrete fiber reinforcement and the performance of wheat straw fiber were compared to hemp fiber[10].

DISCUSSION ON GREEN CONCRETE

When OWA was used as a partial cement substitute, the strength characteristics of concrete were generally decreased, according to numerous studies. The increase in capillary holes in the OWA-containing mortar was ascribed to this. The residual compressive strength of concrete with up to 22 percent OWA was enhanced at higher temperatures of up to 600 C when compared to concrete without OWA. This was bolstered by the fact that the OWA-blended concrete had a lower electrical charge, indicating less fractures and damage when exposed to high temperatures. The enhanced performance of concrete mixed with OWA at higher temperatures was due to the OWA's pozzolanic reaction and filler action, according to the authors. However, because of the lower vapor pressure generated up in the concrete, the existence of a larger number of pores in the OWA concrete may contribute to better fire resistant performance. When OWA was employed as a filler in self-compacting concrete instead of conventional filler, the compressive strength achieved by the former was slightly greater. Sisal fibers were shown to provide greater flexural strength as well as toughness and ductility to concrete, similar to typical fiber reinforced concretes. The composite showed strain hardening behavior and numerous fracture development under tensile when sisal fibres were employed at 10% volume fraction in cement composite. The performance of the concrete when exposed to impact force was also enhanced, such as impact energy, fracture resistance, and failure pattern, owing to the ductility and toughness given in concrete by the inclusion of sisal fibres. The impact energy and ultimate fracture resistance of concrete containing sisal fibres may be increased by up to 6 and 5 times, respectively, when compared to concrete without fibres, according to the results.

Despite the benefits of using sisal fibers, one of the main drawbacks of using this fiber in cement-based concrete is its durability. Untreated sisal fibres linked in cement matrix were shown to deteriorate and become more brittle over time as a result of alkaline attack and fibre mineralization, as described. As a consequence, the resultant cement composite would have problems with durability. The compressive and tensile strengths of the resultant cement composite were clearly reduced in the experiment carried out utilizing corroded sisal fibres that were subjected to different media. Recognizing this, researchers have tried to enhance the endurance of such fibers using two methods: i) coating the fibres before usage, and ii) using SCM to reduce the alkalinity of cement mortar. Thermal treatment and sodium carbonate (Na_2CO_3) treatment techniques were used on the sisal fibres, and the resultant sisal fibre reinforced concretes were shown to be more durable. The increased endurance of the thermally treated sisal fibres was attributed to better crystallinity, which guaranteed greater mechanical strength of the sisal fibres. When sisal fibres were soaked in Na_2CO_3 , calcium carbonate sediments filled in the pits and holes on the surface of the fibres, protecting the interior from alkaline assault during the cement hydration process, resulting in increased concrete durability. The fibre composite including pre-treated sisal fibre with silica fume slurry performed similarly to the control fibre composite having untreated sisal fibre in another study on sisal fibre treatment. While adding silica fume to the sisal fibre mortar increased its durability, using ground granulated blast furnace slag (GGBS) as a partial cement substitute did not decrease the composite's brittleness. Also, when silica fume was employed as a partial cement substitute, the drying shrinkage of sisal fibre mortar was reduced at later ages, while using GGBS resulted in a 9 percent increase in the drying shrinkage value. When met kaolin and calcined waste crushed clay brick were employed as partial cement replacement, there was a substantial increase in the flexural strength (approximately 4 times) and toughness (about 40 times) of sisal fibre composites exposed to hot-water immersion. When shown, the positive impact of cement replacement material on improving the durability of sisal fibre composites was mostly attributable to a decrease in fibre mineralization as the alkalinity in the cement matrix was decreased.

Due to evaporation of water and the formation of drying cracks at later ages, the compressive strength of DPF reinforced concrete that was air-cured was lower than that of water-cured concrete. In terms of the flexural characteristics of DPF reinforced concrete, it was found that the initial crack strength of the fibre reinforced concrete was lower than that of the control concrete, despite increased ductility. However, increasing the fiber content beyond 2% would have a negative impact on the initial crack strength and ductility of the resultant fibre reinforced concrete. Furthermore, it was discovered in the same study that a dry, hot climate had a negative impact on the flexural performance of DPF reinforced concrete, which was ascribed to fast evaporation of water, which resulted in the formation of voids and micro-cracks. When OS was combined with cement paste, there was no substantial reaction, thus the OS simply served as a filler. According to studies, the workability of the OS deteriorated by up to 30% when it was employed as a partial fine aggregate substitute. The increase in water adsorption in the presence of OS caused the slump to decrease, resulting in a more viscous concrete. The unevenly flat OS particle has a worse workability, and the mixing friction has increased. When the aggregate replacement level was raised to 50%, however, the slump worsened, which was ascribed to a lack of coherence between the cement paste and the OS, as described by. The air content of the concrete containing OS was observed to rise due to the porous nature and uneven grading of OS.

In terms of compressive strength, most studies observed a reduction in concrete's 28-d compressive strength as fine aggregate replacement levels with OS increased. However, the 28-d compressive strength of concrete with and without OS was found to be fairly comparable. Nonetheless, as the age of the concrete grew in the research, the strength growth of the OS concrete was lower, eventually culminating in a lower compressive strength of OS concrete compared to the control concrete beyond 56 days. The stress concentration in the weaker OS aggregate was blamed for the OS concrete's poorer strength development. Most agricultural waste materials, especially those from the agriculture industry, are used as SCM because they contain a significant quantity of silica after being burned at high temperatures, such as banana leaf ash, bamboo leaf ash, wheat straw ash, elephant grass ash, and corn cob ash. The high silica concentration in these ashes allows for pozzolanic reactivity, which is advantageous to concrete's later age strength development. Furthermore, by selecting the best burning temperature and grinding the farmed agriculture waste, a better grade pozzolanic material with a higher silica content is produced. The temperatures at which the fire was lit. In general, the use of these agricultural farming waste as SCM would decrease the workability of concrete owing to the porous nature and fineness of the SCM; the strength of the concrete at an early age would also be reduced, if not comparable to the control concrete, as shown in the summary in Table 8. However, owing to the pozzolanic reaction of these SCM, conversion of $\text{Ca}(\text{OH})_2$ to extra calcium silicate hydrate (CSH) may occur, and the resultant concrete's later-age compressive strength may surpass that of the control concrete. The enhanced durability characteristics found in earlier studies were also attributable to the pore refinement effect caused by the pozzolanic reaction of the agricultural farming waste as SCM. When aquaculture farming waste, such as seashells, was used as a partial cement replacement, however, there was little improvement because the majority of the ash was CaCO_3 , and unlike agriculture farming wastes, seashells do not have pozzolanic behavior. In contrast to using agriculture farming waste as a partial cement replacement, when used in powder form as fine ag Due to the fineness of the material, its usage often resulted in decreased workability as a consequence of increased water consumption.

On the other hand, when aquaculture farming waste, such as OS, was utilized as a partial fine aggregate replacement in aggregate form, the strength characteristics were reduced. This was ascribed to the waste aggregates' lower aggregate strength as well as their form. However, owing to the substantially varied nature of the OS employed in various studies, there are conflicting findings on the impact of durability behavior. Several agricultural wastes, such as corn cob, OS, and PS, were tested as coarse aggregate replacements, and the concrete characteristics were all decreased in the presence of these materials, mainly due to the lower intrinsic strength of the materials as aggregate. However, one of the main flaws is the durability of the fibers in the cement matrix, since the fibers may be vulnerable to alkali attack, which occurs during the cement hydration process and may cause increasing brittleness and deterioration over time. However, the long-term durability of natural fibers in concrete may be enhanced with suitable pre-treatments such as heat treatment and the use of SCM to partly substitute cement.

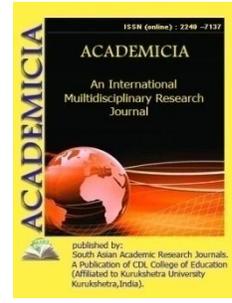

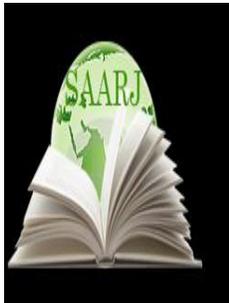

CONCLUSION AND IMPLICATION

In summary, this article outlined the possible use of a range of alternative agricultural wastes from both agriculture and aquaculture in concrete, including cement replacement, aggregate replacement, and fiber reinforcing. Although the use of agricultural waste materials may reduce certain concrete characteristics (such as workability and strength), based on the summarized

results in this study, the dose may be controlled to obtain acceptable concrete performance. Furthermore, these materials may be integrated into concrete for better mechanical and durability performance provided appropriate treatment (such as pre-treatment and burning) and material selection is carried out. As a result, the manufacturing of a more sustainable and green concrete may be accomplished, resulting in waste reduction and decreased negative environmental effect. This would result in more environmentally friendly building for the construction industry and a cleaner environment for society to live in.

ABSTRACT

This article in the literature explains the causes and complications of congenital heart disease in children, comparative diagnosis. This article presents information on the frequency and risk of congestive heart failure in the sympathetic nervous system in children. The most intensive development of a child is observed in the first year of his life. During this period, a significant increase in body weight and height is observed, and the functional activity of the central nervous system improves.

KEYWORDS: Heart, EXOKG Examination, Anthropometric Indicators.

INTRODUCTION

For every 1,000 live births in Uzbekistan, there are between 5.5 and 15.7 children with congenital heart defects. In 50% of cases, congenital heart defects cause disability among all congenital defects, and thus are among the problems of social significance [1,7].

The aim of our research is to compare anthropometric parameters and echocardiographic examinations in children with congenital heart disease. According to the European International Register of Birth Defects, congenital heart defects (CHDs) are the most common group of developmental anomalies in children and remain the leading cause of death in newborns [2,3,4]. Currently, there is a tendency to increase the number and weight of CHD [5,6]. Currently, there is a growing trend in the number and severity of registered CHD [6,10].

This concept has several drawbacks. First, it does not take into account the time of onset of the defect, and second, a number of anomalies of the intrathoracic vessels do not belong to CHD (e.g., permanent superior vena cava), which is important during surgery [1,8]. Third, diseases

such as cardiomyopathies and abnormalities of the cardiac conduction system ("Wolf-Parkinson-White phenomenon, long QT interval syndrome"), which lead to "structural abnormalities" and "functional disorders" [1,9], do not apply to CHD. Furthermore, the term CHD refers only to congenital defects of the thoracic regions of the great vessels (e.g., coarctation of the abdominal aorta). Although the concept of CHD is currently defined, it refers to anatomical deformity of the heart or large vessels developing in the uterus. 'can be rifled [2].

At present, CHD is the leading cause of death compared to other malformations in children and remains the leading cause of death [3]. In addition, a further increase in the prevalence of CHDs is expected. The main reason may be related to the improvement of diagnostic techniques associated with the improvement of the skills of ultrasound diagnostics specialists and the improvement of modern imaging techniques [6]. The most intensive development of a child is observed in the first year of his life. During this period, a significant increase in body weight and height is observed, and the functional activity of the central nervous system improves. Proper growth and weight gain are closely related to the development of functional abilities of organs and systems. Due to hemodynamic disturbances, TYuN has a direct negative impact on the development of the child. Some types of TYuN are associated with a sharp decline in quality of life, an increase in the number of chronic diseases [5], and the formation of delayed neuropsychic development (CPD) The authors also consider congenital defects of the heart to be a cessation of development at a certain stage of ontogeny, which corresponds to a particular stage of phylogeny. Within these theories, only atavistic heart defects (female and neutral) are compatible, and the whole group of male defects cannot be explained because none of the male components of congenital heart defects are compatible with normal embryonic or similar formation[6].

At present, CHD is the leading cause of death compared to other malformations in children and remains the leading cause of death [3]. The main reason may be related to the improvement of diagnostic techniques associated with the improvement of the skills of ultrasound diagnostics specialists and the improvement of modern imaging techniques [6]. Congenital defects are explained by the cessation of cardiac development at different stages of ontogeny; he interprets them as a return to one of the stages of phylogeny. The authors synthesize the previous two views, considering congenital heart defects as cessation of development at a certain stage of ontogeny, which corresponds to this or that stage of phylogeny. Dividing congenital heart defects and large vessels into males, females, and neutrals allows the patient's gender to be used as a diagnostic symptom. However, the male and female types of defects have a very large value of the coefficient of diagnostic value. For example, given the patient field data, the probability of diagnosis in a patent ductus arteriosus is 1.32 times higher. [6]

The study of the effects of external factors on the cardiovascular system is a current problem of applied medicine, which is confirmed by many modern studies aimed at studying the mechanisms of development of congenital heart defects, but the specificity of the types of response to external factors does not provide extensive confirmation of the findings obtained in clinical studies. As a result of our research, we divided patients into age groups and performed anthropometric changes and echocardiographic comparisons in children with congenital heart defects. Congenital heart defect - a permanent defect, deficiency and change in the anatomical structure of the heart; interferes with normal blood flow. Congenital and acquired heartworm are different. Congenital heart disease occurs as a result of malformation of the fetal heart and large

heart vessels during embryonic development. Poisoning of the mother's body in the early stages of pregnancy, suffering from certain diseases, biological effects of ionizing radiation, hereditary diseases, etc. k. causes. In infancy (up to 1 year of age), incomplete development of the cardiovascular system (e.g., incomplete opening of arterial pathways or oval foramen) is also considered a heart defect. The most common types of congenital heart defect are: abnormal pathways in various combinations between large and small circulatory circles, as well as the presence of narrowed or clogged areas in the major arteries of the heart (e.g., pulmonary artery and aorta) or misalignment of these vessels; mixed powders; defects in the number and structure of the heart chambers. Depending on the degree to which the arterial and venous blood is mixed, some congenital heart defects pass with cyanosis (blue powders), some without cyanosis (white powders). It depends on which direction the blood flows (in the direction of the shunt), the degree of pressure rise in the pulmonary artery, and the condition of the heart muscle through the improper holes that connect the large and small circulatory circuits. Symptoms of congenital heart disease include physical abnormalities, paleness or bruising, shortness of breath, changes in heart size and condition, heart murmurs, and more The aim of the study: To study the anthropometric parameters and comparative features of echocardiographic changes in the heart in children born with congenital heart disease (0-3 years).

Research material: The study was conducted at the Bukhara Regional Multidisciplinary Children's Hospital. It was conducted on the basis of bilateral agreements of Bukhara State Medical Institute. Children were divided into 3 groups: group of children aged 0-1 years (n = 20); The results of the examination of the group of children aged 1-2 years (n = 20) and the group of children aged 2-3 years (20 = 10) were studied. The methodology of anthropometric study of children was used to conduct anthropometric measurements (Methodological recommendations on the morphometric features of the assessment of physical development of children and adolescents //N.H. Shomirzaev, S.A. Ten and I. Tukhtanazarova, 1998). Anthropometric research included height, body weight, body length, and chest circumference measurements. Echocardiographic examinations obtained the results of ultrasound anatomy of the heart. The study was conducted on a SONOACE R3-RUS device with linear (7.5 MHz) and convex (3.5 MHz) transducers. In this study, the linear dimensions of each part of the heart, the thickness and volume of the heart were studied using the formula of J. Brunn and co-authors (1981): $V = K \cdot [(L1 \cdot W1 \cdot T1) + (L2 \cdot W2 \cdot T2)]$, where V - gland volume index (cm³), K - coefficient equal to 0.479; L, W, T - length, width and thickness of each piece of cloth. Mathematical processing was performed directly from the Excel 7.0 general data matrix using the capabilities of STTGRAPH 5.1, standard deviation indicators and representation error were detected. **Research results and discussion.** Studies have shown that in children from birth to 1 year of age, height ranges from 65.2 sm to 77.5 sm, with an average of 70.1 ± 0.9 sm, and in children from 1 to 2 years of age from 70.4 sm to 78.3 sm, on average 75.2 ± 0.4 sm, children aged 2 to 3 years were found to have an average height of 82.1 ± 0.2 sm from 76.0 sm to 87.4 sm.

In newborns to 1 year of age, body weight ranged from 3.4 kg to 7.2 kg, with an average of 4.1 ± 0.9 kg, and in children from 1 to 2 years of age ranged from 7.5 kg to 10.2 kg, with an average of 8.5 ± 0.6 kg, 2 to 3 years of age averaged 10.3 ± 0.4 to 9.0 kg to 12.1 kg.

TABLE № 1. INDICATORS OF PHYSICAL DEVELOPMENT OF CHILDREN FROM BIRTH TO 3 YEARS IN THE STUDY

№	Indicators	Children 0-3 years (n = 30)		
		Children 0-1 years old (n = 20)	1-2 year old children (n = 20)	2-3 year olds (n = 20)
1	Height, sm	70,1 ± 0,9	75,2 ± 0,4	82,1±0,2
2	Body weight, kg	4,1 ± 0,9 кг	8,5 ± 0,6	10±0,4
3	Chest circumference, sm	40,2± 0,6	43,4 ± 0,5	45,2± 0,8
4	Abdominal circumference, sm	39,0± 0,4	42,3± 0,5	45,4 ± 0,6

Note: * - reliability level $p \leq 0.05$ compared to the previous group

Echocardiographic parameters of the heart in children from birth to 3 years Right atrium from 8,1 mm to 10.2 mm in children from birth to 1 year, average - 9.15 ± 0.1 mm, pulmonary artery width in children of the same age from 9.2 mm to 11.0 mm, average $10.2 \pm 0.1.1$ to 2 years of age toright atrium 8.5 mm 15.1 ± 0.1 mm on average 16.05 mm, pulmonary artery width 11.2 mm to 13.3 mm 12 in children of the same age 3 ± 0.3 mm. In children aged 2 to 3 years, the right atrium 10.1 from 16.2 mm to , average $18.2 \pm 0,3$ mm, and the pulmonary artery width averaged 13.2 ± 0.3 to 12.1 mm to 14.5 mm. reaches

TABLE №2. COMPARATIVE FEATURES OF ECHOCARDIOGRAPHIC PARAMETERS IN CHILDREN FROM BIRTH TO 3 YEARS

№	Indicators	Children 0-3 years (n = 75)		
		Children 0-1 years old (n = 25)	Children 1-2 years old (n = 25)	Children 2-3 years old (n = 25)
1	Right atrium , mm	9,5 ± 0,1	10,2±0,1	18,2± 0,3
2	Pulmonary artery width, mm	10,2 ± 0,1	12,3± 0,3	13,2± 0,3

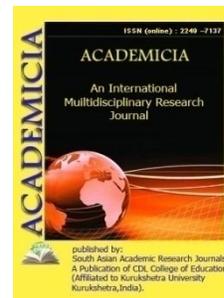

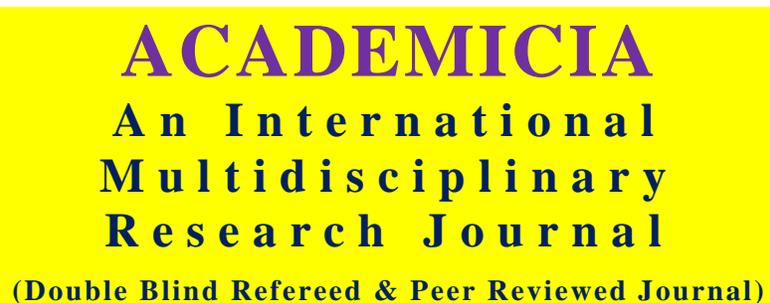

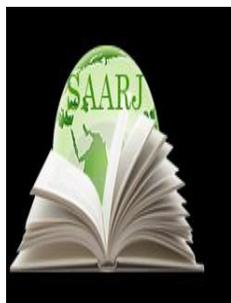

Note: * - reliability level $p \leq 0.05$ compared to the previous group

Anthropometric studies among children born with congenital heart defects from birth to 1 year of age showed that children born with interventricular septal defect had a height gain of 0.9 sm higher than children born with interventricular septal defect, and children weighed 0.63 kg more than children of the same age. detected. In children aged 1 to 2 years, children born with interventricular septal defect were found to have a height of 0.4 sm compared to children born with interventricular septal defect. Children of the same age had a body weight of 0.6 kg. Children born with interventricular septal defect in children aged 2 to 3 years were found to be 0.3 sm taller than children born with interventricular septal defect, and to have a body weight of 0.3 kg more than children of the same age..In children born with congenital heart disease from birth to 1 year of age, the circumference of the thoracic circumference was 0.6 sm higher than in children born with interventricular septal defect, and in children of the same age the abdominal circumference was 0.40 sm higher. Children born with congenital heart disease with congenital heart failure Children with congenital heart disease 0.5 cm higher than in newborns and 0.5 sm higher in children of the same age. Children born with congenital heart disease between the ages of 2 and 3 years , 8 sm, and in children of the same age, the abdominal circumference was found

to be 0.6 sm higher. Conclusions: According to the data obtained, children born with congenital heart disease from birth to 1 year, 1 to 2 years, 2 to 3 years with congenital heart failure, compared with children born with interventricular septal defect (height, body weight, chest circumference, abdominal circumference) was found to be high. Echocardiographic examination revealed that children born with congenital heart defects from 1 to 2 years of age, 1 to 2 years of age from 2 to 3 years of age, **children with congenital heart failure, children born with interventricular septal** defect (aortic width, pulmonary artery width) had lower body weight and height. found to be consistent with growth rates.

ABSTRACT

The article studies the peculiarities of the lexeme «taste-» in English and its role in the speech act as well as their stylistic features. The article discusses the properties of pragmatics as a branch of semiotics and its expression in the utterances of the Uzbek language. The article deals with the classification of the mind and the object of language relations and the sensitivity of different parts of the tongue and oral cavity, the evaluative concepts related to taste receptors, the various semantic features of the words that make up the semantic field of “taste” are explained on the basis of English and Uzbek materials.

KEYWORDS: *Lexical-Semantic Field, Intensity, Taste, Syntagmatics, Paradigmatics, Polysemantic, Seme. Perception, Lexeme, Semantic Field, Semantics, Pragmatics, Syntax.*

INTRODUCTION

It has been noted in various works that pragma linguistics is the study of the linguistic system that is activated in a speech situation (context), the study of language in terms of its intended purpose, a science that studies language in terms of its intended purpose, theory describing speech acts, theory of conversion (oral speech) analysis, is the field of study of linguistic means of expressing interpersonal relationships.

Pragmatics is one of the most important branches of semiotics, a field of linguistics that studies the use of linguistic derivatives that emerge in the speech process. In other words, a contextual movement that expresses an opinion about the movement of pragmatics and represents a situation related to human activity is an area that studies relationships.

All types of speech are formed on the basis of the semantics and verb form of the leading verb that carries the basic information. Pragmatics, on the other hand, uses various elements of speech

- auxiliary tools used in speech – *I think, probably, of course, after all, both* deals with a deeper analysis of the nature of such tools.

In addition to its semantic meaning, the uttered sentence (thought) has its own pragmatic meaning, i.e. it also performs a pragmatic function. For example, the words "*I can do it*" to the person standing next to the cook mean "*I can make any dish delicious and sweet*" depending on the situation. This is its pragmatic meaning. There are cases when the semantic meaning of a sentence does not fully correspond to its functional-pragmatic meaning. For example, the saying, "Pick up collect sweet peppers!" It means *picking peppers with the usual taste*.

The Main Part

Analyses of English dictionaries have shown that the lexeme "taste" has a polysemantic nature and can have different meanings, both when taken separately and as part of phrases and phraseological combinations. This makes it difficult to determine which of the meanings associated with the taste lexeme can be invariant or general. With this in mind, we found it necessary to analyze from a semantic point of view the units of "taste" and related morphological and syntactic structures listed in dictionaries.

It is important to study the semantic field "Taste-taste", its semantic subject groups, the spiritual relationship between them. Based on the archetype "Taste-taste", we divide the scale of the field into the following content groups (groups):

- 1) Qualitative qualities typical of simple taste: *tasty, sapidity, flavor, sweet, savor, delicious, relish, smark, bittersweet, sour, acid, four;*
- 2) Description of complex taste qualities: *bit, fondness, partiality, predilection, relish, sample, smack, touch, critique, delicacy, discernment, elegance, gestation, judgment, nicety, perception, predilection, refinement, sapidity, savor sensibility;*
- 3) Description of the identified complex types of taste: *bad taste, cheapness, crassness, crudeness, gaucherie, immodesty, impropriety, inelegance, showiness, tastelessness, vulgarity;*
- 4) qualify for an unexpressed differentially complex type of taste, for example: *acute (complex with taste-causing properties): untasty, unpleasure;*
- 5) Qualified taste of low intensity, delivered with additives: *tasteless, taste sensation. unsalted, unsalty. blah, bland, dull, lazy, mild;*
- 6) high-intensity sorting taste: *apathy, aversion, blandness, coarseness, disgust, disinclination, dullness, hate, hatred, idleness, indelicacy, indiscrimination, insipidity, laziness, lethargy, lot salty, brackish, briny, piquant, pungent, racy, saline, salted, spicy, tangy.*

It is the presence of the semantic "taste" that is the basis for the combination of the qualities that express and evaluate taste. The core of the field is the taste. Typically, researchers distinguish four main taste traits: sour, sweet, bitter and salty. The rest of the taste buds are grouped around them. Researchers have repeatedly pointed out that the nature of taste is expressed not by describing the objective structure of the senses, but by referring to the information carrier. Therefore, the basic meaning structure of taste qualities is as follows: $\langle \text{Taste} + N + [\text{rating} + \text{intensity}] \rangle$ where N is the standard, the size of the data carrier. For example, sour - "lemon - a red sour-fruited shrub with vinegar taste (juice)." For example; Sour - "lemon vinegar tastes as

sharp as juice." At the same time, "...each nation's idea of a particular taste is associated with different" reference objects. " Thus, the Uzbeks associate the bitter taste with pepper, and the British with the taste of orange peel or coffee grounds. The semantics of 'assessment' and 'intensity' can also be incorporated into the core of the lexical meaning and form its periphery to indicate the intensity of the manifestation of the taste trait and the speakers' sorting and evaluative attitude towards the trait. In the Taste field, enter the following attributes:

1) Adjectives meaning "N + [rating + int] taste". It consists of the following:

a) This value for quality is primary – *nordon, chuchuk, shirin, achchiq / sour, acid, sweet, bitter, tart*;

b) Relative adjectives in which the definition of a taste attribute is secondary – *sho'r, shuvoqli, temirli, asalli, asal hidli va boshqalar / salty, briny, metallic, honeyed, spicyetc.* Carrot, strawberry, vanilla, sugar, metallic, irony flavors, etc: new taste features can be observed in Uzbek with different semantic relative adjectives. Therefore, the taste field in Uzbek is an open system. In English, where word formation is mainly a method of conversion (similarity), we can talk about the openness of the field of taste determination (sugary, saccharine, strawberry, salt), in contrast to the language, which is dominated by normal groups.

2) Adjectives that have a taste of "N" and the reason is "A" – *taxir, nordon, achigan - rank, rancid, angry, rance, ranci.*

3) qualities that have a meaning that indicates the intensity of the manifestation of the taste. According to their semantic structure, they have the following form: a) "N taste + int> + [rating (-)]" - *shirin, shirali (sweet, juicy)*. In Uzbek, the intensity of a taste attribute can also be reduced. In this case, the units formed by reduplication form a lexicogramatically whole: : *shira-sho'r (salty)*; The complex properties of the second component overlap: *shirin-shakar, achchiq-taxir (sweet-sugar, bitter-sour)*; complex adjectives with synonymous components: *nordon-achchiq, chuchmal-shirin (sour-bitter, sour-sweet)*. Excessive manifestation of a taste attribute is often unpleasant to taste, so the semantics of Uzbek adjectives include a negative evaluation semantics. There is no assessment in English.

4) Qualities that indicate complex taste characteristics. This section is represented by two groups. The first group combines adjectives meaning "N1 + N2 taste", where N1 is the first reference marker and N2 is the second reference marker: *sweet and sour ("taste of sugar and lemon"), bitter-salt ("taste of sour and salt"), bitter almonds ("sour and almond flavor")*. In English, these are *sour-sweet (sour-sweet)* and *bitter-sweet (bitter-sweet)* adjectives. The second group of adjectives means "having N + taste": *bog'lovchi, tortiq, ta'mi o'tkir, qamashtiruvchi/ astringent, tart, piquant, pungent, acerb.*

5) Attributes that represent a taste attribute, regardless of any data carrier, with values: a) «taste + rating (+)» – *mazali, ishtahali, suvli, shirin, mazali – flavourous, savoury, delicious, palatable, succulent, tasty, appetizing, sappy, juicy, fruity, dainty*; b) "tasty + rating (-)" – *bemaza / distasteful, unpalatable*; c) "tasteless [rating (-)]"– *ta'msiz, chuchuk/ asteless, insipid, flavourless, unflavoured*. These qualities can be generalized according to the closeness of meaning, so they are divided into "sweet", "sour", "bitter", "salty", "delicious", "tasteless", "tasteless". The same adjectives can be part of different sema groups, for example, salty (*salty /*

unsalted) is an antonym of the adjective and is included in the same group; on the other hand, it shows that it has no specific taste, in which case it can be included in the group of "tasteless".

The adjectives in the Tart group are a combination of several semantic fields: «ta'm», «sezgi», «shakl» and «qisqarish xususiyati»/ «Taste», «Touch», «Shape» and «Contraction Property». Thus, the "taste" takes the adjectives, *qamashish, nordon/ acerb, acrid, pungent, piquant* / located in the nearest center of the field. The Uzbek adjective tends to be the center of the "shortening feature" area, which is closer to the "taste" area than its English equivalent (crunchy, dazzling). Sharp adjectives are included in the field of "form" in the basic sense, but in the secondary sense they belong to the field of "taste". In the Uzbek language, the main taste features are divided into *nordon, achchiq va sho'r (sour-sweet, bitter-sweet, sweet-salty)*, which are associated with sweetness through a mixture of *sour, bitter and salty flavors; also associated with salty and bitter (achchiq-sho'r, sho'r-achchiq - bitter-salty, salty-bitter)*; *shirin va sho'r - sweet and salty* are contrasted by the absence of a semantic component. Closer to the basic taste characteristics are the qualities that are synonymous with them (*sirka, shakar, asal, qiyom, shuvoq, qand*) / (acetic, sugar, honey, treacle, wormwood, sweet) They are qualities that indicate taste (acquired taste: sour, sour, sour, dark / acquired a taste sign ": sour, sour, sour, rancid". 'mga shows different levels of specificity, as a result, these words are adjectives that indicate taste (*nordon, nordon, nordon, qoramti / acquired a taste sign ": sour, sour, sour, rancid*)). Then there are the basic qualities that indicate different levels of taste. Taste fields are semantically similar in English and Uzbek and differ only in quantity. There are «Nordon» va «achchiq» / "acidic" and "bitter" groups, which are central to the two similar languages. In the near periphery are placed synonyms of the main qualities and attributes meaning "acquired taste attribute", which also act as synonyms of the dominant qualities. The long periphery also has adjectives that represent different levels of attribute in Uzbek. It should be noted that the isolation of the group of "salty" words, which differ from each other, is typical of the English language.

Probably the main taste marks for the English mentality are *shirin, achchiq va nordon hamda sho'r* sweet, bitter and sour and salty / sweet, bitter and sour, and salty / although it is an important taste sign, it is still associated with the main things it's not. In the Uzbek language, all taste signs have a complex relationship, but the center is still a "sweet" sign. The number of taste attributes varies with language, but this difference does not mean that some taste definitions are lacking in the languages being compared. Uzbek is a synthetic language, the degree of manifestation of different properties (*nordon, nordonroq, o'ta nordon, shirin, shirinroq, o'ta shirin*) / (*sour, sourer, very sour, sweet, sweetish, sweetest*) / has an advanced system of affixes that allows transmission. In English, the analytical constructions "form + quality" often correspond to them: slightly sweet (=shirinroq), extremely sweet (=shirin).

"Taste" lexemes can also be used as a variety of stylistic means in speech. For example, this lexeme can be used in speech by making metaphorical and metonymic models. For example, the metaphorical model of "Taste - pleasure (pleasure, spiritual pleasure)" reveals the human imagination as a space (object) with dimensions of depth and breadth.

CONCLUSION

In addition, the metaphorical model of "taste - meaning, logic" is widely used. *Logical taste* - refers to a person's positive feelings, while *avoiding taste* - refers to negative emotions such as

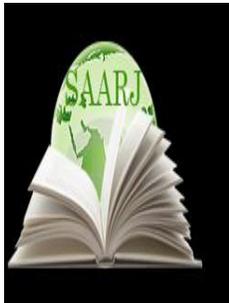

evil. For example: *Both Isomat's words and the applause of the many drinkers of tea made Mullah Berdiyev lose his taste.*

Along with metaphorical models, metonymic models of the type "taste - human" are also used. For example: *Look at the taste that escaped me these days!*

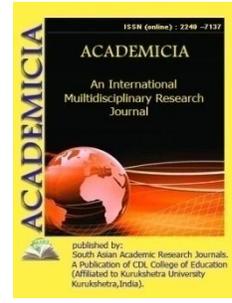

Lexemes with the semantic "taste" combine with lexemes belonging to different word groups and express their pragmatic meaning by expressing the connotative meanings that are related to it. When it is used in speech, its pragmatic features (connotative meaning) always appear as an accompaniment to it. Based on the above considerations, it can be said that "taste" is one of the most important perceptions of human beings. Serves as an object for instant research as one. An analysis of the pragmatic, semantic, and polysemantic features of words with the semantic "taste" in English and Uzbek shows that the role of English lexemes "taste" in information retrieval and There is a commonality between the stylistic features of the montage. In English and Uzbek, the adjectives and synonyms of the document, which represent the different spiritual properties and different levels of the words that make up the taste field, give additional results in a figurative sense in addition to their meaning.

ABSTRACT

Plastic solid waste (PSW) of polymers such as high density polyethylene (HDPE), low density polyethylene (LDPE), Nylon, and others) is posing new difficulties, which are significant research concerns in today's situation. Production of various goods made of various plastic materials has increased dramatically. This massive rise in plastic goods has resulted in increased trash production, posing new problems. Some studies have published findings in the area of PSW management using various recycling techniques. This article summarizes the numerous research projects undertaken by researchers in the area of recycling, as well as the progress made in the recovery and management of PSW using various methodologies (i.e. primary, secondary, tertiary, and quaternary) and various identification/separation approaches. This study also looks at how various reinforcements, such as sand, natural fiber, hemp fiber, metal powder, and others, affect the characteristics of virgin and recycled HDPE/LDPE/Nylon PSW.

KEYWORDS: *Plastic Waste, Plastic Trash, Polymers, Recycling, Solid Waste.*

INTRODUCTION

Plastic solid waste (PSW) recycling, recovery, and management is a problem in today's world. Many commodities are produced using plastics, and industries are becoming increasingly interested in the area of plastic production. Plastics have become an integral element of modern life, and worldwide plastic manufacturing has skyrocketed in the previous 50 years. Traditional plastics are very durable and do not breakdown easily in the environment[1]. Plastics will never

disintegrate and will stay on the landscape for many years. In typical environmental circumstances, polymer takes hundreds of years to decompose. Plastic trash is hazardous because its pigment includes many extremely poisonous trace elements. As a consequence, environmental contaminants emitted by synthetic plastics have been recognized as a major source of concern. PSW is manufactured on a large scale throughout the globe, with annual output exceeding 150 million tonnes. Every year, India consumes about 8 million tonnes of plastic goods, with this figure projected to increase to 12 million tonnes by 2012.

Plasticized PVC is widely used in the manufacture of pipes, window frames, floor coverings, roofing sheets, and cables, and as a result, it is often discarded. Packaging films, wrapping materials, shopping and trash bags, fluid containers, clothes, toys, home and industrial goods, and construction materials are among its many uses. Furthermore, a virgin plastic material can only be recycled 2 to 3 times since the strength of the plastic material decreases with each recycling owing to heat deterioration[2]. Solvents with hydrogen donor capabilities, in particular, have a role in the thermal breakdown of polymers, influencing hydrocarbon production and dispersion. It is worth noting that no accurate estimate of total plastic trash production exists; nevertheless, given that 70% of total plastic consumption is thrown as garbage, the nation generates about 5.6 million tons of plastic waste per year (TPA), or about 15342 tons per day (TPD) (CPCB). A study was performed to examine the demand for different kinds of plastic. PVC, PP, and HDPE all contribute more to the use of plastic, as can be seen in this bar graph. Plastic use is rapidly rising due to a variety of benefits like as flexibility, cheap cost, and excellent chemical stability[3]. Plastic trash from household waste is mostly made up of polyethylene and polypropylene. The more the consumption, the greater the demand for recycling to reduce the usage of raw materials. HDPE (high density polyethylene) LDPE (low density polyethylene) and nylon are the most common raw materials for plastic goods. Plastic makes up a large portion of municipal solid trash, and it is often made up of packaging debris as well as abandoned equipment and products. It cannot be dumped into the environment because of its nature. As new goods are launched on a regular basis, this figure is worsening. This may be very harmful to the ecology and the planet. Plastic trash is causing issues for the environment as well[4].

According to a research, greenhouse gases such as methane emissions produced by fossil fuels have the potential to cause global warming. The trash that is generated on a daily basis, on the other hand, has a far greater potential to release carbon dioxide as a greenhouse gas. It's worth noting that carbon dioxide has 21 times the global warming potential of methane. Plastic polymer use and manufacturing are determined by demand and availability. However, the use and manufacturing of different plastic polymers are not equal in India. In India, each individual consumes 9.7 kilogram of plastic[5]. The study produced by Tata Strategic on the use and production of different plastic wastes. This data plainly shows that there is a significant disparity between polymer demand and production. The use of fresh material to fill these voids is on the rise. Plastic product use can only be decreased to a limited degree, but new material usage may be minimized via recycling and management methods. Many studies on PSW recycling and recovery have been published[6]. In a study, the Delhi-based Central Pollution Control Board claimed that 90% of PSW is recyclable. Eighty percent of post-consumer plastic is disposed of in landfills, eight percent is burned, and seven percent is recycled. Because land filling of HDPE

has severe implications in terms of GHG (greenhouse gas) generation, PSW may be made acceptable for other uses by using various techniques.

Aside from the environmental problems associated with land filling, disposing of vast quantities of leftover fabric is a significant waste of resources and energy. The application domain of recycled plastic may be expanded by strengthening various particles. It may be used to create particle board because wood-based particle boards are formed by compressing different layers with urea formaldehyde-containing glue or resin, and this formaldehyde has the potential to cause a variety of illnesses, including cancer. HDPE, polypropylene (PP), polyvinyl chloride (PVC), wood flour, modified MMT, and glyceryl methacrylate are blended to make a wood plastic composite (GMA). As a result, recycled plastic may be utilized as a resin. Primary, secondary, tertiary, and quaternary recycling methods may all be used to recycle materials[7]. All kinds of polymers and metals may now be recycled thanks to technical advances in industry. Three techniques of plastic recycling have been proposed by certain researchers. The first step is to mechanically separate plastic trash for secondary usage. The second approach is divided into two parts: energy recovery via incineration and pyrolysis for use as fuels or polymer feedstock. The third technique involves bringing the polymer to the point of biodegradation, although this is extremely dependent on the kind and environmental circumstances. Following this, it can be stated that plastics play a significant role in municipal and industrial trash. This article focuses on the processing of various plastic-based products as well as their recycling techniques.

PSW is a significant contributor to the trash produced on a worldwide scale. Because of the increasing production and use of polymer materials, polymer disposal is becoming a worldwide problem[8]. The varying levels of waste production in many nations depending on their socioeconomic levels has become a significant problem for PSW disposal and management. Trash management is a complicated process that requires a variety of data from many sources, such as influencing variables in waste production, large-scale predictions, and trustworthy data. Each year, at least 93 million tonnes of trash are produced throughout Eastern and Central Asia[9]. The amount of trash generated per person per day varies from 0.29 to 2.1 kilograms, with an average of 1.1 kg/capita/day (OECD report 2010). The Organization for Economic Co-operation and Development (OECD) is a 34-country international economic organization that includes AFR (Africa), SAR (South Asia), MENA (Middle East and North Africa), ECA (Eastern and Central Asia), LAC (Latin America and the Caribbean), and EAP (East Asia and the Pacific Region). Solid waste management accounts for less than 5% of worldwide greenhouse gas emissions (GHG). International effort to reduce greenhouse gas (GHG) emissions is increasing in response to rising worries about the danger of climate change, and the solid waste management industry is anticipated to play a role[10].

DISCUSSION ON RECYCLING OF PLASTIC WASTE

PSW recycling is restricted to a certain number of cycles since the product loses some of its characteristics after recycling, such as strength and stability. After a certain amount of recycling, the only option for disposing of PSW is to land fill it. However, land filling pollutes the earth's surface. Land filling also results in carbon dioxide emissions. Plastic also leads to health problems such as skin corrosion/irritation, aspiration danger, severe eye damage/irritation, and so on. Because polymerization processes take a long time to complete, unreacted residual monomers are often discovered in polymeric materials, many of which are harmful to human health and the environment. As a result of the many polymers/plastic-based products available on

the market or as trash, Thermosetting long strands and thermoplastic short link materials are the two main types of plastic. Thermosetting plastic materials cannot be recycled again, while thermoplastic plastic materials may be recycled to some extent. The emphasis of this review is only on thermoplastic materials.

Low Density Polyethylene (LDPE), High Density Polyethylene (HDPE), Polypropylenes (PP), Polystyrene (PS), Polyethylene Terephthalate (PET), and Polyvinyl chloride are the six major families of plastics (PVC). Virgin plastics are readily accessible and produced using traditional methods, yet they are on the brink of replacing fossil fuels in terms of energy use. To begin with, plastics may be thought of as a kind of stored potential energy since the manufacturing of virgin plastics consumes 4% of global oil output, or 1.3 billion barrels per year. As a result, it is always a good idea to reuse and recycle plastic trash. This effort discusses and elaborates on some of the most well-known and widely utilized plastics. PVC is a versatile polymer that may be made into a broad range of short- and long-term goods. PVC usage accounts for 12 percent of overall demand among these main kinds of plastics. In 2013, the global PVC manufacturing capacity was estimated to be about 61 million tons. Plastic recycling is mostly determined by the kind of plastic. The kind of plastic is not guaranteed by trash collection. The problem of recycling compatibility must be addressed first. There may be a lot of plastics in a collection. To separate out different materials, segregation of plastic is required. Because of the various melting temperatures, combining one polymer with another may result in a decrease in the characteristics of recycled material. LIBS (laser induced breakdown spectroscopy) is a novel analytical method that uses pulsed laser sources. It's used to distinguish between different types of plastic trash. The study of the main constituent carbon and hydrogen contained in polymer matrices demonstrates the capabilities of this method.

For spectrum analysis and fingerprinting of different types of plastics, a laser-produced plasma emission is recorded. This method can identify a total of six plastic materials: Low Density Polyethylene (LDPE), High Density Polyethylene (HDPE), Polypropylenes (PP), Polystyrene (PS), Polyethylene Terephthalate (PET), and Polyvinyl chloride (PVC). Calibration is accomplished by shining a laser beam of a particular wavelength from a laser onto some previously recognized plastic waste material. For all PSW materials that need to be recognized, this process is followed. The key to successful recycling is accurate and efficient plastic identification and categorization. Because the value of recycled materials is determined by fraction purity, it is possible to make more precise decisions regarding separation technology based on the identification of the plastics. - Electrostatic separation is a phrase used to describe a large class of contemporary waste management technology that is widely used for separating granular mixes using electrostatic forces acting on particles with a typical size of about 5 mm. This is also known as free-fall. Triboelectric separation is extensively used for sorting and purifying granular materials derived from industrial plastic waste. In addition, there are two different kinds of triboelectric separation methods. One is a roll-type corona-electrostatic separator, which is used to separate plastic materials from metal components. When two materials are fed and spun at a certain speed in this triboelectric separator, the material within experiences two kinds of forces: particle/particle forces and particle/cylinder wall forces. When two materials rub against one other, charge appears on the particles of the materials. One receives a positive charge, while the other receives a negative charge. Then When a material

particle travels through a strong electrostatic field, forces operating between them cause separation.

When PVC is brushed with Teflon, for example, the latter gains a negative charge while the PVC gains a positive charge. Almost any plastic substance may be sorted out using this kind of separation method. However, the greatest separation of material with a particle size of 2-4 mm is limited by this method. Furthermore, it is a method for determining the chemical composition of a broad variety of materials, including metals, cements, oil, polymers, plastics, and the food sector. If excellent reference specimens are available, this method should provide very high accuracy. The time it takes to measure particles varies depending on the amount of components to be identified, and it may take anywhere from a second to 30 minutes. This method involves irradiating a sample with x-rays generated by a source. In most instances, x-ray tubes are utilized, although synchrotron or radioactive material may also be used. The under-inspection element will emit fluorescent X-ray radiation with distinct energies (corresponding to colors in optical light) that are unique to specific elements. A distinct color represents a different amount of energy. It is possible to identify the element by measuring the colors emitted by it. This is a qualitative study. The intensity of color may also be used to determine the quantity of an ingredient. By comparing the spectra of waste samples to those of various model polymers, FT-IR is utilized to identify different kinds of polymers and plastic materials. It's used to get an infrared spectrum of a solid, liquid, or gas's emission or absorption.

A FTIR spectrometer gathers high spectral resolution data across a broad spectral range at the same time. This gives it a big advantage over a dispersive spectrometer, which only measures intensity across a small range of wavelengths at a time. The structural changes as a function of strain are also investigated using FTIR spectroscopy. FTIR spectroscopy has previously been utilized to investigate structural changes as a function of strain. This technique is currently being utilized to analyze the structural changes that occur during polymer recycling. This method was used to separate PET, PVS, and PS, with extremely remarkable results in plastic separation, with 83 percent of the PET being recovered. Another polymer separation method used to detect various plastic polymers is froth flotation. Alter was the first to suggest that froth flotation might be used to recover plastics based on their critical surface tension. Some writers have discovered an issue with huge amounts of plastic garbage. Because of the hydrophobic characteristic of all plastic/polymer materials, froth flotation is difficult because air bubbles in the substance cause it to float. Flotation of material is caused by both hydrophobicity and gravitational force linked to mass. For the recovery of polymers in this experiment, wetting and foaming agents are required. As a wetting agent, calcium lignin sulfate is employed, as well as pine oil and MIBC (methyl isobutyl carbinol) as a foaming agent. When pine oil is employed as a foaming agent, PVC recovery improves, while MIBC findings favor PET recovery.

Overall, froth flotation has been identified as a significant and efficient separation technique in mineral processing engineering, as well as a helpful approach for separating mixed polymers. The material to be separated is first fed into the first tank, then mixed with hot water with the aid of an electro- magnetic feeder. The average residence duration in this tank will be determined by the time it takes for appropriate mixing and full particle contact with water prior to caustic/alkaline treatment. Another container is used for the alkaline treatment. Again, the mean residence time must be chosen for mixing. After that, the pulp will be formed and passed through a vibrating screen to be rinsed with cold water. The surfactants are present in a tank where the

wetted material and cold water are supplied for chemical treatment. The length of time spent in residence is determined by the kind of alkali and chemical employed in the conditioning process. The alkali liquid's pH should be kept steady. The temperature of the water used for alkali treatment is critical and has a significant impact. Because it is often impossible to achieve high temperatures owing to a lack of adequate water heating equipment. After that, samples from various product streams may be isolated and collected at predetermined time intervals for examination and product weight estimation. The plants used for this treatment take up a lot of room, and cleaning and washing the materials has become a time-consuming task. Even if it necessitates more room for the plant installation, washing plants should be built in such a manner that every component can be readily accessed and cleaned. A separation technique that can detect very tiny changes in physical characteristics is required to generate high purity material from complicated streams of post-consumer trash of grade similar to materials produced by post industrial waste. This technique may aid in the separation of usable plastic from trash with the least amount of residual material.

After manual sorting, this technique focuses on identifying main plastic included in a certain waste composition. MDS is a physical separation technique based on material density differences. This optical sensing method may be used, however due to the size of the plastic substance present, it is not always effective. Separation by density is another technique. Electronic trash may be separated using this method by adding a modifier to water, although it may contaminate recovered plastic. It's used to separate polypropylene (PP), low density polyethylene (LDPE), and high density polyethylene (HDPE) from one other, as well as contaminated materials including wood, rubber, and minor metals. Because MDS separates a complicated mixture into several distinct components in a single stage using the same liquid, it has the potential to be extremely inexpensive. The whole procedure is carried out while the mixture runs through a conduit, and the layers are separated in seconds. There are four stages to setting up MDS: (i) Wetting, (ii) Feeding, (iii) Separating, and (iv) Collecting are the four steps in the process. The MDS setup's components are immersed in the liquid surface. The liquid utilized in this procedure is magnetic in nature and circulates throughout the setup, moving from left to right under the effect of pressure differences before returning. To make the surface hydrophilic and remove heavy polymers, the materials are first wetted with hot water for a minute.

Wet particles are placed in a stainless steel box with 1mm holes. To prevent turbulence produced by air in the system, the air in the feeding box is first evacuated before the box is placed in position. When the box's lid is opened, the particles begin to rise and subsequently flow into the separation channel with the mainline; here, the density of the material plays an important role. Different kinds of materials are available in powder and granule form on the market. The material is fed into the barrel by gravity via the hopper. The heaters that surround the cylindrical barrel may be regulated manually using a variety of temperature ranges. The temperature range of a standard screw extruder is typically up to 275 degrees Celsius, which is sufficient to melt thermoplastic materials. As soon as the material enters the barrel, it begins to heat up. The material begins to move forward, towards the die, as the screw turns. The length of the barrel is crucial. Screw speed has a significant influence as well. The material will not melt correctly if the screw has a higher speed because the substance will lead at a quicker pace. If the screw speed is too slow, the material will be overheated and the wire will not properly form. The screw forces the material positively into the barrel and leads it to the die. Melting temperature is a key

characteristic that influences the flow properties of polymers. Multiple heating zones are possible. These heating zones progressively raise the material's temperature. The pressure exerted by the screw on the material may exceed 5000 psi (34 MPa). After then, the material reaches the breaker plate, causing back pressure. This is necessary for consistent material melting and mixing.

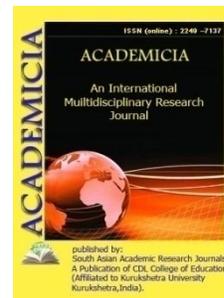

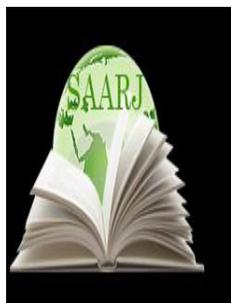

CONCLUSION AND IMPLICATION

This article discusses the many problems of PSW management, including material recycling. Reducing the usage of virgin materials and repurposing PSW will help to ensure the environment's and global warming's long-term viability. Landfilling, being the most convenient method of disposing of PSW, is growing worldwide problems while also raising space requirements. This article discusses different technologies, as well as separation methods, reinforced plastic material, and uses of reinforced PSW, in order to minimize land filling. The different separation/identification methods for PSW, such as froth flotation and MDS, are discussed in this article. Froth flotation is the most often used technique for separating large quantities of PSW in a single term. Contamination of collected trash due to lack of plastic separation may decrease the characteristics of the bi-product. Primary and secondary recycling techniques are widely utilized in Asian nations, however they have drawbacks in terms of losing different characteristics of PSW acquired as a by-product and using a lot of energy. Various researchers have attempted to produce goods with comparable characteristics to virgin material using a variety of different methods, such as tertiary, which involves chemical treatment of PSW in order to recover energy from the polymer, which is a petroleum product in the form of heat. Further, incineration is a recycling method in which PSW is utilized as fuel since it is a petroleum bi-product with little calorific value, resulting in natural resource sustainability. By reinforcing different fillers in polymer material to improve the characteristics, recycling of products using filler material is also becoming an interesting area.

ABSTRACT

The initial stage in plant breeding is to find appropriate genotypes with the required genes among existing kinds, or to develop one if none exist. Mutations are the primary cause of diversity in nature, and plant breeding would be impossible without them. In this context, the primary goal of mutation-based breeding is to create and enhance well-adapted plant types by altering one or two key characteristics to boost production or quality. In order to induce mutations in seed as well as other planting materials, both physical or chemical mutagenesis are employed. The first generation is then used to select for agronomic characteristics, with the majority of mutant lines being eliminated. The agronomic characteristics are verified in the second and third generations by phenotypic stability, with additional assessments taking place in future generations. Finally, only suitable mutant lines are chosen as a new variety or as a parent line for cross breeding. Rice is grown in Vietnam, Thailand, China, as well as the United States; durum wheat is grown in Italy and Bulgaria; barley is grown in Peru throughout Europe; soybeans are grown in Vietnam or China; wheat is grown in China; and leguminous food crops are grown in Pakistan & India. This article brings together data from across the globe on the effect of mutation breeding-derived crop varieties, highlighting the promise of mutation breeding

as a flexible and practical technique that can be used to any crop if the right goals and selection procedures are employed.

KEYWORDS: *Crop Improvement, Genetic, Mutation, Mutagenesis.*

1. INTRODUCTION

The mutation process results in mutant plants with novel and beneficial characteristics due to random genetic differences. In its most basic form, classical breeding entails the selective growth of plants with desired traits and the removal or "culling" of those with less desirable traits. Genetic diversity is widely recognized to be important in evolution and practical breeding. Natural variations do not reflect the original spectral range of de novo mutations. Rather, they are the consequence of genes recombining throughout populations, as well as their ongoing interaction with environmental variables. Green plants are necessary for human survival as food sources, clothing, as well as energy. To get non-poisonous or nutritious fruits, tubers, seeds, and other food items, ancient hunter-gatherers relied on their hunting abilities and plentiful natural flora, as emphasized in Larger and safer food sources were required as the human population grew, and large-scale production methods based on plant domestication were eventually created. Plant breeding is the process of creating new plant types for cultivation and human use[1].

The earliest technique of breeding was straightforward selection of desirable offspring, which relied on the occurrence of de novo mutations. After Gregor Johann Mendel established the principles of heredity in the 19th century, genetics became a key science of plant breeding. When the hybridization technique was established, however, plant breeding progressed much further. Its goal was to combine beneficial genes present in two or more distinct kinds to create pure-line offspring that were better in many ways to the parental types. Cross breeding (or recombinant breeding) is a popular technique in plant breeding that involves crossing various genotypes and then selecting traits. Later, in the late 1920s and early 1930s, Lewis John Stadler's work on inducing genetic changes via X-rays set the groundwork for mutant breeding, a new kind of plant breeding. Recombination of alleles on homologous pairs and their separate assortment during meiosis add to the diversity produced. All genetic differences in any creature, including plants, may be traced back to mutations. Natural selection uses the variety as a raw material, and it is also a driving factor in evolution. Because spontaneous mutations are uncommon and unpredictable in terms of incidence, they are challenging to utilize in plant breeding programs. In this manner, mutant variants with significant and minor phenotypic impacts emerge for a variety of characteristics. Mutation breeding is the process of creating and exploiting genetic diversity via chemical and physical mutagenesis in order to create new kinds. Along with recombinant breeding and transgenic breeding, it is currently a cornerstone of contemporary plant breeding. This technique, which is frequently complemented with germplasm obtained through induced mutation, has become the most popular for breeding plants via sexual reproduction, as Novak and Brunner point out[2].

Mutation breeding Mutagenesis is the process by which chemical, physical, or biological factors produce abrupt heritable changes in an organism's genetic information that are not caused through genetic segregation or genetic recombination. Three kinds of mutagenesis are used in mutation breeding. Induced mutagenesis, in which mutants arise as a result of ionizing radiation (gamma rays, X-rays, ion beams, etc.) or treatment with chemical mutagens; site-directed

mutagenesis, in which a mutation is created at a specific site in a DNA molecule; and insertion mutagenesis, in which mutations occur as a result of DNA insertions, either through genetic transformation as well as insertion of T Plant breeding requires genetic variety of beneficial characteristics for crop development, but numerous mutant alleles, as well as functional analysis of the targeted gene in many instances, are sources of genetic diversity for crop breeding. The method of finding individuals having a target mutation, which includes two main steps: mutant screening & mutant confirmation, is the most important part of mutation breeding. In contrast to the parent, mutant screening is a procedure that involves selecting individuals from a vast mutation population that satisfy particular selection criteria, such as early blooming and disease resistance. These choices, however, are often considered as putative mutant or false mutants[3].

The origins of plant modification have been claimed to date back to 300 BC, with accounts of mutant crops in China. See for a more in-depth analysis. Hugo de Vries discovered mutations as a method for generating variety in the late 1800s while working on the 'rediscovery' of Mendel's principles of heredity. this variation as heritable alterations caused by processes other than segregation and recombination. Figure 1 showing the process of mutagenesis. This phenomenon was characterized by him as rapid alterations in organisms that were hereditary and had rather significant impacts on the phenotypic appearance of the organism. subsequently created the word "mutation" and provided an integrated idea for the occurrence of abrupt, shock-like changes (leaps) in existing characteristics that result in the emergence of new species and diversity. After Stadler discovered the mutagenic activity of X-rays in maize, barley, and wheat, radiation-induced mutations as a method for creating new genetic diversity in plants progressed as a field[4].

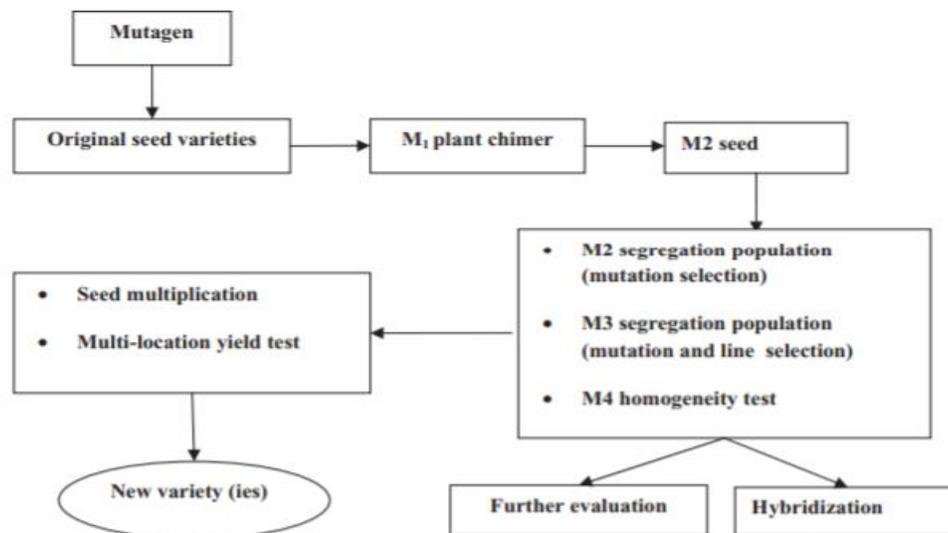

Figure 1: Illustrate the process of mutagenesis for crop Improvement.

1.1. Agents that cause mutations:

Mutagens are agents that cause artificial mutations. Chemical or physical mutagens are the two main categories in which they are classified. Planting materials are traditionally subjected to physical & chemical mutagenic agent to cause mutations in plants. All kinds of planting

materials, such as entire plants, typically seedlings, and in vitro cultivated cells, may be used for mutagenesis. Regardless, seed is the most frequently utilized plant item. Plant propagules including such bulbs, tubers, corms, as well as rhizomes, as well as the induction of mutants in leaves and roots plants, are becoming more efficient as scientists take advantage of totipotency (the capacity of an individual cells to divide as well as produce all the distinguishable cells in an organism to regenerate with whole crops) using single cells and other forms of in vitro propagation[5].

Vegetative cuttings, scions, or in vitro grown tissues such as leaves and stems explants, anthers, cell cultures, microspores, ovules, protoplasts, etc are used to induce mutations. Spikes, tassels, and other mutagenesis treatments are used to target gametes, which are typically found within inflorescences. Physical mutagens, on the other hand, cause large lesions such as chromosomal shortening or rearrangements, while chemical mutagens mostly cause point mutations. It's worth noting that the frequency or kinds of mutations are directly proportional to the mutagen's dose and pace of exposure or administration, not its nature. In the end, the selection of a mutagen will be influenced by a variety of variables, including the researcher's conditions, such as the mutagen's safety, simplicity of use, availability, efficacy in generating specific genetic changes, appropriate tissue, cost, and infrastructure[6].

Mutant cultivars' effects Induced mutation by different mutagens has helped to contemporary plant breeding by increasing genetic diversity. It has played a significant role in the creation of better plant types with traits such as high yield, early maturity, and lodging resistance, among others, all over the globe during the last five decades. The global effect of created and released variants in key crops. Several accomplishments in crop improvement via mutant breeding have resulted in two main outcomes: improved variations that can be grown commercially and novel genetic stocks with enhanced characteristics or greater trait combining capacity. Increased yield, improved nutritional quality, pest and disease resistance, early maturity, drought and salt tolerance, and so on are examples of these characteristics. Although the main goal of mutation breeding is to create new cultivars, the genetic stocks created may be utilized in a variety of ways in plant breeding, such as a donor parent in traditional breeding programs or as a parent in hybrid breeding programs. Apart from this, the goal of mutation research is to map genes, which is a completely distinct goal. Induced mutagenesis, a method for identifying a gene by knocking down its phenotypic expression, is a significant component of molecular genetics and genomics research today. The explanation of this method, however, is beyond the scope of this article[7].

- Direct use of a mutant line developed through physical and chemical mutagenesis, or Somaclonal variation.
- indirect use of a mutant line/lines used as a parental variety/varieties in interbreeding (cross between mutant lines or with a promotional variety/varieties)
- utilisation mutated gene allele (trait), such as the Calrose 76 sd1 allele (semi-dwarf 1 trait) in rice.
- use of mutant gene allele.

Incidence of mutant breeding in various nations Mutation breeding has been used on over 232 different crops and plant species, including wheat, rice, grapefruit, rapeseed, sunflower, cotton, and banana, among others. According to the Food and Agriculture Organization of the United

Nations (FAO)/International Atomic Energy Agency current database, mutant varieties with enhanced characteristics have been officially approved. Direct mutation was used to create more than 67 percent of the types. The induced mutant variants have agronomic & nutritional qualities that make these the market's most popular types. Some example of induced mutagenesis uses in plants for biotic stress resistance. Induced mutagenesis has also been used to create tolerant and resistant types to different abiotic stressors. Lodging resistance, acid sulphate soil tolerance in rice, salinity sensitivity in barley and sugarcane, and other traits are among them. Enhancement of crop productivity or various nutritional characteristics such as crude protein quality, amylose, phytate, protein content, and so on are also objectives of mutant breeding programs in diverse plants[8].

1.2. Mutants into Agriculture: A Effective Direct Application

1.2.1. Synthetic Biology's Potential

T-DNA insertion has direct use in the creation of novel genotypes, such as Golden rice, in addition to its use in functional genomics. To begin, the Golden rice was created by inserting T-DNA containing the genes phytoene synthase or lycopene cyclase and carotene desaturase in order to increase beta carotene synthesis, which is a precursor to vitamin A. With the development of functional genomic research, Golden rice 2 was created by inserting a T-DNA encoding phytoene synthase (from *Zea mays*) and carotene desaturase (from *Erwinia aureodovora*) into the rice genome. When compared to Golden rice, Golden rice 2 accumulates more carotenoids, making it a more promising source of vitamin A. While it's only been introduced in a few countries, including such Australia, New Zealand, Canada, as well as the United States, Golden Rice production may have a significant effect on reducing vitamin A deficiency. Other rice genotypes have been created via the insertion of T-DNA and have already been released in certain countries with a beneficial effect on agriculture, in addition to Golden rice.

2. LITERATURE REVIEW

Bhowmik et al. studied about CRISPR/Cas9 genetic modification is a game-changing technique that will help farmers create crops that will satisfy future demand. The lengthy life cycle of many agricultural species, as well as the fact that desirable genotypes often take many generations to acquire, make gene editing difficult to implement. Microspores are single-celled haploid cells that may grow into double-haploid seedlings and have been extensively utilized as a breeding technique to produce homozygous plants within a generation. They created an efficient haploid mutagenesis method using the CRISPR/Cas9 system and microspore technology to induce genetic changes in the wheat genome in this research. The usefulness and practicality of integrating microspore technology with CRISPR/Cas9-based gene editing for plant trait identification and enhancement are shown in this research[9].

Chikelu et al. studied about the options for producing more food by at least 70% over next four decades to keep up with a rapidly growing human population are bedevilled by erratic weather conditions, drained arable lands, decreasing water resources, and the significant environmental and health costs associated with increasing agrochemical use. Increasing productivity by using "smart" crop types that produce more with less inputs is a feasible alternative. However, genetic similarities among crop varieties—which make entire cropping systems vulnerable to the same stresses—combined with unvarying familial materials limit the possibilities for discovering novel alleles of genes as well as, thus, putting together new gene combinations to break yield

plateaus and improve resilience. Novel alleles are unmasked through induced mutation and used to create better crop types. The history, theoretical and practical concerns, and crop enhancement achievements of induced mutations are discussed, as well as how induced mutagenesis supports plant functional genomics. The contributions of cell and molecular biology methods to improving the efficiency of mutation induction, detection, and deployment are also discussed. In addition, the use of pre-breeding to facilitate the inclusion of mutants into crop development and the integration of phenomics into induced mutagenesis are recommended[10].

Liang et al. conducted research on Food security is a worldwide issue, and increased agricultural yields are needed to feed the world's increasing population. Mutagenesis is a useful technique for crop development that is not subject to the same regulatory constraints as genetically modified species. TILLING, that also combines traditional synthetic mutagenesis with high-throughput genomic sequence screening for genetic variations in desired genes to develop fresh mutant alleles for both genomic information and crop improvement, is a powerful way of creating novel mutant alleles for both genomic studies as well as crop improvement. TILLING is applicable to all genomes, whether small or big, diploid or even allohexaploid, and has a lot of promise for solving the fundamental problem of connecting sequence information to gene activity and modulating important characteristics in plant breeding. TILLING has been successfully used in a variety of crop species, and current TILLING progress is described here, with a focus on advancements in mutation detection technologies, TILLING application in gene functional research, and crop breeding. TILLING or Eco TILLING's potential for agricultural enhancement and functional genetics is also addressed. In addition, a small-scale forward approach including backcross and selling was used to unleash mutant traits that had been masked in M2 (or M3) plants[11].

3. DISCUSSION

The mutation process results in mutant crops with novel and beneficial characteristics due to random genetic differences. In its most basic form, classical breeding entails the selective growth of plants with desired traits and the removal or "culling" of others with less desirable traits. The initial stage in plant breeding is to find appropriate genotypes with the required genes among existing kinds, or to develop one if none exist. Mutation are the primary cause of diversity in nature, so plant breeding would be impossible without them. In this context, the primary goal of mutation-based breeding is to create and enhance well-adapted plant types by altering one or two key characteristics to boost production or quality. Furthermore, advances in cell and molecular biology are improving the efficacy and efficiency of mutation induction as well as the identification of new gene alleles. Physical and chemical mutagens are the most common types of mutagens used by researchers for plant mutagenesis. This chapter examines the technique of mutation induction, as well as the mutagens that are employed for this purpose and how they aid in crop improvement.

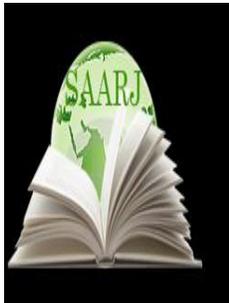

4. CONCLUSION

It will be a huge task to boost food production by at least 70% during the next several decades. There is a pressing need to end hunger among the world's growing population, which is becoming more concerning as a result of climate change, diminishing water supplies, dwindling arable land, and the severe health and environmental risks associated with the use of agrochemicals. Increased production of high-quality food with little input is seen to be an

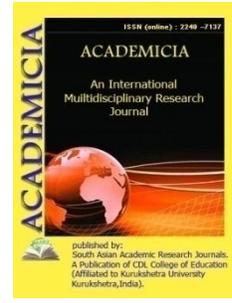

intriguing possibility. On the other side, the limited diversity in plant crops, particularly staple crops, restricts the possibilities for discovering novel gene alleles. As a result, new plant crop variants with novel gene combinations & induced mutation are the best choice thus far. Induced mutation reveals a novel gene combination that produces a new breed with better characteristics to the parents. Furthermore, advances in cell biology are improving the efficacy or efficiency of mutations induction or the identification of new gene alleles. Physical and chemical mutagens are the most common types of mutagens used by researchers for plant mutagenesis. This chapter examines the technique of mutation induction, as well as the mutagens that are employed for this reason as well as how they aid in crop improvement.

ABSTRACT

Currently, the goals, strategies, tasks and content of professional training of university students are undergoing significant changes: the formation of thinking focused on the construction of non-standard forms and models of real professional activity comes to the fore. From these positions, the following skills become important for the future specialist: orientation to project and mobility, independence in solving professional tasks – thus, we are talking about the acquisition of competence.

KEYWORDS: *Independent Study, Tasks, Self-Study, Learning Tools, Strategy, Systemization.*

INTRODUCTION

Modern requirements make it necessary to revise the usual learning strategy. The transition to learning tools is beginning to take place, encouraging students to develop internal motives for cognition, increase the level of theoretical understanding of their practical activities. The importance of fundamental knowledge increases, the course on individualization increases, the volume of independent work of students increases, the transition from educational activities under the guidance of a teacher to independent studies becomes important.

It should be remembered that there is a fundamental difference between the educational activity of students under the guidance of a teacher and its independent forms, which is not paid enough attention to. When a teacher leads students from a concept to reality, such a teaching method is valid only as a methodical technique. When it comes to the formation of a concept through independent work with educational materials and tools, the conditions of activity change decisively.

Thus, it is necessary to teach students how to logically analyze the sources of educational information, in particular, the analysis of information models in which the content of scientific concepts is fixed, which at the same time constitutes one of the most important tasks of training designed to prepare students for independent learning activities.

Modern requirements make it necessary to revise the usual learning strategy. The transition to learning tools is beginning to take place, encouraging students to develop internal motives for cognition, increase the level of theoretical understanding of their practical activities. The importance of fundamental knowledge increases, the course on individualization increases, the volume of independent work of students increases, the transition from educational activities under the guidance of a teacher to independent studies becomes important.

It should be remembered that there is a fundamental difference between the educational activity of students under the guidance of a teacher and its independent forms, which is not paid enough attention to. When a teacher leads students from a concept to reality, such a teaching method is valid only as a methodical technique. When it comes to the formation of a concept through independent work with educational materials and tools, the conditions of activity change decisively.

Thus, it is necessary to teach students how to logically analyze the sources of educational information, in particular, the analysis of information models in which the content of scientific concepts is fixed, which at the same time constitutes one of the most important tasks of training designed to prepare students for independent learning activities.

Independent work of a student (IW) is considered (L.I. Petrova, L.N. Kutergina)¹ as a means of teaching, providing: the formation of the necessary volume and level of knowledge, skills and abilities acquired by students during training, based on the set didactic goals and objectives of the discipline; mastering perfect ways of mental activity that ensure the productivity of cognition in the course of independent mastery of educational material; development of a psychological attitude to systematically replenish their knowledge and skills to navigate the flow of scientific and pedagogical information when solving new cognitive tasks; management of independent cognitive activity of students in the learning process. Didactics of higher education defined the concept of "*independent work of students*". It includes:²

- ◆ the presence of independent cognitive activity, the main motive of which is the independent mastery of new content;
- ◆ reliance on existing knowledge, skills, skills;
- ◆ systematic and systematic organization of independent work, taking into account the preparedness of students and their psychological characteristics;
- ◆ performing tasks (educational, research) under the guidance of a teacher or on the basis of methodological developments that contribute to the assimilation of various knowledge, the acquisition of skills, skills, experience of creative activity and the development of independence in behavior (I.A.Zimnaya, G.M. Kojaspirova, V.Ya. Kislenko, T.A. Kulikova, L.G. Niskanen, N.A.Starodubova, etc.)³.

Tasks of independent work:

Systematization and consolidation of the received theoretical knowledge and practical skills⁴;

- deepening and expanding theoretical knowledge;
- formation of skills to use regulatory, legal, reference documentation and special literature;
- development of cognitive abilities, student activity, creative initiative, independence, responsibility and organization;
- formation of independent thinking, abilities for self-development, self-improvement and self-realization;
- Formation of research skills.

It follows from the above that independent work is an integrative concept, which includes both the readiness of the student himself for independent activity, and the ability of the teacher to develop this activity among students. At the same time, the main thing is not the optimization of its individual types, but the development of students' activity, independence, desire to prove themselves (L.G. Niskanen)⁵.

Independent work in an educational institution can be organized individually with each student, with several students (for example, project teams) and a study group (lecture stream) as a whole.

Analysts of the Research Institute of Higher Education identify the main characteristics of independent work of students.

1. The focus of independent work on the profession. First of all, it is the formation of a steady interest in the chosen profession and methods of mastering its features, which depend on the following parameters: the relationship between teachers and students in the educational process, the level of complexity of tasks for independent work, the involvement of students in the formed activity of the future profession.

2. Professional orientation of independent work. The indisputability of this educational and substantive thesis from the point of view of knowledge, involvement in creative professional activity, effective personal interaction in the profession should not detract from the importance of knowledge of the general humanitarian culture of the relevant blocks of disciplines of the curriculum.

3. The rhythm of independent work of students. The intensification of the educational process involves the rhythmicity of independent work by reducing the routine work of the student in semesters. When forming the time volume of his subject, the teacher should take into account the total workload of students, and not the importance of only his discipline.

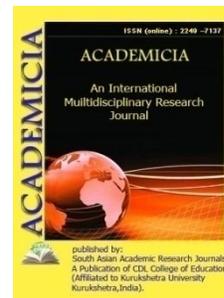

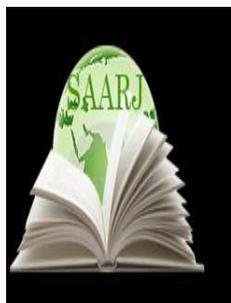

4. Individualization of independent work of students, which includes:

- increasing the proportion of intensive work with more prepared students;
- division of classes into mandatory and creative parts (for everyone trying to cope with more difficult and, most importantly, non-standard tasks, additional questions, educational and problem situations, etc.);
- regular consultations with students;
- Comprehensive and timely information about the thematic content of independent work, deadlines, auxiliary tools, forms, methods of control and evaluation of the final results.

- Depending on the course the student is studying, the specifics of the subject being studied tasks for independent work can be very diverse. It is important to strive to ensure that in junior courses independent work aims to expand and consolidate the knowledge and skills acquired by the student in the classroom.
- Independent work is an important factor in the theoretical and practical preparation of students for the upcoming activities, the formation of the necessary knowledge, skills, moral and mental qualities. In modern conditions, the degree of responsibility of the student has increased both for his educational activities and for the development of his horizons, knowledge, specific subject content and general content.
- Independent work as a form of training organization is possible and necessary to obtain any educational result. However, its types for obtaining different educational results will be different:
 - • to acquire knowledge: work with dictionaries and reference books; familiarization with regulatory documents; educational and research work; work with lecture notes; work with educational material (textbook, primary source, article, additional literature, including materials obtained via the Internet); taking notes of texts; answers to control questions; preparation of abstracts for presentation at a seminar, conference; preparation of abstracts, etc.;
 - • for the formation of skills and abilities: solving typical tasks and exercises; solving variable tasks and exercises; performing drawings, diagrams; performing calculation and graphic works; solving production situational (professional) tasks; designing and modeling of various types and components of professional activity; performing course and final qualifying works; experimental and design work; exercises on a PC and simulator, etc.
- When addressing the problem of the formation of independent work skills in the learning process, it seems necessary to solve a number of issues (issues related to activity in the process of independent work, the effectiveness of independent work, etc.).
- Whilst offering a number of models for self-learning the review authors conceptualized independent learning in terms of processes of self-regulation. These were organized around four or more phases for students to complete including: planning, self-monitoring, controlling the pace and direction of the work and evaluation. Evaluation included students' feelings of pleasure or otherwise. Self-motivation was also identified as necessary for successful independent learning. 'External' elements which supported independent learning included the development of a strong relationship between teachers and students, and the establishment of an 'enabling environment'. Research in the review described an 'enabling environment' as one which included an appropriate 'physical environment', a flexible approach to time that teachers gave students to work on specific tasks and a shared willingness to undertake independent learning on the part of students. Appropriate resources were also necessary and it was important that teachers were knowledgeable about the work being done. An essential element of independent learning identified in the review was positive relationships between teachers and students, based on trust. A mutual responsibility for learning, which drew in students' experiences in their family and local community, was also necessary. The skills which the review found to be necessary for successful engagement in independent learning are covered in the next section.

ABSTRACT

In the study, the coking mechanism of the methane oxycondensation reaction catalyst was developed and the optimal conditions for catalyst regeneration were selected. Based on the results obtained, the process of catalyst regeneration of the methane oxycondensation reaction was modelled and the rate constant and activation energy of the coke formation process was evaluated based on experimental data.

KEYWORDS: *Catalyst, Coke, Regeneration, IR Spectrum, Thermogravimetry, The Velocity Constant, Activation Energy, Mathematical Modelling.*

INTRODUCTION

At a time when oil reserves are declining, natural gas is of great interest as an alternative fuel in petrochemical production. The current traditional method of converting natural gas to liquid fuels is multi-stage, going under high temperature and high pressure. At present, the only sensible way to process natural gas is by its oxycondensation reaction. This process is a one-step process that takes place at normal atmospheric pressure [1-6].

The main target products in the catalytic oxycondensation of methane are ethane and ethylene. Currently, 156 million tons of ethylene is produced worldwide, and the growth in demand for ethylene requires 5-6% per year. Ethylene is an important product of petroleum and gas chemistry and is used in the production of polyethylene, polyvinyl chloride, polystyrene, alkylbenzenes, ethylene oxide and others [7-10].

The efficiency of any petrochemical heterogeneous-catalytic process is primarily determined by the activity, selectivity and stability of the catalyst. Deterioration of the recorded characteristics

is observed during the use of the catalyst. The main reason for the deterioration of these parameters is the formation of coke on the active surface of the catalyst. As a result of coke loss, the catalytic properties of the catalyst are restored. A common method of restoring the catalytic properties of a catalyst is oxidative regeneration [11-16].

EXPERIMENTAL PART

The catalyst for the synthesis of C₂-hydrocarbons was prepared by two methods of precipitation and absorption. High-silicon zeolite, which was thermally and chemically treated with bentonite, was used in our laboratory as a binder [17-20]. Aqueous solutions of manganese acetate and sodium molybdate were used to prepare the catalyst by the precipitation method. The precipitate was filtered, dried at 130 °C, and baked in an oven at 800–1100 °C for 5 h. The required amount of zirconyl nitrate solution was then added to the resulting mass. The catalyst was then filtered, dried, and fired in the above sequence.

In the absorption method, the catalyst was prepared in the following two steps. In the first stage, a solution of manganese acetate was injected into the expanded clay heated to 550-600 °C. The mixture was then fired at 900 °C for 3 h at 150 cha until a homogeneous mass was obtained. In the second stage, an aqueous solution of sodium acetate, ammonium molybdate, was ingested. Subsequent drying and firing steps were continued as above.

The amorphous structures of the catalysts were determined by X-ray phase analysis, the porous structure was determined by the analysis of adsorption curves obtained by the method of thermodesorption of nitrogen, the surface area of the samples (S_{sol}) was determined by the BET method, the volume of micropores and mesopores was determined by BJH method.

The specific surface area of the catalyst was determined by the adsorption-desorption method of nitrogen at -77 °C Micro metrics Sorptometer Tristar 3000 using the BET method. Examination of the catalyst was performed by scanning electron microscopy (SEM) on an analytical auto emission wave electron microscope (ULTRA 55 Carlziss, Germany).

The spatial composition of the catalytic systems was tested on a Shimadzu XRD 7000 X-ray diffractometer.

The catalytic oxycondensation reaction of methane was carried out in a flow reactor under differential reactor conditions. The gaseous products of the reaction were analyzed chromatographically on the chromatograph "Gazochrome 3101" with a thermochemical detector connected to an additional thermostat under the following conditions: column thermostat temperature-100 °C, carrier gas (air) flow rate -35 ml/min, column length filled with activated carbon - 1m, inner diameter - 3 mm. Quantitative analysis was performed using the absolute grading method [21-23].

The catalytic activity of the catalysts was studied in a flow differential reactor, at normal atmospheric pressure, at 750–850 °C, and under a volume ratio of methane: oxygen = 1.5 ÷ 5: 1 [24-29].

The reactor is a quartz tube with an inside diameter of 8 mm and a length of 650 mm. Methane and pure oxygen with 99.9% purity were used for the reaction. The gases were mixed before entering the reactor. The contact gas coming out of the reactor was cooled in an aqueous refrigerator-separator.

This work aims to construct a mathematical model of oxidative regeneration. The kinetic model is the sum of the quantities that characterize the relationship between the reaction parameters of the rate of chemical change (pressure, temperature, reagent concentration, etc.) and the elementary stages, reactions, equations. This relationship is determined based on experimental data in the field of change of reaction parameters.

Manganese-based oxide catalysts prepared by the absorption method for the oxidative dimerization reaction of methane have high catalytic activity and efficiency, and the best results were obtained in the presence of the $(\text{Mn}_2\text{O}_3)_x \cdot (\text{Na}_2\text{MoO}_4)_y \cdot (\text{ZrO}_2)_z$ complex. Glide was used as a carrier. Methane conversion in the presence of catalysts obtained by the above methods was 56.8%, selectivity for target products was 62.3%, selectivity for ethylene was 65.8% and C_2 -hydrocarbon yield was 35.4%.

Regeneration of coking catalysts to restore their activity and selectivity is an important part of the technological process. Oxidative regeneration of coked catalysts is a potent exothermic process. Overheating of the catalyst can lead to a loss of irreversible catalytic activity: rounding of porous structures, crystallization and recrystallization, as well as leakage of active components. In this case, the maximum temperature of the catalyst is determined depending on its composition and structure. Coke formation follows the following scheme:

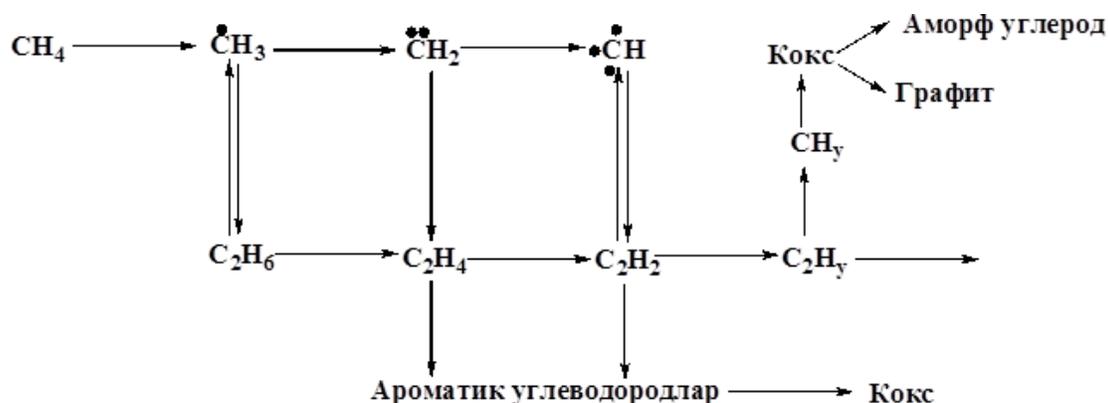

Figure 1. Scheme of coke formation during methane oxycondensation

RESULTS AND DISCUSSION

It is known that in the oxycondensation reaction of methane, the activity and productivity of the catalyst are reduced due to the formation of coke precipitate containing CH_x ($1 \geq x \geq 0$). Oxidative regeneration was used to restore the activity of the catalyst. To determine the structure of the resulting coke (graphitized or amorphous), the experimental results were found to have an error $\pm 3\%$ when compared with the results obtained by the derivatographic analysis method (Fig. 2). The size of the catalyst pores and the specific surface area determine the susceptibility to coking, so the method of physical adsorption of nitrogen was used to determine the surface area of the catalyst, the size and volume of the pores.

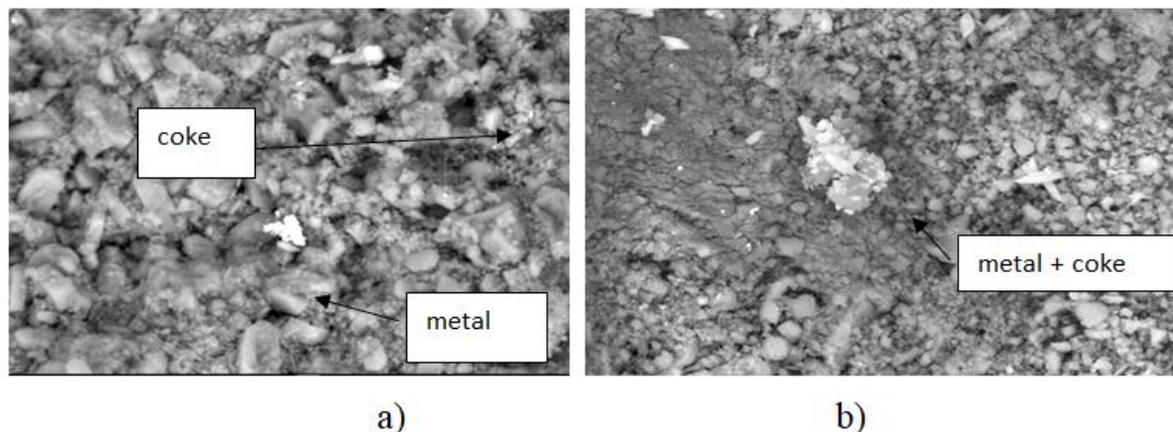

Figure 2. Coke catalyst micrograph (5000 magnification)

The larger the specific surface area of the catalyst, the higher its activity. The formation of coke on the active surface of the catalyst leads to a deterioration of the performance of the regime of catalytic processes. The laws of regeneration of the coking of catalyst particles were realized using a diffusion mathematical model. The amount of coke in the catalysts was determined by the difference between the masses before and after heating in the open air. To do this, the catalyst was heated in air at 110 °C and the mass was measured, then fired in an oven at 800 °C. After 1 h, its mass was measured again and the amount of coke was determined. Catalyst inactivation is reversible (coke sediment is formed) and irreversible (spatial change of the active component, sticking of the active centres of the catalyst under the influence of heat, decomposition, poisoning, etc.). In reactivation, the initial activity of the catalyst can be partially or completely restored. The following reactions can take place between coke and oxygen:

The approximate composition of the coke sediment corresponds to the CH_x formula as noted above. In this case, the combustion of coke $x=0\div 1$ is characterized by the following total reaction:

The coked catalyst sample was placed in a reactor and washed with an inert gas-argon (volumetric velocity of argon 500 h⁻¹) at 650 °C for 20 min. After that, gradually increasing the volume fraction of oxygen, the catalyst was chemically treated at 650 °C in a mixture of inert gas and oxygen. For 2.5 hours, the oxygen concentration in the regeneration mixture was increased to 25%. In this case, the chemical treatment was continued for 1.5 hours. The temperature was then raised to 750 °C for 3 h and chemically treated under an airflow rate of 500 h⁻¹. At the end of the catalyst regeneration cycle, the catalyst was washed at 750 °C in an argon atmosphere with a volumetric velocity of 500 h⁻¹ and cooled in an argon stream. The temperature range of oxidation treatment of catalysts was 200-1200 °C, the heating rate in the air was 10 °C/min. The

amount of coke released was studied in the range of 50–850 °C using a combination of thermogravimetry and differential thermal analysis methods. The absolute error in temperature measurement was ± 5 °C and in mass measurement $\pm 0.5\%$.

For IR spectroscopic examination, 10 g of coked catalyst was taken and 25 ml of chloroform was added. After 2 h, the resulting extract was placed on a plate and placed on an IK-Fure spectrophotometer after the chloroform had evaporated. Spectra were then recorded for 1 h at room temperature in the $600 \div 4,000$ cm^{-1} wavelength range. For quantitative analysis of inactivating components, their extract was prepared on a Soxhlet instrument: catalyst mass - 10 g, extragenic (acetone) volume - 40 ml, extraction time - 1 hour.

The number of extract components was analyzed by the gas-liquid chromatographic method: flame-ionization detector, carrier-gas (hydrogen) flow rate-1 ml/min; the Heating rate in the temperature range $40 \div 200$ °C 10 °C / min; capillary column length 50 m, column diameter 0.32 mm, stationary phase-polyethene glycol (thickness 1.2 μm). Determining the microstructure of the catalysts was carried out on a JEM-2010 instrument using irradiated electron microscopy. Coke formation was assessed according to DTA-TG data.

For laboratory regeneration of the methane oxycondensation reaction catalyst under laboratory conditions, experimental studies were carried out in a flow isothermal reactor by adding $0.3 \div 1.0$ g of catalyst to a reactor with a diameter of 3 mm. The $(\text{Na}_2\text{MoO}_4)_x \cdot (\text{Mn}_2\text{O}_3)_y \cdot (\text{ZrO}_2)_z$ catalyst was used in the experiments. As a result of the study, it was found that the specific surface area of the catalyst according to the BET method is $\sim 65\text{m}^2/\text{g}$. Experimental experiments on catalyst regeneration were carried out at 450-500 °C under conditions of air consumption $10 \div 30\text{ml} / \text{min}$. The catalyst was heated in a nitrogen stream to the required temperature, then an airstream was connected. The catalyst ($0.3 \div 0.5$ mm fractions) was mixed with quartz to increase surface heat absorption. Changes in the concentration of oxygen leaving the $(\text{Na}_2\text{MoO}_4)_x \cdot (\text{Mn}_2\text{O}_3)_y \cdot (\text{ZrO}_2)_z$ catalyst regeneration reactor were detected by gas chromatography. Figure 3 shows the results of the change in the oxygen concentration leaving the $(\text{Na}_2\text{MoO}_4)_x \cdot (\text{Mn}_2\text{O}_3)_y \cdot (\text{ZrO}_2)_z$ catalyst regeneration reactor over time at different temperatures.

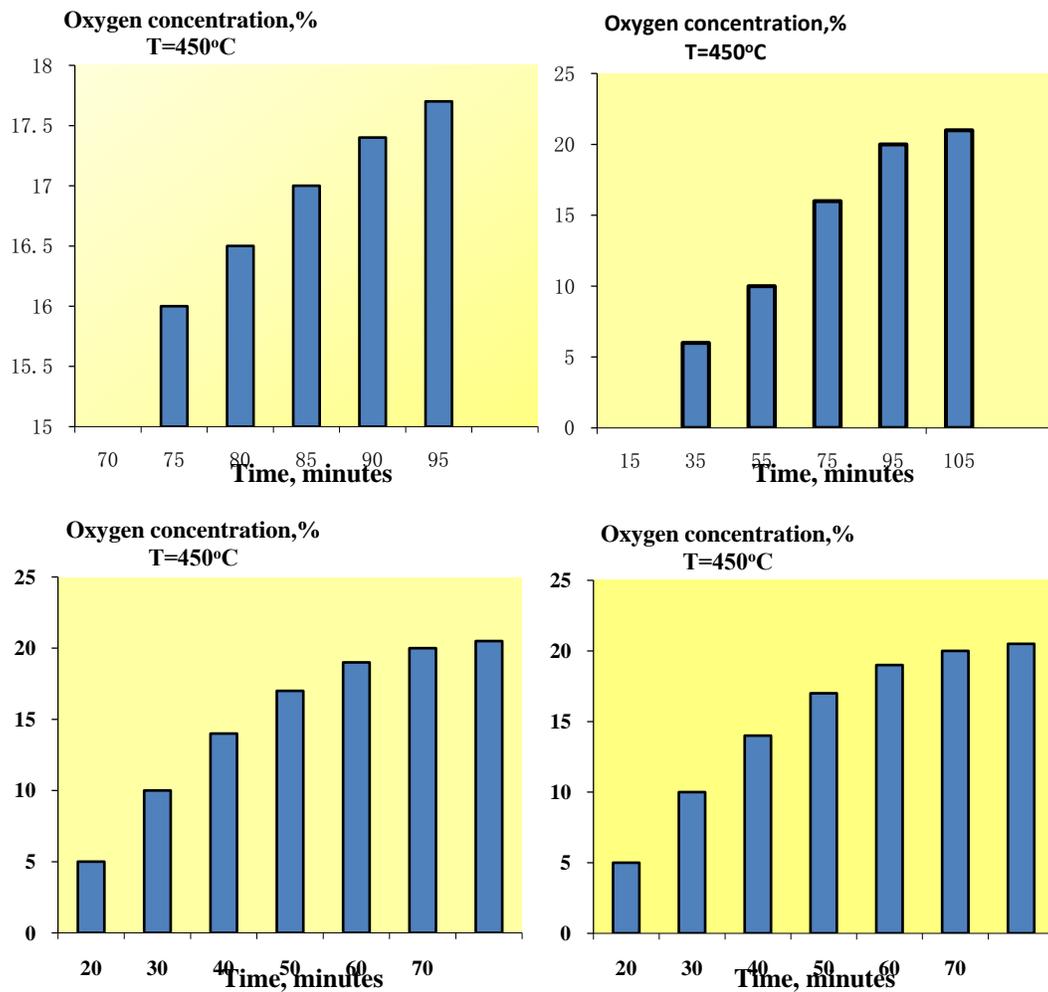

Figure 3. Graph of the change in the concentration of oxygen leaving the reactor over time at different temperatures

Using the formula $-\frac{1}{y} \ln\left(\frac{y_0}{y_1}\right) = k \cdot t + A$, it was studied that the experimental data of the oxygen concentration at the exit of the catalyst regeneration reactor containing $(\text{Na}_2\text{MoO}_4)_x \cdot (\text{Mn}_2\text{O}_3)_y \cdot (\text{ZrO}_2)_z$ depend on the regeneration time. The results obtained are shown in Figure 4 below.

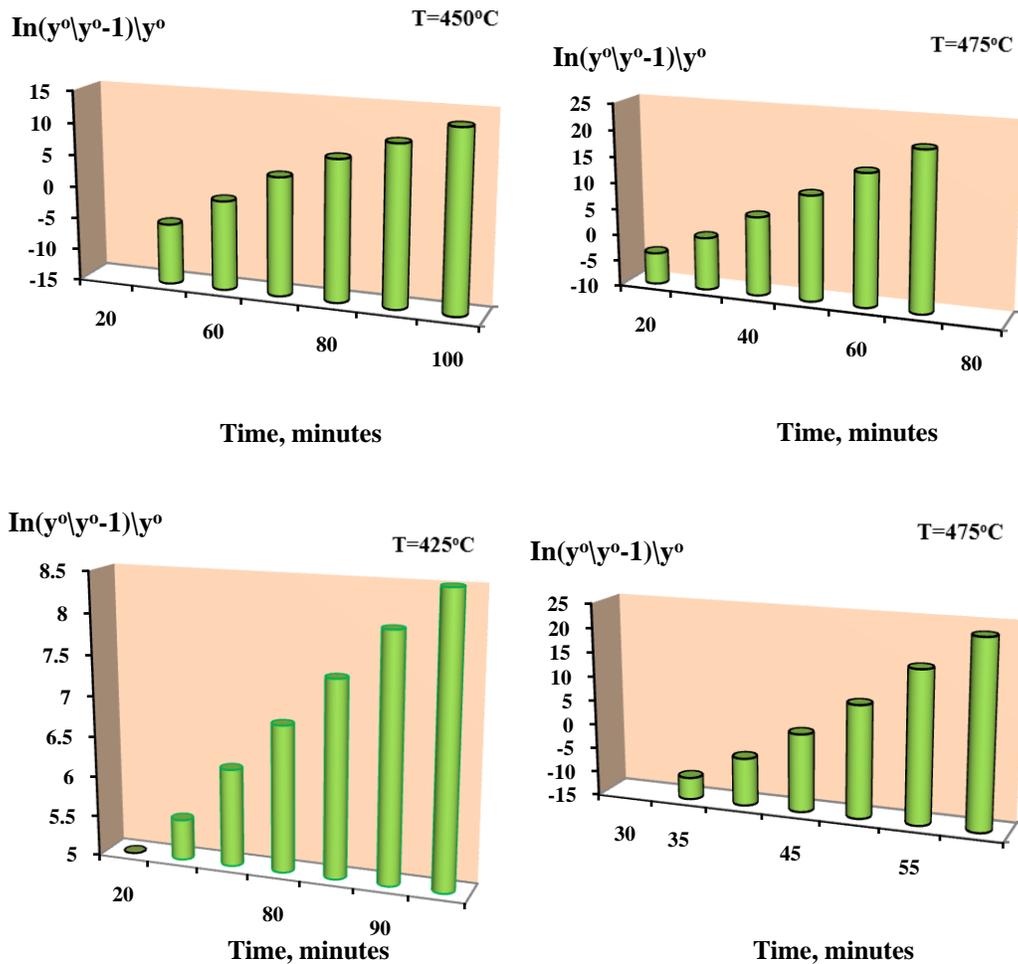

Figure 4. The dependence of the oxygen concentration leaving the reactor on the regeneration time

To determine the value of the reaction rate constant at different temperatures, the relationship between the concentration of carbon dioxide at the exit of the reactor and the regeneration time was linearly formed by the coordinates of the equation $-\frac{1}{y} \ln \left(\frac{y_0}{y_1} \right) = k \cdot t + A$. The results are shown in the figure below (Figure 5).

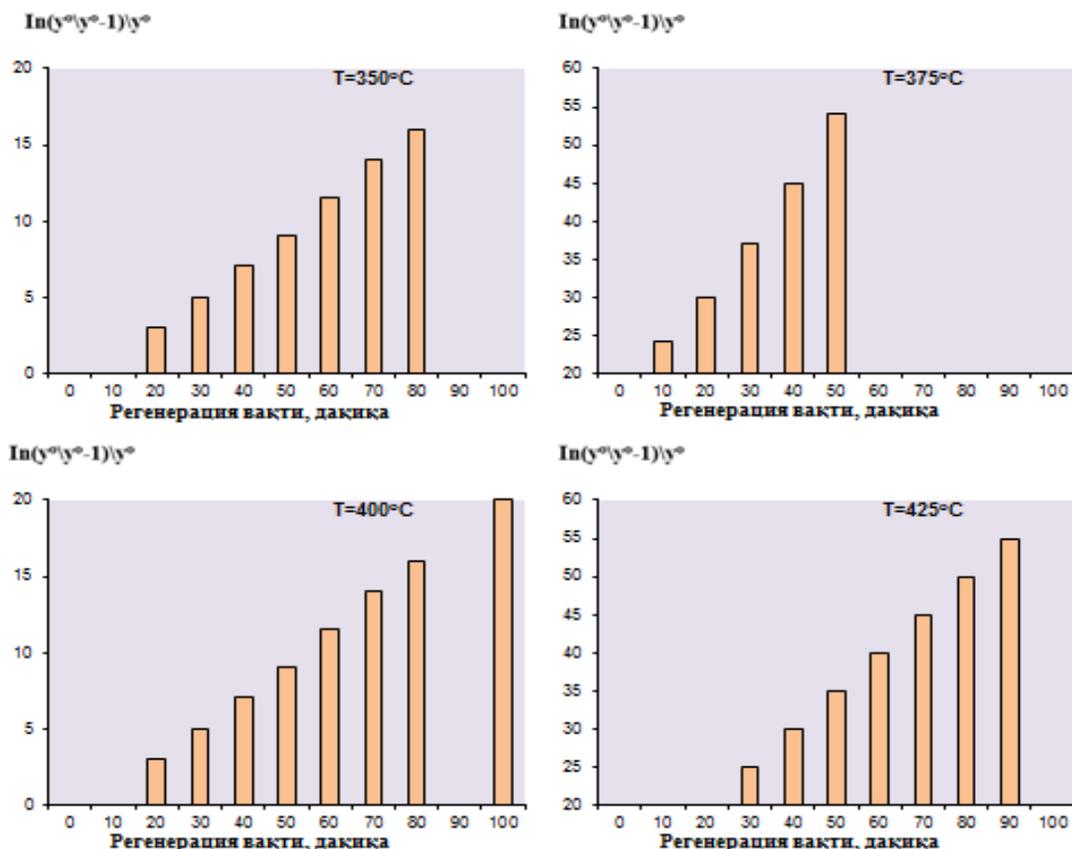

Figure 5. the relationship between the concentration of carbon dioxide at the exit of the reactor and the regeneration time

Based on the calculation of the rate constants of the oxidation reaction of coke in a catalyst containing $(\text{Na}_2\text{MoO}_4)_x \cdot (\text{Mn}_2\text{O}_3)_y \cdot (\text{ZrO}_2)_z$ at different temperatures, the activation energy of the complete oxidation reaction of coke was determined. For this, a correlation graph between $2 + \ln(k)$ and $1000/T$ was constructed and the activation energy was determined based on the value of the slope angle tangent. Based on the results obtained, it was proved that the activation energy of the coke combustion reaction is $75.8 \pm 5 \text{ kJ/mol}$.

Figure 6 below shows a micro photo of a coking catalyst containing $(\text{Na}_2\text{MoO}_4)_x \cdot (\text{Mn}_2\text{O}_3)_y \cdot (\text{ZrO}_2)_z$ after use at different time values at 800°C . As can be seen from the figure, the volume of graphite aggregates accumulated in the catalyst sludge and their volume increase significantly with increasing operating time.

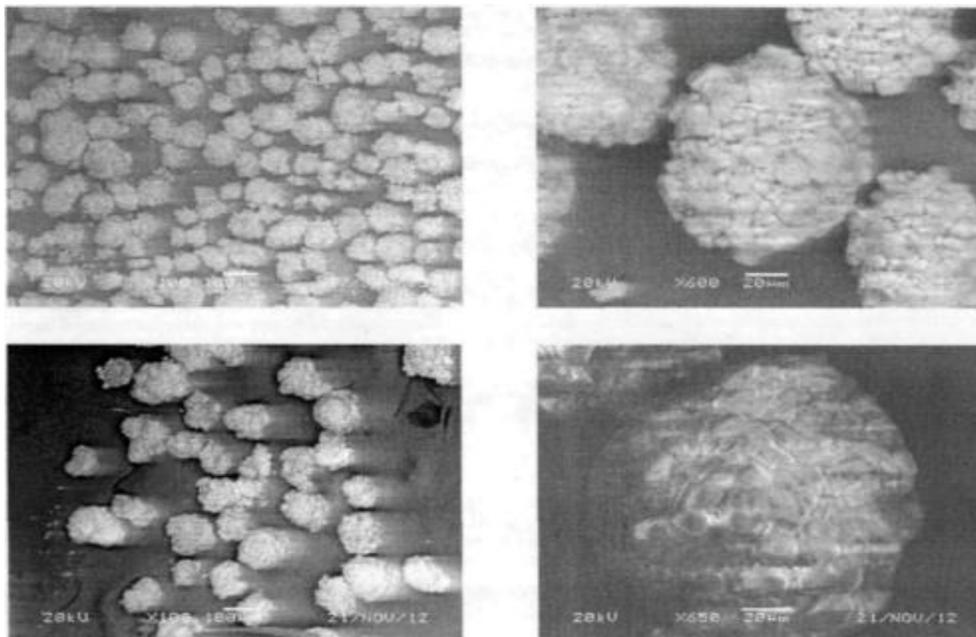

Figure 6. Micro photo image of catalyst surface after 240 hours (A), 480 hours (V), 720 hours (S), 960 hours (D) at 80 °C

The concentration of oxygen at the outlet of the reactor was determined chromatographically. The relationship between the oxygen concentration at the outlet of the reactor and the regeneration time was calculated according to the following formula:

$$-\frac{1}{y_0} \ln \left(\frac{y_0}{y_1} - 1 \right) = k \cdot t + A$$

To fully evaluate the rate and energy of the coke formation process, the reaction rate and activation energy were determined.

The velocity constant and activation energy were calculated based on the experimental data given in the following table:

TABLE 1. VELOCITY CONSTANT AND ACTIVATION ENERGY

Temperature, K	τ , sec	m_0 , r	m , r
973	900	1,0128	0,9138
1073	900	1,0390	0,8595

The process of coke formation is a 1-order reaction. The rate equation for a first-order reaction is:

$$\frac{dx}{d\tau} = k(a - x)$$

The calculation of the velocity constant is performed according to the following equation:

$$k = \frac{2,303}{\tau} \lg \frac{m_0}{m}$$

The activation energy was calculated according to the following equation:

$$\lg \frac{k_2}{k_1} = \frac{E_a}{2,303R} \left(\frac{T_2 - T_1}{T_2 * T_1} \right)$$

Speed constant:

$$T_2 = 1073$$

$$k_2 = \frac{2,303}{900} \lg \frac{1,039}{0,8595} = 2,11 \cdot 10^{-4} c^{-1}$$

$$T = 873K$$

$$k_2 = \frac{2,303}{900} \lg \frac{1,0128}{0,9138} = 1,14 \cdot 10^{-4} c^{-1}$$

Activation energy:

$$\lg \frac{2,11 \cdot 10^{-4}}{1,14 \cdot 10^{-4}} = \frac{E_a}{2,303 \cdot 8,314} \cdot \frac{200}{936729}$$

$$\lg 1,851 = \frac{E_a}{2,303 \cdot 8,314} \cdot \frac{200}{936729}$$

$$0,267 = \frac{E_a}{2,303 \cdot 8,314} \cdot \frac{200}{936729}$$

$$E_a = \frac{0,267 \cdot 19,15 \cdot 936729}{200} = 23,95 \text{ кЖ/моль}$$

CONCLUSION

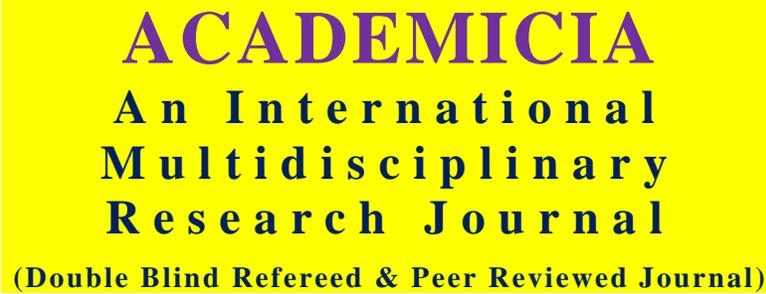

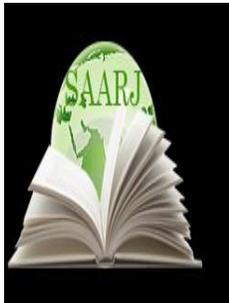

1. The coking mechanism of the methane oxycondensation reaction catalyst has been developed.
2. Optimal conditions for methane oxycondensation reaction catalyst regeneration were selected.
3. The process of regeneration of the methane oxycondensation reaction catalyst was modeled.
4. The rate constant and activation energy of the coke formation process were calculated on the basis of experimental data.

KEY LIMITATIONS AND IMPROVEMENT FACTORS IN THE INDIAN SPORTS AT THE INTERNATIONAL GAMES AND OLYMPICS

Dr. Anjana Lohan*

*Associate Professor,
Head, Deptt. of Physical Education,
S.D. Mahila Mahavidyalay, Narwana (Jind), INDIA

ABSTRACT

Thousands of competitors from across the globe compete in summer and winter sports contests at the contemporary Olympic Games, which are the premier international athletic events. More than 200 countries compete in the Olympic Games, which are regarded as the world's premier sporting event. Every four years, the Olympic Games alternate between the Summer and Winter editions, with the Winter Games taking place every other year. For us Indians and for our nation, India's Olympic performance sounds terrible. Approximately 1.2 billion people live in India, making it the world's second-largest country by population (or about 1/6 of the global population). It's the world's largest democracy. But why is India so far behind in the quest for Olympic Glory while having a population of over a billion people? Every self-respecting Indian is aware of India's underwhelming performance in the Olympics.

Keywords: *International Games and India, Indian Sportsmen and Performance, India in Olympics*

INTRODUCTION

India, a country of 1.3 billion people with a century of Olympic participation under its belt, has only won 28 medals. The USA, on the other side, has the most medals in its collection, with 2,522 to its name. This is obviously not the case of a country's population being exactly proportionate to the number of medals.

India has successfully sent a man into space, has been at the forefront of many scientific breakthroughs, and has compelled the rest of the world to recognise India's achievements in military and science & technology. If the Indian cricket team is regarded as one of the greatest in the world, why can't we apply the same level of commitment and ethics to other sports, including

the Olympic Games? The fact that we are the world's second-most populated and democratic nation really works against us in terms of bringing home a large number of Olympic gold.

Key Limitations in Sports

Cricket is given an excessive amount of attention.

As a nation, we're enamoured with just one sport: cricket. It's only at big events like the Olympics that non-olympic sports get some attention and support from the crowd. When football season ends, we have no idea who the best players in other sports are. They receive less attention, less sponsors, and fewer people hooting and cheering them on, and then we go about whining and insulting athletes when we don't win enough gold.

Infrastructure

Currently, we do not have enough infrastructure for athletes to train and practise, which would help them become more proficient and well-equipped to compete against world-class opponents. If our athletes had access to better facilities and could play all around the nation to remain in shape, that would have been ideal. The individuals in charge of sports federations are chosen because they are close friends of the governing party. However, despite their lack of knowledge of the activity or its requirements, they are selected to lead those who are dedicated to it. Even gold medallist Abhinav Bindra, from India, trained in Germany.

A scarcity of inspiration

Youth in India are discouraged from pursuing a profession in sports from an early age. Medical and engineering are major interests of our parents. And for girls, the situation is much more difficult due to the long list of disadvantages and obstacles they must overcome before their parents would allow them to play. In order to improve their job security, the majority of them had no choice but to stop playing sports. Similarly, India's preoccupation with cricket shows that we are great at chasing something that pays well.

Lack of resources and enough food

Athletes aren't given enough money to cover their basic expenses. Athletes don't have a steady stream of revenue, and the government offers little assistance during the early phases of their careers. It's been suggested that world-class athletes are more genetically and physically fit than the rest of us. Meanwhile, our athletes must depend on their own personal efforts to remain strong and healthy while receiving all the essential nutrients that are exclusive to athletes.

Ineffective management

Indian sports are plagued by administrative problems due to a lack of oversight. India's deficiency in this area may be attributed in part to the absence of former athletes on the administrative side of things. With each new budget, we have been able to improve the allocation of money to various areas of development while also growing our economy. However, despite the large number of young people interested in sports, only a small portion of government funding is dedicated to them. Enough with the IITs and IIMs; when are we going to see a sports-focused research institution?

Corruption in Politics

When it comes to sports, we as a country are rotten to the core. Corruption in sports favours wealthy candidates over less well-off ones, and this is why devoted and brilliant athletes from smaller cities are denied recognition. Politics has a significant impact on sports as well, which results in a dearth of genuine sports heroes in our country. Politicians make it a point to elevate only members of their own family, regardless of ability. Also, sports administration and management have simply become a new method of quickly filling pockets.

Improvements Required

Khelo Youth Games in India

Under-17 school kids and under-21 college students compete yearly in India's national interdisciplinary grassroots games known as Khelo India Youth Games, which take place in January or February. An annual scholarship of 5 lakh will be awarded to the top 1000 students for a period of eight years in order to help them prepare for international sports competitions. The Indian government has taken a bold step with this programme.

A group effort

Sports cannot be heavily subsidised in developing countries like India. There are many industrialists and businessmen in India who are willing to take on the duties of encouraging these gifted sportsmen and putting up the required facilities. Instead of rewarding them with millions of rupees, we should concentrate on providing them with basic facilities so that they may grow into better athletes.

There is an excessive amount of criticism

There has been a lot of dissatisfaction with Indian athletes' past performances. This has a negative impact on their self-esteem. It's important to remember that even if you disagree with their views, please refrain from criticising them. Despite the fact that you have no idea about their backgrounds, training, government backing, or financial resources, they nevertheless made it to the Olympics to compete against others who had these advantages.

Impartial

Gender inequality in sports means that although we may have plenty of Dhonis, we struggle to find Mary Kom and Sania Nehwal. A man and a woman are as diametrically opposed as sports and women. It is a social taboo for females to participate in athletics since they are seen as fragile and their abilities are questioned. This has to end immediately. Special measures should be put in place to promote female involvement in sports.

There should be openness to the system

There should be greater openness in the way players and board members are chosen. The leader of a sports regulating organisation should be a former athlete. Sportsmen will benefit from this as well, since it will open up new employment possibilities. Players should only be evaluated based on how well they perform, not on any other criteria.

As part of its Let's Play for Revitalising Sports in India initiative, the National Institution for Transforming India (NITI Aayog) has set a goal of winning 50 Olympic medals at the 2024 Summer Olympics.

Increasing efficiency

Sports in India have grown phenomenally in the last several years, thanks to mega-events like the Commonwealth Games 2010, Hockey World Cup, and Cricket World Cup, and medal wins abroad. India took home six medals in total at the 2012 Summer Olympics in London, including two silver and four bronze. Sushil Kumar, Abhinav Bindra, Mary Kom, Saina Nehwal, and Sania Mirza's accomplishments have already put India on the map of world sports as superstars. Seeing women in the driver's seat with some significant achievements fills us with pride.

Indians today firmly believe in sports' ability to influence people. Indian sports are undergoing a transformation. No longer does cricket provide all of India's citizens with a sense of pride. They're now able to participate in many kinds of sports. The recent success of Indian athletes in international competitions has ushered in a new age of Indian sports. Some of India's old sports have seen a resurgence thanks to instructors who were previously world-class athletes themselves. Badminton has been revitalised thanks in large part to Gopichand and Padukone. Mahesh Bhupathi's camps in India are a wonderful way to get kids to get outside and have some fun.

The job of regulating and marketing Indian sports has passed to a variety of Indian sports organisations, who want to push the sport to new heights. The Indian Olympic Association and the Sports Authority of India, two sports governing bodies, are striving to raise the bar in Indian sports by implementing different talent development initiatives. There are many sports academies and institutions dedicated to the development of Indian athletes and sportspeople. In addition, a number of corporations are stepping in to help financially strapped games. Sports promotion businesses in India's 1.3 billion-person country get an annual prize.

Our nation is brimming with potential; all our children and youngsters need today is guidance and inspiration. India will win more medals in the future if the government focuses on helping struggling athletes by giving appropriate training to develop their skills and also by providing financial assistance, infrastructure and facilities. Furthermore, it's past time for us to shift our focus from cricket to other sports and begin praising them as well! Sports in India have gone a long way and seem to be going in the right path. Instead of focusing only on international competitions, we should promote domestic sports like the Indian Premier League and the Premier Badminton League, as well as football and kabaddi leagues. Even the Olympic games might benefit from such competitions.

A lone Indian athlete, Norman Pritchard, won two silver medals in athletics in the 1900 Olympic Games and became the first Asian country to earn an Olympic medal.

After sending a team to the very first Olympic Summer Games in 1920, the United States has continued to do so ever since. Since the 1964 Winter Olympics, India has also sent athletes to the summer games.

At the Summer Olympics, Indian competitors brought home 35 medals. A era of dominance occurred between 1928 and 1980, when the Indian Men's Field Hockey Team won eleven gold in twelve Olympics. From 1928 through 1956, the team won eight gold medals in all, including six in a row.

Post-independence

India scores the third goal in the 1948 Olympic final against Britain. Indian sports federations started sending delegations of more than 50 competitors in a variety of sports to the Summer Olympics in 1948, thanks to the IOA's expanded reach. A chef-de-mission led the group. India's field hockey team defeated Great Britain in the Olympics final to take home the gold medal. As an independent country, India has never won a gold medal prior to winning this one.

A team led by Prime Minister Jawaharlal Nehru won the gold medal in 1952 in Helsinki.

Wrestler K. D. Jadhav earned India's first individual gold medal in the 1952 Summer Olympics in London. By beating Pakistan in the 1956 Summer Olympics final, the Indian field hockey team won their sixth consecutive gold medal. The Indian team's run of six consecutive Olympic gold medals was a record at the time. Only the United States men's and women's basketball teams have broken this record since.

The Canadian hockey team finished second at the 1960 Summer Olympics after losing in the final. At the 1964 Summer Olympics, the squad regained their composure by winning the gold medal. However, in the next two Olympics, she only managed to take home bronze medals.

For the first time since the 1924 Summer Olympics, India left empty-handed in 1976.

At the 1980 Summer Olympics, the Indian hockey team set a new milestone by winning a record-tying 8th gold medal.

In the next three Summer Olympics, India had to go home empty-handed. Tennis player Leander Paes earned a bronze medal in the men's singles event at the 1996 Summer Olympics in Atlanta, breaking a 16-year medal drought and becoming the first solo medal winner since 1952. .

Figure 1 : Sushil Kumar the first Indian athlete to win multiple individual Olympic medals since independence

K. Malleswari, the reigning Women's 69 kg World Championship gold winner, finished third in the weightlifting competition at the 2000 Sydney Olympics. It was the first time an Indian woman had ever won an Olympic medal.

Rajyavardhan Singh Rathore won silver in the Men's double trap shooting event at the 2004 Summer Olympics in Athens.

Abhinav Bindra became the first Indian to win an individual gold medal at the Olympic Games when he won the Men's 10 metre air rifle event in the 2008 Beijing Olympics.

Vijender Singh won a bronze medal in the Middleweight division, becoming the first Indian boxer to win a medal in the sport. The three medals won by India in that year's Olympics were the most up to that point. After then, the record was beaten to become the third greatest ever.

The 83-member Indian delegation to the London Olympics in 2012 established a new record and brought home six medals, a new high for the nation.

Wrestler Sushil Kumar became the first Indian after independence to win two Olympic medals in wrestling (bronze in 2008 and silver in 2012). Women's singles bronze medalist Saina Nehwal gave India its first badminton Olympic medal. With her bronze medal in the Women's flyweight category, boxer Mary Kom became the first Indian woman to earn a boxing medal. This was India's best showing until 2020, when it was surpassed. Men's 10 m air rifle champion Gagan Narang finished third. Vijay Kumar won silver in the men's 25-meter rapid fire pistol competition, giving him three medals in total.

Figure 2 : Olympics Bronze medalist Mary Kom

A total of 118 competitors participated in the 2016 Summer Olympics, which was a record amount. In the Women's freestyle 58 kg division, Sakshi Malik earned her maiden Olympic gold as India's first female wrestler. It was a historic day for shuttler P. V Sindhu, who won a silver medal in the Olympics at the age of 25 and became the first Indian woman to do so.

CONCLUSION

India sent a record number of 124 competitors to the Summer Olympics in 2020, which will be held in 2021. Saikhom Mirabai Chanu won a silver medal in the women's 49 kg weightlifting competition on the first day of the Olympics, making her the first Indian woman to do so. Sindhu went on to win the bronze medal match by a 3-0 score against China's He Bingjiao, becoming the first Indian woman to win two Olympic medals. Chopra became the second Indian to win a track & field individual gold with his victory in the Javelin throw (29). India took up the bronze medal in men's field hockey. After winning a gold medal in Moscow in 1972, this was the first medal I'd earned in 41 years. Ravi Kumar Dahiya and Bajrang Punia both took home medals in the men's wrestling tournament. Women's boxing saw Olympic newcomer Lovlina Borgohain take home the bronze medal. She was the second woman to win an Olympic medal in

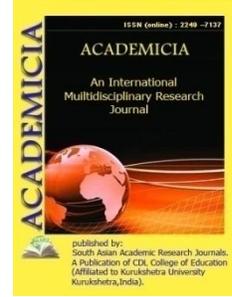

her time in the history of the games. India's 7-medal haul is the most in the country's Olympic history.

ABSTRACT

There are different conventional load shedding approaches, such as under frequency control, but these have a slower response and are unreliable in correctly sharing load in the event of any disruptions or faults. This leads to a rise or decrease in loads, leading to a failure to satisfy the demand for electricity. The paper, titled Intelligent Load Shedding, focused on a more modern approach to load shedding. From the perspectives of architecture, engineering, implementation, and operation, a thorough comparison of traditional versus intelligent load shedding systems was conducted. It has been demonstrated that the intelligent process of load shedding overcomes all of the disadvantages of traditional approaches, is highly efficient, and requires very little maintenance.

KEYWORDS: *Traditional Load Shedding, Intelligent Load Shedding, Frequency Relay, Programmable Logic Controller, Power System Monitoring, Power System Simulation, Traditional Load Shedding, Intelligent Load Shedding, Frequency Relay, Programmable Logic Controller*

INTRODUCTION

Load shedding refers to a system in which electrical power demand is distributed across a number of power sources. Load shedding is utilized to lessen the pressure on the power source to the greatest extent possible when the energy demand exceeds what the power source can offer. A service provider sells electricity to a customer. Two conditions must be met in order for the expense to be negligible: the lowest cost of electricity and an uninterrupted supply of power. The

customer or operator will then arrange with the supplier to shed a minimal amount of the load on a voluntary basis on a defined timetable or on-demand basis[1]. To make the load shedding phase possible, the user side would acquire electricity from different secondary sources rather than the main supplier. On-site diesel generators, contracted or on-site photovoltaic, or another renewable energy source are examples of secondary sources. Consumers receive automatic load shedding during blackouts, whether the suppliers completely halt or restrict energy delivery for a shorter period of time. Brownouts occur when a supplier reduces voltage delivery during peak hours to maintain a balance between demand and supply. This results in automated load shedding for consumers.

Customers experience automated load shedding during brownouts when the supplier decreases the voltage distribution during peak hours to maintain a balance between demand and supply. The part of the load that can be taken away instantly in order to maintain appropriate operation of the necessary components is referred to as load shedding. Any disruption that results in a drop in generation, such as a fault, generation loss, switching problems, or lightning strikes, causes a reduction in load. There are two methods for controlling the transient and dynamic responses of a system whenever exposed to any kind of disturbance[2]. The first one is an excitation loop in which the reactive power and voltage level of the system is controlled and varied. Second one is a prime mover loop where the active power of the generator and frequency of the system is controlled and varied. Both these techniques are discussed below[3]. Excitation loop: There will be a dip in the reactive power if a fault occurs in the device. For the conversion of electrical energy into mechanical energy, reactive power is used and vice versa in the electro-mechanical domain.

The flux energy of the system is then decreased due to fault as soon as the fault is cleared. As soon as the fault is cleared, there is pressure on the rotating machine for proper balance between the generation and demand as well as maintain the level of magnetic energy. The reactive power that the system can produce determines the requirement for operating voltage and voltage regulation. When there are large disruptions, generators use their over-excitation capability to restore system stability and return to normal conditions[4]. Prime-Mover: In the event of a malfunction, prime mover type and turbine governor will have an impact on the machine's performance. Mechanical energy is provided to the generator in order for it to move past any fault or disturbance, and this energy varies depending on the type of turbine, such as gas, turbo, or hydro. This change in energy might cause a disturbance in the system's transient and steady states. More disruptions can also be caused by lightning strikes or network switching strikes [5].

A range of strategies for load shedding have been discussed on the following pages. One of the techniques is a breaker interlock arrangement. A breaker is linked to a group of load-breakers that have previously been designated to fly or is interlocked by remote signals. If a generator breaker or grid link is lost, signals are transmitted to the breakers to open them. Because the amount of load to be shredded has already been decided, this device can work with no additional processing in a short period of time[6]. In figure 1, the approach for load shedding via breaker interlock is shown as a line diagram. A signal will be transmitted to the interlocked load breakers as soon as the main circuit breaker opens, regardless of the time. Because no research was conducted prior to selecting the interlocked breaker, its opening and tripping will not be a function of the system's transient reaction, resulting in unwanted and unnecessary load shedding. The following are some disadvantages of this load-shedding technique:

1. The amount of material that has to be shredded is estimated using the worst-case scenario and is hard-wired. As a result, changing the load's priority is difficult.
2. Only single-stage load shedding is available.
3. Load shedding occurs on a regular basis..

The concept of sub frequency relay is another way used for load shedding. These relay any change in frequency or reduction in frequency rather than detecting any disturbances. After the first stage, the frequency is given time to recover while waiting for a predetermined amount of time to avoid any annoyance tripping. If the frequency continues to decay, an extra delay in time will be added, and time will be allowed to recover. The under frequency relay load shedding approach is presented, with a series of stages for connecting to various circuit breakers one by one until the frequency returns to its normal operating frequency. This method has a number of limitations, including a few frequency relays' slower response time, as well as extra or under load shedding, which creates further disruptions[7]. A flow chart depicts the architecture for load shedding. To determine the quantity of load that must be shed and the time it will take, a pre-calculation is performed. The selection of the load that must be rejected takes precedence. The decline in frequency will continue, and the next group in the priority hierarchy will shed. The process of shedding loads based on priority will continue until the specified stability value is reached [5].

There are different terms used in power system like load shedding, load sharing etc... So first we have to differentiate between load shedding and load sharing.

- Load shedding.
- It is process of cut-off the loads on the approximated area according to the load priority to reduce the increase demand greater than the supply.
- Load sharing
- Load sharing means generally equally share the load in power system. In power system load sharing of transformer is achieved with different techniques. It means in distributed power system if two transformer is connected. One transformer share the load in normal condition. If load demand is increasing and one transformer is connected not able to fulfill demand than another transformer is directly connected with main transformer in parallel and share the load. In power system it is called load sharing of transformer.

Main transformer is called power transformer and another transformer that are connected with the main transformer are called slave transformer in power system. For supplying a load in more than the rating of an existing transformer, two or more transformers may be connected in parallel with the existing (main) transformer. The transformers are connected in parallel when load on one of the transformers is more than its capacity. Due to the parallel operation of transformer reliability of power system is increase and damage to the various equipment in substation like transformers are reduces. To archive parallel operation of transformers some conditions are to be satisfied compulsory. Fig 1 shows the two transformers are connected parallel. There are total two buses in the system one is supply bus and another one is load bus. At the load bus, load is connected. E1 is primary side voltage and E2 is secondary side voltage. If a condition occurs and

load is suddenly increased, then second transformer is in parallel with the main transformer to supply the load demand.

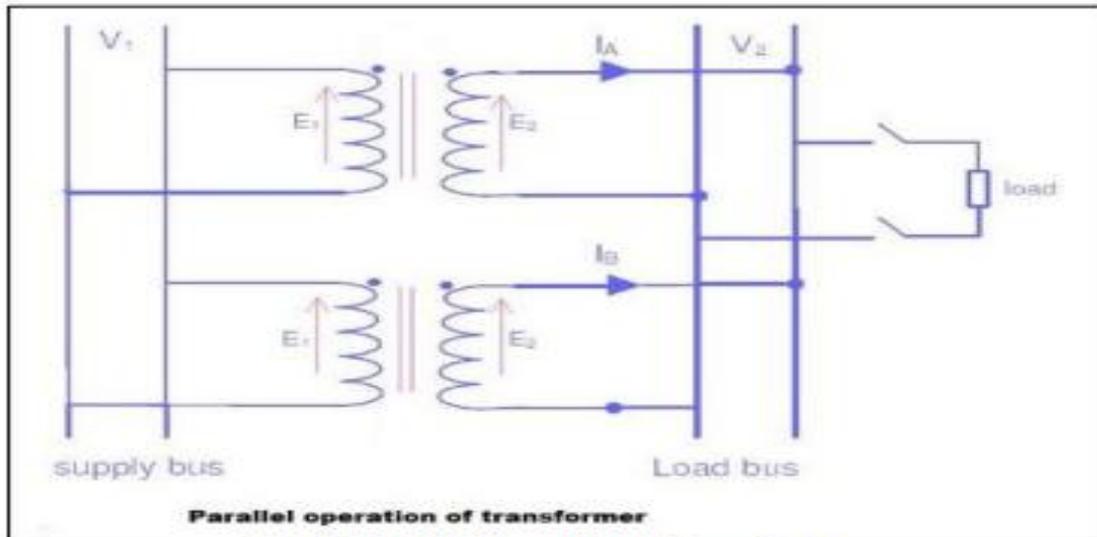

Fig. 1: Parallel Operation of Transformer.

II. NEED OF PARALLEL OPERATION OF TRANSFORMER

- If a large size means large rating of transformer is not available which can actually fulfill the total requirement of load, two or more small size transformers can be connected in parallel to increase the capacity.
- If installation place like substation is located far away, then transportation of smaller size of transformer is easier and may be economical. It will directly affect the cost
- If more than one the transformers run in parallel, is out due to fault of other parallel transformers is the system will share the load, hence power supply may not be interrupted
- If numbers of transformers run in parallel, we can shut down any one of them for maintenance purpose. Other parallel transformers in system will fulfill the load without total interruption of power.

III. CONDITIONS FOR PARALLEL OPERATION OF TRANSFORMER

When two or more transformers run in parallel, they must satisfy the following conditions for satisfactory performance

Voltage Ratio or Turns Ratio

If the transformer connected in parallel have voltage ratio different than this will not good condition for system. Due to the different voltage ratio induced emf generated at the secondary side will be different. Which cause circulating current flows in the loop which are formed by the secondary windings under no-load conditions. The value of this circulating current is much higher than no load current. So chances of damage the winding of transformer. Circulating current cause the losses and damage the insulation of the winding. So the voltage ratio should be proper manner to achieve better parallel operation of transformer. $V_1 V_2 = N_1 N_2$

Same Polarity

Polarity of all transformers that run in parallel, should be the same otherwise huge circulating current that flows in the transformer but no load will be fed from these transformers. Polarity of transformer means the direction of induced emf in secondary. If the directions of induced secondary emf in two transformers are opposite to each other when same input power is fed to both of the transformers, the transformers are said to be in opposite polarity. If the directions of induced secondary emf in two transformers are same when same input power is fed to the both of the transformers, the transformers are said to be in same polarity.

Same Phase Sequence

The voltage between two phases is called line voltages. In this case the phase sequence of line voltages of main transformer and auxiliary transformer which are connected parallel with main transformer must be identical for parallel operation in case of threephase transformers. If the phase sequence is not same, in every cycle each pair of phases will get short-circuited.

Same Impedance Ratio

We know the relation of current with impedance. Current is inversely proportional to the impedance. If we consider two transformers which has different per unit impedance. one transformer have less impedance will draw more current and which has more per unit impedance will draw less current. This leads unequal load sharing. This is not beneficial. Due to this condition, the transformers will not share the load according to their kVA ratings. In that case, it can be corrected by inserting proper amount of resistance or reactance or both in series with either primary or secondary circuits of the transformers where the impedance is below the value required to fulfil this condition.

LITERATURE REVIEW

FarrokhShokooh, J J Dai, ShervinShokooh, Jacques Tastet, Hugo Castro, TanujKhandelwal, and Gary Donner proposed a state-of-the-art load-shedding system that uses real-time data and is updated in the system's model. The technology has generated an optimal approach for shedding the required quantity, which is referred to as intelligent load sharing[2]. The programmable load shedding system (PLSS), which is a fundamental component of Hydro-protection Qu6bec's system and performs monitoring and control functions, has been described by authors Pierre C6te, Simon-Pierre C&e, and Marc Lacroix. Their job include keeping an eye on the frequency and voltage levels, as well as carrying out any necessary shedding if one of these is disrupted. However, if the spare components are unavailable, the cost and procedure of these have become hard chores [3]. Authors Dennis Michaelson, HishamMahmood, and Jin Jiang presented an energy management system based on a micro grid that provides energy through photovoltaic cells and battery storage. Experiments and simulations verified the technique, demonstrating the scenario's potential and viability [4]. Authors Ali Parizad, Hamid Khoshkhoo, ShahabDehghan, and RasoulMoradtalab discussed an isolated power network that is particularly vulnerable in terms of stability. A smart load shedding technique based on a smart load management system for proper functioning in islanded mode has been presented. The intelligent load sharing strategy is presented using a block diagram. The knowledge base of the system is fed by input and output databases from an offline simulation and study system. The knowledge base's outputs are complicated system responses like frequency variation. An automated monitoring system that

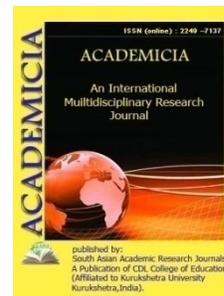

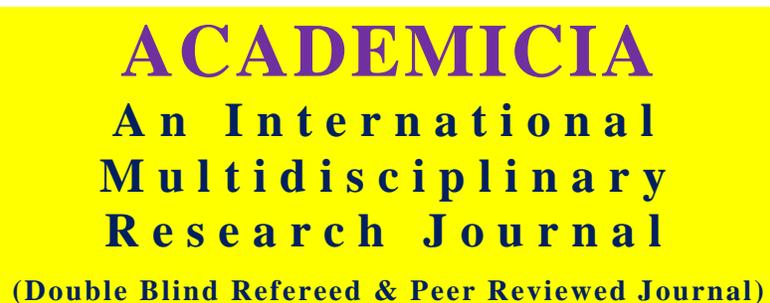

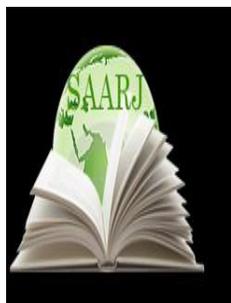

runs a professional knowledge base system in the background keeps track of all of the system's working conditions.

CONCLUSION

Load shedding is the only safeguard for the safety of a system induced by an overload after impact in industrial power systems. The mechanism is protected from collapse by using breaker interlocks, under-frequency relays, and several other PLC-based technologies. However, these are traditional load-sharing solutions, which have their own set of limits and drawbacks. Real-time configuration, pre-fault, and post-fault data unavailability are a few examples. As a result, an intelligent load shedding strategy was presented, which integrates system online data, system dependencies, online and offline simulation information, and a comparison analysis. This system is capable of executing load shedding in less than a hundred milliseconds from the moment a disruption occurs. In Indonesia, PT Newmont installed a functioning model of an intelligent load shedding system. Thirty-four megawatt steam turbines driven by generators and nine five megawatt diesel generator engines provide power to the power system. The eleven-kilovolt power plant distributes electricity via two 150-kV transmission lines. The entire system operates at a frequency of 50Hz, and the voltage is stepped down to 33kV before being sent out. The system employs the multistage frequency approach described in table 2. A comparison of intelligent load sharing and under frequency control is shown in table 3.

ABSTRACT

In human life, the holiday is a uniquely important and major event. The holiday also plays an important role in educating young people, as it embodies, preserves and develops the best traditions, customs and morals of the people. When we observe national holidays or world events celebrated in a country, we learn about the nationality and customs of that country. This is based on millennial experience in setting dates. For example, the time when the sun enters the zodiac sign is marked as the time of Navruz. Professor U. Karabaev in his book "Holidays of the Uzbek people" expressed the following opinion - "The peculiarity of the holiday is the participation of the general public. Hence, expressive and expressive means can be used and observed in all activities in the emergence of a piece of music. This expression is especially evident in public celebrations and performances.

KEYWORDS: *Embodies, Preserves, Uniquely, Especially*

INTRODUCTION

Art is a means of uniting people to beauty. Art is such a social that in any age its main goal is human education. Today, at a time when our country is entering the XXI century, striving for its great future, all our efforts in this direction are accompanied by a sense of faith, a deep understanding of our historical roots, including the history of our art and national music. It would be appropriate in all respects to talk about. Through music, dance and other arts, the goal is to educate people, give them spiritual pleasure, encourage them to do good, and to achieve this, the leader of the artistic team has to use a variety of expressive and influential means. Hence, expressive and expressive means can be used and observed in all activities in the emergence of a piece of music. This expression is especially evident in public celebrations and performances. In recent years, more precisely, after the independence of our country, we can feel the growing

interest in the organization of holidays. Public holidays are the highest form of cultural events and have been perfected with the development of human history. That is why the main part of this lesson focuses on the theme of holidays. Since the creation of mankind, holidays have become of special importance in its way of life. Human life cannot be imagined without holidays, traditions, ceremonies, customs. Holidays are the main means of showing the world the spiritual beauty of society, the way of life of the people, the living conditions. When we observe national holidays or world events celebrated in a country, we learn about the nationality and customs of that country. This means that the holiday is a mirror that demonstrates the most elegant and delicate qualities of life. The holiday is a living source of evidence of society's night, today, and tomorrow. The great scholar of the East, Mahmud Kashgari, said, "The holiday is a day of joy and happiness for the people." Abu Rayhan al-Biruni described the holidays as the "most important days" in life and divided them into the following types:

1. secular holidays;
2. religious holidays.

"Whoever celebrates Navruz will be happy until the next Navruz," said Omar Khayyam. Holidays also vary to some extent, depending on changes in society. New holidays are coming. But this does not change the joy of the holiday, the joy of the people. Man tries to forget the worries of his life during the holidays, to wear new clothes, to write dust with fun. When evaluating the holidays of the twentieth century, scientists in this field work on the basis of the concept of MM Bakhtin. "A holiday is an ideal life at a certain time," says II Mazaev. "Holiday is a unique social event that reflects the life of every citizen and society as a whole," - said D.M. Genkin, clarifying this point, writing: It's a unique antique that adorns. " Doctor of Philology, Professor U. Karabaev gave a detailed description of the features of Uzbek holidays in his book "Holidays of Uzbekistan" and in the book "Holidays of the Uzbek people" created as a revision of this book. Uzbek holidays are essentially no different from the holidays of other nations, they are also an expression of dreams, labor, struggle, traditions, a mirror of beauty, peace, solidarity, equality, continuation of life, an important part. In human life, the holiday is a uniquely important and major event. The holiday also plays an important role in educating young people, as it embodies, preserves and develops the best traditions, customs and morals of the people. History proves that the meaning and idea of holidays originated and changed and developed on the basis of people's thoughts, sorrows and dreams. Another feature of the holidays is that they are associated with a specific time, a special date. In people, the holiday mood appears when a predetermined time, date, day arrives. For example, after the cold days of winter, the warmth of the weather, the surrounding area is covered with blue clothes, the blossoming of giant trees - the arrival of spring brings joy and happiness to all people. Of course, everyone enjoys this change on their own. But because the beauty of nature and the joy of spring are common to all, people are also born to celebrate it together. A special time is set to meet this need. This is based on millennial experience in setting dates. For example, the time when the sun enters the zodiac sign is marked as the time of Navruz. Professor U. Karabaev in his book "Holidays of the Uzbek people" expressed the following opinion - "The peculiarity of the holiday is the participation of the general public. The celebration is primarily organized for the public and it is held with the direct participation of the people. During the holidays, everyone can show off their talents. People can observe the festive events as participants and express their reaction to the events that took place First; Another distinctive feature of the holidays is that they consist of a synthesis of

several (complex) events. Each holiday is organized on the basis of many events. The organization of the holiday is to express its theme, idea, direction through a special form, events and ceremonies. Usually every public (especially outdoor) celebration will have an opening ceremony. Then, somewhere - holiday exhibitions, contests; dor game in second place, wrestlers performances; in third place were performances by askiya and amateurs, puppet theater performances; in the fourth place - concerts of amateur art groups, folklore and ethnographic ensembles; fifth place sports competitions etc. will be organized. Traditions, ceremonies, theatrical concerts and performances, carnivals, performances, folk dances are the main components of the festivities. Public holidays are held on the basis of similar events.

"Bayram" is derived from the Turkish word, which means wedding, ceremony, celebration. There are different interpretations of the word holiday. The holiday is one of the most important parts of social local life, celebrating events that create joy and happiness. The peoples of Central Asia, including the Uzbek people, have many holidays that have been formed from ancient times and passed down from generation to generation. These holidays were formed in the most ancient times by the needs of the people, developed on the basis of social necessity and enriched with the experience of other nations. It is expedient to study the holidays of the Uzbek people in periods. For example:

- Forms of celebration that originated in primitive times (including hunting games, zoophagic (i.e. totem bear, wild goat, cow, which is the worship of horses, etc.) holidays, labor games, orgaist holidays, and other holidays).
- Ancient (pre-Islamic) holidays of the peoples of Central Asia;
- Uzbek holidays from the Middle Ages to the Revolution;
- Holidays of independence.

In recent years, the genre problems of public holidays have become more urgent. Some experts have difficulty in determining the genre of public holidays. As in theatrical art, public festivals also have their own genre types. This problem has been proved by the director, scientists DM Genkin, IG Sharoev, IM Tumanov, AD Silin, N. Vershkovsky, U. Karabaev in their researches. Based on their experience, public holidays can be divided into the following genres: theatrical concert; concert-meeting; public holiday; theatrical performance; festive movement in the streets, squares, stadiums and parks; decades of national art; art festivals; song festivals; dance festivals; carnivals; water festivals; open-air theater performances; street holidays; sports holidays; theatrical children's festivities are among them.

The origin of the holiday, the stages of its development is studied by the science of "Eortology". "Eortology" is derived from the Greek word for holiday. Specialists such as I.Snegiryov, I.Sakharov, F.Buslaev, A.Afanasev, E.Anichkov, K.Mardjanov, DMGenkin, IMTumanov played an important role in the emergence of this science and its scientific and theoretical study. . Oriental thinkers such as Mahmud Kashgari, Abu Rayhan Beruni, Firdausi, Farobi, Ibn Sino, Alisher Navoi, Babur, Agahi, Behbudi, Fitrat also expressed their views on the role of holidays in social life. .

It should be noted that the history of public holidays, especially the genesis of the history of holidays in Uzbekistan, its types have not been fully studied. History is such a science that the more we study deeply, the less we know for sure. In particular, the history of public holidays is

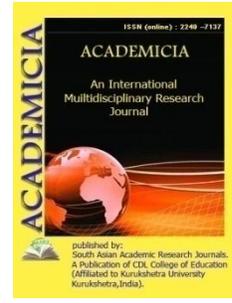

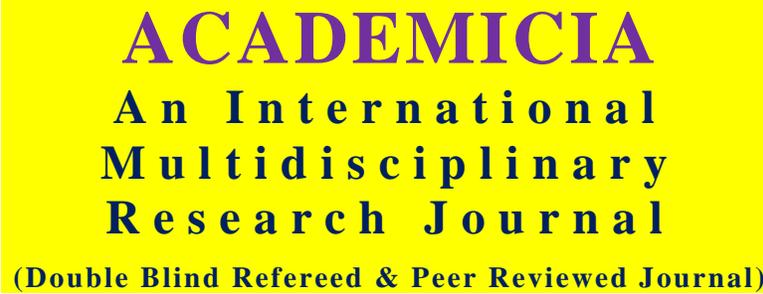

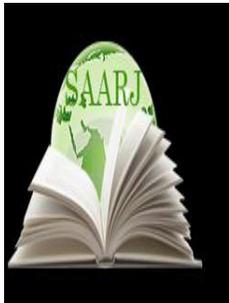

very little studied. One of the first in this field, Doctor of Philosophy, Professor UH Karabaev made a significant contribution to the development of the science of holidays in Uzbekistan. His books "Holidays of Uzbekistan", "Holidays of the Uzbek people" have a deep, scientific approach to this topic and try to fully cover the history of the holidays. Until recently, the history of the holidays was studied as a general art history (literature and theater). However, mass celebrations and performances have occupied a high place in every historical period as the main teaching of upbringing and enlightenment. If we take a brief look at the history of public holidays, we can begin with the holidays of ancient Greece and Rome, which were ideologically compositionally whole. Of course, even before the feasts of ancient Greece and Rome, feasts came into being and were formed in the period after the emergence of mankind. But these festivals were primitive in terms of their spiritual, intellectual level, expressive forms, and lacked compositional integrity. Founded in ancient Greece and Rome, elements of public holiday drama and directing emerged in folk festivals. In the ancient Greeks, the holiday was a kind of independent leisure and recreation, and even in a permanent way it became an integral, active type of activity. As we know, the games Delfe, Pythagoras, Nemeysk and Panfin were very popular. But the most popular of these games was the Olympics.

The Olympic Games are held every 4 years in the specially built city of Olympus. Although ancient Rome was a neighbor of Greece, the festivals were radically different in form and appearance. While the citizens of Athens took an active part in the Greek festivals, in the ancient Roman spectacles the participant was separated from the spectator. It was from this period that the word 'spectacle' became synonymous with the word 'holiday'. As a fierce class struggle took place during the Roman Empire, spectacles were staged to distract the population as the empire was ruled by force. In the performances of the ancient Roman Empire, stage technique, impressive means were much developed. The famous Colosseum, built in Rome in particular, still amazes people. The Colosseum is world-famous not only for its size, but also for its features such as a moving arena, the ability to turn an arena into a lake or forest through stage mechanisms. Especially in ancient Rome, the Triumph parades, dedicated to the victory over the enemy, were a peculiar theatrical military parade. In addition, spectacles such as gladiatorial fights, circus races, artists' competitions, naval battles, luperkali, "little triumph" - applause were popular. In the Middle Ages, the stratification of public holidays developed intensively. In particular, religious festivals flourished, elevating the power of the feudal state to the skies. At the same time, the humorous festivities in the city squares were the people's favorite holiday spectacles, gathering large crowds and showing their aspirations for the future and confidence in the future. was dedicated. Such an approach to public holidays has led to a change in the concept of 'holiday'. In the Middle Ages, the rest of the individual, not free at will, was governed by the church, the clergy. There were more than a hundred religious holidays during this period. Large churches, a church with enormous political power, also took the festivities into its own hands, demonstrating its superiority over the people and turning it into a weapon of its own propaganda. The wealth of the church provided a diverse variety of costumes during these festivities, creating a distinctive theatricality that helped bring the church ceremonies to the level of a public celebration.

TO THE PROBLEMS OF SELF-ASSESSMENT OF CHILDREN WITH DISABILITIES THROUGH ADAPTIVE PHYSICAL EDUCATION AND SPORT

G.R. Muratova*

*(KSPI Acting Assistant Professor),
UZBEKISTAN

Email id: muratovagulnora4@gmail.com

ABSTRACT

In our country, effective measures are being taken to improve the health and physical activity of the nation. One of the means of personality upbringing is adaptive physical culture, which uses physical exercises, competitive and plays activities that are most suitable for children with disabilities. Taking into account the realities caused by the global problem - the fight against the pandemic, the President and the Government of the Republic of Uzbekistan are focusing all their attention on strengthening the physical and mental health of the population. The principle of the adequacy of pedagogical influences means the implementation of the laws of the educational and pedagogical process: the solution of correctional and developmental, compensatory, therapeutic and restorative problems.

KEYWORDS: *Adaptive Physical Education, Disabled, Quality Of Life, Adaptive Sports, People with Disabilities, Microsociium, Psychological Factors*

INTRODUCTION

The article examines the psychological factors that contribute to attracting people with disabilities to adaptive physical culture and adaptive sports. Taking into account the realities caused by the global problem - the fight against the pandemic, the President and the Government of the Republic of Uzbekistan devote all their attention to strengthening the physical and mental health of the population. In this situation, the most vulnerable to the threat were people with poor health and disabled people. And the problem of rehabilitation of people with disabilities is becoming more urgent than ever.

Raising children with disabilities is a very complex process that depends on many different factors. To carry out this process, special tools and methods are required. One of the means of personality upbringing is adaptive physical culture, which uses physical exercises, competitive and plays activities that are most suitable for children with disabilities. It is important to effectively use the educational opportunities of adaptive physical culture classes, and for this you need to know the general orientation and motives of the child's personality: attitude to your flaw, fear of failure, achieving success, making new friends, increasing self-esteem and assessments of people around. [2. 448 p.]

The relevance of the research topic lies in the fact that this article studies the psychological factors that contribute to attracting people with disabilities to adaptive physical culture and adaptive sports. Taking into account the realities caused by the global problem - the fight against the pandemic, the President and the Government of the Republic of Uzbekistan are focusing all their attention on strengthening the physical and mental health of the population. In this situation, the most vulnerable to the threat turned out to be those with weakened health and the disabled. And as never before, the problem of rehabilitation of people with disabilities is becoming even more urgent.

The relevance of the research topic lies in the fact that this article studies the psychological factors that contribute to attracting people with disabilities to adaptive physical culture and adaptive sports. Taking into account the realities caused by the global problem - the fight against the pandemic, the President and the Government of the Republic of Uzbekistan are focusing all their attention on strengthening the physical and mental health of the population. In this situation, the most vulnerable to the threat turned out to be those with weakened health and the disabled. And as never before, the problem of rehabilitation of people with disabilities is becoming even more urgent.

In our country, effective measures are being taken to improve the health and physical activity of the nation. For example, a presidential decree No. UP-5924 of 24.01.2020 "On measures to further improve and popularize physical culture and sports in the Republic of Uzbekistan" was adopted, which states that in recent years, consistent measures have been taken to popularize physical culture in the republic. and sports, promoting a healthy lifestyle among the population, creating the necessary conditions for the physical rehabilitation of persons with disabilities and ensuring a worthy performance of the country in the international sports arena. [1].

Research on adaptive physical culture and adaptive sports is mainly aimed at the issues of physical rehabilitation of children with disabilities and, unfortunately, the psychological factors contributing to both physical rehabilitation and their personal development are still poorly understood.

Research methods and organization. Pedagogical observations of the educational and training process of children with disabilities were carried out at the sports base of athletes in the city of Dangara in the period from November 2020 to March 2021. Also, training plans, self-control diaries of the trainees were studied and consultations were held with their parents.

In the course of the pedagogical research, records were made, stating positive motivation to engage in adaptive physical culture and sports, mainly in those cases when children with DHO, in addition to the goals of physical development, set tasks to improve their personality. (APHC) was the formation of the sports culture of children with disabilities, their maximum adaptation to

an independent life, the formation of the need to get a decent education and subsequently work fruitfully in the chosen field, i.e. make their life as fulfilling as possible.

Sport for children with disabilities is also important because it is a means of communication, makes them forget about their problems; believe in yourself, in your strengths and capabilities; show leadership qualities. And this, in turn, gives them the opportunity to feel like ordinary children. For children with disabilities, regular physical exercises are doubly important, which train the heart, normalize the activity of all functional systems, and develop the necessary physical qualities.

The state should encourage all types of sports activities for people with disabilities. For the development of youth adaptive sports for people with disabilities, a systematic approach and the creation of favorable conditions for physical education are required. It is necessary to expand the range of rehabilitation effects on children with disabilities and provide complex methods of socio-pedagogical orientation, taking into account the individual capabilities of each child. [3, 17p.]

Research results and their analysis. The results of the pedagogical research data led us to the conclusion that it is necessary to conduct seminars and master classes with parents of children with disabilities who want to introduce the child to physical education and sports, explaining to them the sequence and gradualness of the use of such sports that do not require large material investments and specialized institutions. It should also be clarified that the organization and conduct of classes with children with disabilities should be carried out taking into account different principles and approaches.

For example, the principle of a differentiated and individual approach in adaptive physical education assumes the unification of those engaged in relatively homogeneous groups (by age, diseases, indicators of physical development). An individual approach means taking into account the characteristics inherent in one child. Taking into account the principle of compensatory orientation of pedagogical influences provides for the reimbursement of underdeveloped or lost functions due to the restructuring or increased use of preserved functions and the formation of new possibilities. The principle of the adequacy of pedagogical influences means the implementation of the laws of the educational and pedagogical process: the solution of correctional and developmental, compensatory, therapeutic and restorative problems. [4]

When choosing the means, methods, teaching methods, the real possibilities, interests and needs of the student must be taken into account. The principle of the optimality of the pedagogical influence, the reasonably balanced values of the psychophysical load, the expedient stimulation of adaptation processes that enhance the strength and nature of external stimuli. Physical activity should correspond to the optimal reactions of the body.

Taking into account the principle of variability of pedagogical influence implies a variety of not only physical exercises, but also the conditions for their implementation, methods of regulation, emotional state, impact on sensory sensations, speech, fine motor skills and intellect.

The main form of organized classes in all types of adaptive physical culture, as well as in the entire system of physical education, is the lesson form. Depending on the objectives of the program content, classes should be divided into:

- Educational activities - for the formation of special knowledge, teaching a variety of motor skills,
- Classes of correctional and developmental orientation - for the development and correction of physical qualities and coordination abilities,
- Health improving classes - for posture correction, flat feet, prevention of somatic diseases, strengthening of the cardiovascular and respiratory systems,
- Lessons of a therapeutic orientation - for the treatment, restoration and compensation of lost or impaired functions in chronic diseases, injuries, etc.
- Lessons of a recreational orientation - for organized leisure, recreation, play activities.

CONCLUSIONS

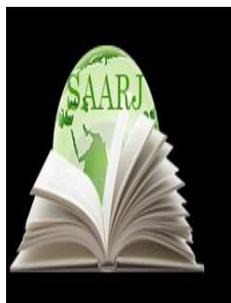

The intensification of work with disabled children in the field of physical culture and sports, undoubtedly, contributes to the humanization of society itself, a change in its attitude towards people with disabilities, and thus has great social significance.

In the field of physical rehabilitation of disabled people, there is still an underestimation of the fact that physical education and sports are much more important for a person with disabilities than for people who are well-off in this respect. Active physical culture and sports activities, participation in sports competitions are a form of so urgently needed communication, restore mental balance, relieve the feeling of isolation, return a sense of confidence and self-respect, and give an opportunity to return to an active life.

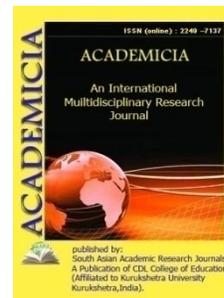

The main task still remains to involve as many people with disabilities in intensive sports as possible in order to use physical education and sports as one of the most important means for their adaptation and integration into society, since these activities create mental attitudes that are extremely necessary for successful reunification of a disabled person with society and participation in useful work. The use of physical culture and sports means is effective, and in some cases the only method of physical rehabilitation and social adaptation.

ABSTRACT

Plants-based nutrition has been proven to protect against 15 of the world's largest leading causes of mortality, including several cancers, and may have potential as a disease-modifying tool for better management or treatment of these diseases. The effects of plant-based diet on breast, prostate, colorectal, or gastrointestinal cancers have been the most thoroughly researched, with the most published supporting data to far. Diets rich in whole foods including plant-based proteins have been proven to protect against these malignancies, as well as other cancers other chronic diseases. Nutritional treatments in the prevention of different malignancies outperform presently available medical therapies, or should be utilized more often as a supplement to first-line medical treatment. Despite the fact that the effects of nutrition are becoming increasingly well-known, as well as the importance of food and lifestyle variables in health and illness is receiving greater attention and focus, the advantages and drawbacks are still underappreciated.

KEYWORDS: *Vegan nutrition, Plant-Based Diet, Cancer, Nutritional Therapy.*

1. INTRODUCTION

The leading causes of death in the United States and many other developed nations are avoidable. Our food, in particular, continues to be the leading cause of mortality and disability in the United States. A significant decrease in mortality and age-adjusted incidence of several malignancies prevalent in Western culture has been seen among populations eating mainly plant-based diets. Breast, prostate, colon, pancreatic, ovary, and uterine endometrial cancers are among these malignancies. However, as the Westernized food and lifestyle expand throughout the globe, this tendency is diminishing. Red or processed meats are implicated as significant carcinogens in reports from the International Agency for Research on Cancer, the World Health Organization's cancer agency. Other dietary factors, such as a high fiber intake, fruits, and vegetables, on the other hand, have been shown to protect against cancer. While the significance of plant-based foods including fruits, vegetables, nuts, seeds, and legumes as nutritional sources is well acknowledged, using diet to prevent and treat illness is still rare. Despite the fact that numerous observational and experimental research studies have shown a significant preventive role of plant-based diets against the rate of cancer as well as many other disease states, including the 15 leading causes of death in the Western world, this remains the case.

A recent comprehensive meta-analysis found that a vegetarian diet has a substantial protective impact against overall cancer incidence (-8 percent), whereas a vegan diet had a considerable decreased risk of total cancer incidence (-15 percent)[1]. Surgery, radiation, and chemotherapy are some of the current cancer treatment methods. Not only do these cancer therapies cost a lot of money for health-care systems, but they also cost a lot of money for individuals. As a result, dietary interventions should be utilized as a preventative measure and may be a cost-effective and safe complement to conventional medical therapies. This study examines the evidence on the impact of diet on cancer incidence and development, with a particular emphasis on the effects of reducing or eliminating animal protein, as well as noteworthy bioactive chemicals in plant foods that provide cancer protection. Though plant-based nutrition has been demonstrated to help prevent and increase survival in a variety of cancers, our study will concentrate mostly on breast, prostate, colorectal, and gastrointestinal (GI) cancers, since these are the classes with the most data to far. Before we get to the end, we'll talk about "other" cancers briefly[2].

Vegan diet & cancer, vegetarian diet as well as cancer, plant-based nutrition as well as cancer, vegetarian diet or breast cancer, vegan diet or prostate cancer, vegan diet and GI cancer were all used in a PubMed search. Cross-referencing publications and finding relevant resources from the Physicians Committee for Responsible Medicine nutrition guide for doctors were part of the secondary search approach. Systematic reviews and meta-analyses, as well as original research using a variety of methods including longitudinal prospective studies, randomized controlled trials, including case series, were used as sources.

1.1 Breast cancer and plant-based nutrition:

Breast cancer is the most prevalent cancer among American women, second only to skin cancer. Every year, an estimated 250,000 women or 460 men are diagnosed with the disease (plus 2,500 instances in males), with 40,000 women and 460 men dying as a result. In order to increase survival, imaging and early detection are often stressed. Early diagnosis and screening, on the other hand, does not protect breast cancer; it merely detects a disease that is already there. Furthermore, current imaging is insufficient to identify cancer in its earliest stages, thus what the

medical profession refers to as "early detection" is, sadly, "late detection." A breast cancer tumor, for example, must be approximately 2 billion cells (30 doublings) in size to be detected by a mammography. The primary element that affects doubling time, and therefore when someone is diagnosed with cancer, may vary from 25 to over a thousand days. This implies that a person may be diagnosed at any point between the ages of 2 and 100, and the main determinant of where they fall on the timeline may be based on what they consume[3].

According to post-mortem studies, up to 39% of women in their 40s have already had breast cancers that are too tiny to be detected by mammography. Breast cancers may also develop in pregnancy as a result of a mother's nutrition. As a result, waiting until a diagnosis to begin eating and living a healthy lifestyle may be too late. Typically, someone is deemed "healthy" if scans or diagnostic screening tests reveal no pathologies or abnormalities, and they don't exhibit any clinical signs of a disease condition. Can someone really be deemed "healthy" if they had been carrying a cancer for decades that was just too tiny to be discovered or cause major clinical signs? Because there is so much more going on at a cellular level inside the human body than scans can ever reveal, it may be more advantageous to consider living in a continuous state of prevention or therapy than awaiting until a disease has advanced to the point of exhibiting outward symptoms. As a result, maybe we should live as if we already had the beginnings of illness in our bodies, since a disease-prevention diet and lifestyle may also be a cure for occult diseases that we can't see[4].

The American Institute for Cancer Research (AICR) issued ten cancer preventive guidelines in 2014. Dietary consumption of mainly whole plant foods (vegetables, fruits, whole grains, legumes) reduces the incidence of many malignancies and other disease states, according to the findings. In a 2013 study of approximately 30,000 post-menopausal women with no history of breast cancer over the course of seven years, it was discovered that following just three of the ten AICR recommendations (maintaining a normal body weight, limiting alcohol, and eating mostly plant-based) resulted in a 62 percent lower risk of breast cancer. Furthermore, the pace at which consuming a plant-based diet may alter an individual's physiology is astounding. In vitro tests of the effects of a healthy diet (plant-based) and lifestyle (daily walking) on tumor cell proliferation and apoptosis were conducted in 2006. Researchers discovered that participants' blood samples were able to inhibit cancer development and destroy 20 percent to 30 percent more malignant cells after just two weeks of healthy living than blood samples obtained before the diet/lifestyle modification. Lower levels of insulin-like growth factor 1 (IGF-1) owing to reduced animal protein consumption were shown to be responsible for the cancer-suppressive impact. IGF-1 is a hormone that promotes cell proliferation, and the more IGF-1 in the bloodstream, the greater the chance of developing cancer. As a result, it is believed that decreasing animal consumption would lower IGF-1 levels and enhance our bodies' natural cancer defences. Ngo and colleagues discovered that after 11 days of decreasing animal protein intake, circulating IGF-1 levels fell by 20%, but levels of the cancer-protecting IGF-1 binding protein rose by 50%. Only individuals who eat a completely plant-based (vegan) diet get cancer prevention due to lower amounts of growth hormone and higher levels of binding protein. Because all animal proteins promote the synthesis of IGF-1, regardless of whether they come from muscle, eggs, or dairy, vegetarians who ingest eggs or dairy do not have the same protective impact[5].

1.2 Breast cancer through heterocyclic amines:

Heterocyclic alkali metals, in addition to IGF-1, are another chemical present in animal products that adds to cancer risk (HCAs). Animal products cooked in different ways at high temperatures have been discovered to contain cancer-causing chemicals since an initial article in 1939. HCAs are “chemicals present when muscle in meat, including beef, pig, fish, and chicken, is cooked using high-temperature methods,” according to the National Cancer Institute. HCAs are produced when high temperatures stimulate chemical interactions between elements of muscle tissue, chemicals that aren't found in plants, thus cooked vegetable burgers/products don't contain any. The longer meat is cooked, the more HCAs are generated, and the findings indicate that well-done meat is linked to an increased risk of breast, colon, oesophagus, pancreatic, prostate, and stomach cancers. This isn't to say that shorter cooking time doesn't generate HCAs; even roasting chicken for 15 minutes at 350 degrees produces significant quantities of HCAs, which cause DNA damage and therefore an elevated risk of cancer.

Several studies, notably the Staten Island Breast Cancer Study Project as well as the Iowa Women's Health Study, have shown a link between consuming more cooked meats and an increased risk of breast cancer in women. Women who ate more grilled, barbecued, or smoked meat throughout their lifetime had a 47 percent higher risk of cancer, according to the Long Island research, while women who ate their meat "well-done" had a 5-fold higher risk of cancer, according to the Iowa study. Studies have also shown a connection between fried meat intake and the quantity of DNA damage in the breast tissue. The most common HCA in cooked beef, 2-amino-1-methyl-6-phenylimidazo pyridine (PhIP), has strong estrogen-like actions and may contribute to cell development nearly as much as endogenous estrogen, which would be the hormone that feeds most human breast cancer tumors. Researchers examined levels of PhIP in subject's breast milk after initial in vitro experiments to establish whether HCAs really find their way into women's breast ducts from their diet, and quantities were found in doses known to be carcinogenic[6].

1.3 Plant-based diets may help prevent breast cancer:

Unfortunately, even after being diagnosed with breast cancer, most women do not make the required dietary and lifestyle adjustments to fight the illness and extend their lives, including eating more whole plant foods.

Fiber, vegetables, and flaxseeds are all helpful. According to studies, women who consume 6 g or more of soluble fiber per day (equal to a cup of black beans) had a 62 percent lower risk of breast cancer than those who consume less than 4 g. Notably, the benefits seem to be stronger for the more difficult-to-treat estrogen receptor negative (ER-) cancers, with premenopausal women who ate a lot of fiber having an 85 percent lower risk. Hundreds of research, including particular pattern and large prospective studies, have shown similar results, with the conclusion being that the more plant-based a person's diet is, the better. According to the findings, every 20 g of fiber eaten per day reduces the risk of breast cancer by around 15%; however, others speculate that the benefits may only be seen after a baseline of 20 g per day is reached. Given that one cup of split peas contains 16 g, 20 g may not seem like much, but the average American woman consumes less than 15 g per day, with vegetarians consuming slightly more at 20 g, healthy vegan diets 37 g, vegans 46 g, and whole-food plant-based diets suggested as therapeutic interventions for many chronic diseases averaging about 60 g. These findings show that people in the United States and other Westernized nations are deficient in fiber, and that increasing fiber consumption through whole foods (rather than supplements) may help improve health[7].

Cooked meat consumption was related to a 47 percent higher risk of breast cancer in the Staten Island women's research, while those who also had a poor diet of fruits and vegetables had a 74 percent increased risk. Increased fruit and vegetable consumption is linked to improved general health and lifestyle behaviours, as well as the presence of numerous bioactive chemicals in fruits and vegetables that protect against cancer. Cruciferous vegetables like broccoli, for example, increase the activity of detoxification enzymes in the liver. Consumption of broccoli and brussels sprouts has been found to enhance caffeine clearance, and the same has been shown to occur with carcinogens. When non-smokers were fed pan-fried beef along with 3 cups of broccoli and brussels sprouts for two weeks and the amounts of HCAs in urine samples were measured, liver clearance was enhanced. Despite eating the same quantity of carcinogens, substantially less was found in the urine of the subjects, supporting the hypothesis that cruciferous vegetables have a detoxifying capacity. It was also shown that liver function improved for up to two weeks after the intake of vegetables was stopped. The safest approach is to choose a vegetarian burger that contains no HCAs in the first place[8].

Lignans have been found to directly inhibit the development and proliferation of breast cancer cells in both in vitro and interventional trials. The risk of breast cancer was shown to be substantially decreased in a 2010 National Cancer Institute-funded research of 45 people with high breast cancer risk who were given 2 tablespoons of ground flaxseed per day. Needle biopsies taken after the yearlong study revealed fewer precancerous changes than before, and 80 percent had lower levels of Ki-67, a biomarker for increased cell proliferation, implying that breast cancer risk can be significantly reduced by simply adding a few tablespoons of ground flaxseeds to one's daily diet. When it comes to women who have already been diagnosed with breast cancer, those who have higher serum lignan levels and eat more dietary lignans have a better chance of surviving. This discovery may be due to an increase in the protein endostatin, which has a role in depriving tumors of blood flow in the breasts of women who eat more lignans, according to the researchers[9].

1.4 Prostate cancer or plant-based nutrition:

In 2018, it is expected that new instances of prostate cancer will be identified, with 609,64 men dying from the illness. Furthermore, according to autopsy studies, about half of men over the age of 80 die of prostate cancer without realizing it. A variety of dietary components have been linked to an increased risk of prostate cancer, and the relevant food sources, like with breast cancer, are of animal origin. This is especially true with milk and eggs when it comes to prostate cancer.

1.5 Prostate cancer and dairy:

Humans are the only species that consumes milk after weaning, much alone drinks the milk of another species, despite the fact that dairy products are often marketed as "natural." Milk and other dairy products are also advertised as being "good" for the body, despite the fact that every animal-derived food product includes significant amounts of sex steroid hormones, particularly dairy since milk is obtained from nursing female cows. Hormone levels in so-called "organic" cows are high enough to affect hormone-related problems such as acne, reproductive dysfunction, early puberty, and increased twin rates. The impacts of growth hormones, in addition to sex steroid hormone, are of special importance when it comes to cancer. When you consider that cow milk is designed to help a calf acquire a few hundred pounds in a few months,

it's easy to see how a lifetime of human exposure to those growth hormones might lead to cancer, especially hormone-sensitive cancers.

1.6 Colorectal cancer or plant-based nutrition:

CRC is the third most frequent cancer in males and the second most prevalent cancer in women in the world, with more than half of all cases occurring in industrialized nations. Obesity and diet have been proven to have a significant effect in reducing the risk of colon cancer. Fortunately, food is a changeable element, and a shift from a disease-promoting to a disease-protecting pattern may be achieved. While specific meals have been linked to an increased or decreased risk of colon cancer, the overall pattern of food consumption may have the biggest impact on disease progression. Numerous studies have indicated that diets rich in unprocessed plant foods including fruits, vegetables, and whole grains protect against colon cancer, while diets rich in meat and saturated fat increase the risk. As a result, vegan and vegetarian diets have been linked to a lower risk of CRC. Vegetarian diets were linked with a reduced overall incidence of CRC compared to non-vegetarians in the Adventist Health trials, which tracked a large prospective cohort of almost 80,000 individuals. Plant-based diets may have a preventive impact in part because they exclude meat, which includes hazardous elements such as saturated fats and carcinogens produced during the cooking or processing of animals. Incorporating many beneficial plant components, such as fiber and micronutrients, into plant-based diets may provide further protection[10].

1.7 Other cancers and plant-based nutrition:

Plant-based diet also has been proven to protect against a variety of different malignancies, both GI and non-GI. According to a systematic review and meta-analysis, people who eat a healthy diet rich in fruits and vegetables had a two-fold lower risk of stomach cancer than those who consume a Western diet rich in meat, fats, and carbohydrates. Processed or red meat consumption has been linked to an increased risk of stomach cancer, which may be mediated in part by the food preservative nitrites found in processed meats. Plant-based nitrates, on the other hand, are not linked to an increased risk of stomach cancer. Similarly, eating more red meat or animal fats raises the risk of pancreatic cancer, whereas eating more fruits, vegetables, and whole grains seems to decrease the risk. A high consumption of fruits and vegetables was also shown to be protective against cervical intraepithelial neoplasia in a review of dietary cervical cancer prevention methods. Higher vitamin, mineral, or antioxidant levels in the blood were linked to a lower risk of high-grade cervical intraepithelial neoplasia. A Western diet heavy in animal's products and refined carbohydrates has been linked to an increased risk of endometrial cancer, while a diet rich in plant foods seems to be beneficial.

2. DISCUSSION

Plant-based nourishment has been proven to protect against 15 of the world's top causes of death, including several cancers, and may have potential as a disease-modifying tool for better management and treatment of these diseases. The effect of plant-based diet on breast, prostate, colorectal, or gastrointestinal cancers have been the most thoroughly researched, with the most published supporting data to far. Diets rich in whole foods including plant-based proteins have been proven to protect against these malignancies, as well as other cancers and chronic diseases. Plant-based nutrition has been proven to protect against 15 of the world's top causes of death, including several cancers, and may have potential as a disease-modifying tool for better

diagnoses and prevention of these diseases. The effects of plant-based diet on breast, colorectal, prostate, and gastrointestinal malignancies have been the most thoroughly researched, with the most published supporting data to far. Diets rich in whole foods including plant-based proteins have been proven to protect against these malignancies, as well as other cancers and chronic diseases.

3. CONCLUSION

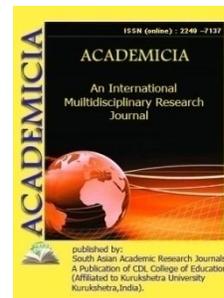

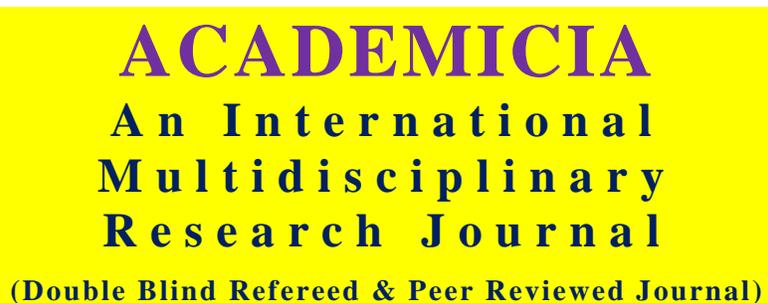

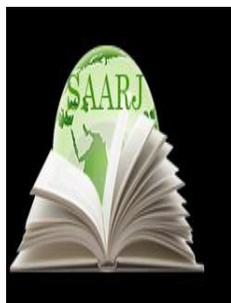

Diet is one of the leading causes of early mortality and disability in industrialized nations, and it also contributes to the high prevalence of malignancies in Western societies. Because of the significant impact of food on cancer incidence and development, as well as the high cost burden imposed by existing treatment regimens, prevention via a mostly plant-based diet seems to be an appealing method of fighting the issue. Though there are still some misconceptions about vegan diets, especially when it comes to iron and B12, The Academy of Nutrition and Dietetics' stated stance on plant-based diets states that "appropriately planned vegetarian, including vegan, diets are healthful, nutrient dense, or may provide medical benefits for the preventative measures and treatment of certain diseases including ischemic heart disease." As a result, worries regarding vegan diets' nutritional insufficiency are unfounded when diets are properly designed.

Adoption of a plant-based diet, as discussed in this article, offers significant protection against a variety of malignancies while posing practically no risk of undesirable side effects. A well-planned plant-based diet is a simple and cost-effective strategy that may be used alone to prevent illness or in conjunction with conventional therapy to treat disease that has already developed. A plant-based diet has also been proven to protect against other Western chronic illnesses such as diabetes, heart disease, and obesity, in addition to cancer prevention. The present lack of nutrition education and understanding among doctors remains a barrier to more broad diet modification prescription for cancer prevention, and it should be addressed beginning early in medical school. With current cancer treatment regimens being unsustainable, a focus on prevention, particularly via food and lifestyle modifications, represents a significant paradigm shift with the potential to significantly reduce disease burden.

ABSTRACT

*The life cycle of the pathogenic oomycete *Phytophthora infestans*, which causes late blight in potatoes and was responsible for catastrophic famines in the 1840s, was explained by German scientist Anton de Bary (1831-1888) in 1860. DE BARY (1861) founded the scientific field of physiological plant pathology in a book on the subject released 150 years ago. With reference to Charles Darwin's (1809-1882) theory of descent with modification by natural selection, we outline the life and scientific accomplishments of Anton de Bary, who created the words "symbiosis" and "parasitism." De Bary's discovery of the cause of wheat stem rust disease, which is caused by infections with the fungus *Puccinia graminis*, is then discussed. We conclude that "nothing in phytopathology makes sense except in the light of Darwinian evolution" since continuous pathogen-host plant co-evolution is widely established in nature. Finally, we discuss the importance of fundamental plant science research in terms of practical applications such as agricultural production maintenance and improvement, as well as food quality.*

KEYWORDS: *Evolution, Physiological, Phytopathology, Scientific, Theory.*

1. INTRODUCTION

The American Phytopathological Society released the inaugural issue of a journal that is being published today a century ago. Erwin F. Smith, a renowned botanist and microbiologist, was requested to write a tribute on the opening page of this new magazine. To the surprise of some of his North American colleagues, a German biologist was honored in *Phytopathology* Volume 1 (No. 1), with the following words: "Of all the personalities contributing to the advancement of

plant pathology from its crude beginnings to the present time, none has been more interesting than De Bary's, none more productive of important results." De Bary paved the way for all that has come after in plant pathology, and we must always remember him with the respect that a great master deserves." Anton de Bary was described as an outstanding biologist in Erwin F. Smith's later biography as "gifted with intellect and the instincts of a careful experimental scientist, one who refused to accept or promote any truth as fact unless proven by rigorous technical methods." Anton de Bary was one of many notable 19th-century scientists who continue to live "in the shadow" of Charles Darwin, the renowned British naturalist. This is owing to the fact that he researched "lower creatures" such as plasmodial slime molds, fungi, and plants to a great degree. Only one of de Bary's many works has allusions to "higher creatures" (vertebrates) or humans.

Furthermore, it is seldom recognized that it was Anton de Bary who coined the words "symbiosis" and "parasitism" in relation to plants and Darwin's natural selection principle. A little-known monograph on potato late blight was published one hundred and fifty years ago, launching the scientific field of experimental plant pathology. The accomplishments of Anton de Bary are discussed in this article. After that, pathogenic fungi and bacteria are addressed in relation to the genesis and development of experimental plant pathology. Finally, we use Darwin's Origin of Species to explain theoretical and applied elements of these worldwide research objectives[1].

Anton de Bary (Figure 1) was born in Frankfurt-Main, Germany, on January 26, 1831. He studied medicine at the Universities of Heidelberg, Marburg, and Berlin from 1849 to 1853, earning his doctorate with an unpublished dissertation on a botanical topic. De plantarum generationes exuali, the title of this 1853 book, reveals the young physician's main interest: plants and related sessile creatures. At the same time, a 22-year-old junior scientist published his first book, despite the fact that he was already an experienced plant and fungus collector. summarized current knowledge on the smut fungi and the diseases that they cause in plants, with regard to cereals and other crop species, in his Researches on the smut fungi and the diseases that they cause in plants, with regard to cereals and other crop species, and proposed that the true causes of these devastating plant diseases could only be elucidated in the future through proper experiments. De Bary joined the University of Tuebingen as a lecturer (Privatdozent) for botany in 1854. The expert for fungi and plants was appointed professor of botany at the University of Freiburg am Breisgau just a year later. The scientist released his landmark book on potato blight at the Botanical Institute in Freiburg i. Br., which subsequently became one of Germany's major center for plant research. The renowned physicist left Freiburg after twelve years of hard labor to take a more appealing post at the University of Halle, where he remained from 1867 until 1872. De Bary served as the first rector of the newly formed University of Strassburg, where he spent his last and most productive years. The biologist died of a tumor infection on the 19th of January 1888 at Strassburg[2].

Anton de Bary began his work as a field naturalist in the surrounding countryside, collecting plants and fungus. Despite his official training as a surgeon, his desire to study plants, fungi, and other "lower creatures" such as myxomycetes eclipsed his interest in medicine. He pioneered advanced laboratory methods for studying the life cycles of plant parasites, myxomycetes, and other "primitive" living organisms. Anton de Bary was a botanist, plant physiologist, myxomycetologist, and phytopathologist as a result of his studies. Furthermore, the laboratory

scientist became one of the founding fathers of modern bacteriology with the publishing of his Lectures on Bacteria[3].

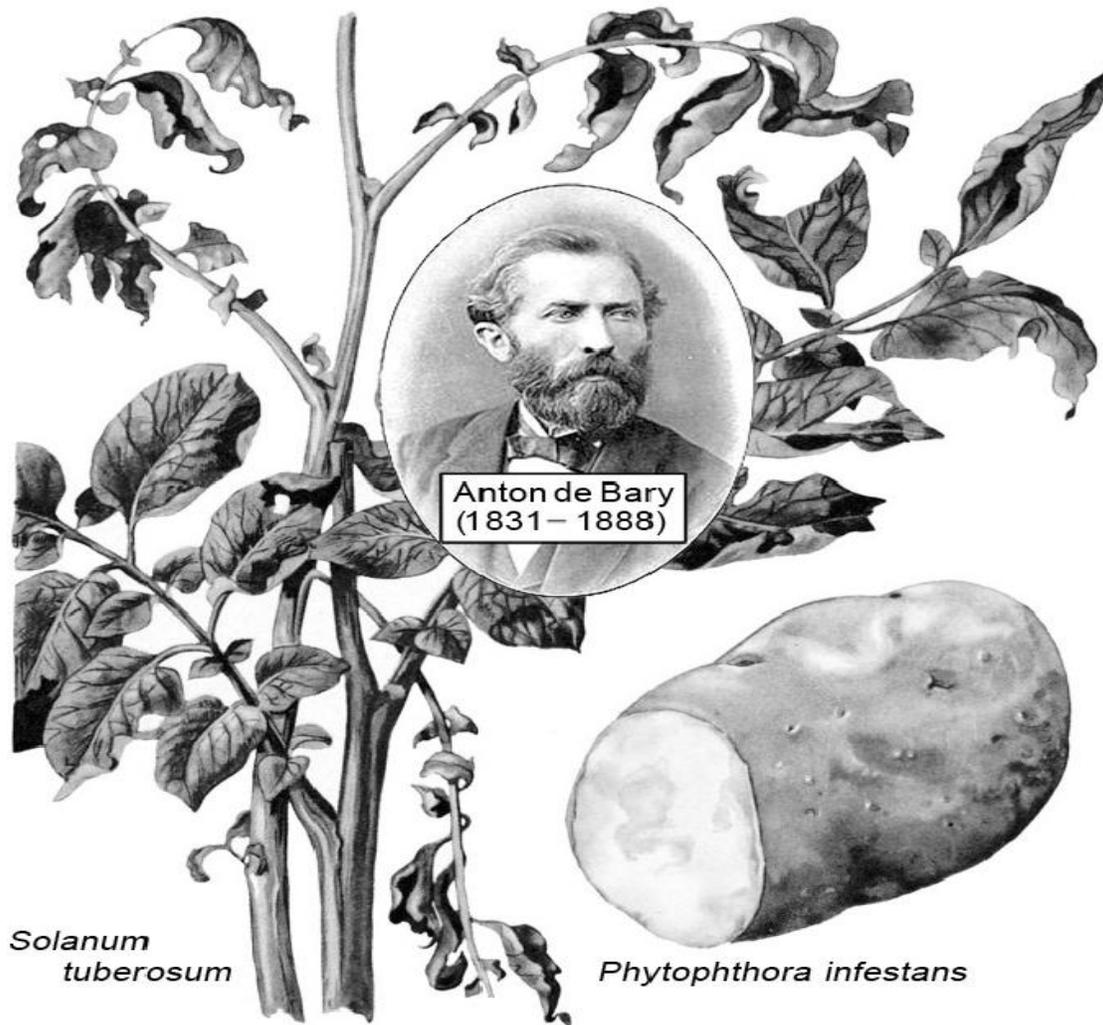

Figure 1: Photograph of the founding father of experimental plant pathology and his research object, potato plants (*Solanum tuberosum*), infected by the oomycete *Phytophthora infestans*. The name “infectious plant destroyer” for this pathogenic fungus was coined by Anton de Bary in 1876[4].

2. REVIEW OF LITERATURE

D. Andrivon in his study discloses about the genesis of the first European populations of the potato late blight disease *Phytophthora infestans* is discussed using historical and scientific data. It demonstrates that the existing hypotheses of a direct introduction of the fungus into Europe and North America from a Mexican or Andean origin and diversification center are suspect. A three-step process involving I migration from central Mexico to South America several centuries ago; (ii) migration from South America to the United States in 1841–1842, and (iii) migration to Europe from either South America, the United States, or both in 1843–1844, is in good agreement with both historical records and the genetics and structure of current populations[5].

Winslow R Briggs in his study discloses that from amateur taxonomy of Minnesota wildflowers to discovery of the phototropin family of blue-light receptors, he took a winding route. He also cites those who influenced his decision to pursue a profession in plant taxonomy, plant development, and ultimately plant photobiology (and out of music). He highlights the numerous detours that a research career may take, including those that lead to dead ends. He also highlights the cyclical character of his career, which has seen him go back and forth between the Atlantic and Pacific seas (with occasional excursions to Freiburg, Germany) and between red-light and blue-light receptors. He discusses his long-standing connection with California's Henry W. Coe State Park during a brief interlude. Finally, he describes how he traced an unexpected route from plant blue-light receptors to a blue-light receptor needed for a bacterial animal pathogen's maximum virulence[6].

G Drews in his study focuses on experimental method and idea, based on Darwin's theory of evolution, were the beginning principles for a phylogenetic taxonomy that could not be realized till now. Experimentally, he defined many species and subspecies, as well as their delimitation. De Bary also accurately described the whole process of fungus infecting plants. Based on his experiments, the words parasitism, symbiosis, heterospory, and heteroecy were created or redefined. His many research on algae, lichens, ferns, and higher plants contributed to the current state of knowledge. De Bary was a highly contemporary instructor who encouraged self-reliance, observation skills, self-control, and a critical assessment of one's own findings and conclusions rather than being dictatorial. He was well-known globally, and many scientists from across the globe came to see his state-of-the-art laboratory[7].

3. DISCUSSION

3.1 Potato blight and the origin of physiological phytopathology:

Fungus-like parasites (oomycetes), such as the potato blight disease *Phytophthora infestans*, and their infection tactics are detailed in a recent paper titled "Genome evolution in plant pathogens" (DODDS, 2010). However, the author of this well-known overview of potato blight studies failed to note that the field of physiological plant pathology was founded 150 years before his article was published. The life cycle of *P. infestans* was discovered at that time. This finding, which was described in a landmark publication titled *The presently spreading potato illness, its cause, and prevention*, was published in November 1861. A research based on plant physiology principles (Figure 2). The author established the field of experimental phytopathology, or the scientific study of plant diseases, with this paper.

Anton de Bary, a German botanist, detailed how the vegetative body (mycelium) of *P. infestans* spreads through the leaf tissue of infected potato (*Solanum tuberosum*) plants in February 1861. (Figure 1). De Bary documented the symptomatic course of the plant disease 'late blight' versus the developmental phases of *P. infestans* in a series of clever studies. De Bary concluded that the oomycete is the causative agent of the potato plant disease based on these investigations, which showed a good connection between the life cycle of *P. infestans* and phases of plant disease development[8].

Anton de Bary presented experimental proof that potato tubers are infected by the fungus through the brown, blighted leaves and detailed the disease's progress in the field in this monograph (Figure 2), which was largely based on his own study. DE BARY (1861) produced precise cross sections through the leaves of infected potato plants, demonstrating the vegetative

structure (mycelium) moving through the intercellular gaps of its host organism (Figure 3 A). He also kept track of the conidiophores' growth as they emerged from the pores of the stomata (Figure 3 B) and the germination of isolated *P. infestans* spores (Figure 3 C). The author concluded that "The disease of the leaves, stems, and fruits is caused by a pathogenic fungus, *P. infestans*, and the disease of the tubers occurs via infection from the leaves" based on these and other observations made according to the principles of experimental plant physiology, a scientific discipline founded in Germany in the 1850s by Julius Sachs. Furthermore, the expert stated that "it would never be feasible to drive the parasite *P. infestans* to extinction... nevertheless, a careful selection of uninfected tubers for agriculture will be sufficient to avoid large-scale outbreaks of this catastrophic plant disease." At the conclusion of the book, he advised farmers on how to avoid another catastrophic potato blight outbreak, such as the one that ravaged Ireland from 1845 to 1848, resulting in crop losses and famine[9].

3.2 Is there really a thing as spontaneous creation of lesser organisms:

De Bary refuted the concept of spontaneous generation with his empirical evidence for the "fungal hypothesis," which says that *P. infestans* is the causative organism of potato blight. Many scientists thought that "lower" or "primitive" species, such as *P. infestans*, might arise from dead material under current environmental circumstances in 1861. Experimental data showed that the oomycete grows exclusively from its own spores and never emerges from scratch, according to the doyen of phytopathology. The notion in "generation without parents," which had never been backed by unambiguous evidence, vanished permanently from the scientific literature with the publishing of these evidence-based findings, which corroborated the similar "microbe-experiments" of Louis Pasteur. As a result, the birth of plant pathology 150 years ago resulted in the collapse of a doctrine that had sparked unending discussion among naturalists and philosophers. DARWIN disregarded the "spontaneous generation argument" in his book *On the Origin of Species* because, in his opinion, the evidence for this idea had always been poor and contentious[10].

3.3 Wheat stem rust: Infection experiments and their consequences:

The brownish uredia and uredospores of the stem rust, which is caused by the fungus *Puccinia graminis* (Figure 4 A-C). Based on de Bary's seminal work of 1865 and subsequent studies, the complex life cycle, with alternation of generations on different host plants, has been elucidated in detail. Due to the elegant studies of DE BARY we know that the common barberry (*Berberis vulgaris*), as well as a grass species, is required for the stem-, black- or cereal rust (*Puccinia graminis*) to complete its life cycle. During the spring and early summer, stem rust infections on wheat and other cereal species (Figure 4 A, B) produce dikaryoticurediniospores. These propagules, which are produced within the uredinia, are distributed by the wind to nearby conspecifics. Here they germinate on the stems or leaves and then infect their new host plant through the stomata. This asexual summer circle, which spreads the infection over wide areas, is indicated in Figure 4 C as a circle. At the end of the growing season, the cereal rust produces dikaryotic teliospores, which, during the next spring, develop into basidiospores. These propagules can not infect cereal plants. However, they are carried by the wind to a second host plant, barberry (*Berberis vulgaris*) and related species. There, the basidiospores infect young leaves via the penetration of the epidermal cells. The resulting infection structures (pycnia or spermagonia), which represent the sexual stage of the life cycle, form, after fertilisation, so-called aecia. These structures produce aeciospores, which are carried by the wind to cereal

plants. After infection, the aeciospores develop into uredinia, and thus the next life cycle of the pathogenic fungus *P. graminis* begins (Figure 4 C). The elucidation of this “sophisticated” (i.e., evolved) life cycle of a plant pathogen, that still causes severe problems in Africa today. These insights were based on careful infection experiments and the use of different host plants and spore. One practical consequence rapidly emerged from this elegant work: the systematic removal of barberry plants close to crop fields. It should be noted that Anton de Bary’s research was based on the principles of experimental plant physiology (see the sub-titles of the monographs, a scientific discipline that was still in its infancy when the botanist-mycologist carried out his seminal work[11].

Figure2: Title page of Anton de Bary’s monograph on the potato late blight. This book also contains recommendations how to prevent the spread of this devastating plant disease[12].

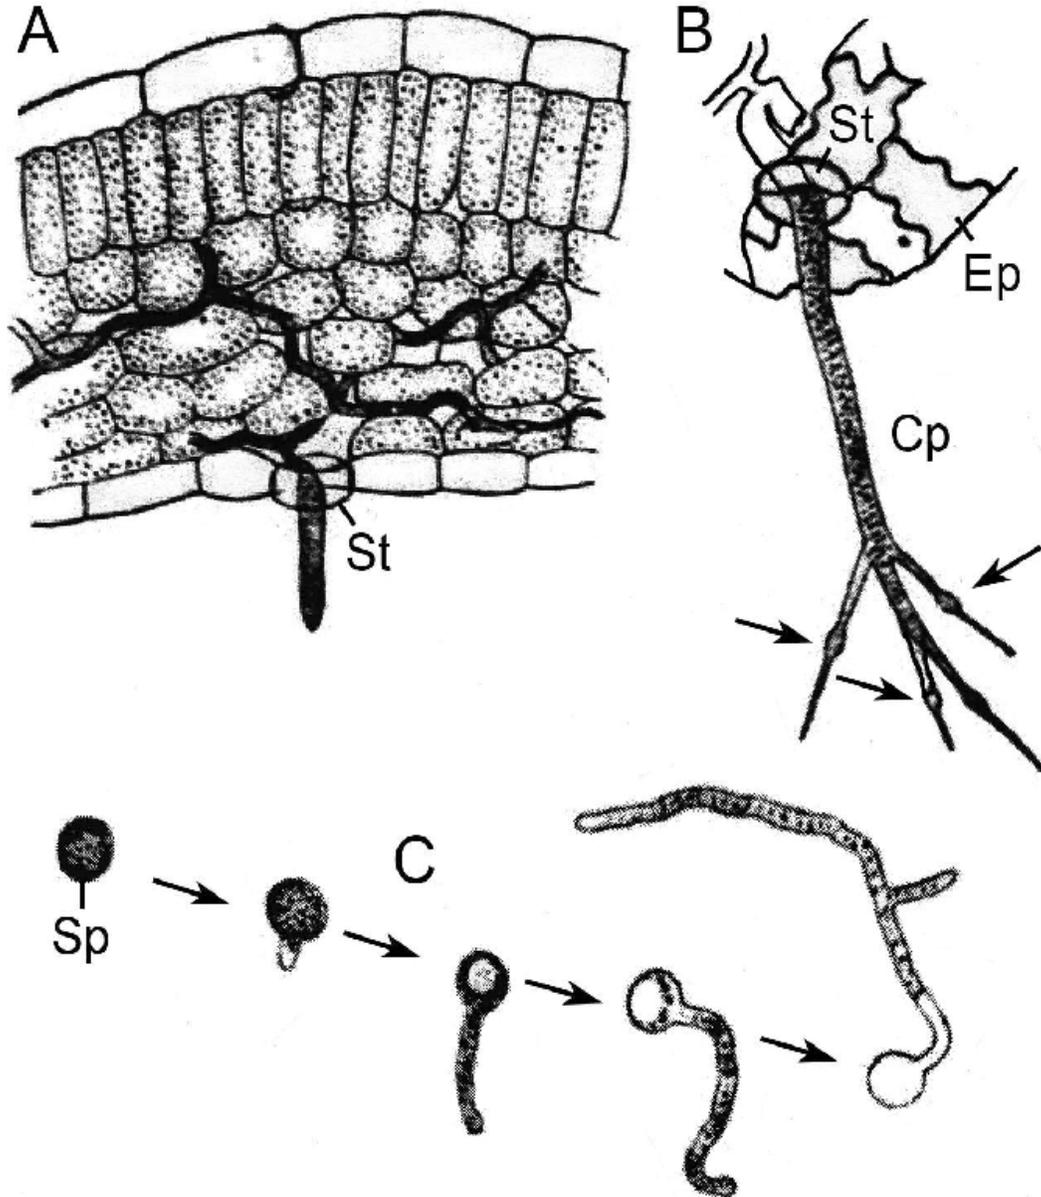

Figure 3: The discovery of the life cycle of the late blight oomycete *Phytophthora infestans* by Anton de Bary. The mycelium of *P. infestans* in a leaf of a potato (*Solanum tuberosum*) plant (A), spore germination in liquid culture (C), and a conidiophore (with spore-containing conidia, arrows) that emerges from a stomatum on the underside of a leaf (B). Cp = conidiophore, Ep = epidermis, Sp = spore, St = stomatum[13].

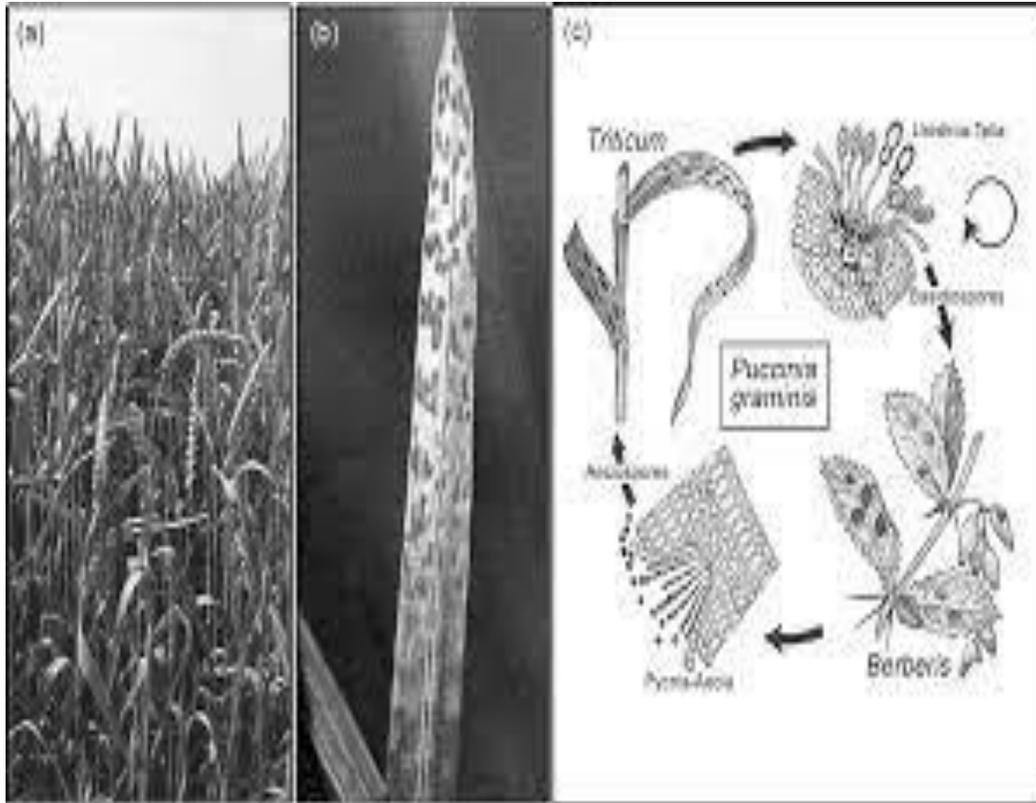

Figure 4: Healthy wheat (*Triticumaestivum*) plants in the fi eld (A) and a dying wheat leaf (B) that is infected by the pathogenic fungus *Puccinia graminis*, which causes this plant disease (stem- or cereal rust). Diagram of the life cycle of *P. graminis* via uredinia-telia (C). These propagules spread asexually on the infected *Triticum* plants (circle), release basidiospores that infect barberry (*Berberis vulgaris*) plants, where they reproduce sexually via pycnia-aecia, and fi nally re-infect wheat plants via aeciospores. Anton de Bary, who elucidated this grass (*Triticum*) host 1- alternate (*Berberis*) host 2- cycle, recommended removing barberry plants in the vicinity of wheat fi elds to prevent the spread of the cereal rust[14].

4. CONCLUSION

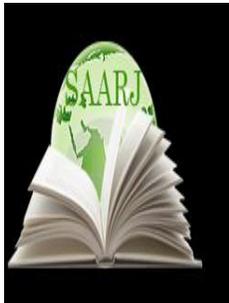

Anton de Bary (Figure 1), a German scientist, was one of the first to apply experimental botany techniques to investigate the causes of illnesses in important crop species like potato and wheat. He explained the life cycles of pathogenic fungus based on thorough studies, came to the conclusion that these eukaryotic microorganisms are the causal agents of disease development, and so became the founding father of experimental plant pathology. With the publishing of a monograph on potato blight 150 years ago, this scientific field was born (Figure 2). DE BARY (1878) pointed out in his renowned book on plant symbioses and diseases that only a Darwinian viewpoint produces relevant results - in other words, “Nothing in plant pathology makes sense unless in the light of Darwinian (adaptive) evolution.” The study of Anton de Bary on potato blight and wheat stem rust demonstrates the practical importance of fundamental research in maintaining steady agricultural yields and food quality. His discoveries on the mechanism of infection and spread of plant diseases in the field led to the development of strategies to avoid

future outbreaks. Furthermore, it was clearly stated that harmful microorganisms such as Phytophthora or Puccinia would never be fully eradicated since living creatures will constantly find methods to adapt to changing environmental circumstances via fast microevolutionary processes. This traditional “Darwinian” perspective on phytopathology was accurate. We now understand that dynamic plant-microbe co-evolutionary processes take place. As a result, new diseases have emerged, such as the modified stem rust strain Puccinia graminis race 1, which was recently identified. Ug99, which has a catastrophic effect on African wheat output, cannot be eradicated. In areas of the world where food production is constantly challenged by plant illnesses, insect catastrophes, droughts, and civil conflicts, these pests will continue to inflict catastrophic crop losses.

ABSTRACT

During the writing of this article, I looked at a lot of physical activity, as well as the organization of physical education classes, the attitude to this science, their study, to get acquainted with its peculiarities. In this article, I have tried to shed light on what we need to focus on in order to develop physical education teachers through professional competencies. They are short and limited in size, rich in content, and written in prose.

KEYWORDS: *In Physical Education, Sports, Muscle, Training, Success, Sports Facilities, Tourism, Games. Subject Matter, Physical, Standards, Accomplished, Educator, Experienced, Inclusive Teaching, Develop Skills.*

INTRODUCTION

It envisages the development of a system of targeted training that will meet the needs of society and the state in qualified and competitive personnel in our country. The education system should increase the opportunities, importance and prestige of knowledge in meeting the diverse educational needs of man and society, as well as focus on the general, cultural, professional and scientific training of specialists, ensuring the fundamentality of the knowledge they acquire. Education is considered a key factor of socio-economic development, a very important value and the main investment of society, its priority and driving force, it is able to think independently, creatively, acquire new knowledge, socio-professional activity. Higher education is not only a scientific institution in the formation of personality, but also a cultural, educational, scientific, methodological, spiritual and educational center of the country. During the years of independence, significant structural, organizational and substantive changes have taken place in the education system of Uzbekistan. Especially in the field of education, the introduction of

modern, innovative pedagogical technologies, increasing the effectiveness of teaching is a topical issue today.

Modern development of physical culture of youth based on national values requires a new approach to the promotion of physical culture, physical education, health, physical maturity, physical development, health promotion, healthy lifestyle. The task of physical education is to develop health, physical qualities, prepare the younger generation for mental and physical labor, and protect the Motherland. This idea has always been reflected in the spirituality of our ancestors. In particular, it is reflected in a number of epics, such as "Alpomish", "Gorogly". Man's physical maturity is glorified and valued in all aspects of historical development. The concept of physical culture is seen as part of folk culture. Physical culture is the accumulation of material and spiritual wealth accumulated in human society and used for human perfection.

Physical culture is a set of achievements in the creation and rational use of special tools, methods and conditions for the purposeful realization of the physical maturity of members of society.

Physical culture plays a role in the development of society:

1. Establishment of reasonable norms (norms) of human activity.
2. Provides services for the collection (informatization) of cultural information on physical education and its transmission from generation to generation.
3. Formation of interpersonal communication.
4. (Aesthetic) service of the person who meets the requirements of movement aesthetics.
5. (Biological) service related to meeting a person's natural need for constant movement and ensuring his physical condition to the extent necessary for daily life.

The starting point of physical culture is conditionally created through "preschool and school physical culture". By this we mean that physical culture is a compulsory subject in secondary schools and other pre-school educational institutions. This, in turn, lays the foundation for general physical education, the full development of physical abilities, the formation of a solid health base. This ensures that the foundation of the level of physical potential required for a comprehensively developed person is laid.

The physical culture of the school serves as the main basis for the formation of the ground for physical education in the student. Therefore, the organization of physical culture education on the basis of modern educational technologies plays an important role in increasing the effectiveness of education.

The introduction of educational technologies in the process of physical education involves not only the continuous improvement of pedagogical skills of teachers, preparation for the implementation of the educational process at a high theoretical and methodological level, the formation of skills to use advanced methods., shapes and tools. However, observations show that it is still difficult to understand the role of teachers in the formation of a single concept of 'pedagogical technology' and its place in the teaching system, the learning process and the integrity of each specific lesson.

It should be noted that in today's rapidly developing world, professors and teachers of educational institutions have great tasks. In this regard, on June 5, 2018, the President of the

Republic of Uzbekistan Sh.M. Mirziyoyev's resolution "On additional measures to improve the quality of education in higher education institutions and ensure their active participation in the ongoing comprehensive reforms in the country" brought the education system to a new level.

Of course, this document is an important step in training. This was the basis for creating adequate conditions for the development of the higher education system. The introduction of innovative pedagogical and information technologies in the education system is one of the most pressing issues today. Therefore, it is important to introduce modern methods, tools and technologies of teaching physical education in the education system. The following are the teaching methods and technologies used in the education system.

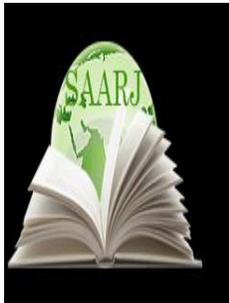

Basic pedagogical methods and technologies

- 1 Traditional education (class-lesson form, monologue, one-sided scheme of communication).
- 2 Interactive methods.
- 3 Non-traditional methods.
- 4 Educational technologies.
- 5 Educational technologies in the field of education.
- 6 Pedagogical methods based on the ethical and personal direction of the pedagogical process.
- 7 Problem-based learning;
- 8 Pedagogical methods based on the effective management and organization of the educational process.
- 9 Didactic lessons and reconstruction of materials based on pedagogical methods.
- 10 Pedagogical methods in educational disciplines.
- 11 The author's pedagogical methods are "The best teacher of the year".
- 12 Alternative methods.
- 13 Nature-friendly methods.

TECHNIQUES OF USING FOLK PROVERBS IN THE CULTIVATION OF ORAL SPEECH OF PRIMARY SCHOOL STUDENTS

Muxtoriy Mohroy Sodirzoda*

*Teacher,
 Fergana State University,
 UZBEKISTAN

ABSTRACT

This article about the function of a language is not only transferring messages, but first and foremost is the transmission of what we report. There is a «space of meanings» fixed in the language knowledge about the world, about the national characteristics of a particular community speaking this language. Language picture of the world is formed as the set of knowledge about the world, reflected in vocabulary, grammar, phraseology.

KEYWORDS: *National Character and Culture, Analysis Of Essence, Content And Structure, Language Awareness Product*

INTRODUCTION

The article focuses on the role of proverbs as the source of folk wisdom, means of expressing national character and culture specificity; and also peculiarities of their use at foreign language classes. In the research paper proverbs are presented as the language awareness product, which reflects people's historical life experience, traditions and culture; the analysis of essence, content and structure of proverbs has been done, characterizing their expressiveness and brevity, which enable to reveal specifics of people mentality, their mind and identity. Special attention is paid to the use of proverbs at foreign language classes for improvement of learners' inter-cultural and socio cultural knowledge; familiarizing them with the culture of the studied language; development of students' foreign language communicative skills and habits, that are important for their intercultural communication with native speakers of the studied foreign language. Examples of language and speech activities on the use of proverbs, directed to the enhancement of learners' communicative skills in different aspects of the language, the role of proverbs in the development of students' oral and written foreign language communication are given in the article.

The function of a language is not only transferring messages, but first and foremost is the transmission of what we report. There is a «space of meanings» fixed in the language knowledge about the world, about the national characteristics of a particular community speaking this language. Language picture of the world is formed as the set of knowledge about the world, reflected in vocabulary, grammar, phraseology.

National character is the elusive phenomenon of ethnicity. Culture, history, living conditions and activities of any nation form a certain psychological features, peculiar to this nation (ethnic group), perceived as one of its characteristics. These psychological traits relate to certain phenomena. For example, the degree of conscious regulation of emotions and feelings of each nation is different: some people are more reserved others more emotional and direct in expressing their feelings and moods.

What is national character? Does it exist? Is it possible to generalize typical features in the scale of the whole, when people are different? It takes all sorts to make a world, says the English proverb. Should we believe that nation is those people from different varieties with their own individual features? The definition of the concept «national character» is very complex and contradictory. We consider the views of various authors regarding the concept of «national character».

S.M. Harutyunyan defines the national character as a kind of national flavor of feelings and emotions, ways of thinking and actions under the influence of conditions of material life, the peculiarities of historical development of this nation and that is manifested in the specificity of their national culture. N. Dzhangildin defines the national character as a combination of specific psychological features, that is the characteristic of the particular socio-ethnic community in the specific economic cultural and environmental conditions of its development.

For the revealing peculiarities of the national character of people of the country of the target language, particular interest and relevance represent proverbs, as they are the product of linguistic awareness of people, transmitted from generation to generation. Proverbs reflect the rich historical experience of people, ideas associated with work, lifestyle and culture of people. Correct and appropriate use of proverbs gives speech a unique originality and special expressiveness. As noted by M. Sholokhov: «...in none of the forms of language folk creativity people's mind is described with such a power, its national history, social structure, everyday life, worldview are reflected so clearly as in proverbs».

According to this scheme, proverbs are characterized by their conciseness and brevity, have their roots back centuries, reflect a true phenomenon and are the source of folk wisdom.

Such expressive means as an exact rhyme, ordinary form and brevity are peculiar to proverbs that made them memorable and necessary in speech. In such sayings people expressed a special characteristic of their people mindset, identity, spirit and character, a way of judgment, moral beliefs. The main purpose of proverbs is to give a national assessment of the phenomena of reality, expressing their worldview. Having studied proverbs and sayings of people it's much easier to understand the mindset and character of the nation that is an important component of intercultural communication.

Proverbs as a whole cover a large part of the human experience. Due to the generalized nature of the structure of proverbs, they can be used at different stages of learning a foreign language,

which in its turn will contribute to the development of foreign language communicative competence of students through the expansion of socio-cultural knowledge, enriching students' vocabulary.

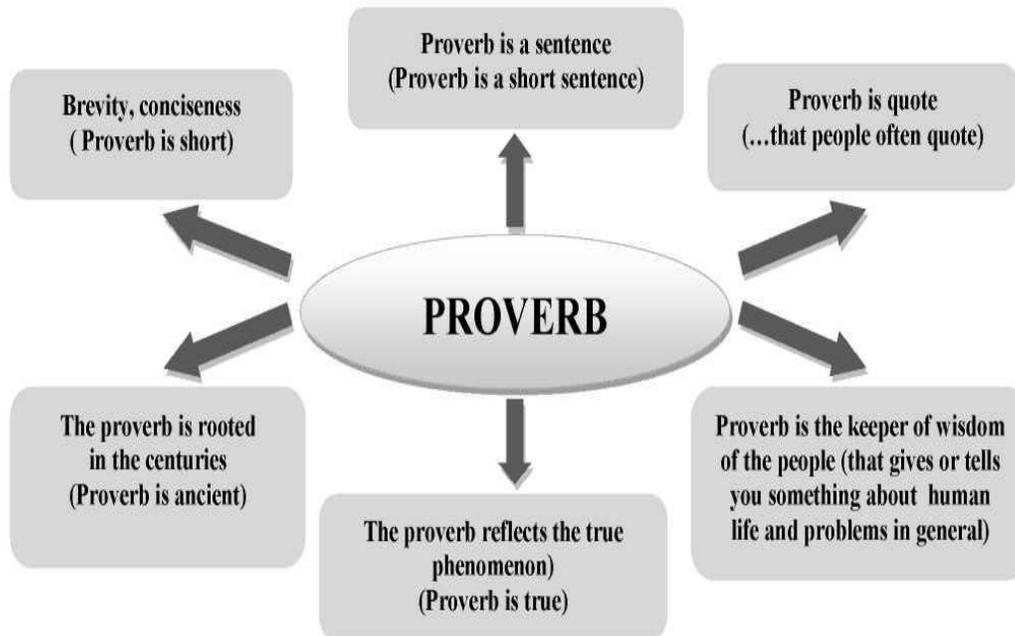

Figure 1. The conceptual content of the term «proverb» by M. I. Dubrovin

Proverbs can be used in the process of learning different aspects of a foreign language. Let's consider using proverbs as a means of improving phonetic skills of the students. Students are offered proverbs and sayings for practicing difficult English sounds that are absent in the native language of pupils, that can be used as a phonetic training to improve auditory-phonetic and rhythmical-international skills. For instance, proverbs *Where is a will there is a way*, *When the cat is away, the mice will play*, *We do not know what is good until we have lost it* are used for practicing mouth-labial sound;

Wealth is nothing without health, *Birds of feather flock together*, and *He was born with a silver spoon in his mouth* for testing the interdental sounds. Difficult sounds are pronounced first in isolation, then in words where this sound occurs in phrases and sentences. Both choral and individual work is conducted. Regular use of the proverbs in English language, selected according to phonetic principle gives a positive result in training and improvement of phonetic skills of students.

Moreover, proverbs contribute to the development of communicative skills of students that are necessary for intercultural communication with native speakers of the studied foreign language and learning their culture. Thanks to proverbs, students become familiar with spiritual heritage, national character of representatives of the foreign culture, their way of thinking and expressing thoughts. Proverbs are a source of development of human values in a broad sense, as students become acquainted with the national values and characteristics of another culture, feels themselves as a part of the intercultural space, at the same time they preserve their own national identity. Systematic and purposeful use of proverbs in foreign language classroom greatly

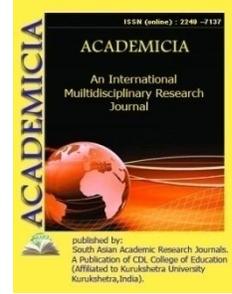

enhances the quality of teaching and learning process and promotes the formation of foreign language communicative competence of students.

ABSTRACT

The method of paper recycling and bleaching has been investigated in the current article. The collecting of waste paper and cardboard is economically and ecologically inevitable due to geographical and temporal dispersion and the necessity to develop suitable methods, particularly in urban regions. The collection of waste paper in industrialized nations is managed in such a manner that waste paper is prevented from entering the waste cycle from the start. However, in third-world countries, despite having sufficient technical knowledge, the process does not work well for a variety of reasons, including a lack of regulatory organizations, a lack of sense of responsibility among professionals in the field of recycling, and public ignorance, and it is necessary to pay attention to proper waste paper collection. Due to the presence of valuable materials in municipal solid waste, which is sometimes referred to as "dirty gold," the municipality must spend a lot of money to collect them (75 to 80 percent), and often this waste can be recovered and buried in the ground by using proper and technical planning based on accurate and reliable data. Economic variables, the most significant of which are inflation, environmental issues, consumer patterns, raw resources, technology, and products are the most important elements influencing paper recycling, according to the findings of this research. Separating waste paper from the source is also the best method to collect it for recycling.

KEYWORDS: *Environment, Fossil Fuel, Recycling Paper, Renewable Energy, Waste Paper.*

1. INTRODUCTION

The effect of energy consumption in manufacturing is a major problem in paper recycling. Processing waste paper for paper and board production necessitates the use of energy generated from fossil fuels like oil and coal[1]. Waste paper processing, unlike the manufacture of virgin fiber based chemical pulp, does not provide a thermal surplus, therefore thermal energy must be supplied to dry the paper web[2]. However, if waste paper could be recovered for energy, the demand for fossil fuels would be decreased, which would have a positive influence on the carbon dioxide balance and greenhouse effect. Furthermore, pulp manufacturing from virgin fibers necessitates the use of round wood, which emits air-polluting chemicals, as does waste paper collecting. Consumers and politicians have turned to the forest sector as an easy target for their environmental goals. This has prompted calls for reforms in the industrial forest production system in nations like as Germany, Sweden, and the United States[3].

The Scandinavian forest sector is concerned that European Union or individual country political choices would impose a set usage rate for waste paper in paper and board manufacturing. If the environmental effects of alternative applications are not thoroughly examined, such choices may result in sub-optimal waste paper usage. Energy recovery and landfill are two important alternatives to recycling for paper manufacturing[4]. When Western Europe is split into two areas, a basic sketch of fiber flow connections may be seen. Though greater recycling is widely considered to be desirable and essential, the advantages of paper recycling have not been thoroughly studied. In a number of nations, waste management policy is defined by a hierarchy of choices, with waste reduction, reuse, and recycling all being preferred over energy recovery. This, in turn, is thought to be better than landfill[5]. Any evaluation of recycling, on the other hand, should compare the effects, costs, and advantages of recycling to those of other waste disposal alternatives. This is the primary goal of the article. The manufacturing procedures are described using an engineering methodology. However, both economic and environmental factors are taken into account. Under different assumptions, the Model produces optimum fiber flows. In 2011, the United States recycled 66.8% of their paper use. More paper is collected for recycling than plastic, metal, and glass combined, and every ton of paper recycled saves more than 3.3 cubic yards of landfill space. Because 87 percent of us have access to curbside or drop-off recycling for paper, it's a material we're accustomed to recycling[6]. Furthermore, in 2011, 76 percent of paper mills utilized some recovered material, indicating that the paper you toss away is making its way into a variety of new goods. The process of converting old paper into new paper may seem to be complicated, but it is really very simple.

You could even attempt recreating this technique with anything from old wrapping paper to junk mail if you're feeling adventurous. Paper recycling, on the other hand, enables us to conserve both energy and materials on a large scale. According to the EPA, recycling one ton of paper saves 17 trees, 7,000 gallons of water, and 463 gallons of gasoline. Continue reading to learn more about how the process works and how to recycle paper properly. Because it has previously been recycled many times, newspaper is a lower quality paper, while printer paper is a better grade paper[7]. The length of the fibers in a piece of paper determines its grade, which shortens with each trip through the recycling process. According to the EPA, after five to seven recycling cycles, the fibers become too short to produce new paper and must be combined with fresh fibers. Have you ever heard of paper having "seven generations"? This term refers to the number of times paper fibers may be recycled before becoming too short.

According to the EPA, there are five main paper grading classifications. While these phrases are primarily helpful to paper mills seeking to process certain types of paper, you may hear them from time to time and need to know how to differentiate between them[8]. Now that you know how paper is turned into new paper, you need to know how you may recycle correctly as a consumer. For example, you may sometimes come upon a kind of paper that you don't know what to deal with. Understanding some fundamental paper terminology – such as those for various types of paper and different types of recycling – may help you put the correct items in the right bin in such circumstances. You may still have questions regarding paper recycling after you know what kinds of paper recycling are accessible to you and which types of paper are recyclable[9]. Here are a few often misunderstood things. Have you ever wondered whether shredded paper might be recycled? Yes, but there may be certain limitations in your area regarding the size of the shredded pieces and how the paper is contained.

For further information, contact your local recycling program. Equipment at paper mills that recycle recovered paper, believe it or not, is intended to remove staples and paper clips, so you don't have to remove them before recycling. However, removing paper clips so that they may be reused is generally in your best interest. The Model takes into account the environmental impact of all important activities and transportation; for example, the carbon dioxide balance is computed in the system. As a result, the Model not only calculates industry-related fiber cycles, but also the function of forestry and forest products in the climatologically significant carbon dioxide circulation. The environmental impacts of the many activities in the overall system are also calculated using the same approach as in certain life cycle assessments. An environmental load index value is assigned to each emission and usage of nonrenewable resources such as oil and coal (ELU-index). The ELU-index is based on the EPS-system, which stands for Environmental Priority Strategies in Product Design.

The concept is based on people's willingness to pay to prevent the negative effects of certain pollutants. We track all manufacturing processes and emissions rather than focusing on just paper and board manufacture, which is the standard approach for life cycle analysis. Scandinavia (Finland, Norway, and Sweden) and Continental Western Europe (the United Kingdom) are the two areas that make up Western Europe. Scandinavia is often referred to as the other region's "lumberyard." Each area has its own production resources as well as a market for paper and energy. The goods are either supplied to the local market or to the international market. Paper is recycled for paper and board manufacture and/or recovered for energy usage after it has served its purpose. Waste paper is collected, sorted, baled, and sent to paper mills in either area for the manufacture of recycled pulp if it can be recycled[10].

2. DISCUSSION

The waste paper is expected to follow the usual waste-handling system if it is recovered for energy consumption. It then takes the place of oil or coal. The gathered paper is eventually sent to Scandinavia or the rest of Western Europe. The price of fossil fuel and round wood determines the value of waste paper. The more waste paper is recovered for energy purposes, the greater the price of oil. In the Model, waste paper that is not repurposed has no economic value and has a negative environmental value. As a result, all waste paper is recovered in the Model. It is expected that there is sufficient capacity for de-ink and energy generation. Newsprint, SC paper, LWC, office paper (wood-free), coated paper (wood-free), tissue, white lined chipboard, return fiber chipboard, wrapping paper, white liner, Kraft-liner, and fluting are among the twelve paper

grades produced by the Model. For each product, recipes indicate the amount of fiber, filler, and calories required. In order to maintain the desired quality of the goods, the Model selects between virgin and recycled fibers. There are five distinct flush and market pulps provided.

Non-integrated paper mills in other areas of Western Europe get dried pulp in sheets from Scandinavian manufacturers. For each pulp quality, the amount of pulp wood short and long fibers and energy required is given. Paper is made using the leftover energy from pulp manufacturing. Back-pressure power or condensation power plants that burn coal, oil, wood, or waste paper may generate electricity. Hydroelectric power facilities, on the other hand, are the primary source of energy in the Nordic nations. The Forestry section of the Model explains how the forest absorbs CO₂. Energy is used and expenses are incurred as a result of timber harvesting and transportation. The energy required in fertilizer production is also taken into account. The pulp mill module explains how to make pulp from wood as a raw material. Electricity, thermal energy, and chemicals are used in addition to wood. The pulp mill's extra energy may be put to good use in the paper mill. Back-pressure steam turbines and condensing turbines may both generate electricity. Waste paper pulp is made from recovered paper in the de-inking mill module. The model estimates the costs of using low-quality waste paper.

Other than that, the calculations are identical to those for the pulp mill. The fiber composition of each particular product is used to determine both the yield of the process that generates recycled pulp and the energy value in waste paper. The impact of filler is also taken into account. The composition of the paper affects the efficiency of the recycled pulp mill and the thermal energy recovered from burning it. The Model's paper mill module explains how paper is made from virgin pulp and waste paper pulp. In addition, several kinds of energy and fillers are used. Emissions to the atmosphere and water are measured and recorded. Different quantities of recovered paper from various goods may be used to make the paper products. Incorrect combinations, however, are prohibited by the Model's restrictions. When creating wood-free characteristics, for example, wood-containing paper is not utilized. In the model, waste paper collection necessitates the use of energy in the form of diesel fuel, electricity, and other resources with variable costs. Standard environmental emissions are taken into account. The amount of resources required varies based on the product and the location. The energy and financial resources required to gather paper are increasing. The resources required to gather the final 30% of consumption, for example, are three to six times greater than those required to collect the first 30%, depending on quality. It's believed that there's enough industrial capability to recycle waste paper into fibers or electricity. This means that, even if it is a possibility, the recovered waste paper does not end up in a landfill since it has economic worth for both paper and energy generation. Energy is required for all activities, including transportation. All of the energy in the model is produced in an energy plant, which also calculates environmental emissions.

Energy may be bought, however certain types of energy, such as all diesel-fueled transportation, cannot be replaced. On the other hand, electricity and heat may be produced using both fossil fuels (oil or coal) and the burning of fiber products. Energy may be created from both water and fossil fuels in Scandinavia, while electricity generated from fossil fuels is required throughout the rest of Western Europe. Emissions, of course, are impacted. Prices, efficiency, manufacturing costs, and transportation costs are among the model's input data. Each paper quality's fiber supply and energy requirements are given. The amount of wood and energy required, as well as the environmental emissions generated during the manufacturing process, are given for each kind

of pulp. The Swedish Pulp and Paper Research Institute and the MoDo Company databases are among the data sources. Data from Germany is considered to be representative of the situation throughout Western Europe. An overview of the literature on the environmental implications of using waste paper in Sweden.

The report includes useful information on sludge, chemical usage, transportation, energy consumption, and emissions to the air and water. It's worth noting that although the statistics for Sweden is regarded trustworthy, the data for the rest of Western Europe might be better. For the year 1990, comprehensive data on the production and trade of Western European forest products was gathered. This was the year in which the most recent data for the nations examined was available. We pushed the model to preserve trees in Scandinavia by recycling fibers in the following two instances. It maximizes the utilization of waste paper for energy recovery and recycling, given the constraints. We minimize the cost of production for the forest industry in the first scenario, and we minimize the burden on the environment in the second situation, as assessed by the ELU-index. In 1990, Western Europe, excluding Scandinavia, had a utilization rate of 53%. The rate is unlikely to drop in the future; on the opposite, it is likely to rise. The model is permitted to utilize a range for the Western European utilization rate while determining the optimum solution. It's difficult to define the top range end of the utilization rate given the economic, technological, and practical constraints.

As a result, we've estimated that this ceiling is 20 percentage units higher than the current level, or 73 percent. When economic optimization is applied, the utilization rate for Western Europe, excluding Scandinavia, reaches the maximum of 73 percent. When environmental optimization is performed, the utilization rate is reduced to the lowest possible level, which is 53%. In this case, an economic optimization is done, i.e. the forest industry's marginal income is optimized. Because of the 'forced' utilization rates in the Scandinavian forest pulp and paper sector, the model is free to utilize recycled fibers in whichever manufacturing processes generate the most money. In the remainder of Western Europe, the forest sector finds a solution with a utilization rate of 53 to 73 percent. The economic answer is found at the top limit, as previously stated. When the entire use of recycled fibers in Scandinavian paper and board manufacturing varies, the total environmental effect for Western Europe as a change in the ELU-index. It also shows the variation in load depending on whether energy in Scandinavia is generated by hydropower or fossil fuels.

If energy is generated from fossil fuels, and the percentage of de-inked pulp used rises from 5 to 60%, the environmental burden reduces at first, then increases. The curve is rather flat, with a minimum utilization rate of about 30%. Initially, de-inked pulp replaces thermal mechanical pulp, but this potential fades with time. A pulp mill generates excess energy, which is utilized to dry the paper web. This energy excess must now be replaced by fossil-fuel-based energy. This implies that the minimal level is determined by the current pulp production structure in Scandinavia, i.e. the balance between chemical and thermomechanical pulp production. If the energy is hydroelectric, the disadvantage of recycling is much higher. The result of a higher utilization rate in this instance is a continual rise in oil consumption.

Another example is the compulsory use of waste paper in the production of newspaper and office paper. A comparison between hydroelectric power and fossil energy is performed as previously stated. If a condensing turbine power plant is utilized, this equates to about 20 GJ of heat energy per ton. If utilized for energy recovery after consumption, 11.5 GJ of heat per ton will be

generated. As a result, when TMP is utilized, the overall energy savings for the whole system is about 7 GJ of heat per ton. The thermo-mechanical pulping process no longer transforms electricity into heat energy, which is required in the paper-making process, when paper is recycled as fibers. The cheapest accessible alternative, fossil (oil) energy, compensates for this energy loss. In addition to being a nonrenewable resource, burning oil for energy generates emissions, the most significant of which is carbon dioxide. If, on the other hand, the energy used to make newsprint comes from fossil fuels, a higher utilization rate is good for the environment. This is because the energy needed to create TMP in this instance is generated from fossil fuels in inefficient condensing power plants (40 percent). When electricity is not required, like when waste paper is utilized, it is more cost-effective to generate heat directly from fossil fuel. The de-inking process (2 G J/ton) and the paper mill (5.1 G J/ton) both need thermal energy.

As a result, instead of receiving 6 GJ of thermal energy, 7.1 GJ of heat per ton must be added. The usage of electric energy, on the other hand, is just 5.2 GJ/ton, which is 5.3 GJ/ton less than when TMP is used. Discrepancies in wood and waste paper transit contribute just a little amount to the ELU-index differences. The index does, however, show a slight rise in environmental effect, owing to higher emissions. In this final example, the ELU-index is used to make an environmental optimization. Given the 'forced' utilization rates in the Scandinavian forest pulp and paper sector, the model is free to utilize recycled fibers in whichever manufacturing processes reduce environmental impact. The model may, as in the previous instance, provide a solution for the forest sector in the remainder of Western Europe with a utilization rate of 53 to 73 percent. The environmental answer for the remainder of Western Europe is located at the lower limit, as previously indicated. When the entire use of recycled fibers in Scandinavian paper and board manufacturing varies, the total environmental effect for Western Europe as a change in the ELU-index. It is believed that, at least on the margin, the altered usage of power in Scandinavia is based on fossil fuel. Given a utilization rate of 53% in the rest of Europe, the figure indicates that a 'forced' utilization rate of about 30% in Scandinavia is environmentally advantageous. However, from 5% to the lowest threshold, the slope is rather flat.

The curve for the environmental effect has the same form as the curve for oil consumption. Oil usage has reduced by approximately 4 million m³ when compared to the preceding scenario. This is because the utilization rate in the remainder of Western Europe has dropped from 73 to 53 percent, resulting in an increase in thermos mechanical pulp output and excess energy that may be utilized to dry the paper web. Comparing the outcomes of economic and environmental improvements is also fascinating. An economic optimization was carried out, with the usage rate for the remainder of Western Europe being the same as when an environmental optimization was carried out, i.e. 53%. The changes between the two optimizations are extremely minor. The market solution gets very near to an ecologically beneficial option for a fixed use of virgin fibers throughout the remainder of Western Europe, and with the current factor prices and levies.

3. CONCLUSION

In a number of nations, waste management policy is defined by a hierarchy of choices, with waste reduction, reuse, and recycling all being preferred to energy recovery, which is then preferred to disposal. The problems are complicated, and the science for evaluating them, life cycle analysis (LCA), is still in its early stages. There has been little research on the advantages of paper recycling. Alternatives were investigated using the LCA concept and a systems analysis methodology at the same time. When compared to conventional life cycle analysis, this method

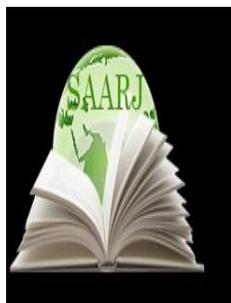

has the benefit of looking at the whole system. While a modification is made in one component of the system, such as a requirement on the utilization rate when manufacturing newspaper, the implications for fossil fuel use in other areas of the system are measured and considered.

The findings highlight the significance of a systems analysis approach and the need to consider all long-term implications. Different fiber grades are required for different products. It is in humanity's best interests to reduce carbon dioxide levels in the atmosphere in order to prevent global warming. Maximum energy recovery from waste paper would only have a little impact on Western Europe's carbon dioxide balance (a few percent of total fossil fuel consumption in Western Europe). Increased manufacture of wood-based pulp or the use of waste paper as fuel are two examples of developments that contribute to the substitution of fossil fuels and, as a result, a reduction in anthropogenic carbon dioxide emissions. Another option is to increase the land area covered by planting trees that absorb carbon dioxide. The amount of paper and paper products in household trash, coupled with the shortage of disposal capacity, is a significant issue in many countries and a driving factor for regulation. These reasons combine to create a compelling case for waste paper collecting, particularly in Western Europe's highly populated nations. The issue of whether the collected paper is recycled as a raw material for paper or for other uses is a complex one.

ABSTRACT

Antibiotics, which have previously revolutionized medical research, are now under jeopardy due to the emergence of multidrug resistance among dangerous microorganisms. The abuse of antimicrobial medicines, as well as the unavailability of newer treatments owing to stringent regulatory restrictions and decreased commercial incentives, has been blamed for the antimicrobial resistance problem. Emergent bacteria, resistance mechanisms, and antimicrobial drugs must all be studied in order to slow the rate of resistance. Health-care environments, as well as the environment and agricultural sectors, need multidisciplinary approaches. Probiotics, antibodies, and vaccinations are examples of progressive alternative treatments that have showed encouraging outcomes in studies, suggesting that they may be used as preventative or supplementary therapy in the future.

KEYWORDS: *Antibiotics, Antimicrobial Resistance, Alternative Therapies, Evolution, Multidrug Resistance.*

1. INTRODUCTION

Antibiotic resistance is a long-standing concern, and the "resistome" is a dynamic and growing issue. Overpopulation, increasing worldwide movement, increased use of antibiotics in clinics and livestock production, selection pressure, inadequate sanitation, wildlife dispersal, and a poor sewage disposal system are all factors that contribute to the global resistome. Antibiotic therapy is one of the most used methods of infection control in contemporary medicine. Many antibiotics were developed during the "golden era" of antibiotics, which lasted from the 1930s through the 1960s. Unfortunately, due to researchers' inability to keep up with the speed of antibiotic discovery in the face of developing resistance bacteria, this period came to an end. Predisposing factors for the development of antibiotic resistance include a persistent inability to create or find new antibiotics, as well as indiscriminate antibiotic usage.

Antimicrobial resistance (AMR) is a significant worldwide hazard to human, animal, and environmental health that is gaining traction. The development, spread, and persistence of multidrug-resistant (MDR) bacteria, often known as "superbugs," is to blame. MDR bacteria may be found in the animal, human, and environment triangles or niches, and these diseases are all interconnected. Excessive use of antibiotics in animals (food, pets, aquatic), antibiotics sold over-the-counter, increased international travel, poor sanitation/hygiene, and release of nonmetabolized antibiotics or their residues into the environment through manure/feces are all possible causes of "the global resistome" or AMR. These variables lead to the development of MDR bacterial illnesses in the population due to genetic selection pressure.

The worldwide use of antimicrobials in cattle has recently shown hotspots of antibiotic usage across continents, which will have economic and public health implications in the coming years. Antibiotics are widely used in food animals such as cattle, poultry, and pigs, and it is predicted that by 2030, their usage would have increased by 67 percent in the world's most populous nations. The effectiveness of an antimicrobial agent is harmed by the potential for tolerance or resistance to develop from the first time it is used. Antimicrobial agents used to treat bacterial, viral, fungal, and parasitic illnesses fall under this category. Several physiological and pharmacological processes may be at play as this resistance develops. It's important not to exaggerate the complexity of all the processes involved in the development and spread of resistance. Furthermore, a critical issue is the absence of basic data on these particular topics, which has resulted in a lack of major accomplishments in managing resistance development. Various institutions and organizations across the world have acknowledged this significant worldwide public health issue. Numerous suggestions and resolutions have been presented, as well as several reports, but little progress has been achieved so far. Antibiotic resistance is, unfortunately, a never-ending problem[1].

Antibiotics were discovered at a pivotal point in human history, revolutionizing medicine and saving many lives. Unfortunately, these "magic bullets" have been accompanied by diseases that have developed resistance to them. Medical professionals are now expressing grave worry about a return to the pre-antibiotic era. Fortunately, over 20,000 putative resistance genes (r genes) have been discovered after analyzing the available bacterial genomes; nevertheless, functional resistance determinants in different microorganisms are much fewer in number. Antibiotic resistance to various antimicrobial drugs was initially identified in intestinal bacteria, such as *Salmonella*, *Shigella*, and *Escherichia coli*, in the late 1950s and early 1960s. These resistant strains caused massive clinical, economic, and human-life losses, mostly in poor countries. In the

industrialized world, however, it was seen as a minor health issue limited to intestinal bacteria. This myth was dispelled in the 1970s when it was discovered that *Neisseria gonorrhoeae* and *Haemophilus influenzae* are both ampicillin resistant, with *Haemophilus* also resistant to tetracycline and chloramphenicol. Antimicrobial resistance has increased as a result of increased usage, especially in poorer countries where these medicines were readily available without a prescription.

Inadequate hygienic conditions aided resistance propagation, and insufficient health-care funding restricted access to new and effective antibiotics. Antibiotic resistance has been designated a "global public health issue" by a number of influential organizations, including the Centers for Disease Control and Prevention (CDC), the Infectious Diseases Society of America, the World Economic Forum, and the World Health Organization (WHO). The World Health Assembly has asked WHO to develop a worldwide action plan to address the issue of antibiotic resistance. The recent release of a book titled "The growing danger of antimicrobial resistance alternatives for action" has added to the issue's value. People in the United Kingdom voted for a £10 million government-sponsored award (the Longitude Prize challenge) to develop new antibiotic resistance-fighting methods. By 2015, President Barack Obama has instructed the National Security Council to develop a comprehensive national action plan to combat antibiotic resistance, based on the recommendations of the US President's Council of Advisors on Science and Technology.

Antibiotic resistance does not seem to be decreasing globally, but it may be shifting in the wrong direction. Antibiotic resistance has a complex etiology, and its effects are seen all across the world. Several efforts have been made to define the various elements of antibiotic resistance, as well as potential remedies to address this worldwide problem. However, a well-coordinated effort is missing, especially at the governmental level across the globe. 16 Antibiotics have played a pivotal part in social and medical evolution, and they are now required in all health-care systems. Without efficient antibiotic treatment to prevent bacterial infections, contemporary medicine's successes, such as organ transplantation, cancer treatments, preterm baby care, and a multitude of sophisticated major operations, would not have been feasible. If comprehensive global action plans are not implemented soon, we may face grave consequences in terms of social, medical, and economic possibilities. We attempt to depict the global scale, main etiologies, and effects, as well as highlight important regions that need immediate attention[2].

1.1 The Emergence of Antibiotic Resistance:

Microorganisms have evolved rigorous methods to evade the deadly effects of antimicrobial compounds as a result of Darwinian selection. The majority of antibiotics are generated naturally by microorganisms such as saprophytic bacteria or environmental fungus, but some are modified synthetic antibiotics and a few are entirely synthetic, such as fluoroquinolones and sulphonamides. Various species have developed defensive mechanisms against them, including changes in the target location, drug entrance or distribution blockage, and enzyme synthesis that may destroy antimicrobials. As a result, antibiotic resistance may simply represent Darwinian competition from natural antimicrobial components generated from microbes. 29,30 The results of a functional meta-genomic study of soil microorganisms showed a wide range of genetic factors linked to antibiotic resistance. Although little is known about this feature in human infections, enzyme synthesis (-lactamases) is an unusual example of a naturally occurring resistance mechanism that has an effect on human health. Although few results suggested a more

complex relationship, it is thought that different antimicrobial compounds generated by saprophytic bacteria inhibit the development of other species present in that environment, providing a reciprocal advantage in such environments. The concentration of antimicrobial compounds in the soil seems to be considerably lower, and may not be able to prevent the development of adjacent bacteria, according to the researchers. Second, evidence suggests that antimicrobials at sublethal concentrations have a substantial influence on microbial physiology and evolution, and that they may function as efficient signaling molecules that drive host or microbial gene expression. Another significant question is why just a few saprophytic bacteria generate carbapenems, a kind of broad-spectrum antibiotic. Several genes involved in carbapenem production may be involved in biofilm development and quorum sensing. These results raise additional questions about the drugs' unintended consequences. Resistance does not just develop against natural antimicrobials; it also develops against synthetic antimicrobials[3].

2. REVIEW OF LITERATURE

J. Davies in his study talks about many of the routes that are responsible for the release of resistance-driving substances into the environment are monitored and controlled by environmental authorities (e.g., antimicrobials, metals, and biocides). As a result, environmental regulators should play a key role in the creation of global and national antimicrobial resistance (AMR) action plans. The absence of environmental-focused mitigation measures in current AMR action plans is considered to be a result of our lack of basic knowledge of many of the major problems. Here, we'll look at the issue of AMR in the environment through the eyes of an environmental regulator, using the Environment Agency (England's regulator) as an example to draw worldwide similarities. The issues that are important to environmental regulators are outlined in order to answer the following questions: What are the AMR's drivers and pathways? What are the implications for environmental regulators' regular job, powers, and responsibilities? What are the information gaps that prevent environmental protection from AMR from being delivered? We provide a series of thought experiments that demonstrate how various mitigation methods may work. We conclude that: (1) AMR Action Plans do not cover all potentially relevant AMR routes and drivers in the environment; and (2) AMR Action Plans are inadequate in part due to a lack of research to guide policy, which must be addressed[4].

T. P. Van Boeckel et al. in his study discloses that antimicrobials are important medicines whose effectiveness is jeopardized by antimicrobial resistance's development and dissemination. Antibiotics are given to food animals for a broad range of nontherapeutic reasons, including growth enhancement. Concerns about the development of resistance and its dissemination to humans as a result of nontherapeutic antimicrobial usage have resulted in a slew of contradictory behaviors and viewpoints. Based on the "precautionary principle," substantial evidence supports the elimination of nontherapeutic antimicrobials (NTAs) in Europe. Even yet, solid scientific proof of the benefits and drawbacks of NTAs is not apparent to all stakeholders. Antibiotic resistance in microorganisms linked with animals fed NTAs and their food products has been found in significant amounts. This resistance spreads to other animals and people both directly and indirectly via touch, the food chain, water, air, and manured and sludge-fertilized soils, among other things. Modern genetic methods are helping to unravel the ecological effect of NTAs, but modeling efforts are hampered by a lack of crucial information on microbial and antibiotic doses at each step of the transmission chain. Nonetheless, the increasing body of data documenting the transmission of resistant bacteria from animals to humans, including that

resulting from the use of NTAs, recommends discontinuing NTA usage in order to decrease the growing environmental burden of resistance genes[5].

N. Zisko et al. in his study discloses about the antibiotic therapy of serious illnesses and the execution of medical and surgical operations under the protection of antibiotics are two main ways that contemporary medicine saves lives. However, we have not kept up with microorganisms' capacity to evolve resistance to antibiotics developed during the golden period of antibiotic discovery, from the 1930s through the 1960s. That period is referred to as "golden" because achievement appeared regular at the time; it is referred to as a "era" since it came to an end. When corporate scientists tried to develop fundamentally novel medicines with action against resistant infections instead of creating variations of existing treatments, they mostly failed. Industry shifted its attention to medicines that prevent or ameliorate noninfectious illnesses after a series of expensive failures to find new antibiotics that would be destined for short-term usage even if they gained regulatory clearance. As individuals in richer areas run out of effective antibiotics, they are forced to share them with those in poorer areas who couldn't buy them in the first place[6].

3. DISCUSSION

3.1 The Global Economic Scenario of Antibiotic Resistance:

Estimating the precise economic effect of antibiotic-resistant bacterial diseases remains a major worldwide problem. In this case, determining the illness distribution linked to antibiotic resistance is critical. Antibiotic resistance is a significant financial burden for the whole globe. Antibiotic-resistant pathogen-associated hospital-acquired infections (HAIs) kill 99,000 people per year in the United States alone. About 50,000 Americans died in 2006 as a result of two prevalent HAIs, pneumonia and sepsis, costing the US economy \$8 billion. Antibiotic-resistant bacterial infections need at least 13 days in the hospital, resulting in an extra 8 million hospital days per year. There have been reports of costs of up to \$29,000 per patient treated for an antibiotic-resistant bacteria illness. In all, economic losses of approximately \$20 billion have been reported in the United States, with yearly productivity losses of roughly \$35 billion owing to antibiotic resistance in health-care systems.

According to the experts at the Research and Development Corporation, a non-profit worldwide organization based in the United States, a worst-case scenario may emerge in the near future in which the globe is left without any effective antimicrobial agents to treat bacterial illnesses. In this scenario, the worldwide economic burden would be about \$120 trillion (\$3 trillion annually), which is almost equivalent to the current annual US health-care expenditure. In general, the global population would be severely impacted: by 2050, about 444 million people will have died from diseases, and birthrates would be quickly declining. These losses are catastrophic, but owing to data limitations, such as the inclusion of general conditions and illnesses vulnerable to antibiotic resistance, these numbers only provide a partial picture of the economic consequences of antibiotic resistance. The use of antibiotics in animals and the food sector is another important aspect of AMR that was overlooked in the study. It is a key player in the rising AMR, and it may result in its own anticipated economic losses. In many poor nations, the use of antimicrobials as growth promoters is also a common occurrence. This technique has been prohibited in the European Union since 2006.

Current cost estimates for antibiotic resistance are restricted in scope and do not take into account the wider societal benefit of antibiotics. These are predisposing variables that lead to error in estimating the true economic cost that the globe is bearing as a result of this problem. Prospective research should use macroeconomic techniques that include all of the consequences of growing antibiotic resistance, including the decrease in efficacy of different medicines in contemporary medicine, to obtain an accurate estimate of the economic implications produced. The precise assessment of the global economic cost of antibiotic resistance may not be completely determined until these problems are addressed[7].

3.2 Causes of Antibiotic Resistance:

Many variables are now at play in the complex genesis of antibiotic resistance. These include insufficient regulations and usage imprecision's, a lack of awareness in best practices that leads to unnecessary or inept antibiotic use, the use of antibiotics as a growth promoter rather than to control infection in poultry and livestock, and online marketing that made the unrestricted availability of low-grade antibiotics very accessible. Overuse of antibiotics is the primary driver of resistance development, as Sir Alexander Fleming predicted when he said that "the public would want the medicine and then will begin an age... of abuses." Antibiotics kill susceptible germs, but they leave resistant pathogens alone, which multiply and flourish as a result of natural selection. Despite the fact that misuse of antibiotics is highly prohibited, over prescription persists throughout the world. In 30 percent to 50 percent of instances, treatment reasons, agent selection, and antibiotic medication duration are all incorrect, according to many studies. Antibiotics are utilized as a growth enhancer in cattle all over the world. Approximately 80% of antibiotics are marketed in the United States only for use as growth supplements and illness control in animals, according to estimates. In another research, a worldwide map of 228 nations was created to show antibiotic use in cattle; the overall antibiotic consumption was estimated to be 63,151 tons in 2010. Van Boeckel et al. also predicted a 67 percent increase in antibiotic use by 2030, almost doubling in the fast growing and densely populated nations of Brazil, Russia, India, China, and South Africa[8].

3.3 Drivers of antibiotic Resistance:

Understanding the different causes of antibiotic resistance is now the most important step in dealing with this worldwide problem. Antibiotic resistance selection in health care systems, the environment, and agriculture/livestock is a natural process (Figure 1). Sanitation settings, infection control standards, water hygiene systems, medication quality, diagnostics and treatments, and travel or movement restrictions are all significant variables that may contribute to antibiotic resistance. In addition to mutations in different genes on the microorganism's chromosome, the interchange of genetic material across organisms plays an important part in antibiotic resistance dissemination. Plasmid transmission is the most common way for antimicrobial resistance genes to be transferred to a host cell. Antibiotics may affect this process by promoting the transfer of resistance components, as well as exerting a selective strain on resistance development. The demonstration of resistance transmission dynamics has raised awareness and knowledge of how resistant infections spread from one person to the next. The feco-oral route is the most significant mode of transmission at the community level, particularly for resistant Enterobacteriaceae infections, which are typically transmitted owing to sanitation failure. CA-MRSA, which is typically spread owing to extended hospital stays or unsanitary hospital environments, is also an excellent example of understanding the transmission dynamics

of resistance at the human–human level. For resistant *N. gonorrhoeae*, sexual intercourse is also a means of transmission[9].

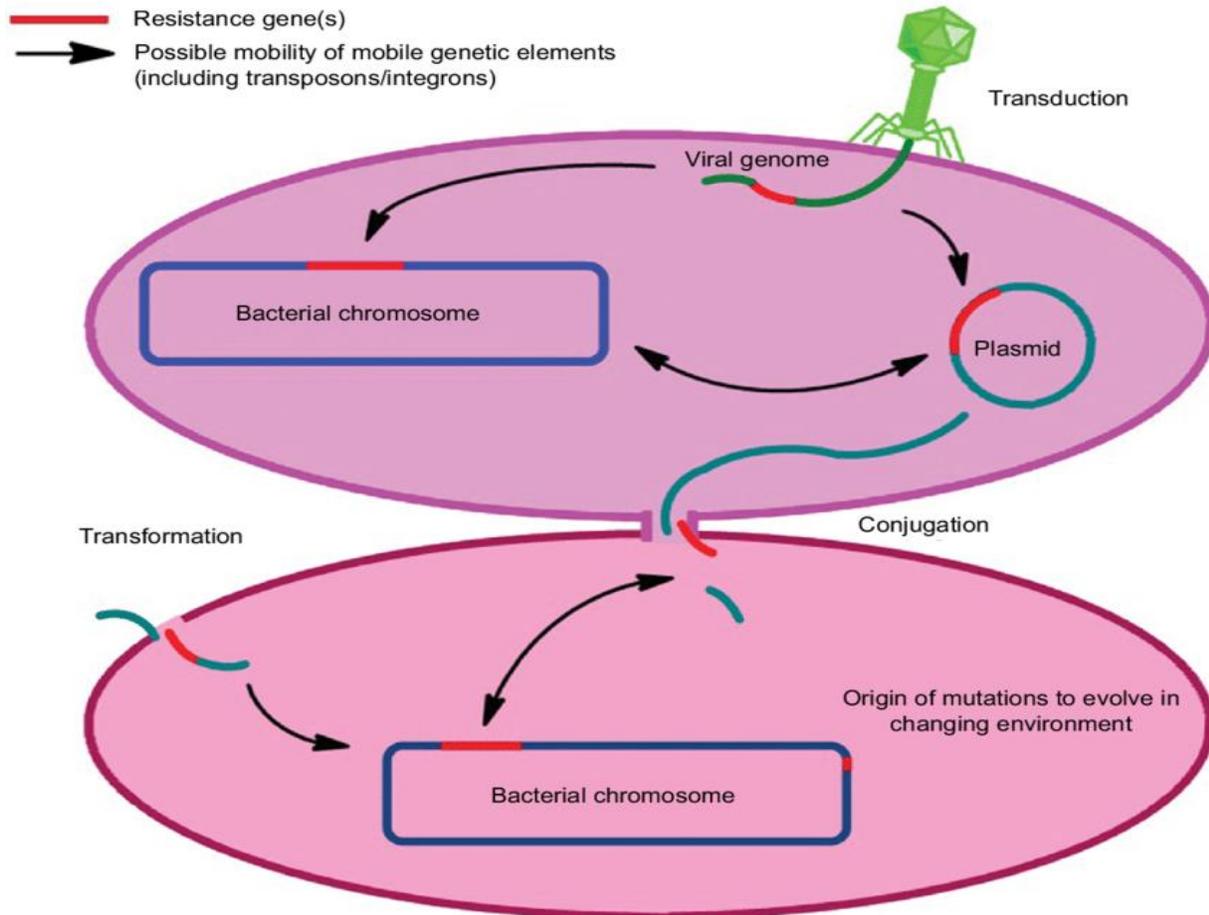

Figure 1: Drivers of antibiotic resistance transmission[10].

3.4 Therapeutic Strategy:

Despite clinical evidence that methods based on small molecule monotherapy are ineffective in resistance situations, infection control has long been a major concern of the evolutionary race. The evaluation of different candidates for infection control throughout the development phase indicates that the emphasis of research would be on new antibiotic discovery and identification. Unfortunately, biotherapeutics such as antibiotics, new combination therapies, and drug delivery methods are still lagging behind the development of novel small molecules, which are often extensions of existing medication classes. Globally, systemic monotherapy approaches are ineffective because resistance has surpassed medication development. Instead of fighting bacterial development, control efforts may be better served by exploring resistance mechanisms based on genetic inspiration, such as furanones used by red sea algae to disrupt resistant bacteria's quorum sensing.

Though biologics are still in their infancy in terms of bacterial infection management, their potential to fight MDR cannot be ignored. Small compounds will always play an important part in infection control; nevertheless, the hunt for a viable therapeutic candidate based on biological

inspiration may be pursued more logistically. Various drug development tools are necessary to address biologics' shortcomings, such as controlled delivery options, partial in vitro stability, insufficient high-throughput, advanced screening tools, inefficient pharmacokinetics, and comparatively unknown pharmacodynamics, but they are not as radical as those available for small molecule development. Between biologics combinations, compounds based on biological inspiration, and medication delivery technologies, a huge potential exists by accident. As a result, a paradigm shift similar to that seen in cancer and complicated viruses might be used to eliminate vulnerable bacteria, manage antibiotic resistance, and protect the host microbiota. A mix of traditional antibiotics, new adjuvants, and feasible restricted delivery methods may be used to create this kind of strategy. Advanced bioinformatics to identify optimal combination delivery and novel targets may offer significant advantages, as opposed to many costly development methods that often fail in trials[11].

Nanotechnology is becoming more widely used in medicine, therefore it is not surprising to find these technologies being used to combat the threat of antibiotic resistance. Nanoparticles may be used in a variety of ways to treat infections therapeutically. They may be combined with currently available antimicrobials to improve their physiochemical action against drug-resistant bacteria. Second, colloidal zinc, silver, copper, and titanium may be employed as antibacterial agents in and of themselves. Antibiotics' main targets are the inhibition or disruption of bacterial cell walls, proteins, and nucleic acids production, but nanoparticles have been found to impact the respiratory system, resulting in the formation of reactive oxygen species, which eventually leads to bacterial mortality. Nanoparticles also target the bacterial cell wall, thus silver nanoparticles, for example, may be used with medicines to increase their antibacterial activity via synergy.

Antimicrobial peptides (AMPs) are new antimicrobial agents that may be found in animals, microbes, and plants. They have a wide range of activity and are particularly effective against bacteria, fungus, and protozoans. The amphipathic structure of AMPs allows them to interact with bacteria' cell walls and cellular membranes. Although antimicrobial action is typically due to disruption to cellular membranes, AMPs may also target other proteins, DNA, RNA, and regulatory enzymes, and therefore seem to be a potential alternative to traditional antibiotics. However, as soon as AMPs are used in clinical practice, resistance to these compounds is expected; therefore, it is critical to investigate the molecular mechanisms of their action and gain a better understanding of resistance to these compounds in order to plan rationally for the use of AMPs as an alternative to antibiotics[3].

4. CONCLUSION

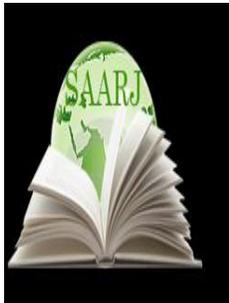

We should strive to get a better understanding of the scope of the AMR problem. In order to manage AMR, it is critical to gather comprehensive and reliable data. The current concern about this problem stems from a lack of knowledge. At this point, it is impossible to forecast the future situation with certainty, although the management of AMR seems to be extremely challenging due to the shortage of new antibiotics. To address this problem, multifaceted methods should be used. Medical students, doctors, and pharmacists must get ongoing and updated training.

Regulations should be put in place, with antibiotic usage being closely monitored as part of the policy. For the development of novel screening and diagnostic instruments, a worldwide and multidisciplinary approach must be considered. The issue's ecological and environmental

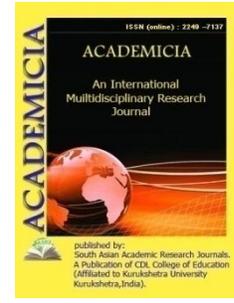

components should not be overlooked; all aspects of "one health" should be included in the control strategy. Alternative methods, particularly in poor nations, may be beneficial. The current level of worldwide attention shows that AMR is no longer an unnoticed problem. Although this focus is insufficient in and of itself to fight AMR, a worldwide code of behavior including all available methods for combating AMR may eradicate the disease in the future. Antibiotic alternatives such as probiotics and lytic bacteriophages may assist to reduce the worldwide burden of AMR. Antibiotics, infection management, vaccination, encouraging healthy food supply practices, and control of person-to-person transmission via screening, treatment, awareness, and education may all help to keep AMR from spreading and spreading. Tracking, bio-surveillance, and response and preventive measures for AMR and MDR pathogens at the national, regional, and global levels may assist to manage the "global resistome."

PHARMACEUTICAL SUPPLY MEASURES IN UZBEKISTAN IN THE EARLY YEARS OF INDEPENDENCE

Yakubova Shakhnoza Abdurahmonovna*

*An Independent Researcher,
 Karshi State University,
 UZBEKISTAN

ABSTRACT

This article details the beginning of the reforms in the pharmaceutical industry in Uzbekistan in the post-independence period, the initial work done to meet the needs of the population, and their results. This, in turn, is important when studying the history of pharmacy in the country.

KEYWORDS: *Uzbekistan, "Pharmacy" Production Association Pharmaceuticals, Academy Of Sciences Of The Republic Of Uzbekistan, Medicines, "Uzkimyofarm", "Uzbiofarm", Committee On Pharmacology, "Uzpharmsanoat".*

INTRODUCTION

In 1991, the population's demand for pharmaceuticals was met by only 34%. The following year, the situation worsened, to 10-12 percent. In the first period of independence, Uzbekistan spent 661 million soums on the purchase of medicines and medical supplies from abroad. soums and 144.4 mln. U.S. dollars were allocated. However, it was not possible to meet the demand of the population for pharmaceutical products with these funds¹.

It is no exaggeration to say that the pharmaceutical industry in Uzbekistan was re-established during the years of independence. Because before independence, almost all medicines and medical supplies were imported, and only two percent of the products in the domestic pharmaceutical market were made in local enterprises. There are only two enterprises in the pharmaceutical system, namely, Uzkimyofarm and Uzbiofarm, which mainly produce 20 types of pharmaceutical products².

In order to meet the demand of the population for pharmaceutical products, the Government of Uzbekistan has made some organizational and structural changes. On March 6, 1992, in accordance with the Decree of the Cabinet of Ministers of the Republic of Uzbekistan No. 74-F, Committees on Pharmacology and Pharmacopoeia were established under the Ministry of Health

of the Republic of Uzbekistan³. The Chairman of the Pharmacology Committee is Doctor of Medical Sciences, Professor O.M. Najmitdinov, Chairman of the Pharmacopoeia Committee, Academician of the Academy of Agricultural Sciences of the Republic of Uzbekistan, Corresponding Member of the Academy of Sciences of the Republic of Uzbekistan S.I. Iskandarov was appointed⁴. The composition of both committees and the regulations of special expert commissions were also approved. A laboratory for quality control of medicines has been established under the General Department of Science and Training of the Ministry of Health of the Republic of Uzbekistan. Its director is Doctor of Pharmaceutical Sciences A.N. Yunuskhodjaev has been appointed. The activities of the committee were focused on the production of medical equipment.

Decrees of the First President of the Republic of Uzbekistan "On the establishment of the State Joint-Stock Concern of the Pharmaceutical Industry of Uzbekistan ("Uzpharmsanoat") in 1993, № 916-PF of July 14, 1994" On regulation of drug sales in the Republic ", Ministers of the Republic of Uzbekistan Resolution of the Cabinet of Ministers of the Republic of Uzbekistan № 344 of July 24, 1992 "On the illegal export of food, medicine and some consumer goods from the Republic of Uzbekistan", January 8, 1993 "On additional measures to provide the population with medicines" Resolutions № 404 of August 6, 1994 "On urgent measures to improve the supply and distribution of medicines and medical devices in the Republic" played an important role in the legal regulation of activities in this area⁵. With the publication of these documents, the industry became one of the main directions of the economy. In order to implement the program of integrated development of the pharmaceutical industry of the republic, the state joint-stock concern "Uzpharmsanoat" was established⁶.

In 1993, 14 republican, regional and municipal production associations functioned within the Pharmacy Production Association. ordered. Effective January 11, 1993, free sale prices were introduced for all medicines, except for 60 types of essential medicines⁷.

Pharmacies varied depending on the form of ownership. In a survey of pharmacy communities, the Tashkent City Pharmaceutical Production Association said that 4 of them wanted to switch to foreign currency, 12 to commercial, 32 to lease, and 45 to collective ownership⁸.

Hospital pharmacies that supply treatment and prevention facilities with medicines and other medical supplies have not been privatized. The existing system of drug supply in these institutions has been preserved. In order to improve the supply of medicines to the population and treatment and prevention facilities, centralized management and control over the activities of pharmacies, the State Joint-Stock Company "Dori-Darmon" was established on the basis of the Republican Association of Pharmaceutical Production. The state joint-stock association "Dori-Darmon" included regional state joint-stock associations, private, public and joint-stock pharmacies⁹. The association's trade plan has improved somewhat in a market economy. For example, in 1994, the association's sales amounted to 44.6 million soums. The association's net profit this year is 10 million soums¹⁰. In 1995, the Dori-Darmon Association imported medicines worth 2,040.9 million soums¹¹.

In accordance with the Resolution of the Cabinet of Ministers of the Republic of Uzbekistan No. 181 of May 25, 1995, the "Main Department for Quality Control of Medicines and Medical Equipment" was established. He is responsible for the quality control of drugs and diagnostics, medical equipment and products, centralized management of the activities of organizations

engaged in the examination, standardization, certification and registration of drugs. At the same time, the General Directorate reviewed the system of regular analysis of the situation in the drug market, research on new drugs and their registration. The main department includes: Committees on Pharmacology and Pharmacopoeia, the Committee on New Medical Techniques, the State Center for Quality Control and Standardization of Medicines, the Bureau for Registration of Medicines and Medical Devices. In 1996, the products of the local pharmaceutical industry in Uzbekistan met the needs of the population in medicines by only 5-6%, and the rest of the medicines had to be imported. For example, in 1995, 353 types of medicines and 86 types of chemical reagents were imported to the Republic on a loan of 51 million US dollars from the European Union¹².

Founded on the basis of a private pharmacy in Tashkent, Farmed has a strong position among private pharmaceutical companies in Uzbekistan. Over the course of a year, the firm has partnered with more than 40 major pharmaceutical companies in 20 countries around the world. The company has also opened a network of pharmacies in Tashkent and a number of regions of the country¹³. The company has set up an information and methodological center to conduct marketing research of the pharmaceutical market.

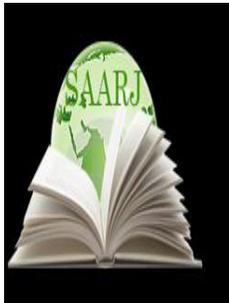

The ongoing reforms in the pharmaceutical sector of the Republic of Uzbekistan necessitated a scientifically based approach to the analysis of the pharmaceutical market to ensure a balance between supply and demand for drugs.

In conclusion, these measures played an important role in providing the population of Uzbekistan with medicines in the difficult social situation in the first years of independence and in recent years have served as an important foundation for the formation of the pharmaceutical industry.

CONFLICTS OF THE PROCESS OF THE INDUSTRIAL STAFF TRAINING IN THE SOVIET PERIOD

Bekzod Mamatkulov*

*Researcher of Karshi Institute of Engineering Economics,
 Deputy Director of the Presidential School in Karshi,
 UZBEKISTAN

ABSTRACT

One of the main factors determining the development of society and the state is the issue of personnel. One of the factors that have a strong impact on the establishment and development of all sectors is the staff. This article analyzes the organization of personnel training in Uzbekistan during the Soviet period, in particular, qualified personnel, and the contradictions in this process.

KEYWORDS: *Tashkent, Samarkand, Uzbekistan, Soviet, Central Asia, Skilled workers, technicians, FZU, FZO, "Hujum" movement, Tashselmash.*

INTRODUCTION

In the early years of Soviet rule, the training of industrial personnel was one of the most problematic tasks. As a result of the growing number of industrial enterprises related to agriculture and development of natural resources in Uzbekistan, they have faced difficulties in staffing. There was a shortage of indigenous peoples, especially among the cadres. This paved the way for the influx of industrial personnel from Russia to Central Asian industrial enterprises. Among the engineering and technical intelligentsia, only 1 percent were indigenous¹.

There were not enough educational institutions to train skilled workers, technical staff. FZU (школа фабрично-заводского ученичества- a professional technical school) began to be organized to train qualified workers.

Skilled workers were organized in two directions: FZU and vocational schools. While FZUs trained workers for almost all areas of industry, vocational schools trained staff for an industrial trust or enterprise.

In 1923, there were 11 vocational schools in Turkestan, where 865 students studied. This year, 1,379 students took part in 19 vocational courses in the country. 827 people studied in technical schools².

In 1926, 738 students studied in 10 factory schools and 176 people studied in 3 vocational schools in Uzbekistan³. In 1925-1926, 1 million 230 thousand rubles will be allocated in Uzbekistan for vocational education⁴. However, the material and technical base of this type of educational institution is weak and the classrooms are not well equipped. They lacked teaching staff.

The largest FZU in Central Asia was established in Tashkent, and in the first academic year, 300 students were admitted to this educational institution⁵.

FZUs operated mainly under large industrial enterprises. Training of working complexes was organized in large industrial enterprises. For example, in Tashkent at the mechanical plant of the General Cotton Committee in 1928-1929, 500 people were trained in special training courses⁶. In addition, 20 clubs were opened at the Tashselmash plant, which employed 254 workers. 225 people took part in educational circles at the "Qizil Tong" sewing factory⁷.

Attempts were made to train specialized industrial personnel in factory schools (фабрично-заводского обучения – ФЗО (FZO)). For example, 289 people were trained at the FZO school under the Fergana silk factory, and 661 people at the FZO of the Samarkand cotton industry⁸. In the Fergana Valley, FZOs have been established to train personnel mainly for the cotton, silk and textile industries. Also, in December 1929, a 6-month FZO school was opened at the Bukhara Silk Spinning Factory. In Bukhara and Andijan, working universities for 120 people were established, with socio-economic, technical and other departments. Such universities were opened in Tashkent for 320 people, in Kokand for 200 people, in Kashkadarya and Surkhandarya regions for 40 people. In 1928-1929, a course was organized at the Tashselmash plant to train and improve the skills of workers, and 500 workers were involved in the course. In 1931, 925 workers were trained in such courses. Only 30 percent of them were Uzbek workers. In 1931, 20 technical circles were organized at the plant, which were attended by 25 workers.

Due to the "Hujum" movement among women, the share of women has increased, and some work has been done on their training. Women worked mainly in the garment, weaving, food, and silk industries.

The school for women seamstresses was opened in 1926 in Tashkent. From 1928 to 1929, the school had 47 students, 57% of whom were Uzbek women⁹.

In general, the share of women in FZUs has also increased. For example, in 1928, women accounted for 28 percent of FZUs, while in 1932 it was 32 percent¹⁰.

Industrial enterprises grew. In 1932, 54.7% of the total number of workers in Uzbekistan worked in large enterprises. In 1927-1928, the figure was 19.8 percent.

The technical modernization of industrial enterprises required a constant increase in the skills of workers. Accordingly, various circles and courses on technical education in factories and plants were multiplied. In 1932, a total of 642 clubs operated in the factories of Uzbekistan, employing 20.9 thousand people.

In 1933, 47 highly skilled workers worked at the Tashselmash plant. By 1934, their number had risen to 112. From 1934 to 1936, the Tashkent Textile Combine trained 874 skilled workers¹¹.

In 1937, 562 students were planned to be educated in industrial technical schools, but in practice 442 students were educated, and the plan was fulfilled by 78.7%¹². 955 students were educated in FZU schools instead of 1050 students. In 1937, 11,109 people were to graduate from industrial colleges, while in practice, 4,131 people graduated by the end of their studies¹³. Also, in 1938, the average annual contingent was fulfilled by 63.8%, the admission plan by 85%, the graduate plan by 43.9%¹⁴.

In 1938, an inspection of the educational process and educational work at the Textile College and the Cotton Training Complex revealed a number of shortcomings. These include non-implementation of the curriculum, low quality of admission, inefficiency of public political and educational work.

The Crafts Union of Uzbekistan has organized schools and courses to staff its enterprises. In 1937 it was planned to train 700 workers in such courses according to the plan, and in practice 302, instead of the planned 841 workers in 1938, 596 workers were trained.

Some work has been done in the regions in this regard. For example, in 1939, 23 women were educated in technical schools of the Bukhara regional trade union, and in 1940, 172 women were educated.

One of the most serious problems in the industry was the shortage of highly educated engineers and technicians. In 1921, a total of 232 specialists were registered in the Turkestan industry, of which only 94 had higher education¹⁵.

In the early years of Soviet rule, Uzbek industrial enterprises were staffed mainly by higher education institutions in the Central regions. Engineers and technicians trained by Moscow State University, Leningrad State University, Moscow Polytechnic Institute, Kharkiv Polygraphic Institute were sent to work in Central Asian industrial enterprises.

With the opening of Turkestan State University in 1920, it became possible to train partly engineering and technical intellectuals. In 1922, 436 students studied at the Department of Mechanics, Civil Engineering, Hydraulic Engineering and Mining of the Technical Faculty of the University¹⁶.

In 1929, the Central Asian Cotton-Irrigation Polytechnic Institute was established on the basis of the Faculty of Engineering, Melioration and Agriculture of the Central Asian State University. In the same years, the Central Asian Silk Institute was established. From 1931 to 1932 the Institute of Railway Engineers, the Institute of Textiles was opened. In 1934, the Central Asian Industrial Institute was established. These institutes have trained engineers and technicians not only in Uzbekistan but in all Central Asian republics.

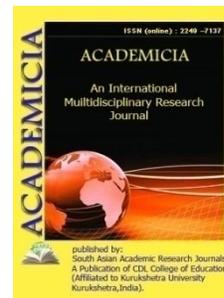

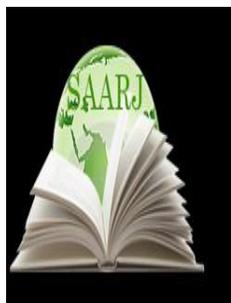

In 1933, 69 technical colleges and 30 working universities were opened in Uzbekistan, as well as working universities in Tashkent and Samarkand.

In 1929, a total of 2,418 specialists worked in the Central Asian republics, of which 197 were engineers and technicians with higher education. The number of engineers in Uzbekistan was almost four times less than in the Central regions.

In summary, Soviet-era documents state that the training plan was overfulfilled, and in practice trust managers and plant directors did not pay enough attention to staff training. Due to staff shortages, the trust administration states were not fully staffed.

ABSTRACT

As the usage of electrical and electronic devices grows, so does the amount of electronic trash produced (e-waste). It is the quickest. The world's increasing garbage stream Printed circuit boards are an integral component of almost all electrical and electronic devices. Improper disposal of these electronic trash may put human health and the environment at risk. On the contrary, the effective management of this trash requires a well-thought-out plan for waste awareness, collection, recycling, and reuse. These days, the effective trash recycling has long been seen as a major problem for any community. Circuit boards (PCBs) (PCBs). Many electronic businesses rely on precious heavy metals and hazardous halogenated organic compounds, which are abundant in these rocks. In this case, the makeup of various PCBs, as well as their hazardous consequences, are addressed in this article. There are a variety of recycling methods in use today. The most significant metals from e-metallic waste's fractions are shown. Metals may be recovered from e-waste once it has been processed. Physical separation through pyrometallurgical, hydrometallurgical, or biohydrometallurgical methods is also addressed, as well as biohydrometallurgical separation.

KEYWORDS: End-Of-Life (EOL), Electronic Waste (E-Waste), Infrastructure, Materials Recovery, Recycling.

1. INTRODUCTION

The increasing reliance on electrical and electronic devices in our everyday lives, as well as their end-of-life waste, has created a new environmental and health issue. Reusing and properly recycling this trash, on the other hand, conserves natural resources and prevents water and air pollution[1]. WEEE (waste electrical and electronic equipment) refers to electrical and electronic equipment, including all of its components, that has ceased functioning or has function problems. Cell phones, videocassette recorders, scanners, faxes, printers, tablets, DVD players, microwaves, x-ray machines, and certain scientific equipment are among the electrical and electronic trash. Large amounts of this trash are produced as a result of constant technological innovation and replacement, particularly in the case of computers and mobile phones[2].

Electronic trash (e-waste) produced across the globe in 2016 was approximately 44.7 million tons, and this is expected to rise to 52.2 million tons in 2021, at a pace of 3 to 4% each year. In 2005, the United Nations University estimated that 8.3–9.1 million tons of e-waste were produced throughout European nations. According to a variety of estimates, total electrical and electronic waste would increase at a rate of 2.5 to 2.7 percent per year, reaching approximately 12.3 million tons by 2020. Every year, a growing number of electric and electronic gadgets are withdrawn from the market in most nations[3]. E-waste generated from outdated laptops is expected to rise by 200–400% in South Africa and China by 2020, while e-waste generated from abandoned TVs and refrigerators would be twice or three times as much in China and India. It has been claimed that the quantity of solid e-waste has risen to alarming new heights, posing a significant threat to human health across the globe. Given that a mobile phone has a lifespan of around a year and a computer has a lifespan of 2–5 years, roughly 100 million mobile phones and 17 million computers are projected to be abandoned globally each year owing to faulty or obsolete technology[4].

Egypt is the biggest market in both the Middle East and Africa at the moment. In 2014, about 370,000 tons were produced, and the country's share will continue to increase. South Africa comes in second on the continent with 350,000 tons produced, followed by Nigeria with 220,000 tons produced in the same year. According to the United Nations Environment Program (UNEP), the rise in generation rates in Egypt is due to a 15% increase in home consumption, a 95% increase in computer users, a 74.5 percent increase in television sales, and a 13.5% increase in mobile phone subscribers. In Egypt, the fastest increasing component of the municipal solid waste (MSW) stream is mobile phones (subscribers > 90 million in 2015).

It expands at three times the rate of typical municipal trash (UNDP Egypt 2015, 2016). Electric and electronic equipment, according to reports, contain over 1000 distinct chemicals, including hazardous heavy metals and organics, which may cause severe environmental contamination issues if discarded improperly[5]. WEEE (waste electrical and electronic equipment) recycling is a crucial topic for waste management and the recovery of valuable materials. In terms of materials and components, WEEE is heterogeneous and complicated. Developing a cost-effective and environmentally friendly recycling system necessitates identifying and quantifying valuable materials and hazardous substances in order to comprehend the physical characteristics of waste and improve metal recovery in order to conserve natural resources and provide an environmentally sustainable waste management solution[6].

In virtually all electric and electronic equipment, printed circuit boards (PCBs) constitute the most essential component (EEE). Copper, precious metals (PMs), and other valuable metals abound on these boards. Because of the inclusion of chlorinated/brominated flame retardants and inorganic chemicals, waste printed circuit boards (WPCBs) have drawn public attention due to their ecologically hazardous components. WPCBs are improperly disposed of, resulting in hazardous chemicals being released into the environment as well as the loss of numerous precious metals. Copper (20%) and gold (250 g/t) are considerably more abundant in printed circuit boards than in copper or gold ore, i.e. 20–40-fold and 25–250-fold, respectively[7].

For treating electrical and electronic wastes and recovering their metal contents, different treatment methods based on physical, pyro metallurgical, bio metallurgical, and hydrometallurgical processes are available. The potential dangers and economic possibilities of e-waste are outlined in this study. A summary of WPCB components is provided, as well as their harmful impacts on humans and the environment[8]. The physical and chemical metallurgical methods for recovering metals from e-waste are addressed. The information is discussed and contrasted to Egypt's existing e-waste control initiatives. The future prospects and difficulties that Egypt has in terms of effective e-waste recycling are also addressed. Printed circuit boards are made up of a wide range of materials, some of which include a variety of hazardous chemicals that, if not properly handled, may pollute the environment and endanger human health[9].

There are over 1000 hazardous chemicals linked to e-waste, with the following being the most frequently reported: Toxic metals (such as barium (Ba), beryllium (Be), cadmium (Cd), cobalt (Co), chromium (Cr), lead (Pb), lithium (Li), lanthanum (La), mercury (Hg), manganese (Mn), molybdenum (Mo), and hexavalent chromium (Cr(VI)) as well as persistent organic pollutants (POPs) such as bromine. The detrimental hazardous consequences of certain metals found in electronic waste on human health[10]. Mechanical processing, which comprises three main steps: dismantling, upgrading, and refining, is typically the first stage in the WPCB recycling process. Dismantling is critical for all types of electronic trash, with the goal of isolating dangerous or valuable components for further treatment. To separate the materials and components into various categories (i.e., plastics, steel, aluminum, copper, printed circuit boards), the dismantling process is done manually using basic equipment like as hammers, tongs, screwdrivers, and conveyors. Following the dismantling process, WPCBs are exposed to a physical process that includes shredding the boards into tiny pieces using a crusher and grinder, followed by magnetic, eddy current, and density separation methods to separate the metallic and non-metallic fractions. Finally, a refining process is used, which includes hydrometallurgical, pyro metallurgical, electrometallurgical, bio metallurgical, and combinations of these processes. In the United States, landfills and incineration are the most common methods of disposal for this trash. The demand for landfills is growing, which is putting a strain on our ecosystem.

Diverted waste treatment techniques are also sought due to a lack of disposal capacity and increasing concern about environmental quality. To keep end-of-life (EOL) electronics out of landfills and incinerators, new waste management solutions are required. However, while developing an effective diversion plan, there are many things to consider. This approach must be founded on the program's long-term economic viability, technological feasibility, and a reasonable degree of societal support. EOL electronic goods should be recycled and reused as part of the plan. The types of processes that can be used and the quantity of trash that can be

treated. Transportation, collection, recovery, and resale facilities are all included. The quantity of trash in the waste stream, the recycling technologies available, government restrictions, and the economics of EOL products are all factors that influence the recycling infrastructure.

2. DISCUSSION

We begin at the point when CEDs first become waste (either through obsolescence or through operational failure) and work our way through the collection, treatment, and final disposition of recycled electronic waste to gain a better understanding of the current processes and infrastructure available for electronic recycling in the United States. This overview covers important actors at each stage and gives a complete picture of the infrastructure for electronic trash recycling. Consumers believe that these CEDs are valuable. This logic is incorrect. The residual value of obsolete electrical equipment is constantly decreasing as electronic technologies advance. With the passing of time, both the resale value of components and the resale value of machines decrease quickly. For example, the value of a computer with technology older than two generations approaches zero.

Furthermore, it is more difficult to recycle older equipment than it is to recycle modern technology. In general, older equipment includes a greater range of materials, such as various polymers, as well as a greater quantity of dangerous elements, such as lead. As a result, it is preferable to discard outdated computer equipment as soon as it seems to be obsolete. Consumers must have both access to and awareness about recycling programs in order to effectively recycle electronics. This basically implies that customers must know where to turn when their technological gadgets become outdated or unusable. Several cities have tested collecting systems that are now accessible to the general public. As a consequence, electronic recycling initiatives are becoming increasingly prevalent. Curbside collection is the collection of e-waste on a regular basis, similar to how ordinary municipal trash is collected, or upon request. The operation expenses of e-waste collection may be significantly reduced if it coexists with an existing curbside trash collection service. This is the most practical collecting method for residents.

Operating expenses, on the other hand, may be greater than for other collecting methods. There's also the risk of theft of gadgets left out for recycling, as well as the abandonment of trash that isn't e-waste. A special drop-off event is a one- or two-day event organized over the weekend to encourage residents to participate. The number of devices gathered in this option is determined on the amount of customer engagement and the weather conditions during the special event time. When specialists from the repair sector collaborate with the program, a special drop-off event is regarded to be an excellent recycling program since these experts can pick out the most valuable goods for resale, repair, and reuse. A year-round collection event is what a permanent collection option is. E-waste may be collected at the municipal solid trash collection facility, resulting in little expenses. Although this kind of collection program has been proven to be the most cost-effective, it is not appropriate for every town size. This collecting method requires that the amount of collected devices be verified on a regular basis, and that the devices be delivered to a recycler after specified quantities have been gathered. Consumers may bring old electronic equipment to a shop when they buy new electronic equipment under the point-of-purchase collection model, and merchants act as the collecting agency.

Depending on the retailer's choice, this collection option may be implemented as a permanent or one-time drop-off event. For this technique of collecting to be effective, the retailer's active involvement is required. Geographic location, accessibility and comfort for customers, and population dispersion may all be factors in determining a suitable collecting site. Electronic equipment retail shops or big public parking lots may be utilized as collecting sites for special drop-off events. The transportation element of electronic recycling is also significant. Transportation is supplied by the local government, a private recycler, or a third party with curbside pickup. Residents are responsible for transportation to the collection location in permanent collection, and the recycler is responsible for transporting the collected e-waste to the processing facility. Consumers must bring their e-waste to the collection location in the case of a special drop-off event. The transportation to the recycling processing facility is subsequently handled by the local government or the recycler.

The salvaged and recycled materials market is the third market. Examining and testing for reuse are time-consuming and labor-intensive activities, notwithstanding their simplicity. A plug-and-play test is performed to determine whether or not equipment is functioning. Dismantling equipment that fails the plug-and-play test for component resale and reuse is an option. Individual component recovery from e-waste is more difficult than a simple plug-and-play test that can be used to evaluate an entire system. Employees in charge of component recovery must understand (1) how to dismantle the system, (2) which components are valuable, and (3) which components, such as a hard drive, need extra caution in their handling. To optimize economic value, the disassembly process begins with the more valuable high-end components and ends with the less valuable low-end ones. Hazardous contaminants are also removed throughout the demanufacturing process. Because ink is a hazardous chemical, printer ink cartridges must be removed before the printer may be recycled. Due to the difficulties of removing the laminated layer from the metal, laminated metals are also removed and discarded. The sequence in which the manufacturing processes are performed is critical to output efficiency.

Even though they are destroyed, data from special drop-off event collecting systems has shown that more than half of the computers are in excellent operating order. These used computers may readily be sold on secondary markets since there is still a need for them. In 1997, the TV repair business in the United States had a market value of approximately US\$ 17 billion and employed 588,000 people. The computer repair business, on the other hand, is expanding. Because a computer is a combination of current electronic technology, this sector depends on high-tech, qualified personnel. As a result, this sector is divided into two segments: companies that repair computer displays and companies that repair computers themselves.

Those in the computer repair business have the opportunity to collaborate with recyclers. If the collected equipment has any market value, some electronic equipment that has been collected for recycling may be repaired and resold by the repair business. However, even if the unit is still functional, there is no market for it if it is old and outdated, such as 286 CPUs. Overseas is the biggest market for gadgets gathered in the United States.

More than half of the e-waste collected for recycling in the western United States is projected to be shipped to other nations such as China, India, and Pakistan, where recycling prices are far lower than in the United States. However, due to ongoing registration in many of these nations, the situation is still in flux. Because the glass recovered is utilized as a raw material for new CRTs, glass-to-glass recycling is considered a closed loop recycling process. CRTs are collected

and transported to a recycler, where the whole glass is crushed into cullet without the panel and funnel glass being separated. The cullet is sent to CRT producers to be used in the production of new CRTs. The composition of CRT glass varies based on the manufacturer and the time it was manufactured, particularly for panel glass.

One of the reasons why glass producers are hesitant to accept recycled CRT glass is because of this. Glass manufacturers are adamant about avoiding mixing various kinds of glass. Due to the difficulties in establishing the precise composition of recycled glass, using used CRT glass poses considerable risk to the glass production business. The danger of employing glass with an unknown composition is that a little amount of the incorrect composition may contaminate a whole glass furnace's contents, causing changes in glass characteristics. The glass furnace may need to be shut down for 3–4 days to rectify an erroneous glass composition. The glass-to-glass technique has many advantages. First, recycled cullet may be used to substitute virgin materials at a similar or lower cost, and it can enhance the furnace's efficiency, reducing the amount of energy used to make CRT glass. In addition, since recycled glass already has a high purity, this method may enhance the quality of the output glass and decrease emissions from the glass-making process.

Cullet has a greater value to a main CRT glass producer than it does to a lead smelter, which is another glass recycling technique. In addition, as compared to glass-to-lead, the glass-to-glass method lowers regulatory burden by treating CRTs as universal waste rather than hazardous waste, as defined by the Resource Conservation and Recovery Act. Another factor is high-definition television (HDTV). The market for new televisions in the United States is virtually saturated (more than 99 percent), but the arrival of HDTV in the near future, as well as customer preference for flat panel displays, may hasten the obsolescence and replacement of traditional CRT television sets. To deal with these developments, regulation and research will be required to improve glass-to-glass recycling and the development of new uses for old CRT glass. One unique aspect of CRT recycling is that there is a low-cost option: foreign recycling, which costs around a tenth of what domestic alternatives do. Labor costs, variations in work methods, appropriate waste disposal techniques, and environmental effect are all variables that influence cost. Another incentive for exporting CRTs is the low transportation cost: empty containers must return to their home nations after unloading the products in the United States.

Adding value to these containers by filling them with CRTs and other old devices is a good idea. Although this option is applicable to other electronic trash, CRTs are the most important item since CRT recycling facilities are situated on the east coast and exporting is often from the west coast of the United States. Plastics are widely apparent in electrical and electronic devices, such as telephones, TVs, and personal computers. Many plastic components, however, are concealed from view and form the infrastructure that connects and supports contemporary life. Plastics are essential materials for use in electronics because of their unique electrical insulating characteristics, as well as their strength, stress resistance, flexibility, and durability. Because thermo sets cannot be remelted and molded into new items, they are usually shredded when recycled. Circuit wire boards, electrical switch housings, electrical motor components, electrical breakers, and other electronic components utilize thermosets. Plastics, behind metals, offer the most potential for electrical product salvage. Electronic goods are typically made of 'engineering thermoplastics,' which have a high intrinsic value. Engineering thermoplastics sell for dollars per pound when pelletized, compared to pennies per pound for bottle and container-grade plastics.

3. CONCLUSION

When e-waste is collected, it contains a wealth of useful materials. As a result, appropriate disposal procedures should be implemented to ensure that it does not harm the environment or provide a health risk to humans. WPCB recycling has traditionally relied on physical and chemical techniques. Physical recycling techniques such as magnetic separation or density separations are easy, convenient, ecologically friendly, and energy efficient. They are thought to be more cost-effective in terms of recycling and separating metallic components than non-metallic ones. Brominated fire retardants are converted to monomers via chemical recycling techniques, which remove the metals that remain in the residue. Many studies are being conducted on chemical recycling methods, with an emphasis on the metallic portions.

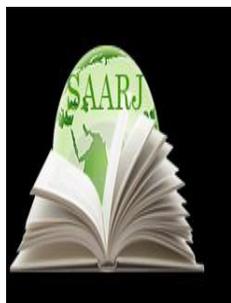

Despite lacking most of the necessary components to carry out an e-waste system, Egypt remains a viable market for e-waste recycling. Egypt has many organizational and technological challenges. Examples include a lack of recycling methods, a lack of cost recovery for e-waste services, a lack of strong laws, a lack of civic awareness, and a scarcity of suitable disposal locations. Existing recycling efforts in Egypt are still in their infancy and do not meet international environmental requirements. A poll regarding e-waste management activities is included in this assessment. It must be considered that, if the present pace of e-waste production in Egypt continues, there will be a massive hoard and the amount of discarded trash will significantly grow, as well as the noxious impact on people and the environment. To deal with this threat, the community and the government must work together. Everyone must accept responsibility, and the e-waste recycling system must be modernized with the participation and assistance of all sectors. Rigid regulations influencing e-waste management behavior should be examined.

ABSTRACT

*The onion (*Allium cepa* L.) is an important vegetable that has a high production, domestic, and international commerce. It is historically used as a food component in the Mediterranean diet. In the everyday diet, it is eaten raw, cooked, or processed into various onion products. When onions are added to certain meals, they produce a high concentration of bioactive chemicals that may have health benefits. One of the most widely researched advantages is its impact on cardiovascular disease, which includes hypocholesterolemic, hypolipidemic, anti-hypertensive, antithrombotic, and hypoglycemic actions. Onion consumption has also been shown to have antiproliferative effects in many cancer cell lines, to be involved in bone metabolism and behavior as a potential antidepressant agent, and to stimulate the growth of specific microorganisms in the colon (*Bifidobacteria* and *Lactobacilli*) with a general beneficial effect on health. Furthermore, the use of onion as an antibacterial, antioxidant, anti-inflammatory, and asthma-protective substance has been documented in folk medicine.*

KEYWORDS: Antibacterial, Cancer, Onion, Phytochemicals, Vegetable.

1. INTRODUCTION

Since ancient times, the onion (*Allium cepa* L.) has been regarded as a culinary and medicinal plant. It is the second most commonly grown vegetable bulb crop after tomato, and it is a vegetable bulb crop that is familiar to most cultures and eaten globally. It's a low-latitude horticulture crop with a short growing season. Due to its highly appreciated flavor, fragrance, and distinctive taste, as well as the therapeutic qualities of its flavor components, it is often referred to as "Queen of the Kitchen." Throughout the year, onions are used in curries, as spices, in salads, as a condiment, or cooked with other vegetables, such as boiled or baked. It's also utilized in a variety of processed foods, including as pickles, powder, paste, and flakes, and it has therapeutic properties[1]–[4]. The depiction of Onion is shown in Figure 1.

Figure 1: Illustrates the vegetable Onion[5].

It is typically eaten raw, but since fresh onion losses in storage have been estimated to be in the range of 20-30%, processed goods are the most practical option. As a result, the international market for onion is increasingly focusing on dehydrated products such as flakes, rings, granules, kibbles, powder, and frozen or canned onions, as well as onion in vinegar, brine, or as essential oil, despite the fact that its commercial products are less abundant than garlic's. Dehydrated foods have a significant economic value, not only because of their culinary applications, but also because of their medical qualities as nutraceuticals, since they contain greater quantities of beneficial chemicals than fresh foods.

1.1 Historical Aspects:

Humans have been eating onions since the Neolithic period, and they are still eaten all throughout the globe. There have always been individuals who enjoyed the usage of onions and utilized them in large amounts throughout this long time, but there have also been others who rejected and despised them. Onions have been grown for at least 5000 years in at least 175 nations across the world. The spherical bulb was considered as a symbol of the cosmos by ancient Egyptians. The name comes from the Latin word unus, which means "one," and the onion was brought to Britain by the Romans, from whence it may have spread to the Americas. The earliest written record of the onion is from 2600–2100 BC and comes from the Sumerians. We learn that leek had a significant part in the kingdom of Ancient Egypt in the Papyrus Ebers, which is based on ancient Egyptian texts and expertise[6]–[9].

a. Botany:

The genus *Allium* is extremely vast, with numerous wild edible species (only a tiny percentage is commercially grown), and it is widely spread across temperate zones in the northern hemisphere. The primary source of origin is thought to be Central Asia, with the Mediterranean areas serving as a secondary source. There are about 780 species in the genus *Allium*, with a wide range of physical characteristics. Onion's chromosomal number is 16 (2n).

1.2 Chemical Structure of Prominent Phytochemicals:

a. Saponin:

Saponins are a kind of amphipathic glycoside having foaming properties. One or more hydrophilic glycoside moieties are coupled with a lipophilic triterpene derivative in their structure. Polycyclic (C₂₇) aglycones (C₃₀) are linked to one or more sugar side chains, and the aglycone is either steroidal or triterpene. Figure 2 illustrates the chemical structure of Saponin.

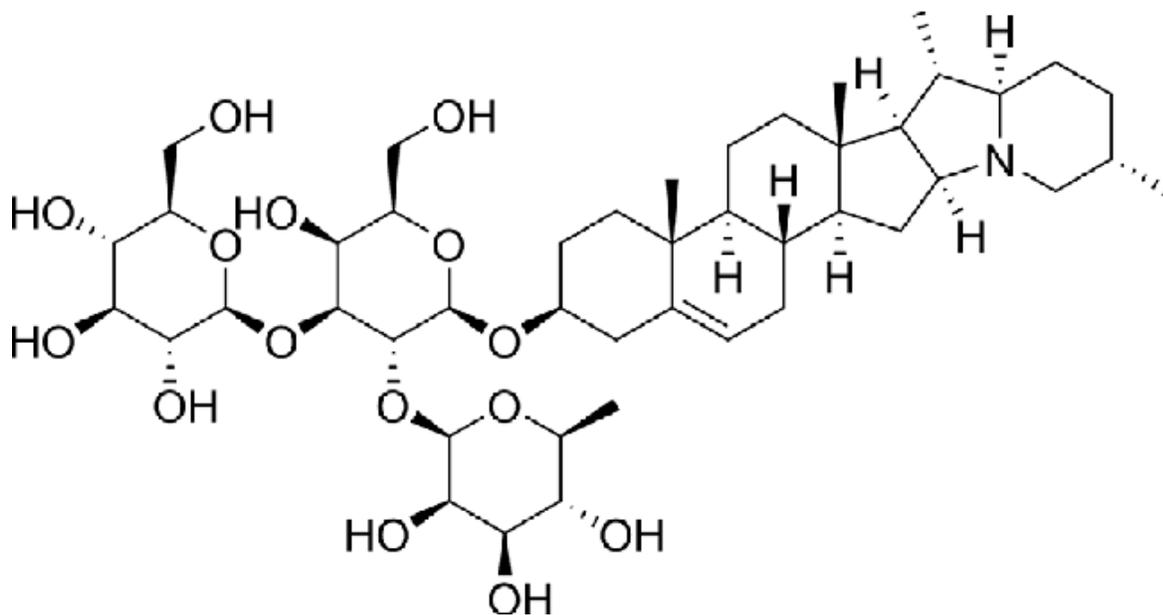

Figure 2: Illustrates the chemical structure of Saponin[10]

b. Quercetin:

Quercetin has five hydroxyl groups, which govern its biological activity and the number of derivatives it may produce. Glycosides and ethers are the two main types of quercetin derivatives found in onions. Only trace amounts of sulfate and prenyl substituents are detected.

c. Anthocyanin:

Organic molecules called anthocyanins are present in the epidermal layer of plant cells. They have a complicated structure that includes an aromatic three-ring molecular region with one or more sugar molecules attached. Anthocyanin is made up of a flavylumcation (2-phenylbenzopyrylium) that connects hydroxyl (–OH) and/or methoxyl (–OCH₃) to one or more sugars. The sugar-free anthocyanidinaglycones and the anthocyanin glycosides are split into the anthocyanins, which are mainly 3 glucosides of the anthocyanidins.

1.3 Properties and Biological Role of Onion Phytochemicals:

a. Properties:

Several studies have shown that alliums' biological and medicinal activities are mostly attributable to their high concentration of organosulfur compounds. The primary sulfur-containing constituents in whole onions and garlic are S alk(en)yl-L-cysteine sulfoxides (ACSOs), such as alliin, and -glutamylcysteines, which, in addition to serving as storage peptides, are biosynthetic intermediates for corresponding ACSOs; from these, and through different metabolic pathways in each vegetable, volatiles such as allicin, and lipid- Onions get their distinctive odor and taste from these chemicals, as well as the majority of their biological characteristics.

b. Biological Roles:

Onions not only provide taste to a dish, but they also contain phytochemicals that are good for your health. Onions include phytochemicals, which are natural substances that have the ability to improve human health and protect against a range of illnesses, including cancer. Antimicrobial, antiallergenic, anti-inflammatory, and antithrombotic properties are all found in organo sulfur compounds. In addition, flavonols found in onions, such as quercetin and kaempferol, have antiviral, antibacterial, anti-inflammatory, and anticancer properties, as well as heart and brain protection.

1.4 Antioxidant Activity:

Flavonoids have long been known to have anti-oxidant effects. It is onion flavonoids' most well-studied and documented action, which protects cells and tissues against reactive oxygen species (ROS). ROS produce free radicals, which cause exogenous damage to cells in many organs. Flavonoids, such as quercetin and kaempferol, have also been shown in vitro to stabilize free electrons produced by ROS. The hydroxyl configuration of flavonoids' B ring plays an important role in scavenging ROS by contributing hydrogen and an electron to hydroxyl and peroxy, stabilizing them. The flavonoid heterocycle causes a reaction between a free 3-OH and the aromatic rings, resulting in antioxidant activity. Furthermore, studies show that the quantity, location, frequency, and amount of sugar residues all have a role in antioxidant action.

1.5 Antibacterial Activity:

Flavonoids have been shown in many studies to have potent antibacterial effects. Their antibacterial inhibitory effect obstructs the formation of microbial enzymes, adhesins, transport proteins, and other proteins.

Quercetin is a flavonoid that has been researched extensively for its ability to suppress bacterial growth. It has showed tremendous promise in totally inhibiting the development of *Staphylococcus aureus*. Kaempferol has been proven in studies to be an inhibitor of *Helicobacter pylori*. Onion and garlic extracts have been shown to have bactericidal effects against *Streptococcus mutans*, *Strep tococussobrinus*, *Porphyromonas gingivalis*, and *Prevotellaintermedia* (Gram-positive bacteria), which are the bacteria that cause dental cavities and adult periodontitis, respectively. Onion, on the other hand, is ineffective against Gram-negative bacteria. Aside from organosulfur compounds, some quercetin oxidation products found

in onions have been shown to have antibacterial action against *H. pylori* and MRSA (multidrug resistant *S. aureus*).

1.6 Antiviral Activity:

Flavonoids have long been recognized to be effective against viruses, according to studies. Flavonoids have been shown by several scientists to have antiviral action, meaning they can suppress or destroy viruses. The blocking and destruction of viral protein and nucleic acids is the method for limiting viral proliferation.

1.7 Anticancer Activity:

Onion phytochemicals are important in the prevention of a variety of carcinogenic actions. Flavonoids have been shown in many studies to have a beneficial effect in cancer risk reduction. Flavonoids use a variety of mechanisms to prevent cancer, including cell cycle arrest, tyrosine kinase inhibition, p53 protein control, heat shock protein inhibition, and inhibiting Ras protein production (a class of cellular protein). Onion intake, according to Kumar and Pandey, lowers the risk of cancer in many organs, including the prostate, stomach, breast, and lungs. In a human phase I study, quercetin was evaluated as a tyrosine kinase inhibitory drug. Ovarian cancer, lung cancer, leukemia, bladder cancer, prostate cancer, breast cancer, and pancreatic cancer have all been linked to kaempferol.

1.8 Anti-inflammatory Activity:

Inflammation is a complicated biological reaction. Pathogen infection, chemical irritation, and damage to cells and tissues are all known to trigger it. Many animal models have been used to demonstrate the function of flavonoids in the prevention of inflammation, and quercetin and kaempferol have been shown to be effective anti-inflammatory drugs. In vitro, quercetin has been shown to block various isotypes of immunoglobulins such as IgM, IgG, and IgA, all of which are mitogen triggered.

1.9 Hepatoprotective Activity:

The term "hepatoprotective" simply refers to the ability to protect the liver from harm. The flavonoid's property in this respect has been well investigated. Quercetin supplementation has been found to protect mice's liver cells against iron excess hepatic damage. Hepatoprotective properties of anthocyanin have also been discovered. The anthocyanin cyanidin-3-O-glucoside (C3G) has been discovered to enhance hepatic Gclc expression for protein kinase A activation by raising cAMP levels, which aids in phosphorylation of the element binding protein for improved Gclc transcription.

1.10 Antihypertensive Effect:

A study of hypertension in rats found that quercetin and its methylated metabolite isorhamnetin, found in onions, can lower blood pressure and prevent angiotensin-II-induced endothelial dysfunction by inhibiting the overexpression of p47phox, a membrane NADPH oxidase regulatory subunit. The increased superoxide production resulted in a high nitric oxide level. Other studies in hypertensive rats using ethanolic extracts of onion and garlic found that oral administration of extracts on a normal salt diet or during a high salt diet had no effect on blood pressure.

1.11 Antiplatelet or Antithrombotic Effect:

In vitro, onion suppresses platelet aggregation, and many platelet inhibitors have been extracted and identified. According to studies on onion's antithrombotic properties, its aqueous extracts prevent the production of thromboxane, a powerful inducer of platelet aggregation. The antiplatelet action of onions is thought to be a characteristic of organosulfur compounds, according to many epidemiologic research. Antithrombotic action has been discovered in a family of -sulfinyl-disulfides (cepaenes) present in onion extracts.

2. DISCUSSION

The onion (*Allium cepa*) is a Central Asian native and one of the world's oldest cultivated plants, having been grown for almost 4000 years. Onions and other members of the genus *Allium* have long been used for a variety of functions, including food preparation and flavoring. The significance of onion stems from the flavor it gives to other meals as a result of its composition. When onions are added to certain meals, they produce a high concentration of bioactive chemicals that may have health benefits. One of the most widely researched advantages is its impact on cardiovascular disease, which includes hypocholesterolemic, hypolipidemic, anti-hypertensive, antithrombotic, and hypoglycemic actions. The significance of phytochemicals in the treatment of a variety of human diseases distinguishes the onion as a valuable commodity in the culinary and pharmaceutical industries. The creation of top cultivars with high phytochemical content is crucial for onions' future in the food sector.

3. CONCLUSION

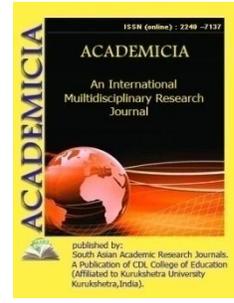

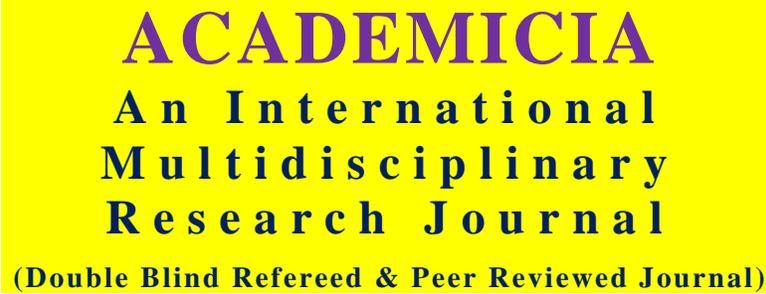

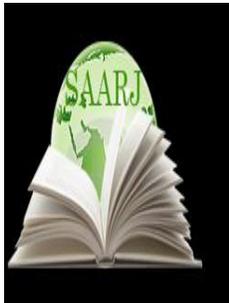

The onion is one of the most often used vegetables for improving the flavor and taste of a broad range of dishes throughout the globe. Aside from that, onion plays a significant function in salads when eaten raw because of the health advantages of direct phytochemical consumption in the raw form. The significance of phytochemicals in the treatment of a variety of human diseases distinguishes the onion as a valuable commodity in the culinary and pharmaceutical industries. The creation of top cultivars with high phytochemical content is crucial for onions' future in the food sector. More study is needed at every step of production, from the farmer's field to the processing facility, and appropriate methods must be created to maintain the beneficial phytochemicals for human health.

By establishing a quality-based technique for processing raw onions, phytochemicals in onions may be maintained. There is a dearth of scientific data on the effects of postharvest processing techniques on the phytochemicals found in onions. More study is also required on the effect of preharvest techniques on phytochemical development, which has yet to be fully investigated.

THE EMERGENCE OF THE LIBERATION MOVEMENT IN KASHKADARYA

Ravshanova Gulora Poyonovna*

*Independent Researcher at Karshi SU,
UZBEKISTAN

ABSTRACT

The article describes the rise of the anti-Soviet movement in the Kashkadarya oasis to the level of a national liberation struggle. An analysis of the data also shows the courageous leaders who led the struggle as the ideological leader of the volunteers during the uprising, who took an active part in the uprising and led the special rebel groups against the Red Army.

INTRODUCTION

The Soviets, who occupied the main part of Turkestan, focused on the conquest of the Bukhara Khanate. In November 1919, the Central Committee of the Russian Communist (b) Party, the Central Executive Committee of the All-Union, and the Turkestan Affairs Commission of the Council of People's Commissars of the RSFSR set out to carry out a "people's revolution" in the Bukhara Khanate. The commission included VV Kuybishev, MV Frunze, Sh.Z. Eliava, Ya.E. Rudzutak from Komfirka and Soviet leaders.

The Turkic Commission was given the historic task of "turning Turkestan into a model republic in the Soviet East, of fraternal support for the liberation struggle of the oppressed peoples of Bukhara and Khiva against the Emir and Khan, as well as the British imperialists seeking to colonize the country." [1].

The Bukhara Khanate, according to Soviet dictators, was the backbone of the anti-revolutionary movement in Central Asia at that time. For this reason, the Tukkomissiya focused primarily on Bukhara. The Soviets were terrified of British intervention at the time.

The negotiations of the Turkic Commission with Amir Sayyid Alimkhan on January 7 and March 30, 1920 showed that the khanate and the Soviets could not establish close relations. The

Amir was well aware of the Soviets' original goal of occupying all of Turkestan, which was delayed by Bukhara and Khiva due to the fact that the khanates were favored by Britain, Turkey, and Iran.

Amir Alimkhan's goal was to increase the army and strengthen the defense. The news that Khiva had fallen into the hands of the Soviets made him think hard and hasten to take emergency measures. Now Bukhara was the only khanate that had not been occupied by the Soviets, and the only throne that had not been occupied by him. Over the next three years (1917–1920), the ranks of the army were steadily increased, and the number of rifles purchased from the British reached tens of thousands. The calculation made on July 12, 1920, shows that the Emir had 13,220 cavalry and 12,000 infantry. In the principalities of the khanate, such as Karshi, Shakhrisabz, Kitab, Chorjoi, Termez, Sherabad, Dushanbe, 70,000 volunteers were assigned to military operations. Arming volunteers was a difficult task. Although Amir Alimkhan hoped for foreign help in this regard, he could not believe that the promises would be fulfilled.

The Turkestan delegation of the All-Union Central Executive Committee of the Soviets and the Council of People's Commissars of the RSFSR met in Tashkent to consider the conquest of Bukhara, and Petrograd was very upset by the prolonged occupation. In a telegram to VI Lenin on August 1, 1920, M. Frunze attributed the reason for the delay to the fact that the internal revolutionary situation in Bukhara was being slowed down "due to political instability and factors." Although the telegrams say that "the people are dissatisfied with the regime of the Emir," the public in Bukhara is full of red phrases such as the political disenfranchisement of M. Frunze, the low level of revolutionary consciousness. The Soviet intended to destroy the Bukhara Khanate under the banner of an "internal revolutionary explosion[2]."

The commander of the Turkestan Front, M. Frunze, wrote on July 30, 1920: The Revolutionary Council of our Front has decided to resolve the issue in the near future.

The commander had made a plan to invade the khanate. Three or four days before the attack on the capital Bukhara, on August 28, 1920, a surprise attack was planned on Kitab, Shakhrisabz and Karshi, which were strongholds. This military policy was intended to distract the emir from the defense of the capital.

The Revolutionary Committee intensified its propaganda in many parts of the khanate, turning over dissidents and secretly arming them. The young people of Bukhara allied with the Soviet and began to actively assist them in this work. The Amir's danger was from them.

No matter how much the young people of Bukhara urged them to start an armed uprising, the Shura allegedly rejected their speeches and planned to gain time, to gather strength to occupy the main bases of the emirate. Preparations after Kolesov's defeat in March 1918 thus ended in late August 1920. It is impossible to say that Amir Sayyid Alimkhan was not aware of these actions. He expected the threat of the Soviet attack from Samarkand to the Kashka oasis, Kitab, Shakhrisabz and Karshi. For this reason, the defense forces will be strengthened in the Black Wood Pass, the number of snipers and soldiers will be increased.

In the villages, there are rumors that "if we overthrow the Emir, his lands, treasures, property, all the land and wealth of the rich and officials will be given to the poor, landless, land tax, tribute tax, all taxes will be completely banned" [1,2].

On August 28, 1920, the 1st Turkestan Cavalry Division launched an attack on the Takhta Karacha Pass. After the capture of Kitab and Shahrisabz by the Soviet cavalry division, Yakkabog, Chirakchi and Karshi were captured one after another.

When the regional center Karshi was captured by the Reds, the entire military force was thrown into Bukhara. The Soviet Union focused on the overthrow of Amir Sayyid Alimkhan and the capture of the khanate's capital.

The conquest of the Qashqa oasis, the economic and military base of the khanate, dashed the trust and hopes of Amir Sayyid Alimkhan. After that, in spite of the unprecedented preparations for the defense of Bukhara, Amir Sayyid Alimkhan held a secret meeting with a few of his relatives and accepted the offer to leave Bukhara.

September 2 was a dark morning in Bukhara. By order of M. Frunze, the planes ruthlessly bombed the ancient city, the Emir's residence Ark, mosques and madrasas, bazaars - crowded places. On September 2, 1920, Bukhara, the last khanate capital in Turkestan, fell to the Soviets. The Soviets were thus able to take control of the territories of the three khanates.

One or two days before the attack on Bukhara, Amir Sayyid Alimkhan and his relatives, the most loyal, the most reliable people, officials, and soldiers were stationed in Karshi, in the summer residence of the mayor of the city Togaybek in Haramsaray. Although Karshi was occupied by the Reds two or three days ago, its control was not established, and the main military forces were involved in the invasion of Bukhara. The temporary situation did not allow the emir, who had fled Bukhara, to stay in Karshi for a few days. Many famous rich people, dodhos and karavulbegs from places like Kitab, Shahrisabz, Yakkabog, Chirakchi, Dehkanbod remain unaware. They were given the command of the Emir[3].

The last meeting of Amir Sayyid Alimkhan in Karshi was attended by beys, commanders, rich people, priests, eshans and mullahs, who were loyal to the throne, and only those who were considered the most necessary.

In early September 1920, at a meeting held immediately after the fall of Bukhara to the Soviets, Amir Sayyid Alimkhan expressed his confidence in victory and his far-sightedness.

Epifanov, the head of the investigation department of the Main Political Department, wrote about the "counter-revolutionary organization": "Citizens: 1. Mulla Navruz Pulatov. 2. Erka amin Dustmurodov. 3. Maxmaraimbek Abdusattorov. 4. Abdurasulqulbek Abdusattorov. 5. Mullo Tojiddin Salimov. 6. Khojanazar Inotullaev. 7. Khoja Abdulaziz Mullo Bokihojaev. 8. A Review of the Criminal Activity of Mullo Nemat Shodmonov" provides valuable insights into the history of the period from the escape of Amir Sayyid Alimkhan to the spring of 1926. [3]

The General Political Directorate (GPU) has been following in the footsteps of the "counter-revolutionary organization" since the establishment of the Soviet regime in Kashkadarya. In the 20s and 21s, when the Soviets were still relatively small, it was impossible to take drastic measures against the enemies of the revolution. For this reason, there were temporary concessions to certain aspects of the amir's regime, to the beys and officials. The BSB, as a detective, a murderer, a punitive body, did not ignore even small resistance movements [4].

The loyal revelations of the emirate were threatened by a growing revolution in the East. The current of revolution turned all its intensity towards the oppressors and washed away the old

beliefs. Mirza Navruz Pulatov, Erka Amin Dustmurodov, Muhammad Rahim Abdusattorov, Abdurasulkulbek Abdusattorov, Mullo Tojiddin Salimov, Khojanazar Inotullaev, Khoji Abdulaziz Mullo Bokihojaev and Mullo Nemat Shogimov (now Mullo Nemat Shogmonov) and the Karshi Agoligi Nuriddinkhoja (shot for his counter-revolutionary activities) to form a "counter-revolutionary organization" in Karshi. The number of members of the "counter-revolutionary organization" has reached 70. This organization has set itself the task of ending the revolutionary movement of the "Young Bukhara". When the Emir fell from the throne in Bukhara, the organization set the sole goal of overthrowing the Soviet government and launched a campaign to bring back the Emir who had fled to Afghanistan.

After the fall of the Emirate in Bukhara, the Emir fled to Karshi, a city now known as Behbudi. Amir was warmly welcomed by members of the Counter-Revolutionary Organization. With the help of the Emir, the Europeans living in Karshi at that time were forced to exterminate on the basis of national liberation. As a result, about 800 Europeans were killed, and neither women nor children were left out of the bloody revenge.

In connection with the arrival of the Red Army in the city of Karshi, the "Counter-Revolutionary Organization" is constantly propagandizing an armed uprising among the population. The armed uprising was supposed to take place against the Soviet government and the Red Army. The "counter-revolutionary organization" uses the factor of the population to achieve its goal [4].

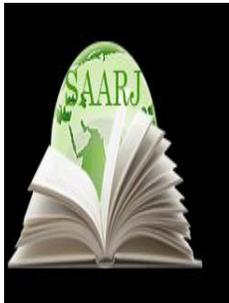

The above-named people are at the forefront of the struggle as the ideological leader of the volunteers during the uprising, actively participating in the uprising, and even fighting the Red Army by leading separate rebel groups.

The first action of the rebels, led by Muhammad Rahimbek and Khojanazar Inotullaev, was to demolish the Karshi railway station. Railway goods are looted, workers and railway workers are arrested, beaten and shot [5].

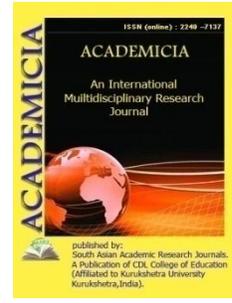

The study of the history of the establishment of the Soviet dictatorship in Uzbekistan in the 1920s makes an invaluable contribution to the practical understanding of the value of such sacred concepts as the independence of the Motherland, the freedom of the people.

ABSTRACT

*This article provides information on the role of physical and physiological properties of grains and cereals, the effects of microorganisms and pests, as well as storage regimes. The body length of the beetle is 2.5-3.5 mm. The whiskers of male beetles are comb-shaped, with 8-10 joints with long growths, and the whiskers of females are rosary. The presence of a moldy and pungent odor on the grain mass indicates the development of storage fungi. The main role here belongs to the fungus *Penicillium*. The initial stage of development of microorganisms is insignificant from the outside. this condition can be clearly determined by observing the dynamics of the microflora of the grain mass, because at this time there are still no signs of spoilage in the grain.*

KEYWORDS: *Lentils, Entomology, Rosary, Penicillium, Ball Beetle.*

INTRODUCTION

In addition to microorganisms, there are visible and invisible living organisms in the grain mass that are called pests. the main pests settle on the grain before and after harvest, and then begin to live in the same conditions as the grain.

Pests include more than a million different insects in the insect class. The science that studies insects is called entomology. Of these, only one describes the beetle's habitat, survival and control measures.

Chinese grain beetle (*Callosobruchus chinensis* L.). Damage. the Chinese grain beetle, like the bean beetle, harms beans, peas, and cowpeas, lentils. Spread. Afghanistan, India, Indonesia, the Far East, Southern, Central and Eastern Europe, Central and South Africa, Mauritius, Bermuda, the West Indies and Hawaii.

Definition The body of the beetle is short oval; reddish-brown, with black and light spots of short feathers streaked along the wings. The base of the front of the back is wider than the tip. The next leg has teeth on the inside. The body length of the beetle is 2.5-3.5 mm. The whiskers of male beetles are comb-shaped, with 8-10 joints with long growths, and the whiskers of females are rosary. These signs make it easier to identify males and females. the larvae and fungi are very similar to the larvae and fungi of the bean beetle.

Living life. This beetle, like the bean beetle, infects the grains of plants that fall on it in the fields and in the barns after harvest. Elsewhere, it spreads mainly with grains. lays its eggs on the surface of beans in the fields and on grain or grain bags in warehouses, while the female beetle lays an average of 60 eggs. Eggs develop on average 8 days, larvae 17 days and fungi 7 days. under different conditions, the full development of this pest takes 18-60 days. Several larvae can mature in a single grain of bean. This pest gives several joints per year. It develops without hibernation when the temperature is high enough.

Control measures. Measures will be taken to control the bean beetle. *Callosobruchus quadrimacutatus* F. Damage. This beetle infects peas, soybeans, beans and peas. The grain is damaged just like beans and Chinese beetles. spread Occurs in India, Turkey, Greece, Belgium, Algeria, Central Africa, the United States and Australia. Definition. The body of the beetle is elongated oval. the front of the back widens further backwards, with two grooves on either side of the back edge; there will be one large thorn on the inside of the next number. the main color of the beetle is brown, there are one dark spot near and in the middle of the tip of the wing, sometimes these spots are not clearly visible or not at all. The length of the beetle is 3.5-5 mm. the larvae and fungi are very similar to the larvae and fungi of the bean beetle. Living life. Basically, it's like a Chinese grain beetle. It is most often spread by damaged grains. develops in the grains of the above plants grown in the field and stored in warehouses.

Females lay up to 100 eggs. When the conditions are right, the eggs develop in 4-5 days and the larvae in 17-22 days, the full development period lasts up to 30-38 days. gives 3 joints per year.

Control measures. Measures will be taken to control bean and Chinese grain beetles. Egyptian pea beetle (*Brachidius incarnatus* Boh.).

Damage. This beetle, like other grain beetles, causes damage to peas, lentils and pea grains. Spread. Occurs in North Africa, Spain, Portugal, Southern France.

Definition The body of the beetle is short, oval, reddish-brown in color, with a slightly darker part near the base of its wings; on the wings there are elongated, sometimes bumpy spots of yellow short feathers. The pygmies are gray and covered with brown spots. the thighs of the next leg are very thick and have sharp teeth. The length of the beetle is 5-3.5 mm. The larvae and fungi are very similar to the larvae and fungi of the bean beetle.

Living life. In general, they live like Chinese and four-toed beetles. control measures. Effects of microorganisms on the grain mass of bean beetles.

The amount of dry matter loss in the grain and the degree of deterioration of grain quality depends on the conditions of development of microorganisms and their active life.

Microorganisms affect the grain mass as follows:

1. The purity of the grain batch is disturbed (color, smell, taste deteriorate);
2. Decreased seed-bearing properties of grain;
3. Grain mass exhibits toxicity;
4. The temperature of the grain mass rises as a result of the activity of microorganisms;
5. The dry matter in the grain begins to disappear.

The initial stage of development of microorganisms is insignificant from the outside. This condition can be clearly determined by observing the dynamics of the microflora of the grain mass, because at this time there are still no signs of spoilage in the grain. The danger of this stage is that when bacteria and fungi find an opportunity for their active development, they cause spontaneous heating or suffocation and putrefaction in the grain mass. Therefore, the active growth of microorganisms in the grain mass cannot be allowed. This is done by timely processing of the grain mass.

Changes in grain freshness under the influence of microorganisms

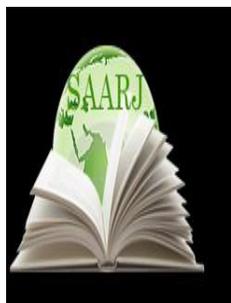

The color, gloss, odor, taste of grain are important indicators of freshness. Grains ripened and harvested under normal conditions should be stored in the same condition as grains of this type or variety.

As the vital activity of microorganisms increases, changes in grain viability are observed in the following sequence: the grain becomes dull, spotted and darkened grains begin to appear, in some grains colonies of fungi and bacteria are formed, much of the grain darkens, broken grains appear. The color of the grain mass darkens, the elasticity disappears, and the final stage of spontaneous heating begins. The presence of a distinct odor from the grain mass during storage indicates the development of each microorganism. The presence of a moldy and pungent odor on the grain mass indicates the development of storage fungi. The main role here belongs to the fungus *Penicillium*. The complex of substances in the grain mass and the substances released from the fungus give it a pungent odor and unpleasant taste. And it is swallowed by the grain. Not all frosts are completely removed when measures are taken to remove them. This odor is transmitted to it and to other grain products.

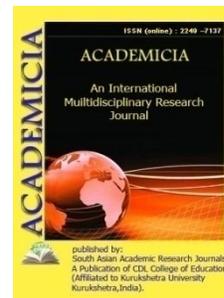

In addition to the stench of grain storage, there are odors of rot, barn and mite, the occurrence of which is associated with the vital activity of each microorganism. The development of yeasts causes the appearance of a warehouse odor in the grain mass.

ABSTRACT

Continuous usage of fossil fuels (non-renewable natural resources) is rapidly diminishing, and their combustion is causing an increase in carbon dioxide in the atmosphere. For environmental and economic sustainability, renewable carbon-neutral transportation fuels are needed. Biodiesel made from oil crops has the potential to be a carbon-neutral sustainable alternative to petroleum-based fuels. It is mainly generated via direct usage and mixing, microemulsions, thermal cracking (pyrolysis), and transesterification, and is made up of monoalkyl esters of long-chain fatty acids. Transesterification of vegetable oils and animal fats is the most prevalent technique for producing biodiesel. Batch procedures, supercritical processes, ultrasonic techniques, and microwave methods are all accessible for the transesterification reaction. Water content of oils or fats and free fatty acids, molar ratio of glycerides to alcohol, catalysts, reaction duration, and reaction temperature are all variables that affect the transesterification process. The significance, history, characteristics, suppliers, and methods for producing biodiesel are discussed in this study.

KEYWORDS: *Alternate Fuel, Biodiesel, Renewable, Transesterification, Vegetative Oil.*

1. INTRODUCTION

Petroleum consumption has been steadily rising as a result of industrialisation and modernisation. Energy consumption has increased as a result of economic growth. Fossil fuels such as petroleum, coal, and natural gas provide the energy required to meet demand. According to the International Energy Agency (IEA) and Shahid and Jamal, the world will need 50% more energy in 2030 than it does now, with China and India accounting for half of it. Climate change is now the world's most significant environmental issue. Nearly one million species may go

extinct if global temperatures rise by more than 2°C, and hundreds of millions of humans could perish. Between 2007 and 2020, approximately 4.1 billion metric tons of CO₂ are expected to be emitted into the atmosphere. From 2020 to 2035, an additional 8.6 billion tons CO₂ is projected to be emitted into the atmosphere[1]–[4].

The high viscosity, low volatility, and polyunsaturated nature of triglycerides cause problems when they are substituted for diesel fuels. Pyrolysis, microemulsification, and transesterification are three major methods that have been explored in an effort to overcome these limitations and enable vegetable oils and oil wastes to be used as a viable alternative fuel. Transesterification is the most frequent and generally recognized of these.

The transesterification reaction is the chemical process through which biodiesel is made. Triacylglycerols react with short-chain monohydric alcohols at high temperatures in the presence of a suitable catalyst (alkali, acid, or enzyme) to produce fatty acid alkyl esters (FAAE) and glycerol. Transesterification is the most straightforward and cost-effective method of producing biodiesel[5].

1.1 History of Biodiesel:

The diesel (compression ignition) engine was developed by Rudolf Diesel to operate on a variety of fuels, including coal dust suspended in water, heavy mineral oil, and vegetable oil. Diesel's early engine attempts were a complete disaster. He demonstrated his engine, which ran entirely on peanut oil, at the World Exhibition in Paris in 1900. 'The diesel engine can be fueled with vegetable oils and would assist greatly in the growth of agriculture in the nations that utilize it,' Diesel claimed in 1911. 'The use of vegetable oils for engine fuels may seem trivial nowadays,' Diesel wrote in 1912. However, such oils may become as significant in the future as petroleum and coal tar products are now.' Diesel passed away in 1913. Later, his engine was adapted to operate on the toxic petroleum fuel known today as "diesel." Nonetheless, his agricultural ideas and innovation laid the groundwork for a civilization powered by clean, renewable, locally produced fuel. Vegetable oils were utilized to substitute diesel fuel in emergency circumstances. Biofuels are becoming more popular as a result of their renewable nature and ability to reduce pollution[6], [7].

1.2 Source of Biodiesel:

Vegetable oil, waste cooking oil, and animal fats may all be used to make biodiesel. Algae, microalgae, and fungus may all be used to make biodiesel. However, the majority of research has focused on oil-producing plants. The selection of feedstock is the initial stage. More than 350 oil-bearing crops have been identified as possible biodiesel sources throughout the world. The most frequently utilized feedstocks for biodiesel manufacturing. The availability of a diverse variety of feedstocks is the most significant element in biodiesel manufacturing. Low manufacturing costs and large-scale production are two major criteria for the feedstock. Geographical locations, climate circumstances, local soil texture and conditions, and agricultural methods all influence the availability and output of biodiesel feedstock. There are four types of biodiesel feedstocks:

- Vegetable oils that is edible, such as rapeseed, soybean, peanut, sunflower, palm, and coconut.
- Vegetable oils that is not edible, such as jatropha, karanja, sea mango, algae, and halophytes.

- Oil that has been used before or that has been recycled.
- Beef tallow, yellow grease, chicken fat, and by-products from fish oils are examples of animal fats.

1.3 Biodiesel production technologies:

The extraction of oil is the second stage in the biodiesel manufacturing process. The oil contained in the seeds is removed during the oil extraction process. The primary result of this process is crude oil, with seeds or kernel cakes as significant by-products. The oil may be extracted using one of three methods:

- Enzymatic extraction.
- Solvent extraction.
- Mechanical extraction.

The most common technique (using mechanical expellers or presses) is the mechanical method. Whole seeds, kernels, or a combination of both are utilized in this technique, although whole seeds are the most frequent choice. Oil extraction yields are 68–80 percent using the mechanical technique. The chemical extraction technique uses just kernels as a feedstock. A liquid solvent is used to extract the oil from the seed in the solvent extraction technique. The pace of oil extraction is influenced by a number of variables (such as particle size, type of liquid chosen, temperature and agitation of the solvent). The solvent approach is used in three methods for oil extraction:

- Ultrasonication technique
- Soxhlet extraction.
- Hot water extraction.

1.4 Direct use and Blending:

It was proposed in 1980 that vegetal oil might be utilized as a fuel. The idea of utilizing edible oil as a fuel implies that petroleum will be used in lieu of vegetable oil and alcohol as alternatives, and that renewable energy must be used to replace non-renewable resources. Sunflower oil was investigated by academics in South Africa (during an oil embargo). In Caterpillar, Brazil, in 1980, pre-combustion chamber engines were run using a 10% vegetable oil mixture to sustain complete power without any changes or adjustments to the engine. At the time, replacing 100% vegetable oil for diesel fuel was not feasible, but a mix of 20% vegetable oil and 80% diesel fuel was feasible and effective. In certain short-term tests, a 50/50 mix of vegetal oil and diesel was utilized[5], [8].

1.5 Pyrolysis:

Thermal cracking is another name for pyrolysis. Pyrolysis is a chemical transformation caused by the application of heat energy in the absence of air or nitrogen in the presence of a catalyst. Vegetable oils, animal fats, natural fatty acids, and methyl esters of fatty acids may all be used as substrates for the pyrolysis process of producing biodiesel. The pyrolysis of triglycerides to produce biodiesel has been shown to be acceptable for diesel engines. The liquid portions of temperature-based vegetable oil conversion are expected to resemble diesel fuels. Alkanes,

alkenes, alkadienes, aromatics, and carboxylic acids are produced during this kind of triglyceride breakdown. The pyrolyzate was shown to have lower viscosity, flash point, and pour point than petroleum diesel fuel while having similar calorific values.

1.6 Catalytic transesterification:

Alkali, acid, enzyme, and heterogeneous catalysts are used in the transesterification of triglycerides. Sodium hydroxide, sodium methoxide, potassium hydroxide, and potassium methoxide are more effective alkali catalysts. Sulfuric, hydrochloric, and sulfuric acids are the most often used acid catalysts. Heterogeneous catalysts may also be used to produce biodiesel. Enzymes, titanium-silicates, alkaline-earth metal complexes, anion exchange resins, and guanidines heterogenized on organic polymers are examples of heterogeneous catalysts. The catalytic transesterification of vegetable oils/animal fats with methanol is a crucial industrial process in the production of biodiesel. This process, also known as methanolysis, has been extensively researched and established utilizing acids or alkalis as catalysts, such as sulfuric acid or sodium hydroxide. For long-chain alcohols, however, these catalytic systems are less active or totally inert. Sodium or potassium hydroxide, or sodium or potassium methoxide, are often used as catalysts since they are comparatively less costly and very active for this process.

1.7 Enzyme-catalysed transesterification:

Enzymes may also catalyze transesterification. Lipase is the most often utilized enzyme for transesterification. Lipase from *Candida antarctica*, *Candida rugosa*, *Pseudomonas cepacia*, immobilized lipase (Lipozyme RMIM), *Pseudomonas* sp., and *Rhizomucormiehei* has been described. Using a commercially available immobilized lipase, the enzymatic transesterification of soy bean oil with methanol and ethanol was studied (Lipozyme RMIM). The greatest results were obtained in a solvent-free system with a 3.0 ethanol/oil molar ratio, a temperature of 50°C, and a 7.0 percent (w/w) enzyme concentration. They got a 60% yield and it took 1 hour to complete the reaction. Using *P. cepacia* lipase immobilized enzyme on celite material at 50°C in the presence of 4–5 percent (w/w) water for 8 hours, Shah and Gupta achieved a 98 percent yield. The transesterification process in the enzyme-catalyzed system takes longer than the other two catalytic ways of transesterification. Extracellular and intracellular lipases may efficiently catalyze the transesterification of triglycerides in both aqueous and non-aqueous environments. Using alkali or acid-catalyzed transesterification, enzyme-catalyzed transesterification may solve the issues described above.

1.8 Catalyst effect:

Alkali, acid, or enzyme catalysts are employed in the transesterification of triglycerides. The most common commercially utilized transesterification is alkali-catalyzed transesterification, which is considerably quicker than acid-catalyzed transesterification. The most efficient catalysts were determined to be Na, NaOH, and KOH in that research. The authors used ultrasonic energy to examine the impact of various catalyst concentrations on base catalyzed transesterification during biodiesel synthesis from vegetable oil. When the catalyst was employed at a low concentration, such as 0.5 percent wt/wt of oil, the highest yields of ester were achieved. At greater reaction temperatures, hydrochloric acid outperforms sodium hydroxide, according to the findings of several researches[9].

1.9 The effect of temperature and time:

Depending on the kind of vegetable oil or fat used, transesterification may occur at various temperatures. At room temperature, there are few reports on the transesterification process. The reaction of palm oil transesterification with methanol (6:1) and 1% KOH was studied at various temperatures. Ester yields at 50 and 65 degrees Celsius were 73 and 82 percent after 4 minutes, respectively. At 40–70°C, the impact of reaction temperature on propyl oleate synthesis was investigated using free immobilized *P. fluorescens* lipase. At 60°C, the conversion ratio to propyl oleate was greatest, but at 70°C, the activity reduced.

1.10 Properties and qualities of biodiesel:

Physicochemical characteristics are used to characterize the qualities or quality of biodiesel. CN, caloric value (MJ/kg), density (kg/m³), viscosity (mm² / s), cloud and pour points (°C), flash point (°C), acid value (mg KOH/g-oil), ash content (%), water content and sediment, copper corrosion, distillation range, carbon residue, sulphur content, glycerine presence (percent m/m), phosphorus (mg/kg), and oxidation. The chemical and physical characteristics of biodiesel are determined by the kind of raw material used and the fatty acid content.

1.11 Viscosity:

The ability of a fuel to flow is described by its viscosity. This property is essential in the functioning of fuel injection equipment and spray atomization, especially at low temperatures when the fuel's fluidity is affected by the rise in viscosity[10].

1.12 Fuel density and relative density:

The density of a fuel is defined by its weight per unit volume. Oils have a higher energy density and are thus denser. Biodiesel density may be determined using the EN ISO 3675/12 185 and ASTM D1298 standards. Density should be evaluated using this reference standard at a temperature of 15 or 20°C. The density of the fuel in comparison to the density of water is known as relative density. Biodiesel's relative density is used to convert mass to volume, compute flow and viscosity characteristics, and evaluate the homogeneity of biodiesel tanks.

1.13 Flash point:

When exposed to a flame, the flash point of a fuel is the temperature at which it will ignite. Fuel volatility is inversely proportional to its flash point. Biodiesel has a higher flash point than petroleum diesel, making it safe to carry, handle, and store.

1.14 Titre:

Titre is the temperature at which solidified oil transforms into liquid oil. Because the transesterification process for biodiesel production is essentially a liquid process, oils with high titre may need heating, increasing energy requirements and production costs for a biodiesel plant.

1.15 Free Glycerin:

The quantity of glycerol left in the final biodiesel is referred to as free glycerol. The quantity of free glycerol in biodiesel is determined by the manufacturing method.

1.16 Ash of Sulphate:

The quantity of inorganic impurities in the fuel, such as abrasive particulates, catalyst residue, and soluble metal soaps, is referred to as ash content. To measure the proportion of sulphated ash present, the bio diesel is ignited and burnt, then treated with sulphuric acid. The ASTM D874 standard specifies that the samples may include no more than 0.02 percent sulphated ash.

2. DISCUSSION

Biodiesel is a biodegradable, renewable fuel made in the United States from vegetable oils, animal fats, or restaurant grease. Biodiesel is a liquid fuel that is often referred to as B100 or "neat" biodiesel. Biodiesel, like petroleum diesel, is used to power compression-ignition engines. Biodiesel is a resource that has a lot of potential. Esterification and transesterification are the two most important processes in biodiesel synthesis. The kind of feedstock oil, reaction circumstances, catalyst employed, and alcohol to oil molar ratio all have an impact on these reactions. Biodiesel produced from rapeseed oil and ethanols made from maize were formerly thought to be the pinnacle of future low-carbon transportation. Biofuels may account for 27% of worldwide transportation fuels by 2050, according to the International Energy Agency. By 2030, transportation fuels must achieve a 14 percent reduction. Biodiesel has a bright future since it is the perfect fuel for future generations.

3. CONCLUSION

Energy is a key need for sustaining economic development and maintaining human growth index norms. After the industrial sector, transportation is the second most energy-intensive sector, accounting for 30% of total supplied energy. Oil accounts for almost all fossil fuel energy use in the transportation industry (97.6 %). However, the anticipated depletion of fossil fuels, as well as the environmental issues connected with their use, has prompted many academics to look into alternate fuels. Biodiesel is a resource that has a lot of potential. Esterification and transesterification are the two most important processes in biodiesel synthesis. The kind of feedstock oil, reaction circumstances, catalyst employed, and alcohol to oil molar ratio all have an impact on these reactions.

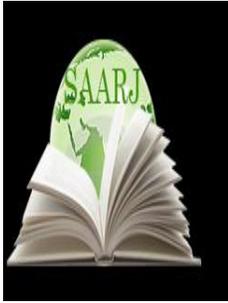

Another method to save manufacturing costs is to recover glycerol. The biodiesel glycerol is more concentrated since water is present in the system. Physicochemical characteristics such as CN, density, viscosity, cloud and pour points, flash point, acid value, copper corrosion, glycerine, and oxidation stability define biodiesel.

ABSTRACT

With the many manifestations of climate change and the ever-increasing need for energy, energy sustainability and environmental preservation have become global issues. Electricity consumption increases as cities and countries become more technologically sophisticated, reaching levels that may be unmanageable if left unchecked. The Smart Grid is a solution to the transition to more environmentally friendly technologies like distributed generation and microgrids. It is critical that the general public be aware of the issue, as well as prospective researchers and policymakers. This article provides an overview of the Smart Grid, including its basic characteristics, functions, and features. It explains the fundamentals of Smart Grid technology and how they connect to other technologies, as well as research efforts, difficulties, and concerns. It shows how these technologies created the current electrical grid and how it has continued to develop and enhance its role in better matching energy demand and supply. Smart Grid deployment and practices are also revealed in different places. Smart Grid efforts in different countries are aided by concrete energy legislation. Surprisingly, Smart Grid practices in various areas don't seem to suggest rivalry, but rather a cross-regional community with comparable goals and lessons to learn.

KEYWORDS: *Communication, Control, Network, Security, Smart Grid.*

1. INTRODUCTION

Smart Grids aren't something that just happened. They arose from a desire to upgrade the electrical system, make it more environmentally friendly, and enhance power distribution. Utility companies may utilize existing infrastructure instead of building new power plants and substations since Smart Grids are more autonomous and improve the efficacy and efficiency of electricity supply. Smart Grids enable renewable energy resources to be securely connected into the grid to augment the power supply with electricity generated and stored by consumers[1]–[3].

The goal of this article is to provide a high-level overview of the Smart Grid, including its features, functions, and characteristics. Its goal is to show how Smart System technologies have influenced today's energy grid. It looks at policies, pilots, and projects from around the world to see how far Smart Grid technology has advanced. It will also look for research activity, trends, problems, and opportunities. The more people who are aware of the Smart Grid, the better they will comprehend its importance, and the more willing they will be to make any necessary sacrifices. More information on Smart Grid achievements and problems promotes active involvement in efforts to enhance their capabilities and mitigate their drawbacks[4].

1.1 Smart grid:

A grid is a network of electrical wires that transmit energy to specific locations; smart denotes intelligence, neatness, trimness, style, or automation. One may get a sense of what the Smart Grid is like in certain ways. The term "smart grid" has no universally agreed-upon definition. It can be explained in both simple and complex ways. It was once merely a dream and a concept, but it is now one of the most widely discussed topics in modern electrical systems. Simply stated, a Smart Grid is a network that is aware of its surroundings. Electric electricity can only be transmitted or distributed via the conventional grid. This contemporary grid is capable of storing information, communicating with one another, and making choices. The Smart Grid replaces today's grid with one that is more cooperative, responsive, and organic[5]–[8].

1.2 Infrastructure:

A Smart Grid system's infrastructure and design are always in relation to predetermined goals and capabilities. The grid's resilience, self-healing capabilities, and integrability may all be improved by implementing a Smart Grid. The National Institute of Standards and Technology (NIST) has developed a conceptual model to aid in the design, specification, documentation, and organization of the Smart Grid's linked networks and equipment. Smart Grid actors and applications are divided into seven domains (with subdomains) by NIST. Furthermore, it classifies as actors devices (such as smart meters and solar energy generators), systems (such as control systems), programs, and stakeholders that make decisions and exchange information required for performing applications; applications are defined as tasks carried out by one or more actors within a domain (such as home automation, solar energy generation and energy storage and energy management). Actors with comparable goals are found in the same domain.

1.3 Smart Grid functionalities:

The Smart Grid proposes solutions and responses to the problem of insufficient electricity supply. The Energy Independence and Security Act (EISA) of 2007 lays the groundwork for grid modernisation. The following features of the Smart Grid are listed in the section:

1.4 Reliability, Security, and Efficiency of Grid:

Any power system needs a steady supply of electricity. It hinders the grid's ability to provide the services required by end users. Smart Grids provide self-healing and improved fault detection. It is becoming more difficult to analyze grid reliability as grids grow in size and complexity, but new analytical methods developed through research efforts have continued to strengthen the reliability foundation for modern networks. Bayesian networks may be used to predict grid service dependability using a data mining technique to identify grid system structure from raw historical system data. The effectiveness of hybrid generating is aided by remote monitoring and automated Smart Grid control for instable distribution[9]. The information network in Smart Grids allows for many features, and while it is vulnerable to attacks, it has been countered by promising solutions such as an intrusion detection system (IDS) or a wavelet-based steganographic technique that randomly hides household sensitive information inside normal readings.

1.4 Deployment as well as Integration of Distributed Resources and Generation:

Small sources of power known as distributed energy resources (DER) can assist in meeting regular power demand. The transition to Smart Grids is aided by DER such as storage and renewable energy. Renewable energy sources like distributed generators may assist alleviate the challenges of diminishing fossil fuel supplies and rising consumer demand. Thermal generating and electric cars may be included in distributed generation, which includes wind turbines, solar panels, and battery storage systems. However, combining these sources would necessitate the handling and processing of massive amounts of data.

1.5 Demand response and demand-side resources:

Demand response is defined as "changes in electric usage by demand-side resources from their normal consumption patterns in response to changes in the price of electricity over time, or to incentive payments designed to induce lower electricity use at times of high wholesale market prices or when system reliability is jeopardized," according to the Federal Energy Regulatory Commission. Consumers may participate in grid operations by reducing or shifting their energy consumption during peak times in exchange for financial incentives. One of the goals of the United States Department of Energy is to develop grid modernization technologies and techniques for demand response. Environmental, economic, and reliability concerns have prompted increased investment in demand-side resources, such as energy efficiency and load control programs.

1.6 Technologies:

This section explains Smart Grid technology and research, as well as where they are focused. It's difficult to cover everything due to the volume of articles accessible. This section, in general, provides an overview of what is being accomplished. In the preceding section on Smart Grid features, we highlighted some interesting research:

1.7 Control and communication:

Clean energy grid connected control methods and techniques are being used in the area of control for Smart Grids. Power electronics-based control, multi-agent system-based control, advanced fault management control, and virtual power plant (VPP) control technologies are all

examples of these techniques. VPPs are systems made up of tiny dispersed generating units that come together to create a single virtual generating unit. Individual management of these units is possible additional big power plants can now be linked into the grid system utilizing hundreds of tiny energy conversion units thanks to advancements in power electronics and contemporary inverter management techniques (ECS). These conversion systems may run independently, linked to the grid, or separated from the grid. Small and medium power conversion topologies, as well as their control (mostly for PV systems), are available, and wind turbine design and control have been established[10].

1.8 Sensing and measurement:

Sensors are vital components of the Smart Grid. These small nodes act as detection stations for equipment and energy sources, allowing for remote monitoring. Synchrophasors, also known as phasor measurement units (PMUs), are high-speed sensors that give synchronized measurements of real-time voltage and current phasors. Advanced power systems monitoring, protection, and control applications rely on phasor measurements. PMUs record grid conditions with great accuracy and are 100 times faster than Supervisory Control and Data Acquisition (SCADA). Resilient communication for Smart Grid ubiquitous sensor network is another study involving sensors. In the Smart Grid, secure and dependable surveillance is provided by cognitive radio sensor networks. Cognitive radio sensor networks: smart communication for Smart Grids—a case study of Pakistan, and Quality-of-service differentiation in single-path and multi-path routing for wireless sensor network-based Smart Grid applications.

1.9 EVs, PHEVs and V2G:

EVs and V2G have many advantages. V2G is a system that allows electric cars, plug-in hybrid electric vehicles, and fuel cell electric vehicles to connect with the power grid to provide peak power, spinning reserve, renewable energy storage, and backup. V2G scheduling may significantly reduce the peaks and valleys in power demand profiles. The V2G idea has the potential to enhance the grid's efficiency, stability, and dependability. The cost of owning an electric vehicle is approximately half, while EVs have a minimal effect on the network in terms of distribution system losses and voltage control. The V2G capacity for synchronized charging and discharging of the EV fleet in a distribution feeder may be enhanced by real-time communication, smart metering, and home area networks (HANs). A case study in Portugal demonstrates that EV smart charging and PV production characteristics are quite similar. Charging is a critical component of V2G technology and work on charging and discharging has been active, with a large number of papers and conferences.

1.10 Security:

Smart Grid security is an outgrowth of Smart Grids' sophisticated networks, which are made up of millions of interconnected devices and organizations. Smart meters, intelligent devices in electricity supply and demand, components in insecure physical locations, outdated equipment that may be incompatible with current devices, device-to-device communication, unorganized communication among teams involved, IP-based components that are vulnerable to attacks, and the fact that there are many stakeholders are the most common vulnerabilities in Smart Grids. The International Electrotechnical Commission (IEC), the IEEE Power & Energy Society (PES), the National Institute of Standards and Technology (NIST), and the National Standard of the People's Republic of China Smart Grid all contribute to the development of Smart Grid security

standards. The need for a framework for evaluating Smart Grid security is critical. Chakib Bekara studied the security problems and challenges faced by IoT-based Smart Grids and identified the most important security services to consider. The Internet of Things (IoT) is the next stage in the development of the Internet today, in which actual things are endowed with computing and communication capabilities. The feasibility and efficacy of a physical security layer built using a conceptual layering model are shown in preliminary simulation results from a research on cross-layer security framework.

1.11 Integration of Renewable:

While numerous renewable energy studies have been performed to investigate additional sources of clean energy, integrating renewable energy sources into the power system is one of the difficulties in the modernization and smartening of the electric grid. Some systems are already overburdened, making it harder to get electricity from wind farms into the grid for consumption. Renewable energy sources are inherently variable and intermittent. Electricity has always gone in one direction, from a power plant to a consumer. Electricity must enter the system from various places as a result of the extra sources coming from alternative sources. To integrate wind, solar, and other alternative energy sources into the distribution system and transport them to their destinations, grid automation, two-way power flow, and sophisticated controls are required. New devices in Smart Grid systems must be able to interact with current equipment, and coordinated efforts are required to adapt solar photovoltaic and wind energy. There are additional computer tools for evaluating the integration of renewable energy into energy systems. In terms of applications, matching technology, and the goals they achieve, these energy instruments are varied. Feasibility and viability assessments are commonplace all around the globe. These may be used to help build different grid-connected renewable energy systems for particular areas.

1.12 Issues as well as challenges in Smart Grids:

Despite the apparent progress made in the creation of Smart Grids, their technology, and systems, problems and obstacles remain, and ultimate achievement remains a long way off. The following problems and challenges may be investigated further:

- V2G: battery wear, limited electric vehicle adoption, new battery technologies.
- Cost and benefit, expertise, and institutional inertia are all barriers to adoption.
- Expenses, customer engagement, data security, and privacy
- IoT-based Smart Grid security problems and difficulties
- The layout of the route.
- Standards compliance and interoperability
- AMI vulnerabilities, physical security, and cyber security
- Smart Grid simulators and co-simulators: capable of simulating just basic situations, such as time synchronization and data transfer.
- There is a scarcity of scalable, interoperable context-aware middleware platforms.

- Issues with interoperability with intelligent devices, as well as technical standards for data recording and transmission.

2. DISCUSSION

A smart grid is an electrical network that allows for a two-way flow of power and data, as well as the detection, reaction, and prevention of changes in consumption and other problems, using digital communications technology. Smart grids are self-healing and allow energy consumers to have an active role in the system. The Smart Grid idea has progressed from a pipe dream to a goal that is progressively becoming a reality. Devices and systems have become increasingly capable of supporting the development of a more intelligent grid as technology has advanced.

The Smart Grid is part of an Internet of Things architecture that may be used to remotely monitor and control anything from lights to traffic signals, traffic congestion, parking spots, road alerts, and early detection of things like power outages caused by earthquakes and severe weather. Time series forecasting in Smart Grids, dependability and power quality studies, power flow optimization, battery systems, cloud computing, and realistic large-scale renewable energy source integration are all areas where study is possible. Smart Grids have a bright future since new technologies will be utilized to create them.

3. CONCLUSION

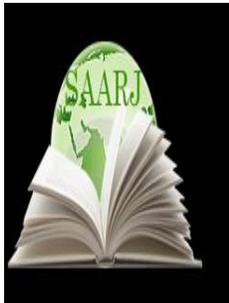

The Smart Grid idea has progressed from a pipe dream to a goal that is progressively becoming a reality. Devices and systems have become increasingly capable of supporting the development of a more intelligent grid as technology has advanced. Smart Grid efforts throughout the country are aided by concrete energy policy. Smart Grid activities in various areas seldom imply rivalry, but rather a cross-regional community with comparable goals and lessons to learn.

The Smart Infrastructure was born out of the necessity to upgrade the electric grid, according to this study. The traditional grid eventually grew limiting and required additional features. Smart Grids' functions and features have been discovered. The article outlined the fundamentals of Smart Grid technology and associated technologies, as well as the research efforts, difficulties, and concerns that surround them. Time series forecasting in Smart Grids, dependability and power quality studies, power flow optimization, battery systems, cloud computing, and realistic large-scale renewable energy source integration are all areas where study is possible. Even the problems and obstacles found, such as V2G battery wear, data protection, physical and cyber security, simulator limits, and distribution system automation, may serve as excellent starting points for future study. When starting on this complicated system, the Smart Grid's fundamental concept is insufficient. Even using existing experiences and technology as a guide, pursuing a Smart Grid requires a long-term commitment of time, money, and ongoing research and testing. The Smart Grid can be more successful in achieving energy sustainability and environmental conservation and preservation if more effort is put into Smart Grid research. Although the Smart Grid's precise future is impossible to foresee, recent developments show a dynamic fusion of sectors, mechanics, and communities.

ABSTRACT

This article discusses the fact that Sayyadi's epic "Tahir and Zuhra" reflects the traditions of folklore, in particular, it was created on the basis of a fairy tale and became one of the most famous works in the written literature of the East. The ideological content of the epic, the images and events depicted in it, the fact that Sayyodi was well acquainted with the examples of folklore and skillfully used the achievements of folklore in the creation of his work were studied in detail. The following motives are decisive in the narrative: childlessness of the vizir and the shah; wandering and blooming garden; noble old man; the unusual birth of Tahir and Zuhra by means of an apple; the death of the vizier and the shah's order to kill Zuhra; execution of Tahir in the river; the capture of the chest with Takhir by the scythes of the Ruman princesses; the return of Tahir; execution-dissection of Tahir. At first glance, the traditional plot of the eastern fairy tale "Tahir and Zuhra" contains the usual plot of the separation and death of lovers. In our opinion, the narrative contains the most ancient mythological, historical and cosmogonic realities rooted in the culture and science of Sumer and Ancient Egypt.

KEYWORDS: *Folklore Motifs, Fairy-Tale, Creative Approach, Epic Genre, Description Of Spiritual Experiences, Characters, Episodes, Originality, Rich Fantasy, Talent And Ability, Etc.*

INTRODUCTION

Examples of large and small volumes of artistic creativity, which include the plot dedicated to the love of “Tahir and Zuhra”, are distinguished by the fact that it has its own place in Oriental literature. In particular, this topic “found wide fame among the peoples of Central Asia, Arabia and India, absorbed artistic literature, the spirit of those who loved the folklore creativity of the

people and sang with interest in distant times” [1, p.56]. This popular plot theme also played an important role in the development of genres such as fairy tales, myths, epic, narratives in Turkish folk literature.

The theme of “*Tahir and Zuhra*” is not alien to Uzbek literature either. Especially among the samples of folklore creativity of the Uzbek people many works related to this plot. The fairy tale “*Tahir and Zuhra*” became one of the favorite works of Uzbeks. There are also several variants of the epic “*Tahir and Zuhra*”, written from folk tales by folk poets.

MATERIALS

This topic was brought to Uzbek literature by the poet Sayyadi, who lived in the XVII-XVIII centuries. He further strengthened the relations of folk art and literature with his work “*Tahir and Zuhra*”, artistically reproduced the famous plot and enriched it creatively. In fact, the ideological world of the epic, the world of images, its plot and composition are distinguished by its harmony with the Uzbek folk tale “*Tahir and Zuhra*”.

As described in the fairy tale “*Tahir and Zuhra*”, it turned out that in the past time there was a king, but he had no children. The motivation for childlessness is exactly met in the fairy tale of Sayyadi. The city of Totor had a king named Bobokhon, seven climates obeyed him, but he was not fully satisfied:

Вале камлиги фарзанди йўқ эрди,

Кеча-кундуз гаму ғусса ер эрди.

Бу шоҳ кўнглида доим эрди бу гам,

Бу гамдин кўнгли ҳаргиз бўлмади жам [2, p. 21].

The idea of who will be the owner of the state in the future tormented the king in both works. Such illusions led them to melancholy, were always the main motivator of their sadness.

In the fairy tale it is said that one day from the days when the King was offended, a right-handed minister came to him. The minister is also indifferent. The king and the minister went to one house and decided that it was better to leave the kingdom rather than to live without a child. Then both left the richness and left the city and went to the same garden, walking along the road. In the garden they were met by an old man, and gave them a red apple each, and then he said: “- *I gave you the apple on this condition that whichever of you give your wife this apple, she will give birth to a son, name him Tahir, whichever of your wife gives birth to a girl, name her Zuhra. But do not separate them from each other. When they grow, relative-in-law, do not forget, and left to the side that he has come*” [3, p.1]. It seems that in a fairy tale the old man recommends the names of the children who will be born, as well as the fact that they should be king and Queen.

The same is true of the minister’s indifference to Sayyadifairy tale is also met. In contrast to the fairy tale, the minister in the epic asks the King Bohir and himself for a child, and prays the Creator. An avid pray gives its effect. The minister goes to sleep and dreams. In a dream it turns out that the king and himself will have children. When they wake up, he asks the nobleman King, saying that saints consider them too. The King Bobokhongot also delighted, and he himself and the children of his minister will intend that if a son - a friend, a girl will be born - a friend, a boy-

a girl will come to the world –“praise”, and whoever will recognize from this condition will be a rascal.

Now, returning to the fairy tale again, the king and the minister, who received apples from the old man, returned home and continued to travel around the kingdom. When the time came, their wives gave to birth when they were hunting. The King’s wife gave birth to a daughter, and the minister’s wife to a son. To the man who went to the gift for good news, the King became angry, and ordered to kill his daughter and bring handkerchief painted with in her blood. And the minister rode horse taking the road towards his house happily. On the way, the horse stumbles upon the stone, falling from the horse and the minister died. The event of the minister’s death is also meant in Sayyadi. But this death is not accidental death, as in a fairy tale:

*Билинг: Тоҳирки беш ёшқа етибдур,
Бу Боҳир Тангри амрин битқарибдур,
Ки Боҳирнинг вафотин билди ул шох,
Дедиким: “Бу эрур тақдири Оллоҳ” [2, p. 29].*

That is, the death of the minister will lead to a violation of the condition in both works. The King’s intention is changed and he denies the idea of making Tahir son-in-law.

The message that Tahir is engaged in the Zuhra is given both in the fairy tale and in the epic through interesting events and details close to each other. In the fairy tale it is said that one day, when Tahir was playing with a walnut, the thrown nut touched the charm of an old woman, in which the thread was spinned. Then the old woman got angry and said, “Hey, sly orphan! Rather than playing with me, you’d better go and play with Zuhra” she condemned him. This made Tahir much more interested. And the question which asked Tahir got no answer by the old woman, but she taught him ways to find answers from her mother. Through the trick taught by the old woman, Tahir learned about the events between his father and the king in the past. From the detail of the fried wheat is effectively used. That is, Tahir asks his mother to fry wheat, bring it in her hands. When he clasped his mother’s hands tightly, the mother with a hand burn will be forced to tell her child the truth.

The same images are presented in Sayyadi. It is written in the epic that Tahir and Zuhra studied in the same school. One day, when both were going to school, a woman appeared in front of them. Tahir joked and he threw a talusto her side. When talus touched the women,

*Деди хотун: “Манинг-ла қилма бози,
Бўла кўр Зухрохоним бирла сози,
Агар санда ақл бўлса, эй ўғлон,
Қила кўр Зухрохоним бирла жавлон” [2, p. 31].*

After that, Tahir realized that he had some kind of secret that he did not know about. That woman said that he should ask his mother what this secret is. Tahir came to home and told his mother that he is hungry, that he wanted fried wheat. His mother quickly prepared what was said. And Tahir said that he would bring fried wheat in her hands, that he wants to eat from her mother’s hands. The mother brought fried wheat, as the son wanted. Then tightly grabbed his mother’s hand and asked her to tell the events related to his father:

*Кўли куйгач, деди: “Эй нури дийда,
Эшитсанг қиссани, бўлгунг рамида.
Отанг бирла Бобохон қилди паймон,
Ажал етди, отанг топмади дармон.
Унуттуқ борисин, сан ҳам унутгил,
На савдодур, болам, кўнглунг советгил.
Ки ул хоним эрур хонларга лойиқ,
Кўнгул берма анга сан, бўлма ошиқ” [2, p. 32-33].*

DISCUSSION

It turns out that the events in a fairy tale are exactly the same as the events in a tale. Only in a fairy tale the image of a nut changed to talus and an old woman turned into an image of a woman. But both also have the same duty in the work. The state of ordering the King to execute his daughter, but the fact that the girl will not be killed is met only in a tale. The fried wheat, knowing the secret of past events by burning his mother's hand - is described as one in both works.

Similarities are also observed in the image of Tahir and Zuhra in one school, as well as the events that take place in the school. School events will change the life of Tahir and Zuhra. The love brings both closer and progresses so that they can not live without each other. This closeness will go until the complain reaches to the king over them. If the distinctive aspect is the teacher's complaint, who teaches them in a fairy tale, warn the gardener warns the ruler in the epic about the relationship between them.

Then the conflict between the king and Tahir strengthens. The king begins to look for ways to get rid of Tahir. And the love of Tahir for Zuhra becomes more and more intense. In the tale it was said that “*Scientists*” said: “*Let the King kill Tahir*”. They said this to the King. The King called the craftsmen with anger and said to them: -make a big crate. I will throw Tahir to the river! Hearing this, Zuhra brought a dish full of gold to the craftsmen and said: “*take these gold, let the crate be so thorough, let the water not pass into it, let the poor man live wherever he goes*”, and she cried[3].

When the crate was ready, the King gathered the people in a large square. The people asked the king not to let Tahir flow into the river. However, this demand of the people did not come true.

“*Tahir and Zuhra*” fairy tale also has the image of events like these. However, due to the possibilities of the genre of the fairy tales, Sayyadi tries to explain more widely the events. For example, in the epic, The King Bobokhon calls to his presence Tohir and talks with him, and also Tahir's mother Shokhi Khuban appeals to the ruler. And in the tale there are no such episodes. Crate detail is available in both works. The decision to make a crate and throw Tahir into the river is issued by the King. The phenomenon of Zuhra's strengthening of the crate and the resistance of the flow of Tahir in the river is given both in the fairy tale and in the epic.

Now let's pay attention to the events of Tahir's throw to the river. In this, too, similarities and peculiarities are observed. The people gathered along the river. With grief, Tahir's mother also

came. *“At that moment herald announced:-Now Tahir will be brought! –he said.Everyone looked on the way to Tahir. Tahir’s mother was forced to see her poor son:-Where is my innocent son, let me see him once, -she cried.They tied Tahir’s hands behind his back and brought them to his mother. The mother was crying, hugging her child and died. The people gathered on the square and remained silent. After a while, who was crying, who was shouting, took the Tahir and put it in the crate”*[3, p.1].

In fact, in a tale, Tahir’s mother dies until her son is thrown into the river. The injustice and oppression done to her son will lead to her death.

In Sayyadi’s epic, he tries to describe in more detail the events associated with the image of the mother. Tahir’s mother – shokhi Khuban, is portrayed as a thoughtful woman, supporting the love of her son, raising his sympathy. Shokhi Khuban gives encouragement after hearing the message of his son’s throwing into the river, persuading that he must be brave and accept this decision.

Lentils bring Tahir and put it in the crate. They also put food and water for another couple of days. Lock the mouth of the crate, throw it into the water and let it flow. Zukhra and Tohir’s mothershokhi Huban, got in grief and cried.

The main events that will happen in the tale will move to the Land of Khorezm. Because when the crate in six months, flows into the Land of Khorezm. As long as the king of Khorezm has two beautiful daughters. Every Friday they go on a river cruise with their canines. On one of such days, they will see the crate, flowing in the water. Sister princesses are making an effort to catch the crate. The elder girl soaked her hair, but the crate was not caught. A crate was inserted into the younger girl’s hair and pulled it out to the edge of the water. *“Now the sisters started arguing.”* After a long quarrel, the end came to a consultation. The elder one said, *“I get the crate,”* the younger one said, *“I get what comes out of the crate.”**They opened the crate. There was ayoung man, he was so handsome, that in the world he did not have a tench. His hair was black, curly. His eyebrows were dark, the eyes are bright, and the figure is slender. The girls had a long quarrel. Younger girl stood up and said:-Why do you argue? What was in the crate, I said that I would take it. It will be mine, I will not give it to anyone,”*she said[3, p.1].

From this event, the king was also aware. He came to the river and saw Tahir. Supporting his youngerdaughter, even Tahir did not agree, he made a wedding for forty nights, forty days.

After Tahir floodedfrom Totor’s land, the place where the events in the fairy tale are depicted also changes. In its own way, Sayyadi approaches to the fairy tale with a creative side.The next life of Tahir will continue until a certain time in the city of Baghdad. Baghdad was ruled by a ruler named Adil, who became known for his righteousness. The King had three sons and three daughters. The name of one of his daughters was Mohim. Mohim dreams one day. In a dream, future events in life are evident. She asks baby-sitfor interpretation of her dream. The nanny predicts that the princess will fall in love.

The three daughters of the King were also beautiful. They had a garden that each of them go in turn. The garden was so beautiful as Bogi Eram. It was time for Mohim to rest in the garden. There was a river along the garden. From afar she saw something darkening and flowing. When it came closer she found out that it was the crate. The diver pulled the crate out of the water.

Mohim unlocked it, became excited. Because that was the guy shedreamt. Shakhri asked Mokhim for the reason why she was so excited:

*Деди Шаҳрига Моҳим: “Бехабарсан,
Манинг оҳимни сан на деб сўрарсан?
Тушумда кўрганимни мунда кўрдум,
Ки Лайли бўлдуму девона бўлдум,
Кўрар бўлсанг, ётур сандуқ ичинда,
Ки қолдим кулфату қайғу ичинда” [2, p. 85].*

When Shakhri looked into the crate, a handsome young man lay unconscious. They woke him up and asked him why he lay here.

It turns out that Sayyadi gives a wider place to the image of events. To the Epic he also includes such personages as Jahongir, Shahri, and skillfully use them. Each of these images carries specific tasks. For example, after the Crate event, they hand over Tahir to Shakhri, and she takes care of him for a few days in her house until Tahir restores.

As Tahir lies Mohim, he lies to the King as well, hides from them the events associated with his life in the past. The king will council with the ministers, decidesto make the wedding of Tahir and give a wedding for three nights.

Events after the wedding play an important role in the composition of both works. During the narrative of events, the image of the Qorabotir emerges. In a tale, his father marries Zuhra to Qorabotir. In the epic, too, Bobokhon will want to Qorabotir to become his groom. As if, in this way, dreams that Zuhra would forget Tahir.

Both in the fairy tale, which is the product of folklore, and in the epic, which is considered an example of written literature, after the separation of Zuhra from Tahir, sorrow remains in grief, her mind is occupied only by Tahir.

In a tale it is said that one day Zuhra dreamed. She walked with Tahir in a dream. The grief woke up with sadness and began to search for Tahir. She went to caravanserai and gave the caravan leader dish of full of gold and sent him to other lands to determine if there was Tahir. When the caravan leader after forty days, arrived in place where Tahir appeared in Khorezm.

The image of the caravan leader in the tale is given in the style of the image of Sayyadi as qosid. Qosid - means messenger. The main task of Qosid in the epic is to bring a message about Tahir for the Zuhra.

Both the caravan leader and qosid manage the tasks assigned to them. The caravan leader that came to the garden reads a poem in the thought that Tahir also exists among so many people. Tahir, who heard the poem, smiled and laughed. In the same way, the caravan leader finds Tahir and meets him. The park is described in the style of a walking are in the epic. Qasid also comes to Baghdad, telling the romantic ghazals:

Ки ногоҳ учради шаҳр, оти Бағдод,

*Бўлур гамли киши Бағдодда дилиод.
Сайргоҳ эрди, шаҳлар сайр этарди,
У шаҳлар сайргоҳ ичра ўтарди.
Туруб шаҳзодалар бирла бу Тоҳир,
Нишона отар эрди, кўрди зоҳир[2, p. 113].*

Both in the fairy tale and in the epic, messengers find Tahir and acts as a place to meet him. After Qasid meeting with Tahir, he introduces himself and says that he came from the land of the Totor, that he is the messenger of Zuhra. Both cry, and hug. When Tahir hears the message of Zuhra, he places Qasid in a caravanserai and goes to Khan to get permission. He comes to the harem and tell the Shakhri the whole secret. All the people of the palace will be aware of it. The ruler hears from Tahir the events associated with his life and makes a fair decision. He appreciates the love of Tahir for Zuhra and gives him permission.

In the tale, too, special attention is paid to the process of Tahir's departure from Khorezm to his homeland. The caravan leader says to Tahir that Zuhra has married, there is no longer any benefit from it, he has only come to know his message. Still Tahir insists to leave. Here he speaks of the fact that the King arranged his daughter to him, even if he did not agree, but still did not speak a mouth to the girl, and did not even look at her face. Despite the fact that the caravan is revered, Tahir insists strongly. Then the caravan advises him to say goodbye to his wife. After that, Tahir's wife was left to cry, and he started on his road.

A tale is considered a smaller and more compact genre than epic. And in the epic there is an opportunity to describe events more broadly. It is natural that the depicted images in it also have more than a fairy tale. The desire to deeply immerse in the inner world of heroes, the spiritual world and dreams is considered a feature inherent in the more epic genre. For this reason, it also attaches special importance to the events in the process that happened in Sayyadi's epic until Tahir left home. The events after Tahir takes Khan's permission will not go smoothly. Especially in the process of the image of events associated with the mother of Mohim, such features are observed. For the mother, the fate and happiness of her daughter are in the first place. For this reason, she is very much in opposition to the departure of Tahir to his homeland. The spiritual state of the mother, the suffering of the grief of the child, the detail of 'belbog', the spiritual experiences of the Mohim, the marriage of Shakhrito Qasid, the episodes of the transfer of the Mohim to Qasid and Tahir's departure to the land of the Totor are only events that can be met only in the epic.

The caravan finally reached the destination. Here's the road divisible by three. One-if there is no return, the other-if there is a risk, and third – if there is way. Thinking not knowing which way the caravan would walk, Tahir offered to follow a dangerous path in his dream to see Zuhra as soon as possible. With it, they walked along a dangerous path and faced the robbers. The robbers threw them into the dungeon.

There is also a description of the events associated with the pirates in the epic "Tahir and Zuhra". After Tahir leaves Baghdad, he will be caught by robbers on the road. After knowing that he is in love, the robbers let him go. So he continues going. Then a second group of robbers catches Tahir. With poems in love, he also gets rid of them. On the road he faces the mountain. He has

difficulties in passing through the mountain, and becomes helpless and prays for the God. By the power of God, the path will be opened up. Tahir will be glad and continue again.

Even in the tale, the recovery of Tahir from pirates is described in a peculiar way. The liberation of the people of Tahir and caravan from the robbers is caused by one of his schoolmates. His friend, who was among the robbers, gave gold to the dungeon and sent Tahir and those who were coming with him to free him from the dungeon.

Another of the similar aspects in both works occurs in the process of Tahir's returning to the land and meeting him again with Zuhra. The awakening of Zuhra from the ghazel told by Tahir is considered a characteristic feature both for the fairy tale and for epic. In a tale, Tahir comes to the house, where Zuhra lives during the morning, he wakes her up, by telling ghazels. In the epic, too, it is also a warning that the beloved of Zuhra, Tahir tells ghazels.

Another of the similar aspects in the tale "*Tahir and Zuhra*" and the plot of Sayyadi's "*Tahir and Zuhra*" seems to be the story of the murder of Tahir. Death brings both works closer to the end. In the fairy tale it is said that the king laid a cliff and gathered the people on the field. The executioners also brought Tahir. Despite the fact that Zuhra asked his father so much, he did not listen. The executioner split the body of Tahir into two and hung it on the gate.

Sayyadi's skill is evident in the image of Mokhim remembering until Tahir's execution in the epic. After Tahir, Zuhra can not live in life. It is precisely that the poet reflects the experiences of Zuhra, that she is the owner of true love, and to what extent special attention is paid to her devotion to love, gives a special charm.

Another harmonious state can also be observed in the image of the death of Qorabotir. In both works, Qorabotir kills himself after the death of Zuhra. In the tale it was said that Qorabotir was put in the middle of Zuhra and Tahir. A red rose over Tahir, a white rose over Zuhra, and a thorn over Qorabotir is grown.

Sayyadi also impressively expresses the fact that the rose from the grave of Tahir and Zuhra, and thorn from the grave of Qorabotir grew. However, after the death of Zuhra, the entry of father into a dream, after which Qorabotir is buried in another separate place, the description of such events as one that dying after hearing about the events associated Tahir with Mokhim, occurs as a result of Sayyadi's creative activity.

Sayyadi uses the noble plot, which is popular among the people in the creation of his epic "*Tahir and Zuhra*". Uzbek folk tale "*Tahir and Zuhra*" emphasizes the fact that it was the basis for the poet's epic in the introductory part of the work. It is written in it that the poet dreamed one day. He dreamt of walking in a wonderful, beautiful park. It was spring, flowers opened, everything is beautiful around, everyone is glad. Immediately Sayyadi met Tahir and Zuhra, and asked him to write a book about their love. Events in this dream inspired the poet:

*Давот бирла қалам илгимга олдим,
Аларнинг ишқини кўнглумга солдим.
Аларнинг қиссасини назм қилдим,
Ки ошиқларга яхши базм қилдим.
Қуруқ жазра эди, бўстон қилдим,*

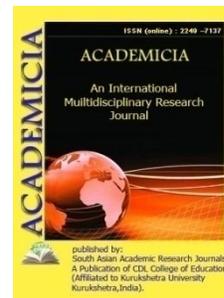

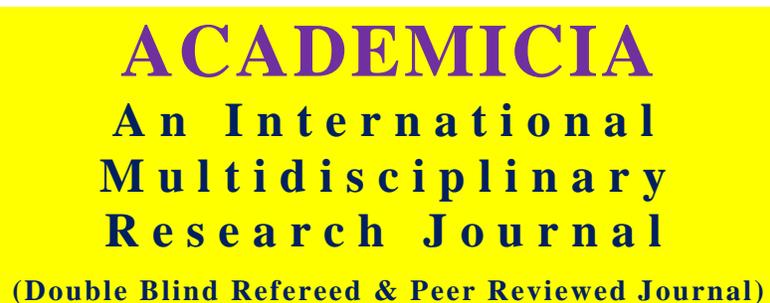

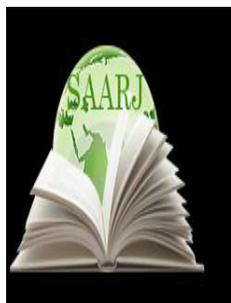

Бу ошиқларга хуб достон қилдим[2, р. 20].

CONCLUSION

The main goal of the poet was to turn a common tale into epic among the people. On this road, he works hard for four years. As a result, one of the famous works in oriental written literature comes to the world. In fact, the ideological content of the epic, the images and events depicted in it, the harmony of events in the Uzbek folk fairy tale “*Tahir and Zuhra*”, proves that Sayyadi knew well the samples of the oral creativity of the people and skillfully used the achievements of folklore in the creation of his work. Creative approach, skillfully using the capabilities of the genre of the epic - will fully unleash the possibilities of Sayyadi. Therefore, “*Tahir and Zuhra*” takes the main place in a wider, more detailed description of events and in-depth presentation of the inner spiritual experiences of the main images. Also included in it are the personages, as well as additional episodes, which mean that the epic occurred as a product of the original, rich fantasy, specific talent.

ABSTRACT

Surfactants, strength of crushed ores, stresses of concentration of active substances, physicochemical processes, changes in concentration, surface tension of substances. The results show that the refractive index, hydrogen index and electrical conductivity of surfactants such as CF-8201, OP-10, V-87 and Soapstock at concentrations greater than 0.2% are minimal. Studies have also shown that the mechanism of action of aqueous surfactant solutions on technological and physicochemical processes is adsorption at the interface of amphiphilic surfactant molecules, which leads to a decrease in surface tension, improvement and wetting of the solution.

KEYWORDS: *Adsorption, Solubility, Concentration, Hydrogen Index, Electrical Conductivity.*

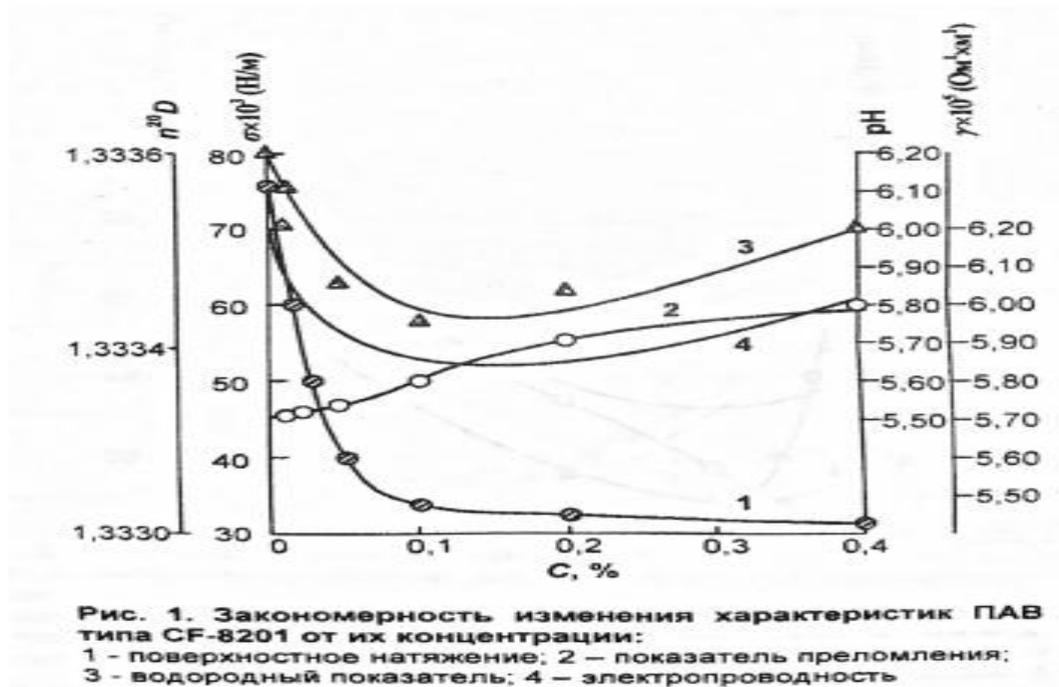

INTRODUCTION

One of the urgent tasks of preparing ore for enrichment is to reduce the energy consumption in crushing and grinding minerals. The simplest and most economical way to change the properties of a mineral is to physicochemically clean it with aqueous solutions of surfactants (surfactants).

Studies have shown that aqueous solutions of surfactants enhance the grinding process of ores, which reduces the strength of the liner, balls, and crushed ores. Studies have also shown that the mechanism of action of aqueous surfactant solutions on technological and physicochemical processes is adsorption at the interface of amphiphilic surfactant molecules, which leads to a decrease in surface tension, improvement and wetting of the solution.

To select the optimum concentration of surfactant and its aqueous solutions, we used changes in surface tension, refractive index, hydrogen index and electrical conductivity for surface conductors CF-8201, OP-10, Geronol V-87, the main properties of soap calcium we studied. Akilbinzolsulfonate depends on their concentration. The main properties of the solubility of surfactants in tap water:

1. The emulsifier CF-8201 is soluble in tap water at a concentration of 0.01-0.4% with strong stirring. Once completely dissolved, the solution becomes clear (actual solution).
2. Surfactant OP-10 is soluble in tap water at a concentration of 0.01-0.4%. Once completely dissolved, the color of the solution becomes clear (actual solution).

3. Geronol V-87 is soluble in tap water at a concentration of 0.01-0.4%. After melting, the color of the solution becomes clear (realsolution).

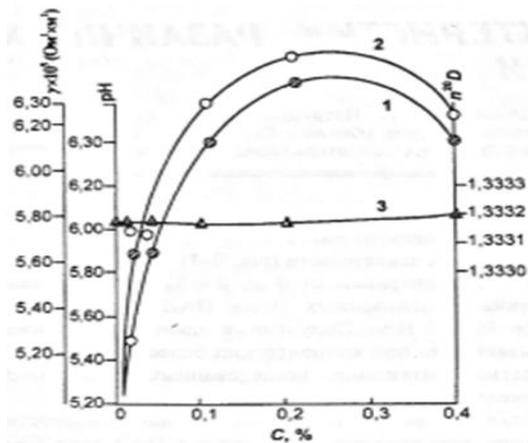

Рис. 2. Закономерность изменения характеристик ПАВ типа ОП-10 от их концентрации:
1 - поверхностное натяжение; 2 – показатель преломления;
3 - водородный показатель

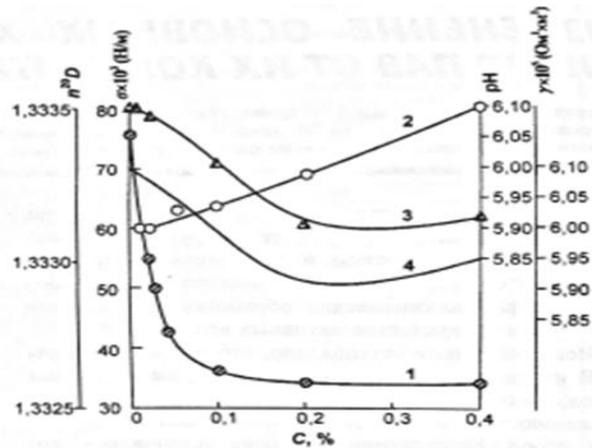

Рис. 4. Закономерность изменения характеристик ПАВ типа Собсток от их концентрации:
1 - поверхностное натяжение; 2 – показатель преломления;
3 - водородный показатель; 4 – электропроводность

4. Soap stocks with a concentration of 0.01-0.4% are soluble in tap water when rubbed with surfactants. Once completely dissolved, we have a system of suspended particles that, over time, slowly settle to the bottom (suspension). In the laboratory, we determined the laws of variation of surface tension, refractive index, hydrogen index and electrical conductivity of surfactants CF-8201, OP-10, V-87 and Soapstock depending on their concentration. shown in the pictureure. 1-4.

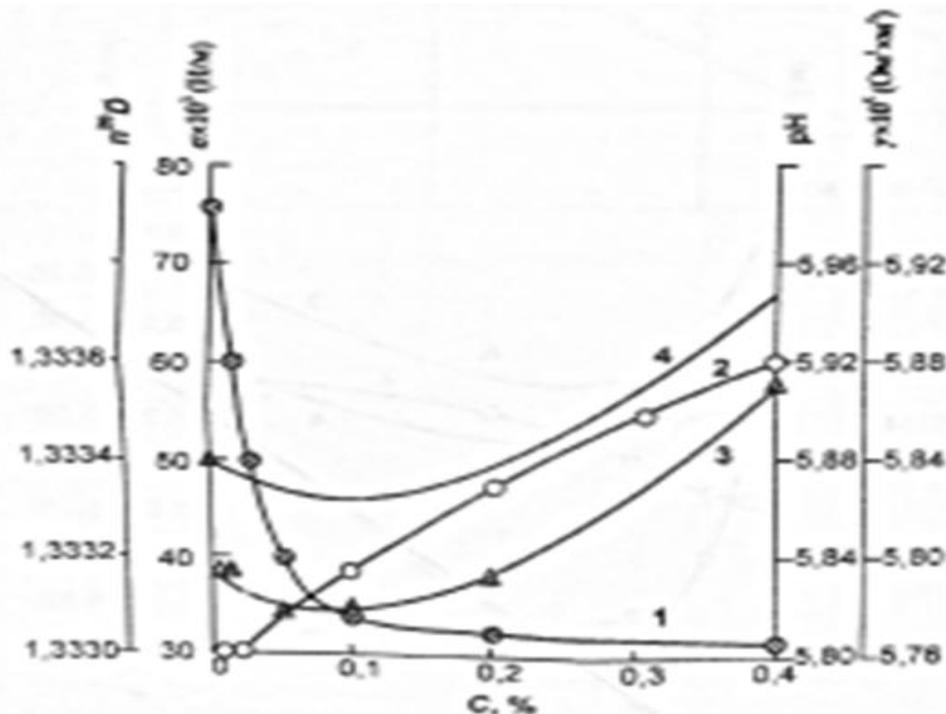

Рис. 3. Закономерность изменения характеристик ПАВ типа V-87 от их концентрации:
1 - поверхностное натяжение; 2 – показатель преломления;
3 - водородный показатель; 4 – электропроводность

The results obtained (Picture. 1-3) show that with an increase in concentration from 0 to 0.4%, the surface tension of the studied types of surfactants decreases from 73.5 to 30×10^3 N / m. The results show that the surface tension of the surfactants studied at a concentration of more than 0.1-0.2% decreases almost slightly.

Studies have shown that the change in surface tension of the concentrations of surfactants of the types CF-8201, OP-10 and V-87 is characterized by the dependence of the hyperbolic type. _

The results obtained (Pictureure 1-4) show that with an increase in concentration from 0 to 0.4%, the refractive index, high value index and electrical conductivity of surfactants such as CF-8201, OP-10, V- permeability 87 and Soapstock decreases. The results show that the refractive index, hydrogen index and electrical conductivity of surfactants such as CF-8201, OP-10, V-87 and Soapstock at concentrations greater than 0.2% are minimal. A further increase in concentration is accompanied by an increase in the refractive index of the hydrogen index and the electrical conductivity. The resulting pattern is characterized by parabolic results. The regularity of the change in the refractive index of surfactants of the Soapstock type to their concentration is characterized by the dependence of the linear type (Picture. 4).

CONCLUSION:

1. With an increase in concentration from 0 to 0.4%, the surface tension of surfactants decreases from 73.5 to 30×10^3 N / m. The results obtained show that the surface tension of the surfactants studied at a concentration of more than 0.1-0.2% decreases almost slightly.

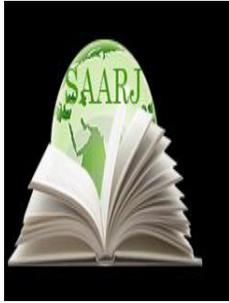

The laws of variation of surface tension of the concentration of surfactants of the types CF-8201, OP-10 and V-87 are characterized by the dependence of the hyperbolic type.

2. As the concentration increases from 0 to 0.4%, the refractive index, hydrogen index, and electrical conductivity of surfactants such as CF-8201, OP-10, V-87, and Soapstock decrease. The results show that the refractive index, hydrogen index and electrical conductivity of surfactants such as CF-8201, OP-10, V-87 and Soapstock have a minimum value at a concentration of more than 0.2%. A further increase in concentration is accompanied by a refractive index of hydrogen and an increase in electrical conductivity. The resulting pattern is characterized by parabolic results. The regularity of the refractive index of surfactants of the Soapstock type to their concentration is characterized by a linear type dependence.

ABSTRACT

Data security has become a top worry for everyone linked to the internet, as it has merged with our lives and grown at a breakneck pace over the past few decades. Data security guarantees that only the intended recipients have access to our information and prohibits any data modification or change. Various techniques and approaches have been developed to attain this degree of security. Cryptography is a set of methods for encrypting data using particular algorithms that render the data unreadable to the naked eye until decoded using preset procedures by the sender. In order to secure personal, financial, medical, and ecommerce data while maintaining a reasonable degree of privacy, cryptography will continue to be used in IT and business strategies. Cryptography is an ancient technology that is continuously being explored, with historical origins.

KEYWORDS: *Cryptography, Security, Algorithm, Cipher, Decryption, Data Security.*

1. INTRODUCTION

Cryptography is a method of ensuring message secrecy. In Greek, the word has a particular meaning: "hidden writing." Nowadays, however, people and organizations' privacy is protected by high-level encryption, which ensures that information transmitted is safe and only the authorized recipient has access to it. Examples date back to 2000 B.C., when the ancient Egyptians employed "secret" hieroglyphics, as well as other evidence from ancient Greece and Rome, such as hidden inscriptions and the renowned Caesar cipher[1]–[3].

Hundreds of millions of individuals use cryptography on a regular basis to secure data and information, but the majorities are unaware of it. Cryptographic systems, in addition to being very valuable, are also exceedingly fragile, since a single programming or specification mistake may undermine them. Figure 1 illustrates the concept of cryptography.

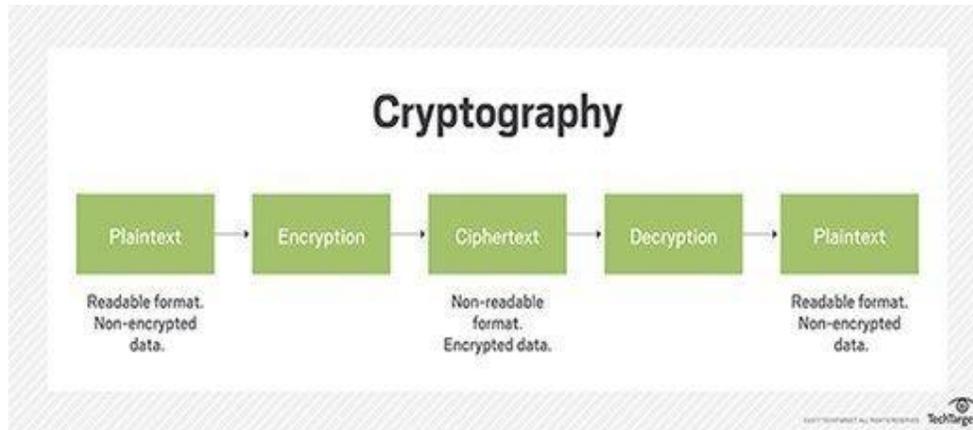

Figure 1: Illustrates the Concept of Cryptography[4].

1.1 Historical Algorithms:

This part will present a few historical algorithms, as well as pencil and paper examples for the non-mathematical reader. Long before public key cryptography was introduced, these methods were developed and deployed.

1.2 Caesar Cipher:

During the Gallic Wars, Julius Caesar, the Emperor of Rome, developed one of the oldest and earliest instances of cryptography. The letters A through W are encoded using the letters three positions ahead of each letter in the alphabet, while the remaining letters X, Y, and Z are represented by A, B, and C in this kind of method. This implies that a “shift” of 3 is employed, but we could have a similar effect on the encrypted text by using any value between 1 and 25. As a result, a shift is now often referred to as a Caesar Cipher.

The Caesar cipher is easy to crack since it is one of the most basic forms of encryption. The letters that were shifted must be moved three letters back to their original places in order to decode the cipher text. Despite this flaw, it may have been powerful enough for Julius Caesar to employ throughout his battles in the past. However, since the shifted letter in the Caesar Cipher is always three, anybody attempting to decode it just has to move the letters[5], [6].

1.3 Simple Substitution Ciphers:

Take, for example, the Simple Substitutions Cipher, commonly known as the Monoalphabetic Cipher. In a Simple Substitution Cipher, the alphabet letters are placed in random order beneath the correctly written alphabet, as shown here:

A B C D E F G H I J K L M N O P Q R S T U V W X Y Z E R
J A U W P X H L C N G

The same key is used for encryption and decryption. The encryption rule is that "each letter is substituted by the letter underneath it," while the decryption rule is the inverse. For example, the plaintext CAN's equivalent cipher text is QDN.

1.4 Transposition Ciphers:

Other cipher families use a key and a specific rule to arrange the letters in plaintext to convert them to cipher text. Transposition is the process of changing the letters in plaintext using rules and a particular key. A columnar transposition cipher is one of the most basic kinds of transposition ciphers, and it comes in two flavors: full columnar transposition and partial columnar transposition. A rectangle shape is used to represent the written plaintext horizontally, regardless of which form is used, and its width should correspond to the length of the key being used. The message may be written in as many rows as needed[7]–[9]. When using full columnar transposition, the plaintext is transcribed and any empty columns are filled with null to ensure that each column has the same length. For example:

```
s e c o n d
d i v i s i o n
a d v a n c i n g
t o n i g h t x
```

Depending on the key, the cipher text is then generated from the columns. If we use the key "321654" in this example, the cipher text will be:

```
cvdngeiaaisdncndonoxnsattoivgh
```

However, when it comes to an incomplete columnar transposition cipher, the columns are not required to be completed, so the null characters are left out. This results in columns of different lengths, which can cause the ciphertext to be more difficult to decipher without the key.

1.5 Modern Algorithms:

a. Stream Ciphers:

Stream ciphers use the key to create pseudorandom bits, and the plaintext is encrypted by XORing the plaintext with the pseudorandom bits. In the past, stream ciphers were often avoided because they were more easily cracked than block ciphers. However, after years of development, the stream cipher has improved in security and can now be used in connections, Bluetooth, communications, mobile 4G, TLS connections, and other applications.

Each bit in a stream cipher is encrypted separately. The first is the synchronous stream cipher, in which the key stream is dependent on the key; the second is the asynchronous stream cipher, in which the ciphertext is reliant on the key stream. A dotted line has been drawn. The stream cipher would be asynchronous if it was present; otherwise, it would be synchronous. An example of an asynchronous cipher is the cipher feedback (CFB).

b. Block Ciphers:

This type of cipher consists of both an algorithm for encryption and an algorithm for decryption:

- The encryption method (E) and a plaintext block (P) are given a key (K), and C is the result, which consists of a ciphertext block. $C = E(K, P)$ can be used to express the encryption operation (K, P).

The decryption method (D) is the opposite of the preceding process, which involves decrypting the ciphertext for the plaintext, P. $P = D(K, C)$ is a formula that can be written (K, C).

To make the block cipher more secure, a pseudorandom permutation (PRP) is employed. An attacker will not be able to decode the block cipher and calculate the output from any input if the key is kept secret. This is true as long as K's secrecy and randomness are guaranteed from the attacker's perspective. In a broad sense, this implies that the attacker won't be able to spot any patterns in the data that's either input to or output from the block cipher.

The size of the block and the size of the key are usually referred to in a block cipher. The value of both is crucial to the security. A 64-bit or 128-bit block is used in several block ciphers. Because it's critical that the blocks don't become too big, the memory footprint and ciphertext length are both modest. A block cipher processes blocks rather than bits when it comes to ciphertext length. To put it another way, if we wish to encrypt a 16-bit message and replace the blocks with 128-bit blocks, we must first transform the message to 128-bit blocks; only then can the block cipher begin processing and produce a 128-bit ciphertext. When it comes to memory footprint, we require at least 128-bit RAM to work with and process a 128-bit block. Most CPU registers are tiny enough to fit. Alternatively, specialized hardware circuits may be utilized to accomplish this. In most instances, 68 bits, 128 bits, and even 512-bit blocks are still small enough for efficient implementation. However, if the blocks grow in size (i.e., in kilobytes), the cost and performance of the system may suffer. Figure 2 illustrates the block diagram of cipher.

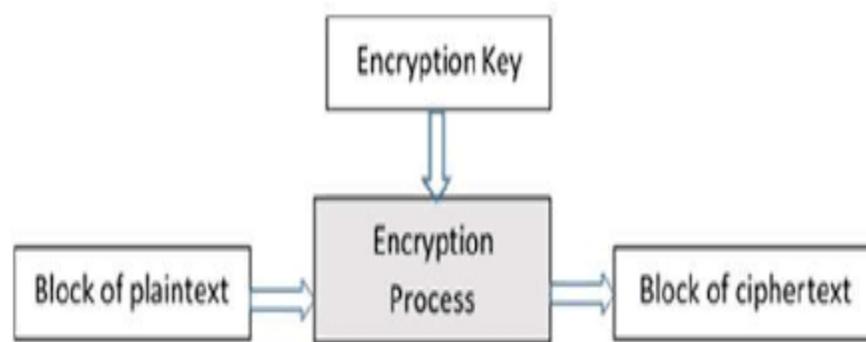

Figure 2: Illustrates the block diagram of cipher[10].

1.6 Hash Functions:

They operate by translating an arbitrarily-sized input to a fixed-size output via a process termed compression, which was formerly known as pseudo random functions (PRF). However, this is not the same as the compression found in .zip and .rar files. It is, instead, a non-invertible mapping. In order to be helpful, a hash function must satisfy two requirements:

It must have two properties: one, it must be one-way, and two, it must be collision resistant.

1.7 Public key Systems:

A cryptography revolution occurred with the introduction of public key encryption. Even in the 1970s and 1980s, broad cryptography and encryption were clearly restricted to the military and intelligence communities. Cryptography only expanded into other sectors as a result of public key systems and methods.

Because the public key may be shared without fear of being compromised, public key encryption allows us to communicate without relying on secret channels. The following is a list of the public key's characteristics:

- With the use of public key encryption, key distribution may be done via public channels, possibly simplifying the system's initial deployment and making system maintenance easier as parties join or depart.
- The use of public key encryption reduces the need to keep a large number of secret keys. Even if all parties wish to be able to communicate securely, everyone may keep their own private key in a safe manner.
- In open settings, public key cryptography is better, particularly when parties that have never interacted before wish to communicate and engage safely. For example, a business may be able to publish their public key online, and anybody who wishes to make a transaction may use the retailer's public key whenever they need their credit card information encrypted.

1.8 Digital Signatures:

Digital signatures, unlike cryptography, did not exist prior to the advent of computers. With the introduction of computer communications, the need for digital signatures to be addressed emerged, particularly in commercial settings where many parties are involved and each must agree to keeping their declarations and/or offers confidential. Unforgeable signatures were originally proposed hundreds of years ago, but they were handwritten signatures. Diffie and Hellman originally proposed the concept of digital signatures in their article "New Directions in Cryptography."

As a result, in a scenario where the sender and receiver do not have full confidence in one another, authentication alone will not be enough to bridge the gap. Something more is needed, namely a digital signature that functions similarly to a handwritten signature..

1.9 Digital Signature Requirements:

With the "digitalization" age that we are now seeing and living in, the connection that established the link between signature and encryption came into being. The following would be the criteria for an unforgeable signature schema:

- Each user should be able to create their own signature on any document they want.
- Each user should be able to quickly determine whether or not a given string is the signature of a different user.
- No one should be able to create signatures on papers that were not signed by the original owner.

1.10 Digital Signature Principles:

It is critical both within and outside the digital realm to be able to verify that a user or person delivered a message. Handwritten signatures are used to accomplish this in today's society. When it comes to creating digital signatures, public-key cryptography is used. The fundamental concept is that the person signing a document or message uses a private key (called private-key), and the person receiving the message or document must use the corresponding public-key.

1.11 Difference between Digital Signature and Message Authentication:

When communicating via an unsecured channel, parties may want to include authentication in the messages they send to the receiver so that the recipient can determine whether the message is genuine or if it has been altered. Message authentication generates an authentication tag for each message transmitted; receivers must validate it after receiving the message to guarantee that no external attacker has the capacity to create authentication tags that aren't being utilized by the communicating parties.

Message authentication is similar to digital signature in certain ways, but the distinction is that with message authentication, just the second party is needed to authenticate the message. There can be no third-party verification of the message's authenticity or if it was produced by the actual sender. However, in the case of a digital signature, other parties may verify the signature's authenticity. As a result, digital signatures have provided a message authentication method.

2. DISCUSSION

Cryptography is a technique of using codes to secure information and communications so that only those who are supposed to read and process it may do so. The prefix "crypt-" denotes "secret" or "vault," while the suffix "-graphy" denotes "writing." Secret-key cryptography, public-key cryptography, and hash function cryptography are the three kinds of cryptography. Authentication, integrity, secrecy, and non-repudiation are only a few of the main security objectives that cryptography helps to achieve. In the presence of an adversary, cryptographic methods are employed to guarantee data confidentiality and integrity. Various cryptographic techniques, such as symmetric key cryptography or public key cryptography, may be employed during data transit and storage depending on the security requirements and risks involved.

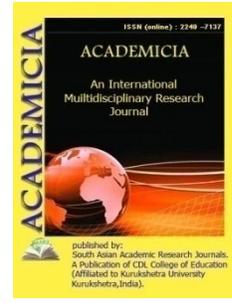

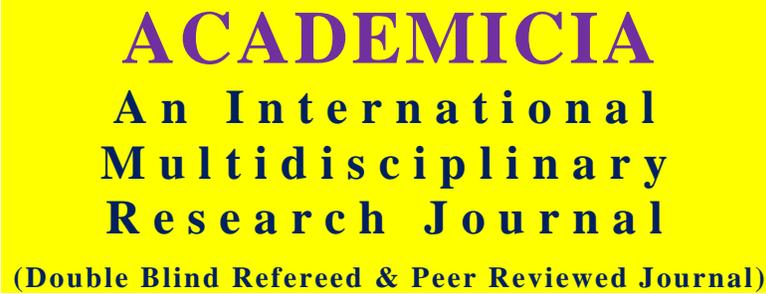

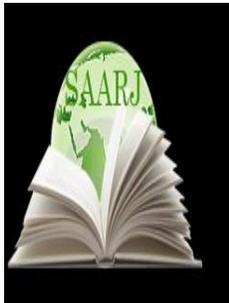

3. CONCLUSION

Authentication, integrity, secrecy, and non-repudiation are only a few of the main security objectives that cryptography helps to achieve. To accomplish these objectives, cryptographic algorithms are created. The aim of cryptography is to provide dependable, strong, and resilient network and data security. Various cryptographic techniques, such as symmetric key cryptography or public key cryptography, may be employed during data transit and storage depending on the security requirements and risks involved. We presented an overview of some of the research that has been done in the area of cryptography, as well as an explanation of how the various algorithms used in cryptography for various security reasons function in this article. In order to secure personal, financial, medical, and e-commerce data while maintaining a reasonable degree of privacy, cryptography will continue to be used in IT and business strategies.

ABSTRACT

For ages, chocolate/cocoa has been prized for its flavor and potential health benefits. Chocolate was formerly chastised for its fat content, and its intake was considered a sin rather than a cure for acne, cavities, obesity, high blood pressure, coronary artery disease, and diabetes. As a result, many doctors tended to caution patients about the health risks of eating excessive quantities of chocolate. The discovery of physiologically active phenolic chemicals in cocoa has altered this view and sparked study into its impact on aging, oxidative stress, blood pressure control, and atherosclerosis. Chocolate is being praised for its high antioxidant content. In many research, however, conflicting findings and methodological problems have made it difficult for health experts and the general public to comprehend the current data on chocolate's health effects. The goal of this review is to evaluate studies on the advantages and dangers of chocolate intake over the past decade.

KEYWORDS: *Chocolate, Cocoa, Flavonoids, Polyphenols, Theobroma Cacao.*

1. INTRODUCTION

In the 16th century, chocolate was introduced to Europe. The contemporary chocolate business has evolved since then, and cocoa beans are now handled in a variety of methods. Chocolate is the most widely desired food in the planet. It was formerly believed to be a luxury item, but it is today considered a medication.

1.1 History:

Chocolate originated in Mexico, where the cacao tree was cultivated by the Mayas, Incas, and Aztecs. It was formerly thought to be an aphrodisiac, available exclusively to the wealthy and powerful. Due to its exorbitant cost, chocolate was eventually supplanted as the primary beverage by coffee and tea. Chocolate, on the other hand, eventually became a popular delicacy in most industrialized nations, including Europe and North America. Cocoa is now mostly cultivated in West Africa, Indonesia, and Sri Lanka[1]–[3].

It was formerly thought to be the drink of Gods because of its health benefits, a connection that gave birth to the scientific name of the cacao tree, *Theobroma cacao*, derived from the Greek words *theo* (God) and *broma* (fruit) (drink). Carl Von Linné (1707–1778), a Swedish scientist, gave the tree its credit. In reality, this term is indicative of chocolate's social, religious, and economic significance in both New and Old World civilizations. In American English, the tree and its dried seeds are referred to as 'cacao' before being processed; after processing, such as roasting and grinding, the word 'cocoa' is used. The term "chocolate" refers to a meal made from roasted cacao seeds. The chemical composition of chocolate is shown in Figure 1.

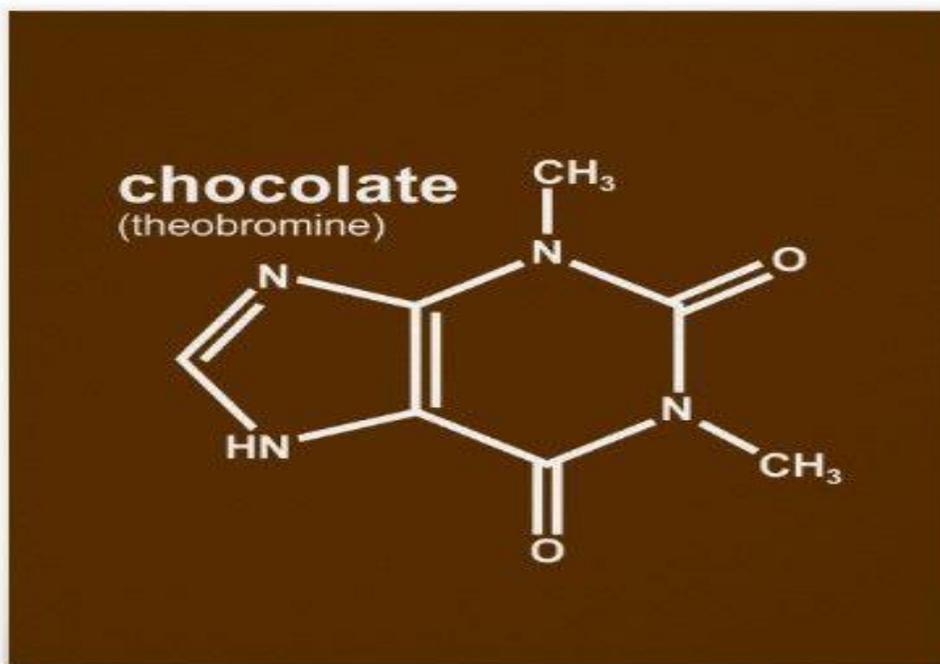

Figure 1: Illustrates the chemical compound of chocolate[4].

1.2 Chemical compounds of chocolate that may affect human health:

Several writers have praised chocolate's nutritional properties, and some have even referred to it as a "complete meal." The following are some of the most important compounds present in chocolate.

a. Fats:

Cocoa butter, which includes about 33% oleic acid (monounsaturated), 25% palmitic acid (saturated), and 33% stearic acid, is the most common fat found in dark chocolate (saturated). The fatty acid oleic acid has a beneficial impact on lipid levels. Total cholesterol and low-density lipoprotein levels are negatively affected by saturated fats. Regardless of whether it is a saturated fat or not, stearic acid may have no impact on lipid levels or may raise them. The difference in stearic acid absorption between cocoa-derived and animal-derived sources may be due to the distinct nature of cocoa-derived stearic acid. Few studies, however, have ruled out this possibility[5]–[7].

b. Antioxidants:

Cocoa butter, which includes about 33% oleic acid (monounsaturated), 25% palmitic acid (saturated), and 33% stearic acid, is the most common fat found in dark chocolate (saturated). The fatty acid oleic acid has a beneficial impact on lipid levels. Total cholesterol and low-density lipoprotein levels are negatively affected by saturated fats. Regardless of whether it is a saturated fat or not, stearic acid may have no impact on lipid levels or may raise them. The difference in stearic acid absorption between cocoa-derived and animal-derived sources may be due to the distinct nature of cocoa-derived stearic acid. Few studies, however, have ruled out this possibility.

c. Nitrogenous compounds:

Proteins as well as the methylxanthines theobromine and caffeine are among cacao's nitrogenous components. They're stimulants for the central nervous system, diuretics, and smooth muscle relaxants.

1.3 Minerals and other properties:

Minerals such as potassium, phosphorus, copper, iron, zinc, and magnesium are also found in cocoa mass, which enhance the health advantages of chocolate. Despite the presence of the stimulants caffeine and theobromine in chocolate, it also includes valeric acid, which works as a stress reliever.

1.4 Potential Health Benefits of Chocolate Consumption:

Regular use of cocoa is thought to be inversely related to the risk of cardiovascular disease. The possible anti-pathogenic effects of cocoa have piqued people's attention in the last decade. A variety of possible pathways via which cocoa may exert its health-promoting benefits have been suggested, but they are still being disputed. A few of them are covered in this article.

1.5 Cocoa and cardiovascular diseases:

Numerous studies have indicated that cocoa may be helpful in the treatment of cardiovascular disorders (CVD). Zomer et al. have found that consuming dark chocolate on a regular basis may be an effective cardiovascular preventative approach in individuals with metabolic illness. The following are some of the possible mechanisms involved in cocoa's positive benefits[8].

1.6 Rich source of antioxidants:

In the development of atherosclerosis, oxidative stress and decreased antioxidant defenses play a key role. Chocolate is the third most antioxidant-rich food in the United States. Chocolate's antioxidants have been proven to prevent plasma lipid oxidation. However, there is a research

that refutes chocolate's direct antioxidant capability, claiming that the significant rise in plasma total antioxidative capacity seen after eating flavonol-rich foods is most likely attributable to elevated uric acid levels caused by fructose metabolism, rather than flavonols.

1.7 Blood pressure lowering effects:

In the Netherlands, males aged 65 to 84 were recruited for a large-scale, longer-term research. When the participants first participated in the research, they were questioned about their food consumption, and then again at five-year intervals. Men who drank cocoa on a daily basis had substantially lower blood pressure than those who did not during the following 15 years. Dark chocolate bars were shown to lower systolic blood pressure in healthy individuals as well as young and elderly hypertension patients after 15 days of consumption.

1.8 Effects on blood vessels and nitric oxide:

The precise mechanism behind chocolate's antihypertensive benefits is unknown, although it may include enhanced nitric oxide (NO) bioavailability, flavonol-induced inhibition of angiotensin converting enzyme, and stearic acid-based diastolic blood pressure decrease.

1.9 Inhibits platelet activation:

Another typical aspect of atherosclerotic lesions is platelet dysfunction. Cocoa has aspirin-like effects on platelet function, and the combined effects of cocoa and aspirin are cumulative, implying that cocoa may help avoid clots. Platelets are affected in two ways by chocolate. It not only lowers platelet aggregation, but it also lowers platelet adhesion[9], [10]. When compared to a group that consumed low-procyanidin chocolate, consumption of high-procyanidin chocolate substantially reduced leukotriene levels and raised prostacyclin levels.

a. Antidiabetic effects:

To increase insulin sensitivity in diabetics, a variety of methods have been explored. In endothelial cells, NO bioavailability has a role in insulin sensitivity. As a result, flavonol may help to lower insulin resistance by increasing NO bioavailability. With healthy individuals and hypertension patients, flavonol-rich chocolate consumption resulted in a decrease in insulin resistance and an improvement in insulin sensitivity. Another research found that eating flavonol-rich chocolate improved glucose and insulin responses to an oral glucose tolerance test in hypertensive individuals with impaired glucose tolerance.

b. Antistress effects:

There are several bioactive compounds in chocolate that promote alertness. A study in Switzerland also confirmed that chocolate alleviates stress. Following 14 days of dark chocolate ingestion, stress parameters in the adults exhibiting high anxiety profiles became comparable with the low-stress subjects. Chocolate affects stress levels by prompting serotonin production which is a calming neurotransmitter.

c. Anti-obese effects:

Chocolate has many bioactive chemicals that enhance alertness. Chocolate also relieves tension, according to a research conducted in Switzerland. Stress indicators in individuals with high anxiety profiles were similar to those in low-stress participants after 14 days of dark chocolate

consumption. Chocolate reduces stress by triggering the synthesis of serotonin, a relaxing neurotransmitter.

d. Effects on the neurons:

A new research of young, healthy individuals utilizing magnetic resonance imaging discovered that cocoa consumption increases cerebral blood flow, indicating that cocoa may help cure diseases like dementia and stroke. Chocolate consumption was also linked to improved cognitive function, according to Nurk et al. Larsson et al. looked at the link between chocolate intake and the risk of stroke in males and found that eating chocolate every day lowers the chance of a stroke attack. Chocolate increases cerebral blood flow, according to Walters et al.

e. Antitumour effects:

Cocoa seems to prevent the development of malignant cells in vitro, according to a few studies. At this time, the precise mechanisms of anticancer action are unknown. On the other hand, other research indicate that eating too much chocolate increases the risk of cancer. To explore the processes involved in cocoa activities and to justify cocoa's use as a cancer preventive and treatment therapy, further preclinical and clinical studies are required.

f. Anti-inflammatory effects:

By attaching directly to the active sites of lipoxygenase enzymes, chocolate suppresses lipoxygenase pathways.

1.10 Cocoa and exercise recovery:

Chocolate supplementation before exercise has been shown to hasten the recovery of post-exercise physiological and metabolic alterations. When compared to the glucose levels of placebos, plasma glucose levels of participants rose substantially 15 minutes after chocolate consumption and remained at fairly high levels until 30 minutes after an hour of jogging.

1.11 Potential Health Challenges of Chocolate Consumption:

Surprisingly, there is little research on the negative consequences of chocolate, despite the abundance of studies extolling its advantages. One of chocolate's components, theobromine, is thought to induce heartburn by relaxing the oesophageal sphincter muscle, allowing stomach acidic contents to enter the oesophagus. Children's allergic responses to chocolate have been reported in a few studies.

2. DISCUSSION

Chocolate is a liquid, solid, or paste produced from roasted and powdered cacao pods that may be consumed on its own or used as a flavoring ingredient in other dishes. Cacao has been eaten in some form since the Olmec civilisation (19th-11th century BCE), and chocolate drinks were produced by the majority of Mesoamerican peoples, including the Maya and Aztecs. The cacao tree's seeds have a strong bitter flavor that must be fermented to bring out the flavor. The beans are dried, cleaned, and roasted after fermentation. The shell is removed to provide cocoa nibs, which are subsequently crushed into cocoa mass, which is raw chocolate. Chocolate liquor is made from cocoa material that has been liquefied by heat. It's also possible to chill the liquor and separate it into its two components: cocoa solids and cocoa butter. Baking chocolate, often known as bitter chocolate, is made out of various amounts of cocoa solids and cocoa butter, with

no additional sugar. Dutch cocoa is made from powdered baking cocoa, which has more fiber than cocoa butter and may be processed with alkali. Sweet chocolate, which is made out of cocoa solids, cocoa butter or additional vegetable oils, and sugar, accounts for the majority of chocolate eaten today. Milk chocolate is delicious chocolate with milk powder or condensed milk added to it. There are no cocoa solids in white chocolate, just cocoa butter, sugar, and milk.

3. CONCLUSION

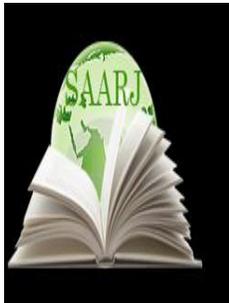

The bulk of research touting chocolate's health advantages are small-scale and funded/conducted by chocolate producers, whose personal interests cannot be overlooked. This necessitates careful evaluation of the findings' implications, since there is a risk of study bias. Before doctors may confidently suggest 'a chocolate a day' to their patients, further large-scale observational and/or interventional research from non-biased sources are required.

Furthermore, the polyphenol content of the items utilized in controlled trials is typically considerably greater than that of most commercially available goods. Because flavonols have a bitter flavor, producers have developed cocoa processing methods that remove the bitterness along with the flavonoids. Cocoa processing may result in the loss of up to 90% of the flavonoids. As a result, it must be determined if consuming goods with reduced polyphenol concentration is linked to any health advantages in people.

ABSTRACT

This article presents the results of a study on the process of reviving the eggs of a foreign hybrid of the silkworm "HUATONG", which was revived in the spring period in two ways, one of which is simple, widely used by specialists, and the other is used in automated hatcheries with optimal temperature and humidity. For these studies, the hatchery of the farm "Shukhrat bogi Baraka" of the Qorakhitoy region of the Akhangaran district of the Tashkent region was selected. The experiments were carried out with the first batch of eggs in 4 variants and 12 replications; in each replication was 1000 eggs. The number of revived caterpillars and non-revived eggs were analyzed, and the percentage of revivability by replication was comparatively analyzed.

KEYWORDS: *Spring, Summer, Season, Breed, Hybrid, Silkworm Eggs, Silkworms, Party, Resuscitation Methods, Incubator, Temperature, Environmental Factors, Light, Food, Incubation.*

INTRODUCTION

The growing demand for natural fabrics in the world market from year to year has led to the production of natural silk and silk products, as well as requires mulberry silkworm eggs, their revitalization, cocoon preparation, pre-processing, cocoon spinning and finished products on the basis of new intensive technologies

Based on the above, scientific and practical research on the production of quality superelite, elite and industrial mulberry silkworms is currently being conducted in more than 20 countries around the world.

Presently, 75-80% of mulberry silkworm eggs are produced in the Peoples Republic of China, 11-12.5% in India, 1.3% in Uzbekistan and the rest in other countries where silkworm breeding is developing.

Creation of a new generation of silkworm breeds and hybrids in scientific research institutions of developed countries, which are resistant to changing environmental conditions of spring and summer, meet all the requirements of biological and all productivity indicators worm farms, along with the development of excellent methods and intensive technologies for the revival of silkworm eggs, bringing their cocoon productivity and technological properties to a level that meets the requirements of industrial enterprises, certain results have been achieved in their production testing on farms and in specially organized incubators.

In order to further develop the silk industry in Uzbekistan, make full use of existing opportunities, increase the material interests of the rural population by providing them with permanent jobs, re-equip silk enterprises with new equipment and technologies and attract foreign investment and production of new scientific developments through the introduction of intensive technologies, particular attention is paid to increasing the quantity and quality of products.

Especially by the President of the Republic of Uzbekistan in 2018, Resolution No PQ-3616 of March 20 "On additional measures for the further development of the silk industry" defines the strategic directions and prospects of research in the silk industry, extensive testing of scientific and selection achievements through the rapid development of the industry, further development of mulberry silkworm breeds and hybrids, primary breeding of mulberry varieties, the widespread introduction of advanced scientific developments and intensive agro-technologies, taking into account the natural climatic conditions of the regions.

Research materials and methods

Our research was conducted in the incubator of the farm "Shukhrat Bagi Baraka" in the Karahitay region of Ahangaron district of Tashkent region. We know that the sharp changes in natural climatic conditions in recent years have created a number of difficulties in the process of timely implementation of agro-technical measures. It is especially important to keep the temperature and humidity in the incubator at a constant level in the process of revitalization of mulberry silkworm eggs in the spring in different regions of the country. Otherwise, the embryonic development and revitalization of mulberry silkworm eggs leads to a decrease in the biological and, in turn, the productivity of the larvae of the cocoon.

It has been proved that positive results can be achieved by reducing the impact of the above adverse consequences as well as scientific research has been conducted to increase the economic value traits of silkworms.

The main purpose of the study was to develop a modern innovative new agrotechnology to increase the percentage of mulberry silkworm eggs revitalization in the spring and summer seasons for silk clusters, farms and home-grown worms, as a result, the research showed that the percentage of revitalization of eggs revived by the automated method was higher and more positive than the percentage of revival of eggs revived by the simple (comparative) method.

As a starting material in the spring from the eggs of the 1st batch of silkworms "HUATONG" hybrids imported from abroad 3000 pieces of samples were taken in four variants of three replications.

The number of eggs in each variant and replication, egg yolk weight, one egg weight, arithmetic mean, number of physiologically defective eggs, and number of eggs laid for resuscitation (gr) were calculated, and each replication and variants were placed in two different ways.

The first method: In the method used by ordinary (comparative) local experts, the incubator temperature was heated with room-mounted heating equipment and the humidity level was adjusted using a damp sheet, the room floor was wetted every 2-3 hours and a bucket of water was placed in different parts of the room.

The temperature and humidity in the room was measured for 2-3 hours using psychrometer, and the results of the study were recorded in a special workbook.

The second method (experiment) the temperature and humidity in the automated incubator were kept constant and controlled by an ultrasonic device with an automatic control system to ensure that it did not rise or fall sharply above the norm.

The temperature and humidity in the incubator room were measured every 2-3 hours using an ultrasonic device and psychrometers, thermometers, and the results of the study were recorded in a special workbook.

Today, a group of leading scientists in Uzbekistan are working in order to create strains and hybrids of mulberry silkworms that are resistant to extreme natural climates and various environmental factors in the spring and summer seasons, as well as to improve their biological and cocoon productivity [1], creation of high-yielding hybrids, which are manifested during the breeding season of the breed in order to produce purebred hybrids at breeding seed stations and seed enterprises[2], changes in reproductive traits in the population of pure breeds of silkworms under adverse environmental conditions[3], manifestation of cocoon productivity indicators of F₂ generation breeds under adverse stress conditions[4], methods of obtaining interspecific and interspecific hybrid combinations of silkworms [5], the effect of differential resuscitation of mulberry silkworm breeds and hybrids, the correct timing of revival, the quality of cocoons collected, delivered and stored in rearing house [6], the effect silkworm feed on the biological cocoon productivity and technological properties of silkworm larvae of mulberry leaf varieties and the level of nutrients [7-11], extensive scientific research has been carried out and positive results have been achieved.

However, insufficient attention has been paid to scientific research on improving the viability, cocoon productivity and technological properties of mulberry silkworm eggs by reviving them at the same temperature and humidity, based on new technologies and mechanized electronic control, in the rapidly changing, unfavorable natural climate of spring and summer.

RESEARCH RESULTS

In our experiments, the goal is to grow fine-grained cocoons that meet the requirements of cocoon processing enterprises in the spring and summer cocoon clusters, farms and home-grown worms with a high recovery rate, healthy, in general, the biological, cocoon productivity and technological characteristics of larvae, we conducted experiments on the imported HUATONG hybrid.

When we compare our experience with the arithmetic mean differences in the percentage of seed revival of HUATONG hybrids in an automated incubator and a simple (comparative) incubator in the spring of 2021, the samples obtained are shown in Table 1.

**TABLE 1 REVIVAL RATE OF MULBERRY SILKWORM EGGS (SPRING 2021)
HUATONG №1 BATCH IN AUTOMATED HYGROTHERMAL MODE**

№	Breeds and hybrids	Number of batches	Number of samples	Total number of eggs, pieces	Number of live worms, pcs	Number of non-live worms, pcs	Revived worms, percentage

2. rep.	"HUATONG"		replication2	1000	983	17	98,3
3. rep.	"HUATONG"		replication3	1000	984	16	98,4
Average:				1000	984	16	98,3
3.ver.	"HUATONG"	1- batch	replication 1	1000	983	17	98,3
2. rep.	"HUATONG"		replication2	1000	985	15	98,5
3. rep.	"HUATONG"		replication3	1000	986	14	98,6
Average:				1000	985	15	98,4
4.var.	"HUATONG"	1- batch	replication 1	1000	984	16	98,4
2. rep.	"HUATONG"		replication2	1000	988	12	98,8
3. rep.	"HUATONG"		replication3	1000	985	15	98,5
Average:				1000	986	14	98,5
Total:				1000	985	15	98,4

According to the analysis of the data presented in Table 1, the arithmetic mean between the various options and replications was determined by the percentage of silkworm eggs revival in spring by an automatic method.

In addition, the total number of silkworm eggs in each variant was 1,000 with 3,000 replications. At the same time the average number of live worms in our experimental variant was 985 eggs. It can be seen that the number of non-live eggs was 15 and the arithmetic mean of live worms was 98.4%.

**TABLE 2 REVIVAL RATE OF MULBERRY SILKWORM EGGS (SPRING 2021)
HUATONG №1 BATCH IN SIMPLE (COMPARATIVE) WAY**

№	Breeds and hybrids	Number of batches	Number of samples	Total number of eggs, pieces	Number of revived worms, pcs	Number of non-revived worms, pcs	Revived worms, percentage
1.var.	“HUATONG”	1-batch	replication 1	1000	965	35	96,5
2.rep.	“HUATONG”		replication 2	1000	961	39	96,1
3.rep.	“HUATONG”		replication 3	1000	957	43	95,7
Average:				1000	961	39	96,1
2.var.	“HUATONG”	1-batch	replication 1	1000	955	45	95,5
2.rep.	“HUATONG”		replication 2	1000	947	53	94,7
3.rep.	“HUATONG”		replication 3	1000	950	50	95
Average:				1000	951	49	95
3.var.	“HUATONG”	1-batch	replication 1	1000	943	57	94,3
2.rep.	“HUATONG”		replication 2	1000	945	55	94,5
3.rep.	“HUATONG”		replication 3	1000	951	49	95,1
Average:				1000	946	54	94,6
4.var.	“HUATONG”	1-batch	replication 1	1000	948	52	94,8
2.rep.	“HUATONG”		replication 2	1000	956	44	95,6
3.rep.	“HUATONG”		replication 3	1000	952	48	95,2
Average:				1000	952	48	95,2
Total :				1000	952	48	95,2

Analyzing the data presented in Table 2, the percentage of revitalization of mulberry silkworm eggs in the comparative spring season was as follows in terms of different options and reductions.

In simultaneous comparative variants, where the total number of silkworm eggs in each variant was 3000, the number of replications was 1000, the average number of live worms in each variant was 952, the average number of non-live worms was 48, and the arithmetic mean of live worms was 95.2%.

Experiments show that the eggs of HUATONG hybrids were 3.2% higher when revived in an automated incubator than in a normal (comparative) incubator.

This, in turn, has led to a positive increase in other economic values.

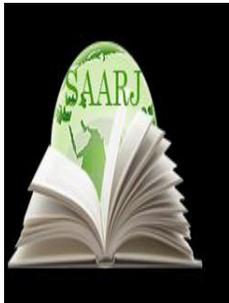

CONCLUSION

Based on the results of the above analytical studies, maintain room temperature and humidity at the same level in accordance with agrotechnical rules when reviving mulberry silkworm eggs for spring resuscitation improves survival rate of silkworm, cocoon yield and fiber technology.

ABSTRACT

The article analyzes the sphere of civic activity, as well as the network form of its organization. The features of this sphere of public life, which are significant for predicting its development, are revealed. Theories of social movements are considered. The factors and reasons for the activation of network civic activity, the conditions for its implementation in modern society are noted.

KEYWORDS: *Civil Society, Civic Engagement, Social Movement, Network Analysis, Network Organizations, Social Actors, Social Structure.*

INTRODUCTORY PART

In modern civil society, great importance is attached to personal and informal relationships aimed at achieving a common result and public good. Citizens begin to resolve issues of concern to them, going out into the public space, attracting the attention of the public. As a result, there is a development of social mechanisms that spread in the horizontal environment of activists. In such movements, subjects on equal terms try to form a joint decision on issues of interest to them. They begin to use the resources at their disposal as openly as possible. One can observe a picture in which individuals seek solutions to their problems through social movements formed around them or other forms of activity created on a common interest.

Socio-political changes in modern Uzbek society over the past five years have changed significantly, as a result of which civic activity has received a new impetus for development. In

various spheres of public relations, there is an increase in the involvement of citizens and social groups in solving urgent social problems.

One of the features of civic engagement is the increasing use of the network principle for its organization. Network mobilization of the population in civil campaigns, actions and movements effectively affects the achievement of results and allows private initiatives to reach a new level. The network organization attracts by the presence of informal horizontal connections, openness, as well as the problems of the movement. Many social movements are networked and often involve issues of concern to the general population. Such movements are formed in the field of human rights protection, education, ecology, politics and the social sphere.

The motivation for participation in civic campaigns can be of different nature, but for the most part it is an expression of one's position. In addition, there are opportunities for the inclusion of activists in public activities without significant expenditure of resources. First of all, such opportunities are provided by the Internet.

Civil activity becomes an influencing mechanism of influence on the formalized structures of society and the state, as well as on ordinary citizens. It often happens that the state itself implements them, and tries to make the networked civic activity manageable. It often happens that civic activity comes from state institutions and various political forces.

Research methodology and methods

The study uses a range of sources, which include the fundamental works of researchers in the field of civil society and the network approach in the theory of organization. The analysis of civil movements in modern Uzbekistan is based on the criteria of network forms of organization formulated in the works of M. Castells, W. Mastenbrook and other scientists.

The methodological basis of the work was formed by the method of network analysis, used to study specific civic movements, methods of political analysis are also used, such as event analysis and content analysis, as well as situational analysis and case-study. General scientific methods were used: comparative and logical methods, methods of induction and deduction, as well as structural-functional and systems approaches. In addition, an expert survey method was applied to collect empirical data.

Research results and discussion

The term "organization" can be viewed from several angles. [1, p. 632; 7; nine].

The relationship in the organization between its elements can be built vertically and horizontally, in each case, the dominance of the type of management communication will determine the type of organizational structure. In this aspect, two types of organizations can be distinguished - network and hierarchical or non-network. A hierarchical structure is a multilevel form of organization of objects with a strict correlation of lower-level objects to a specific upper-level object. The most common form of hierarchical organizations is government agencies and structures, which, in turn, control political organizations, commercial and non-profit structures. Networked organizations are organizations that use networked connections, relationships, and technologies in manufacturing management. These are associations that are built on a common goal, on certain rules of cooperation in groups.

The organization of civic engagement can be expressed through both forms of organization - both through the network and through the hierarchical one. Now there is an active discussion of the development of network forms of organization and the shift of priorities from a hierarchical form of management to a network one.

Constant changes in various spheres of public life lead to an increase in civic engagement and the need to apply new forms of organizing activities. At present, the heated discussion of problems in society, the holding of various actions in the country shows an increase in the number of civil movements. They are becoming more and more dissatisfied with the rules of the game, the prevailing norms, the environment, etc. Against the background of all these problems, we see the creation of new movements and organizations that in various ways are trying to assist in meeting the legitimate rights and interests of citizens. Basically, they all start with local stocks. The effective use of mass media helps such movements to find supporters in other regions and cities, which ultimately turns them into large-scale campaigns.

There are many approaches to defining the concept of "social movement", the interpretation of which depends on the choice of the basic concept and key concepts. There are four main approaches to the study of social movements: the theory of "collective behavior" (Turner, Killian); the theory of "resource mobilization" (Zald, McCarthy); the theory of the "political process" (Tilly); theory of "new social movements" (Touraine, Melucci) [8, P.47].

The first three refer to the results of American studies, the last one to European ones. The theory of collective behavior connects the essence of a social movement with the public, its social base. G. Bloomer considered collective behavior as any group activity in which individuals act together in such a way that between them there is a certain division of labor and a certain mutual adaptation of various lines of individual behavior, identifies elementary collective groupings (crowd, panic, riot, riots, etc.) and more complex, organized forms of collective behavior, which include social movements, social organization, institutions [8, P.43].

Elementary collective groups are spontaneous and natural, function with the help of primitive mechanisms of collective behavior, and arise under certain conditions and circumstances. Social movements, according to G. Bloomer, in the process of their activities are formed from a poorly organized form, gradually assuming the character of society, social organization. Turner and Killian define a social movement as some kind of collective entity that acts with some consistency to promote or prevent change in the society or organization of which they are a part. [5, P.9].

The English researcher E. Giddens defines social movements as active subjects of the social structure of society. The author notes the meaningfulness of human action and behavior in movements, which refers this knowledge to an element of the structure of social action. In accordance with this theory, social movements are "social practices ordered in space and time", which "are not created by social actors, but only constantly reproduced by them" [8, p. 126].

Melucci argues that social movements do not coincide with "visible" political conflicts. Even when they are not involved in campaigns and mobilizations, social movements can be active in the area of cultural production. Melucci introduces the concept of "sphere of movement", defined by him as social networks of groups and individuals,

Russian sociologist O. Yanitskiy understands social movement as a stable collective social subject that has its own ideology, leader and organizational structure, capable of mobilizing resources and achieving through a sequence of collective actions social (political) changes in the interests of society or its partindependent and self-sufficient cells, which are not always, but quite often, build up into a more global movement structure. The public activity of these communities is focused on the social problems of private and everyday life, it is little politicized, specific (objective) and rejects abstractions, but at the same time does not exclude possible transitions to generalizing activities. [4, p.82].

It is possible to identify some characteristics of network organizational forms: the formation of a flat hierarchy, in which all departments are equal from the point of view of the main processes; minimization of the number of hierarchical constructions; equality and cooperation of divisions of the organization; the formation of a close and open relationship between the organization and its elements with the environment.

Note that the relationship in the organization between its elements can be built both vertically and horizontally. And one of the key aspects of the network is its contractual structure, voluntary participation and the general idea that brings people together.

CONCLUSIONS

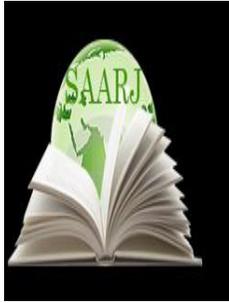

Modern trends in the development of social movements are to increase the openness and publicity of collective action through social media.

Network forms of organizing civic engagement are successfully developing mechanisms of self-organization of citizens in modern society, allowing its organizers to achieve significant results.

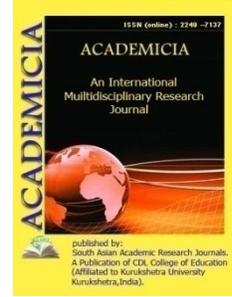

Let us emphasize several characteristics of networks that allow them to exist in the field of public administration. First, networks link the state and civil society. This structure is empirically observable and is theoretically described as a multitude of diverse public, private, public organizations and institutions that have some common interest. Second, the network is formed to develop agreements in the process of exchanging the resources available to its actors. This means that there is a mutual interest of network participants in each other. Resources can be unevenly distributed, but regardless of the degree of their concentration and a certain dominance of a number of network participants, the latter are forced to interact. There is a resource dependence between network participants. Third, the common cooperative interest is an important characteristic of the network. This distinguishes this regulatory system from the market, where each participant pursues, first of all, his own interests. Fourth, from the point of view of making decisions, network participants do not line up in a certain hierarchy, where any organization has an advantage due to its position of power. All network participants are equal in terms of the possibility of forming a joint decision on an issue of interest. Here, not vertical, but horizontal relationships are observed. Fifth, the network is a contractual structure consisting of a set of contacts arising from agreed formal and informal rules of communication. The actions carried out by network organizations have an impact on the socio-political situation in society, especially in resolving acute social problems that require resources and costs.

ABSTRACT

Operating systems are used in computers, and computers are extremely useful in saving time, thus they play an essential part in people's life. Computers mostly utilize operating systems. Users may describe an operating system as a system that runs their application programs and provides a user interface through which they can interact with the computer's hardware. The majority of commercially available operating systems today include flaws in their code, as well as security flaws and vulnerabilities. The author chooses to create this review paper due to a lack of knowledge about operating systems. In this review article, the author discusses operating systems, their history and development, applications, functions and types, as well as their advantages and difficulties. The author thinks that this article will aid in the comprehension of operating systems. The architecture of the robotics operating system is also used to write robot software. New updates have been released to address problems and defects, allowing OS to offer its users with the safest computing environment possible. As a result, the future of operating systems seems promising.

KEYWORDS: Computer, Hardware, Management, Operating System, Software.

1. INTRODUCTION

Humans will be unable to succeed, manage, and utilize computer systems without operating systems. A computer database/operating program's system is a system that provides software resources, processor hardware, and other mutual facilities. Operating systems are the most active kinds of system software and are regarded as the primary programs that execute when hitting a device. Users utilize operating systems to run their applications programs. It also provides users with a suitable interface for interacting with computer hardware. Operating systems are also responsible for providing a multi-level secure execution platform, hosting device drivers, regulating input and output peripherals, managing data storage, assigning main memory to different programs, generating threads, and launching processes. Linux, Mac OS, Windows, Unix, and other operating systems are examples of operating systems[1].

Operating systems such as Windows and Linux, like any other technology, have difficulties in terms of computer security, since they encounter many viruses, mistakes, and flaws throughout the course of their lives. To address these issues, the developers of these operating systems provide updates to address these issues and offer the safest computing environment for its operators and applications programs. The author of this review article discusses operating systems, their history and development, their types and functions, their benefits and difficulties, and their applications[2].

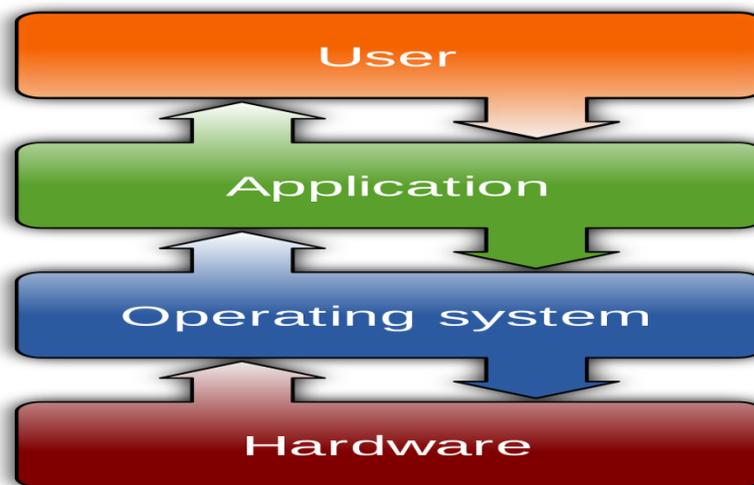

Figure 1:Representation of Architecture of operating system[3]

The design of operating systems is the interaction between computer software and hardware. Figure 1 depicts the operating system's design.

1.1 Various Type of operating system:

Figure 2 shows the many kinds of operating systems available today, including Mobile, Network, Distributed, Real-time, Multitasking, Multiprocessing, and Batch shown in Figure 2.

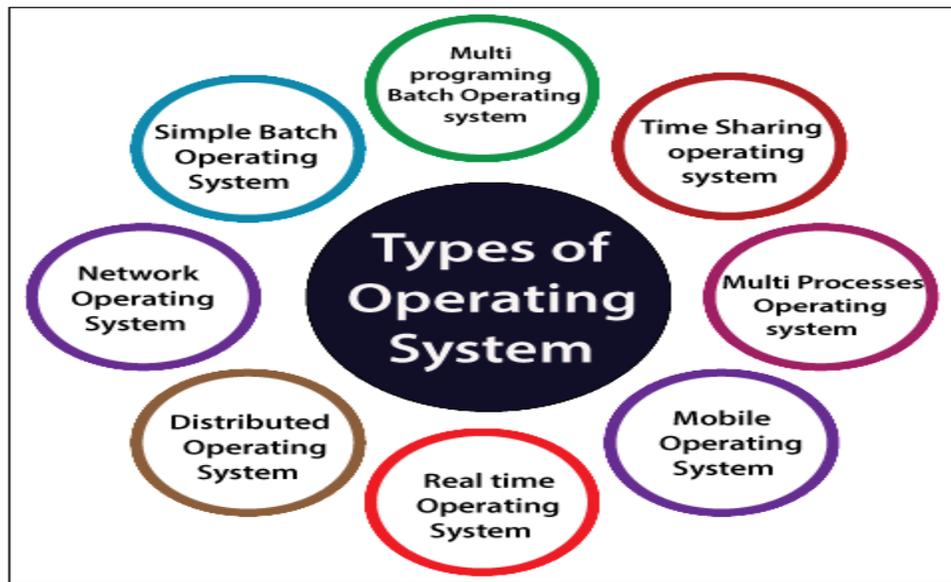

Figure 2: Various types of operating systems that are available in market[4]

a. *Mobile Operating System:* The systems that are intended to power wearable devices, tablets, and mobile phones are known as mobile operating systems. The following mobile operating systems are Android and iOS.

Advantages:

- It allows users complete access to all aspects of the device, including hardware and software.

Disadvantages:

- The upgrades are expensive and take a long time to complete.

Network Operating System: It's a networking solution that can help with application, security, groups, users, data, and a variety of other tasks. It's essentially a server that operates it.

Advantages:

- Centralized servers are very reliable.
- Servers may be accessible from a number of locations and platforms remotely..

Challenges:

- The cost of purchasing a server is expensive.
- It is necessary to preserve and update the information.

Distributed Operating System: It's a system that uses several mainframes spread over multiple computers to provide rapid computing to its workers.

Advantages:

- A user may utilize another resource that is available at another location by using the resource sharing feature.
- It provides superior services to its clients.

Real time Operating System: It is a system that operates on real-world applications and processes data in real time. RTOS include Windows CE, Vx Works, RT Linux, and QNX.

Advantages:

- This approach allows users to reuse their code.
- Priority scheduling is used in this system.

Multitasking Operating System: It's a system that enables several practices or activities to be completed at the same time using multiple CPUs. Sharing of time refers to the time on the mainframe that is shared by several operators.

Advantages:

- The idle time of CPU reduces.
- It removes the copy of software.

Disadvantages:

- Reliability is the main problem in multitasking.

b. Batch Operating System:

It is a system that does not interface with the computer directly. As certain computer procedures take a long time to complete. Work with a similar kind of need is collected together and executed as a collection to speed up the same process. Every operator creates a job on an offline device, such as a punch card, and delivers it to the computer operator in this format.

Challenges in Batch operating system:

- In this system, the interaction of user and job is less.
- Difficult to provide desired priority.

1.2 Operating System function:

In operating system, following tasks are shown in Figure 3.

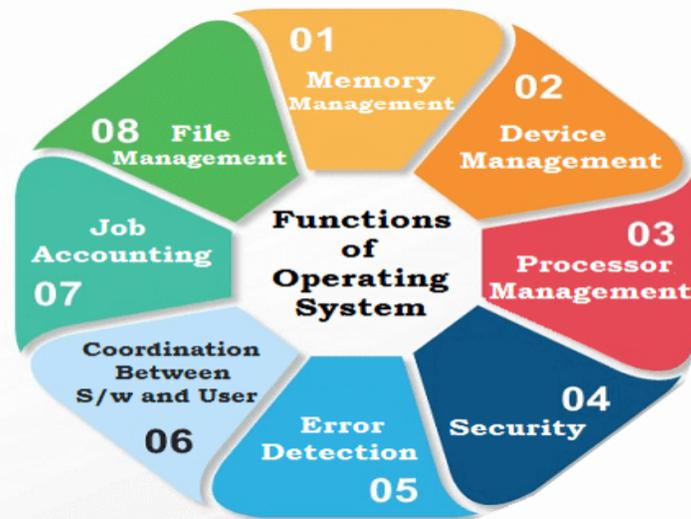

Figure 3: Various functions that are performed in operating system[5]

- *File Management:* This refers to the administration of file-related tasks such as file protection, sharing, name, organization, storage, and retrieval.
- *Job Accounting:* Job accounting may be defined as the keeping track of the resources and time spent by several operators.
- *Security:* Security is the function that protects a computer's papers and data from unauthorized access, danger, and viruses.
- *Process Management:* This is the management that creates and eliminates practices. It provides administration and communication tools, among other things.
- *Device Management:* This feature allows you to keep track of all of your instruments. Input/Output control is also part of this management. It also performs the task of device distribution.
- *Memory Management:* It is used in applications to allocate and de-allocate memory space.
- *Error Detection:* Error detection is the process of detecting a mistake produced by noise or other impairments during transmission from the transmitter to the receiver. The process of identifying errors in data and returning it to its original, error-free form is known as error detection.
- *Software-to-user coordination:* In this case, the user issues instructions to the system to coordinate it.

1.3 Benefits of Operating System:

- The operating system is in charge of input and output management.
- It enables you to conceal hardware specifics by creating an abstraction.
- Graphical User Interface (GUI) may be utilized in the form of buttons and icons, making it simple to experiment with.

- A user may run programs and apps.
- The operating system is used to synchronize practices.
- The Operating System is in charge of resource allocation.
- The operating system acts as a link between the application and the hardware..

1.4 Challenges of Operating system[6]:

- If there is a problem with the operating system, the user may lose all of their data.
- The operating system is not completely secure since viruses may strike at any moment.
- Operating system software is prohibitively expensive for small companies, adding to their financial burden. Consider the example of Microsoft's Windows operating system..

1.5 Common desktops operating system:

The common desktop Operating system which is mentioned below:

- *Linux*: It is a free or low-cost operating system for its users[12]. It has a lot in common with UNIX. Linux is well-known for being a fast and well-organized operating system[7][8].
- *UNIX*: It was created in the 1970s. The C programming language is used in the UNIX operating system. It's a multi-user operating system that prioritizes adaptability and flexibility.
- *Mac OS*: Since 2011, Apple Inc. has been manufacturing and marketing the Mac OS operating system. Mac OS is primarily utilized in Apple's Macintosh PCs and workstations.
- *Windows*: The first version of Windows was released in 1985. It's a graphical user interface-based operating system that comes in a variety of flavors, including Windows XP, Windows 7, and Windows 8. It is a Microsoft-based operating system that is often found in personal and corporate computers. Because of the user-friendly Windows 95, it was mainly responsible for the rapid growth of personal computers.

1.6 Applications of Operating System in human life:

- *Human-computer communication*: As technology advances, it is becoming clear that people are attempting to interact with computers. People may become more connected as a consequence of technology advances such as social media, mobile phones, videoconferencing, chat rooms, and e-mail. It allows you to save time, effort, and money. Radio, television, and print media all played an important role in our everyday lives. In terms of production, control, storage, and broadcasting, computers have an effect on them as well. A document may be written on a computer, viewed on a screen, edited, printed on a printer, or sent to the rest of the world through the World Wide Web.
- *Computer's Impact on Education*: The introduction of computers into the educational sector resulted in a high quality of learning and instruction. We may use a computer to connect to the internet and link this information to a variety of ways in order to study any topic. Computers are also used to facilitate interaction between students and instructors. Smart classrooms are also available at educational institutions[9].

- *Computer's newest trends and future expectations:* With the advent of computers, human life has altered dramatically. As a consequence, it's critical to emphasize the upcoming changes that computers will bring. Future changes will be focused on space travel, driverless vehicles, 3D printing, interest-based education, machine learning (ML), and artificial intelligence technology (AI)[10].

2. DISCUSSION

As previously stated, the operating system is the software that is used to run user programs and offer an interface for communicating with computer hardware. Many technologies, including artificial intelligence, machine learning, and the internet of things[13], are now accessible on the market, and their inventors utilized operating systems to create them. People may also use the Robotics operating system framework to develop robot software. Introduction to operating systems, evolution and history, types and functions, benefits and challenges, and applications of operating systems are all covered in this article. This article, according to the author, will assist individuals who wish to learn about operating systems. Operating systems are important in human existence because without them, humans would be unable to utilize and manage computers. In today's operating systems, there are certain difficulties such as bugs, failures, and hardware issues. In light of this, developers are working hard to resolve these issues and offer their users with the safest computing experience possible. As a result, the operating system's future seems promising.

3. CONCLUSION

Currently, operating systems play a significant part in people's lives since computers and technology make work easier. An operating system is a system that runs user applications programs and provides a user interface for interacting with computer hardware. The following desktop operating systems are Linux, Unix, Windows, and Mac OS. People have shown a lack of knowledge about operating systems. The author chooses to write this paper in order to address this issue. The author of this review article addressed operating systems, applications, functions and types, as well as their advantages and difficulties. Operating systems are mostly used in computers, but robotics operating systems are increasingly being utilized to write robot software. Operating systems, like any other technology, are susceptible to bugs, viruses, and other problems. Updates are currently being developed to address these issues. Since a result, the operating system's future is bright, as it is employed in supercomputers and aids in the reduction of work load.

ABSTRACT

Photovoltaic technology has advanced rapidly in recent years; with studies showing that only around 20% of solar energy is turned into electricity, while more than 50% of incoming solar radiation is converted into heat. By eliminating the surplus heat, the electrical efficiency and operating temperature of PV modules may be increased. As a result, the PVT collector, a hybrid collector, was born. PV cell cooling has become an essential research topic in order to enhance PV panel efficiency, power output, and performance characteristics. For several hybrid PVT solar collector designs, many theoretical, experimental, and economic investigations have been conducted. In various applications, other alternative concepts may be better. This article examines the historical and current trends in PVT technology development, focusing on the performance and economic feasibility of PVT systems in various application areas. Future suggestions and critical evaluations will be made in order to overcome the obstacles and difficulties that are preventing the advancement of PVT technology.

KEYWORDS: *Efficiency, Photovoltaic, Photovoltaic Thermal (PVT), Solar Energy, Thermal.*

1. INTRODUCTION

Due to its capacity to operate under diffuse radiation, solar PV panels are becoming more popular all over the globe. As a result, it's critical to understand how PV panels react to changing weather conditions. Only 15–20 percent of solar irradiation can be converted into energy in reality, with the remainder being lost as heat. With every one degree increase in module temperature, PV module efficiency drops by around 0.40–0.65 percent. In hot dry regions, PV

temperatures may exceed 80 degrees Celsius. As a result, constant attempts are made to improve photovoltaic efficiency. A photovoltaic thermal (PVT) system is a well-engineered solar cogeneration system that combines photovoltaic (PV) modules with solar thermal components to produce both energy and heat. The efficiency of PV cells decreases as their working temperature rises, which may be increased by removing the heat with appropriate cooling. The waste heat extracted to cool the PV module may be used in a variety of heating applications, including crop and fish drying, textile manufacturing, building heating, and dehumidification.

The main benefit of hybrid PVT systems is that they provide two yields, namely electricity and heat, for a little additional cost and a fraction of the area. This is a great example of optimization since the negative effects of overheating the panel are reduced by extracting the excess heat and repurposing it for beneficial purposes. Micro-channel cooling systems, thermo-electric cooling systems, heat pipe cooling systems, mist water cooling systems, water film cooling systems, PCM [1].

All of these systems operate with various kinds of fluids and may be categorized using the following criteria: single phase or two phase, moving parts or no moving parts, generation or no generation, active or passive, working fluid utilized. The following are some of the most frequently utilized cooling systems: Micro-channel heat exchangers are the most common kind of confinement heat exchanger. This system is used in electronic cooling and features channels with a hydraulic diameter of less than 1 mm. They may be machined on the backs of microelectronic component sub-strates in integrated circuits, where the heat produced by the electronic components is pushed into the coolant. Thermoelectric cooling systems use thermoelectric devices, which are made up of two types of semiconductors: n type and p type. Thermally, the materials are connected in parallel, while electrically, they are connected in series. When there is a temperature gradient, the majority of carriers diffuse from the hot to the cold side, resulting in a voltage and current. An applied voltage pushes a current through the materials in the opposite effect, resulting in an efficient heat pump that cools one side and heats the other [2].

Heat pipes transmit heat from a source via the evaporation and condensation of a fluid. Heat pipes are effective heat transfer devices that can transport heat over long distances and are intended to have a low temperature decrease. Several researchers cooperated on the photovoltaic cooling application of heat pipes cooling technology. This technique has been explored for concentrator photovoltaic panels in particular (CPV)[3].

Water is the operating fluid in the Liquid PVT Collector. In recent years, many researches on this cooling method have been conducted. The use of water as the working fluid improves efficiency significantly, according to studies. The energy delivered to the water in the tubes via conduction is transmitted to the posterior surface of the panel. Tubes, channels, and spiral tubes are all possible forms for the sheet and tube arrangement. Depending on the cooling technology employed, cooling systems have different limits. Because the PV module must be physically connected to the thermal absorber in order to have a better heat transfer, one of the most frequent restrictions is the need for glue. As a result, the average stagnation temperature for unglazed PVT is 80 C, whereas it may reach 130 C for glazed PVT[4].

Raghuraman presented two separate one-dimensional models for predicting the thermal and electrical performance of PVT photovoltaic combined air/liquid PVT collectors, as well as some

recommendations for maximizing the total energy gained from the collectors, such as selective absorber Optical premasters, distance interval of glass absorber plate, and thermal contact, two years later. Incorporated and tested a novel transparent hybrid a-Si PV/T in the hybrid unit. The findings indicate that simple and inexpensive hybrid systems with consistent photovoltaic and thermal efficiency may be built. According to a research on hybrid forced-air systems [5].

The system can only be autonomous for certain design parameters and flows. A flat plane booster reflector was added to a flat hybrid solar air heater to expand this research. A strong thermal contact between the photovoltaic element and the absorber plate is critical for achieving excellent thermal performance in a PVT collector. To join the two pieces, a coating of high conductivity glue is usually used. The thermal contact between the PV panel and the collector is assessed using various materials and application methods. It was discovered that the PV panel's power output improved by 10% above the original design. More sophisticated methods, such as laminating together all of the components, may be utilized. In compared to previous PVT approaches, the experimental results revealed a substantial improvement in both thermal and electrical performance. Using pc-Si PV cells, the thermal and electrical efficiency at zero decreased temperature was 79 percent and 8.8 percent, respectively a non-contact situation a photovoltaic-thermal collector, which comprises of a PV panel separated by a traditional sheet and tube solar thermal collector. The thermal efficiency of the non-contact type system surpasses that of the contact type collector at higher input temperatures when PV transmissivity is high (> 0.75) [6].

The average yearly efficiency of photovoltaic power generation improved from 2.8 percent to 7.7 percent using a hybrid system, according to Kalogirou. The economic study revealed a 4.6-year payback time. When a photovoltaic panel was combined with a solar air collector, discovered that the electrical efficiency improved from 8.6 percent to 12.5 percent. According to the numerical model created by Siddiqui and Zubair, hybrid collectors are more beneficial in regions with high solar radiation and ambient temperature, such as those prevalent in the Middle East. Another benefit of PVT is the low cost of production. As a result, the energy payback time for PVT collectors was shown to be much lower than for conventional collectors.

2. DISCUSSION

2.1. Application:

The number of transparent coverings that may be utilized in a sheet-and-tube arrangement has been thoroughly examined. Single-glazed PVT was mentioned. A glazed collector produces more heat than an unglazed one. Nonetheless, owing to increased optical losses, its electrical output is decreased. It was also discovered that the effectiveness of exogetics rises with the flow temperature up to a certain point. Maximum value of 13.36 percent for glazed and 11.92 percent for non-glazed the optimal flow temperature for unglazed PVT collectors is, 83.6°C and 38.8°C, respectively. Chow and his colleagues Chow took measurements in the open air on two comparable sites. thermosiphon PVT sheet-and-tube water collection systems in Hong Kong is available in two versions, one glazed and the other unglazed.

Six factors have an impact. The effectiveness of a set of operational settings was assessed. The examination of the first law If any of these options is available; the glazed design is always preferable. The total energy output, or thermal output, must be maximized. However, an unglazed system is more beneficial for high values of PV cell efficiency, according to the energy

study. The packing factor, water mass to collector area ratio, and wind velocity are all beneficial for a glazed system, while the increase in solar radiation and ambient temperature are not. The use of additional coverings Reflection causes further losses. Other materials may be used instead of glass. Polycarbonate, for example, is a lighter, cheaper, and stronger material. For example, polymethyl- methacrylate and polyvinyl fluoride may be used.

The front cover the use of glass, on the other hand, is the finest choice because of its excellent optical characteristics, UV resistance, and high thermal tolerance Between the PV laminate and the cover layer, there is an air gap. must be thin enough to take advantage of the insulating qualities of air, while also inhibiting convective fluxes and microbursts turbulence.

Photovoltaic modules are usually attached to an absorber. EVA is used to encapsulate the cells. However, there are a few exceptions. PV lamination using conventional EVA presents technological challenges. It may disintegrate at high temperatures in the presence of acetic acid over 80 degrees Celsius As a result; traditional PV laminates are unable to survive the test. Temperatures in glazed collectors that are typically functioning at a standstill between 120 and 180 degrees Celsius A new idea for a glazed PVT collector The development of a PV laminate using Sloane gel is under underway. Using a gel instead of an EVA lamination material has many advantages. features such as high temperature resistance, transparency, thermal dilatation stress adjustment, and favorable In a PVT collector, heat transmission from PV to heat exchanger [7].

2.2. Advantage:

Other designs have been examined in addition to the conventional "sheet and tube" kind of water hybrid collectors .By changing the arrangement of the various components, the performance was examined .Sheet and tube, channel, free flow, and double absorption were recognized as the four major kinds of PVT based on the water flow pattern and heat exchange technique..

It is self-evident that a shorter distance between heat production and heat collecting results in more effective heat transfer. In the channel idea, this is achieved when the liquid flows directly over or below the PV cells.

The fluid absorption spectra should be sufficiently distinct from the PV absorption spectrum in channel PVT collectors. The inclusion of a second glass cover makes the assembly bulky and brittle.

The PV module may be transparent or opaque, with a black heat absorber underneath the channel. In comparison to a wide channel, this shape is more adapted to resist water pressures in the channels. In this arrangement, the absorber's "box channel" structure is used. Sandiness and Rested utilized this design to enhance heat transmission to running water by filling the square-shape box-type absorber channels with ceramic granulate. The findings for low-temperature water heating applications were encouraging. The BIPVT technique for facades uses a channel design with liquid flow beneath the PV cells. The system not only produces electricity and hot water at the same time, but also enhances the thermal insulation of the building envelope, thanks to the employment of wall-mounted water-type PVT collectors. According to the simulation findings, there is an optimal water mass flow rate for achieving the required energy performance. They also looked at the yearly energy performance of a BIPVT water system in both natural and forced circulation modes as part of their research. Both types of operation were able to decrease

heat transmission through the PVT water wall by 72 percent and 71 percent, respectively, when compared to a standard building façade. The payback time of the BIPVT water system was determined, and the economic benefit of the BIPVT water system was shown to be considerably superior to a standard BIPV.

2.3. Working:

The creation of theoretical and empirical models is an important technique in engineering for predicting the performance of solar PVT collectors, for example, across a broad variety of operating circumstances. These models may be used for design reasons once they have been validated. PVT collector analytical models are based on energy balance equations that take into account the necessary heat transfer modes and appropriate boundary conditions. Several software tools, such as EES or ANSYS Fluent, are available to solve the governing equations. EES is generic equation-solving software that solves a number of non-linear algebraic equations at the same time. In a PVT collector, there are many different kinds of flow pathways.

PV cells above an absorber plate block incoming radiation, resulting in a decrease in energy conversion to usable heat, as many studies have shown. Created a model to investigate the performance of a heat pipe PVT system and utilized it to do parametric tests on a variety of parameters, including Pf. By raising Pf from 0.7 to 0.9, the temperature of the solar cell was reduced. Found that although a larger packing factor improves PV efficiency by approximately 3.5 percent, it degrades thermal efficiency. Garg and his colleagues using a computer model investigated the performance of a direct forced flow hybrid system for residential hot water generation. The usable heat contained in a tank was used to obtain the entire thermal energy. They came to the conclusion that raising the packing factor from 50% to 100% improved overall daily efficiency. The ratio of absolute total thermal plus electrical energy to total sun insulation was used to calculate efficiency. Dubai and Tiwari created a thermal model for a PVT solar water heating system and tested it for Pf = 30.56 percent, 50 percent, and 100 percent. Because PV cells are encased in glass, the PV modules were used to replace the glass cover on the collector's water intake side. With the rise in the area covered by PV cells, there was a reduction in thermal efficiency. Analyzed the hourly fluctuation of cell temperature and solar cell efficiency over the course of one day to combine and compare the findings. Compared the thermal and electrical efficiency of a photovoltaic-thermosiphon collector system with various packing factors of 0.50 percent and 100 percent using an experimentally verified numerical model. For the absorber, a box channel structure was constructed from a number of extruded aluminum alloy modules [8].

Two layers of EVA and tedlar-polyester-tedlar were used to encase the solar cells. The PV module's location was also assessed. The findings for thermal and electrical efficiency were greater when the PV module was installed in the bottom portion of the collector rather than the upper. Herrando found that a full covering of the solar collector with PV and a lower collector flow-rate improve both heat and electrical conversion accomplished with the PVT collector, while optimizing CO₂ emissions reductions, with low solar irradiation and low ambient temperatures in the UK. A hybrid PVT system can provide 51 percent of total energy demand and 36 percent of total hot water demand over the course of a year with a completely covered collector and a flow rate of 20 l/h. The coverage value for power needs was only marginally

greater than for a PV-only system (49 percent). Geometric features, environmental, and operational conditions are all discussed in section A physical concept for a hybrid flat plate collector with finned water channel was described by The effect of variables such as fin width to tube diameter ratio, input temperature, and mass flow rate on thermal and electrical efficiency was investigated using a parametric analysis. They found that increasing the fin width to tube diameter ratio from 1 to 10 reduces thermal efficiency by almost half. The flow rate and the temperature of the input fluid were determined to be the most significant factors [9].

The impact of a water storage tank's capacity was investigated further. A lower capacity increased just the thermal efficiency, but the electrical and total daily efficiency decreased. Other writers have also noted the presence of an optimal flowrate. Solar PVT modules incorporated into the building structure (BIPV/T) were investigated by .For various kinds of cells, the impact of mass flow rate on system efficiency was investigated. Although an optimal value was not determined, it was discovered that efficiencies grew until they reached a certain flow-rate value, at which point they stabilized. The electrical performance was found to be unaffected by the collector flow-rate (just a 5% fluctuation), while the hot water output was substantially impacted. As the volumetric flow rate rose from 20 l/h to 200 l/h, it decreased by approximately 35%. Optimal flow rate estimates for various absorber plate structures and PVT kinds Energy performance utilizing the second law method was utilized to investigate factors for improving the PVT hybrid collector. Aside from the presence or absence of the cover glass, the mass flow rate was shown to be a critical factor in energy efficiency. In terms of thermal and global exergies efficiency, glazed PVT collectors have a rather low optimal flow rate of 2.3 g/s m². Under a broad variety of environmental circumstances, photovoltaic conversion efficiency decreased with solar radiation intensity (3.6 percent/kW m² at Ta = 20 C); whereas, the energy efficiency of PVT increased 3.6 percent per kW m² (at Ta = 20 C). As a result, PVT's benefit in terms of solar radiation will be much greater. Due to the intermittent nature of solar energy, various algorithms and circuits were developed to determine the maximum power production from PVT collectors. Despite this, no control mechanisms have been implemented to monitor maximum power production from the PVT system. According, a PVT control method based on Artificial Neural Network (ANN) may be used to modify the Maximum Power Operating Point (MPP) by taking into account PVT model behavior. For a given irradiation and ambient temperature, an optimal mass flow rate is determined. The simulation results show a high level of agreement with the ANN outputs. The operating water temperature is another factor that influences the thermal and electrical performance of hybrid collectors. Low temperatures promote the generation of electricity from PV cells, while higher temperatures increase the value of thermal energy [10].

3. CONCLUSION

Clean solar power harvesting that is both efficient and cost-effective may be extremely important in meeting today's increasing energy demands and calming climate worries. It is anticipated that in the not-too-distant future, Solar energy will be cost-effective, making it possible to invest in and install solar systems even without government subsidies. As well as incentives this article gives a synopsis of current research. PVT thermal regulation methods are a kind of PVT. The investigation is still ongoing. The information above about PV cooling technique has been simplified to help you find what you're looking for. the unsolved issues and the future

possibilities in this area. The many Solar photovoltaic system applications include building integrated air PVT systems, solar air heating PVT systems, and liquid PVT systems.

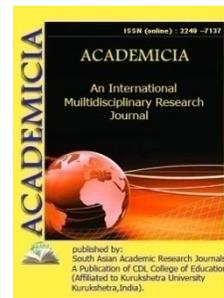

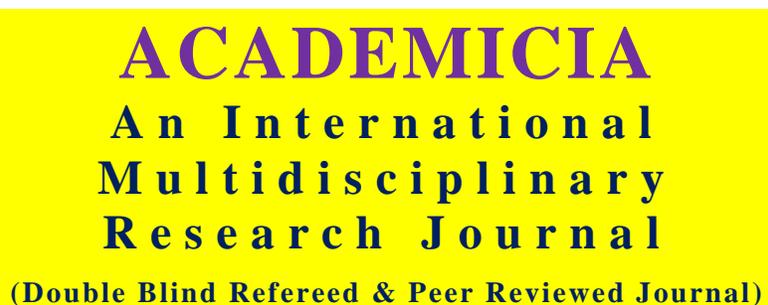

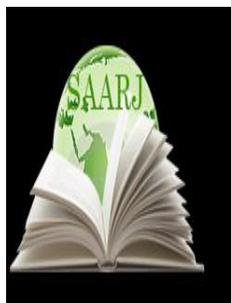

Although there is a level, it is still restricted by the product dependability and availability. As a result, considerable research in the area of PVT is needed. Primarily in the design and manufacturing of thermal absorbers, as well as in material and component selection. Coating selection, energy conversion and cost reduction, performance testing, system control, and system liability some topics have only been researched on a small scale till now. Theoretical foundation despite the fact that considerable work in the PV/T research has been done, there are still some possibilities for future development available.

This technology includes the following: Developing novel practical, cost-effective, and energy-efficient technologies, such as PV/T based on PCM slurry, Improving the structural/geometrical characteristics of the structure PV/T configurations that are currently in use, Investigating the PV/long-term T's dynamic performance systems, PV/T system demonstration in actual buildings and feasibility analysis Comprehensive economic and environmental assessments that take into account Long-term measurements are used to account for the impact of climatic variables on the system's performance. Desalination and ply-generation systems, for example, required to be researched further. The use of heat pipes (with thermostats) is also an option. PVT solar collectors (because to their various configurations) have not been tested. PCM and thermoelectric systems have also been widely explored. additional potential future emphasis area in PVT technology several researchers have also suggested it. Despite the fact that PVT technology research and development work is under progress. over the past 30–35 years, the economic and political elements, as well as some technological problems, such as the issue of energy storage, have yet to be resolved. In a broad sense, it's been addressed. All of these efforts sought to provide the most energy efficient PV/T system feasible.

THE PROBLEM OF WRITTEN SPEECH IN RUSSIAN LANGUAGE COURSES AT HIGHER EDUCATION

Maseeva Muzaffara Kutfiddinovna*

*Department Uzbek Language and Literature,
Russian language Samarkand State Medical Institute,
UZBEKISTAN

ABSTRACT

Language and literature play a key role in personality formation a person, his life in society, everyday communication and professional activity. An important stage in the development of language and literature is stage of general education. The purpose of the concept of teaching Russian language and literature in educational institutions of the Russian Federation – designate problems existing in the teaching of these subjects in schools of different types, outline possible ways to solve them and determine conditions conducive to the development of language and literary education school children. Together with legally approved Federal State Educational Standards (FSES) and Exemplary Basic Education Programs (VET) concept forms the basis of philological education at school.

KEYWORDS: *Designate, Federation, Determine*

INTRODUCTION

Russian language and literature traditionally form the basis of Russian education. The Russian language is necessary for a citizen of Russia as the main one a means of communicating with other people. Literature created in Russian, is the bearer of important for the self-awareness of the people and the individual meanings, spiritual and moral ideas. Language and literature preserve historical experience of generations and pass it on to descendants.

Since childhood, a person thinks and expresses his thoughts in his native language, with his with the help he learns the world and joins the national and world culture. The habit of using the language makes it difficult to realize that a full-fledged mastering it should be the result of conscious labor and applied effort. The better we are able to apply communication and stylistic the resources of the language, the more we can achieve, because the skill is competent and expressively speaking and writing, listening, reading and understanding is the basis intellectual

development of the personality, contributes to successful activities a person in any professional field.

Problems of studying the Russian language and literature

Long-term tradition of systematic study of the Russian language and literature at school, the accumulated methodological approaches, the developed examination base, approved educational and methodological complexes, specific scientific and pedagogical teams and educational practices - all this is undoubted important potential of the domestic teaching system. However, there is a whole a number of problems that still remain unresolved and are even aggravated in recent times. The origins of these problems are both inside and outside the system. Education, they need to be addressed comprehensively. These problems can be classified as follows.

Problems of reading and understanding text by modern schoolchildren

- Literary education at school is being built today in conditions a noticeable decrease in children's motivation to read. Modification of properties and conditions the existence of texts with which children and adolescents deal (electronic media with nonlinear text presentation capabilities, system hyperlinks, an abundance of short everyday texts that appear instantly in printed form and blurring the idea of the special status of the printed words, etc.), an increase in the total number of texts, a decrease in their volume and restructuring along with a range of social and linguo-social problems lead to the fact that the traditional, linearly unfolding large book text is more and more difficult to perceive and read children. This becomes a serious obstacle to the development of literary works and the soil on which the imitation reader's activities (reading short retellings, using ready-made essays and abstracts, etc.).

- The main type of educational work in literature lessons is analysis (checking) of works, acquaintance with historical and cultural information about work, author and literary process, mastering the conceptual apparatus literary criticism. This important analytical, interpretive activity makes sense if it was preceded by full reading and understanding artwork. Meanwhile, it is the stage of reading that is often falls out of school use, from the area of special attention and control, especially in high school. The reason is the elementary lack of educational time and volume of programs. A quick acquaintance with the texts or their retellings, reliance on the summary of the textbook, and not on the text of the work itself - signs of negative phenomena in the teaching of literature. During school study of literature (historical and literary facts and events, artistic features of outstanding literary works) a balance is needed between developing reading and comprehension skills literary text as an artistic reality, on the one hand, and mastering a set of analytical skills to understand laws of the historical development of literature as an art form and correctly interpret works of art - on the other.

- In many cases, the student is not formed interest in mastering the voluminous corps of Russian and world literature that the program offers him. Existed many decades external stimulus (in the form of compulsory graduation and introductory essay on literature) is missing today. Unified State Exam in literature needs to be taken by a very small part of schoolchildren. Need in literary education, its prestige in society today is small. The fundamental values that literature carries as an art form, come into conflict with momentary, pragmatic values, often coming to the fore in everyday life, in the means mass media. In fact, literary education collided today with a serious challenge - the search for internal motivation to attract children and adolescents to literature, the development of argumentation and methods for increasing interest in acquaintance with both

Russian classics and the most significant works of modern literature. Mastering the rich of classical and modern literature needs a thoughtful accompanied by adults, it is necessary to increase the attention of adults to the very process of interaction between the reader-student and literature.

Substantive problems

Russian language

- Analysis of examination test materials for the high school course and texts of the composition newly introduced to the Russian school (2014), as well as observations of the speech practice of school graduates show that many graduates do not have enough skills in correct and expressive oral and written speech (including in relation to different situations and communication conditions), the norms of the Russian literary language, features Russian speech etiquette, do not know how to correctly, accurately express their thoughts.

- In the school practice of teaching the Russian language, mastering theoretical knowledge in many cases turns out to be isolated from the ability to apply this knowledge in practical speech activity. Assimilation does not maintain a significant number of spelling and punctuation rules actively improving student literacy; skill phonetically to parse a word does not guarantee compliance with orthoepic norms when the use of this word in living speech; knowledge of sentence structure and the ability to draw up its scheme does not determine the correct construction of independent expression, etc.

- The course of the Russian language at school has changed significantly in recent years: more attention is paid to the development of students' speech abilities; goes to past prioritization of spelling and punctuation skills as such. However, the ratio of theoretical and applied elements the content of the subject "Russian language" is still far from optimal. The concepts of "consistency" and "scientific" are interpreted by the authors of various textbooks in different ways: in many cases, scientific character in them turns into pseudoscience, and consistency - redundancy of formal classifications. Formation of communication skills is possible only on the basis of solid theoretical knowledge and formed speech skills. However, this is where the main difficulty and one of the reasons for the loss of interest in the subject "Russian language". Linguistic theory and practice of the formation of linguistic skills in many modern textbooks does not give a holistic view of language as a means of expressing a certain meaning and reflection of the environment in the world, a tool of thought and therefore does not develop internal motivation to study subject. A schoolchild who learns a language that has been spoken since childhood should understand why he is studying, for example, the morphology or syntax of Russian language, etc.

- The basic and advanced levels of learning the Russian language in practice are not implemented, since there is no special form of final control for philologically oriented students - Unified State Exam in Russian profile level. As stated in the Federal State educational standard for complete (senior) school (2012, paragraph 9), substantive results at an in-depth level "oriented mainly to prepare for the subsequent professional education, the development of individual abilities of students through deeper than that provided by the basic course, mastering the basic sciences, systematic knowledge and methods of action inherent in this subject". Thus, the purpose of the subject "Russian language" at an advanced level consists, among other things, in providing continuity of learning the Russian language in the chain "school - university" for language and text oriented learners. Approaches to the final attestations in the Russian

language at the basic and advanced levels should be different. If the priority of the check is obvious at the basic level communicative competence of students, then at an in-depth level at the first the plan leaves the language competence, the level of which should allow students to solve linguistic problems, continue their studies at higher educational institutions according to their programs.

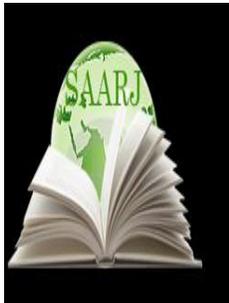

CONCLUSION

It is necessary to take into account the obligation to fully implement the creative potential of a language teacher, endowed with the proper degree public trust, with all the possibilities for creative work at school. To this end, regulatory requirements should be optimized. to the structure of the working programs of training courses, eliminate redundant parameters of control over the long-term planning of the teacher's work.

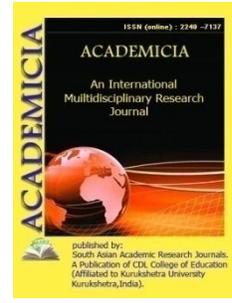

It is necessary to implement a set of measures to create textbooks Russian language and literature of a new generation, built on the basis principles of differentiation and individualization focused on the optimal combination of compulsory and optional components of educational programs involving the priority development of independent creative student work while minimizing all types of reproductive activities in the process of mastering linguistic and literary material. At this must take into account the fact that schoolchildren in their environment in reality, they are more likely to deal with materials consisting of parts with a varied presentation of information (text, sound, graphics, three-dimensional objects, etc.) rather than just linear text. This should be borne in mind when development of modern courses.

ABSTRACT

The processes of modernization in the field of education are associated with the idea of creating conditions for the development of the personality and disclosure of the individuality of the student. Teachers are faced with the task of improving the system of forms and methods of work that contribute to the advancement of students in learning in accordance with their individual abilities. In the modern world, the problem of gender education is of concern to both scientists and practitioners. This is largely due to the fact that attention to the personality of the child is increasing, and gender characteristics are one of the main characteristics of the personality. Namely, gender upbringing presupposes the correct assimilation of gender roles by children, which implies gender equality in the future, the absence of gender prejudices and gender discrimination.

KEYWORDS: *Masculine Nature, Continuity Of Education, Upbringing, Female Education, Plato's Academy, Civic Education, General Educational Nature.*

INTRODUCTION

The gender approach in education has a thousand-year history. The first schools appeared in ancient Greece. The most well - known educational systems are Spartan, Athenian, as well as chivalrous upbringing and the upbringing of a gentleman (J. Locke). At that time, society considered it necessary to form in boys the qualities of a highly educated and business man, distinguished by sophistication in communicating with people and possessing the qualities of a businessman, warrior, entrepreneur. It's not hard to notice, that education, starting from Antiquity and up to the Renaissance, was of a masculine nature, that is, it was aimed at the upbringing and

training of the complex male characteristics of behavior. Female representatives were forbidden to attend educational institutions.

Nevertheless, women aspired to knowledge. In her book, Margaret Alik writes that in There were about 30 women among the teachers and students of the Pythagorean school. At the Academy Plato's representatives of the "weaker sex" came to lectures dressed in a man's suit, since the law did not allow women to attend public meetings.

It is known that Axiopea from the Peloponnese studied natural philosophy at Plato's Academy. Her area of special interest was physics. After Plato's death, she taught at his Academies. To the Epicurus School, established in Athens around the III century BC. as well as to the Academy.

According to Plato, women had equal access with men. The social status of women in ancient Rome was much higher than in Athens. Many of them had a good education. Plutarch, describing his impressions of During his life in Pompei, he mentions Cornelia Scipio, who was well educated and had a deep knowledge of geometry and philosophy. Among the Romans, medical classes were particularly attractive, to which women were also admitted.

These historical data suggest that, despite the masculine nature of education, women also had access to the sciences, however, in very limited quantities and as an exception. Attitudes towards women's education began to change during the Enlightenment. Then for the first time, the question of the possibility of developing women's intellectual abilities and women's education began to be considered. In the theory of differential gender education Jean-Jacques Rousseau (1712 - 1778), which he wrote in the novel "Emil, or about education" (1762) and "Yulia or new eloiza" (1761), pronounced the idea that the female has a number of positive qualities, which are absent in men and which have an important positive impact on the process of formation of male the subject. According to J.J. Rousseau, women are endowed with the ability to evoke the best human feelings in men - love, compassion, care and, thus, can have a beneficial effect on them.

The theory of "natural" female education is built by J.J. Rousseau as a concept of supervised education, the main conditions of which are: 1) home education, reducing to a minimum contact with the outside world and with society (since self-control of sensuality, sexuality through reason is not available to women, and strong dependence on others leads to moral decline and death, as, for example, the heroine of the novel "New Eloise" Julia, despite the best intentions); 2) the upbringing of a woman for motherhood; 3) The continuity of education, during which the functions of the father-educator after marriage, the woman passes to her husband.¹

Within the framework of the patriarchal society, the ideas of J.J. Rousseau, undoubtedly, were a breakthrough, but still did not reflect the role of a woman as a person equal to a man. A woman is still perceived as a secondary, dependent being.

In the age of Enlightenment, ideas for the protection of women's rights and women's emancipation were first expressed. Mary Wollstonecraft (1759 - 1797) in her book "In Defense of Women's Rights" (1792) defended women's rights to education. The philosophical concept of women's education by Mary Wollstonecraft is fundamental how does it differ from the concept of women's education Zh.-ZH. Rousseau. M. Wollstonecraft has hired teachers as mentors, which, in her opinion, forms a structural relationship of non-dependence in the teacher/student relationship. The leading role in education is played by the development of a woman's

epistemological, logical and philosophical abilities, within which her moral and civic education (aimed at the liberal transformation of society) is also carried out.

The liberal-rationalistic characteristics of subjectivity are considered by M.

Wollstonecraft as relevant to both sexes. At the same time, M. Wollstonecraft's great merit lies in the fact that for the first time she analyzed the traditional model of female subjectivity as an artificial social construct created within the framework of male culture and criticized many characteristics of patriarchal society.

In Russia, the breakthrough of women's education occurred in 1764, when Catherine II signed the decree "General Institution on the education of both sexes of youth". After that, she started organizing educational institutions in which, in her opinion, it was possible to grow a new type of subjects who would feel a sense of duty towards society and their loved ones. It is noteworthy that the education of women was legalized in the era of female rule. The first institutes for girls were founded in Moscow (1764) and in St. Petersburg (1767). And in the 1770s, public schools were organized, which were of a general educational nature.

It is believed that science is a man's business and all scientific discoveries are made exclusively by men. History proves the illegality of such an opinion. Returning to the development of women's education in Russia, it is worth noting that it was Russia that became the first in the world to proclaim in the Constitution of 1918 the legal equality of men and women in all spheres of social life. This led to an increase in the level of culture and education of women and by the early 1930s illiteracy among women has been largely eliminated.

Psychology shows that not all mental properties of men and women depend on their gender, and even where such determination definitely exists, it is mediated and significantly modified by environmental conditions, upbringing, occupation, etc."².

Therefore, in modern science, the concept of gender and gender are distinguished. The concept of "gender" refers to the anatomical and biological structure of women and men. Under the term "gender" is understood as a socio-cultural characteristic of gender. In this regard, the gender approach is based on the idea that "it is not the biological or physical differences between men and women that are important, but the cultural and social significance that society attaches to these differences"³. Initially, within the framework of a patriarchal society, the social roles of men and women were clearly separated: a woman is a mother, a hostess in the house, a man is a breadwinner, a defender.

This division was socially justified - the farm was large, there were many children, there was no one to deal with them except the woman-mother. Now the situation has changed. Democracy has granted equal rights to women and men in education, the realization of professional interests, participation in public and political life of society. But with all this, the methods and style of education remained the same - patriarchal. This is especially true of family education, where girls they are trained to do household work and raise children, and boys are aimed at development of professional abilities. On the one hand, society requires the education of a competitive professional, regardless of gender, on the other hand, family and school educate the younger generation within the framework of patriarchy.

Thus, the main idea of the gender approach in education is "to take into account the specifics of the impact on the development of boys and girls of all factors of the educational process

(content, teaching methods, organization of school life, pedagogical communication, a set of subjects, etc.)"⁴.

The goal of the gender approach, according to J.I.B. Shtyleva, is "deconstruction traditional cultural limitations of personal potential development depending on gender, understanding and creating conditions for maximum self realization and disclosure of the abilities of girls and boys in the process of pedagogical interaction". Continuing the thought of J.I.B. Shtyleva, in the article "Prospects of gender education in Russia: a teacher's view" (2001) the main task of gender education is determined by the need to "explain the nature of stereotypes, show their historical variability and social conditionality".

According to the authors of the article, "from the point of view of the age characteristics of students, gender education can be considered as the education of schoolchildren, students and adults. Then the inclusion of the topic of public perception of gender differences in the existing system of education and upbringing comes to the fore. Gender education of schoolchildren is aimed at helping them cope with the problems of socialization, an important part of which is the self-identification of the child as a boy and a girl and thus accepting a certain social role.

The education of students is based on the explanation of gender stereotypes faced by young people entering adulthood, and the joint search for ways to overcome these stereotypes". Thus, Russian scientists have conceptually spelled out the main ideas, goals and objectives of the gender approach in education. However, the intellectual tradition biological determinism, characteristic of most Russian specialists in the field of social sciences hinders the introduction of a gender approach in pedagogical science. V. Sukovataya notes in this regard that the traditions of the gender-role approach in education are applied "by default", as self-evident and "are not reflected by either scientists or practitioners as an essential component of the educational process"⁵.

Realizing this, O.A. Khasbulatova, O.A. Voronina, etc. at the meeting Coordinating Council on Gender Issues of the Ministry of Health and Social development of the Russian Federation (9.12.2005) discussed the introduction of a gender approach in education. Thus, O.A. Khasbulatova said that gender education is considered "as an integral factor in the formation of a democratic personality"

type. What is this role?

Gender issues contribute to a deeper understanding of human rights, a modern understanding of the concepts of sustainable democratic development.

Mastering the basics of gender knowledge helps to free oneself from the "captivity" of gender stereotypes. Gender education contributes to the growth of self-awareness of young people, their active integration into all spheres of society. Mastering the basics of gender knowledge helps to increase the responsibility of fathers for the upbringing of children. In the process of gender education, a tolerant and legal consciousness is formed"⁶.

For the introduction of a gender approach in education, it is necessary, according to O.A. Voronina, "1) to include in the state educational standards on social Sciences and Humanities gender approach; 2) to promote the inclusion of gender theory in educational programs in social Sciences and Humanities; 3) to review the system of issuing volumes MO and EMA and make recommendations MO or EMA only those books which do not contain any stereotyped concept

of the roles of men and women or discriminatory on the floor of claims; 4) support program the preparation and training of teachers of higher and secondary schools in areas of gender theory; 5) support the conduct of gender studies"2.

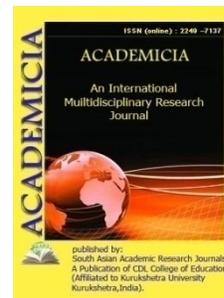

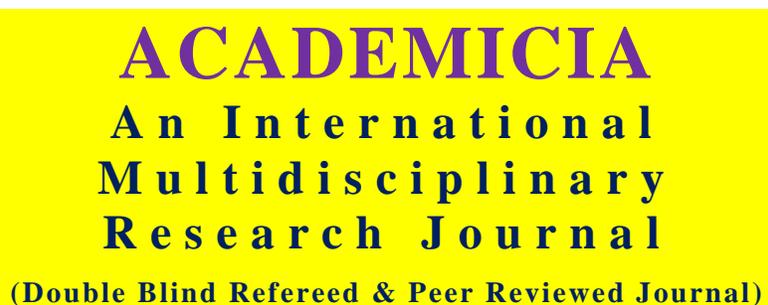

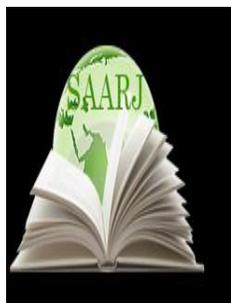

Thus, the introduction of a gender approach in education will make it possible to implement the principle of equality, will lead to an understanding of the concepts of sustainable democratic development.

When we think about a foreign language, we usually think about vocabulary, pronunciation and grammar. However, even if a person knows all the vocabulary and all the rules of grammar, and even if he speaks, reads and writes quite well, a lot of things in the language can be difficult for him. This is because understanding how a language is really used depends on more than just knowing vocabulary and grammar. In English, there are thousands of idioms alone (standard expressions, meaning more than the words they are made up of). Along with idioms, there are cliches, proverbs, sayings, metaphors, comparisons, euphemisms and allusions. Take, for example, the phrase "... to meet one's Waterloo", which has to do with Napoleon's defeat at Waterloo and is used in modern English in the meaning of "to suffer an important failure in life."

The historical component of language awareness deserves special attention. On the one hand, young people nowadays undoubtedly have a lot of knowledge in the field of grammar and vocabulary, thanks to the wide opportunities to learn the language abroad, in numerous language schools and use excellent authentic textbooks and teaching aids. On the other hand, most of them are very little reads, and general cultural awareness is at a very low level.

ABSTRACT

A biosensor is a device that combines a receptor and a transducer to transform a biological reaction into an electrical signal. Because of the broad variety of biosensor applications, such as health care and illness diagnostics, environmental monitoring, water and food quality monitoring, and medication delivery, the design and development of biosensors has taken center stage for researchers and scientists in the last decade. The main challenges in biosensor development are I efficient biorecognition signal capture and transformation into electrochemical, electrical, optical, gravimetric, or acoustic signals (transduction process), and (ii) improving transducer performance (i.e., increasing sensitivity, shorter response time, reproducibility, and low detection limits even to detect biorecognition signals). These problems may be solved by combining sensing technologies with nanomaterials that vary in size from zero to three dimensional, have a high surface-to-volume ratio, excellent conductivities, shock-bearing properties, and color tunability. Nanoparticles (NPs) (high stability and carrier capacity), nanowires (NWs) and nanorods (NRs) (high detection sensitivity), carbon nanotubes (CNTs) (large surface area, high electrical and thermal conductivity), and quantum dots (QDs) are some of the nanomaterials (NMs) used in the fabrication of nanobiosensors (color tunability). Furthermore, these nanomaterials may function as transduction elements in and of themselves. This review summarizes the evolution of biosensors, the different types of biosensors based on their receptors and transducers, and modern biosensor approaches that use nanomaterials such as NPs (e.g., noble metal NPs and metal oxide NPs), NWs, NRs, CNTs, QDs, and dendrimers, as well as their recent advancement in biosensing technology with the expansion.

KEYWORDS: *Biosensors, Carbon Nanotubes, Gold Nanoparticles, Nanomaterials, Nanobiosensing.*

1. INTRODUCTION

Nowadays, we take pleasure in the benefits of science and technology in our day-to-day life. We frequently use various types of appliances or gadgets to interact with the physical environment, such as computers, copy machines, mobile phones, microwave ovens, refrigerators, air conditioning and television remotes, smoke detectors, infrared (IR) thermometers, turning on and off lamps and fans. Many of these applications rely on sensors to function. A sensor is a device or module that detects changes in physical quantities such as pressure, heat, humidity, movement, force, and electrical quantities such as current and transforms them into signals that can be monitored and analyzed. A device that can transfer energy from one form to another is known as a transducer. A measuring system's heart is the sensor. Range, drift, calibration, sensitivity, selectivity, linearity, high resolution, reproducibility, repeatability, and reaction time are all qualities that an ideal sensor should have. Sensor technology has grown in importance as a result of a variety of applications, including environmental and food quality monitoring, medical diagnosis and health care, automotive and industrial production, and space, military, and security[1], [2].

1.1. BioSensor Classification:

Sensors are divided into many groups based on the physical amount (substance) or analyte to be measured, such as[3]–[5]

1. Source of energy (active and passive sensors),
2. Direct physical contact (contact and non-contact sensors),
3. compare-and-containment (absolute and relative sensors),
4. Sensors, both analog and digital, and
5. Detection of signals (physical, chemical, thermal, and biological)

1.1.1. Active and Passive Sensors:

Active sensors, such as microphones, thermistors, strain gauges, and capacitive and inductive sensors, need an external energy source to function. Parametric sensors are the name for these kinds of sensors (output is a function of the parameter). Thermocouples, piezoelectric sensors, and photodiodes are examples of passive sensors that produce signals without requiring external energy. Self-generating sensors are the name for these kinds of sensors.

1.1.2. Contact and noncontact sensors:

Touch sensors, such as temperature sensors, need physical contact with a stimulus, while non-contact sensors, such as optical and magnetic sensors and infrared thermometers, do not.

1.1.3. Absolute and relative sensors:

Absolute sensors, such as the thermistor and strain gauge, respond to stimuli on a scale of one to one thousand. Relative sensors detect stimuli in relation to a fixed or changeable reference, such as a thermocouple that detects temperature differences and a pressure gauge that measures pressure in relation to atmospheric pressure.

1.1.4. Analog and Digital Sensors:

An analog sensor converts a physical amount measured into an analog representation (continuous in time). This category of analog sensors includes thermocouples, resistance temperature detectors (RTD), and strain gauges. The output of a digital sensor is in the form of a pulse. The digital sensor category includes encoders.

1.1.5. Detection of signals:

Sensors are classified as physical, chemical, thermal, or biological depending on how they detect signals.

1. *Physical Sensors:* Physical sensors take physical measurements and transform them into a signal that the user can recognize. Environmental changes such as force, acceleration, velocity of flow, mass, volume, density, and pressure may be detected by these sensors. Physical sensors have been widely used in the biomedical sector, especially as microelectromechanical system (MEMS) technology has advanced, allowing for the creation of more accurate and smaller sensors, as well as the development of new measurement technologies.
2. *Chemical Sensors:* A chemical sensor is defined as “a device that converts chemical information into an analytically useful signal ranging from the concentration of a particular sample component to total composition analysis,” according to the International Union of Pure and Applied Chemistry (IUPAC). Chemical sensors are used to monitor the activity or concentration of chemical species in the gaseous or liquid phases. They're also utilized in environmental pollution monitoring, food and pharmaceuticals analysis, and organophosphorus chemical assay monitoring. They may also be utilized to make clinical diagnoses.
3. *Thermal Sensors:* A thermal sensor is a device that measures the temperature of an environment and converts the input data into electrical data so that temperature changes may be recorded or monitored. Thermocouples, thermistors, and RTDs are examples of temperature sensors.
4. *Biological Sensors:* Biomolecular activities such as antibody/antigen contacts, DNA connections, enzymatic interactions, and cellular communication processes are all monitored by biological sensors. In brief, biological sensors are referred to as biosensors.

2. BIOSENSOR

2.1. Principle and Design:

A biosensor is a device or probe that combines a biological element like an enzyme or an antibody with an electrical component to produce a quantifiable signal. The electronic component detects, records, and sends data on physiological changes as well as the presence of different chemical or biological elements in the environment. Biosensors are available in a variety of sizes and forms, and they can detect and measure even low amounts of infections, hazardous chemicals, and pH values. An analyte, bioreceptor, transducer, electronics, and display are all components of a conventional biosensor[6], [7].

1. **Analyte:** An interesting material whose components are being identified or discovered (e.g., glucose, ammonia, alcohol, and lactose).
2. **Bioreceptor:** A biomolecule (molecule) or a biological element (e.g., enzymes, cells, aptamers, deoxyribonucleic acid (DNA or RNA), and antibodies) that can detect the target substrate (i.e., an analyte) is known as a bioreceptor. During the interaction between bioreceptor and analyte, signal generation (in the form of light, heat, pH, charge or mass change, plant or animal tissue, and microbial products) is termed biorecognition.
3. A device that converts energy from one form to another is known as a transducer. A biosensor's transducer is an important component. It transforms a biorecognition event into an electrical signal that corresponds to a quantity or the presence of a chemical or biological target. Signalization is the name for this energy conversion process. The number of analyte–bioreceptor interactions is proportional to the number of optical or electrical signals generated by transducers. Transducers are classified as electrochemical, optical, thermal, electronic, or gravimetric transducers based on their working mechanism.
4. **Electronics:** The signal is transduced and processed before being displayed. The transducer's electrical impulses are amplified and transformed to digital form. The display unit quantifies the processed signals.
5. **Display:** The display unit consists of a user interpretation system, such as a computer or printer, that produces output so that the user may read and comprehend the appropriate answer. The output may be in the form of a numerical, graphical, or tabular value, or a figure, depending on the end-user need.

2.2. *Biosensor Evolution:*

The development of biosensors has been divided into three generations depending on component attachment, i.e., the technique of integrating the bio-recognition element (bioreceptor) with the transducer. The biosensors of the first generation (1st gen) detect the concentration of analytes and products of bioreceptor reactions that diffuse to the transducer's surface and generate an electric response. Mediators-less amperometric biosensors are another name for this kind of sensor. In his initial paper, the founder of biosensors, Leland Charles Clark Jr., outlined the components of a biosensor. An electrode that can monitor the oxygen content in blood was the subject of this 1956 report. Clark reported the use of an amperometric enzyme electrode for glucose detection in an experiment in 1962. Updike and Hicks improved Clark's work in 1967, creating the first functioning enzyme electrode based on glucose oxidase mounted on an oxygen sensor [8], [9].

2.3. *Biosensor Characteristics:*

Certain static and dynamic criteria are required to create a highly effective and competent biosensor system. The performance of biosensors may be adjusted for commercial usage based on these criteria.

1. **Selectivity:** When choosing a bioreceptor for a biosensor, selectivity is an important characteristic to consider. In a sample including mixed spices and undesirable impurities, a bioreceptor may identify a certain target analyte molecule.

2. *Sensitivity*: The smallest quantity of analyte that can be properly detected/identified in a few steps and at low concentrations (ng/mL or fg/mL) to confirm the presence of analyte traces in a sample.
3. *Linearity*: Linearity helps to ensure that the measured findings are accurate. The greater the linearity (straight line), the more accurate the detection of substrate concentration.
4. *Response time*: The amount of time it takes to get 95% of the results. (e) *Reproducibility*: Precision (similar result when the sample is tested more than once) and accuracy are two characteristics of reproducibility (capability of a sensor to generate a mean value closer to the actual value when the sample is measured every time). It refers to the biosensor's ability repeatability provide similar findings when the same sample is tested several times.
5. *Stability*: One of the most important qualities in biosensor applications that need continuous monitoring is stability. The degree of susceptibility to environmental perturbations both within and outside the biosensing equipment is referred to as stability. The affinity of the bioreceptor (the degree of the analyte's binding to the bioreceptor) and the bioreceptor's degradation with time are two variables that influence stability.

2.4. *Biosensor classification*:

Biosensor classification is a broad and interdisciplinary subject. Bioreceptors are the main component in biosensor fabrication, as previously stated. Enzymatic biosensors (the most common biosensor class), immunosensors (high specificity and sensitivity and are specifically useful in diagnosis), aptamer or nucleic acid-based biosensors (high specificity for microbial strains and nucleic acid-containing analyte), and microbial or whole-cell biosensors are the different types of biosensors. The second categorization is based on the transducer, with electrochemical (potentiometric, amperometric, impedance, and conductometric) biosensors, electronic biosensors, thermal biosensors, optical, and mass-based or gravimetric sensors being the most common. Bioreceptor analyte combinations, which are restricted, are another categorization. Detection systems (optical, electrical, electronic, thermal, mechanical, and magnetic) and technology (nano, surface plasmon resonance (SPR), biosensors-on-chip (lab-on-chip), electrometers, and deployable) are divided into categories.

2.5. *Biosensor classification*:

Bioreceptors-based Biosensors are categorized as catalytic, affinity, or non-catalytic biosensors based on the biorecognition principle. The interaction of analyte bioreceptors in a catalytic biosensor leads to the creation of a novel biochemical reaction product. Enzymes, bacteria, tissues, and entire cells are all included in this biosensor. The analyte is permanently attached to the receptor in an affinity (non-catalytic) biosensor, and no new biological reaction product is produced during the contact. Antibodies, cell receptors, and nucleic acids are among the targets for detection in this kind of sensor.

3. NANOMATERIAL-BASED BIOSENSORS (Nanobiosensors)

Biosensor research and development has grown more open and interdisciplinary as a result of advancements in nanotechnology. Exploring NMs for various features, such as NPs (metal and oxide-based), NWs, NRs, CNTs, QDs, and nanocomposites (dendrimers), offers the potential of

enhancing biosensor performance and increasing detection power via size and shape management.

Nanobiosensors have the same fundamental operating principle as their macro- and micro-counterparts, but they are built with nanoscale components for signal or data processing. Because of their dimensionality, nanobiosensors offer an advantage over their traditional macro- and micro-counterparts in terms of interdisciplinary applications[10], [11]. Nanobiosensors are useful in the field of nanotechnology for:

1. Biochemical detection in cellular organelles and medical diagnostics
2. Detecting nanoscopic particles in industrial and environmental settings, and
3. Identifying very low levels of potentially hazardous chemicals.

The role of NMs in the improvement of biosensing systems has been extensively researched based on their categorization. For example, NPs-based biosensors include all sensors that use metallic NPs as biochemical signal enhancers. Similarly, nanotube-based biosensors that use CNTs are utilized as enhancers of reaction specificity and efficiency, while NW biosensors use NWs as charge transport and carriers. QDs are also used as contrast agents in QD-based sensors to improve optical responses.

4. DISCUSSION

New methods to sensor technology have been used to satisfy the growing needs of different sectors. With advancements in nanotechnology and nanoscience, sensor technology has grown even more. Nanotechnology has spanned physics, chemistry, biotechnology, biology, bioinformatics, medical science, healthcare, food engineering or processing, aerospace, and electronics, as well as the energy sector and environmental research. The capacity to handle and control materials at the atomic and molecular level (nanometer range), as well as a subsequent knowledge of basic nanoscale phenomena, have opened up new possibilities for biosensor development. More significantly, dimensionality is a key factor in influencing the physical, chemical, biological, electrical, and optical properties of nanomaterials. Nanomaterials are divided into four categories depending on their nanoscopic dimensions: 0D, 1D, 2D, and 3D materials. A 0D NM (NPs and QDs) is a material with nanoscale dimensions in all three dimensions. It is 1D NM if two dimensions of a material are nanosized while the other dimension is considerably bigger (NWs, NRs, NTs, nanobelts, and nanoribbons). It's a 2D NM if just one dimension is nanosized (nanoprisms, nanoplates, nanocoatings, nanolayers, nanosheets, nanowalls, nanodisks, and CNTs). Bulk nanomaterials (also known as 3D NMs) are materials that are not limited to the nanoscale in any dimension (less than 100 nm) (nanoballs, dendritic structures, nanocoils, nanocones, nanopillars, multi-nanolayers, and nanoflowers). The ability to synthesize materials in the nanoscale range allows for unique physical, chemical, and biological characteristics, and is critical to nanotechnology's success. A top-down method (a bulk material is restructured to create nanosized materials) and a bottom-up approach (a bulk material is restructured to form nanosized materials) have both been used to synthesize NMs (materials of nanodimension are formed by assembling molecule by molecule or atom by atom). Lithography, laser ablation, ion milling, and chemical etching are some of the methods used in the top-down approach. Molecular beam epitaxy, physical or chemical vapor deposition and evaporation, and bio/chemical processes for the creation of supramolecular complexes, self-assembled

monolayers, and protein-polymer nanocomposites are all popular methods in the bottom-up approach.

Biosensor research and development has grown more open and interdisciplinary as a result of advancements in nanotechnology. Exploring NMs for various features, such as NPs (metal and oxide-based), NWs, NRs, CNTs, QDs, and nanocomposites (dendrimers), offers the potential of enhancing biosensor performance and increasing detection power via size and shape management.

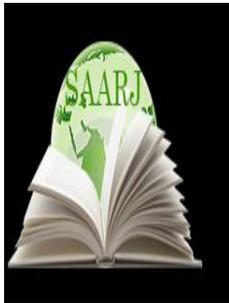

5. CONCLUSION

In this review article, we have discussed types and mechanisms of biosensors based on receptors (enzymes, antibodies, whole-cell, and aptamers), transducers (electrochemical, electronic, optical, gravimetric, and acoustic), and nanomaterials (gold NPs, Ag NPs, Pt NPs, Pd NPs, NWs, NRs, CNTs, QDs, and dendrimers). Biosensors offer versatile applications in the fields of engineering and technology, medicine and biomedical, toxicology and ecotoxicology, food safety monitoring, drug delivery, and disease progression. With the application of NMs in biosensors, we have witnessed rapid growth in biosensing technology is witnessed in the recent decade. This is because of the employment of new biorecognition elements and transducers, progress in miniaturization, design, and manufacture of nanostructured devices at the micro-level, and new synthesis techniques of NMs, all of which bring together the life and physical scientists and engineering and technology. The sensing technology has become more versatile, robust, and dynamic with the induction of nanomaterials. The transduction mechanism has been improved significantly (like greater sensitivity, faster detection, shorter response time, and reproducibility) by using different nanomaterials (such as NPs, NRs, NWs, CNTs, QDs, and dendrimers) that each has different characteristics within biosensors. Though there is considerable improvement in the use of nanostructured materials in biosensors applications, there are few limitations, which hinder these applications for the next level. For instance, lack of selectivity remains a setback for the CNT-based gas sensors, hampering its usage in CNT-based devices. However, this hurdle can be overcome by coupling CNTs with other materials. The other issues in these sensors include the sustainability of nanostructures in sensor applications, which have been insufficiently investigated, the fabrication of nanostructures, and the toxicity, which changes according to the physical properties of the material type. These issues should be investigated and addressed while expanding new nanostructured materials for their use in biosensors. Most nanobiosensor devices used in biomedical applications require a large sample for detection, which may lead to false-positive or false-negative results. Very few biosensors have attained commercial success at the global level, apart from electrochemical glucose sensors and lateral flow pregnancy tests. There is also a need for making nanostructure-based biosensors at an affordable cost that give rapid results with accuracy and are user-friendly. For example, nanomaterials should be integrated with a tiny biochip (lab-on-chip) for sample handling and analysis for multiplexed clinical diagnosis. More research should be done in this area and we expect the ongoing academic research to be realized into commercially viable prototypes by industries in near future.

ABSTRACT

Big data refers to data or data sets that are so big or complicated that conventional data processing application are insufficient, necessitating the use of distributed databases. Big data has always been at the heart of companies like Google, eBay, LinkedIn, and Facebook. It's a collection of large and complex data sets that includes massive amounts of data, social media analytics, data management capabilities, real-time data, and so on. Sensor design, data curation, sharing, storage, analysis, visualization, and information privacy are all challenges. Big data refers to datasets with a lot of diversity and velocity, making conventional tools and methods challenging to manage. Big data analytics is the study of large amounts of data in order to uncover hidden correlations. Big Data is a kind of data whose complexity necessitates the development of new methods, algorithms, and analytics to manage it and extract value and hidden information. We need a new platform known as Hadoop as the fundamental platform for organizing Big Data and solving the issue of making it usable for analytics.

KEYWORDS: *Big Data, Challenges, Parallel Programming, Map Reduce Technique.*

1. INTRODUCTION

Big data is generated by every digital activity and social media interaction. Systems, sensors, and mobile devices all send data. Big data is pouring in from a number of places at an alarming rate, volume, and diversity. To extract real value from big data, we need the best processing power,

analytical capabilities, and expertise. Accurate big data may help you make more confident decisions. Good choices result in increased operational efficiency, cost savings, and risk reduction. Data collections may be analyzed to discover new connections, which can be used to "identify economic trends, prevent illnesses, and fight crime, among other things." Scientists, corporate executives, media and advertising practitioners, and governments all face challenges with big data sets in fields such as Internet search, banking, and business informatics. Because inexpensive and many information-gathering mobile devices, aerial (remote sensing), software logs, cameras, microphones, radio-frequency identification (RFID) readers, and wireless sensor networks are rapidly being used, data sets are growing in size[1]–[3]. The "scale" of big data varies greatly, ranging from a few hundred gigabytes to several petabytes. Real life examples are stated below:

- Consumer goods businesses and retailers are using social media platforms like Facebook and Twitter to get unparalleled insight into consumer behavior, preferences, and perceptions.
- Manufacturers may track minute vibration data from their equipment, which varies somewhat as it ages, to determine when it's time to replace or repair it. Changing it too early loses money, while replacing it too late results in a costly work halt. The idea of Big Data is shown in Figure 1.

Figure 1: Illustrates the concept of Big Data[4].

1.1 Three Vs of big data:

a. Volume:

Gigabytes to petabytes of data have been kept in corporate repositories. Many reasons contribute to the growth in data volume, including transaction-based data that has been kept over time, unstructured data from social media, and so on. Sensor and machine-to-machine data is being gathered in large quantities. Excessive data volume was a storage problem in the past. However, when storage prices fall, other challenges arise, such as determining relevance in huge data quantities and using analytics to extract value from relevant data. Amount of data is referred to as volume[5], [6].

b. Velocity:

Data is arriving at breakneck speed and must be processed as quickly as possible. The requirement to deal with fast-moving data in near-real time is being driven by RFID sensors and smart meters. Most companies struggle to respond fast enough to cope with data velocity. The term "velocity" refers to the rate at which data was processed. Big data must be utilized for time-sensitive operations like detecting fraud. It pours into your company in order to enhance its worth.

c. Variety:

Data is now available in a variety of forms. Traditional databases store structured and quantitative data. Line-of-business apps generate information. Unstructured text documents, email, video, audio, and financial transactions are all examples of unstructured text documents. Managing, integrating, and regulating various types of data is still a challenge for many businesses. There are many kinds and sources of data. From organized and historical data kept in corporate storage to unstructured, semi structured, audio, video, and other types of data, the diversity of data has expanded. We consider two additional dimensions when thinking about big data:

d. Variability:

Data flows may be extremely erratic with periodic peaks as velocity and types of data increase. It's all over social media. Peak data loads that occur on a daily, seasonal, or event-based basis are impossible to manage. There's much more unstructured data here. The inconsistency of the data, which may stymie the process of correctly processing and maintaining the data. The data's irregularity may sometimes stymie the process of effectively processing and maintaining the data.

e. Complexity:

Today's data is derived from a variety of sources. Linking, matching, and transforming data across systems is still a challenge. Relationships, hierarchies, and various data connections must all be connected and correlated. Otherwise, your data may soon get out of hand. Data management becomes very complicated when huge amounts of data are collected from various sources. Data, in particular, must be linked, integrated, and correlated so that consumers can understand the information or messages that the data is intended to communicate.

f. Veracity

The significant variability in data quality collected. The accuracy of data analysis is dependent on the accuracy of the original data.

1.2 Parallel Programming & Map reduce:

Data analysis software inherently parallelizes. Many programmers are interested in developing parallel applications. In the area of parallel databases, parallel research has had the greatest success. Parallel databases allow programmers to split up input data tables into parts and execute each piece via the same single-machine program on each processor, rather than having to untangle an algorithm into different threads to run on various cores. Parallel programming is as simple as programming a single computer using this "parallel dataflow" paradigm. It also works in data centers with "shared-nothing" clusters of computers: the machines may interact using simple data streams rather than costly shared RAM or disk infrastructure[7]–[9].

Data analysis software inherently parallelizes. Many programmers are interested in developing parallel applications. In the area of parallel databases, parallel research has had the greatest success. Parallel databases allow programmers to split up input data tables into parts and execute each piece via the same single-machine program on each processor, rather than having to untangle an algorithm into different threads to run on various cores. Parallel programming is as simple as programming a single computer using this "parallel dataflow" paradigm. It also works in data centers with "shared-nothing" clusters of computers: the machines may interact using simple data streams rather than costly shared RAM or disk infrastructure.

Map Reduce is at the core of Hadoop. This programming paradigm is responsible for Hadoop's enormous scalability over thousands of servers. It can handle petabytes or zetabytes of data stored in Apache Hadoop in batches. If we've worked with clustered scale-out data processing systems before. The Map Reduce idea is therefore easy to grasp. The Map Reduce programming paradigm has turned a new page in the narrative of parallelism. The Map Reduce framework is a parallel dataflow system that divides data across many computers. They all use the same single-node logic. Map Reduce requires programmers to use conventional programming languages such as C, Java, Python, and Perl to create their programs. Map Reduce enables programs to be written to and read from conventional files in a file system rather than needing database schema definitions, in addition to its familiar syntax.

Map Reduce is a term that refers to two different jobs. The first is the task of map, which involves converting one set of data into another. Value pairs are used to break down individual components. Reduce takes the output of a map as input and merges the data values into a smaller set. After the map task, the reduce job is always run. As a result, the name Map Reduce is a series. Figure 2 depicts the Map Reduce idea in Big Data.

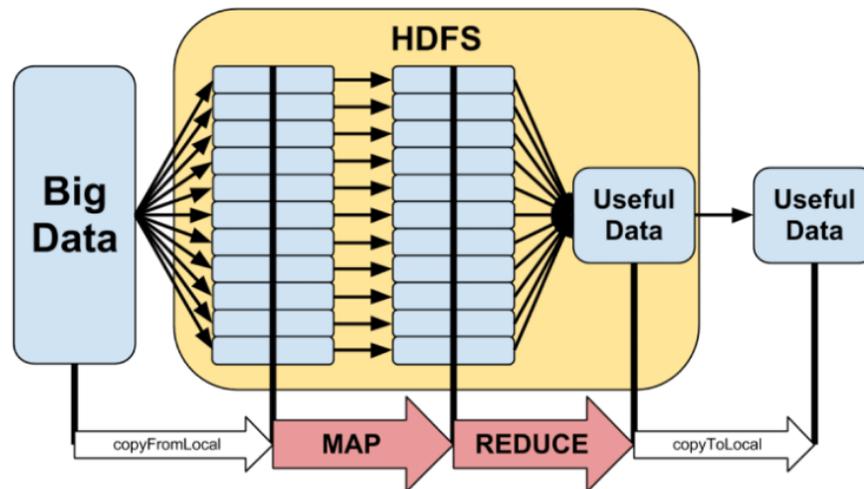

Figure 2: Illustrates the concept of MapReduce in Big Data[10].

1.3 Best Big Data Analytics Use Cases:

a. Sentiment Analysis:

Sentiment research provides valuable corporate information for improving customer experience, revitalizing a brand, and gaining a competitive edge. The capacity to dig for multistructured data collected from many sources into a single database is crucial to effective sentiment analysis.

b. 360-Degree View of Customer:

A 360-degree customer perspective allows you to get a better understanding of your customers' motives and behavior. To get a 360-degree customer evaluation, data from many sources, such as social media, data-gathering sensors, mobile devices, and so on, must be analyzed. As a consequence, more effective micro-segmentation and real-time marketing become possible.

c. Ad Hoc Data Analysis:

Ad-hoc analysis examines just the data that has been requested or required, adding another layer of analysis to data sets that are growing bigger and more diverse. By evaluating relevant data from unstructured sources, both external and internal, big data ad-hoc analytics may aid in the endeavor to acquire deeper insight into consumers.

d. Real-Time Analytics:

Real-time analytics systems rapidly interpret and analyze data sets, delivering findings even as new data is produced and gathered. This fast-paced approach to analytics may result in rapid responses and adjustments. Better sentiment analysis, split testing, and targeted marketing are all possible with it.

e. Multi-Channel Marketing:

Multi-channel marketing integrates various kinds of media, such as business websites, social media, and physical shops, to provide a seamless experience. Multi-channel marketing necessitates an integrated big data strategy at all phases of the purchasing process.

f. Customer Micro-Segmentation:

For smaller groupings, customer micro-segmentation allows for more customized and targeted communications. This customized strategy requires the analysis of large amounts of data gathered from sources such as consumer internet interactions, social media, and so on.

g. Data Warehouse Modernization:

To improve operational efficiency, combine big data and data warehouse capabilities. Optimize your data warehouse so that new kinds of analysis may be performed. Before deciding what data should be transferred to the data warehouse, utilize big data technology to create a staging area or landing zone for your incoming data. Using in sequence integration software and tools, extract rarely used or aged data from warehouse and application databases.

h. Bigdata Challenges:

Big Data's heterogeneity, size, timeliness, complexity, and privacy issues stymie progress at all stages of the value-creation pipeline. The issues begin during data acquisition, when the data tsunami forces us to make ad hoc choices about what data to retain and what to discard, as well as how to save what we keep consistently with the appropriate information. Today, a lot of data isn't in an organized format by default; for example, tweets and blogs are unstructured text, while pictures and video are formatted for storage and presentation. However, this is not the case for semantic content and search. A key test is converting such information into a structured format for subsequent examination. When data can be linked to other data, its value skyrockets. As a result, data integration is a significant source of value. Today, the bulk of data is produced directly in digital format; we have the potential and the task to influence production in order to

ease subsequent linking and to automatically connect data that has not yet been created. Other fundamental problems include data analysis, organization, recovery, and modeling. Data analysis is an obvious bottleneck in many applications, owing to the original methods' limited scalability as well as the complexity of the data to be processed. Finally, non-technical domain specialists must present the findings and explain them in order to extract actionable knowledge.

i. Volume of data:

The amount of data, particularly machine-generated data, is expanding, as is the pace at which it grows each year, thanks to new data sources that are emerging. In the year 2000, for example, the world's data storage capacity was 800,000 petabytes (PB). It is expected to reach 35 zettabytes (ZB) by 2020, according to IBM. Twitter, for example, produces more than 7 terabytes (TB) of data per day. Facebook has a storage capacity of ten terabytes. Mobile gadgets play a significant role as well.

j. Big data skills are in short supply:

There is already a scarcity of data scientists available. This involves a scarcity of individuals who can work effectively with huge amounts of data and large data sets. Companies need the appropriate mix of people to help them make sense of the data streams that are flooding in. This includes the ability to apply predictive analytics to large data, which is a skill set that even most data scientists lack.

2. DISCUSSION

Big data is a collection of technologies for storing, analyzing, and managing large amounts of data, as well as a macro-tool for seeing patterns in the chaos of this information explosion in order to develop smart solutions. It is now utilized in a wide range of fields, including medical, agriculture, gaming, and environmental protection. The three main ideas of big data were initially linked with three essential concepts: volume, diversity, and velocity. Because large data analysis poses sampling difficulties, only observations and sample were previously allowed. As a result, big data often contains data in quantities that conventional software cannot handle in a reasonable amount of time or for a reasonable price. Big data is used by Amazon, Netflix, and many other businesses to offer services to their consumers.

3. CONCLUSION

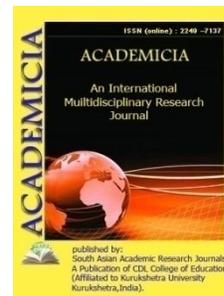

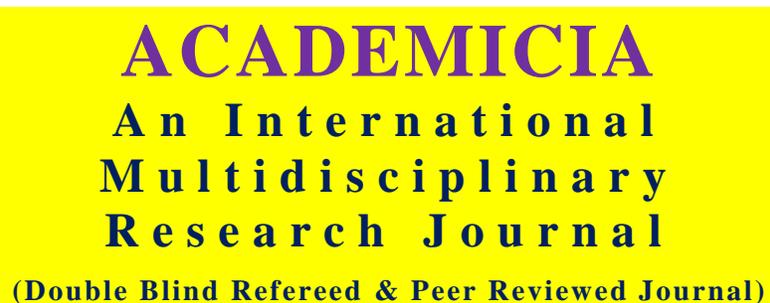

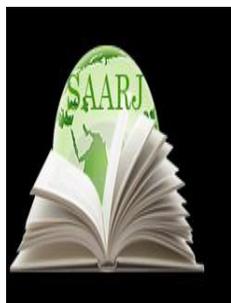

The combination of Big Data, low-cost commodity technology, and analytic software has created a watershed moment in data analysis history. Because of the convergence of these developments, we now have the capability to analyze massive data sets rapidly and cost-effectively for the first time in history. All of these skills aren't theoretical or simple. They offer a significant step forward and a clear opportunity to achieve massive improvements in efficiency, production, revenue, and profitability.

When large data systems are accessible, requirements for handing out that may appear impossible now will become commonplace. We learn how to take advantage of them. Systems of the size of Facebook and Google would have been science fiction not long ago. 100 transactions per second for airline and financial systems was unheard of at the time. A number of new criteria will integrate data from a variety of sources, not all of which will be held by the business. Some

will, for example, make advantage of government "open data." There are many opportunities for inventors!

INTRODUCTION

The territory of Uzbekistan has ancient roots of urban culture. We can see this situation in the presence of the ruins of Goktepa, Afrasiab, Yerkurgan, Podayotoktepa, Poykent and dozens of other major and ancient cities in the territory of our homeland. Along with these large cities there are more than a hundred small towns and large villages in the territory of Uzbekistan, many of which have reached to our days in the territory of the Samarkand oasis in the form of large archaeological monuments such as Kafirkal, Dobuscal, Ofarinkent, Robinjan, Ishtikhan, Mingtepa, Kushaniya. There is general information in science about the ruins of these cities¹. In the sentence of such cities of sogd, it is possible to include a large archaeological Quldortepe, which is located around the village of Bahrin, Urgut District of Samarkand region. Interest in the study of this monument began in the late 30-ies of the XX century.

Archaeological and written sources confirm that Quldortepa Sogd served as the central city of the monkey, that is, its capital, which at that time was among the great possessions. Total area 17

g.ga equal. We can also find out that this city, in turn, consists of three parts, namely ark, Shahristan and Rabot, through the following studies.

The archaeological study and research of qoldortepe has been carried out in four stages to date.

First stage: on the eve of the Second World War, the first marotaba archaeologists G. In the town of Quldortepa.V.Grigoryev and I.A.Sukharevites conducted archaeological research. The main purpose of this study was to find out the answer to the question of whether the city of Boside, which was considered the capital of the monkey, Quldortepe was the region of the first medieval Sogdian, was exactly itself, or another city. But the researchers did not achieve the expected result, but finished the research work.

The second stage: after that there were V. in 1953-1954 years. I. Sarianidi is engaged in partial excavation work. It was also assumed that the purpose of this excavation was the destruction of the city of Boside, which was considered the capital of the monkey, the region of the first medieval Sogdian here².

In the second phase of the study, the following data were collected. The city of Boside is the residence of the governor of the monkey, an important source covering the history of the Tan dynasty (618-907), one of the ruling dynasties of China, was mentioned in Tan shu. Also there are opinions about this city that the city of Basista is the same as the city of Boside, which was recorded in the works of some scientists of the muarriks of antiquity and was mentioned in connection with the Alexander Makedonsky walks. It is not surprising if the subsequent period when historians did not pay attention to the information about the city of Boside, which was recorded in Chinese sources, caused a different interpretation of the place of this toponym³. This monument is located in the eastern part of the village of Bahrain, 35 km to the east-south from the city of Samarkand. It is preserved in the form of a hill with a length of 6 meters, which is now 1700 meters in height. The total area of the monument is about 17 hectares, and there are also Hills slightly elevated in the north-east, south-east and South–West corners, that is, the place of the zodiac. In addition, in the north western corner are located several large hills, which are clearly distinguished. The center of the city is occupied by an elevated Massif, which is equal to its high places. In the western corner of the monument there is an arch with a height of 15 meters, next to it is a small water basin, which at that time provided the city with drinking water. As a result of excavations, a variety of ceramics found here belong to different periods. The most ancient of them dates back to the beginning of our era, and the earthenware from the upper layers dates back to the XI-XII centuries⁴.

The third stage: in 1955-1956, in cooperation with the Museum of history of Culture and art of Uzbekistan in Samarkand and the State Hermitage Museum in Leningrad began digging. Archaeologists B. for these excavations.Eat it.Stavisky, M.K.Those who were led byovovas⁵. This excavation work was carried out on an area of 100 m² in the north-eastern part of the Ark. From the top layer of the excavation area, it was studied by finding fragments of ceramic and glass dating back to the IX-XII centuries. In the Ark, a building with four periods of construction from top to bottom has been opened and studied.

Archaeological finds from quldortepe are very similar to those found in Talibarzu, Panjikent and Kafirkal. The remains of an artifact and a wall found in separate layers of the monument made it possible to determine its age. Here such findings prove that the age of the Kuldortepe is not less than the I century of our era.

Archaeological materials indicate that the Kuldortepa was formed on the banks of a small lake formed from groundwater (Springs) and was quickly surrounded by a defensive wall. In the III-IV centuries on the banks of this lake, a 10-meter-high urban raft was restored. When it comes to the VIII century BC, life around the ark ceases, as a result of which quickly the city wall of mudafa also becomes a ruin.

Although life in qoldortepe continued even in the IX-XII centuries, but during this period the population was significantly reduced and the prestige of the city was significantly reduced⁶.

During this excavation work, the central part of the Ark and the north-west sides of the city were explored. In addition, as a result of archaeological research conducted in 1956 year, the study of the defensive walls of the north-eastern part of the ancient city was completed. According to the technique of making found ceramics, it became known that the Tali-Barzu monument was characteristic of the third layer.

The study of the Quldortepa archaeological monument provides information about the features inherent in the culture of the first medieval Sogd urban settlement. In the IV-V centuries-old strata of the city, part of the sewerage networks of the city were opened⁷.

During the study of the remains of buildings adjacent to the outer walls of the Ark dating back to the VIII-IX centuries, a bronze coin was minted in Sogd belonging to an unknown ruler who ruled in the VIII century. On the first side of the coin is the face of the ruler, and on the second side is the Sogdian stamp. It is worth noting that out of such coins, four were found in the form of fluff, and another one was also found in Afrasiab.

It provides information on various household items made of ceramic, glass, copper, bronze and silver, as well as the stages of the discovery of suvd deposits and coins of cuneiform Origin, the emergence, development and destruction of the Ark, the period.

At the same time with the excavations on the central hill of the Ark, new excavations were carried out in another part of the city territory. This excavation was carried out in the place where it was assumed that the monumental architectural monument remains. It was here that the ceramics of the Middle Ages did not exist, it became clear that this architectural complex dates back to the early stages of city life. As a result of Archaeological Research in 1956-1957 years, the energetic walls of four rooms of this architectural complex were identified, which were built from pakhsa. The walls of the room are built of a large block and rectangular baked brick⁸.

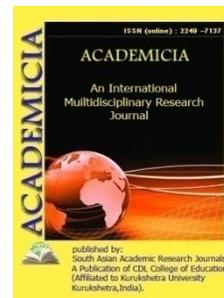

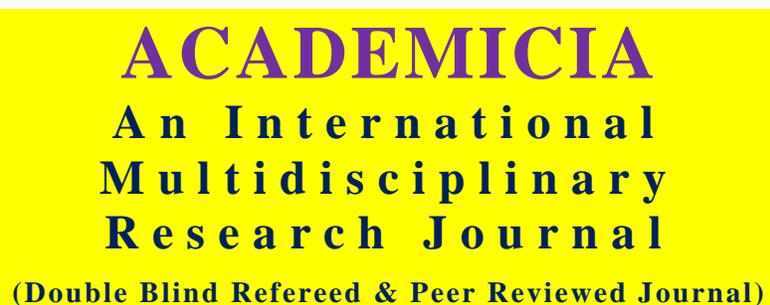

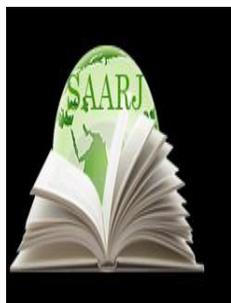

The excavations carried out in quldortepe in 1956-1957 years revealed our impressions about the life of this ancient city. As a result of these studies, the monumental building on the central hill of the Ark of the materials obtained from the I excavation point is demolished in the VIII century, but in the IX century new buildings on the slopes of this hill were erected. Among the findings found from excavation I, the absence of ceramic objects dating back to the beginning of the X-XI century, suggests that during this period there was no life in the Ark, at least in part of it. In qoldortepe, in the XI-XII century, temporary life is restored. As a result of the excavations carried out at the III excavation point of the monument, it became known that during the period of the arab occupation, life in the north-western part of Quldortepe was stopped. The research of the years 1956-1957 gave valuable archaeological data that nominate the features inherent in the urban culture of sogd⁹. But after this study, it remains only to stop carrying out inspection work for a long time at the monument.

The fourth stage: in July 2018 and in 2019, the scientific staff of the National Center of Archeology of the Academy of Sciences of the Republic of Uzbekistan and the professors of the Faculty of history of Samarkand State University will start scientific research at the monument again. In particular, as a result of excavations in the Memorial Arch, it became known that it was built in antiquity and was rebuilt in the IV – V centuries. Two periods of construction have been identified as a result of a stratigraphic excavation on the defensive wall in the south of the city. The first period of construction of the defense wall was reverted to the outer, southern side of the forty, and the bunda was excavated from the pakhsa platform and over it from the raw brick, while the outer side was built in antiquity in the form of a semi-circular (corrugated) high wall. The second construction period was recorded on the inner side of the defensive wall, with a new wall in the form of an additional “rubashka” with raw material over the platform. As a result, he received 11 m.ga reached.¹⁰ As a result of the archaeological excavations carried out in the fourth stage, it was determined that the arch and the walls of Shahristan were formed in the I century BC.

In conclusion, Quldortepa is a city located in an important network of Samarkand Sogdians. In the monument we can see that in the first Middle Ages there were cultural ties with Afrasiab, Choch, Panjikent, Jizzakh, Nakhshab, there were mutual similarities of ceramic objects, with architectural styles of that period, with building styles, too. In addition, the material and material evidence found from the monument shows that Quldortepa was one of the important political and cultural centers of Sogd in his time.

ABSTRACT

The article discusses various methods for modifying polypropylene. Compositions have been developed that have improved physical and mechanical characteristics and have an optimal composition for the production of thin oriented products. A comparative analysis was carried out for various indicators: melt flow rate, ultimate strength, deformation, activation energy of thermo-oxidative destruction. Industrial approbation of some compositions has been carried out.

KEYWORDS: *Polypropylene, Composition, Approbation, Deformation.*

INTRODUCTION

Polypropylene belongs to the class of polyolefins and is a synthetic thermoplastic non-polar polymer. It is a white solid that is industrially obtained by the polymerization of propylene. Polymerization is carried out at low and medium pressures in the presence of organometallic catalysts. Polypropylene is produced stabilized, dyed or unpainted. Polypropylene is a plastic material that is highly resistant to repeated bending and impact. It is also characterized by wear resistance and good electrical insulating properties over a wide temperature range. It has a gloss and good transparency, is chemically resistant and does not crack when exposed to the environment.

Polypropylene is characterized by a more complex molecular structure compared to most industrially produced polymers, since, in addition to the chemical composition of the average

molecular weight monomer and molecular weight distribution, its structure is influenced by the spatial arrangement of the side groups with respect to the main chain. In technical terms, the most important and promising is isotactic polypropylene. Depending on the type and ratio of the stereoisomers present, the properties of polypropylene vary over a wide range [1].

By the type of molecular structure, three main types of polypropylene can be distinguished: isotactic, syndiotactic and atactic. Isotactic and syndiotactic polypropylenes are referred to as stereoregular polymers. Isotactic polypropylene is a polymer in which the methyl groups are directed to one side of the imaginary plane of the main chain; syndiotactic - methyl groups alternate strictly; atactic - methyl groups are randomly located. Depending on the molecular weight and isotactic content, the properties of polypropylene can vary over a wide range. Of greatest industrial interest is polypropylene with a molecular weight of 80,000–200,000 and an isotactic content of 80–98%.

Due to its crystal structure, stereoregular polypropylene retains good mechanical properties and shape up to the melting point. Effective expansion of the brand assortment of polymeric materials is achieved due to their directed modification, which makes it possible to significantly improve their technological and operational properties, to create new types of products for new areas of application, including in more severe operating conditions [2].

Modification of polymers should be understood as a purposeful change in their properties by carrying out chemical reactions on the functional groups present in the polymer, or by changing its supramolecular structure.

This definition logically implies the division of polymer modification into chemical and structural.

Chemical modification of polymers consists in a directed change in the properties of the polymer by conducting interactions of the polymer macromolecules with low- or high-molecular substances - modifiers [3].

Chemical modification includes several varieties.

1. Reactions not accompanied by a change in the degree of polymerization of macromolecules (polymer-analogous transformations and intramolecular reactions). Intramolecular reactions occur with the participation of functional groups or atoms belonging to the same macromolecule. Often, as a result of such reactions, sufficiently heat-resistant polymers with a system of conjugated double bonds or polymers with intramolecular cycles are formed.

The introduction of a small number of units of a different nature into the composition of macromolecules at the stage of their synthesis can lead to significant changes in the properties of the polymer material. Monomers containing a peroxide or hydroperoxide group, unsaturated derivatives of dyes, stabilizers, physiologically active substances, etc., are used as modifying agents. When using the chemical modification method, it is possible to obtain polymer materials in one stage in which all components, including poor compatible with the polymer, are bound to its macromolecules by strong covalent bonds. This prevents the release of components on the surface of polymers during their processing and use.

1. Reactions leading to an increase in the degree of polymerization.
2. Reactions during which the degree of polymerization decreases.

Structural (physical) modification of polymers is a directed change in the physical and mechanical properties of polymers by modifying their supramolecular structure under the influence of physical factors. The physical modification of polymers does not change the chemical structure of macromolecules.

One of the methods of structural modification is polymer orientation, which is achieved by stretching the polymer body. The simplest and most common orientation for linear polymers is uniaxial orientation. As a result, chain macromolecules, chaotically (statically) oriented in the original body, under the influence of an external directional stretching effect, acquire one or another degree of orientation. In an amorphous flexible-chain polymer, the oriented state is non-equilibrium and, in order to fix it, it is necessary to cool the polymer below the glass transition temperature without removing the tensile stress. In the case of flexible-chain crystallizing polymers, the oriented state can be considered equilibrium below the melting point of the crystallites, and the removal of the tensile stress at the drawing temperature does not lead to misorientation, since the crystallites form an oriented framework that preserves the amorphous regions of the polymer body in the oriented state.

Physicochemical modification can be distinguished as a separate type, in which a physical effect on a polymer entails a change in the chemical structure of macromolecules. In this case, as a rule, the physical structure of the polymer also changes, which manifests itself in the rearrangement of supramolecular formations.

Modification of industrial polymers is widely used to obtain polymer materials with improved properties. The introduction of small amounts of polymer additives has become widespread. At the same time, there is a complex effect of additives on the structure and properties of polymers.

The introduction of the modifier can be carried out both during the synthesis process and during the processing of polymers. With the introduction of small amounts of modifiers, the physical and mechanical properties of the material increase, the durability increases, and the performance of plastic products increases. In addition, the reduction and stabilization of viscosity due to modification improves the processability of materials at the stage of forming products, increases productivity and reduces equipment wear [4].

Main part. The work investigated compositions based on polypropylene, to which various modification methods were applied. Specimens were made by injection molding; the rheological and physical-mechanical characteristics of the material were assessed by the existing methods. Polypropylene of the PPG1035-08 grade (TU 2211-008-50236110-06) was used as a base polymer in the work, and polyamide of the Grodnamid PA6-L-U1 grade was used as a modifier. According to the production regulations, it is necessary to introduce a chalk additive, therefore, compositions containing chalk and also without chalk were made. This was necessary to assess the interaction of the chalk with the modifier.

Based on the listed requirements for thermal stabilizers, a choice was made from three thermal stabilizers of different classes: phenolic type Hostanox 03 Pills, phosphite type Sandostab-P-EPQ, complex type Kretilen. In fig. 1 shows the structural formula of Hostanox 03 Pills. It consists mainly of ethylene-1,2-bis (3,3-bis (4-hydroxy-3-tert-butyl-phenyl) -butyrate).

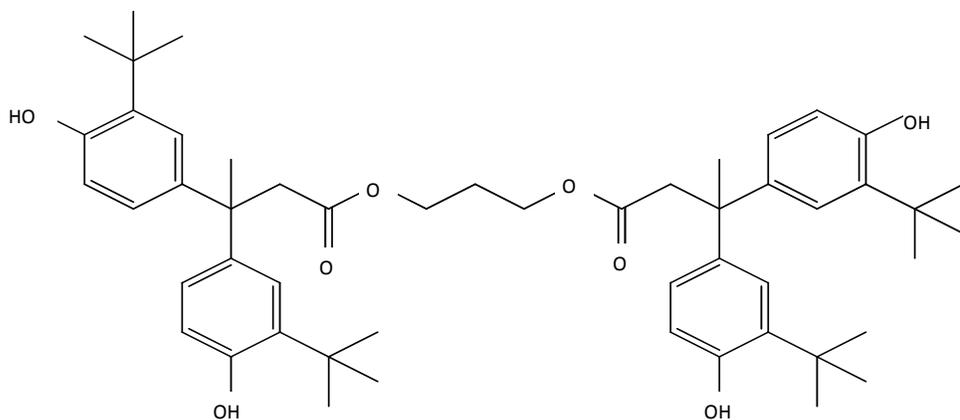

Fig .1. Structura formula H ostanox 03 Pills

Sandostab-P-EPQ is used for thermal stabilization of polymers, especially polyolefins and polycarbonates. Sandostab P-EPQ consists mainly of a phosphonite of the formula tetra- (2,5-di-tert-butyl-phenyl) -4,4-diphenylene diphosphonite (Fig. 2).

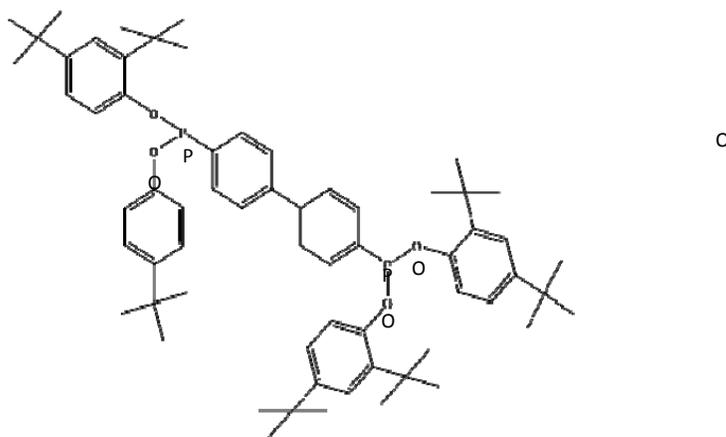

Fig. 2.Structural formula of Sandostab-P-EPQ stabilizer

Based on the analysis of scientific literature, we came to the conclusion that it is necessary to use a complex stabilizer [5]. The thermal stabilizer, known under the trademark "Kretilen" PP AO 15 (TU 2243-001-796831892009), has the necessary qualities and is also more affordable compared to its counterparts. This thermal stabilizer is a synergistic mixture of phenolic and phosphite type stabilizers. Has a complex effect and protects the polymer from thermal oxidative degradation during processing by extrusion and during the operation of products from it at elevated temperatures. Has some UV protection. To date, such mixtures are the most effective.

An important characteristic of a polymeric material is its supramolecular structure. Crystal size control allows you to adjust the basic physical and mechanical characteristics of the material. Substances that can change the supramolecular structure are called nucleators. The introduction of a nucleator leads to the formation of a more perfect crystal structure (it increases the number of crystallization centers and thereby reduces the size of crystalline formations). Under the action of nucleators, the size of crystalline formations becomes less than the length of the visible light wave. The described effect leads to an increase in the heat resistance of polypropylene by 12–15

° C. As a rule, the active substance in the composition of nucleator concentrates are salts of organic acids: sodium benzoate, potassium benzoate, sodium naphthenate; in addition, finely dispersed powders of silica, talc, quartz, kaolin and other mineral compounds are used. Therefore, in some compositions, a P0023 / 22-PP nucleator was used.

It follows from the results of rheological tests that the modified polypropylene has a lower MFI. Values range from 3-4 g / 10 min. These are optimal values for the extrusion process, but they are also suitable for injection molding processes.

The resistance of the developed compositions to thermal oxidative destruction can be estimated based on the values of the activation energy of thermal oxidative destruction (E_d). Calculations were made according to [6].

The values of the activation energy indicate that the composition of the composition: polypropylene, nucleator 1 wt. %, stabilizer 1 wt. %, dye ≈ 0.1 wt. %, has a higher value of the activation energy of thermal oxidative destruction. This means that the potential barrier to the destruction reaction increases. Products made from this composition should have improved physical and mechanical characteristics, and the service life should also increase.

The values of physical and mechanical characteristics confirm that some compositions are superior to primary polypropylene in these indicators.

Then, under production conditions at the SPO Khimvolokno enterprise, an oriented thread was made from the developed compositions and physical and mechanical tests were carried out.

The mechanical properties of polyolefins vary over a very wide range. The properties of products made of polymeric materials differ from those of the initial isotropic polymers in that, as a rule, the properties of products are not the same in different directions. The filaments have the greatest modulus in the direction of stretching, the films - in the plane of the surface.

Physical and mechanical characteristics of polypropylene yarn

Composition of the composition	Specific strength, S_N / tex	Specific thickness, tex	An effort, H	Deformation, %
Primary polypropylene, chalk 3 wt. % (according to TU BY 400031289.169)	48,2	93	45	22,8
Polypropylene, stabilizer 1 wt. %, polyamide 3 wt. %, chalk 3% wt.	49	112	54,88	19
Polypropylene, stabilizer 1 wt. %, dye ≈ 0.25 wt. %, nucleator 1 wt. %	49,9	45,6	23,2	90
Polypropylene, polyamide ($\phi = 0.15$) 3 wt. %, stabilizer 1 wt. %, dye ≈ 0.25 wt. %	51,5	42	22,7	80

The table shows the results of physical and mechanical tests of polypropylene yarns from the developed compositions. All strength indicators fit into the regulations for the production of polypropylene yarn. However, it should be noted that when using undried polyamide during the

production of the film, frequent breaks of the web are observed. We assume that the moisture contained in the polyamide interacts with the chalk additive during processing, which leads to a strong heterogeneity of the material. Further, when orienting the polypropylene thread, it breaks. Drying the polyamide eliminates frequent film breakage. When using dried polyamide, the film is uniform in thickness.

CONCLUSION

The use of complex stabilizers in the composition has shown its effectiveness. The use of a nucleator leads to the formation of a finer crystal structure, which is confirmed by the values of the activation energy of thermooxidative destruction ($E_d = 157.7$ kJ / mol) and an improvement in the strength parameters of the polypropylene thread.

The use of polyamide leads to an increase in the strength characteristics of products made by casting, however, an increase in the physical and mechanical characteristics of the thread is not observed.

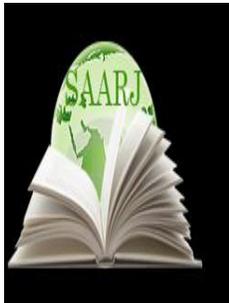

The introduction of a chalk additive into the composition is necessary to control shrinkage and prevent the formation of crazes during thread orientation.

All the compositions obtained correspond to the NLA for a thin oriented polypropylene thread. The developed compositions are supposed to be used in the production of oriented film thread intended for the production of woven bags.

ABSTRACT

In the last several decades the development of wireless broadband technologies has been a response to rising demand for mobile Internet and wireless multimedia applications such as live TV, live movies, video conferencing, and so on. In the telecommunications industry, mobile communication is critical. WiMAX and LTE have facilitated the convergence of mobile and fixed broadband networks through a common wide area radio access technology and flexible network architecture. Since 2007, the IEEE 802.16 working group has been working on a new revision of the IEEE 802.16 standards as a higher level air interface to satisfy the ITU-R/IMT-advanced requirements for 4G systems and the next generation. 4G mobile technology ensures great mobility by providing high data rates and high capacity IP-based services and applications. The 4G wireless system, its design, security services, advantages, and difficulties are all described in this article.

KEYWORDS: LTE, Mobile Communication, Networks, Wireless Technology, 4G Networks.

1. INTRODUCTION

A packet switched wireless system with broad area coverage and high throughput is referred to as a 4G wireless system. It is cost-effective and spectrally efficient. Orthogonal Frequency Division Multiplexing (OFDM), Ultra Wide Band (UWB), and Millimeter wireless are all used

in 4G wireless. A 20 megabit per second data rate is used. The maximum mobile speed will be 200 kilometers per hour[1]. Long-term channel prediction, both in terms of time and frequency, user scheduling, and smart antennas coupled with adaptive modulation and power management are all used to accomplish the high performance[2]. 2 to 8 GHz is the frequency range. It allows users to access mobile phones from anywhere in the globe. 4G improvement promises to take the wireless experience to a whole new level with amazing user applications including complex graphical user interfaces, high-end gaming, high-definition video, and high-performance photography[3].

Consumer expectations for mobile phones and other comparable goods are evolving. Consumers want a better user experience as well as more sophisticated and helpful apps on a more ergonomic device. To enable future 4G applications such as three-dimensional (3D) and holographic games, 16 megapixel smart cameras, and high-definition (HD) camcorders, existing 3G devices will need to increase in areas like as imaging and computing power. These types of apps will require more processing capacity than existing 3G phones can provide, necessitating the development of more effective application processors[4]. The development of mobile and wireless communication technology has been fast. Gadgets continue to shrink in size while increasing in processing power. Power. Users, on the whole, prefer more complex and sophisticated products. Apps that are useful As a result, capacity development is essential[5].The most important need in wireless communications .Various mobile services have evolved since their inception. The transition from 1G to 4G (first to fourth generation) has started.In the following manner:

1. 1G: The first-generation (1G) wireless network. Essentially, it was made up of an analog cellular system and architecture of a circuit switched network These wireless devices. Only rudimentary voice telephony was provided by networks, and Low capacity and restricted coverage are the major issues they face. region. As a result, there has been considerable rise in the telecommunications industry. High frequency ranges were required, which opened the door for With the invention of digital transmission methods techniques for analog transmission [6].
2. 2G: In the early 1990s, second generation (2G) wireless technology was introduced. Technology was developed to fulfill the capacity needs of Voice and telephone are growing in popularity, but circuit switching is restricted. Text messaging and data services This technique was used. A digital transmission system is one that can send and receive data in real time. Reducing the signal's size and compressing it more effectively as compared to analog systems, yet at the same time more packets may be sent in the same amount of time as time permits. Broadband with lower power[7].
3. 2.5G: 2.5G is an intermediate step made after 2G but before 3G. The transition from 2G to 3G was essentially a refinement of the two main 2G technologies. technologies. This technology allowed for a better experience. Capacity on 2G radio frequency (RF) channels, as well as reported data rates of up to 384 kbps throughput [3]. 3G refers to the third generation of mobile and wireless technology. technology, which succeeds 2G and comes before 4G. 2.5G was a transitional technology between 2G and 3G. 3G is used to provide high data speeds. As a result, 3G wireless Technology was developed to provide faster data transfer rates, increased network capacity, and other benefits. network services that are more complex and improved. In May of that year, The first pre-commercial 3G service was offered

by NTT DoCoMo. FOMA is a Japanese television network[6]. After that, after that, after that, after that, after that, after that, after NTT DoCoMo was the first company to offer a pre-commercial service. In October 2001, Japan launched its first commercial 3G network.

4. 4G: 4G stands for fourth-generation cellular service. It has improved from 3G and is now the most widely used. Wireless service that is widely available, quick, and high-speed. 4G is currently only accessible in a few areas. 4G The wireless service was created to provide high-speed data. Regardless of the technology that powers 4G. For instance Sprint makes use of a technology known as WiMax. Verizon Wireless, on the other hand, uses Long Term Evolution (LTE). LTE stands for Long Term Evolution. 4G wireless is, on average, more expensive than 3G wireless. Data speeds of four to ten gigabits per second are anticipated to be available via technology. 10 times more powerful than today's 3G networks. Because 4G is a multifunctional and flexible technology, it can make use of almost all packet switching technologies.

Both orthogonal frequency division multiplexing (OFDM) and orthogonal frequency division multiple access (OFDMA) may be used (OFDMA). The OFDM method divides a digital signal into narrowband and frequency segments. The capacity of 4G to reduce the interaction among symbols and channels connected with data streaming is the rationale for its adoption. Multiple input/multiple output technology is also possible with 4G. (MIMO). 4G includes the Universal Mobile Telecommunication Service (UMTS), which is essentially a broadband 3G technology. Frames or packets are used to transmit data with this broadband technology. As a result, it can transport audio, video, text, and other kinds of multimedia datagrams at a speed of 2 megabits per second. UMTS is a component of 4G since it allows 4G to utilize GSM-based international mobile phone roaming (Global system for Mobile Communications). Time division synchronous code division multiple access (TD-SCDMA), a wireless telecommunications technique, enables 4G to transmit both circuit switched and packet switched data[8].

1.1 History 4G Wireless Networks:

The International Mobile Telecommunications-Advanced (IMT-Advanced) standard launched the first stages of what became known as 4G in 2008. Although competing approaches such as LTE and WiMAX (Worldwide Interoperability for Microwave Access) aimed to fill the gap between 3G and 4G, no mobile network or cellular carrier was able to achieve the 100 Mbps speed that 4G stipulated in 2008, there were competing approaches such as LTE and WiMAX (Worldwide Interoperability for Microwave Access) that directed to fill the gap between 3G and 4G. Sprint was a big supporter of WiMAX, while Verizon pushed for LTE. WiMAX and LTE vary in that WiMAX does not utilise OFDM, which has been a critical component of alcommercial 4G installations over time. Sprint shifted gears in 2011 and started to offer LTE throughout its network, while WiMAX began to go away. Since 2011, LTE has gradually improved in speed and performance, with 4G LTE-A technology delivering the full 100 Mbps of network throughput specified by the original IMT-Advanced standard to cellular networks. The development and deployment of 4G's successor, 5G, will take many years. A new generation of technology takes many years to roll out, just as it did with previous generations. The deployment of new carrier technology and antennas, as well as mobile devices that accept the new standard, are all part of the 5G rollout. It will take time for all of those efforts to bear fruit. As with 1G, 2G, and 3G networks, 4G networks will eventually be phased out in favour of future generations at an undetermined period[9].

1.2 Benefits of 4G networks :

- *Technology Performance Improvement:* Increases uplink and downlink throughput while lowering latency and expanding network possibilities. In the next years, it is widely expected that mobile data traffic would continue to increase substantially. Regardless of the 4G technology utilized (LTE or WiMAX) in contrast to 3G, the bulk of the fundamental transport and throughput constraints will definitely be provided by the technology itself. 4G technologies provide at least a twofold increase in spectrum efficiency, improved support for real-time applications, and higher maximum speeds. Though there are other network and capacity challenges, such as edge or gateway management, signaling management, that must be completely addressed in order to maximize the upgrade's advantages.
- *New Mobile Application Enablement:* This feature allows new mobile apps to be developed to complement current ones (Streaming Music). The improved 4G bandwidth and latency will benefit a variety of 4G services, such as digital storage and smart home monitoring. Other services, such as MMS, digital picture frames, and various near-field communication applications, will not benefit from using a 4G network. As a result, it's critical to take a close look at the services and applications that are likely to benefit from 4G advancements. We can see that video streaming, MMOG/gaming, and expertise applications like interactive learning benefit the most from the deployment of 4G technology.
- *Addressable Device Expansion:* Network potentials and chipset scale may allow for the expansion of connectivity to a variety of innovative devices. Smart phones and more specialized gadgets continue to evolve handset technologies to include a wide range of features and value added services. The Terminal operating model has always supported a carrier-controlled service experience. Commercial operating systems like Windows Mobile and RIM have attracted heavy data users, causing network congestion by reducing control. Furthermore, the growing open eco-systems, which are further enabled by 4G, present a difficult opportunity for operators, as third parties develop services, applications, and customization tools to meet user needs. Because to open standards, gadgets are becoming more configurable, and more specialized devices such as netbooks, readers, and tablets are entering the market. We believe that manufacturers should consider a micro-segmentation-based device roadmap to satisfy the requirements of smaller user segments; different new distribution channels are required to enable the acceptance of Converged Mobile Gadgets and 4G apps.
- *Differentiated Customer Experience:* It allows you to manage the user's expectations and experience when using new features and services. We consider the user's experience in gaining a deep understanding of how these services are completely facilitated and how they integrate into the fabric of our lives, the need or capability to deploy expertise or configured gadgets to support enhancement, and finally, how to make money and when to share the revenue from service delivery. It has been insufficient in comprehending the experience of a 4G user until now, and it is unclear how much the user experience will change as more and different 4G services become available [5]. We are well aware that customer expectations in terms of price points are shifting, with increasing expectations to pay "a little for a little," which contrasts with current pricing and expects an extra bundling of services and apps into a

"solution" that helps them live better. As a result, the adoption of 4G services will rely heavily on addressing the most likely Use-Cases for 4G services.

- *Changes in Business Models:* 4G wireless technology will be critical in enabling new collaboration and monetization models. The industry has been exposed to the illusion of all-you-can-eat pricing structures, or flat-rate phone and data plans, during the last several years. This has driven performance in line with Pareto's data consumption rule, which states that 4 percent of users consume more than 70% of the bandwidth. In areas with a large number of smart devices, the resulting network bottlenecks limit access [5]. According to the bandwidth needs of many 4G use cases, the aforementioned issue will only grow worse if current pricing mechanisms are not changed. One option now being explored by operators is to move toward tiered pricing depending on traditional characteristics such as time, speed, and service quality. The bandwidth on demand service model, as well as the related pricing technique of charging premium price for these burst needs, is another viable service type. This may be useful for organizing high-bandwidth events like video streaming or live television. Given what we know now, 4G wireless technology will need a shift in pricing structures to favor smaller upfront costs (subscriptions, one-time purchases, ad-based, fermium, and per-use). Open development manifestos and collaborative solution deployment/creation techniques, on the other hand, may have an impact on how various pricing models operate. Without a doubt, the new 4G service eco-system and use-cases arrangements raise the important question of who will pay for the services and how the revenue will be divided.

1.3 Challenges of 4G Networks :

- *Security and Privacy:* When developing 4G Wireless Networks, security measures must be implemented to ensure the safest possible data transmission technique. "The 4G core delivers mobility, security, and QoS by reusing existing methods while still working on a few mobility and handover concerns," the authors state explicitly [5]. As a result, in order to protect data being transmitted across the network from hackers and other security breaches, the organization must develop an efficient and effective set of tools that will support the most stringent 4G security measures. Because of the nature of the 4G wireless network, there is a higher risk of security breaches, so multiple levels of security, including increased validation requirements, will be required to protect data and information transmitted across the network. One of the main goals of 4G wireless networks is to provide faultless service to a large geographic area. Smaller local area networks, obviously, will use various operating systems[10]. The diversity of these networks, which exchange various types of data, exacerbates privacy and security concerns. Furthermore, because new gadgets and services are introduced in 4G wireless networks for the first time, the encryption and decryption schemes used in 3G wireless networks are incompatible with 4G wireless networks. There are two approaches that may be used to overcome these problems. The first method entails adapting existing privacy and security techniques for use in heterogeneous 4G wireless networks. When existing methods fail to adapt to 4G wireless networks, the latter method relies on developing new, fresh dynamic reconfigurable, lightweight, and adaptive mechanisms.
- *Quality of Service:* In terms of network quality, various telecommunication service providers, such as Ericsson's 4G Wireless Networks for Telia Sonera, assure users of enhanced

connectivity and the highest possible data quality that is transmitted across the network. It allows users to stay connected at all times, even while "on the move," thanks to data rates nearly ten times higher than today's conventional mobile broadband networks and real-time performance. As a result, service providers must develop an efficient and effective method for 4G Wireless Networks that improves quality, implements effective security measures, and ensures that all users have access to a wide range of options for downloading music, video, and picture files without delay. Integrating IP-based and non-IP-based devices is a significant challenge for 4G wireless networks. We all know that non-IP address based devices are often utilized for applications like VoIP. IP address-based devices, on the other hand, are often employed for data delivery [5].

1.4 Evolution Of Mobile Wimax Technology :

Mobile WiMAX has proven to be an essential component of today's contemporary, digital environment. As a consequence, individuals are becoming more reliant on mobile computers. The demand for high-speed data downloading and transport on mobile devices has prompted the development of new techniques to meet the various requirements of mobile computing. In the past two decades, our globe has seen many innovative developments in the area of wireless networks. Today, wireless networks have become an important part of people's daily lives, and they are becoming more popular with each passing day due to the need for mobility and high-speed broadband access. In the area of wireless networks, new and rapidly developing technologies are now being developed that enable high-speed broadband wireless access. Mobile WiMAX (Worldwide Interoperability for Microwave Access) is a sophisticated next-generation mobile broadband wireless network that supports 4G and is based on IEEE 802.16e-2005[7].

It was originally designed to solve problems with wired networks, but it later evolved into a 4G wireless network with upgrades from 802.16-2004, 802.16e-2005, and 802.16m. IEEE 802.16e - 2005 is an upgrade to IEEE 802.16 -2004[8], which was the fixed data transmission technique for broadband connections to MAN at the time. The Wireless MAN-OFDMA specification helps to provide an improved air interface for use in unlicensed or licensed bands. Nowadays, users want to be able to stay online at all times, as well as have fast data transmission at a low cost with no data loss. Currently, a large number of PDAs (Personal Digital Assistants) on the market are capable of flawless wireless data transmission while maintaining mobility. Such requirements will become increasingly common in the future, so developers (such as the WiMAX Forum) are on the lookout for them in order to make these devices more user-friendly. For such issues, WiMAX (802.16e-2005) is the solution. WiMAX has a range of nearly 30 miles and can support data rates of up to 75 Mbps.

2. DISCUSSION

Fourth (4th) Generation Technology is abbreviated as 4G. 4G technology is essentially a 3G technology extension with increased capacity and service offerings. However, no one knows what the actual meaning of 4G is at this moment. Some argue that 4G technology is a future technology that is mainly in its maturation stage. The main expectation for 4G technology is high-quality audio/video streaming via an end-to-end Internet Protocol connection. Nothing of this may matter if the Internet Protocol (IP) multimedia subsystem movement accomplishes its goals. WiMAX or mobile structural design will become more transparent over time, making the adoption of many designs by a single network operator more common. Application flexibility

and high dynamism consumers traffic, radio environment, air interfaces, and quality of service are the key characteristics of 4G services that users are interested in. The wireless industry will benefit from numerous advances in fourth generation (4G) technology, including downlink data speeds well above 100 megabits per second (Mbps), reduced latency, efficient spectrum utilization, and low-cost implementations. With impressive network capabilities, 4G enhancements promise to take the wireless experience to a whole new level with impressive user applications like sophisticated graphical user interfaces, high-end gaming, high-definition video, and high-performance Ad hoc and multi hop networks (multi hop networks are required for voice due to the strict delay requirements).

3. CONCLUSION

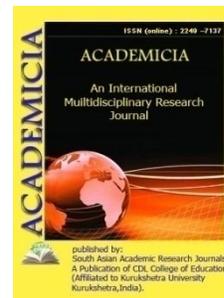

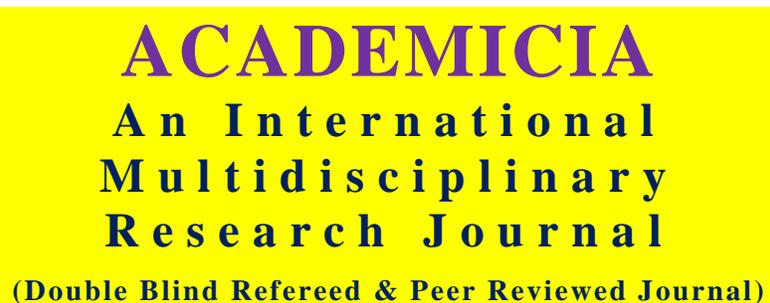

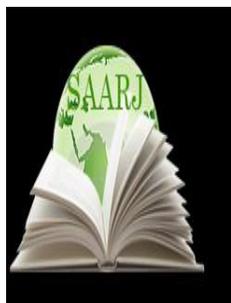

This paper provides an overview of 4G wireless networks and technologies, as well as the development of WiMAX and LTE network design and the OFDMA method. We've seen that the number of people using wireless internet has exceeded the number of people using fixed broadband. As a result, in an increasingly digital and wireless world, technologies with greater throughputs are becoming more important. Coverage and capacity are critical components of a successful and advanced 4G wireless network. The most viable technologies for a successful 4G rollout are LTEAdvanced and WiMAX. As a result, a new technology that is cost-effective, has greater throughput, better coverage, and capacity is required in today's world. It is clear that 4G technologies will have a global impact on web-based communications. Improved applications such as telemedicine, which may save lives, will be possible thanks to 4G technology. It is a completely IP-based network that will vastly enhance data transmission. There will be minimal signal interruptions, and downloads will be completed in a couple of seconds, quicker than ever before. A 5G cell phone, as well as a 5G network based on 4G technology, will be released in the near future, enabling the whole globe to connect indefinitely.

ABSTRACT

When heavy metals are exposed to stress, they declinate into molecular oxygens, releasing highly reactive transitional chemical products such as hydrogen peroxide (H₂O₂), superoxide radicals, and hydroxyl radicals, all of which are classified as reactive oxygens. Heavy metal pollution is a serious global environmental problem because it disrupts plant growth and causes genetic dissimilarity. Heavy metals, both necessary and non-essential, have similar fatal effects on plants, such as poor biomass accretion, chlorosis, growth inhibition, photosynthetic inhibition, altered water balance and nutrient integration, and senescence, which ultimately leads to plant disease. The goal of the research was to look at the impacts of heavy metals on plants and biological systems, as well as remediation techniques. Precipitation, Biosorption, Ion Exchange, and Filtration are all efficient techniques for overcoming this issue, but they are not cost-effective. Phytoremediation was shown to be the most efficient and cost-effective method in this respect. Although bioremediation seems to be the greatest option, it does have certain drawbacks. In order to use this technique effectively, a longer study must be accompanied in order to decrease the constraint.

KEYWORDS: Agriculture, Anthropogenic, Metals, Pollution, Soil.

1. INTRODUCTION

Human usage and management of water and soil resources have impacted the growth, survival, degradation, and revival of anthropoid advancements supported by agriculture. Soil and water are essential natural resources for the domesticated food production system based on plants and animals. Despite the fact that soil is often referred to as the "productive substrate," not all soils are suitable for crop development. In ideal agricultural soils, mineral inputs, soil organic matter, air, and water are all present. The balanced contributions of these components enable water retention and drainage, root zone oxygen, nutrition to assist yield growth, and plant physiological care. The circulation of soil components in a particular soil is influenced by five factors: parental material, time, weather, species, and landscape.

Each component has a direct and overlapping impact on the suitability of a soil for agricultural use. Agriculture disrupts the natural cycle of nutrients in soil. Plant nutrients may be extracted from the soil using precision agronomy and harvesting of crops for human and animal use. To maintain soil richness for sufficient yield harvests, soil amendments are generally required. To improve soil fertility, early hominids used animal dung, charcoals, ashes, and lime in their arenas (CaCO₃). Farmers now employ a range of soil additives, including inorganic compound manures and carbon-based sources of nutrients, such as manure/compost, to enhance soil richness, which has resulted in an oversupply of primary macronutrients. Excess nutrients, especially nitrogen and phosphorus, may pollute the soil and groundwater when they are transferred from agricultural areas through surface runoff or leaching[1], [2].

Soil is an important component that receives a significant amount of pollutants each year from a variety of sources. Soil, in general, serves as a natural barrier by controlling the movement of chemical components and chemicals into the atmosphere, as well as a sink for substance pollutants. Heavy metals are usually thought to be naturally occurring substances, although they are found in large amounts in certain ecological areas as a result of human activity. As a consequence, the environment's ability to replace lifecycles is damaged, posing a threat to human, animal, and plant health. This is due to the non-degradability of heavy metals, which causes bioaccumulation in food chains. In a broad range of biological patterns, heavy metals may be found in both degraded and uncontaminated soil coverings. Because heavy metals cannot be tarnished or removed, they accumulate in soils, water, and residues[3], [4]. Heavy metals in soils may also form naturally as a result of human activity (Figure 1). Atmospheric emissions from volcanoes, movement of mainland soils, and weathering of metal-supplemented rocks are examples of natural bases.

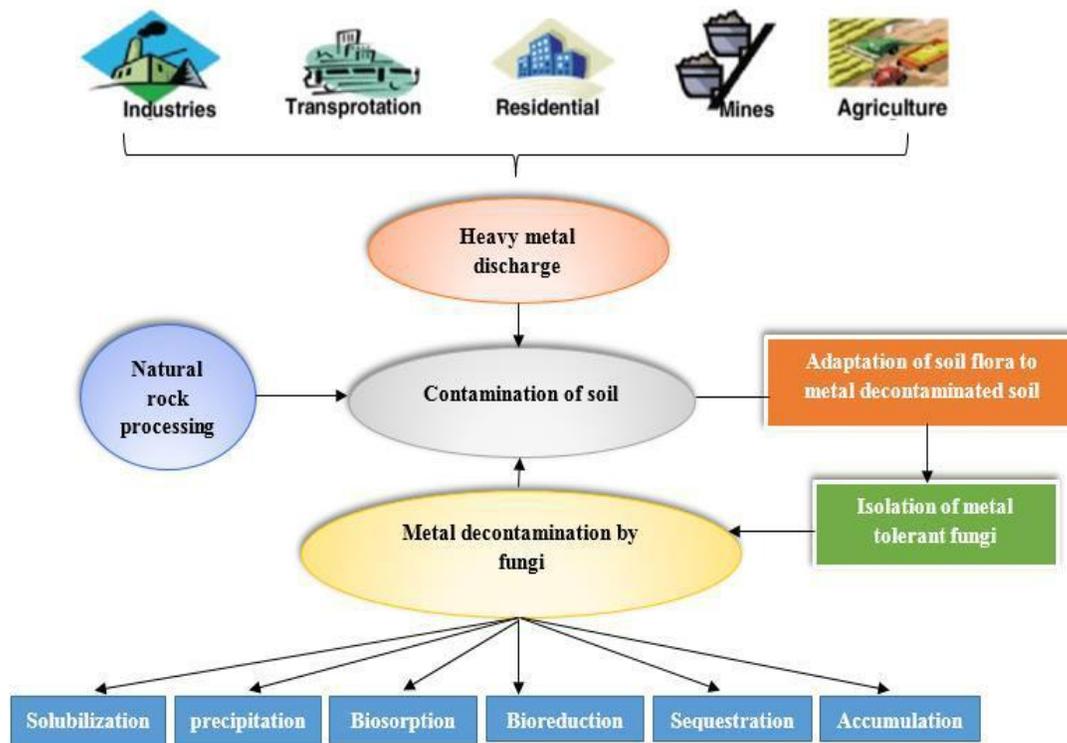

Figure 1: Heavy Metal Pollution Sources And The Approved Approaches For Metal Refinement [5].

Adulteration of agricultural and forestry soils with trace metals and metalloids has been a major source of worry throughout history. Metals in agricultural soils may enter food chains, increasing human exposure and risk (both cancer-causing and non-carcinogenic hazards), while metals in woods are mainly a danger to pore water supplies, environmental risk, and woodland health. Metalloid and trace metal pollution in agricultural and forest soils has been a significant issue for decades. Due to rapid automation in emerging nations, the global world's excessive use of metals and manufactured chemicals, coupled with inadequate environmental management, resulted in widespread contamination. Heavy metal contamination in agricultural soils has sparked concern in recent years about the risk of direct consumption, bioaccumulation via the food chain, and ecological system effects to human health. Heavy metals such as copper, zinc, and manganese, as well as unneeded heavy metals such as cadmium, chromium, manganese, and lead, are the most hazardous to humans and marine life.

The presence of metallic elements in soils is a major issue since they accumulate in food chains, causing damage to the whole environment. Organic pollutants are biodegradable, but the presence of heavy metals in the atmosphere reduces the biodegradable frequency, thus doubling the emissions, i.e. organic pollutants and heavy metals. Heavy metals endanger people, animals, plants, and natural ecosystems in a number of ways. Variations in soil pH, penetrability, pigment, and usual interaction, as well as uninterrupted ingestion, plant adsorption, food-cycle, drinking contaminated marine, and changes in soil pH, penetrability, pigment, and usual interaction, all have an impact on soil value.

2. LITERATURE REVIEW

A.Mahar et al discussed toxic metals have been released into the environment as a consequence of mining activities, industrial production, and household and agricultural usage of metal and metal-containing compounds. Metal contamination has grave consequences for human health and the environment. Few heavy metals are toxic and fatal in small amounts, and some are teratogenic, mutagenic, and endocrine disruptors, while others induce behavioral and neurological problems in babies and children. As a result, heavy metals polluted soil remediation may be the sole viable alternative for reducing the detrimental impacts on ecosystem health. In light of the above facts, this paper attempts to evaluate the present state, difficulties, and possibilities in phytoremediation for heavy metals removal from polluted soils. Phytoextraction and phytostabilization are highlighted as the most promising and alternative techniques for soil reclamation[6].

A. N.Ganeshamurthy et al. describes about the ecological risk related with metallic element contamination into water, plants and soil in developed and under-developed agriculture. Since the invention, the percentage of Indians living in towns and developed regions has increased to 27%. Despite restricted regulations and restrictions, underdeveloped agribusinesses are operated on a large scale in many developed regions throughout the globe. Non-degradable pollutants introduced into the system by human activities, such as metallic elements in soil, water, air, and crops, cause more concern since they have a tendency to bio-accumulate. Metallic element poisoning has wreaked havoc on humanity in the past, destabilizing intellect and causing embarrassing conduct. The body suffers from a shortage of important elements such as Cu, Zn, and others as a result of these pathogenic elements. With current level knowledge, a long-term and assured technique to block the entry of metallic elements into the food cycle is challenging. There are a number of options for reducing the outcome's concentration. Crop lands used in a different manner, which is indirectly eaten by people and animals, is a superior tonic for retaining element entrance into the food chain. There are many ecological regulations in India that regulate water, air, soil, and trash. Governmental foundations are built on the belief that a regulatory paradigm is sufficient. Regulatory mechanisms may not be in place in all instances, but they are essential derivators to complement other methods by putting a "limit" on the degree of deprivation that is informally acceptable, as well as allowing for alternative, cleaner, and appropriate replacements to be "possible." [7].

ShaliniArora et al. discussed soil analysis and its potentially harmful impacts on human health. The study of the environment has been going on for a long time, and the molecular structure of naturally occurring topsoil has been changing through time in response to the ecological conditions of the environment. This percentage is the deciding element of soil richness because when the soil arrangement changes, the richness and quality of the soil degrades quickly. Metallic poisoning is a common side effect of long-term, low-level exposure to fundamental pollutants in the environment. Exposure to hazardous metallic elements has been linked to a number of long-term illnesses and may result in a wide range of health problems. Urban soil receives various contributions of metallic elements from a variety of moving and stationary sources, such as vehicular traffic, power generation facilities, waste incineration, and resuspension of surrounding polluted top soil, and contributes significantly to contamination in developed areas. Because roadside topsoil is more polluted than any other location, such as grounds or a farm home, the percentage of the composition of the top soil varies in various

regions of the atmosphere. Due to significant growth in automobiles and industry, these differences are particularly noticeable in Indian metro areas. As a result, studying urbanized top soil is crucial for determining the source, movement, and metallic pollution in developed regions[8].

3. HEAVY METAL BASES

Heavy metals may originate mutually from regular and anthropogenic procedures and finish up in dissimilar environmental sections shown in Figure 2.

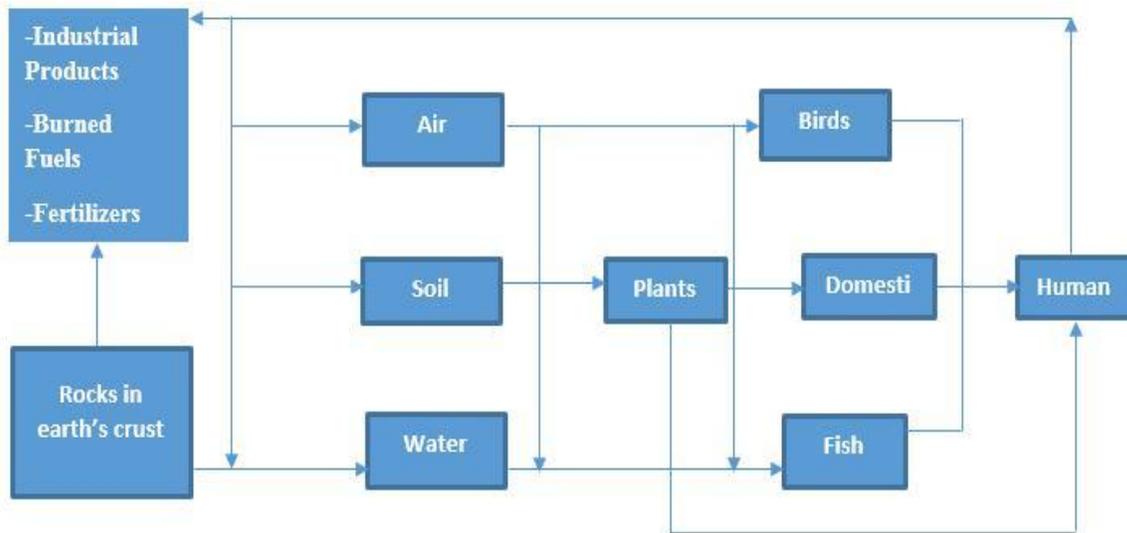

Figure 2: Illustrates the metallic element and their cycling in the soil-water-air organism ecosystem.

2.1. Natural Processes:

Natural heavy metal emissions occur as a result of a variety of environmental factors. Such pollutants include volcanic eruptions, sea-salt sprigs, forest fires, rock cracking, biogenic source, and wind-borne soil particles. Metals may be released from their usual spheres and into various environmental sections as a result of natural weathering processes. Heavy metals include hydroxides, oxides, sulphides, sulphates, phosphates, and carbon-based compounds. Even though residues of the above-mentioned heavy metals have been discovered in humans and other animals, they continue to cause serious health issues.

2.2. Anthropogenic Processes:

Heavy metal anthropogenic activities have been shown to go beyond natural metal variations. Metals often detected in wind-blown dusts come from industrial locations. Smelting, which releases arsenic, copper, and insecticides, which releases arsenic; and the flickering of fossil energies, which releases nickel, mercury, and extra heavy metallic elements, are all significant anthropogenic bases that knowingly contribute to heavy metal adulteration in the atmosphere. Because of everyday production of products to meet the needs of the large population, anthropological activities were discovered to pay greater attention to environmental pollution.

4. MECHANISMS OF REMEDIATING HEAVY METALS

Due to a range of metals, metalloids, and anionic elements, acid mine water treatment methods generally yield high density slush that is dissimilar, making disposal difficult. As a result, recent research has focused on chemical types recovered from Acid Mine Drainage (AMD) and subordinate slush. This helps to recover scarce resources while also making sludge treatment and disposal easier and safer, decreasing their ecological footprints. Metal laden leftover is disposed of in landfills and leftover retention tarns, causing subordinate contamination of exterior and sub-surface water sources. It can also clue to soil pollution, which reduces efficiency. So as to protect humanoid well-being, floras, faunas, soil, and including other habitat sections, heavy metal remediation technologies should be given appropriate and thorough consideration[9], [10]. The majority of physical and chemical metallic element remediation methods necessitate the processing of massive volumes of sludge, devastate habitats, and are extremely costly (Figure 3).

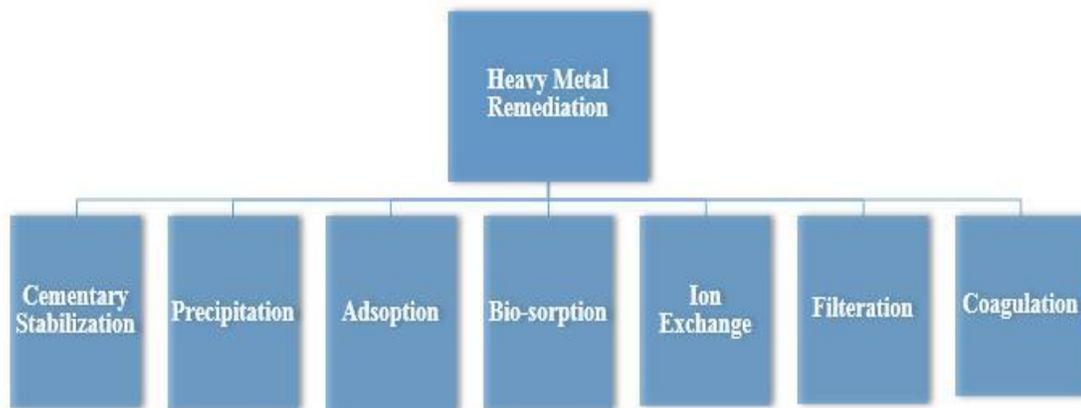

Figure 3: Illustrates the various methods to remove heavy metals from agricultural soil.

4.1. Precipitation:

Various alkaline chemical reactants have been employed to neutralize AMD (Acid-Mine-Drainage) throughout the years in order to increase the pH and, as a consequence, precipitate and recover the metals. The most common alkaline reactants utilized for successive recovery of reserves resources from AMD and magnesium hydroxide ($Mg(OH)_2$) are caustic potash ($NaOH$), clastic rock ($CaCO_3$), burntlime (CaO), sodium carbonate (Na_2CO_3), and calcium hydroxide ($Ca(OH)_2$).

4.2. Adsorption:

Because of its instability and elution capabilities, surface assimilation is regarded the most efficient and economically viable option for eliminating metals from liquid blends. With highly concentrated solutions, surface assimilation is unsuccessful because the adsorptive rapidly becomes saturated with the adsorbate. It's only useful for very dilute mixes, it takes a long time to renew, and it doesn't discriminate between metals when it comes to attenuation.

4.3. Ion Exchange:

Between a solid substrate and a soil solution, this is often referred to as ion exchange. Clay and mastics with an increased atomic interchange potential are often used to approve alloys made from liquid blends. This method, however, is time intensive and only works for a limited number of metal concentrations in the combination. Heat and alkalinity affect this arrangement as well.

4.4. *Biosorption:*

Biosorbents have many benefits, including accessibility, performance, and capacity. This is a basic and easy process. It's simple to regenerate, which makes it attractive. However, if the feedstuff blend concentration is too high, the progression will rapidly outstretch, preventing advance impurity removal.

4.5. *Membrane Technologies:*

When the water includes a significant concentration of pollutants, sheath equipment for acid mine drainage recovery is especially effective. Either assisted diffusion or reverse osmosis are used in this process. Some of the membranes used in mine water treatment filtration include ultrafiltration, Nano filtration, diffusion, microfiltration, and element percolation.

5. CHALLENGES IN THE PHYTOMINING OF METALLIC ELEMENTS POLLUTED SOIL

Several biological, physical, and biochemical techniques have been employed to remove heavy metals from the soil during the last two centuries. These approaches, however, have significant drawbacks. They need a lot of time and effort, as well as a lot of disturbance in the native soil microbiota and constant changes in the physio-chemical characteristics of the soil. Phytoremediation technique is given unique attention amongst different perspectives to repair the heavy metal contaminated soil undisturbed. Phytomining is a method that uses natural or genetically engineered plants to remove dangerous chemicals from the environment, such as radioactive elements, fungicides, polychloroterphenyl and polynuclear pungent natural gas, and convert them to safe combinations. The emphasis of phytomining is divided into three layers: I plant-centered element removal with monetary advantages, (ii) threat reduction, and maintainable soil supervision, in which phytoremediation gradually increases soil richness, allowing crop development to be tracked. High biomass fabrication and fast-budding plants, such as poplar, jatropha, and willow, are being used for the twin aim of energy generation and phytomining in the accumulation. Phytomining is a solar-powered, recyclable machine that has a good reputation in the community. In the near future, phytoextraction of metallic elements is expected to be a cost-effective equipment for agromining of metallic elements.

6. DISCUSSION

There is a complicated connection between environmental chemical composition of natural resources and emissions, according to their independent study. Ferrosol sewage sludge is the source of heavy metal's environmental impact. The impacts of heavy metal emissions from different sources on topsoil and flowing water in various regions of the globe, as well as their dominance of pollution or metallic residues. Heavy metals such as chromium, manganese, copper, mercury, and zinc pollute soil, posing serious environmental problems since they are non-essential and detrimental to flora and wildlife, as well as having a direct hazardous effect on human health. Anthropogenic activities such as mining, industrial development, and agronomic practices such as the use of pesticides, fungicides, and composts have lately discharged heavy metals into the topsoil, water, and atmosphere. Through a number of physiological processes, these metallic elements are released into the plant system, affecting plant growth. The absorption of metallic elements into the environment varies according to a variety of factors, and it becomes hazardous when it exceeds acceptable limits. The possible genesis of these components has led

to an increasing presence of metallic elements in the environment, whether via direct absorption from contaminated soil, depletion of fully-fledged crops on polluted soils, or drinking wastewater that has infiltrated through these soils. The goal of this study was to look at how heavy metals affect agriculture and how they affect human health, as well as to propose some ways for removing heavy metals from crops and soil. Heavy metal buildup occurs only when vegetal crops are cultivated in a contaminated region with metallic elements, and these metallic elements subsequently enter the food chain. When people consume a metallic element-contaminated root vegetable, they develop a range of severe health issues. These heavy metals have an impact on soil nutrient status, soil strength, water supplies, and extramarine living organisms, in addition to plants and people.

7. CONCLUSION

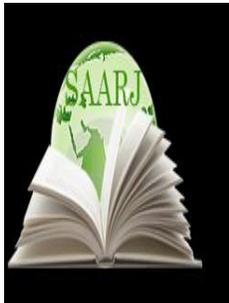

By producing different types of garbage and dumping them without proper management, modern lifestyles and industrialisation have created countless environmental problems. These trashes contaminate the environment, causing the most critical and fatal impacts on living creatures, jeopardizing their survival. The most hazardous feature of industrial wastes and other trashes is the discharge and buildup of metals, particularly heavy metals. Metallic element contamination of agricultural soils as a result of growth and industrial development is of great concern due to the potential health risk caused by consuming contaminated crops. Vegetables are an important component of the human diet because they provide vital nutrients for optimum health. As a consequence of frequent applications of fertilizers and pesticides, heavy metals have accumulated in plants. The toxicity of heavy metals ingested via contaminated vegetables is a major issue.

However, just a few research have been conducted to establish the permissible limits of heavy metal music. As a result, it is recommended that trash be processed before being thrown in the environment in order to reduce the sound impacts on the atmosphere by converting them into less hazardous forms. Effective treatments are too costly. The most efficient and cost-effective approach in this respect has been determined to be bioremediation, which entails the use of living organisms to address certain pollution-causing circumstances via effective absorption of pollutants from the desired environment. It has been discovered that phyto-remediation, or the employment of plants to clean up trash, is extremely successful. In addition, a new research on heavy metal exposure in babies, the elderly, and women, especially pregnant women, is required. In addition, strategy and policy are needed to monitor the limits of accretion in vegetables and hyperactive accumulators specified for certain plants.

**FORMATION OF A PROFESSIONALLY-ORIENTED LEXICAL
 COMPETENCE FOR CS STUDYING FOREIGN LANGUAGES, ISSUE OF
 TEACHING IN THE EDUCATIONAL PROCESS**

N. K. Suleymanova*

*(PhD), Associate Professor,
 Doctor of Philosophy, Department of Languages Academy,
 Armed Forces of the Republic of UZBEKISTAN

ABSTRACT

The article explores the professionally oriented lexical competence of cadets and about the problem lecture and its use in the educational process. The concept of lexical competence, solving communication problems. Role-playing games, project methods, search methods. Formation of lexical skills.

KEYWORDS: *Linguistic Competence, Professionally Oriented Vocabulary, Lexical Skills, Professionally Oriented Approach, Teaching Method, Pedagogical Problem, Problem Lecture, Educational Technologies, Problem Presentation, Problem Game.*

INTRODUCTION

One of the components of linguistic competence is professionally oriented competence. The main task for teachers is to teach cadets professionally oriented vocabulary for the need to understand texts in their specialty and work with them. The student must be able to correctly correlate a specific lexical unit with other lexemes in thematic and semantic groups, with synonyms and antonyms. Master the rules of specific word formation and combination, the rules for choosing and using a lexical unit in its grammatical and stylistic structure.

Motivation plays an important role. It acts as the main direction of the process of forming professionally-oriented lexical competence.

Lexical competence is the ability of a cadet to determine the meaning of a word in context, the ability to use it orally and in writing. It should be noted that lexical competence also includes knowledge of the system and norms of the target language, which are subsequently applied in practice. Lexical competence is based on lexical skill. Lexical skills include knowledge of the word as the most important unit of the language, its forms, meanings and use.

In pedagogy, in many situations, the concept of "problem" is used to solve compound-pedagogical, psychological, and educational problems. A pedagogical problem is a pedagogical problem that must be solved, but the method of solution is not yet known. Problem-learning technologies are educational technologies that allow students to develop creative searches for small-scale research, promote obvious hypotheses, substantiate results, arrive at specific results, etc. Problemlearning technologies are based on enhancing student functions.

A problem lecture is a lecture in which the student's performance improves by participating in problem situations and towards solving problem problems. In drawing up problem-based learning, the methods used by the teacher are of particular importance. Therefore, the choice of teacher must be paid special attention. The main methods of problem-based learning are as follows: - research method; - heuristic method; - a method for creating a problem situation; - creative method; - partially creative method.

Researchers such as A.E. Sizemina, A.N. Shamov conditionally distinguish several levels in the formation of foreign language lexical competence, under which the process of forming the ability of students to solve communicative problems associated with the practical use of foreign language vocabulary in speech activity on the basis of acquired knowledge, skills and abilities is considered [5].

A professionally oriented approach is one of the main tasks of teaching a foreign language. The use of new teaching authentic materials gives the effectiveness of teaching any foreign language.

So, role-playing games, project methods, search methods, which also form social and communicative competence, help to form professionally-oriented vocabulary among cadets.

Role-playing is a way of expanding the experience by presenting them with an unexpected situation, in which it is proposed to take the position (role) of one of the participants and then work out a way that will lead this situation to a worthy end.

The project method is always focused on the independent activity of cadets: individual, pair, group, which students perform for a certain period of time.

The method of the educational project is one of the personality-oriented technologies, a way of organizing the independent activity of cadets aimed at solving the problem of the educational project, integrating the problem approach, group methods, reflexive, presentation, research, search and other methods [4].

With the problem-search method of teaching, research activity acts as a form of organizing the educational process aimed at acquiring new knowledge. First of all, of course, we are talking about the fact that when this kind of action is included in the lesson, research abilities are developed and the competence of cadets is formed.

At present, professionally oriented teaching of a foreign language is recognized as a priority area in the renewal of education.

A lecture is a report of educational material, a monological method of cooperation between a teacher and a cadet. The lecture is also a mediator of the objective connection between evidence and what happened. A lecture is the ratio of using short auxiliary dialogs that provide diagnostics, and is a factor of a qualitatively - material interpretation of the teacher's knowledge for students. This refers to the reverse relationship. The lecture consists of a connection form and

style of learning. A lecture is a connection between learning forms. This is listening to her with attention, a visual examination of the aids, a synopsis and with all this a finished lesson.

The useful aspects of a problem lecture are known: Gaining knowledge through personal research work, interest in the educational process, the development of practical effectiveness and other learning outcomes. Problematic lecture in the educational process helps to independently develop knowledge, development provides students with creative thinking and teaches them to actively participate in the learning process.

P.I. Obratsov made a huge contribution to the development of the theory of professionally oriented teaching of a foreign language. He substantiated the principle of the professional orientation of educational material when teaching a foreign language in a non-linguistic university. P.I. Obratsov emphasized that the study of a foreign language should not be an end in itself, but a means of achieving the goal of increasing the level of education, erudition within the framework of their specialty [2].

Working on professionally oriented vocabulary requires solving a number of questions: how to explain new words, what should learners know about each new vocabulary unit, and what are the difficulties in mastering it ?

There are several approaches to explaining new words: when a new foreign word is associated either directly with the concept that it denotes, or with a word of the native language using translation.

The formation of lexical skills involves the passage of certain stages: the semantisation of lexical units; automation of lexical units (the formation of lexical skills); further improvement of lexical skills.

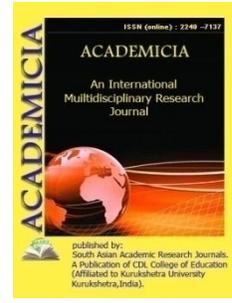

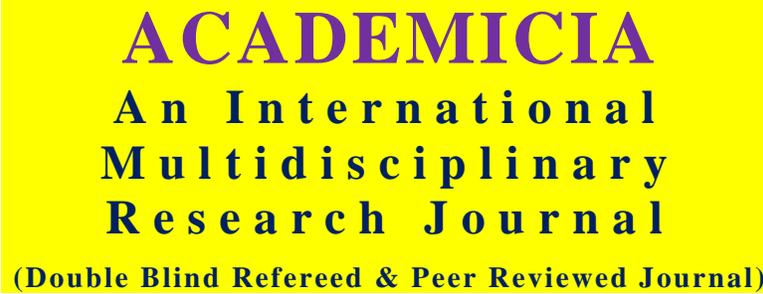

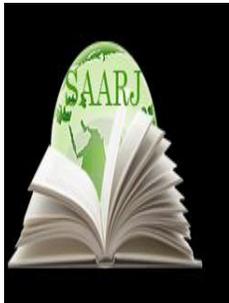

Professional vocabulary is the main component of both expressive and receptive types of speech activity, and if cadets have mastered or, more importantly, learned to assimilate vocational lexical material and can use it in various situations of professional interaction, then we can say with a certain degree of confidence that students mastered both vocabulary knowledge and skills and abilities in all types of speech activity.

The lecture saves study time and is effective in understanding information. Problematic lecture is one of the active types of lecture. A problem lecture in the educational process helps to solve different types of problems. This type of lecture is distinguished by the fact that helps the student in creative thinking and develops. Technology problem lectures are not distinguished by variability, because the process of obtaining student knowledge is divided into several stages, they are connected with each other. When a problem situation arises, the introduced training problem is complex, but students must solve it. In the second (closed) stage of solving this problem, he himself must strive for a solution. He must understand what information and what is needed to solve this problem. In the third (open) stage, there are many ways to solve the problem of this situation.

Pedagogical Institute Preschool, Bukhara State University,
UZBEKISTAN

ABSTRACT

The article discusses the use of modeling technology as a modern approach in the teaching of mother tongue in secondary schools. The article also provides information on the need and benefits of modeling in education.

KEYWORDS: *Education, Upbringing, Teaching, Modeling, Modern Approach, Optimization, General Secondary Education, Continuing Education, Pedagogy, Linguistics, Linguistics*

INTRODUCTION

Methods: In the article we tried to cover current issues of Uzbek linguistics using such methods as "Observation", "Analysis", "Comparison", "Comparative". We have highlighted the need for modeling technology in mother tongue education today.

Conclusions: Today's state educational standards place great demands on the suitability of students for independent learning activities. Most of the disciplines in the social and humanities were theoretical. At present, the traditional form of education does not meet the needs of the public education system and students. That is why we have a task to enrich the native language lessons of general secondary schools with modern, optimal, independent teaching technology. This article presents the basics of the need for teaching methods based on the technology of modeling the syntax of native language lessons.

Discussion: The technology of modeling mother tongue lessons in the general secondary education system is being introduced as a necessity for the teaching process today. These processes are being carried out step by step. The results of the process are aimed at the effectiveness of the education system.

President of the Republic of Uzbekistan ShavkatMirziyoyev chaired a video conference on August 23, 2021 on the development of public education, improving the skills and prestige of teachers in society, raising the morale of the younger generation. . From the first days of his presidency, the head of our state has been paying special attention to the training of innovative and creative-minded modern cadres in our country, educating young people in the spirit of patriotism and high spirituality.

At the meeting, the President reflected on the ongoing reforms in the country to reform the school education system and the urgent tasks ahead in this regard. emphasizing the importance and significance of these issues. Indeed, if we look at the history of the developed countries of the world, we see that the reforms aimed at changing the life of society in them began with the education system, kindergartens, schools, upbringing. Because you can't change a person or a society without changing the school. The basis of education and upbringing is the school. The driving force behind the school is the teacher. In order to grow up and bring up a harmoniously developed young generation that is physically healthy, spiritually mature, independent-minded, has deep knowledge and a modern outlook, and is able to take responsibility for the fate and future of our country. work is underway. First of all, the head of state stressed the need to reconsider the workload and the number of lessons in schools, to create a methodology that encourages students not only to memorize, but also to think. The experience of Finland in this regard was cited as an example. It is one of the most advanced countries in the world in general literacy, natural sciences and mathematics. "If the teaching methods in schools do not change, the quality, content and environment of education will not change," said ShavkatMirziyoyev [1,143]. In fact, as the President said, the school system, textbooks and programs should be in optimal condition. Our students need to acquire knowledge that encourages them to think and act independently, using their golden time effectively. As a result of today's rapid globalization, there is a growing body of information that needs to be studied, and yesterday's knowledge is becoming obsolete. Therefore, in our opinion, schoolchildren should be able to start their independent activities in the future with the help of this knowledge, while studying the information in the textbooks. In other words, the knowledge gained during the eleven years of education remains a real foundation for our youth. "We need to develop our material and spiritual life in harmony," he said. The school should be the main link in this. The development of school education should become a great national goal for us, a nationwide movement, "the head of state said during the meeting. [2,202-203] State educators, who have such a strong focus and demand for education and upbringing, have responsibilities. We need to research this in depth and enrich it with the most effective and optimal versions of school textbooks and teaching technologies. It should be noted that mankind has long been interested in creating conditions for a prosperous life, the early detection of natural disasters. Therefore, it is natural for human beings to study phenomena of the external world.

Specialists in the field of science study only the features of a process that interest them. For example, geologists study the history of the earth's development, such as when, where, and how animals lived, how plants grew, and how the climate changed. This will help them find minerals. But they do not study the history of the development of human society on earth, as historians do. The study of the world around us can lead to inaccurate and incomplete information. But this does not prevent others from flying into space, discovering the secret of the atomic nucleus, mastering the laws of development of society, and so on. Based on them, a model of the event

and process being studied is created. The model should reflect their characteristics as fully as possible. The approximate nature of the model can take many forms. For example, the accuracy of the instruments used during the experiment affects the accuracy of the result obtained. The concept of model is derived from the Latin word "modelus", which in the natural sciences or science in general is understood as a material device that, when information about a particular object is entered into it, the same object is formed as a product. In other words, the model is an imitation of natural objects (similarity, imitation, natural appearance) [3,97], which corresponds to the Uzbek template and standard words [3,97]. It serves as the basis for the occurrence of events and is studied in concrete or abstract objects, reduced objects and schemes. Explaining this with a simple real-life example, the characteristics that characterize an apple - its roundness, fruitfulness, sweetness, etc. - are an intellectual model of that concept. If we make an apple from clay or an artificial material, this is its material model [3,57-59]. The model is important to know on the following grounds:

First, modeling is a method that simplifies each science object. The modeling of linguistic units is based on the stable relationships of the elements within these characters. Therefore, the division of relations between the elements of the whole into stable and unstable types is of great importance for linguistic modeling. Second, Modeling is a general scientific method common to all disciplines and is based on the following principles: deductiveness - is based on logical reasoning and is based on the principle of specificity to generality; The use of a thinking experiment is to interpret the model as an idealized object.

The concept of linguistic model was introduced by such representatives of structural linguistics as E. Sepir, L. Bloomfield, R. Jakobson, Chomsky, Harris, Hocket. Its development dates back to the 60s and 70s of the twentieth century (the period when mathematical and cybernetic linguistics began to develop). The linguistic model can be divided into the following types:

1. Models of human speech activity. These models reflect specific speech processes and events. For example, the pronunciation model of a specific sound or the speech pattern of speech.
2. Linguistic research models. It reflects a research process based on specific linguistic phenomena.
3. Metamodels - in which linguistic models are selected, which have a hypothetical-deductive character, are very abstract and rationalized. The method of modeling is actively applied in some languages, including English.

The structure of a simple sentence in Uzbek: $S + O + V$: *I picked flowers. I ate fruit.*

S =subject, **O** = object, **V** = verb.

In determining the linguistic essence of a simple sentence, linguists rely on the following interpretation of syntactic theory about speech:

1. The smallest pattern of speech, as a linguistic unit, is the general unity that exists in our minds, and it is the ability to form and express thought in our speech in accordance with the laws of language.
2. In determining the smallest form of a sentence, its external structure, internal structure and essence are distinguished.

3. The definition of the essence of the components of the minimum sentence pattern is based on the coherence (valence), ie the semantic (semantic) and syntactic, as well as morphological cohesiveness of lexical units. and those representing them) were removed.

4. In determining the smallest sentence pattern in Uzbek, the main difference in sentence structure between Indo-European and Turkic languages was the focus. The difference is that Indo-European languages are not unique to monosyllabic sentences and can never be ownerless.

There is no significant difference between Turkic languages, especially Uzbek, “I write a letter, you carry a letter” and “I write a letter, you carry a letter”, ie in Uzbek the cut is perfectly formed in terms of personality [4,54].

Based on the four principles outlined above, [W_{Pm}] is defined as the smallest building block of a simple sentence. In [W_{Pm}], [W] is the part of speech that serves as a noun, a lexical meaning, and belongs to an independent group of words, that is, to a word, a phrase, an extended compound (adjective, adverb, movement names turnover). More specifically, [W] is a linguistic pattern that can act as a noun unit in speech and can occur in the form of any unit of speech (word, phrase, or even sentence). [P_m] is a symbol of the set of tools that make the noun unit [W] into a speech pattern, which is expressed in speech in the form of cut-off category indicators.

[W_{Pm}] = The following speech derivatives of SG consist only of a unit of atov formed by cross-sectional indicators:

	[W]	[P _m]
1.	<i>Yoz</i>	<i>-moqchi+miz</i>
2.	<i>Ketmoqchibo'l</i>	<i>-ma+sa +kerak</i>
3.	<i>O'qi</i>	<i>∅</i>
4.	<i>Oqko'ngil</i>	<i>-siz</i>
4.	<i>Aytib qo'y</i>	<i>-ma+sa+ngiz</i>
5.	<i>Talaba</i>	<i>-man</i>
6.	<i>Ona bo'l</i>	<i>-gan+ekan</i>
7.	<i>Bola</i>	<i>edi+m</i>
8.	<i>Kim</i>	<i>-san</i>
9.	<i>O'ttiz</i>	<i>-dir</i>
10.	<i>Baxtiyor</i>	<i>-siz+lar</i>

The main criterion in defining the smallest sentence pattern in Uzbek language - [W_{Pm}] = SG is that Turkic languages, in particular, Uzbek, form the center of speech in the sentence structure. After all, the smallest construction pattern of a sentence consists of a unit of atov formed by cross-sectional indicators. [W_{Pm}] = SG exists in our minds as a linguistic syntactic unit, an opportunity to shape and articulate thought in our speech in accordance with the laws of language.

W_{Pm} is a model of minimal simple speech. M: *I read. You wrote*

Therefore, the smallest model of a compound sentence in Uzbek is:

S1 + V1, S2 + V2: *Autumn has come, the weather has started to cool.*

The simple sentence construction in English and Russian is defined as follows: S + V + O: *I'm writing a letter. He's playing a checker.*

I have write the letter. I am reading an interesting article.

The general linguistic pattern of compound sentences is $[WPm R WPm] = QG$, which is divided into three intermediate forms:

- $[WPm , WPm]=QG$
- $[WPm \rightarrow WPm]=QG$
- $[WPm \leftrightarrow WPm]=QG$

At first glance, these intermediate scenes seem to be a symbolic representation of the following conjunctions and conjunctions without the traditional conjunctions. (For example, *Spring has come and the universe is flourishing* - $[WPm, WPm] = QG$. *When spring comes, the universe is flourishing* - $[WPm \rightarrow WPm] = QG$. *When spring comes and the universe is flourishing* - such as $[WPm \leftrightarrow WPm] = QG$). But this is not the case. In her research, Professor R. Sayfullayeva states that "if freed from the influence of the paradigm of connectives, which is reflected in the spiritual relations between the components of compound sentences, it, like all linguistic units, has a very simple, concise and clear structure. shows [30], - he writes. The general linguistic pattern of compound sentences - $[WPm R WPm] =$ As a result of generating QG and observing its variants, distinguishes three typical types: In fact, these construction patterns are not based on the means of connecting simple sentences in compound sentences when simple sentences are excluded from the compound sentence on the basis of whether they can be used independently. As a continuation of the above models, there is a phrase and a sentence model. **T - H** phrase model. In this case, **T** = subordinate word, **H** = dominant word (subordinate-governor). Creative models have emerged as a result of the development of linguistics, this method has a number of advantages and pragmatic aspects:

- modeling is a practical method, not a descriptive one;
- the modeling method is optimal ("most convenient", "most optimal") in any situation;
- The modeling method is based on the principle of economy. There is no need for lengthy descriptions and descriptions;
- Facilitates and simplifies the explanation and interpretation of the object.

The method of modeling has recently begun to be actively applied in linguistics. Since the concept of "model" is used in different senses in science and technology, there is no single classification of types of modeling. Depending on the nature of the classification model, the nature of the object being modeled, modeling can be performed depending on the area or direction in which it is applied [4,46]. Models can be conditionally classified as follows:

1. A natural model is a model that is identical to the object under study and differs from it only in size, speed of processes, and in some cases the material from which it is made.
2. Mathematical model - a model that differs from the prototype (original) in its physical structure, but has the same mathematical image as the prototype.

3. Logical-mathematical model - an abstract model consisting of symbols, used in the study of the thought process.

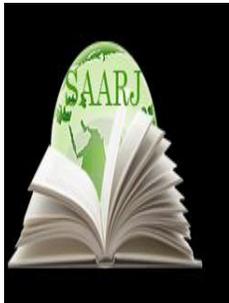

4. Computer model - a model created on a computer using algorithms and programs based on mathematical, logical modeling methods.

For many years, observational methods have been the only method in linguistics. But with the help of these methods the inner essence of linguistic phenomena is not revealed. The observation method allows you to study word forms, sentence structure and other structural features. Due to the complex structure of language and speech, it is not possible to study them in detail using the observation method. Models of human speech activity have been created on the basis of observation methods. These models reflect specific speech processes and events. For example, the pronunciation model of a specific sound or the speech pattern of speech. Linguistic research models and metamodels are also studied. It reflects the research process based on specific linguistic phenomena. For example, a general model of morphological word formation in Uzbek: base + word-formative addition; custom models: base + th; basis + -dosh; like base + -dose.

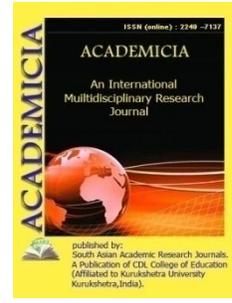

Metamodels - in which linguistic models are selected, which are hypothetical-deductive, abstract and rational [5,76 - 78]. We have only considered the basics of modeling technologies and models of certain objects in linguistics. Based on these construction patterns, the student is able to systematize the information being studied. The model simplifies and speeds up the learning process. It should be noted that the above models do not provide a complete picture of the object under study. At the same time as the process of optimizing general secondary school textbooks is underway, there is a need to use the most effective, time-saving, and at the same time informative technologies in the teaching of textbooks. Today, you can't get students interested in the science of their mother tongue by memorizing the rules and taking a traditional lesson with theoretical information. The process of globalization, the development of IT technologies, encourages people in society to move faster. There is a lot of information, innovations, creative ideas, which are accepted by our society. You can't step into tomorrow without studying today's information. Because tomorrow's study may be more complicated. The thinking of children growing up in such a society is also growing rapidly. Students realize that a forty-five-minute lesson in general secondary school is a waste of time if they do not receive new information in a particular area, and they lose interest in the subject in the next lesson. Children's interest in science and natural sciences in schools is satisfactory, but in the humanities, including mother tongue lessons, teaching students in a non-traditional, live way is one of the most pressing issues today. Because, as mentioned above, theory can be reliable, robust, and interesting if taught in practice. Children learn their mother tongue quickly, easily, and perfectly in practical processes. Based on the compatibility of mathematics in the mother tongue lessons, the theoretical knowledge can be solved independently, just as a child solves an independent example on the basis of formulas, as in mathematics. we would have a lot of success. The expected result of this process is, firstly, saving time, secondly, raw materials (paper), and thirdly, human energy and money. Teaching and learning syntax based on mathematical models can be quite effective. Because mathematical models allow the child to think independently, to innovate, to easily study scientific information. The future of the country is in the hands of young people who have the same independent thinking, creative ideas and innovations.

ABSTRACT

The Android operating system is essentially a mobile operating system that is quickly gaining market share, with dozens of smart phones and tablets now available or soon to be available. It's a mobile operating system based on a modified version of the Linux kernel version 2.6. The Open Phone Alliance, a collection of more than 30 mobile and technology firms aiming to open up the mobile handset ecosystem, created Android. Because the Android developer kit supports many of the standard packages used by Jetty, as well as Jetty's modularity and small footprint, it was feasible to convert Jetty to it and make it operate on the Android platform. These days, the Android operating system is one of the most frequently utilized. The kernel, libraries, application framework, and apps are the four major layers of the Android Operating System. Its kernel is Linux-based. The Linux kernel is responsible for fundamental system functions including virtual memory, networking, drivers, and power management. Different aspects of Android OS architecture, as well as security features, are addressed in this article.

KEYWORDS: *Android, Framework, Linux, Operating System, Sandbox.*

1. INTRODUCTION

The Android operating system is now one of the most popular mobile operating systems. Google developed the Android mobile operating system, which is based on the Linux kernel. The Android operating system was created with smartphones and tablets in mind. Android is the fastest growing mobile operating system because it is open source. It has become a favorite of many consumers and developers due to its open nature. Furthermore, software developers can

easily modify and enhance it to meet the latest mobile technology requirements. Each month, Android users download over 1.5 billion apps and games from Google Play[1]. Users and software developers may build their own apps for a broad variety of devices thanks to its powerful development framework. Application Framework, Dalvik virtual machine, Integrated browser, Optimized Graphics, SQLite, Media Support, GSM Technology, Bluetooth, Edge, 3G, Wi-Fi, Camera, and GPS are some of the key features of the Android operating system. Android provides an Android Software Development Kit to assist developers in better software development (SDK). For application development, it provides the Java programming language[2].

A debugger, libraries, a handset emulator based on QEMU (Quick Emulator), documentation, sample code, and tutorials are all included in the Android software development kit. Android is the most widely used operating system on many mobile devices across the globe. By the end of 2020, it will have taken up roughly 75% of the global market[3]. Open Handset Alliance, for example, has created the first Android operating system that is based on a modified version of the Linux kernel as well as other open-source applications. Google first funded the initiative in 2005, and it eventually acquired the whole business. The first Android smartphone was launched in September 2008, and it quickly became the market leader owing to many characteristics such as user friendliness, community support, customization, and large-scale production of Android devices. As a result, the market assesses the need for clever developers to create Android-enabled gadgets. As a result, the Android operating system has evolved into a comprehensive collection of operating systems for a variety of devices, including wearables, mobile phones, laptop computers, smart TVs, tablets, set-top boxes, and more[4].

Android is a Linux-based operating system that is mainly intended for touch-screen mobile devices like smartphones and tablets. Starting with black and white phones and progressing to smartphones and small computers in the past 15 years, the operating system has evolved significantly[5]. Android is one of the most popular smartphone operating systems these days. Android is a piece of software that was created in 2003 in Palo Alto, California. Android is a sophisticated operating system that supports a wide range of Smartphone apps. These apps are more user-friendly and sophisticated. The ARM architectural platform underpins the hardware that runs Android software. Android is an open-source operating system, which means it is available for free and may be used by anybody. Android offers millions of applications that may help you manage your life in one way or another, and it is accessible for a cheap price in the market, which is why it is so popular[6].

The entire Java programming language is supported by Android development. Other API and JSE packages aren't supported either. The android developer kit (SDK) was originally published in 2008 with version 1.0, and the most recent upgrade is jelly bean. Android is a mobile software stack that consists of an operating system, middleware, and essential apps. Android is a mobile operating system that is built on a modified Linux kernel. The industry's growing interest stems from two main factors: its open source nature and its architectural model. Because Android is an open-source project, it can be thoroughly analyzed and comprehended, allowing for feature understanding, bug fixes, new functions, and, ultimately, porting to new hardware. On the other hand, its Linux kernel-based architectural paradigm brings Linux to the mobile sector, enabling users to benefit from Linux's expertise and capabilities. Both of these features make Android a desirable target for usage in a variety of settings[7].

Another thing to keep in mind while using Android is that it has its own Virtual Machine (VM) environment. Android apps are written in Java, which necessitates the usage of a virtual machine (VM), which has both benefits and drawbacks[8]. A solution stack is a collection of software subsystems or components required to provide a fully functioning solution, such as a product or service, in computing. Middleware is a kind of computer software that links software components or individuals with their applications. Software that connects two or more different software programs. Because it links two programs and transfers data between them, middleware is often referred to as plumbing[9].

Data from one database may be accessible via another using middleware. On top of Java core libraries running on a Dalvik virtual machine with JIT compilation, the Android opensource software stack comprises of Java apps running on a Java-based, object-oriented application framework. Surface manager, Open Core media framework, SQLite relational database management system, OpenGL ES 2.0 3D graphics API, WebKit layout engine, SGL graphics engine, SSL, and Bionic libc are just a few of the C libraries. The Android operating system, which includes the Linux kernel, has around 12 million lines of code, including 3 million lines of XML, 2.8 million lines of C, 2.1 million lines of Java, and 1.75 million lines of C++. WAVE and CALFIT are used by Android. WAVE is an Android API that makes it simple to administer sensor networks (BSNs) on mobile devices[10].

1.1 Architecture Of Android Operating System:

The Android operating system is made up of a number of different software components. The Linux kernel, native libraries, Android Runtime, Application Framework, and Applications are the main components of the Android Operating System Architecture or Software Stack and shown in Figure 1.

- *Linux Kernel:* The Linux Kernel is the software stack's lowest layer. The whole Android operating system is based on this layer, with a few tweaks from Google. It includes the following features, such as the core Operating System: Process management, memory management, and device management (camera, keyboard, display, and so on) are all things to consider. This layer is how the Android operating system communicates with the device's hardware. Many essential hardware device drivers are also found at this layer. Virtual memory, networking, drivers, and power management are all managed by the Linux kernel.
- *Layer Native Libraries:* Android's native libraries sit on top of the Linux Kernel layer. This layer allows the device to process a variety of data kinds. Data is hardware-specific. These libraries are all developed in the C or C++ programming languages. The java interface is used to access these libraries. The following are some of the most significant native libraries: Surface Manager: This program is used to control the device's display. Surface Manager is a program that allows you to arrange windows on your screen. SQLite is the database that Android uses to store data. It is a relational database that can be accessed by any program. Web Kit is the HTML content display engine of the Safari browser. Playback and recording of numerous audio, video, and image formats are provided via the Media Framework. MP3, AAC, AMR, JPG, MPEG4, H.264, and PNG are just a few examples.
- *Runtime for Android:* Dalvik Virtual Machine and Core Java libraries make up the Android Runtime. It shares the same layer as the library layer [5]. Dalvik Virtual Machine is a Java

Virtual Machine that is used to execute apps on Android devices. Every Android application may operate in its own process, with its own instance of the Dalvik virtual computer, thanks to the Dalvik VM. Multiple instances of the Dalvik Virtual Machine may be generated at the same time, offering security, isolation, memory management, and threading support. Unlike the Java Virtual Machine, which is based on processes, the Dalvik Virtual Machine is based on registers. The Dalvik Virtual Machine runs .dex files generated by the dx tool from .class files. The dx tool is part of the Android SDK. DVM is designed for settings with limited processing power and memory. DVM was created by Google's Dan Bornstein.

- *Framework for Applications:* In the form of Java classes, the Application Framework layer offers numerous higher-level services or key APIs to applications. These services are permitted to be used in apps by application developers. These are the building elements that developers' programs interface with directly. The following are important components of the application framework: The Activity Manager is in charge of the application life cycle. Content Providers: This component controls data sharing across apps and how data is accessed from other applications. The Telephony Manager is in charge of all voice call-related functions. Location Manager: This program is designed to manage locations using GPS or cell towers. Manage the different kinds of resources that are utilized in application.
- *Application Layer:* The top layer of the Android architecture is the Applications Layer. Some apps, such as an SMS client app, a dialer, a web browser, and a contact manager, come preloaded on every device. A developer may create his own application and then replace it with one that already exists.

Figure 1: Diagrammatic Representation of Architecture of Android Operating System [GEEKSFORGEES]

1.2 Feature Of android operating system :

- *User Interaction:* The Android operating system offers a stylish, appealing, and pleasant user interface.

- *Smartphone Layout:* For the purpose of storing data in databases, SQLite, a lightweight relational database, is utilized. Android supports a variety of connection protocols, including Bluetooth, Wi-Fi, and Wi Max. In the Android operating system, you may send SMS, MMS, and use the android cloud to device messaging infrastructure.
- *Web browser:* The Android operating system's browser relies on web kit, which is combined with Chrome's V8 JavaScript engine to support it.
- *Support for Java:* Although the majority of Android apps are written in Java, the platform lacks a Java virtual machine, therefore DVM is used instead. DVM is optimized for Android and battery-powered mobile devices.
- *Multitasking:* Android offers multitasking, which allows you to go from one program to another or run several apps at the same time.
- *Multitouch:* Android includes native multitouch capability, which was originally introduced in the HTC Hero. Video or still cameras, touch screens, GPS, accelerometers, gyroscopes, magnetometers, proximity and pressure sensors, thermometers, and other hardware are all supported by Android.
- *GCM (Google Cloud Messaging):* Google Cloud Messaging is a service that enables users on Android smartphones to send brief messages to other users. Transferring files, accessing the phonebook, voice calling, and sending contacts between phones are all supported via Bluetooth. Support for keyboard, mouse, and joystick is provided. The many versions of Android operating systems, as well as their versions logos, are given below.

1.3 Security features of android operating system:

- *Linux Kernel:* the Linux kernel underpins the Android operating system. Many research developers investigate, attack, and repair it due to its open source nature. As a result, Linux has developed into a reliable and secure kernel. Android comes with a number of important security measures, including:
 - a. A permissions model based on the user each file and directory in the Linux file system has three user-based permissions. Other users, group, and owner - The Owner permissions only apply to the file or directory's owner. Group - Only the group that has been allocated to the file or directory is affected by the group permissions. Other users - This term refers to a group of people that aren't Permissions granted to one user are granted to all other users on the system. There are three fundamental permission kinds for any file or directory: read - The read permission indicates that the user has the ability to read the file's contents. Write - A user's ability to write or modify a file or directory is defined by their write permissions. Execute - A user's ability to run a file or see the contents of a directory is defined by the execute permission. This permission model guarantees that while accessing Android files, appropriate security is maintained.
 - b. Process isolation: The Android operating system gives each Android application a unique user ID (UID) and executes it as a distinct process.
 - c. Secure IPC extensible mechanism
 - d. The ability to delete insecure and unneeded kernel components .

- *The Application Sandbox:* A sandbox is a security feature that separates running applications and limits the device's resources to the application. It's often used to run untested code or applications from untrustworthy individuals or websites. Sandboxing is a method that restricts access to a device's resources. As a result, the system's security is enhanced. Sandboxing technology is often used to test unknown applications for the presence of a virus or other malicious code without causing damage to the host device. Untrusted programs can only access those resources of the device for which permission has been given with the aid of sandbox. If it attempts to access the device's other resources, permission is refused.
- *Inter-process communication that is secure:* For inter-process communication, some of the programs still utilize conventional Linux methods like network connections, file systems, and shared files. However, the Android operating system has additional IPC features like as Binder, Services, Intents, and Content Providers. All of these mechanisms enable developers to authenticate an application's identity and define security rules.
- *Signing the Application:* Applications must be digitally signed in order to be installed and operate on Android OS. Android OS uses this technique to identify an application's creator. This functionality may also be used to build confidence between apps. If a program is not correctly signed, it will not be able to be installed on the emulator. To create keys and sign applications, common tools like Key tool and Jarsigner are utilized. apk files
- *Permissions specified by the application and given by the user:* Permissions are a security feature in Android that allows or restricts application access. Android apps have no permissions by default, which keeps them secure by preventing them from accessing protected APIs [14]. Camera functions, location data (GPS), Bluetooth functions, Telephony capabilities, SMS/MMS functions, and network or data connections are just a few of the APIs that are secured. Only the operating system has access to these resources.

2. DISCUSSION

Android has become one of the most significant competitors in the mobile industry because of widespread backing from major corporations, particularly Google. Because smartphones and tablets are so widely used and available, manufacturers may customize the system to meet their specific requirements, including both the hardware and software layers. However, the platform's unpleasant feature, fragmentation, continues to exist. Manufacturers require time to integrate a new version of Android into previously launched devices on the market. Typically, they do not offer constant assistance to everyone. Despite the challenges, a new version is released about once a year. As additional hardware and software firms join the initiative, the scope of the development may expand. It's worth noting that the platform has a lot of support outside of the core Android project. Android is a mobile operating system. In today's economy, mobile phones are popular commodities. Mobile features are determined by software. Because mobile phones are low-powered devices that operate on batteries and are rechargeable, the operating system for mobile phones has played a critical role. The need for creating apps that can operate on mobile devices is increasing these days. Google created Android in order to provide such functionalities. The Dalvik Virtual Machine makes the runtime environment easier. To build the apps, you'll need Android components. Google created the Android operating system, which was subsequently adopted by the Open Handset Alliance. The Android operating system offers a

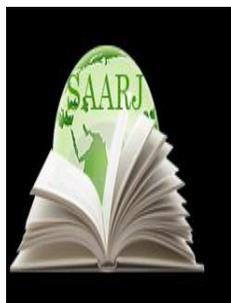

versatile environment for developing Java apps. This operating system is free, stable, and easy to use.

3. DISCUSSION

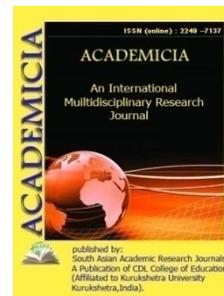

It is apparent from the preceding explanation that the Android Operating System employs a number of security mechanisms. When a developer installs an application, it creates a new user profile for that program. Each program runs on its own Dalvik VM instance. As a result, apps are unable to access each other's data. Permissions are required for apps to access shared data or resources. All Android apps are signed, so consumers know they're getting the real deal. Developers may use the signature process to regulate which apps can give access to other applications on the system.

ABSTRACT

The biggest challenge India faced after independence was producing enough food to feed its expanding population. As a result, high-yielding varieties are utilized in conjunction with water, fertilizers, and chemical infusions. This combination of high-yield processing methods aided in the growth of the country's food surplus, soil quality, deforestation, pesticide toxicity, and long-term farming. Furthermore, many scientists are rethinking agricultural practices based on biological data rather than the heavy use of artificial chemical fertilizers. Organic agriculture is gaining popularity throughout the globe as a way to improve agricultural efficiency, income, food security, and environmental protection. In addition, the report's goal was to evaluate the status of organic farming in India. Organic farming has the potential to offer high-quality food without compromising soil, environmental, or human health; nevertheless, large organic farms must produce enough food to feed India's entire population. The present study will aid future research and raise awareness about the advantages of organic farming as well as the advantages of organic food production.

KEYWORDS: *Environment, Organic Farming, Pesticides, Soil, Sustainable.*

1. INTRODUCTION

Having agriculture as the cornerstone of the Indian economy, which is supported by almost 67 percent of the population and 55 percent of the overall workforce, is reaching the criteria for satisfying the demands of the growing Indian population via agricultural and other related activities. For India to attain double-digit GDP growth, agricultural growth of about 4% or more was expected to be required. While farming has the potential to meet the demands of an ever-increasing population, it also confronts many difficulties. It is undeniable that India's agricultural production increased dramatically during the green revolution. The inventions used at the outset of the green revolution, assisted by policy, and further encouraged by agrochemicals, equipment, and irrigation availability, have been the main driving factors in increasing agricultural output. While these innovations certainly improved Indian food security, there was one major drawback: farmers had to depend on the supplies they had purchased. When manufacturing fertilizers and insecticides, the two most essential inputs in green revolution (GR) technologies, the requirement for fossilizing fuel or expensive energy, both of which are linked to major health and environmental problems, was a critical consideration[1], [2].

Organic agriculture, in its most basic form, refers to plant cultivation without the use of synthetic fertilizers or pesticides. The maintenance of the soil and the use of natural instruments to add organic matter to the soil are all part of organic agriculture. Organic farms are those that avoid or limit the use of pesticides and fertilizers, chemicals, growth regulators, and animal feed additives to the greatest degree feasible. The term "organic" refers to agricultural processing methods for the production of food and fiber. Organic farming is used to produce both agricultural products such as grains, foods, milk, and eggs, as well as fibers such as flowers, cotton, and refined food products. Organic agriculture regulation is dependent on the establishment of biological variety in the field in order to eliminate pest species' habitat and properly maintain and regenerate soil fertility. Organic farmers should not use synthetic pesticides or fertilizers[3], [4].

The ecological approach to agriculture and horticulture recognizes that the environment in which plants thrive is far larger than the sum of its individual parts, and that all living things are interdependent and linked. Organic farming entails treating the soil and the nutritional ecology in a way that benefits future generations. The provision of a healthy source of food to land living forms via the use of composts, manure, and/or organic materials. Rather of being discarded and burnt, renewable resources should be chosen, a viable planet developed, the atmosphere lowered, and waste repurposed.

Organic manures, such as agricultural manures, cultivation residue, biogas slurry, crop waste, oil cakes, earthworms, and compost, enhance fertile soil. The rhizosphere's environment will be influenced by changes in porosity, ventilation, temperature, water retention, and soil microorganisms as a result of these soil changes. Sulphur, nitrogen, potash, phosphate, magnesium, and calcium are all elements that these crustaceans provide to plants. Earthworms are important for aeration, microflora development, and soil turnover, all of which are important for growing plants. One acre of organically rich soil with high humidity may produce 25-30 tons of earthworms, ranging from 50,000 to 4,00,000. The castings of earthworms are rich in soil nutrients such as magnesium, sulphur (2.9 percent), nitrogen (2.5 percent), calcium, and potash (1.4 percent), among others. Aside from organic alteration and the addition of earthworm castings (the highest in Actinomycetes) to the soil, a range of diseases and nematodes also had a role in regulating[5], [6].

1.1. Main Principles of Organic Farming:

The following are the fundamental concepts of organic agriculture:

- Work in a closed setting as much as possible, relying on local services.
- Long-term soil fertility should be preserved.
- Remove all possible sources of contamination from agricultural practices.
- Produce high-quality, nutrient-dense foods.
- Reduce the use of fossil fuels in agricultural techniques.
- Providing cattle with living conditions that meet their physiological requirements.
- To enable farmers to make a living and develop their human potential via their labor.
- Adhere to organic farming's four foundations (Figure 1).

1.1.1. Organic Certificates:

Organic foods that have been certified are those that have been grown and processed in compliance with universal standards that have been verified by an independent government or a USDA-accredited private organization. Both "organic" and "non-organic" goods must be certified. The yearly submission of an organic framework schedule, as well as a farm and production facility assessment, are required for certification. Organic measures such as long-term soil management, buffering between organic farming and conventional neighborhood farms, and record keeping are all checked by inspectors. Production inspection includes procedures such as cleanup and pest control, component shipment and storage, and documentation and audit management. Biological foods are treated gently to maintain food safety without the need of additives or containers. Approved organic goods are exempt from synthetic agrochemicals, irradiation, and genetically engineered crops or additives[7], [8].

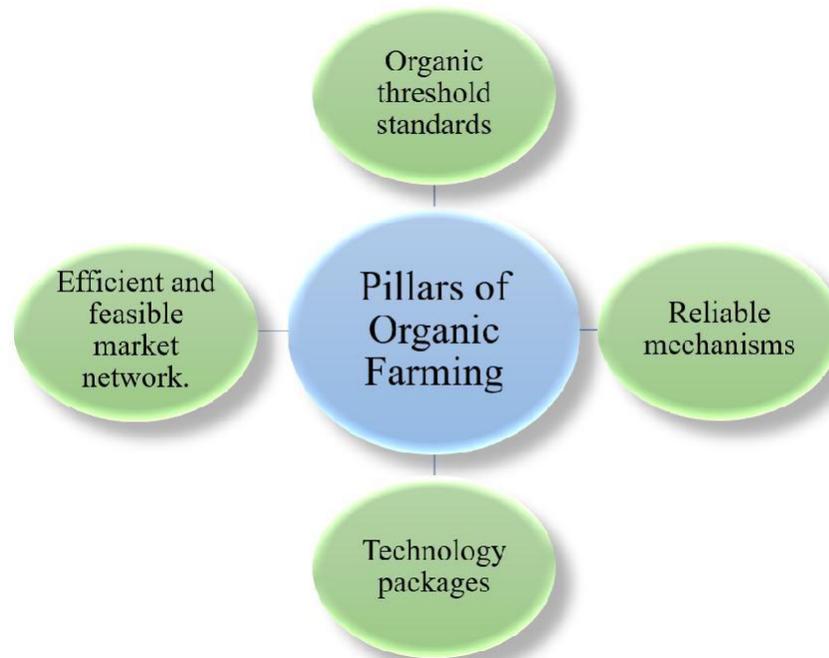

Figure 1: Displays pictorial representation of the four main pillar of organic farming

1.2. Organic Food Vs Conventional Food:

Organic foods are significantly less likely than conventional meals to contain pesticides, according to a 2002 research. Organic food prices are higher than conventional food prices because the organic price tag more closely reflects the true cost of food production: replacement labor and the extensive use of chemicals, both of which have nutritional and environmental consequences that society bears. Water cleansing and pesticide residue removal are two examples of such costs. Costs of organic food include expenditures for cultivation, harvesting, storage, and transportation. In the case of packaged goods, manufacturing and service costs are also applied. Organic foods must adhere to stricter regulations than conventional foods when it comes to any of these processes. Organic farming is usually (but not always) more expensive than conventional farming because of the intensive management and labor required. The evidence is mounting that organic foods will cost the same as or less than conventional foods if all of the operational costs of standard food processing are included into food pricing.

1.3. Safety of Organic Food:

Organic foods are just as healthy as any other kind of food. Customers, like any other product, should be cleaned before use to ensure maximum hygiene. Organic goods, as previously mentioned, have much less pesticide contamination than conventional items. Organic crops are thought to be more susceptible to E. coli contamination as a result of different raw manure implementations, while conventional farmers utilize tons of raw manure with little supervision. Organic laws impose strict manure requirements for organic agriculture, such as composting or spreading manure at least 90 days before harvest, giving pathogens more opportunity to break through microbially. [9].

1.4. Organic Food Industry:

Approximately 2% of American food supply are generated using organic methods. Sales of organic products, the fastest growing agricultural sector, have increased by at least 20% on average over the past decade. Organic vegetables may be found at natural and mainstream grocery stores, as well as straight from producers such as CSAs and the farming sector. Organic food CSAs are also available. Many chefs utilize organic food in their restaurants throughout the globe, and they seek greater flavor and consistency. Organic food acceptance is also increasing internationally, with major global organic food industry nations such as Japan and Germany leading the way [10].

2. BENEFITS OF ORGANIC FARMING IN INDIA

While switching from conventional agricultural methods to organic farming offers numerous advantages, in the context of the rural Indian economy, many of these advantages may not be realized. Finally, the advantages that are really possible to be considered as benefits for Indian agricultural methods must be clarified. Here are a few of the advantages of this partnership (Figure 2) [9].

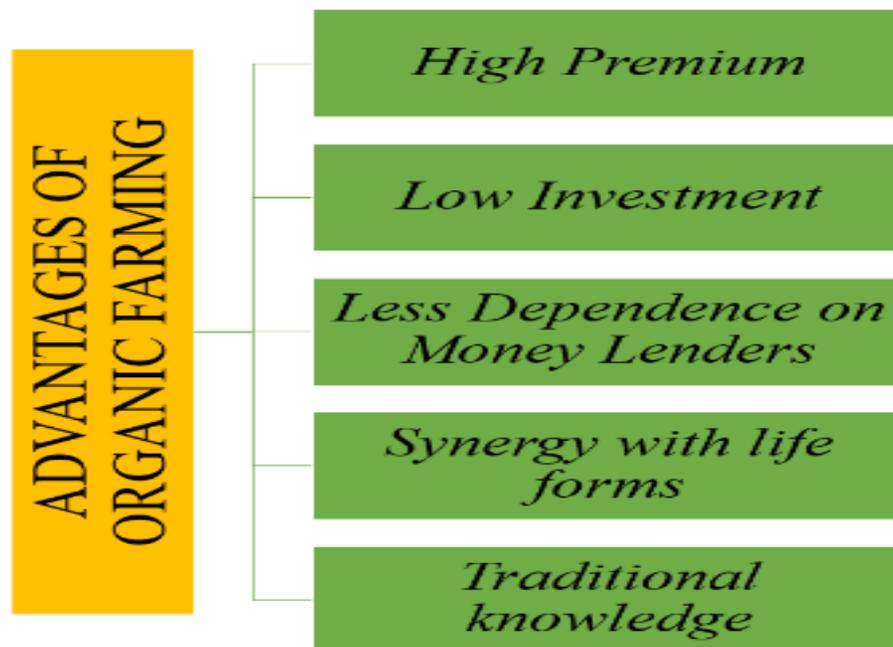

Figure 2: Illustrates the Major Advantages that are Associated with the Organic Farming in India.

2.1. High-Priced:

Despite the fact that organic food is on the rise and costs 20-30% more than conventional produce, a moderate farmer has plenty of room for the income of medium-sized farmers to keep food on the table with a meal and flourish.

2.2. Low Capital Expenditure:

Organic agricultural costs are lower when compared to traditional chemical farming techniques. Furthermore, organic fertilizer manufacturing does not need the use of sophisticated techniques. Furthermore, since organic fertilizers and insecticides may be manufactured locally, farmers have reduced yearly expenses. Because agriculture is heavily influenced by various factors such as temperature, pests, and diseases, as well as various weather factors, including the rainy season, whenever crop failure occurs, small producers in organic farming have very little to lose because their investments are low, so natural disasters, pesticides, or disease attack are not a concern.

2.3. Reduction in reliance on money lenders:

Farmers' suicides are frequent in India as a consequence of overwhelming debt. Farmers are not dependent on greedy money lenders since excessively expensive chemical supplies are not required in biological agriculture. By failing to produce crops, this would not compel farmers to perform a certain action.

2.4. Synergy with living things:

Synergies with many kinds of flora and animals are part of organic agriculture. This synergy is easily understood by small farmers, making it simple to execute.

2.5. Traditional knowledge:

Farmers should be introduced to organic agriculture based on their conventional expertise in order to obtain excellent outcomes in organic farming methods. In the case of organic agriculture, small farmers do not depend on those who provide chemical knowledge.

3. AGRICULTURE POLLUTION

The public's attention is still focused on the more apparent indications of agriculture's environmental consequences, whereas the unseen or less visible effects of air pollutants are likely to cost the most money[10]. Agricultural output has four major effects on air quality and the environment:

- reduced particle pollution and greenhouse gas emissions from fires (mainly rangeland and woodland fires);
- rice methane emissions and poultry production;
- nitrous oxide from fertilizer and manure;
- ammonia from manure and urine

3.1. Rural Development and Organic Farming Cooperation:

Organic and sustainable agriculture is also a multi-level genuine potential to contribute to dynamic rural economies via sustainable development. In actuality, the organic market's growth has already created new employment possibilities in agriculture, manufacturing, and associated services. These agricultural methods have the potential to offer significant economic and social advantages to rural communities while also having a positive environmental effect. To assist the industry's expansion and associated businesses in the food chain, financial support and other tools to convert farmers to organic farming are available.

3.2. Organic Food Exports and Consumption in India

People believe that organic food is just a misleading phrase that is solely meant to help poor countries. While India is making strenuous efforts, the majority of organic food is destined for export. But that isn't the case. While 50% of organic food production in India is for export, many individuals are searching for organic food for local use.

The health of children has been a significant factor in deterring people from consuming organic food. Organic food costs in India are more than 25% more than conventional food prices. However, due of the nutritional advantages of organic fruit and the fact that organic food is deemed completely safe for home use, many families are now able to spend more money. The proliferation of organic food shops in India demonstrates the country's growing interest in organic goods. Organic food is becoming a common sight in many supermarkets and restaurants. India has a wider range of organic food consumption than other emerging nations. For the Indian organic food consumer, however, knowledge is needed. Several consumers are unaware of the difference between natural and processed foods.

Many people purchase natural products that they assume to be organic. Customers are also unaware of the credential system. Because a certificate for the domestic market in India isn't actually required, there are a lot of fake organic products on the market. In terms of organically generated exports, India's organic food production is on the increase, with farmers shifting to organic agriculture. India is becoming a significant producer of organic basmati rice, organic spices, organic herbs, and other organic products. Exports account for more than 53% of organic food presently produced in India, which is considerably higher than organic food exports in 2003-2004, when they accounted for just 6 to 7% of total agricultural commodities manufactured in India.

However, although the cost of manufacturing organic farming pre-requirements is low, the cost of transitioning from chemicals to organic farming is very expensive. Many more organic farmers in India are in the process of converting and are still paying a high price. As these farmers embrace organic farming, production costs are expected to drop, making India one of the most important producers of organic food. The following ingredients are presently found in organic foods produced in India and exported:

- Barley, wheat, corn, or maize are all organic grains.
- Black grammes and red grammes are organic pulses.
- Bananas, peaches, limes, pineapples, passion fruits, cassavas, and walnuts are all organic fruits.
- Soya, sunflower, mustard, cotton seeds, and groundnut oil and seeds are all organic.
- Organic vegetables include onion, potato, garlic, brinjal, and cabbage. Cloves, mace, cardamom, chilly, almonds, tamarind, pepper, vanilla, chocolate, amla, and other organic herbs and spices etc.
- Other ingredients include coffee, jaggery, cotton, tea, textiles, and sugar.

4. DISCUSSION

With 67 percent of its population and 55 percent of its workforce depending on agriculture and associated industries, India is a nation that is heavily reliant on agriculture. Agriculture fulfills the required criteria, accounting for 30% of total income in India, the world's fastest-growing population. Bio agriculture has also been recognized as an old Indian tradition that has been practiced for millennia in a variety of rural and rural civilizations. The use of synthetic fertilizers, artificial pesticides, genetic altering techniques, and other approaches has increased as a result of the introduction of new technologies and a rising population pressure. The proclivity towards traditional farming. Organic food items are becoming more needed in industrialized countries as people become more aware of environmental protection and food quality, and soil quality, which is free of chemical pests, is significantly affected by organic processes. Organic farming still offers a lot of money-making potential. Different types of organic nutrient sources are available naturally in India's soil to enable organic agriculture.

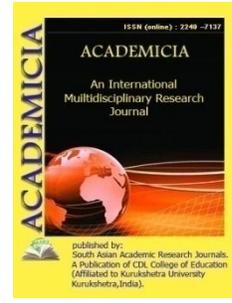

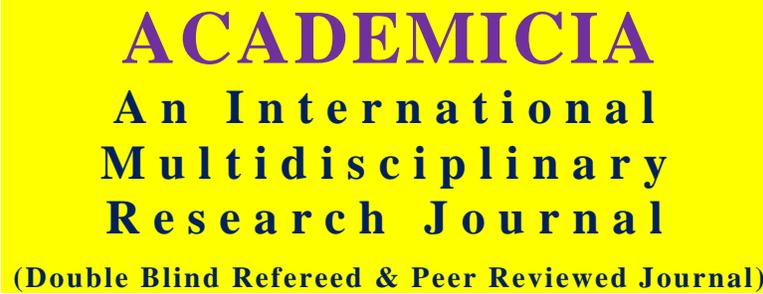

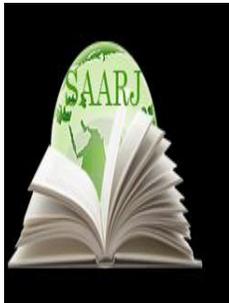

India has an inventive, long-lasting traditional agricultural system, extensive drylands, and little use of chemical fertilizers and pesticides. Furthermore, abundant precipitation occurs as natural organic soil in the northeastern hilly areas of the country, with just a few minor chemicals utilized for a long time. Traditional Indian peasants have a broad viewpoint, in-depth research, perseverance, and experience in maintaining soil fertility and pesticides, which has resulted in increased organic food and economic development in India. Organic farming has made tremendous progress. India is now the world's largest organic producer, with 1.78 million hectares of organic agriculture in 2017. Several innovations in organic agriculture have been discovered, including the incorporation of mycorrhizal fungi and nano-biostimulants, more conscientious mapping of cultivation areas through sensor technologies and geo-datography, 3D printers, the development of side streams and wastes, as well as the major resources, development, and enhancement of organic farming through drip irrigation advancements. The Bee Scanning App, which enables apiculturists to fight the parasitic Varroa mite while also providing the foundation for community modeling and captive breeding, is another step forward in organic agriculture.

5. CONCLUSION

Organic farming is seen in a variety of ways. However, there is broad agreement on its environmental friendliness and inherent ability to protect human health. Organic agriculture has also been proven to be efficient and healthful in a variety of studies. Organic agriculture is labor-intensive and employs more people in poor countries, therefore the price of organic output is higher. However, in a nation like India, where labor is abundant and relatively cheap, organically-based agriculture offers a major potential answer to the issue presented by chemical agriculture. The government has made efforts to encourage organic farming in general. In addition, a number of organizations for the marketing of organic agricultural goods have been established. The organic food business in India is being driven by the continuing expansion of organic goods in developing countries and the Indian government's export promotion policies, which are expected to promote economic development as well as health and safety standards for the Indian people.

THE PECULIARITY OF PSYCHOLOGISM IN A.KADYRI'S NOVEL "BYGONE DAYS"

F. K. Khabibullayeva*

*Doctor of Philosophy (PhD),
Philological Sciences of the Department of Russian Language and,
Literature Andijan State University,
UZBEKISTAN

ABSTRACT

The article, based on two translations into Russian of A.Kadyri's novel "Bygone Days", examines the problem of recreating the inner world of the hero in a literary translation. The variety of means of depicting the inner world of the character, on the one hand, and differences in artistic tradition, mentality, lifestyle, etc. on the other, create certain difficulties in recreating the inner world of the character in translation. Now one sentence from the heart of the proverb goes: "the separation of Two Souls is the dream of parents, not the flange of this Falcon!" This verse, which seems to take away the prospect of Your Own Secret Meaning Father, finally makes him cry. Thus, the PP was implemented during the Soviet period, when the doctrine secretly or explicitly prevailed, according to which nationalities and, accordingly, national languages would gradually disappear – a single Soviet people would be formed over time.

KEYWORDS: *Literary Translation, Adequacy Of Translation, Original, Artistic Psychologism, Inner World, National Identity.*

INTRODUCTION

Psychologism in literature is a complete, detailed and in-depth depiction of feelings and emotions, thoughts and experiences of a literary hero. Psychologism is the author's attempt to describe the inner world of the hero by artistic means.

One of the main attractive features of fiction is its ability to reveal the secrets of the inner world of a person, to express spiritual movements as accurately and vividly as a person cannot do in everyday, ordinary life. Andrey Borisovich Yesin correctly notes: "psychologism is "a fairly

complete, detailed and in-depth depiction of feelings, thoughts, experiences of a fictional person (literary character) with the help of specific means of fiction" [1, 12].

The psychological dictionary edited by Vladimir Petrovich Zinchenko defines "psychologism" as a stylistic characteristic of literary works, in which the inner world of the characters is depicted in detail and deeply, i.e. their feelings, thoughts, feelings, and, perhaps, a subtle and convincing psychological analysis of mental phenomena and behavior is given [2, 386].

The variety of means of depicting the inner world of the character, on the one hand, and differences in artistic tradition, mentality, lifestyle, etc. on the other, create certain difficulties in recreating the inner world of the character in translation. The primary task of the translator is to maximally approximate his perception of the translated work with the perception of the same text by the implicit reader. And this is a very difficult, almost impossible task, since for this it is necessary to know the culture, language, customs, religion, etc. at the level of the "implicit" reader. Therefore, there cannot be a completely adequate translation in principle, but every translator should strive for this. However, in practice, translators are content to convey what is directly reflected in the text, and everything that is behind the text remains out of their field of vision. As a result, the translation cannot reflect all the shades of colors that were easily applied by the hand of an artist who trusted his reader.

The character is expressed in the internal psychological state, in the way of thinking, in the manner of speaking, holding oneself. That is, the character embodies in its individuality the spiritual and moral qualities, aesthetic and ethical views of a certain people, which is reflected in speech, actions, psychological states, portrait, landscape, etc.

In the novel "Bygone Days" Abdullah Kadiri reveals the emotional world of his main character - Atabek, full of drama and emotions, by intertwining the characteristics of the character with the fixation of his condition. At the same time, he avoids a detailed description of the entire process of the mental movements of the actors, but very accurately reproduces the psychological moment, the inner state of a person at some point in his life. So, for example, the rich inner world, the ability to deep feelings, the moral basis of the character of Atabek are revealed through a severe life test - separation from his wife (chapter "Will you not forget me?").

"The singing of the young man who drove a double in the distance is heard:" the flange of this Falcon, which separates the two Yors!"The spirit, as the strength comes out of the chest, gives a different effect to the Otabek, as if this singing had made tevara a zir-r. The fur is as if this peasant was hiccup from his perspective. This verse is repeated again from the mouth of the peasant and illuminates the Tabarak. Now one sentence from the heart of the proverb goes: "the separation of Two Souls is the dream of parents, not the flange of this Falcon!"This verse, which seems to take away the prospect of Your Own Secret Meaning Father, finally makes him cry. The face of the tears is the spoon of the rear saddle and the mane of the horse begins to drip..."[4, 143]

The first sentence of the above passage in the PP reads as follows: "From afar comes the song of a man driving a team of oxen on arable land: "Time changes the color of the heavens, and fate separates lovers..."

In-first, in the original we are not talking about a singing person in general, but about a singing horseman, i.e., a young man - a young man. It would seem that there is no great trouble. But the

author emphasizes that it is the dzhigit who sings. And that is why the song is so touching, because the burning pain of the singer's loss is still fresh, and it seems to infect Atabek, makes him empathize with him, vividly feel the pain of loss threatening himself in the future. Thus, the author psychologically prepares the hero to make a fateful decision: "...I will not return to Tashkent" [5,148]. On the other hand, songs of love content are sung by the young, while the singing of such by others - both still "green" and "mature" - is considered indecent. From what has been said, it is clear that national identity is already observed in the choice of a word, or rather, quite often it determines a particular choice. We will not call the translation of the song line successful either: "Time changes the color of the heavens, and fate separates lovers ..." As we see, there are not one, but already two verses, between which there is a figurative-thematic parallelism, very characteristic of the Russian folklore tradition. In our opinion, such stylization is inappropriate, it nullifies the function of the song line as an artistic detail. Moreover, the figurative-thematic parallelism gives the verses a kind of semantic completeness, whereas in the original you can hear an endless complaint: "Oh, fate, fate is a lover's lover!.." What to do, such was the national mentality, only in one out of a thousand, or even in as many as ten thousand such cases there was a riot, and in all other cases – humility, with a burning pain in the soul, which broke out in such songs, poems, etc. From this point of view, the situation is no better in the VP, where the verse has acquired the following form: "By the will of fate, lovers' hearts are separated!" In our opinion, there is no feeling in this verse, it carries nothing but dry information. If so, how could he touch the Atabek to the quick, make him tremble, get emotional to such an extent that tears involuntarily flowed from him.

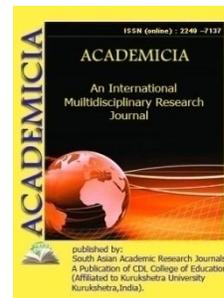

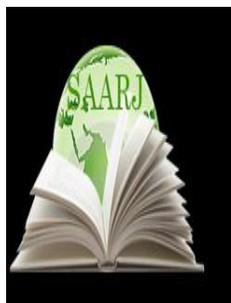

A comparison of the first (PP) and second (VP) translations of the novel "Bygone Days" suggests that the authors of the PP did not attach due importance to the reconstruction of national color, whereas in the VP there is a desire to recreate national identity in places, even to the detriment of the acceptability of the translation. Of course, this is primarily due to the socio-cultural conditions of the time when these transfers were carried out. Thus, the PP was implemented during the Soviet period, when the doctrine secretly or explicitly prevailed, according to which nationalities and, accordingly, national languages would gradually disappear – a single Soviet people would be formed over time. The EAP already belongs to the era of sovereignty, when the national is emphasized, which is very important when entering the world community as a full member.

Our research allows us to conclude that the work on the translation of the novel "Bygone Days" into Russian has not yet been completed, and that, relying on existing translations, it is possible to achieve better results in terms of recreating a deep image of the feelings and emotions, thoughts and experiences of the literary hero.

WAYS OF USING THE GEOGEBRA PROGRAM FOR CONSTRUCTING THE POLYHEDRONS SECTION

G. X. Qaypnazarova*

*Associate Professor,
Nukus State Pedagogical Institute named after Ajiniyaz,
UZBEKISTAN

ABSTRACT

The article discusses the use of the Geogebra program in geometry lessons on the topic of cross-sections of polyhedra. Brief information about the Geogebra program is given. The drawings in the conditions of the problem were drawn using the Geogebra program. The relevance and practical significance of the research topic is indicated.

KEYWORDS: *Polyhedra, Section, Prism, Cube, Truncated Pyramid, Geogebra Program.*

INTRODUCTION

The development of students' ability to visualize and deal with spatial figures is one of the primary challenges in the teaching of stereometry in school geometry. In stereometry, different planes are used to examine parts of figures, and in some circumstances, polyhedras. Here are some tips on where to search for polyhedra sections and how to schedule an appointment. There are three sorts of geometric problems: 1) the computation; 2) the proof; and 3) the constructing;

When studying a polyhedra's cross section, pupils first learn about the plane, which is defined as:

- Through three points;
- Through straight line and a point;
- Through two parallel straight lines;
- Through two parallel straight lines;

The ability to construct two intersecting straight lines is required.

There are three techniques for calculating age, and the trace method is one of the simplest and most widely used in school. To begin with, a convex polygon is a convex flat polygon with ends that are usually the points of intersection of the cutting plane with the polygon's edges and sides

that are the intersections of the convex polyhedras. In any type of stereometry, solving problems necessitates not only math and analytical abilities, but also the capacity to describe.

Two locations are usually located and a straight line drawn through them to produce a straight line of intersection of planes. The passing straight line is used to find a point of junction of a straight line with another straight line. The sought point is then found by crossing the given straight line with the given straight line.

Geometry is one of the most difficult courses in high school. The transition from plane to spatial figures is one of the most difficult aspects of this task.

Making polyhedras and their easy sections is allocated 1 hour in the 10th grade plan, which is a relatively short time. We'll look at the illustrations on the tables in the Geogebra program to make the most of our time during the class. Let's begin with the Geogebra application. GeoGebra's first version was launched in 2002. Markus Hohenwarter, an Austrian mathematician and professor at the University of Salzburg, wrote it.

The program is developed in Java and may be downloaded for free. The platform is interactive (Windows, Linux, Mac OS, etc.) It works on a wide network, on personal computers, tablets, and even cellphones, and is available in more than 60 languages.

The word GeoGebra is made up of the first and last portions of the words Geometry and Algebra. One of GeoGebra's best qualities is its reliance on the unity of two-dimensional algebra and geometry.

Geogebra helps you to foster a creative environment in scientific classes at high schools and colleges by producing high-quality geometric drawings and picturing the outcomes in the form of dynamic models. You can get the latest version of GeoGebra from the manufacturer's website, <https://www.geogebra.org> [3: 7], and install it on your computer.

Let's look at some examples of how the above general concepts are put into practice. We look at the challenge of constructing the conditions given in Geogebra Problems 3.22,3.23 in the 10th grade geometry textbook.

Problem 1: Using squares, draw a plane through the opposite side of a rectangular prism's lower base. The base's side is the same as. Locate the surface of the section that was made. [2: 303] [2: 303] [2: 303] [To answer the problem, we must first do what is specified in the Geogebra program's problem condition, which is to make a section. It is difficult for kids to make a section. That is why the Geogebra program was chosen.

The reason for choosing the program Geogebra is that it is very easy and convenient to create geometric figures in this program.

Solution

Passes through sections AB and E_1D_1 straight lines. AB and E_1D_1 the sides are the sides of the polygon in the section. Find the side of this polygon CC_1D_1D that lies D_1X on the side. D_1X on a straight line D_1 we know a point. Find the F point of intersection of the other point AB and CD the straight line. It CC_1D_1D lies in the plane of the collar and in the plane of the section, so that their intersection is a straight line D_1X . D_1 and F connect the points with a straight X line to get a

point. D_1X section CC_1D_1D is the side of the section on the side. Y We find a similar point. There will be a sought polygon in the section $ABXD_1E_1Y$ (Figure 1).

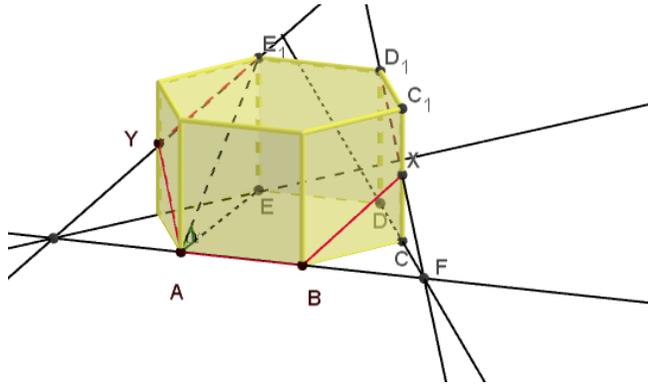

Figure 1

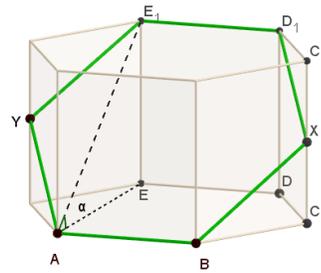

Figure 2

Now we find the surface of the section. (Figure 2). The hexagon at the base of the prism is the orthogonal projection of the hexagon in section. Hence the surface of the section $S = \frac{S_0}{\cos\alpha}$, in this S_0 – the surface of the base of the prism, α and the angle formed by the section plane with the base plane. EA and AB Since it is perpendicular, E_1A and AB perpendicular. (Theorem on three perpendiculars.) Therefore $\alpha = \angle EAE_1 = \angle EAE_1$. $EE_1 = a$, $AE = a\sqrt{3}$ (side of a right triangle drawn inside a circle of radius), $AE = \sqrt{a^2 + (a\sqrt{3})^2} = 2a$.

$$\text{So, } \cos\alpha = \frac{a\sqrt{3}}{2a} = \frac{\sqrt{3}}{2}.$$

$$\text{The surface of the base of the prism } S_0 = 6 \cdot \frac{1}{2} a^2 \sin 60^\circ = \frac{3a^2\sqrt{3}}{2}.$$

$$\text{The surface of the section } S = \frac{S_0}{\cos\alpha} = 3a^2$$

Next in the tables we give the figures made in geogebra.

Problem 2. $ABCDAA_1B_1C_1D_1$ of the cube AD and CD its edges M and N are given. The cube of MNB_1 make the section that is formed by cutting with a plane [1: 139] (Figure 3)

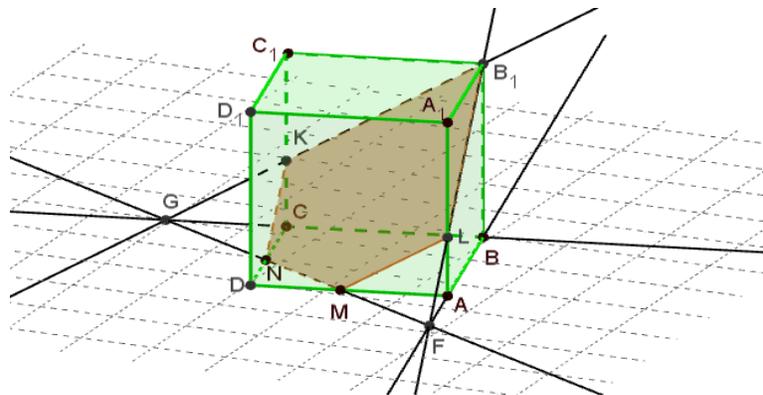

Figure 3

Problem 3. ABCDAA₁B₁C₁D₁ draw the cube and AB, BC and BB₁ which are the middle of the edges, M, N and L mark the points. Make the section that is formed when you section the MNL cube evenly [1:139].(Figure 4)

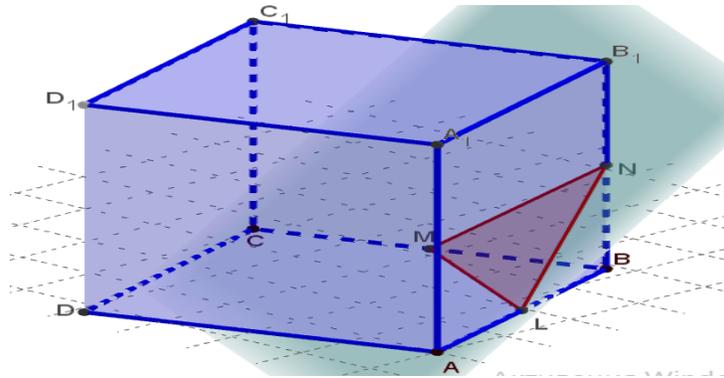

Figure 4

Problem 4. in a right triangular prism the sides of the base are 10 cm, 17 cm and 21 cm, and the height is 18 cm. Find the surface of the section through the small heights of the sides and base of the prism. [2: 303].

Solution. Given: ABCA₁B₁C₁ - in a triangular prism, A₁B₁ = 17cm, B₁C₁ = 10cm, A₁C₁ = 28cm AA₁ = DD₁ = 18cm.

Need find: $S_{BDB_1D_1}$ -?

How to find: To solve this problem, draw a straight line B perpendicular to AC the end of the base and mark its AC point of intersection with the side. Then a straight line is drawn from the BD end B₁ of the prism parallel to the straight line.(Figure 5). Its AC₁ is the point of intersection D₁ with the side. After then, from these points B, D, D₁, B₁ we make a rectangle that is we searched BDD₁B₁ will be rectangle. Let's find the surface of this rectangle. For this, we first find the surface of the base using the Heron formula. So for Geron's formula, we first determine the perimeter of the rectangle:

$$P_{ABC} = 17 + 10 + 21 = 48 \text{ cm}$$

According to Geron's formula:

$$S_{ABC} = \sqrt{24(24 - 10)(24 - 17)(24 - 21)} = \sqrt{24 \cdot 14 \cdot 7 \cdot 3} = 3 \cdot 7 \cdot 4 = 84$$

Now we find the height of the triangle using another formula to find the surface:

$$S_{ABC} = \frac{1}{2} AC \cdot BD$$

$$\text{From there: } BD = \frac{84 \cdot 2}{21} = 8 \text{ cm}$$

$$S_{BDB_1D_1} = BD \cdot DD_1 = 18 \cdot 8 = 144(\text{sm}^2)$$

Hence, the surface area of the section sought is 144(sm²).

Problem 5. The height of the rectangular pyramid is 4 cm. The sides of the bases are 2 cm and 8 cm. Find the surface of the diagonal sections [4,308]

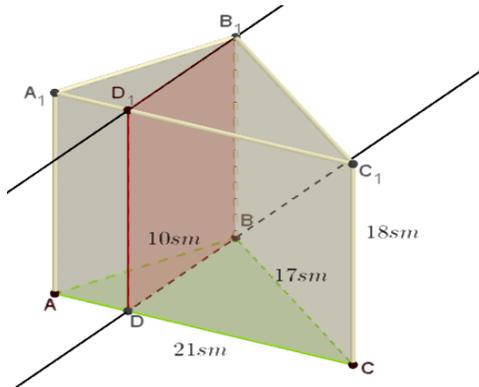

Figure 5

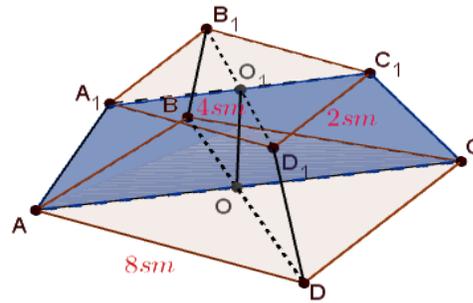

Figure 6

Solution. Given: $ABCD A_1 B_1 C_1 D_1$ - truncated pyramid $OO_1 = 4\text{cm}$, $AB = BC = CD = AD = 8\text{cm}$, $CD = AD = 8\text{cm}$, $A_1 B_1 = B_1 C_1 = C_1 D_1 = A_1 D_1 = 2\text{cm}$. (Figure 6). Need to find:

$$S_{ACC_1 A_1} = \frac{AC + A_1 C_1}{2} \cdot OO_1.$$

$$\Delta ADC \text{ from } AC = \sqrt{AB^2 + BC^2} = \sqrt{2 \cdot AB^2} = 8\sqrt{2} \text{ cm}$$

$$\Delta A_1 B_1 C_1 \text{ - from } A_1 C_1 = \sqrt{A_1 B_1^2 + B_1 C_1^2} = \sqrt{2 \cdot A_1 B_1^2} = 2\sqrt{2} \text{ cm.}$$

These are:

$$S_{ACC_1 A_1} = \frac{8\sqrt{2} + 2\sqrt{2}}{2} \cdot 4 = 20\sqrt{2} \text{ cm}^2$$

CONCLUSION:

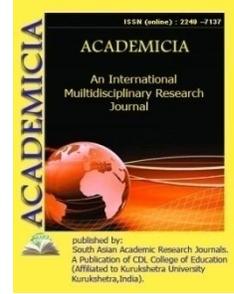

It is critical to pique pupils' interest in science and to encourage in-depth study of the subject. When Geogebra is used to teach geometry, it helps to increase the quality of the lessons. The findings can be used to further research and improve multi-subject themes in a school geometry course. At the same time, higher education institutes in the field of mathematics teaching methods, teacher retraining centers, and school mathematics classes should teach how to utilize the Geogebra program.

AN OVERVIEW ON AGRICULTURE IN AFRICA

Dr Ashok Kumar*

*Sanskriti University, Mathura,
 Uttar Pradesh, INDIA
 Email id: dean.soa@sanskriti.edu.in

ABSTRACT

In most developing countries, agricultural growth is at the core of poverty reduction and improved food security. However, Sub-Saharan Africa (hence referred to as Africa) is the only area in the world whose agricultural output per capita has stayed unchanged for the last 40 years. The application of customized methods and technology has revolutionized agricultural practice and production throughout Asia and Latin America, resulting in the so-called "green revolution." On the continent, no indigenous African green revolution technology have been disseminated. This chapter will argue that if adequate investments are made in key interventions such as soil fertility improvement, improved seeds, water management, market access, extension services, access to credit, and weather forecasting, Africa can achieve similar increases in productivity and food security. Where they have occurred, even in part, the results have been spectacular. However, bringing them to scale in a manner that increases agricultural production and alleviates poverty on a long-term basis would need greater investments and novel institutional structures. Thankfully, many research and development initiatives on the continent, such as the Millennium Villages Project, are giving useful information. Finally, this chapter highlights the major difficulties that remain.

KEYWORDS: Agriculture, Africa, Security, Subsistence, Urbanisation

1. INTRODUCTION

Many of the world's rural poor are smallholder farmers, and most of South and Southeast Asia, as well as most of Sub-Saharan Africa (hereinafter referred to as "SSA"), are smallholder farmers. Agriculture is dominated by smallholders in places like Africa. But why do small-scale farmers continue to be poor[1]. One such example is despite being highly efficient consumers of, the answer is that remain impoverished despite their abundant resources because most poor

nations provide them limited technological and economic possibilities to which they can react. This is especially true in Africa, the world's sole continent the globe in which agricultural output per capita is high over the last 40 years, it has stayed unchanged. This has led in food instability and an increase in reliance on food assistance and the continent's growing poverty Food insecurity is a key indicator of poverty. One of the continent's most serious challenges Africa is now experiencing a food crisis comparable to that of the United States.

In the 1960s, Asian nations were defined by Famine, chronic food insecurity, widespread poverty, fast population increase, weak institutions, corrupt governments, and Western pessimism are all factors. What factors contributed to Asia's Green Revolution's success against the backdrop of this architects claim that the Green Revolution in India, It was successful due of There have been significant technical and institutional developments. The lack of significant investments in agriculture, which is a characteristic in most African nations, was a key reason in India's agricultural output stagnation in the 1960s. when there are similarities The Green Revolution occurred as a result of investments made in Africa[2]. The spurts in the water are an example. Before and after the manufacturing that took place in Zimbabwe 6 years after independence Kenya has been independent since independence. From the 1960s through the 1970s Following the collapse of the Derg regime in Ethiopia, and after the banning of maize and rice in Nigeria imports.

There is a lot of evidence that smallholder farming is beneficial[1]. Can work productively in a competitive market when given the appropriate assistance this may have a negative impact. There are significant impacts on poverty alleviation. To the majority of observers, reducing poverty entails increasing smallholder agriculture. Agriculture as a source of broad-based economic growth Agricultural and non-agricultural enterprises are both growing and employing people. 8 It's also critical for lowering the continent's increasing population of undernourished people, which is projected to reach 212 million. Approximately one-third of the population. Smallholder farming is usually seen as a strategic asset. Agriculture is critical to overall development, yet expansion in impoverished rural regions may exacerbate poverty. decrease through three different methods[3].

- the direct effects of increased agricultural productivity and incomes on the rural poor,
- benefits of cheaper food for both the urban and rural poor, and
- Agriculture's contribution to economic growth and the generation of more opportunities in the nonfarm rural sector.

Economic shift defined by a rise in the significance of the nonfarm economy and a decrease in the agriculture sector's relative importance. Smallholder agriculture is often seen as a win-win alternative for fair development in this regard[4]. Agriculture is back on the policy agenda for donors and poor nations alike, after almost two decades of neglect. Accordingly, the most significant reason for this progress is a shared awareness that economic growth is the most effective means of alleviating poverty, and that expansion in the agricultural sector, which includes smallholders, drives this growth and is critical to overall economic development. Africa has the world's most severe and persistent poverty, with more than half of the population being smallholder subsistence farmers. 12 In July 2004, former United Nations Secretary-General Kofi Annan emphasized what he called "Africa's 21st Century Green Revolution" to achieve the

Millennium Development Goals by 2015 against the backdrop of growing food insecurity and poverty, as well as the realization of agriculture's enormous potential.

He emphasized the need of paying particular attention to agricultural methods in regions that are mostly cut off from functional markets. This is true in Africa, Asia, and Latin America's distant regions. Increasing smallholder agricultural production requires scaling up a number of practical initiatives. This chapter covers the scientific foundations of the main interventions that are required. Beginning with the introduction, the chapter is split into four sections. The biophysical limitations to increased output are discussed in the next section. The third section focuses on practical ways to control soil fertility, which is increasingly being recognized as a major contributor to decreasing production. Other complementing initiatives, such as better germplasm, water management, weather forecasting extension, markets, and microfinance, are discussed in the fourth part. The last part shows how impacts may be scaled up to national levels, showcasing some of the Millennium Villages Projects' methods and outcomes. In conclusion, we stress that the knowledge foundation needed to reverse Africa's perilous food situation is accessible, and that there is space in the necessary expenditures for targeted input subsidies. One may ask why Africa is unable to feed itself, given its vast variety. There are many factors that restrict output potential, including decreasing soil fertility, insufficient utilization of enhanced germplasm, and limited irrigation[5]. Without initially addressing the issues of soil and land degradation, little progress in smallholder farming in Africa is likely to be made.

Agriculture is inappropriate for around 55 percent of Africa's land area. Only 11% of the continent, distributed across several nations, contains high-quality soil that can support more than twice the continent's present population. 14 The majority of the remaining arable land has a medium or low potential for agriculture, with at least one significant restriction. Under low-input systems, this land is at a significant risk of deterioration. Soil deterioration was projected to have impacted 500 million hectares, or 17% of Africa's land, by 1990[6]. 15 Susceptible dry regions (arid, semiarid, and subhumid aridity zones), which encompass 43 percent of Africa and impact 485 million people, are the worst-affected areas. 16 In 1990, it was projected that 65 percent of agricultural land, 31 percent of permanent pastures, and 19 percent of forest and woodland in Africa were degraded in some way[7]. The present state of affairs is unquestionably worse. Soil moisture stress limits land production on 86 percent of African soils¹⁴, but soil fertility deterioration has now added a significant human-induced constraint to productivity. Other issues frequently mentioned³ include a high human illness burden, especially HIV/AIDS; a large rural inland population; a lack of significant river basins for irrigation; insufficient regulatory frameworks (albeit improving); and markets that do not function for the poor. One method to boost agricultural yields is to utilize inorganic fertilizers. Since the mid-1960s, fertilizer usage has resulted in a 50–75 percent rise in agricultural yields in developing nations outside of Africa.

Unfortunately, only a tiny percentage of African farmers utilize fertilizers, and the quantities used are often insufficient. Each acre gets an average of less than 9 kg of nitrogen and 6 kg of phosphorus. A typical crop requires at least 60 kg of nitrogen and 30 kg of phosphorus per hectare. Africa uses approximately 10% of the world's chemical fertilizer per hectare of agriculture, which is by far the lowest. The present level of fertilizer usage in Africa is unsustainable. This causes nutrient depletion, which is exacerbated by the poor intrinsic fertility of many African soils, with over 80% of them having chemical or physical restrictions on crop development[8]. Fertilizer usage is limited, owing to its high cost, and it contributes substantially

to the unprofitable character of smallholder farming seen across Africa. Few subsistence farmers can afford fertilizers, which may cost almost four times as much in many areas of Africa as they do in North America or Europe.

Transport expenses in Africa are about seven times greater than in the United States (in tons per kilometer). By the time fertilizers reach the farmer in rural Malawi, transportation and associated expenses (import tariffs, demurrage, and a variety of levies) have more than doubled the worldwide price. Thus, smallholder farmers in Africa have not reaped the benefits of actual worldwide price reductions of approximately 38% for nitrogen and more than 50% for phosphorus over the last 25 years[9]. The high expense of transportation is a major driving force behind this. For example, transporting one ton of fertilizer 1000 kilometers costs \$15 in the United States, \$30 in Asia, and \$100 in Africa. Similarly, transporting 1 ton of corn from Iowa (USA) to Mombasa (13,600 km) costs \$50, while transporting 1 ton of maize from Mombasa to Kampala (900 km) costs \$100. According to estimates from the mid-1990s, every African country's soils had a negative nutrient balance, indicating that the quantity of nitrogen, phosphorous, and potassium supplied as inputs was substantially less than the amount taken at harvest or lost via erosion and leaching.

This is in stark contrast to the nutrient excess of northern hemisphere soils, which presents a significant environmental risk. It also contrasts with Asia's average fertilizer nutrient usage rates of 150 kg/ha and Latin America's average of 75 kg/ha. Fertilizer use in Africa has grown by just 0.64 percent since 1980, despite a population growth of 75%, from 345 million to 607 million people. Fertilizer consumption in the Association of Southeast Asian Nations area of Southeast Asia increased at a rate of more than 12% each year during the same time, although having a somewhat lower overall population than Africa. In Asia, production increases with better crop types are predicted to be 88 percent, but only 28 percent in Africa, due to low input usage. Nutrients and soil moisture are complimentary inputs[10]. This is especially true in Africa, where chemical fertilizer prices are expensive at the farm level and rainfall is unpredictable in many places.

High yields require a lot of fertilizer, good seeds, and other expensive inputs. Farm-level investments in fertilizers, seeds, and other inputs, on the other hand, are hazardous in regions where rainfall is unpredictable and crops often fail due to drought. A key disparity in crop productivity in Asia and Africa is explained by this dilemma, in which farmers cannot afford to apply the inputs needed to produce high yields. More than half of arable land in Asia is irrigated, and the average yearly fertilizer application is about 40 kg/ha of arable land. Irrigation is used on less than 5% of agriculture in Africa, and the average fertilizer application is less than 10 kg/ha.

Farming is subject to a wide range of meteorological conditions. Weather extremes are anticipated to become more common in certain areas as a result of long-term climate change. Improved water and fertilizer usage efficiency will need innovations in water collection and reuse, the development of small-scale irrigation techniques, and the use of water-saving irrigation systems that allow for precise nutrient delivery. Millions of small-scale farmers in Asia have benefited from low-cost irrigation technology, which have increased agricultural production, income, and family food security. In Kenya, Tanzania, Zambia, and other nations, efforts to increase groundwater usage include the distribution of low-cost treadle pumps and drip irrigation kits. In much of Africa, surface water is now the main source of irrigation. As a result,

across most of Africa, surface water storage systems are required to maximize the utilization of river water.

However, in certain locations, the expense of construction and possible environmental consequences may prevent the establishment of surface water storage. Reducing the huge yield gap between actual and prospective yields is another important element in improving agricultural production in Africa. For maize, a major food crop in many African nations, the disparity is more than 50%. Other key crops in the area, such as cassava, sorghum, and rice, are also affected. This yield gap demonstrates Africa's unrealized potential for improving agricultural output and productivity. In Africa, adoption of enhanced germplasm is usually low. Even in maize, where adoption rates are about 57 percent, the gap between research and adoption is increasing. Cassava production is increasing rapidly, but it is still below 40%. The poor adoption of the various technologies available may be attributed to a number of reasons.
