The high cost of inputs (fertilizers and pesticides), the lack of liquidity and credit, and the lack of access to supplemental irrigation are all factors that contribute to farming's high risk. Furthermore, unstable land tenure rights are a major deterrent to farmers investing in soil amendments or soil and water resource conservation initiatives. Despite the fact that techniques and technology are relevant and accessible, smallholder farmers often lack access to them. As a result, extension and input distribution systems are mutually reinforcing extension contributes to agricultural productivity increase when input distribution systems are operating, and vice versa. Agricultural technology are likewise evolving at a fast pace. Farmers must be educated on which technologies are most effective, how to utilize them, and how to create effective demand for viable new technologies in order for the input distribution system to provide them.

Unfortunately, in many African nations, agricultural extension is weak and decreasing. Where agricultural extension services are available, the ratio of agricultural officers on the ground to farmers is often enormous. Retrenchments after structural adjustment programs, HIV/AIDS, conflicts, and civil wars are among causes that have led to the decline of extension services. Private extension services are disproportionately geared toward affluent areas and high-value crops. Remote regions and impoverished farmers with little marketable surplus, particularly those producing low-value commodities, are underserved. Thankfully, nonprofit private providers are increasingly focusing on these groups. Based on many multilocational research, a consensus has developed that combinations of inorganic (fertilizers) and organic (nutrients) inputs provide the greatest and most sustained production increases per unit nutrient supplied. This agreement departs from the fertilizer package strategy, which has historically failed in the area. However, this adds to the already difficult task of guaranteeing fertilizer supply, as well as the additional issue of increasing farmers' capacity to generate organic matter.

Agroforestry technologies, such as improved fallows with fast-growing leguminous trees and cover crops that mobilize atmospheric nitrogen, biomass transfer from nutrient-mobilizing plants, such as *Tithonia diversifolia*, compost, crop residues, and animal manure, are all promising organic soil fertility strategies. When cattle are given leguminous tree fodder, the nutritional content of manure, particularly phosphorus, may be greatly enhanced. Leguminous tree technology improves soil fertility, yields, weed control, and provides fodder and fuel, as well as serving as stakes for higher-value crops like tomatoes and climbing beans. Increased biodiversity, carbon sequestration, and watershed protection are all benefits of agroforestry

technology. Mineral fertilizers, particularly phosphorus, would still be required if agroforestry and other organic fertilizers were used.

This may come from more traditional phosphorus fertilizers or finely ground phosphate rock, and Africa has numerous “reactive” rock resources that might be explored further. Agricultural research projects in western Kenya, a highly populated area with more than 1000 people per square kilometer in some places, best illustrate the benefits of this integrated approach to soil fertility management. The issue of poor and decreasing soil fertility is exemplified in this area, and the ongoing danger to land resources is exacerbated by the desire to increase food production and decrease poverty. Reversing agricultural stagnation (due largely to low and declining soil fertility), safeguarding the natural resource base, slowing population growth rates, combating the negative effects of the HIV/AIDS pandemic on the community, and reducing poverty are all intrinsically linked to achieving food security.

The World Agro forestry Centre and other partner organizations tested a low-cost integrated soil package to address this issue. Recapitalize phosphorus-deficient soils; supplement phosphorus dressings with organic manure to increase phosphorus use efficiency; use existing on-farm organic resources (including biomass transfer) to supply nitrogen to crops; use improved fallows of agro forestry species to replenish soil nitrogen and reclaim Striga-infested soils; supplement phosphorus dressings with organic manure to increase phosphorus use efficiency; supplement phosphorus dressings with organic manure to increase phosphorus use. Thousands of farmers embraced the technology, and maize (the main food crop) yields rose two to three times above normal yields of 1–2 tons/ha or less in only one growing season. The tree fallows offer numerous advantages, including in situ fuelwood production, collection of leached nitrates, recycling of other nutrients, and Striga management, in addition to nitrogen recycling at 100–200 kg/ha. Farmers were also encouraged to diversify and obtain better kinds of other crops, such as cassava, sweet potatoes, beans, sorghum, and fruits, such as mangoes, avocados, and passion fruit, as a result of the increased maize yields.

Access to lunch for school-aged children in one of the communities was a spillover effect of improved agricultural yields. Others in the area used the communities as learning centers. They also served as field laboratories for researchers and farmers to test institutional and technological advances. This significantly contributed to the project's success. The initiative, however, lasted just three years and terminated before farmers were able to maintain efforts to get the required supplies and support community-based farmer-to-farmer distribution networks. Thankfully, the Millennium Villages Project has taken up the project and is pushing the same nutrient mobilization agroforestry initiatives. However, increasing soil organic matter and nitrogen advantages takes time and may only occur when inorganic fertilizers are used to boost plant biomass development. Mulch management is one of CT's most difficult tasks. Farmers must protect the mulch by preventing animals from eating agricultural leftovers and suppressing bushfires. To achieve this, a variety of techniques are suggested, ranging from the use of green manure and leguminous tree cover crops to weed-controlling and mulch-producing cover crops to herbicide-based CT systems. CT is a knowledge-intensive system, with the farmer's actions (management) being more important than the inputs he or she uses. Spreading CT among smallholder farmers necessitates a focus on information transfer and knowledge development to and within agricultural communities. It entails academics and extension workers collaborating with farmers and other stakeholders to create regionally tailored conservation agricultural

methods. It necessitates the involvement of many partners. The African Conservation Network is pursuing this objective, and it has also given a thorough assessment of the current information base.

Through market-led procedures, Africa has a lot of potential to boost agricultural development and relieve hunger and poverty. Despite some pessimism, sufficient market possibilities exist that have yet to be completely explored and may enable more fast and sustainable agricultural development in Africa. Staple foods, for example, represent a promising domestic market opportunity, not only because Africa is a net importer of many staple foods, but also because projections show that demand for human consumption and livestock feed will double by 2015, adding an additional \$50 billion per year to effective demand. Many African farmers are in a strong position to compete in these essential markets.

Furthermore, Africa's expanding urban markets are boosting demand for more varied and higher-value-added commodities, opening up new possibilities for many African farmers. Many African nations also have a competitive edge in the goods that other African countries buy. African nations may boost intraregional agricultural trade by more than 50% by lowering trade barriers in both the agricultural and non-agricultural sectors. Intra-African commerce may also help to improve food security by allowing output to be transferred from high-potential agro ecological zones to regions with structural food shortages. Intra-African commerce may be more accessible to smallholders since cross-border exports may not be subject to the same degree of rigorous quality requirements needed for foreign markets. In drought years, increased cross-border commerce in agricultural staples may also assist to stabilize food supply and prices at the sub regional level.

Farmers' competitiveness and capacity to enhance their market position is a key problem with growing market volatility and competition for smallholders. Taking use of economies of scale is one method to boost production. Small-scale farmers confront a variety of challenges, including a lack of money, inaccurate information, geographic dispersion, and inadequate infrastructure and communications. Collective marketing via rural producers' groups may be one effective method to address these challenges. The state's retreat from economic activity, along with a relatively undeveloped private sector, exacerbates these limitations. Farmers may reduce transaction costs and therefore get the advantages of collective marketing by acting collectively via farmer organizations. This is an important element in smallholder tea, coffee, and dairy producers' success in Kenya's highlands. Contract farming is another method for increasing market access that may potentially replace the state's role in supplying knowledge, inputs, and financing. The degree to which contract farming may benefit small farmers who are the focus of poverty reduction initiatives is a crucial issue. Almost all contract farming programs, according to the data thus far, exclude small farmers. 60 Weak institutions are to blame for many of the transaction expenses that prevent companies from working with smaller farmers.

Growers might, for example, directly obtain vital production information if information markets were better established, rather than depending on the company for the high fixed costs of extension services. There are many success examples in Africa that may be used to help further improve this system. Smallholder tea producers in Malawi, dairy farmers in Kenya, and confectionery peanut growers in Senegal are just a few examples. How should smallholders react to changes in agrifood organizations, such as the global expansion of supermarkets one apparent solution is to accept these developments as a business reality and to organize around

them. In practice, this entails establishing direct ties with new markets, as well as information providers, non-governmental organizations, commercial players, and the government. Small farmers must create a new generation of economic organizations that operate at greater degrees of detail, coordinate technology, and enhance scheduling as a result of their interaction with new markets. Knowledge transfer from other areas with more sophisticated connections, such as Asia and Latin America, is critical.

However, lowering the bloated marketing margins caused by transportation and processing costs must come first. Improvements in road and transportation networks, greater access to market information systems, and improved coordination and contractual agreements among farmers, dealers, and purchasers are all part of reducing these margins. These investments in rural infrastructure and market development would also enable linkages with the nonfarm sector, boosting total income and employment in both rural and urban regions and increasing demand for agricultural goods. It is essential for success in the post-reform period to define an acceptable and realistic role for the public sector. Because agricultural commodities demand is inelastic in general, and more so in the face of market failure, even modest increases in aggregate production may significantly lower output prices.

As a result, technological advancements have resulted in greater output. In that order of significance, Africa produces all of the major grains: maize, wheat, and rice. Corn is the most widely cultivated crop, being planted in almost every ecological zone. Egypt and the Indian Ocean islands of Réunion and Mauritius, where cultivation is irrigated, have the highest yields per acre. Millet and sorghum are also grown throughout the continent, although mostly in the savanna areas. Rice production and consumption have grown in importance in recent years, and they are strongly linked to regions of growing urbanization. Egypt, Guinea, Senegal, Mali, Sierra Leone, Liberia, Côte d'Ivoire, Nigeria, Tanzania, and Madagascar are the most significant rice-producing nations. Wheat production was previously limited to South Africa, North Africa, and the highland zones of Ethiopia and Kenya, but new cultivars have allowed it to be grown (with irrigation) in savanna nations like Nigeria.

Except in the subtropical regions of North Africa and the highland zones of East and Southern Africa, where pure stands of alfalfa (lucerne) are cultivated, fodder crops are not commonly planted. Berseem (a kind of clover used for fodder) is also cultivated under irrigation in Egypt and Sudan. Protein-rich legumes are extensively grown, typically in combination with other crops. Velvet beans, cowpeas, soybeans, and lablab are among them (hyacinth beans). Broad beans and vetches are also grown in North Africa. Peanuts (groundnuts) are extensively produced in Western Africa, for both local and export use. Cassava farming has exploded in popularity, especially in western and central Africa; it has replaced yam production in many regions and is no longer considered a famine reserve. Potatoes are grown at greater altitudes in nations like Ethiopia, Kenya, and Madagascar, as well as in North and South Africa's Mediterranean climatic zones. Sweet potatoes are more common in tropical and subtropical areas, while plantains are often cultivated in tropical forest zones.

2. DISCUSSION

Agriculture is Africa's most significant economic activity by a long shot. It employs about two-thirds of the continent's working population and contributes an average of 30 to 60% of gross domestic output and approximately 30% of the value of exports to each nation. Despite this,

arable land and land planted with permanent crops account for just approximately 6% of Africa's total land area. Except in countries with large populations of European ancestors, such as South Africa, Zimbabwe, and Kenya, agriculture has largely been confined to subsistence farming and has been heavily reliant on the inefficient system of shifting cultivation, in which land is temporarily cultivated with simple implements until its fertility declines, then abandoned for a period to allow the soil to recover. Furthermore, arable land has been distributed throughout much of Africa via a complicated system of community tenure and ownership rather than through personally acquired title, and peasant farmers have had rights to utilize relatively small and dispersed holdings. This land ownership structure has tended to keep agricultural output intensity low and has slowed the pace at which capital has been mobilized for modernization. A number of nations have attempted to increase productivity by utilizing improved seed and planting materials, tractors and other automated equipment, and increased use of mineral fertilizers and pesticides. However, such efforts have been rather restricted, raising worries about their role in speeding up soil erosion and desertification. Land has become private rather than communal property in places where commercial crops are grown, and cultivation is intense. A lack of integration between crop production and animal husbandry is also to blame for the continuation of relatively low-productivity agricultural systems over vast swaths of the continent. Sedentary cultivators such as the Hausa in Nigeria and the Kikuyu in Kenya have traditionally lived apart from their nomadic herdsman neighbors (the Fulani and Maasai, respectively), resulting in a lack of access to animals for draft power and manure for fertilizer across large swaths of the continent. In many places, the presence of insect pests such as the tsetse fly inhibits mixed farming.

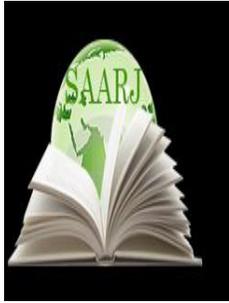

3. CONCLUSION

The consequences of decreasing agricultural production in Africa, the region where this decrease is most visible, will increase poverty, particularly in rural and urban areas. Underperforming agriculture, on the other hand, hinders economic development and may have severe environmental effects. This chapter has emphasized some of the unique challenges that African smallholder agriculture confronts, such as decreasing soil fertility, limited adoption of improved germplasma, reliance on unpredictable rainfall, inadequate farmer extension services, and restricted market access. On the continent, the technology and ideas required to solve these issues already exist. The difficulty is to make them available to farmers at a large scale. This objective is critical for the success of the African Green Revolution, which has been long overdue. African governments and leaders have increased their efforts and are working to find answers to long-standing issues, such as providing targeted input subsidies. As Malawi's input subsidy program and the Millennium Villages Project have shown, the impacts on food security may be swift. These impacts must be scaled up, and governments must be assisted in developing the technological and institutional ability to keep them going. Identification of the kind and size of public-private partnerships required for establishing comprehensive and sustainable input and product markets will be a major issue and focus of future study. To this aim, cross-country cooperation among developing countries may be very beneficial to this process, particularly in terms of technology transfer and market skill development.

ABSTRACT

The research focuses particularly on two important areas lacking from the existing literature: variables promoting perseverance in same-sex parented families; as well as health and wellbeing results for same-sex couples who experience separation, such as the negotiation of joint custody arrangements post-separation. The present article seeks to give a thorough review of the design and methodology of this longitudinal research and evaluate its relevance. The work, love, play research is a mixed format, three wave, longitudinal controlled trial of same-sex interested parents. The sample comprises lesbian, gay, bisexual as well as transgender families in Australia and New Zealand caring for any kids under the age of 18 years. The research will be performed over six years from 2008 to 2014. Quantitative data are to be gathered through three on-line questionnaires in 2008, 2010 and 2012 from the cohort of parents recruited in Wave. Qualitative data will be gathered through interviews with purposively chosen subsamples in 2012 and 2013. Data collecting started in 2008 and 355 participants to Wave One of the research have consented to participate in future polls. Work is now ongoing to expand this sample size. The methodology and survey tools are discussed. This research will make an essential addition to the current research on the same parented households.

KEYWORDS: *Bisexual, Heterosexual, Same-Sex Parent, Transgender.*

1. INTRODUCTION

Families led by same-sex couples have achieved greater public visibility over recent years in the Western world, with increasing media and political attention focused on debates about gay marriage, and lesbians' and gay men's reproductive rights, including access to in vitro-

fertilization and surgical rights. In addition, this is a developing academic study project that aims to improve the sociological and psychological knowledge of lesbian, gay, bisexual and transgender (LGBT) parents and their children's experiences[1]. While families led by same-sex partners have gained more public exposure in recent years, there will still be numerous difficulties for these families in coping with legal and societal settings that are not favorable of same-sex partnerships. The Work, Love, Play research is a major randomized trial of same-sex parenting. It seeks to explore various aspects of family life within this group and analyses how they evolve over time.

It is impossible to properly determine the number of families led by parents of the same sex in any nation. Data from the Australian Census of 2001 show that one in five lesbian couples and up to 5% of homosexual men have children living with them in their homes. This statistic may well underestimate the real number of parents who are attracted by the same sex because it does not include single parents and parents who have children who do not live at home with them. The United States Census Bureau also projected in 2000 that 1/3 of lesbians and 1/5 of homosexual families presently tend to raise children. Regardless of exact statistics, it is nevertheless evident that a significant percentage of lesbians and gay men may at some time in their life become parents[2]. Strengths of the research design also include longitudinal approach, which will enable understanding of changes with time within inner family connections and societal supports. The mixed approach design also allows for data triangulation. A high sample size was achieved by recruiting both homosexual males and lesbians.

Research indicates that homosexual couples and homosexuals attracted only parents in many respects. A significant percentage of lesbians and homosexual men have straight offspring. Many lesbian couples conceive their children via anonymous sperm donors obtained through fertility clinics or a known donor who could or cannot become a child's father or become a child's father. Donation of sperm to lesbians offers many homosexual men a chance to become parents, some of whom have continuing co-parenting/care agreements with the mother of the children. A lesser but growing number of homosexual men via surrogacy agreements have become parents. Lesbians and homosexual men may also support or adopt children in situations that are legally allowed. Many parents of the same sex have mixed families, which include children from prior partnerships and children conceived during one or both parents' relationships. This family diversity is challenging conventional, heterosexual, family conceptions or definitions[3].

The greatest difficulty for most homosexual family members is to address the legal and communal environment which usually does not accept same sex partnerships and frequently does not take various forms of the family into account. Normative conceptions of the family center on the biological relationship between children and their heterosexual parents. Non-biological parents of children conceived within the same sex frequently have limited tools to make sure they are legally recognized as a parent. Large families may also not recognize non-biological children or parents as part of their families[4]. Parenting families of the same sex may face discrimination in health, welfare, education and legal systems or suffer unfavorable attitudes from service providers while dealing with key milestones of life such as pregnancy, pre- and post-native services, child care and schooling. Even if there are no obvious prejudices, involvement with official institutions such as childcare, schools and the health system necessitates that homosexual parents constantly negotiate procedures that all homes are led by a heterosexual spouse. For example, most registration or child-related information forms do not

include space for two moms or two dads. This implies that parents of the same sex have to haggle frequently with the service providers to make sure both parents are recognized. The process of 'out' on frequent times may be difficult for some parents and many worry about their children becoming homophobic or discriminatory at school[5].

More personally, some lesbian and gay parents experience lack of support within their own extensive family network or, in some instances, outright hatred. Furthermore, if lesbians or homosexuals become parents, they may lose some of their links in the lesbian and homosexual society, an essential source of support and confirmation for many people who love same sex. Extensive research has shown that same-sex individuals have been marginalized and stigmatized by their sexual identity. This may lead to decreased social connectivity and has a detrimental effect on physical and mental health and access to healthcare attracted by the same sex. This may be exacerbated by parents of the same sex who feel insecure and suffer psychological anguish due to their worries about the effect of homophobia on their children. Researchers performed a research comparing lesbian and heterosexual moms' psychological well-being and the United States. The research showed that sexual orientation does not in itself contribute to lesbian women's mental health but to their legal and social environment. In the United States, lesbian moms reported more concern about their legal status as parents and had more depressive symptoms than lesbian mothers in Canada[6].

Despite such difficulties, there is a broad range of studies showing that developmental, social and emotional results are at least comparable to those of their heterosexual parents for kids raised in same sex homes. Studies show that there are mechanisms in the family, including relationship quality and parents' psychological well-being, which lead to a greater degree of well-being among children, regardless of their sexual orientation. In addition, recent studies have revealed that lesbian moms are more equal than heterosexual couples in organizing families and working duties that may lead to greater levels of happiness in the relationship. There are nevertheless significant gaps in the study on parent families of the same sex. First of all, the dominance of research aimed at results for children brought up in homosexual parenting homes implies that there are just a few studies on the health and well-being of same-sex parents. Factors which promote and increase resilience in homosexual households are similarly scarce. What allows a family to survive under difficult circumstances while others fight?

A significant gap in study pertains to the experiences of separation of parents of the same sex. Although it is widely established that at least one in three Australian heterosexual marriages ends in divorce, Australian research on the separation of homosexual couples or the experience and effect of separation on the health and well-being of parents and children has been extremely sparse. Approximately 20% of couples had split by the conclusion of the trial in a small Australian study of 25 lesbian parent households. A worldwide longitudinal study of lesbian moms who had children via donor insemination showed that by the time their children were 10 years old 38 per cent (n = 30) of pairs had split. Research has not, however, investigated whether separated spouses may get enough assistance or health and well-being results[7]. A number of research in heterosexual households have used the idea of resilience. Family resilience may be considered to balance stress and pressure with the skills and strengths of that family unit – or "excellent results despite adversity." If demands or stresses exceed capacities and resources, there may be a family crisis or collapse. A resilient family may use their ability to handle demands, risks and stresses effectively[8].

The study of family resilience includes identifying variables protecting families against crisis or collapse (separation). These protective variables are identified in the research on family resilience at three different, but interconnected levels: individual, family and community levels. Individual level protection factors include: better parenting and income levels, good markers of mental health; excellent coping abilities and an overall feeling of positivity. Family level protection factors include: family cohesion, the quality of the connections between parents (including communication quality and negotiation of household and childcare duties) and the quality of interactions between parents and children. Protective factors at the Community level include: availability to resources and assistance, access to community networks, a feeling of connectedness to local communities and extended families and strong social networks. Formal institutional support and informal networks and support systems are essential at this level. Legal acknowledgment of partnerships has also been proven to promote resilience in the case of homosexual families. The increasing legitimacy with legalization makes it possible for the family to get greater official cash assistance and also offers up possibilities for social relationship development[9].

Some studies have looked at the resilience of homosexuals and lesbians, but few studied resilience in homosexual families. The Work, Love, Play (WLP) study investigates the extent to which the factors contributing to family stability are linked with resilience in families identified in previous research on heterosexual families when a parent or more identifies as being attracted to the same sex and which are more diverse in structure than traditional heterosexual family structures. The WLP research will also investigate variables that contribute to the resilience and well-being of families in social settings, characterized by legal and heterosexual community and prejudice against same-sex parents and children[10]. The research will also examine the experience of separation amongst same-sex couples with children. The objectives of the WLP study are given below.

1. It describes the features and variety of parent families of the same sex in Australia and New Zealand
2. Investigate the causes of breakdown in relationships and resiliency in parent families of the same sex
3. Examine changes in the stability and parenting of relationships between individuals
4. Exploring the effect on same-sex family parents of discrimination and homophobic societal views
5. Find obstacles to adequate provision of services to homosexual parent families across a variety of sectors, including community and health services
6. Develop methods for research findings to be translated into Good Practice Guidelines for use by providers in mainstream services and services aimed at homosexually attracted people and families in same sex families.

2. METHODOLOGY

2.1 Design:

A mixed methodological research comprising three waves and longitudinal cohort studies of same-sex parents in Australia and New Zealand was planned to be performed between 2008 and

2014 over a period of six years. The sample includes lesbian, homosexual, bisexual and transgender parents who care for children under 18. In 2008, the first online survey gathered quantitative data, with two further online polls scheduled for 2010 and 2012. Qualitative data will be gathered via interviews in 2012 and 2013 using deliberately chosen subsamples and open-ended interviews. The key findings of interest for sub-studies are the following: increased understanding of variables that contribute to resilience in homely families and increased knowledge of the experiences of parents in partner separation and post-separation parenthood.

2.2 Sample:

The cohort sample includes participants from Australia and New Zealand who identify gay, lesbian, bisexual and transgender persons as same-sex persons and presently active parents or children under 18 years of age. Alone parents who are attracted to the same sex are able to join. The method for sampling is restricted to one respondent per household. The self-finished survey asks that participants speak and write English. There is no sufficient census data available in Australia and New Zealand to determine the population size of the same-sex parents. In addition, prior investigations of this demographic group included relatively small samples and were mainly qualitative. As such, insufficient information is provided to perform a power calculation to establish a suitable sample size for this research. Data from Wave One were gathered from June to November 2008. During the time, the survey was carried out by 445 eligible individuals with 355 (80%) consenting to participate in the longitudinal research. In 2009/early 2010, further sampling and recruiting for particular categories started to increase the sample, with the objective of having at least 50 cases in all interest areas, including gender and location of residence.

Among the 445 first-round Wave One respondents, 85% (n = 377) lived in Australia and 15% (n = 68) in New Zealand. Most were lesbians (75 percent, n = 334) and 15 percent (n = 65) were homosexual, 8 percent (n= 36) were bisexual and 1 percent (3) were takatapui and 2 percent (n = 7) were transgender responses. The bulk of respondents (76 percent, n = 340) lived in urban regions within or outside of the country. Just under a quarter of the participants identified their homes as regional or rural/remote areas (23 percent n=102). Of the 355 people consented to be contacted for future polls, 301 were women, 49 were males and four identified their sex as "other". Objective cohort sub-samples for qualitative interview research in two particular areas of interest will be recruited from the Wave one cohort: determinants of resilience in homosexual families and the experience of parental separation for homosexual parent families.

2.3 Data Collection:

The surveys for 2008, 2010 and 2012 are done online. A survey hosting firm put up the questionnaire online, collects and maintains data on a secure server which is only available to researchers through a password for the Wave One survey (2008). The Wave One questionnaire included more than 100 questions and occupied around 30 to 60 minutes. Only relevant questions could be asked of each individual responder using the computerized format. Questions regarding present relations, for example, were not raised if an interviewer indicated that they are now single in a prior inquiry. At the conclusion of the survey, participants were invited to participate and if so, to give contact information for future study. The respondents were told that this choice was optional and anonymous and that they could only participate in the Wave One research. Volunteer participants were sought for the Wave One survey through.

1. A sponsored banner of the website was posted on the 'Pink Sofa' website for three months.

2. Gay and Lesbian Health advertising Vitoria newsletters and websites and Brisbane Lesbian news "City- Lickers"
3. Business cards in size were created and distributed to community and health centers across Australia and New Zealand and to social supporting organizations of gay and lesbians.
4. Information on the study was posted in a series of e-mail lists including: Gay Dads Australia (and their state-based e-lists); Rainbow Families Council; ACT Queer; Australia's Lesbian Medical Association; Gay and Lesbian Researchers; GLBT Research Network of New Zealand; Auckland Gay and Lesbian Welfare; New Zealand Families; Gay & Lesbian Line; HOT News (South Australia); Pride and Hospitality (South Australia).
5. Informal advertising via e-mail to personal networks was created, and individuals were asked to forward it to friends and colleagues.

3. RESULTS AND DISCUSSION

The poll covered a range of demographic questions such as sex, sexuality, age, location, training, employment, cultural/ethnic backgrounds, languages spoken and respondents' income and their spouse, when applicable. If the respondents answered that they are presently in a relationship, questions were asked regarding their relationship, including the time and the duration of cohabitation. They were also questioned whether they now had a parenting agreement with someone else. One open question asked respondents to describe the structure of their existing family. Respondents were questioned about the conception techniques and their relationship status at conception for each of their children. Options were provided for the promotion, adoption or other permanent care arrangements. The "Negotiation the Life Course" (NLC) study, a longitudinal study of Australian couples carried out by the Australian Demographic and Social Research Institute at the Australian National University and the School of Social Sciences at Queensland University, adapted a series of questions on the division of labor in the home. The NLC survey utilizes a CATI technique to gather information every three years from 1500 Australian respondents. The NLC's first wave took place in 1996 and 1997, followed by three waves in 2000, 2003 and 2006.

The Work, Love, Play research is the first large-scale study undertaken in Australia and New Zealand by same sex family members. Its importance rests in its significant contribution to national and worldwide family resilience literature. Furthermore, because the experience of separation among homosexual parent families has not before been studied, this study will fill a large vacuum in international literature. The research will also provide a significant addition to evidence on the health and well-being of parents and their children attracted by the same sex. Other features of the research include bigger samples compared to prior studies by lesbian and homosexual male parents. There is few published research on homosexual male parents and prior studies of lesbian parents tended to be qualitative studies exploring small samples.

The combined approach (qualitative and quantitative) to this research is suitable for investigating the notion of resilience in parent households of the same sex. Because little research has been carried out on this subject, the gathering of qualitative data will allow additional investigation and explanation of the main themes arising from the study Waves 1 and 2. The projective, longitudinal design of the research provides the chance to examine the separation experience of a same-sex parent sample, including an assessment of pre- and post-separation variables and

parental well-being. In addition, the design allows the study of family well-being in Australia over time, and in areas where since Wave One the rules on same-sex parenting have altered. For example, 83 responders from Victoria, Australia have consented to take part in the future research waves. New rules that allow two moms to appear on a birth certificate and provide potential lesbian parents wider use of reproductive technologies came into effect in January 2010 in this State.

The WLP study has several drawbacks. There is no sample framework for lesbian and homosexual parents to generate a random selection of participants for the research. The unlikely sampling techniques employed in this research may generate some partiality in the sample, as individuals more related to social networks and support networks are likely to be exposed to data regarding the study. Unfortunately, this implies that the sample may be underrepresented for individuals who are more socially isolated, or who have worse mental health. The online survey technique also implies that a response rate cannot be determined since it is not known how many individuals viewed and refused to participate in the research.

4. CONCLUSION

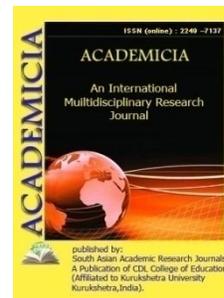

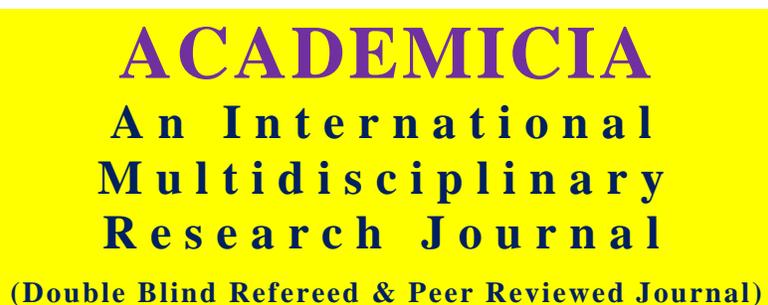

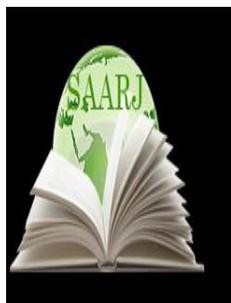

In this research, the current Wave One sample had a very high level of education. This is not unusual. Most gay, lesbian, bisexual and transgender (GLBT) studies in Australia use samples who have greater average levels of education than the overall population. It is not apparent whether this represents an actual greater degree of knowledge among Australians who openly recognize that same sex is attracted to them, or if individuals from poorer socio-economic backgrounds, especially online research, are less inclined to engage in study. Similarly, the sample included a low proportion of non-English speakers. Again, in Australian studies this is not unusual and does not focus particularly on a cultural group. The ethnic variety in Australia and New Zealand makes it difficult for all individuals from a wide range of cultural backgrounds to properly reflect their experiences. It is difficult to acquire sufficient numbers to guarantee representation within the total sample without a broad targeting of certain cultural groups. It should be emphasized that experiences of same-sex attracted parents in Australia and New Zealand may vary in various socioeconomic and cultural groupings.

ABSTRACT

The article shows the conditions and the possibility of amperometric titration of noble metal ions with solutions of 4-methoxyphenylcarboxymethyl-diethyldithiocarbamate (MFKMDETC) and 4-methoxy phenylcarboxy methyl-dithio-carbamate (MFKMDFTC) in non-aqueous and mixed media (n-acetic acid), DFA with background electrolytes with different acid-base properties. Methods of amperometric titration of micrograms of amounts of noble metal ions in the presence of foreign ions containing foreign ions are proposed.

KEYWORDS: *Palladium, Mpkmdetk, Mpkmdftk, Solution, Acetic Acid, N-Propanol, Dmf, DmsO, Background Electrolytes.*

INTRODUCTION

Amperometric titration of metal ions in non-aqueous and mixed media with various complexants will expand their analytical capabilities and simplify the solution of many complex analytical problems. First of all, this is due to the fact that the nature of the solvent strongly affects the strength of the resulting complex, moreover, it is not the same for different cations, which determines the selectivity and rapidity of the method. In addition, the methods of non-aqueous compleximetry successfully solve the problem of accurate and selective determination of metals in objects of organic origin, as well as directly in extracts obtained during concentration.

We tried to find the optimal conditions for the amperometric titration of a number of noble metals with solutions of 4-methoxyphenyl-carboxymethyldithiocarbamate (MPKMDETC) and (4-methoxyphenylcar-boxymethyl) -diphenylthiocarbazone (MPKMDFTK) in various non-aqueous protolytic acids, on basic electrolyte media. There are no data in the literature on the amperometric titration of ions of various metals with solutions of the above reagents, since they were synthesized relatively recently [1] and, in addition to their biological activity, their other properties have not yet been studied [2].

Reagents and equipment. The initial 0.002 M Na_2PdCl_4 solutions, as well as 0.01 M solutions of MPKMDETC and MPKMDFTK were prepared by dissolving the corresponding weighed portions of these reagents in acetic acid (n-propanol, DMF, and DMSO). The concentration of noble metals was determined amperometrically using a 0.01 M potassium iodide solution. Amperometric titration was performed on a setup with two platinum wire electrodes rotating (1000 rpm) on a common axis. The design of electrodes, piston automatic microburettes and apparatus are described in detail in [3].

Amperometric titration was carried out on a setup with two rotating (1000 rpm) electrodes on a platinum wire on a common axis. The design of electrodes, automatic piston microburettes and equipment are described in detail in [3].

In accordance with the voltammetric behavior of MPKMDETC, MPKMDFTK and other products participating in electrochemical media, amperometric titration of noble metal ions must be carried out at a polarization voltage of 0.75-1.15 V, depending on the nature and concentration of the background electrolyte (acetates, nitrates, chlorides, perchlorates of alkali metals and ammonium) [4]. In this case, the indicator current should arise beyond the equivalence point (i.e.) due to the oxidation of the free reagent and the reduction of the dissolved oxygen in the air.

The experimental data showed that in the studied media and backgrounds 0.15-0.40 M solutions of noble metal ions with solutions of MPKMDETC and MPKMDFTK titrated quite well and quickly, and the shape of the curve coincides with the expected one with some constancy of current at the beginning of titration, followed by a sharp transition (kink) at the titration endpoint (CTT).

Determination of noble metal ions in individual solutions.

It was found that when titrating ions of the following noble metals, the corresponding molar ratio Me: reagent is: Pd: reagent 1: 2 and Pt: reagent 1: 4, the titrated solution acquires a reddish-brown color. When passing from acetate backgrounds to perchlorate ones, containing a certain amount of perchloric acid, the shape of the titration curve of noble metal ions deteriorates significantly, which ultimately leads to a decrease in the reproducibility and accuracy of the results. This is explained by an increase in the acidity of the analyzed medium during the transition from acetates to perchlorates [4]. Some of the data obtained are shown in Table 1.

The results of determining various concentrations of noble metal ions with a solution of MPKMDETC in 10.0 ml of the test solution under optimal conditions indicate the good accuracy of the developed method. The effect of additives to acetic acid, n-propanol, DMF, DMSO, such as chloroform, tetrachloromethane, benzene, toluene, hexane, methyl ethyl ketone, dioxane, etc. , as in the titration of noble metal ions in their individual solutions, with the only difference that

the content of the protolytic solvent in the analyzed sample was controlled in strict accordance with the volume of the added inert solvent. Due to the decrease in the solubility of the background electrolyte under these conditions to values less than 0.2 M under the influence of large additions of an inert solvent, the background concentration (from 40-50 vol.% Of an inert solvent) must be continuously reduced close to values of the order of 0.05 M. Addition of any of the above solvents in the amount of 10-20 vol.% (depending on the nature of the solvent) practically does not interfere with the shape of the titration curve becomes less steeply inclined to the axis of the volumes. For the same reason, at solvent contents above 50-60 vol.%, The reproducibility and accuracy of determinations of noble metal ions deteriorate.

TABLE 1 RESULTS OF AMPEROMETRIC TITRATION OF VARIOUS AMOUNTS OF PALLADIUM (II) IONS WITH A SOLUTION OF MPKMDETC IN DMSO AGAINST THE BACKGROUND OF 0.20 M LITHIUM PERCHLORATE

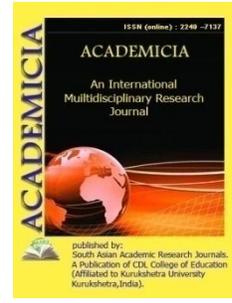

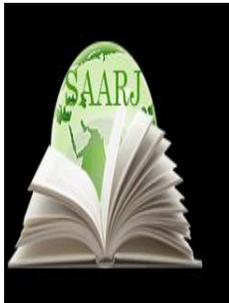

Mixture composition,%	Found Me, μg ($P=0,95; x \pm \Delta X$)	n	S	S_r
Pd 247,00	246,91 \pm 0,41	4	0,21	0,001
Pt 493,10	493,80 \pm 0,52	3	0,62	0,001
Pd 740,71	739,45 \pm 1,43	4	0,91	0,001
Pt 998,10	987,91 \pm 1,54	4	0,63	0,001

The revealed nature of the influence of inert solvents on the form of the titration curve is explained by the mode of a decrease in the electrical conductivity of the titrated solution at a high content of an inert solvent in the protolytic medium, which leads to a significant and continuously increasing ohmic voltage drop in the analyzed solution with an increase in the indicator current.

ABSTRACT

The article discusses the stages of development of grammar and related phenomena, the creation of an electronic database of linguistic units and its inclusion in the National Corps of Languages, improving the quality of automatic translation in computer linguistics, linguistic modeling of language, the theory of lemma.

KEYWORDS: *Grammar, Electronic Database, Computer Linguistics, Automatic Translation, Lemma Theory.*

INTRODUCTION

The study of grammar and related phenomena in world linguistics has its own stages of historical development, and is mainly one of the processes that has been rapidly improving since the second half of the XVII century and the beginning of the XIX century. The issue of creating an electronic database of this category of linguistic units with different interpretations and its inclusion in the National Corps of Languages has been addressed only in the largest corps in the world.

However, even the practice in this area does not satisfy theoretically and practically researchers from countries that intend to form their own National Corps. In world linguistics, the lexicographical forms of the National Corps in the 21st century and before have been relatively well developed. In particular, linguistic dictionaries. Consequently, at a time when the movement for the scientific and theoretical study of corpus linguistics is intensifying, these dictionaries are gaining in importance in the semantic layout of the corpus.

In the field of computer linguistics, computerization has become a topical issue in world linguistics in order to improve the quality of automatic translation, linguistic modeling of language, the development of the theory and algorithm of lemma of words in each language and

increase the use of centuries-old national and cultural heritage. Computer linguistics, in particular, the creation of the corpus, the expansion of the existing corpus size, the development of programs that automatically process text, remains one of the most important issues facing linguistics. In world linguistics, corpus linguistics became the object of study in the 1960s.

Although the view that “reliable linguistic information can only be obtained from a large set of massive texts” was stated by RG Piatrovsky in the 1960s, targeted research in the field of corpus began in the 1940s by Bloomfield, Fries and Bonjers. Brown Corps (1961-1964) founders Nielson Francis and Henry Kuchera were the first to develop corpus building principles. The work of John Sinclair, author of the Bank of England (1980) project, is also noteworthy in this regard.

In Russian linguistics VP Zakharov, AB Kutuzov, EV Nedoshivina, VV Rykov, V. Plungyans conducted research on the corps, its types, peculiarities, the social significance of the corps, the principles of corps formation. Author's corps was studied by OV Kukushkina, AA Polikarpov, EV Surovtseva. In Uzbek linguistics, a lot of research has been done on computer linguistics, lexicographic processing of text and linguostatistical analysis. The observations of A.Pulatov, S.Muhamedov, M.Ayimbetov, S.Muhamedova, S.Karimov, G.Jumanazarova, A.Babanarov, D.Urinbaeva, N.Abdurahmanova, A.Norov and others are noted as such works.

It should be noted that these studies have gained relevance by proposing modern methods of lexicographic and linguostatistical research of the text using the innovative approach - the achievements of computer linguistics. Although a number of studies have been conducted during the years of independence in computer linguistics to achieve automatic translation, understanding and processing of the Uzbek language by artificial intelligence, the approach to corpus linguistics as a whole, in a monographic plan, is weak.

However, in all areas of linguistics, the definition of "... the task of comprehensive support of scientific and creative research, the creation of the necessary conditions for them" indicates the need for in-depth research on the integration of disciplines. In world linguistics, the process of adaptation to modern information technologies is accelerating. In particular, "Computer Linguistics" has achieved certain success in Western linguistics, Russian linguistics, and even Turkish and Kazakh linguistics. With the advent of computer technology, software developers have created a new type of dictionary - the electronic dictionary.

This type of dictionary is an entirely new word in the history of lexicography, marking a new qualitative stage of its development. Now, electronic dictionaries remain in the shadow of paper dictionaries, and the need to create electronic content for a language platform is growing. Indeed, electronic dictionaries have a number of obvious and important advantages over traditional dictionaries. Their only drawback is that they are dependent on a personal computer and are therefore relatively limited. However, while this shortcoming is not complete, at least it will soon be remedied due to the increasing pace of computerization, including the availability of laptops.

Linguistic dictionaries in Russian are now very common electronic dictionaries, so we will focus only on bilingual Uzbek-English and Uzbek-Russian dictionaries. It is known that a host of grammatical terms belong to Russian and English. There are some terms of Latin origin, but it should be noted that Uzbek linguistic terms are formed mainly on the basis of Russian terminology, through translation. To study this issue, it is necessary to conduct a comparative study of Uzbek linguistic terms with terms of other languages.

It is interesting to compare these dictionaries because the communities that create them have different views on the principles of electronic lexicography. Electronic dictionaries are also becoming increasingly important when it comes to the National Language Corps. In this regard, some research in Uzbek linguistics, including practical work, is now underway.

It is known that the language is reflected in dictionaries, and today in Uzbek lexicography, in the field of computer linguistics, there are a number of problems. For the creation of an electronic platform of the Uzbek language, the development of the language corps, the educational corps, sectoral terminology, linguistic dictionaries, educational dictionaries should be created. Effective use of the works of such scientists as K.D.Bak, J.Malkil, P.N.Denisov, V.G.Gak, L.A.Novikov, V.V.Morkovkin, S.G.Barkhudarov as world experience in this regard should.

Today, there is a need for a new approach to the issue of creating linguistic dictionaries, both to improve the content of education and to create educational and language corps. In particular, it is advisable to create electronic dictionaries by categorizing linguistic dictionaries according to their level of importance. For example, the use of noun and verb phrases in speech is more active than other categories.

The educational process is also in greater need of e-learning materials than printed information. In this case, first of all, it is necessary to create separate dictionaries on word groups, which will also speed up the search process and save time. In addition, electronic dictionaries divided into categories for researchers in the field of philology, linguistics, including lexicology, create the conditions for increasing the efficiency of work, gaining an immediate idea of the general appearance.

In particular, the dictionary of famous horses can be developed in different forms.

1. "Dictionary of famous horses"
2. "Dictionary of famous horses"
3. "Dictionary of place names"
4. "Dictionary of active industry terms"
5. "Dictionary of names of organizations"

The difference between these dictionaries and existing general and traditional dictionaries is that the words included in these classified dictionaries are composed primarily of the most active words according to their use, and each word is given a spelling and transcription form. In addition, noun and verb phrases are mostly used to refer to formal activities in accordance with the needs of society.

In order to avoid duplication of documents, texts of different styles, the preparation of dictionaries "Synonymous horses", "Synonymous verbs" facilitates the use of language, office work. The following approach can be used to ensure the widespread use of words related to the Uzbek language in the communication process:

1. "Dictionary of famous Uzbek horses"
2. "Dictionary of Uzbek names"

3. "Dictionary of Uzbek verbs"

4. "Dictionary of Uzbek place names"

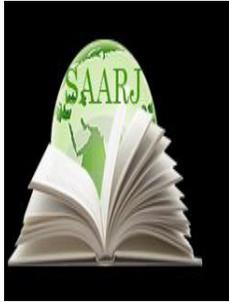

Such dictionaries are, of course, created in electronic form. Each word in this dictionary also serves to study spelling and pronunciation norms. Such dictionaries, first of all, in the system of continuing education, mainly in philological, linguistic research, as well as in the process of paperwork, document preparation, closely assist students, researchers, professionals and professionals. These types of dictionaries can serve as a convenient electronic content that can serve both the development of computer linguistics and corpus linguistics. The fate of the Uzbek language and future linguistics depends on the electronic corpus of the language.

In this regard, it is important to coordinate the state order and the activities of scientists in the country, to achieve the effectiveness of electronic record keeping, e-learning, e-communication, the main force is not the print media. In this sense, it is necessary to fully support the creation of a national corps of the Uzbek language as an important practical research to ensure the implementation of the state language policy.

ABSTRACT

Many businesses and government agencies may now use Big Data to get important information. Such information can aid decision-makers in improving their strategies and plans. It gives the company a competitive advantage and adds value to a variety of economic and social sectors. In fact, a number of governments have launched programs to boost Big Data research and development, with significant funding. In order to maximize profits and optimize resources, the private sector has made numerous investments. This article discusses a variety of Big Data projects, opportunities, examples, and models from a variety of industries, including healthcare, commerce, tourism, and politics. It also includes examples of technologies and solutions that have been developed to address Big Data issues. Data with a lot of fields (columns) has better statistical power, while data with a lot of characteristics or columns has a higher false discovery rate.

KEYWORDS: *Big Data, Big Data Opportunities, Big Data Applications, Big Data Technologies.*

1. INTRODUCTION

Big data is a discipline that deals with methods for analyzing, methodically extracting information from, or otherwise dealing with data volumes that are too big or complicated for conventional data-processing application software to handle[1]. Data capture, storage, analysis, search, sharing, transfer, visualization, querying, updating, information privacy, and data source are all difficulties in big data analysis. The three main ideas of big data were initially linked with

three essential concepts: volume, diversity, and velocity. Because large data analysis poses sampling difficulties, only observations and sample were previously allowed[2]. As a result, big data often contains data in quantities that conventional software cannot handle in a reasonable amount of time or for a reasonable price. The phrase "big data" is now mostly used to refer to the use of predictive analytics, user behavior analytics, or other sophisticated data analytics techniques to extract value from large amounts of data, rather than a specific data set size.

"There's no denying that the amounts of data currently accessible are massive, but that's not the most important feature of this new data environment." Data collections may be analyzed to discover new connections that can be used to "identify economic trends, prevent illnesses, fight crime, and so on." In fields such as Internet searches, fintech, healthcare analytics, geographic information systems, urban informatics, and business informatics, scientists, corporate executives, medical practitioners, advertising, and governments all face challenges with big data sets. In fields like as meteorology, genomicsconnectomics, complicated physics simulations, biology, and environmental studies, scientists face constraints. As data is collected by devices such as mobile devices, cheap and numerous information-sensing Internet of things devices, aerial (remote sensing), software logs, cameras, microphones, radio-frequency identification (RFID) readers, and wireless sensor networks, the size and number of available data sets has grown rapidly. Since the 1980s, the world's technological per-capita capacity to store information has approximately doubled every 40 months; in 2012, 2.5 exabytes (2.5260 bytes) of data were produced per day. Between 2013 and 2020, the worldwide data volume is expected to increase rapidly from 4.4 zettabytes to 44 zettabytes, according to an IDC study.

According to IDC, there will be 163 zettabytes of data in 2025[3]. One issue that huge companies have is deciding who should be in charge of big-data projects that impact the whole company. Big data is challenging to handle and analyze for relational database management systems and desktop statistical software packages used to display data[4]. "Massively parallel software operating on tens, hundreds, or even thousands of servers" may be required for big data processing and analysis. What constitutes "big data" varies according to the skills of people who analyze it and the technologies they use. Furthermore, as technology advances, large data becomes a shifting target. When confronted with hundreds of terabytes of data for the first time, some companies may need to rethink their data management choices. For others, tens or hundreds of terabytes may be required before data size becomes a major concern. Many businesses and governments are increasingly seeing the benefits of Big Data.

In reality, effective Big Data mining allows various sectors (economic, social, medical, scientific, and so on) to gain a competitive edge and create value. The 3Vs basic features of Big Data are what characterize it the most. Velocity (data grows and changes quickly), Variety (data comes in a variety of forms), and Volume (a large quantity of data is produced every second) are the three Vs. According to these three qualities must all be present in order for a source to be classified as a Big Data source[5]. We can't talk about Big Data if one of these three Vs doesn't apply. Certain actors have added additional Vs and other features to better define Big Data: Value (relevant information can be extracted for the benefit of many sectors), Complexity (it is difficult to organize and analyze Big data because of evolving data relationships), and Immutability (collected and stored Big Data can be permanent), Vision (the defined purpose of Big Data mining), Verification (processed data comply to some specifications), Validation (the purpose is fulfilled), Value (pertinent information can be extracted for the benefit of many

sectors), Complexity (it is difficult to organize and analyze Big data because of evolving data relationships).

Furthermore, others claim that any massive quantity of digital data sets that we can no longer gather and analyze properly using current infrastructures and technology is by definition Big Data. This paper discusses a variety of Big Data initiatives, possibilities, examples, and models in a variety of industries, including health, research, commerce, transportation, tourism, and politics. It also discusses some of the technologies that are utilized to build Big Data applications[6].

1.1 Big data opportunities:

Many academics have discussed the benefits of Big Data in their respective fields. The major possibilities and advantages of Big Data in the following areas are summarized in this section: health, research, commerce, transportation, tourism, and politics. The aim is to provide a broad overview of the topic[7].

- *The healthcare industry:* Big Data analysis provides important information to the health industry. Several Big Data applications have been tried to enhance the commercial and public medical services, as well as to better assist patients and doctors. As described below, Big Data analytics may change the health domain by assisting in the optimization of operational services, providing decision-support tools, and lowering the high cost of this sector.
- 1) *Health-care cost-cutting:* Big Data analytics aids health-care organizations in determining which departments need to be restructured. It assists in assessing and monitoring service quality, medical unit performance, and human resource and medical equipment requirements in real time[8].
- 2) *Better disease evolution knowledge:* Data analytics of vast sources of information on viruses and DNAs may aid in disease evolution understanding. Doctors and researchers may use this information to discover new methods to avoid hereditary and genetic illnesses[9].
- 3) *Assisting medical decision-makers:* For example, a study of past surgery outcomes based on patient profiles might be coupled with an examination of a patient's current symptoms or medical data. This connection aids in the selection of the most appropriate intervention and treatment options based on the patient's profile.
- 4) *Improved prevention:* Predictive Big Data models can evaluate healthcare data from both the commercial and public sectors to help prevent diseases from spreading. These models work by identifying worrisome signs in the population's health. Decision-makers can devise an effective preventive strategy and halt the epidemic's progress based on the afflicted areas and population symptoms. Medical services may be customized in a variety of ways. In order to enhance patient happiness, several medical initiatives gather and evaluate patient input in real time. Real-time medical data, for example, may be used to monitor patients' health in order to adjust medication dosages or provide medical suggestions based on the studied symptoms[10].
- *The commercial sector:* If properly utilized and handled, data may be a real asset for businesses. Large and diverse data sources (e.g., internal data produced by internal business operations, external data gathered from public sources, online sites, and data bought from

other organizations) may be effectively integrated and analyzed thanks to Big Data advanced technology. In the commerce industry, big data analytics allows for the extraction of useful information. It allows you to get a deeper knowledge of your consumers' habits and preferences. It's also utilized to see how effective business tactics are. Such information allows businesses to adjust and improve their goods, services, and plans (like targeted advertising in real-time). As a result, it makes it possible to boost customer happiness, profitability, and competitiveness. According to the Big Data market will grow by 45 percent in 2014, reaching a value of \$25 billion. In general, Big Data mining provides for improved macroeconomic and microeconomic monitoring, as well as assisting decisionmakers in spotting commercial possibilities and anticipating recessions. Facebook, Google, and Amazon, for example, gather and sell data on web users' behaviors, feedback, comments, and online purchases. Credit card firms (such as Equifax and Transunion) follow suit in order to boost revenues and improve services. Furthermore, the development of various ICTs, as well as high connectivity across many organizations (e.g., corporate subsidiaries, partners, suppliers, and consumers online), has resulted in new business models based on real-time Big Data sharing and monetization. Indeed, as points out, businesses may use Big Data at several phases depending on their maturity level:

1. Rather than simply monitoring internal company operations, businesses may use Big Data analysis to better understand consumer behavior and improve their commercial strategy and goods.
 2. Businesses that have reached a particular level of maturity are more ready to improve their procedures and identify new possibilities.
 3. The company reaches the next maturity level when it is able to monetize the value of the gathered Big Data in addition to optimizing its business model. This may be accomplished by reselling data and analytical findings for extra profit. Another option is to use Big Data insights to improve goods and the consumer experience in shops and online.
- *Agriculture sector:* The use of Big Data produced in the agricultural industry may provide useful information. Such knowledge allows for the optimization of production methods, the adaptation of plans in response to climatic forecasts, the monitoring of demand by area and customer profiles, and much more. This may be accomplished by evaluating data from a variety of heterogeneous sources (e.g., weather and history, demand forecasts, and smart sensors). A Japanese initiative, for example, seeks to create an enhanced recommendation system based on Big Data analysis, according to [8]. The aim is to suggest the best product combinations, restaurants, and manufacturers that provide goods that are in accordance with the consumers' tastes to internet users (e.g., Bio products or products with with no allergic substances). By just filling out the patient's symptoms, the system will also suggest appropriate goods and their providers. Its goal is to link various entities (users, restaurants, and producers) and provide granular data access based on user profiles.
 - *The tourism industry:* To enhance tourism operations and better serve visitors, many Big Data models have been created or are in the works. In reality, businesses may utilize Big Data technology to get important insights, such as a better understanding of visitors' behaviors, the identification of changing preferences and requirements, and the monitoring of tourists' geo-position, activities, and context. It is feasible, for example, to suggest hotels,

restaurants, and activities to visitors in real time based on their interests, online habits, and geolocations. Suggested a Tourist Recommendation System in this regard. This system is built on a foundation of comprehensive Big Data analysis and visualization capabilities, including: i) an examination of past visitor activity patterns. ii) Real-time analysis of current tourist activities, preferences, profile, and website visits. iii) the tourist's whereabouts is being tracked. iv) Other factors such as weather and traffic congestion are monitored. The aim is to provide customized real-time recommendations.

- *Politics Sectors:* Many governments are evaluating various sources of moving or static data in real time (for example, logs, historical events, public and private surveillance cameras, citizen comments on social media, online transactions, GPS data, and mobile communications). They also make use of data produced by a variety of government ICTs. The aim is to uncover useful information, trends, and correlations, or to develop prediction models that will allow the government to improve its policies and services to people. Another key aim is to maintain constant surveillance and monitoring in order to safeguard people and reduce the effect of crimes. For example, the government may use sophisticated Big Data algorithms to anticipate events that might jeopardize the country's security or to identify suspects, criminal organizations, and terrorists. However, monitoring individuals' communications and activities raises a slew of privacy concerns that are difficult to address. delves into these problems. Furthermore, political scientists and professionals may utilize Big Data analytics to extract useful information. This kind of knowledge allows people to get a better grasp of political problems. For example, offers a geopolitical analysis-based Big Data application. This program assesses President Barack Obama's political beliefs over a certain period of time. The program downloads Obama's speeches from the White House website, cleans them for consistency, and extracts the data sets that are relevant to the use case. The program use data mining methods to measure the president's attention on political topics, examine his emotions, and determine his mode in the face of significant political events. The suggested model may be used to identify political trends, predict the effect of elections on the country's development, verify political views, track political goals, and assess people' confidence in the present political environment, among other things.

1.2 Big Data Technologies:

- *Hadoop Ecosystem:* Hadoop Framework was created to store and process data in a distributed data processing environment using a simple programming paradigm. Data from a variety of high-speed and low-cost devices may be saved and examined. In the last year, businesses have embraced Hadoop as a Big Data Technology for their data warehouse needs. The trend seems to be continuing and accelerating in the next year. Companies that haven't looked into Hadoop yet are likely to see its benefits and applications.
- *Artificial Intelligence:* Artificial intelligence (AI) is a broad field of computer science concerned with the creation of intelligent machines capable of performing tasks that would normally require human intelligence. From Apple's Siri to self-driving cars, AI is rapidly evolving. As an interdisciplinary branch of science, it considers a variety of approaches, such as increased Machine Learning and Deep Learning, to make a significant change in the majority of tech industries. Existing Big Data Technologies are being revolutionized by AI.

- *NoSQL*: Database NoSQL Database NoSQL Database NoSQL In the database, NoSQL includes a variety of different Big Data Technologies that were created to design modern applications. It depicts a non-SQL or non-relational database with a data acquisition and recovery method. They are used in real-time Web and Big Data Analytics. It saves unstructured data and provides quicker performance and flexibility for a variety of data formats, including MongoDB, Redis, and Cassandra. In a variety of devices, it offers design integrity, simpler horizontal scalability, and control over possibilities. By default, it utilizes data structures that aren't related to databases, which speeds up NoSQL computations. Every day, Facebook, Google, Twitter, and other comparable businesses keep gigabytes of consumer data.
- *Programming in R*: R is an open-source Big Data programming language and technology. The free program is extensively used for statistical computation, visualization, and help communication in unified development environments like Eclipse and Visual Studio. According to experts, it was the most widely spoken language on the planet. Data miners and statisticians utilize the system to create statistical software and, in particular, data analysis.
- *Data Lakes*: In terms of structural and unstructured data, Data Lakes refers to a centralized repository for storing all data types at all levels. Data may be stored in its raw form without being converted into structured data during data accumulation. It allows for real-time data analysis ranging from dashboards and data visualization to Big Data transformation for improved business intelligence. Businesses that utilize Data Lakes remain ahead of the competition by doing new analytics, such as Machine Learning, using new log file sources, social media data, and click-streaming.
- *The Beam*: Apache Beam provides a simple API for building complex Parallel Data Processing pipelines using a variety of Execution Engines or Runners. In 2016, the Apache Software Foundation created these Big Data technologies.
- *Using Docker*: Docker is a Big Data technology that simplifies the creation, deployment, and operation of container applications. Containers assist developers in loading a program with all of the necessary components, such as libraries and other dependencies.
- *Flow of air*: Apache For the administration of data pipelines, Airflow is a Process Management and Scheduling System. DAGs (Directed Acyclic Graphs) tasks are used in Airflow job processes. The process code description makes it simple to handle, verify, and version huge amounts of data.
- *Block chain technology*: Block chain is a Big Data technology that has a unique data secure feature in the digital Bitcoin money that prevents data from being erased or changed once it has been published. It's a highly secure environment that's a great fit for a variety of Big Data applications in sectors like manufacturing, banking, insurance, medical care, and retail, to mention a few.

2. DISCUSSION

Big Data refers to all of the data that is being produced at an unprecedented pace across the world. This information may be organized or unstructured. An economy that is strongly knowledge-oriented owes a large portion of today's commercial companies' success. Data is what

drives contemporary businesses across the globe, therefore making sense of it and unraveling the different patterns and exposing previously unknown relationships within the enormous sea of data becomes essential and very gratifying. There is a need to turn Big Data into Business Intelligence that businesses can use right now. For businesses of whatever size, region, market share, customer segmentation, or other categorizations, better data leads to better decision making and a better method to plan. Hadoop is the platform of choice for handling massive amounts of data.

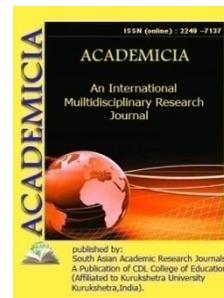

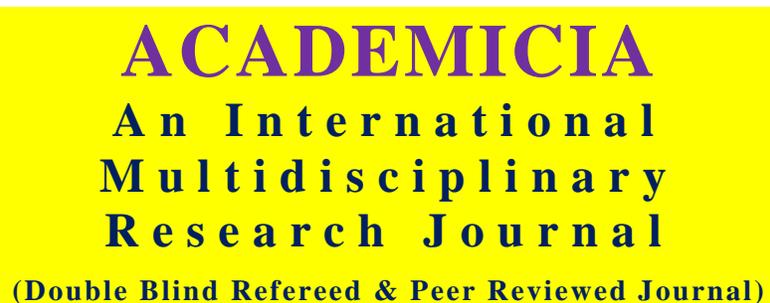

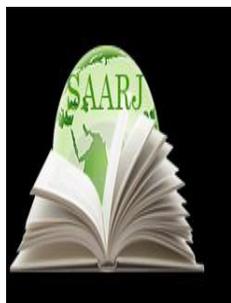

3. CONCLUSION

There are many instances of Big Data possibilities and solutions, as we've seen in this article. We can conclude that analyzing Big Data is beneficial for gaining reliable insight. Such knowledge enables decision-makers to make sound decisions, improve policies and strategies, maximize profits, and improve the competitiveness of businesses. Furthermore, by allowing advanced complex analysis across multiple sources, the Big Data revolution contributes to the enrichment of various scientific fields. New business models, such as data value monetization and business metamorphosis, have emerged as a result of Big Data analytics. In fact, organizations use Big Data to varying degrees of maturity. They can not only rely on real-time Big Data analysis to optimize strategies and processes as they grow and mature, but they can also monetize the value of Big Data. They can then focus their efforts not only on improving services and products, but also on developing their ecosystem. A single platform that links all ecosystem participants is needed to support the growth of organizations. To support the needs of various parties (e.g., governments, enterprises, customers, administrations, suppliers, social network communities, and users), this platform should rely on Big Data analysis and modeling. Entities should be able to get a better understanding, immediate feedback, and customized suggestions via such a platform. The goal is to maximize all of the entities' profits. Traditional technologies, on the other hand, are incapable of dealing with Big Data challenges (i.e., velocity, volume, variety and complexity). To ensure performance, results reliability, data availability, and scalability, Big Data modeling and mining necessitate advanced technologies and methods. Another challenge is striking a balance between various security and privacy requirements, fast, reliable processing, and granular role-based access to a number of highly connected Big Data sources. To meet such challenges, a variety of technologies have been developed. However, there are numerous drawbacks. Many areas are still open to research in order to improve the features and capabilities of Big Data applications.

A REVIEW PAPER ON BIO FERTILIZERS AND ORGANIC AGRICULTURE

Mr Durgesh Nandan*

*Sanskriti University, Mathura,
Uttar Pradesh, INDIA

Email id: durgesh.soa@sanskriti.edu.in

ABSTRACT

Bio fertilisers play an important role in worldwide food production because they provide rapid nutrition for plants, allowing them to develop more quickly and efficiently. While there have been negative effects associated with the excessive and imbalanced usage of these synthetic inputs. Furthermore, continuing to use conventional chemical fertilisers disturbs soil ecology, decreases soil fertility, has serious health effects, and pollutes ground water. Current soil management practices largely depend on inorganic chemical-based fertilizers, which pose a serious health and environmental danger. Chemical fertilizers, on the other hand, have a number of negative consequences, including pollution, global warming, soil microbial diversity, and so on. Furthermore, because of its microbial dispersion and role in the degradation of soil environmental sustainability, it influenced the dynamics of soil plants. The function of bio fertilizers in stimulating different growth and defence genes in signalling networks of cellular pathways, which leads to cellular responses and thus crop improvement, such as plant growth and productivity, nutrient profiles, plant defence and protective characteristics, has been highlighted in this review. The information gained from the literature reviewed here will enable us to acquire a better understanding of the physiological underpinnings of bio fertilizers, reducing the challenges associated with their usage.

KEYWORDS: Agriculture, Bio Fertilizers, Plants, Soil, Sustainable Farming.

1. INTRODUCTION:

Since their evolution, agriculture and agricultural resources have been the only livelihood of mankind. Most of the world's population is relying on food, food and other key products of agriculture (fibre, wood, gums and medicinal goods) to support a healthy lifestyle. In line with increasing population trends, researchers/agricultural scientists/agro-industries must create appropriate techniques of sustainable agriculture in order to fulfil the needs of the increasing population[1]. Any civic society's major objective is to control farming methods up to levels which may ban hunger demands enough. The traditional agricultural practises include food and feed production only at household level. Only families of farmers and their small village communities can use traditional methods. The progress of scientific technology can lead to a rise in the production per acre. Sustainable farming principles are not only a means of cultivating crops up to their maximum level, but ecological conservation also determines the success of sustainability in agriculture[2]. The way farming is evolving nowadays is perplexing, since the focus is on the conservation of environmental resources and the agricultural system is only concerned with maximum agro-production. Agriculture involves the usage for enhancing crop output by different hormones, artificial fertilisers and other synthetic minerals. The impacts on soil and plant health are of Synthetic Chemicals and Minerals. Although output may rise with greater chemical use, the degradation of key minerals and other nutritional components occasionally acts as a barrier to higher production[3].

Sustainability in agriculture may be accomplished without jeopardising future generations' environmental resources and capacity to fulfil their own needs. Excess usage of chemicals causes favourable living circumstances to become less widespread, since residues that function as secondary pollutants might infiltrate the food chains and food webs and enter ultimately human beings. With the impact of health dangers, secondary pollutants can remain for a reasonably long time in the environment[4]. A new age of industrialisation may be opened up by the use of biofertilizers rather than chemicals in agriculture. Without degrading natural climate, biofertilizers might assist provide nutrients for agricultural plants. This section might be a welcoming approach to the creation and usage of biofertilizers for sustainable farming.

1.1 Biofertilizers:

Biofilters maintain a rich soil environment with a variety of micro- and macronutrients via nitrogen fixation, phosphate and polymerisation, release of plant growth regulating substances, antibiotics and soil biodegradation which improves nutrient intakes and increases tolerance for soil products [5]. Biofertilizers are neither chemical and organic fertilisers in that they do not give nutrients directly to crops and are relatively straightforward and cost-effective cultures of specially designed bacteria and fungus. Thus, at a time when agriculture faces a wide variety of environmental pressures and changes, bio-enrichment can tackle the problem of feeding a growing global population[6].

1.1.1 Characteristics Necessary for the Release of Bio fertilizer in the Market:

The usage of biofertilizers for increased crop output for farmers is one of the main limitations in the agriculture industry. While several biofertilizers are currently on the market, they are of different quantities and qualities depending on the manufacturing facility. A biofertilizer must have the following preconditional properties before release into the market.

1.1.1.1 Offer:

Bio fertilizers should be readily available on the market. Easy access minimises transportation costs and saves farmer's time.

1.1.1.2 Stability of the storage:

The formulations for bio fertilizers should be stable in various air conditions. With time length, the quality of wording should remain the same.

1.1.1.3 Effectiveness:

Bio fertilizers in minimum quantity should be required for their on-field application and should make the combination of nutrients necessary in crops efficient.

1.1.1.4 Solubility and action:

Formulations should be soluble in water as they are cost reduction and may be administered in wider field areas using the spray method.

Formulation should ensure that no adverse effects are caused to plant nutrients supplied immediately. It should be easy to use and should not affect the health of the farmer. For farmers at a reasonable cost, it should be accessible since it also influences the price of crops. It should be seasonal and available to farmers all year round.

1.1.2 Quality Control and Scale-Up:

One of the biggest obstacles for improved crop productivity is the availability of excellent biofertilizers on the market. Biofertilizer ratings vary, however, unit to unit and manner of action. The manufacturing unit must have the following criteria before the commercial production of biofertilizers:

- Determination of appropriate field design of the required inoculum.
- When production is economically understood and workable, planning should begin on facilities and organisation.
- Adequate personnel training in manufacturing and quality control technical elements.
- Provision of microbiological installations necessary.
- Uninterrupted provision of microbial consortia to support healthy strain lifecycle with maximal biomass production and access to necessary equipment.

1.1.3 Potential of Biofertilizers in crops production:

Bio fertilizers could be employed as a nutrient source or to improve soil microbiology by keeping fruit yield and quality and encouraging cheap production costs for nutritionally supplied plants[5]. Microorganisms attaching nitrogen plays a significant function in boosting production by transforming the atmospheric nitrogen into plant-usable organic forms. Rhizobia are linked symbiotically with legumes, and nitrogen fixation occurs in the root or stem nodules of the bacteria. Inoculation with rhizobium aids increase nodulation, plant development and generates 10-15 percent more grain production under cultivated conditions than non-inoculated crops.

The two main non-symbiotic N-fixing bacteria in non-leguminous cultivations are azotobacter and Azospirillum. These N-fixing bacteria may be rice plants that are free-living, or naturally. Azotobacter and Azospirillum can improve plant development and boost the yields of several key crops on various soils and climatic areas under proper conditions[7]. As Azotobacter has a range of metabolic activities, it plays an essential part in the natural nitrogen cycle. In order to synthesise and secrete substances such as thiamines and riboflavin, the nicotine acid, pantothenic acid, biotin, heteroxins, gibberellin and ammonia secretion in the rhizosphere in the presence of root exudates which can contribute to n modification, Azotobacter plays a significant role in nitrogen fixation[7].

Various soil bacteria and certain fungal species have the capacity to bring soil in soluble forms of insoluble phosphate by removing or lowering the phosphate pH and releasing accessible phosphate. PSB-produced organic acids solvent insoluble phosphates by reducing pH, cation chelating and phosphate competing in soil adsorption sites. Plant growth promoting bacteria (PGPB) represents a wide range of soil bacteria (for example, genus Azospirillum, Azotobacter, Bacillus, Pseudomonas) that play a major part in plant rhizosphere growing in conjunction with a host plant[8].

Promoting plant growth, improved yield, N intake and other components using PGPR inoculations that greatly encourage canola and sugar beet development, and increased stir and root growth. Plant growth promoters, such as Bacillus and Pseudomonas (PGPR) that are capable of producing indoleacetic acid (IAA) and gibberellins, are capable of having a positive impact on plant development and are thus utilised for farming as biofertilizers. Pseudomonas not only destroys organic nitrogen molecules, but also enhances the circulation of N and P in land. Field visual inspections showed that, despite unfavourable, very dry climatic circumstances, plant growing regulators led to strong development of greener and bigger leaves. PGPR inoculations that protect plants from soil-borne illnesses, mostly caused by pathogens, via the suppression of plant diseases-causing organisms.

1.1.4 Potential Of Bio fertilizers in Crops Production

Bio fertilizers could be employed as a nutrient source or to improve soil microbiology by keeping fruit yield and quality and encouraging cheap production costs for nutritionally supplied plants. Microorganisms attaching nitrogen plays a significant function in boosting production by transforming the atmospheric nitrogen into plant-usable organic forms. Rhizobia are linked symbiotically with legumes, and nitrogen fixation occurs in the root or stem nodules of the bacteria[9]. Inoculation with rhizobium aids increase nodulation, plant development and generates 10-15 percent more grain production under cultivated conditions than non-inoculated crops.

The two main non-symbiotic N-fixing bacteria in non-leguminous cultivations are azotobacter and Azospirillum. These N-fixing bacteria may be rice plants that are free-living, or naturally. Azotobacter and Azospirillum can improve plant development and boost the yields of several key crops on various soils and climatic areas under proper conditions. As Azotobacter has a range of metabolic activities, it plays an essential part in the natural nitrogen cycle[10]. In order to synthesise and secrete substances such as thiamine's and riboflavin, the nicotine acid, pantothenic acid, biotin, heteroxins, gibberellin and ammonia secretion in the rhizosphere in the presence of root exudates which can contribute to n modification, Azotobacter plays a significant

role in nitrogen fixation. Various soil bacteria and certain fungal species have the capacity to bring soil in soluble forms of insoluble phosphate by removing or lowering the phosphate pH and releasing accessible phosphate. PSB-produced organic acids solvent insoluble phosphates by reducing pH, cation chelating and phosphate competing in soil adsorption sites. Plant growth promoting bacteria (PGPB) represents a wide range of soil bacteria (for example, genus *Azospirillum*, *Azotobacter*, *Bacillus*, *Pseudomonas*) that play a major part in plant rhizosphere growing in conjunction with a host plant. Promoting plant growth, improved yield, N intake and other components using PGPR inoculations that greatly encourage canola and sugar beet development, and increased stir and root growth. Plant growth promoters, such as *Bacillus* and *Pseudomonas* (PGPR) that are capable of producing indolacetic acid (IAA) and gibberellins, are capable of having a positive impact on plant development and are thus utilised for farming as biofertilisers.

1.2 Nitrogen Fixation:

Nitrogen fixation, which makes nitrogen recycling and offers a key contribution to nitrogen homeostasis in the biosphere, is regarded as one of the major biological processes and an interested microbial activity on the earth's surface after photo synthesis. Fixation of organic nitrogen is crucial in the maintenance of soil fertility. Based on the quick growth and high degree of nitrogen fixation, *Azotobacter* are employed to research nitrogen fixing and plant inoculation. They are very oxygen tolerant whereas fiber-induced nitrogen and are related to nitrogenase breathing. They have breathing protection, hydrogenase absorption, and turn off nitrogenase enzyme defence against oxygen. It is found that *Azotobacter chroococcum* has hydrogenase absorption that metabolises hydrogen. *Azotobacter* may convert nitrogen into ammonia and the plants in turn, as illustrated in Figure 1.

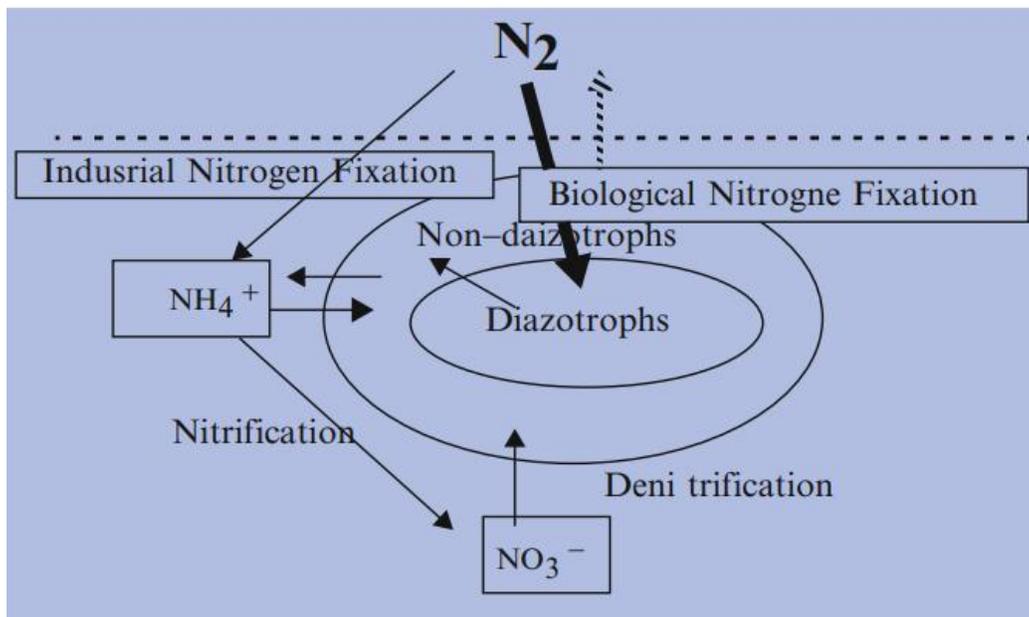

Figure 1: Nitrogen to Ammonia Cycle and Its Fixation by Diazotrophs with the Soil as Biofertilizers.

1.3 Types of Biofertilizers:

Biofertilizers are live microbe formulae (useful bacteria and fungi) readily applied, improving soil and plant species quality and health by increasing the availability of nutrients to soil and plants. The microorganisms used in microbial biofertilization may be classified into two types, which are symbiotic, non-symbiotic, and blue-green. Bio fertilizers include, thus, symbiotically Rhizobium spp. nitrogen fixers symbiotically free, Algae bio fertilizers, phosphate solubility bacteria, Mycorrhizal and Biofertilizers, blue green algae, or BGA in combination with Azolla. Microbial fertilisers such as rhizobiums and phosphate solubilizes, (PSB), make the two necessary nutrients available to plants by their synergistic action extremely helpful to enhance nitrogen content (N) and phosphorus content (P). The plant growth promoting rhizobactéries (PGPRs) are the foundation of many marketable biofertilizers that lead to plant growth through several processes, among them the biological N₂, increasing the availability of nutrients in the rhespheres, expanding the root area, enhancing the useful host symbiosis to provide sequestered iron by bacterial siderophores, and soluble phosphate. Few of them are discussed below.

1.3.1 Rhizobium Bio fertilizer:

In underdeveloped nations, the lack of substantial nutrients in food crops poses significant challenges. Technologies with more emphasis on using microbial consortium products, particularly plant growth-fostering rhizobacteria, are needed for the solution of these tough tasks in order to support sustainable crop development and to fulfil future food requirements. Rhizobium is an endosymbiont for the nitrogen fixation belonging to the Rhizobiaceae family. It infects plant roots and causes certain root nodules to develop. Root nodules microorganisms decrease molecular nitrogen in form of a plant system of ammonia for protein, vitamin and other essential nitrogen-contaminating compound synthesis.

1.3.2 Azotobacter Bio fertilizer:

Since Azotobacter is a no symbiont, it offers a wide variety of benefits for the crops. Azotobacter Azotobacter's connection with crop plants helps them maintain their healthy lifestyles and maximum output. Azotobacter belongs to the Azotobacteraceae family and is aerobic in nature. Several science papers propose the usage for the maximum crop output of Azotobacter in the field. The Azotobacter and associated strains are used to improve the dry matter of the plant and the synthesis of secondary metabolites. Sustainable farming practises might provide benefit for the important functional characteristics of the strains of Azotobacter, which include enhancing fertility of the soil and nitrogen fixation, boosting yield, promoting plant development, helping to withstand drought and anti-pathogenic plants.

1.3.3 Azospirillum Bio fertilizer:

Azospirillum is another bio fertilizer category that supports the growth of diverse biochemical reactions needed in the creation of food. In general, Azospirillum is a key member of the Rhodospirillal order and has occasionally been closely connected with grasses, in particular maize and rice. Nitrogen fixation, secretion of special fungicides and phytohormones are connected with their connection. In particular, indole-3-acetic acid (IAA), salicylic acid, and auxins are produced with a specific ability of Azospirillum. Azospirillum protects plants against biotic and abiotic stress and increases moisture and nutrient intake and boosts total output.

1.3.4 Phosphate-Solubilizing Microbe Bio fertilizer:

Phosphorus has its own relevance among macronutrients as it controls signals, protein synthesis, respiration and fixation of nitrogen in plants. Phosphorus is an insoluble element in soil; hence plants do not use it. It needs to be transformed from a complicated bound to a free form for frequent ingestion. Some bacterial strains can reduce phosphorus into the simplest form, so that plant roots are readily absorbed. Phosphate-solubilizing bacteria are, however, widespread in nature and may vary according to the soil types and the area from where they are isolated.

1.3.5 Arbuscular Mycorrhizal Biofertilizer:

In their many stages of growth and development, natural resources are continually faced by abiotic stress. Under stressful conditions, plants begin to produce particular categories of secondary metabolites in order to counteract reactive oxygen overproduction. The synthesis of particular components allows the plant to survive under harder conditions to a certain extent. One of the most essential aspects in maintaining good crop plant life is the symbiotic connection. AMF are a crucial symbol for the effective absorption of nutrients and diverse enzyme responses of the majority of plants.

2 DISCUSSION

Consumer views about the usage of bio fertilisers and food produced acceptability and manufacturing safety for human well-being are quite important. The consequences of chemical fertilisers on the public, the land and the ecosystem are deteriorating. However, development, marketing and their technique of application are under the authority of major businesses and genetic committees. Bio fertilize agro-industrial issues can be solved in a very specific manner. Chemical fertilisers in contemporary farming have decreased soil fertility, rendering it inadequate for the cultivation of crops. Furthermore, these inputs' extensive usage has resulted in serious health and environmental threats such as soil erosion, pollution of the water, pesticide poisoning, decreasing groundwater table, water logging and biodiversity depletion. Bio fertilisers naturally activate the soil's inexpensive, efficient and environmental friendly microorganisms and, as a result, promote plant growth and restore the natural fertility of the soil from drought or soil disease. Further research and development are needed to understand the mechanisms to act for different biofertilizer and find more competent rhizobacterial strains and carrier materials to make agriculture more sustainable and economical. The success of biofertilizer technology requires further research and development. Farmers should be instructed on the environmental and other major favourable impacts on the farming system of biofertilizers to make them more popular among farmers.

3 CONCLUSION

For the economic prosperity of a country, a thorough understanding of biofertilizer production and use is needed. In order for farmers to be aware of their core concept of sustainability, design, manner of production, use and storage conditions are crucial. In agriculture, sustainability is very useful for eliminating the real agricultural difficulties associated with crop production. In addition, the design of their agriculture system based on biotechnological and environmental issues of biofertilizers requires the training of marginal farmers in underdeveloped nations. This chapter provides a comprehensive examination of biofertilizer effectiveness in achieving sustainable agriculture.

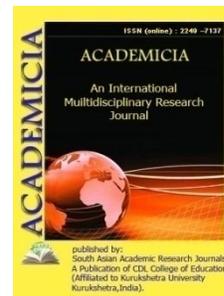

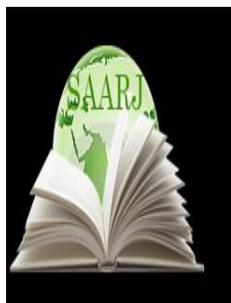

Biofertilizers are able to address the difficulties of agro-industry and provide new chances for the improvement of farmers in agriculture, businesses, academics and other key government sectors in rural regions. Although bio fertilisers are able to significantly boost agricultural land productivity, the most decisive element in the increase in productivity is the integrated approach to the determination of the best-favored plant microbe interaction. The emerging technology can play a crucial part in the investigation of the most advantageous plant-microorganism interaction utilising a potent molecular biotechnology tool. The success of biofertilizers is therefore dependent upon innovations of novel tactics linked to functions and the appropriate administration of the many helpful bacteria to the field using sophisticated and better procedures. A major step in achieving long-term success in this growing sector is extensive study on generating effective, temperature-tailoring strains. The most essential and hard aspect of the research is to examine the real bio-fertilizer mechanism for their efficiency in sustainable development exploration, along with the discovery of numerous bio-fertilizer strains and their characteristics.

ABSTRACT

This paper provides information on the effects of Gibberellin A₃ (GA₃) and Auxin-indolyl-3-acetic acid (heteroauxin) stimulants on seed germination and growth for the culture of Lagochilus inebrians and the determination of lagoxilin diterpenoid by a known method in the literature.

KEYWORDS: *Lagochilus Inebrians, Lagochilus Pubescens, Gibberellin A₃, Auxin, Heteroauxin, Stimulator Infrared Spectroscopy, Lagoxillin, Thin Layer Chromatography.*

INTRODUCTION

Nowadays, the cultivation of promising plant species, the extraction of substances with high biological activity and the creation of new drugs based on them are developing rapidly around the world. Natural compounds extracted from plants have a high biological activity and have a special place in medical practice and in the national economy. Lagochilus inebrians Bunge is an intoxicating herb that is used as a sedative antihypertensive and anti-allergic agent. The main effect ingredient of the Lagoxilus plant is lagoxilin diterpenoid, a quaternary alcohol. Therefore, most lagochilus plants have hemostatic properties.

Main part:

Lagochilus is a perennial herb growing to a height of 20-60 cm. The stems are branched, ascending, the base is woody, four-sided, covered with hard glandular hairs. The leaves are

simple, cut into three or five segments, opposite the band on the stem and branches. The flowers are pink, arranged in a semicircle on the stems and branches. The fruit is 4 nuts (fig. 1) and blooms in june-september. *Lagochilus* is harvested in july-august [1-5].

Fig. 1. *Lagochilus inebrians* Bge plant and its flower

The *lagochilus* plant grows in rivers, streams and rocks in the village of Navandak, Mirdosh, Langar of Akmal Ikramov collective farm of Xatirchi district, Nurata district of Navoi region of Uzbekistan. It is also found in Bukhara and Kashkadarya regions. It is grown in the village of Darmana on the former Frunze state farm in the Chimkent region. It is grown wild in the villages of Kushrabat, Gujumsay, Bazarjay, Jush, in Samarkand region. *Lagochilus* is named after the appearance of a rabbit's lip (from the Greek "lagos" - rabbit, "cheilos" - lip). Plants belonging to the genus *Lagochilus* belong to the family of lilacs (Lamiaceae or Labiamae).

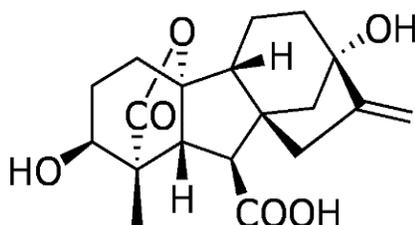

The chemical composition of *Lagochilus* plant contains vitamin K1, 0,6-1,97 % lagoxilin, 0,67% flavonoid glycosides, 44-77 mg % ascorbic acid, 6-7 % organic acids, 5-10 mg % carotene, 9,66 -12,42 % resin, 2,58-2,78 % additives and other substances and also calcium and iron salts. *Lagochilus* leaves contain lagoxilin, 0,03% essential oil, 11-14% additives, organic acids, 7-10 mg% carotene and 77-100 mg% vitamin C. The pharmacology of *lagochilus* plant species has been studied in the pharmacology departments of Kuban, Samarkand and Andijan medical universities. In addition, aqueous and alcoholic decoctions of the species *Lagochilus inebrians* have been found to have hemostatic properties, physiologically active properties such as sedative, hypotensive, sedative, anti-shock, anti-radiation and desallergic (anti-allergic) [5-10]. As the demand for *Lagochilus*-based preparations increased from year to year, the natural reserves of the wild-growing *Lagochilus* plant declined dramatically and are now listed in the Red book. To date, almost no practical work has been done on the cultivation of this medicinal plant in the country and the creation of cultivated plantations. Therefore, to study the effect of gibberellin A₃ (GA₃) and auxin-indolyl-3-acetic acid (heteroauxin) stimulants on seed germination and growth for culturing *Lagochilus inebrians* under laboratory conditions.

Gibberellins plant hormones regulate gibberellins plant growth and affect their developmental processes. These include stem elongation, germination, inactivity, flowering, enzyme induction, and leaf and fruit aging. Gibberellins were first discovered in 1926 by the japanese scientist Eiichi Kurasava [12].

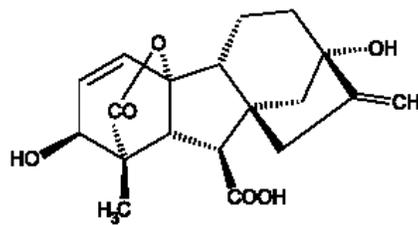

It was first isolated from fungal species by Teijiro Yabutava Sumuki in 1935 and studied by Khurasava. Yabuta named the isolated substance as Gibberelin [12].

Interest in Gibberellins began outside Japan after world war II. The first scientific study of Gibberellin in the USA was conducted by Camp Detrick in Maryland. He tested gibberellin as a stimulant in a seedling of bean *Vicia faba*. The isolation of new species of gibberellins in the UK was initiated by large chemical industries. Interest in gibberellins has spread around the world, with its use in important beneficial plants becoming more prominent. For instance, research on this topic was conducted by David in California in the middle of 1960s. Thomson led the trial of gibberellins in seedless vines grown in special areas of California in 1962 [13].

Gibberellins are made with ent-gibberellan skeletons. When gibberellins were discovered, they were named GA₁ (Gibberellin A₁) according to the gan rule. Gibberellinic acid was the first Gibberellin GA₃ with a specific structure. In 2003, 126 Gibberellic acids were isolated from plants, fungi, and bacteria [12]. Gibberellins are tetracyclic diterpenic acids. At the base of each are 2 tattoos involving 19 or 20 carbons: 19-carbon gibberellins, for example, gibberellic acid does not contain 20-carbon, and instead has a five-membered lactone bridge bound to 4- and 10-carbon. 19-carbon states are, in general, biologically active forms of gibberellins. As well as highly effective in biologically active forms of hydroxylated gibberellins. In general, the most biologically active compounds are dihydroxylated gibberellins. Hydroxyl groups were involved in both the 3 and 13 carbons in them. Gibberellic acid is considered dihydroxylated [14].

Gibberellin A₁ (GA₁)

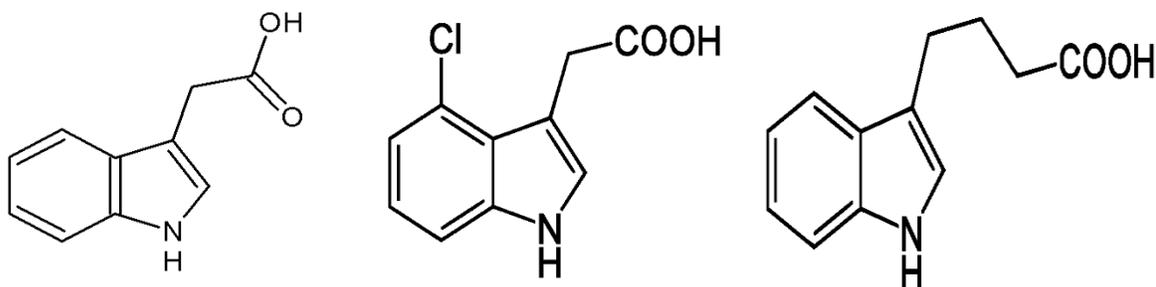

Gibberellic acid (GA₃)

The Biological functions of gibberellins include various forms of cessation of stasis and stem elongation in the natural process. Before the photosynthetic apparatus is formed, it retains sufficient nutrient reserves of starch to feed the plant growing from seed in the early stages of stem elongation. Usually during stem elongation, the breakdown of starch into glucose begins in the endosperm after the seed is soaked in water. If plants are exposed to unfavorable temperatures, they produce large amounts of gibberellins. They enhance cell elongation, breakage and germination, seedless fruiting and seed germination. Gibberellins perform fully by stopping the inactivity of the seed and act as a chemical messenger. Its hormones bind to receptors, activate proteins, bind to complex DNA, and produce enzymes that enhance growth in the embryo. The main effect of gibberellins is to reduce proteins, and then again not to participate in the interaction of phytohormones and gene control [15].

Auxins are a class of plant hormones (or plant-growing substances) that are distinguished by some morphologically similar properties. Auxins often play a key role in the normal growth of plant life processes. It also plays an important role in the development of the plant body. Auxins

and their role in plant development were first demonstrated by dutch scientist Fritz Vent. Kennes Siman isolated this phytohormone and determined that its chemical structure was Indole-3-acetic acid [16]. Vent and Siman later became the author of the book phytohormones, or plant hormones, in 1937.

Local auxins indole-3-acetic acid is the most abundant local auxin found in plants and plays the most important role. It causes most of the effects of auxin in plants and is the strongest local auxin. There are more than three local endogenous auxins. All auxins are compounds with one carboxylic acid group bound by an aromatic ring.

**Indol-3-acetic
acid**

**4-chlorindol-3-acetic
acid**

**Indole-3-butanoic
acid**

The name auxins is a greek word (auxein - growth). They were the first major plant hormones to be discovered. The distribution of auxin sample within the plant is the key factor for plant growth, the reaction of which is important for the environment and the development of plant organs. It transports molecules from cell to cell throughout the plant body through the active transport of a very complex and well-coordinated auxin (called polar auxin transport) [16]. Thus, the plant affects their appearance and regulates them without the need for a nervous system.

The specificity of auxins is that they interact with or counteract other plant hormones. For example, the ratio of auxin to sitochinin is determined by counting the buds in front of the root in plant tissue. At the molecular level, all auxins are compounds of the same carboxylic acid group bound by a benzene ring. The most important member of the auxin family is indole-3-acetic acid [13]. It is the strongest local auxin. Its stability as a local auxin has been tested in many ways in plants. For example, it has always been found that, under conditions, it generalizes the results obtained by reducing its molecules.

However, the molecules of indole-3-acetic acid are chemically variable in aqueous solution, so it is not used as a plant growth regulator. There are four natural (endogenous) auxins: indole-3-acetic acid, 4-chlorindol-3-acetic acid, phenyl acetic acid, and indole-3-butanoic acid. All of which have been identified separately from plants [16]. In addition to endogenous (local) auxins, scientists and manufacturers have developed many synthetic auxin compounds with auxinic activity.

Synthetic auxin analogues include 1-naphthalene acetic acid, 2,4-dichlorophenoxyacetic acid, and others. Some synthetic auxins, such as 2,4-dichlorophenoxyacetic acid and 2,4,5-trichlorophenoxyacetic acid, have been used as herbicides. As well as the sodium salt of 2,4-dichlorophenoxyacetic acid, a herbicide used to control weeds.

Broad-leaved plants (dicotyledonous), for example, rhubarb (dicotyledons), thin-leaved plants (single-leaved), for example, are more susceptible to auxins than grasses and cereals plants. Therefore, synthetic auxins are also useful as herbicides [12-16].

RESULTS AND DISCUSSIONS:

For the study of the effect of stimulants Gibberellin A₃ (GA₃) and Auxin – indolil-3-acetic acid (*heterooxine*) on the germination and growth of seeds, for the cultivation of Lagoche in inebrians plant, Gibberellin A₃ (GA₃) were extracted five different masses from gibberellin A₃ (GA₃) to prepare a solution of 10⁻⁴ M, 10⁻⁵ M, 10⁻⁶ M, 10⁻⁷ M and 10⁻⁸ m with a melted and dissolved in 2 liters of water. To prepare a solution of Gibberellin A₃ with 10⁻⁴ M li, Gibberelin A₃ (Mr=346,4 gr/ mol) was taken from 0,06928 gr or 69,28 mg, and for 10⁻⁵ M li was taken from 6,928 mg and dissolved in 2,0 liters of water. Then it was postponed for a day. The remaining solutions are prepared in the same way. For the preparation of solutions of auxin – indolil-3-acetic acid (*heterooxine*) 10⁻⁴ M, 10⁻⁵ M, 10⁻⁶ M, 10⁻⁷ M and 10⁻⁸ m, five different masses of auxin was taken and dissolved in 2 liters of water. From Auxin (Mr=175,184 gr/mol) were taken 0,350368 gr or 350,368 mg for the preparation of 10⁻⁴ M li solution of Auxin and also for 10⁻⁵ M was taken 35,0368 mg and dissolved in 2 liters of water. Then it was postponed for a day. The remaining solutions are prepared in the same way, and the seeds of the plant 10 units are soaked for 24 hours in the above solutions, and the soil:sand:manure prepared in the proportions of 2:1:1 in the pans, planted at a depth of 3-5 cm. The main indicators of the plant grown under the influence of solutions of Gibberillin A₃ and Auxin – indolil-3-acetic acid (*heterooxine*) 10⁻⁴, 10⁻⁵, 10⁻⁶, 10⁻⁷, 10⁻⁸ M are presented in Table 1.

TABLE 1 EFFECT OF GIBBERILLIN A₃ AND AUKSIN-INDOLIL-3-ACETIC ACID (HETEROAUKSIN) ON THE GERMINATION AND GROWTH PROCESS OF LAGOXILUS PLANT SEEDS

The drug concentration, mol	Time of germination of seed (day)	The length of the plant for 8 days (cm)	Number of plants grown from 10 seeds	The degree of germination of seeds (%)	Length of the root of the plant, cm
Control GKMAT	9-12	3,8	3	30	12,6
Gibberellin A₃					
10 ⁻⁴	7	5.2	4	45	13,5
10 ⁻⁵	6	5.9	5	60	13,6
10 ⁻⁶	7	5.7	4	50	13,4
10 ⁻⁷	8	5.3	4	45	13,3
10 ⁻⁸	10	4.8	4	55	13,2
Auxin-indolil-3-acetic acid					
10 ⁻⁴	7	5,2	4	45	14,6
10 ⁻⁵	6	5,6	4	50	15,0
10 ⁻⁶	7	5,8	5	55	15,5
10 ⁻⁷	8	5,1	4	60	14,8
10 ⁻⁸	10	4,9	2	50	14,3

From the indicators presented in Table 1, it can be seen that the growth rate of the lagoxilus plant and the degree of fertility of its seeds, the time of germination, the length of the plant and its root is 10^{-4} - 10^{-5} M of gibberellin A₃ and auxins, the length of the plant and leaves under the influence of concentrations it was found to have an effective effect on the increase in the number of seeds and 10^{-4} , 10^{-5} concentrations of plant seeds increased from 40% to 60%. The length of the plant was 5,6 cm, the length of the root was 14,3 cm. The seeds of plants germinated on 7-10 day. The most optimal for the growth process of the plant is the use of solutions of this concentration when planting the lagoxilus plant from seeds in field conditions. In control, the seeds of the lagoxilus plant sprouted between 9-12 days, the length of the plant was 3,8 cm, the length of the root 12,6 cm. The degree of fertility of plant seeds was observed to be from 20% to 30% in control.

In the experimental section, Gibberellin A₃ (GA₃) was taken from Gibberellin A₃ (GA₃) to prepare the solutions and dissolved in 2 liters of water. To prepare a solution of Gibberellin A₃ with 10^{-4} M li, Gibberellin A₃ (Mr=346,4 gr/ mol) was taken from 0,06928 gr or 69,28 mg, and for 10^{-5} M li was taken from 6,928 mg and dissolved in 2,0 liters of water. Then it was postponed for a day. The remaining solutions were prepared in the same way. For the preparation of solutions of Auxin – indolil-3-acetic acid (heterooxine), the mass of five different was taken from the Auxin and dissolved in 2 liters of water. From Auxin (Mr=175,184 gr/mol) were taken 0,350368 gr or 350,368 mg for the preparation of 10^{-4} M li solution of Auxin and also for 10^{-5} M was taken 35,0368 mg and dissolved in 2 liters of water. Then it was postponed for a day. The remaining solutions are prepared in the same way.

For the preparation and processing of soil, ordinary soil, sand and manure were obtained. Soil: sand: manure ratio is obtained from 2:1:1 (by mass) and mixed well with each other. Then put in special containers, prepared for planting. The small stones were placed with 3,0-3,5 cm before covering the mixture of soil:sand :manure on the bottom of special dishes. The goal of it is to grow the sprouted plant well and let the air enter from the bottom of the container. The ground was made ready for planting.

For processing Lagoxilus seeds, Lagoxilus plant seeds were taken and treated with each solution. This process was carried out as follows. The lagoxilus seeds were soaked in different concentrated solutions of each substance being tested, and a day later sown at a depth of 1,5-2,0 cm, corresponding to each container.

Figure 2. Growth process of Lagochilus inebrians Bge plant

The seeds were watered after planting. Each process was followed. Room temperature and light were given the same.

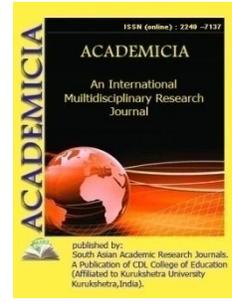

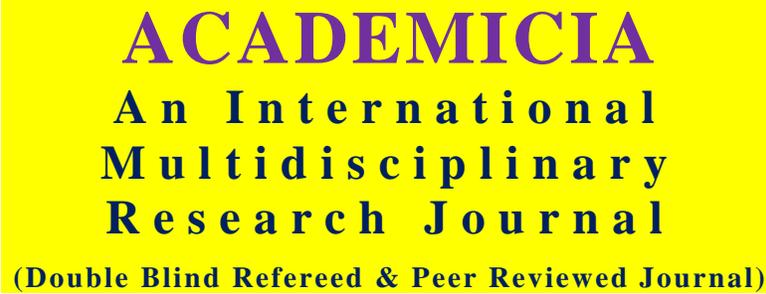

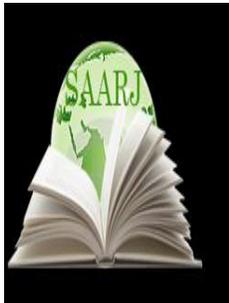

CONCLUSION

Growth and development of the Lagochilus plant at gibberellin A₃ and 10⁻⁵ and 10⁻⁶ molar concentrations of auxin were found to increase the root and stem length of the lagoxilus plant. The formation and proliferation of lateral and additional roots under the influence of auxin.

ABSTRACT

The problems of the theory literature and literary criticism are one of the most pressing issues today. It is important to research and analyze the development Uzbek literary criticism in objective and content marking the problems of literary process. The article raises those problems.

KEYWORDS: *Process, National, Pedagogy, Eternity, Factors, Periodizatsion.*

INTRODUCTION

The literary process is a constant movement of literature that is constantly growing, developing, and renewing. When we talk about particular national literature, we mean the ongoing literary process, its achievements, the development of genres, its influence on the world's artistic thinking, its contribution. We refer to the period from the 90s of the XX century to the present day as the "Literature of the Independence Period." The literary process of this period is characterized by unique developments in artistic thinking, the perfection of genres and their diversity, the strengthening of individualization in the artistic representation of real reality, the expansion of opportunities to use the most advanced experiences and traditions of world literature. The history of literature, the theory of literature, and the attitude to literary criticism, the principles of its analysis and research, have changed radically. Today, the criteria of world literature measured and evaluated the level of development in the literary process. The novelties of the literary process, literary connections, and interactions in world literature are also reflected in our national literature. The specific course of the literary process in each national literature depends on the socio-political and economic life, cultural and educational conditions of each period. This feature can also be seen in today's literary process. The textbook "Fundamentals of Literary Theory" correctly describes the important internal factors of the development of literature: Inheritance in literature, adherence to traditions, The uniqueness of each national

literature guarantees that the national image is not lost. The development potential of literature based on a rich tradition is, of course, higher than others”[1, 434].

The literature of the independence period is developing with a rich experience accumulated in the history of our literature, a huge cultural and enlightenment heritage, and a deep sense of responsibility to inherit immortal national traditions. The literary process is in full swing on an unprecedented scale, with infinite possibilities and conditions. An important factor in this is, first of all, the attention and care paid to the creative people of our country, the great creative work carried out in our independent Motherland. The Writers' Alley has been built in the center of Tashkent, the Writers' Union has been provided with a new building with all amenities, creative schools are operating in the capital and regional centers, young artists are encouraged to become poets, writers, playwrights, and publicists. inspires, enriches the treasury of our literature with richly artistic works. Umarali Normatov, an old critic, commented on the positive changes in the current literary process: works based on the philosophy of existentialism, which artistically studies the strange feelings, qualities, and unconscious states beyond the subconscious, are also created, or similar interpretations take root. There are many absurd works and absurd heroes who show the absurdity of the life and work of a person who has been deceived by the vain ideas of this mortal world, with all its sharpness and tragedy, often in symbolic and figurative terms”[2, 5].

The novelty of the literary process is the birth of a work of art that has attracted the attention of the public, an important event in the development of artistic thinking. It is literary criticism to reveal the essence, aesthetic significance of this important event. Literary criticism is a barometer of the literary process. But while literary criticism should always be at the forefront of the literary process, we criticized it for lagging, failing to make accurate and aim assessments. Literary criticism is lagging in the scientific and theoretical study of qualitative changes in the literary process, emerging and emerging new principles, new principles of artistic reflection of reality. Literary criticism, in particular, lags the timely assessment of the works of artists who see reality from a different perspective and create works that are difficult for the reader to comprehend at once.

During the years of independence, most of the famous examples of world literature, hitherto unknown to Uzbek readers, were originally translated. Classical examples of modern literature have become the spiritual property of Uzbek readers. The contribution of the journal "World Literature" in the implementation of this noble work is significant. The works of J. Joyce, M. Proust, A. Camus, F. Kafka, stories, short stories, and novels translated from Japanese, Chinese, Iranian, and Arabic enriched the treasury of the Uzbek school of translation. Under the influence of these works, the Uzbek literature also increased the number of works with a new spirit, a new artistic interpretation of life and reality, which must be perceived through the subconscious. H.Dustmuhammad, N.Eshonqul, U.Hamdani, I.Sultan, A.Yuldashev, U.Yakub, and dozens of other talented writers created works with features of modern literature and presented them to readers. The stories, short stories, novels created by these writers also educate the reader, increase his level of understanding, feeling, and perception of the work of art. This is called receptive aesthetics in scientific language. But who cultivates and nurtures this receptive aesthetics? "Independence. Literature. A collection of literary-critical articles entitled "Criticism" contains many contradictory and contradictory views on this issue. Some advocate the principle of "criticism for criticism", while others argue that literary criticism should help the public to

understand the essence of the work, to cultivate its aesthetic taste. Well-known literary critic Ibrahim Gafurov expresses the following views on literary criticism, the role of literary criticism:

Criticism is not a matter of classification. Sorting is just one aspect of it. Another very important aspect is to explain based on aesthetic knowledge, to hold discussions (but not to make judgments), to make interesting comments, to make objective assessments and draw deep conclusions, to cultivate artistic taste in students”[3, 144].

The complex contains a variety of opinions about the current state of literary criticism, its struggling aspects, its weaknesses. He accuses his colleagues of bias, saying that criticism has diminished, that impartiality has been replaced by impartiality, and that critical articles written on a work do not go beyond praise and applause. Abduqayum Yuldash openly expressed his dissatisfaction with the position of today's literary criticism:

"I am not happy about today's criticism," he said. Perhaps it is difficult to find an actual work among the huge amount of literary waste that is constantly being published, or the Uzbek language is predominant, but it is becoming increasingly difficult to find serious analytical articles by our critics. 88].

The author, who is sympathetic to Dobrolyubov's views, concludes that "... criticism is, first, creativity, discovery, and naturally impartiality and truthfulness" [4].

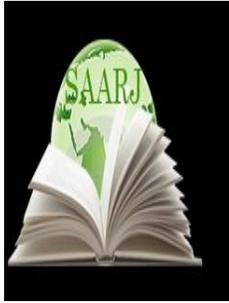

The conversation on "The Voice of the New Generation" provided many useful insights into today's literary process and the problems of literary criticism. We can add the state of literary criticism to the sadly stated that it lags the literary process. We should also acknowledge that our leading critics are doing a lot of research on works of art that are an actual event in our literature and that objectivity and truthfulness are the principal features of many literary-critical articles. But when the quality, position, and level of literary criticism are taken into account, the amount of objection seems to be considerably greater than the amount of objection. Because, as A. Yuldashev noted, the changes in the literary process, the lack of literary criticism in the timely objective and objective assessment of works created with high talent. An in-depth analysis of the power of art and magic in *The Monkey-led Man*, *Poincaré*, and *Windy Night* will help to develop the reader's aesthetic taste. If the belief that “no, this is not the task of literary criticism” is followed, then criticism is for criticism.

Muhammad Ali's tetralogy "The Great Sultanate" is a huge monument of art created in the Uzbek literature of the independence period. Literary critic Damin Turaev has created a significant treatise on tetralogy. It explores the artistic features of tetralogical novels, the gallery of images, the artistic interpretation of historical truth, the aspects of the writer's skill. There are even cases when the artistic depiction of the historical period covered in the epic emphasizes the presence of modern styles, the appearance of subconscious currents. The scientific pamphlet helps the reader to understand the essence of the work. The literary-critical articles of many of our hard-working scholars on the changes and innovations in the literary process, the analysis of works emerging in a new way of thinking, confirm that literary criticism is steadily and constantly moving forward in fulfilling its historical mission. But it is not right to turn a blind eye to the problems of literary criticism today with this sense of satisfaction. In his conversation with Rahmon Kochkor, U.Normatov discussed the problems of literary process and literary criticism in the journals "Jahon Adabiyati", "Sharq Yulduzi", "Yoshlik", "Uzbekistan Adabiyati va Sanati", and offered to hold regular literary and creative talks. activities should be

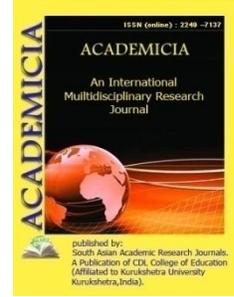

strengthened. For the elite reader of modern literature, the idea of educating the elite reader is less accurate and well-founded. However, the conversation organized by R. Kochkor in 2015, no such serious debate has taken place since the debate. Literary criticism must always be responsive, combative, combative, and extremely intolerant of negative situations that overshadow the power of artistic thinking and magic. Then our literature, literary criticism will rise even higher.

THE ASSESSMENT OF DOMESTIC AND FAMILY VIOLENCE BETWEEN SAME-SEX COUPLES

Dr. Arminder Kaur*

 Uttar Pradesh, INDIA

Email id: arminder.smas@sanskriti.edu.in

ABSTRACT

The causes of and interventions for intimate partner violence (IPV) have been addressed and researched throughout the last several decades. This article provides a narrative overview of IPV in same-sex couples, often known as same-sex IPV (SSIPV). Despite the popular belief that IPV is just a problem in heterosexual relationships, numerous studies have shown that IPV is just as common in lesbian and gay couples as it is in heterosexual ones. While there were parallels between heterosexual and lesbian, gay, and bisexual (LGB) IPV, LGB IPV had its own characteristics and dynamics. These characteristics are primarily linked to the detection and treatment of SSIPV in the community, as well as the necessity to examine the impact of sexual minority stresses. Our results indicate that there are few studies that address LGB people who are victims of IPV; this is mostly owing to the long-standing quiet in the LGB community about violence, a silence based on fears and misconceptions that has prevented a public debate on the issue. The major topics addressed in the published papers that we have examined have been recognized. Based on the evaluations, we believe it is critical to provide a space where this topic may be openly addressed and handled by both LGB and heterosexual individuals.

KEYWORDS: *Bisexual, Gay, Intimate Partner, Lesbian, Violence.*

1. INTRODUCTION

Intimate partner violence (IPV) has piqued the attention of mental health professionals in recent decades. IPV is defined as any conduct between a couple that includes acts of physical and sexual assault, emotional and psychological abuse, and controlling behaviour, according to the World Health Organization. According to a number of writers, the term "interpersonal violence" refers to a kind of violence that may be perpetrated by men and women of any age, marital

status, or sexual orientation. Numerous research has also examined the effects of IPV on mental health and overall well-being[1]. Lesbian, gay, and bisexual (LGB) people had worse results than heterosexual people “across many life dimensions, such as mental and physical health, subjective wellbeing, employment, poverty, homelessness, and social exclusion.” IPV in the LGB community has not been researched as extensively as it has in the heterosexual population: in 2015, LGB IPV research accounted for just 3% of all IPV studies. Despite the fact that there is few research on same-sex intimate partner violence (SSIPV), they show that it happens at a rate similar to or even greater than heterosexual IPV. Because of the various methods employed in the studies, determining LGB IPV prevalence rates may be challenging. However, almost one-third of sexual minority males and half of sexual minority women in the United States said they had been victims of physical or psychological abuse in a romantic relationship, according to one of the most current and representative research findings. In addition, more than half of homosexual males and over seventy percent of lesbian women said they had been victims of psychological IPV. According to studies, 4.1 million LGB individuals in the United States have been exposed to IPV at some point in their lives[2].

IPV prevalence in LGB couples seemed to be comparable to or greater than in heterosexual couples across time: IPV was experienced by 61.1 percent of bisexual women, 43.8 percent of lesbian women, 37.3 percent of bisexual men, and 26.0 percent of gay males, compared to 5.0 percent of heterosexual women and 29.0 percent of heterosexual men. When it came to severe violence episodes, the prevalence of LGB adults (bisexual women: 49.3 percent; lesbian women: 29.4 percent; homosexual men: 16.4 percent) was comparable to or higher than heterosexual adults (bisexual women: 49.3 percent; lesbian women: 29.4 percent; homosexual men: 16.4 percent) (heterosexual women: 23.6 percent; heterosexual men: 13.9 percent). Researchers found that gay and bisexual couples were more likely than heterosexual couples to experience all types of abuse. Furthermore, he theorized that a greater proportion of violence was driven by specific risk factors related to minority stress that only LGB persons face. Furthermore, the research found that lesbian women were more likely than heterosexual women, gay men, and heterosexual men to be engaged in IPV. Furthermore, bisexual individuals seemed to be the most abused group among the others; bisexual women, in particular, were more likely to be victims of all types of IPV, with the exception of psychological IPV[3].

The majority of studies on the incidence of SSIPV have focused on North American communities, with a few smaller studies focusing on Australian, Chinese, South African, and British populations, with comparable or even greater IPV rates than North American ones. Scholars used Facebook ads to recruit participants in the United States, Canada, Australia, the United Kingdom, the Republic of South Africa (RSA), Brazil, Nigeria, Kenya, and India for their transnational study. Their results revealed that the United States and the other countries had comparable rates of physical abuse, with Australia, Brazil, the Republic of South Africa, and the United Kingdom having similar or higher rates of physical abuse than the United States. Two studies on lesbian IPV were performed in Italy. The emphasis of the study was on the lack of protection legislation for lesbian women who have been victims of IPV, and academics tried to quantify the incidence of IPV among Italian lesbian women. A total of 102 lesbian women, mainly from Italy, were included in the study (88.2 percent). A questionnaire with 29 multiple-choice questions was given to the participants. The respondent confessed to being frightened of her spouse returning home in more than one out of every five cases (20.6 percent of the total). In

addition, 41.2 percent of women had hidden anything from their relationships in the past because they were scared of their partners' responses. Furthermore, 14.7 percent of lesbian women said they were always frightened about their relationships. The psychological harm caused by a pair dispute was recognized by almost half of the respondents, whereas physical injury was recorded by 5.9% of the interviewees[4].

In light of these results, it is clear that LGB IPV requires more investigation. Nonetheless, the public perceives LGB abuse as an uncommon occurrence; this perception is especially prevalent when it comes to bisexual and lesbian women, who are frequently romanticized as being in tranquil and utopian relationships, free of the violence and aggressiveness associated with "normal" male virility. Lesbian victims may find it difficult to recognize that their partner's conduct is abusive and not typical because of this stereotype. Previous study has recommended that further research be done on the subject: LGB IPV has a double-invisible character, which is why there have been so few studies on it. Health professionals have previously encountered many barriers to obtainingSSIPV research and data, a reality that has been linked to harmful effects such as discrimination and disinformation, in addition to the more apparent results[5].

1.1 Stress in Sexual Minority:

According to the researchers, LGB individuals face particular stresses as a result of their sexual minority status. These stresses, which seem to be linked to IPV, mirrored the experience of members of a stigmatized group who faced unique and extra stressors that no one outside the group could ever experience, according to Meyer's concept of Sexual Minority Stress. Internalized stressors and externalized stressors were incorporated in this paradigm. Internalized stressors were shown to be positively linked to physical, sexual, and psychological IPV in studies; externalized stressors, on the other hand, were found to be unrelated to any type of IPV, especially when combined with internalized minority stressors. As a result, research mostly focused on internalized minority stressors, such as Internalized Homophobia, demonstrating that IPV offenders directed their negative feelings onto their partners, which they had previously self-addressed as homosexuals. Partners have robbed people with internalized homophobia of pleasant feelings about their sexual orientation, reinforcing their sense of guilt for inciting the abuse. Internalized homophobia and IPV were linked in lesbian relationships, according to researchers, and were affected by the quality of the relationship. As a result, comprehending the gay IPV phenomena required consideration of both couples' characteristics and individual experiences. Although there was evidence of a link between internalized homophobia and IPV, data indicated that it was not substantial. This finding may be explained by the fact that research participants had low degrees of internalized homophobia, since LGB individuals with high levels of internalized homophobia are unlikely to participate in any LGB study. Another reason may be that the individuals in the sample were all highly educated white folks[6].

Scholars examined a sample of gay and bisexual males and found that disclosure was positively linked to the likelihood of physical and psychological IPV. Such results may be attributable to the fact that being out gay meant you were more likely to be abused by your spouse for a longer length of time, but it could also mean you were in an abusive relationship for a shorter period of time. In terms of this final point, offenders may threaten to evict the victim in front of their family, employer, landlord, previous spouse, or current guardian of their children. The Concept of Consciousness the final internalized minority stressor examined in connection to IPV was stigma. According to researchers, stigma awareness increases the risk of IPV. IPV offenders and

victims both reported high levels of stigma awareness; therefore, it can be inferred that IPV increases stigma consciousness and is positively associated with the propensity to overlook abuse in order to shield IPV victims from the homophobic judicial system.

These findings are consistent with high stigma awareness rates among individuals who are likely to face prejudice and be compelled to avoid discriminatory settings. According to what we know, there is evidence of a link between minority stresses and SSIPV in the literature. Internalized stresses and IPV were shown to be highly linked, as previously stated. According to certain research, there is a link between prior discrimination and a greater likelihood of IPV. Studies on the connection between experienced prejudice and the likelihood of SSIPV victimization, on the other hand, are contradictory: some suggest a link, while others deny it. These results indicate that although the link between sexual orientation discrimination (based on other people's emotions and ideas) and IPV is not entirely apparent, there is a link between victimization and personal sentiments about one's own sexual orientation. It should be emphasized, however, that such considerations are based on cross-sectional research, making it impossible to establish whether a component emerged before, during, or after the incidence of IPV. This means that generalizing such results should be done with caution; instead, further study on predictors and related variables should be undertaken. Furthermore, clinicians should be aware that minority stressors are one of the most significant barriers to people who have experienced or are involved in IPV seeking help, as well as what can help them: heterosexism has been shown to exacerbate difficulties in reporting abuse to the police and accessing services for LGB people. IPV victims may be hesitant to seek legal help because they are afraid of prejudice or inadequate legal protection. According to the researchers, over 60% of lesbian women questioned chose not to leave their violent relationship due to a lack of resources, and the majority of the sample did not seek assistance at a women's shelter. Scholars point out that agencies and shelters were often unprepared to assist gay IPV victims.

The IPV Stigmatization Model was developed by researchers to explain why people are afraid to seek assistance. Three elements of the individual experience were outlined in the model: "stigma internalization," "expected stigma," and "culture stigma." Internalized negative attitudes about IPV, referred to as stigma internalization, and may affect people's help-seeking actions and psychological suffering. Surviving IPV may lead to feelings of guilt, humiliation, and self-blame, all of which can make it difficult to seek treatment for low self-efficacy. Anticipated stigma was concerned about whether others would respond with disdain or rejection toward the survivor if they learned about the IPV, influencing the choice to seek treatment[7].

1.2 Specific Treatments:

Researchers documented instances of creative initiatives created within LGB communities, even if study revealed significant gaps in current services. In comparison to heterosexual IPV protocols, they included new treatments that benefited both survivors and perpetrators. They provided batterer intervention programmes as well as advocacy programmes to assist LGB persons in navigating the judicial system. Furthermore, The Queer Asian Women's Shelter and Queer Asian and Pacific Islander Women promoted two approaches that focused on the specific needs of queer women in San Francisco: they attempted to better respond to IPV and address the complexities of being part of a small marginalized community like the LGB community, teaching how to ask service providers for help. A procedure for dealing with friends and family members of IPV victims was established by the Washington State Coalition against Domestic

Violence. According to the study, most victims of abuse sought assistance from friends and family before seeking services, providing them a key supportive role.

Services were sometimes linked to community-based efforts that included hosting seminars and forums to discuss healthy relationships. Lesbian victims seemed to enjoy talks on how to establish healthy relationships more than support groups for survivors, according to scholars. This may be owing to victims' worries about their privacy, which was safeguarded during discussions on a variety of issues related to violence. Instead of identifying who suffered violence and protecting participants' privacy, such a conversation may focus on other topics such as relationship expectations, negotiating differences, power dynamics, and warning indications of abuse. Another goal was to move from organizational interventions to community-based prevention in order to promote lesbian communities' health connections and offer knowledge and prevention. Rather of standardizing programmes, the various methods described aim to better adapt to local circumstances.

2. DISCUSSION

In the United States, a few research on therapy for LGB IPV victims were performed. Individualized mental health therapy has been shown in studies to help SSIPV sufferers. Because victims may fear consequences from the information provided during the session, couple therapy involving the victim and abuser has been shown to be less beneficial. Despite these results, research has shown that psychology graduate students and therapists are more likely to recommend couples therapy rather than individual counselling for LGB IPV victims than for victims of other genders. The person-centered approach and Gestalt therapy were suggested as two kinds of psychotherapy that would be suitable for SSIPV sufferers. These methods enabled victims to gain confidence in therapists over time, allowing them to become more conscious of their situation, the abuse they had experienced, and the repercussions that came with it. Furthermore, it urges therapists to allow victims to control the session, allowing them to learn how to successfully direct their life in this way. Researchers discovered that victims' knowledge of the abuse was considered to be longer-lasting due to the high desire to accept assistance. As a result of this reality, victims were able to acquire and utilize helpful resources in order to leave the abusive relationship and achieve independence from the spouse[8].

In the United States, it is not uncommon for abusers to complete psycho-educational programmes aimed at reducing the risk of future violence against partners. These programmes are referred to as "batterer intervention programmes", and they are based on two models: Cognitive Behavioral Therapy (CBT) is a kind of therapy that attempts to reduce aggressive tendencies and develop helpful tools for resolving relationship problems. The Duluth Model was developed to dismantle and eradicate patriarchal ideas in abusive males who were then taught to believe they had the right to dominate women[9].

The Duluth model, alone or in combination with CBT methods, was the most often utilized programme in the treatment of abusers, according to the researchers. Both methods ignore the unique characteristics of lesbian, gay, bisexual, and transgender relationships, as well as the role played by issues such as homophobia. Furthermore, the Duluth model, which is based on patriarchal ideology, was originally designed only for heterosexual couples; however, it was later applied to LGB perpetrators, despite the fact that in the United States, groups were frequently separated during treatment based on sexual orientation, even though the programmes were

largely the same for both groups. This feminist psycho-educational method focuses on re-education in order to foster more adaptable attitudes, improve communication skills, and eventually eliminate violent behaviors. To the best of our knowledge, no studies have been conducted to assess the impact of such therapy on the LGB community, and the few studies conducted on heterosexuals have shown very minor benefits. Scholars using a feminist framework to IPV believe that a one-size-fits-all treatment model for IPV offenders should be replaced with culturally appropriate and unique treatment choices for LGB abusers, according to the researchers. Treatment interventions, they believe, should address problems of sexism, homophobia, racism, and classism in order to address how society unfairly disadvantages some while favoring others[10]. In the North American Domestic Violence Intervention Program Survey, researchers examined 3,246 questionnaires submitted to directors of domestic violence perpetrator programmes in the United States and Canada. Because it is difficult for LGB individuals to freely express themselves in heterosexual groups, the findings show that the most frequent approach to LGB batterers is one-on-one treatment rather than group therapy. Two programmes were proposed for the LGB community.

Even though there is a dearth of literature on LGB IPV in general, there is a need for treatment-focused research. The findings indicated that a number of barriers hinder LGB individuals from seeking assistance in the event of IPV, the most significant of which is heterosexism. IPV sufferers may be hesitant to seek help out of fear of prejudice. Rarely was a solution given to assist LGB persons in obtaining IPV therapy, and writers advocated changes to conventional therapies or programmes. According to studies, many agencies and shelters are unprepared to help IPV gay and bisexual victims. Many emergency departments, shelters, organizations, and clinics in the United States had IPV advocacy programmes; nevertheless, most of these services had previously failed to properly react to abuse among LGB communities. The bulk of studies look solely at North American services and programmes in metropolitan regions, ignoring rural areas and foreign nations. When SSIPV treatment programmes were compared to conventional protocols, they were changed in terms of evaluating sexual identity, assisting SSIPV victims in accessing the legal system, and minimizing stigmatization. However, suggestions were included in the trials in order to concentrate on LGB-specific therapy. Despite the fact that many academics advocate for modified forms of IPV therapy, no empirical study has been done to see whether LGB individuals gain more from modified versions of treatment than conventional therapies.

It's also important to address a cultural and social context issue: the fact that we only identified papers on therapy in the North American setting suggests a paucity of study in this area in other countries; however, some studies may not have been included in international databases. According to the reviewed research, a psychological therapy tailored to particular LGB needs is needed, and it must be completed in order to ensure new usable resources and build self-determination. Intervention for LGB IPV victims and offenders should be part of a comprehensive treatment strategy that may include couples or individual therapy, but should always be tailored to each particular scenario. Appropriate training for mental health professionals, as well as established standards for evaluation and treatment, may result in more favorable results. Improvements should focus on the victims' well-being and happiness, as well as therapeutic characteristics such as the treatment's long-term consequences; furthermore, a new strategy may specify simpler access to services. IPV seems to be as frequent and severe in same-

gender relationships as it is in heterosexual couples, therefore rules and procedures should be updated to provide the same level of protection.

Due to the lack of specialized SSIPV programmes, it is critical that emerging IPV programmes provide outreach and educational services by collaborating with the community and offering a variety of services, starting with direct and physical resources like shelters, food and clothing, transportation, financial and legal assistance, 24-hour hotlines, and individual and group therapy. Although conventional battered women's shelters may serve as a model for LGB organizations, certain modifications should be made, such as more inclusive language and an emphasis on individual experiences rather than gender, which can help LGB persons feel more comfortable in reporting violence. Because IPV is still a relatively obscure problem in the LGB community, warning signals may be overlooked. As a result, education about IPV and how to identify its symptoms should be aimed particularly towards the LGB population.

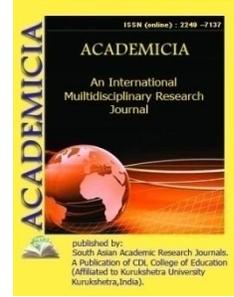

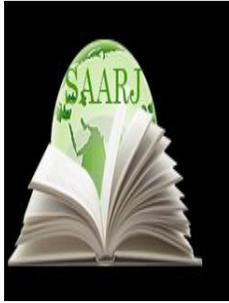

3. CONCLUSION

In comparison to heterosexual IPV, the literature on LGB IPV is new and sparse. However, there is a growing corpus of empirical research that provides significant findings and concerns about LGB IPV. Previous research focused on the incidence of IPV in the gay and bisexual community, as well as LGB-specific characteristics in IPV and treatment obstacles. There are limited articles on LGB IPV treatments and therapies. Counseling interventions, especially for victims, and therapy: couple, group, and perpetrator therapy are two categories. Despite the popular belief that IPV is exclusively a problem in heterosexual relationships, it has been shown that its prevalence among LGB couples is similar to, if not greater than, that of heterosexual couples. While there were some parallels between heterosexual and LGB IPV (such as general patterns, kinds, consequences, cycle of violence, and drug use), LGB IPV had distinct characteristics and dynamics that were involved in detecting and treating IPV in the community.

ABSTRACT

The trendiest term in the twenty-first century is big data, which is collected by flooding data from billions of devices. Big data is data that is produced in large quantities, at a fast pace, and in a variety of formats that are complicated (veracity), necessitating analytical processes and active data management in order to extract useful insights. Similarly, big data is seen as a game-changer capable of altering the way companies function in various organizations in order to gain a lasting competitive edge. This article provides an overview of big data technologies in higher education and explores how big data analytics may provide value to Higher Education Institutions and help them maintain a competitive edge. Given the rising importance of educational institutions as a source of income that boosts the economy, the education industry is working in an increasingly complicated and competitive environment.

KEYWORDS: *Big Data, Higher Education, Innovation, Learning, Teaching.*

1. INTRODUCTION

We are living in the information era, and big data has become an integral component of most of our daily lives. As a result of the everyday explosion of data, new integrated innovative technology demands have reached an all-time high. Many organizations, including science, healthcare, engineering, business, and eventually society at large, are attempting to change their organizations using big data in order to gain a competitive edge over their counterparts in the

same setting. The term "big data" isn't defined in any manner (an efficient way of applying big data). As a result, big data may be described as a collection of data that is so complicated and vast that processing and analyzing it using on-hand database management tools is difficult. The primary aim of big data is to manage, process, and analyze its properties. Volume, Velocity, Variety, Veracity, and Value (i.e., the unknown insights of data) are the 5 Vs of data-related aspects. As a consequence, by evaluating performance and establishing competitive advantages, big data capabilities may provide long-term value.

The idea of using big data analytics in higher education is to get a more evidence-based competitive edge in terms of new teaching-learning approaches. Despite the fact that big data analytics is still a relatively new use in higher education, the technology has the potential to improve and contribute to institutions. Education institutions may use big data analytics to address some of their problems, as they face growing pressure from both national and international economic, global competitive advantage, and social and political change. Universities contain a lot of information. Although these databases are plentiful and increasing, they are often underused. As a result, the higher education industry has access to a significant quantity of data that may be utilized to make effective decisions for better educational quality. Higher and professional education is a domain that must be evaluated and transformed on a regular basis to keep up with the fast pace of changing trends in various market sectors, which in turn creates a variety of workforce needs. Technology has had a significant impact on the way education is delivered. Mobile devices and apparatuses, teleconference and remote access systems, educational platforms and services, and other technologies that students, teachers, academic faculty, evaluation specialists, researchers, and decision-makers in education interact with and use in an effort to impact and improve teaching and learning but also to realistically impact and improve teaching and learning.

The connection with these technologies produces a significant quantity of data, which may vary from a single access log file to institutional activities. The educational systems are still not fully prepared to deal with and exploit them for the purposes of continuous quality improvement. Health professions education, also known as health education, is one of the most common settings in which these technologies are used, resulting in a wide range of educational data. Furthermore, health education must always reflect the increasing corpus of medical knowledge and evidence in order to effectively integrate it in education and educate future health professionals to address the problems that healthcare systems will face in the future. The need to govern these challenges in health education is now more important than ever, and as a result, different approaches such as big data and analytics that could be useful in investigating and exploiting educational data have received attention.

1.1 Big Data Analytics in Higher Education Institutions:

As a result of the everyday explosion of data, new integrated innovative technology demands have reached an all-time high. Big data has developed as a result of this. Many studies have been conducted on the application of big data in a variety of areas, including data availability, cost, applicability, importance, and security. Despite this, just a few articles discuss the integrated use of Big Data in higher education. Higher education institutions have access to a massive quantity of data from a variety of sources, all of which are regulated by various procedures. As a result, big data has the ability to harness institutional data, which may help the education sector's future, especially in decision-making. Big data analytics may be evaluated as a complete technological

IT source in educational institutions by evaluating a set of processes that will contribute to long-term competitive advantage. The analytics of big data architectural component may be utilized to convert data from many sources and formats into useful insights in higher education using big data analytics technologies.

Big data component architecture is made up of five levels. Data, data analytics, data aggregation, information exploration, and data governance are examples of these levels. The data layer covers the data sources required to offer insights that will enable repeated operational procedures. As a result, the data layer can assist any difficulties that institutions have in making better decisions. analytics: The analytics layer assists with the analysis and visualization of data in HEIs for the purpose of improving learning and the environment in which it occurs data aggregation: The data aggregation layer assists with the analysis and visualization of data in HEIs for the purpose of improving learning and the environment in which it occurs. The processes of data management arising from different sources of data, such as data from communication channels, sizes, and formats, are referred to as the data aggregation layer (unstructured and structured). As a result, the data aggregation layer attempts to analyze data from a wide range of sources.

However, one of the major challenges in implementing Big data technology is the variability of incoming data; the information exploration layer produces outputs such as real-time or near-real-time data by examining reports and visualizing them to derive meaningful insights; the data governance layer entails understanding data management, its lifecycle, and security; and the data governance layer entails understanding data management, its lifecycle, and security. The governance, standards, rules, tools, and procedures for data management are considered dominant data management. The process of managing data throughout its lifetime is known as data life-cycle management. Big data analytics offers innovativeness for data monitoring, auditing, and protection. Data security and privacy management is a concept in which big data analytics provides innovativeness for data monitoring, auditing, and protection.

As a result, each of the big data architectural components may be predicted to have the capacity of big data application inside educational institutions. As a result, the study aims to utilize the UTAUT model to grasp the anticipated capabilities of big data analytics to generate prolonged competitive advantage and business value, based on the complexity of big data analytics and sustained competitive advantage as stated by and. For example, big data may help maximize student learning success when some students are undecided about which main subject to take, leaving teachers wondering how to tailor learning pathways so that no student falls behind. Higher education is one of the areas where volume, diversity, and velocity coexist in data. In the higher educational environment, large quantities of educational data are collected and produced on a regular basis from many sources and in various forms. Educational data ranges from those generated by students' use of and interaction with learning management systems (LMSs) and platforms, to learning activities and course information, which includes learning objectives, syllabuses, learning material and activities, examination results, and course evaluation, as well as other types of data related to administrative, educational, and quality assurance.

The limited exploitation of large educational data, as well as the quantity and nature of these data in higher education, necessitates the use of specific methods to uncover new useful information that is presently buried inside data. Such methods may be developed and modified from other areas that are characterized by big data, and they can be effectively used to large educational

data. These methods may be utilized to generate insights "about student performance and learning approaches" and illustrate areas within large educational data that can be favorably affected, such as students' real performance according to taught curriculum. Big data and analytics, when used together, have recently showed potential in encouraging various activities in higher education. These actions pertain to "administrative decision-making and organizational resource allocation," "early identification of students at risk of failing," "development of effective instructional techniques," and "transforming the traditional view of the curriculum to reconsider it as a network of relations and connections between the various entities of data gathered and regularly produced from LMSs." The curriculum and its contents, as a significant component of large educational data, are one of the recognized areas in which big data and Analytics are properly relevant for inquiry and development in higher education.

1.2 Big Data Analysis Innovative Teaching-Learning:

Higher education institutions are now in the process of rethinking how they achieve their purpose in order to maintain a competitive edge. However, political and economic pressures have increased scrutiny of the quality of higher education institutions, particularly in terms of labor costs such as government funding and policy changes, access and continued growth of students, leadership changes, economic sustainable development, and updates of institutional policy are mostly the challenges the high education institutions face. Educational data analytics and mining may make previously ignored, invisible, and therefore inaccessible data apparent. The higher education industry, as may be observed, is rapidly expanding. The projection depicts how sustainability patterns are anticipated to change depending on different nation perspectives.

Most CEOs now identify data as a new digital innovation that is regarded as a need in the higher education system owing to the development and evolution of sustainable competitive advantage. The degree to which an organization integrates a concept while also producing a strategy that no existing or prospective competitors follow is referred to as competitive advantage[1]. Similarly, a company is considered to have a competitive advantage if no present rivals are adopting an innovation strategy at the same time and it has not yet been able to duplicate the advantages of the approach. As a result, when a company outperforms its rivals, it has a competitive advantage. Despite the fact that big data is still relatively new and little understood, it has the potential to provide organizations with much more development potential than conventional technology. Big data analytics integrative functions may utilize various statistical analyses and machine language to identify dangers, problems, and opportunities in the system, which can offer economic value for higher education. As a result, education may become more dynamic and less expensive, learning methods can be enhanced, and operations can be provided [2]. As a result, educational achievement may be improved. The compatibility of big data technology with sustainability, especially in the phase of multidimensional environment, intelligent distribution of sources, integrated practices, and expertise priorities, may be disputed.

1.3 Advantages Of Big Data In Education :

- *It assists you in finding solutions to difficult problems:*The greatest approach to brainstorm answers to the difficult problems confronting the education sector is to evaluate your current data. The more you understand about your past, the more you can learn from it.If you work in higher education, for example, you may see a drop in enrolment. You can use big data to get

the context cues you need to figure out where, when, and how your enrollments are changing[3].

- *It is easily accessible:* It's inconvenient and time-consuming to search through a wall-to-wall arrangement of file cabinets. It's much simpler to locate what you're searching for since big data depends on a technical infrastructure to collect, store, and manage information. Institutional silos, in addition to infrastructure, may make it difficult to exchange information. Leadership may have access to data that instructors do not, which may create obstacles to learning and development. With the proper tools and data analytics, you can create a more collaborative workplace. Because all of the data is in one place, all you need is internet connection to locate what you're looking for. You don't even need to install a program or plug-in since many software products are accessible via browsers like Google Chrome and Safari[4].
- *It may help you save money:* In higher education, proper resource allocation is critical, and your data is the key to efficiency. For one thing, your data may provide information about various class sections' enrollment figures. If just two of the five sections of ENG 102 are full, the remaining three may be merged to save resources such as classroom space, instructor time, and energy usage[5]. From an infrastructure standpoint, cloud-based solutions have the ability to reduce data storage costs while also relieving strain on your IT staff. Manual sorting and transcribing of data has historically been needed, which is time intensive and may take weeks, if not months. It may also take a long time to generate customized reports on a regular basis. Your workers' time might be better spent on more productive activities[6]. An analytics software will automate most of this time-consuming labor, and the convenience of digital data makes data access fast and simple, saving you money in the long term. Efforts to attract students for higher education are another cost-cutting advantage. Your data may reveal you which potential students are more likely to succeed at your institution, as well as who are more likely to drop out or fail, by looking at previous school performance. This may assist you in developing more effective acceptance procedures that optimize the return on investment for each student[7].
- *It is Fast:* This was briefly stated under the cost-cutting advantage, but it needs repeating. You'll save a lot of time sifting through data to locate one specific report or piece of information on a certain kid now that all of your school's information is in one place. Big data is also accessible in real time, allowing you to make faster choices than ever before. This is especially useful during enrollment times, when instructors are keeping track of statistics in order to plan for the next semester. Year-Over-Year Enrollment reports may be automated to assist you see how enrollments are doing in comparison to the same time last year[6]. Then you may make choices on the spot to enhance or maintain the consistency of your enrollments.
- *It assists you in adapting:* You may create new courses, instructional techniques, and other ways to offer students what they need and desire by detecting patterns. Take, for example, community colleges. Because these institutions are mostly inhabited by adults who are juggling job, families, and education, a flexible timetable is one of their top priorities when choosing a school. Many of these adult students now find that online courses are even more convenient than late-night or weekend sessions, thanks to the growth of online learning. Big

data will reveal the exact statistics behind this since online learning is better suited for some kinds of courses such as those that do not need a lab or hands-on learning. Perhaps on-campus biology class enrollments have remained stable while on-campus English course enrollments have decreased[8]. You may modify your course offers appropriately to guarantee that your students always have the greatest choices.

1.4 Analysis Of Data Mining In Education:

Data mining methods are gaining traction in the education industry, and the results of these approaches may offer essential decision-making assistance. Data mining in education is referred to as an example, educational data mining (EDM). EDM is a new genre. Data mining is a field that focuses on using data mining tools and techniques to solve problems. Methods for analyzing data in the field of education This section contains a list of for EDM, a literature review or survey articles are required. It emphasizes their most important achievements A review of current literature contains a review or survey article. This is a review of shows twenty years of e-learning data mining research[9]. From a pedagogical standpoint, surroundings are important. The creators discovered and categorized problems that need to be researched in order to be solved Performances by student learners.

Another review of the literature focuses on EDM and learning analytics in higher education and was released in 2019. This study's findings are based on a review of the literature. four major areas were covered: Computer-assisted instruction (CSLA) and the use of DM methods to obtain information that may be used depending on student engagement in the LMS (2) Predictive analytics with the help of computers (CSPA), as well as the usage of EDM and LA to predict student performance[10]. Assessment-based performance and retention in courses. In a learning activity, engagement and subject knowledge are important; (3) The use of computer-assisted behavioral analytics (CSBA) to detect student behavioral trends and use DM methods When it comes to engaging in online learning activities, I have a few preferences. and (4) visualization analytics with the aid of a computer (CSVA) as well as a mix of data visualization methods Data mining and knowledge representation have progressed as a result of these advancements. to provide a visual representation of student behavior in relation to the educational activity

2. DISCUSSION

The application of Big Data and Open Data in Education will be examined in this research. Also, how much data can be utilized and extracted to make something valuable, assisting the business in increasing revenues. As a result, defining Big Data and Open Data clarifies how these two technologies are categorized. Following that, it is critical to discuss the objectives and purposes of Big Data in education, as well as the value and impacts of Big Data in education. We investigate how Big Data's value potential has changed in recent years and what the future holds. Finally, we will examine the educational advantages of Big Data and Open Data, as well as a short explanation of how these technologies may contribute to a world-class educational system. In the field of education, assisting instructors and students in making more focused decisions. Big Data has the potential to significantly enhance education. May afford to create a contemporary, dynamic educational system from which every single student can benefit to the fullest extent possible. Furthermore, instructors now have important tools that they did not have previously, allowing them to make more precise choices and pick from a wide range of innovative learning techniques. As a result, Big Data is actively engaged in changing the way

sectors, including education, operate. Traditional problems will no longer exist in the new age of data, but excellent techniques will be maintained. New learning methods will be added to the school system, making it more efficient and focused. However, the journey into this new age has only just begun, and there are many challenges ahead, including a scarcity of skilled people in the fields of Big Data and Data analytics. Furthermore, instructors and academics must be trained and engaged in these new technologies, and students must embrace and utilize them.

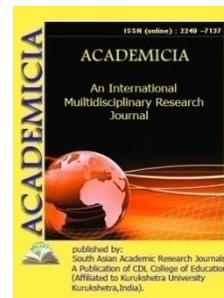

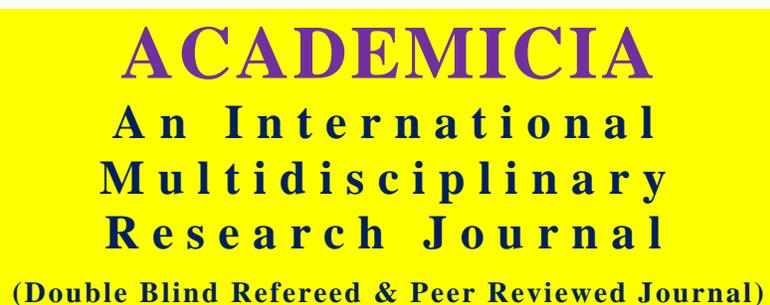

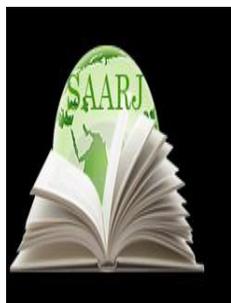

3. CONCLUSION

The explosion of data has given rise to big data, which is used to analyze large amounts of data from a number of sources. Its capabilities may be very beneficial to higher education institutions. Higher education institutions must investigate the long-term implications of using big data analytics, which may help institutions expand their teaching-learning focus. Executives could suggest that administrators and educators assist the system and gain value from practical applications, such as creating a culture of data use for educational decision making, being keen with data users by asking critical questions about market deals and suggesting the most beneficial uses and features, involving IT departments in data collection and application planning, and starting with the most basic uses and features. As a consequence, institutions may save money by integrating educational abilities and making better decisions. This framework aims to improve the development of innovative teaching-learning orientations for educational institution performance as an insightful contribution to curriculum design for instructors and learners in education in particular, as well as the education sector's overall competitive advantage.

ABSTRACT

The article shows the conditions and the possibility of amperometric titration of palladium (II) ions with solutions of diethylamino-4-methyl-hexine -2-ol-4 (DEMGO) in non-aqueous media (acetic acid, n-propanol, DMF, DMSO) and their mixtures with background electrolytes having different acid-base properties. Methods of amperometric titration of micrograms of amounts of palladium (II) ions in the presence of foreign ions containing foreign ions are proposed

KEYWORDS: *Palladium, Diethylamino-4-Methyl-Hexin-2-Ol-4, Solution, Acetic Acid, Npropanol, DMF, DMSO, Background Electrolytes.*

INTRODUCTION

Amperometric titration of metal ions in non-aqueous and mixed media with various complexants will expand their analytical capabilities and simplify the solution of many complex analytical problems. First of all, this is due to the fact that the nature of the solvent strongly affects the strength of the resulting complex, moreover, it is not the same for different cations, which determines the selectivity and rapidity of the method. In addition, the methods of non-aqueous compleximetry successfully solve the problem of accurate and selective determination of metals in objects of organic origin, as well as directly in extracts obtained during concentration.

We tried to find the optimal conditions for amperometric titration of a number of noble metals with solutions of diethylamino-4-methyl-hexin-2-ol-4 (DEMGO) in non-aqueous protolytic media, on background electrolytes of different acid-base properties.

Reagents and equipment

The initial 0.002 M solutions of Na_2PdCl_4 , K_2PtCl_6 , AuCl_3 and AgNO_3 , as well as a 0.01 M DEMGO solution, were prepared by dissolving the corresponding weighed portions of these reagents in acetic acid (n-propanol, DMF, and DMSO). The concentration of noble metals was determined amperometrically using a 0.01 M potassium iodide solution [1]. Amperometric titration was carried out on a setup with two platinum wire electrodes rotating (1000 rpm) on a common axis. The design of electrodes, piston automatic microburettes and apparatus are described in detail in [2].

Amperometric titration was carried out on a setup with two rotating (1000 rpm) electrodes on a platinum wire on a common axis. The design of electrodes, piston automatic microburettes and equipment are described in detail in [3].

In accordance with the voltammetric behavior of DEMGO and other products participating in electrochemical media, amperometric titration of noble metal ions must be carried out at a polarization voltage of 0.75-1.15 V, depending on the nature and concentration of the background electrolyte (acetates, nitrates, chlorides, alkali metal perchlorates and ammonium) [4]. In this case, the indicator current should arise beyond the equivalence point (i.e.) due to the oxidation of the free reagent and the reduction of the dissolved oxygen in the air.

The experimental data showed that in the studied media and backgrounds 0.15-0.40 M solutions of noble metal ions with DEMGO solutions are titrated quite well and quickly, and the shape of the curve coincides with the expected one with some constant current at the beginning of titration with a subsequent sharp transition (break) at the end point of titration (CTT).

Determination of ions and platinum (IV) in individual solutions.

It was found that when titrating ions of the following noble metals, the corresponding molar ratio Me: reagent is: Pd: reagent 1: 2 and Pt: reagent 1: 4, the titrated solution acquires a reddish-brown color. When passing from acetate backgrounds to perchlorate ones, containing a certain amount of perchloric acid, the shape of the titration curve of noble metal ions deteriorates significantly, which ultimately leads to a decrease in the reproducibility and accuracy of the results. This is explained by an increase in the acidity of the analyzed medium during the transition from acetates to perchlorates [5]. Some of the data obtained are shown in the table.

TABLE RESULTS OF AMPEROMETRIC TITRATION OF VARIOUS AMOUNTS OF PLATINUM (IV) IONS WITH A DEMGO SOLUTION IN DMSO AGAINST A BACKGROUND OF 0.20 M LITHIUM PERCHLORATE

Mixture composition,%	Found Me, μg ($P=0,95; x \pm \Delta X$)	N	S	S_r
Pd 15,44	15,423 \pm 0,16	3	0,061	0,004
Pd 30,88	30,854 \pm 0,12	4	0,052	0,002
Pd 61,75	61,782 \pm 0,18	3	0,033	0,001
Pd 123,50	123,494 \pm 0,20	4	0,102	0,001
Pd 247,00	246.951 \pm 0,41	4	0,213	0,001
Pd 493,10	493,793 \pm 0,52	3	0,624	0,001

The results of the determination of various concentrations of noble metal ions with a DEMGO solution in 10.0 ml of the test solution under optimal conditions testify to the good accuracy of the developed technique. The effect of additives to acetic acid, n-propanol, DMF, DMSO, such as chloroform, tetrachloromethane, benzene, toluene, hexane, methyl ethyl ketone, dioxane, etc. as in the titration of noble metal ions in their individual solutions, with the only difference that the content of protolytic solvent in the analyzed sample was controlled in strict accordance with the volume of the added inert solvent. Due to the decrease in the solubility of the background electrolyte under these conditions to values less than 0.2 M under the influence of large additions of an inert solvent, the background concentration (from 40-50 vol.% Of an inert solvent) must be continuously reduced close to values of the order of 0.05 M. Addition of any of the above solvents in the amount of 10-20 vol.% (depending on the nature of the solvent) practically does not interfere with the shape of the titration curve becomes less steeply inclined to the axis of the volumes. For the same reason, at solvent contents above 50-60 vol.%, The reproducibility and accuracy of determinations of noble metal ions deteriorate.

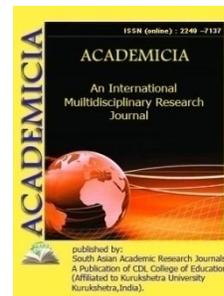

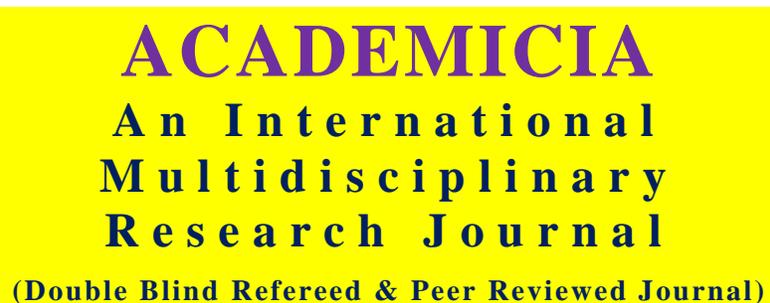

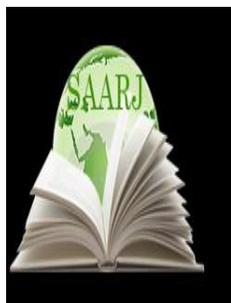

The revealed nature of the influence of inert solvents on the form of the titration curve is explained by the mode of a decrease in the electrical conductivity of the titrated solution at a high content of an inert solvent in the protolytic medium, which leads to a significant and continuously increasing ohmic voltage drop in the analyzed solution with an increase in the indicator current.

Consequently, amperometric methods for the determination of platinum (IV) ions with a DEMGO solution are distinguished by high selectivity and reproducibility with a relative standard deviation not exceeding 0.133.

ABSTRACT

The study of the development of creative abilities requires the identification of the conditions under which this process takes place, i.e. the developing environment. Some aspects of this problem have been studied. However, the opportunities for creative development of students included in modern programs are not fully used by primary school teachers.

KEYWORDS: *Primary School Teachers, Modern Programs, Some Aspects Of This Problem, Conditions Under Which This Process*

INTRODUCTION

Young school age is a period of rapid development of the child's psychological development, all mental functions, the formation of complex activities, the formation of the foundations of creative abilities, motives and needs, ethical norms, self-esteem, voluntary regulation of behavior is an important stage. Creativity is a complex mental process related to a person's character, interests, and abilities. Imagination is the focus of his attention. A new product that a person receives in his work can be objectively new (a socially significant discovery) and subjectively new (a discovery for himself). The development of the creative process, in turn, enriches the imagination, expands the child's knowledge, experience and interests. Creative activity develops children's emotions, contributes to a more acceptable and intensive development of higher mental functions such as memory, thinking, perception, attention. The second, in turn, determines a child's academic success. Creative activity develops a child's personality, helping him or her to master moral and ethical norms. In creating a work of creativity, the child reflects in them his understanding of his life values, personal qualities. Primary school age children love

to engage in the arts. They sing and dance passionately, sculpt and draw, write fairy tales, and engage in folk crafts. Creativity enriches and delights a child's life. Children can be creative, regardless of their personal complexes. Often adults who criticize his creative abilities are ashamed to show them off. Each child has unique characteristics that can be recognized early.

The study of the development of creative abilities requires the identification of the conditions under which this process takes place, i.e. the developing environment. Some aspects of this problem have been studied. However, the opportunities for creative development of students included in modern programs are not fully used by primary school teachers.

The aim is to theoretically substantiate and define the pedagogical conditions for the development of creative abilities in the process of labor education.

Functions:

1. Theoretical analysis of the problem of developing creative abilities in students.
2. Emphasize the developmental characteristics of creative abilities in primary school students.

Implement the selection of content and methods for the development of creative abilities of primary school students in labor education classes

Develop a system of creative tasks as a means of developing creative skills in labor lessons in primary school students.

The object of study is the development of creative skills in primary school students.

The topic is the pedagogical conditions for the development of creative abilities in young students in the process of labor training.

Research methods:

Tracking

Conversation,

Free conversations

Games to develop creative skills

The analysis of the problem of developing creative abilities is determined by the content included in this concept. Often in the everyday mind, creative ability is defined by different types of artistic activities, beautiful drawing, writing poetry, writing music. However, the creative abilities to be disclosed, their structure and characteristic features, determine the consideration of the concepts of 'creativity' and 'ability'.

To date, there are different approaches to the definition of creativity in the philosophical, psychological, pedagogical literature. The main difficulty is primarily related to the lack of a direct operational, psychological content of this concept; it can only explain the use of the definition of creativity so far by creating its product - a new one. Philosophers define creativity as a necessary condition for the development of matter, the formation of new forms of it, the emergence of many forms of creation. The Philosophical Encyclopedia describes creativity as follows: "Creativity is an activity that never before attracts new things."

From the point of view of psychology and pedagogy, it is especially important to study the creative work itself, the process of preparation for creativity, to identify forms, methods and means of developing creativity. Creativity is purposeful, determined, intense work. It requires mental activity, intellectual abilities, willpower, emotional qualities, and high performance.

L.S. Vygotsky argues that the highest expression of creativity still exists in a few selected geniuses of humanity, but in the daily life that surrounds us, creativity is a necessary condition for existence. Some of the out-of-the-ordinary and new lies must also come from the human creative process.

The phenomenology of creativity can be divided into three main types that correspond to the types of creativity:

Stimulus-effective - activity can be effective, but this activity is determined by the action of certain external stimuli each time.

Heuristic - the activity is creative in nature. A person with a reliable solution method will continue to analyze the structure and structure of their activities, comparing individual tasks with each other, which will lead him to find new original, more rational solutions from the outside. Every legitimacy found is experienced as a new "own" way of discovering, creative finding, solving tasks;

Creative - The empirical regularity found independently is not used as a solution, but works as a new problem. The patterns found were proven by analyzing their original genetic basis. Here the action of the person becomes generative in nature and gradually loses the form of response: its result is broader than the original goal. Thus, creativity begins in the narrow sense of the word, not just the answer, but the solution of the task at hand. At the same time, it remains both a decision and an answer, but at the same time there is something "outside" it, and that defines his creative state.

The phenomenology of creativity can be divided into three main types that correspond to the types of creativity:

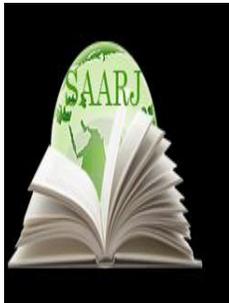

Stimulus-effective - activity can be effective, but this activity is determined by the action of certain external stimuli each time.

Heuristic - the activity is creative in nature. A person with a reliable solution method will continue to analyze the structure and structure of their activities, comparing individual tasks with each other, which will lead him to find new original, more rational solutions from the outside. AN ANALYSIS OF PLANT TISSUE CULTURE

Dr Ashok Kumar*

*Sanskriti University, Mathura,
 Uttar Pradesh, INDIA
 Email id: dean.soa@sanskriti.edu.in

ABSTRACT

Forestry, Agriculture, horticulture and plant breeding have all made extensive use of plant tissue culture. It's a kind of applied biotechnology that's utilized for things like plant mass propagation, viral eradication, secondary metabolite synthesis, and in-vitro cloning. Plant tissue culture has recently been utilized for short and medium term conservation, also known as slow growth, and cryopreservation, also known as long term conservation, of endangered plant species. These techniques had been effectively employed to preserve plant species with refractory seeds or dormant seeds, and they outperformed traditional conservation approaches. Plant tissue cultures are a useful tool for studying cell wall production in live cells. Tissue cultures also offer cells and culture media, which may be readily separated to isolate enzymes and cell wall polymers for future research. Tissue cultures with treachery element differentiation or extracellular lignin production have yielded valuable data on a variety of xylem and lignin-related topics. This paper also discusses several aspects of Plant Tissue Culture.

KEYWORDS: Agriculture, Conservation, Cytokinin, Plant, Tissue Culture.

1. INTRODUCTION

Natural resource conservation refers to humanity's judicious use of the planet's resources. Conservation is defined as the preservation of genetic, biological, and ecological variety in their natural abundance. Conservation is the exchange of current gratification for later gratification. As the world's human population reaches eight billion, concerns concerning the pace of extinction of other species on our planet are increasing. Humans are the direct or indirect cause of the majority of contemporary extinctions, according to compelling evidence. Residential and commercial development, overexploitation through fishing, hunting, or gathering, disruption by people during work and leisure activities, pollution, and the introduction of alien species are the main threats to these species[1].

Ex-situ and in-situ conservation are the two primary strategies for preserving biodiversity. Ex-situ conservation is the process of protecting or preserving an endangered plant or animal outside of its natural habitat, either by removing the entire population or a portion of it from the threatened habitat and relocating it to a new environment, which could be a wild area or a human-controlled environment. Biological Gardens, Seed banks, Gene banks, Germplasm banks, and In-vitro storage are examples of ex-situ conservation methods. In-situ conservation, on the other hand, is concerned with the protection and preservation of species in their native environment, in areas where they normally exist. The whole ecosystem is preserved and maintained using this approach, ensuring the conservation of all known and undiscovered component species. Strict nature reserve (SNR), Games Reserve, and National Park are the most common in-situ conservation techniques. Large wild regions have vanished as a consequence of natural catastrophes, pests, diseases, and threats from shifting government policies and urban expansion, making in-situ conservation almost difficult. Ex-situ conservation is extremely difficult to carry out due to the following issues: an adequate sample must be taken for the conservation of genetic diversity, land space is extremely important, particularly in the case of very large forest trees, whereas land availability is drastically reduced, labor costs and trained personnel are extremely difficult to come by[2].

1.1 Plant tissue culture:

Plant tissue culture is a cutting-edge technique for propagating and conserving plant species. Plant tissue culture methods have recently gained industrial significance in the areas of plant propagation, disease eradication, plant enhancement, and secondary metabolite synthesis, in addition to its use as a research tool. Explants are little bits of tissue that may be used to grow hundreds of thousands of plants in a continuous process. Under regulated circumstances, a single explant may be reproduced into thousands of plants in a very short time and space, regardless of the season or weather, on a year-round basis[3].

Plant tissue culture is the in vitro aseptic cultivation of cells, tissues, organs, or entire plants under regulated nutritional and environmental conditions to generate plant clones. The clones that arise are true to type for the genotype that was chosen. The regulated circumstances offer a favorable environment for the culture's development and multiplication. These conditions include sufficient food supply, a pH medium, an appropriate temperature, and a suitable gaseous and liquid environment. For large-scale plant multiplication, plant tissue culture technique is extensively utilized. Plant tissue culture methods have been more important in the fields of plant propagation, disease eradication, plant improvement, and secondary metabolite synthesis in recent years, in addition to its usage as a research tool[4].

Plant tissue culture media includes all of the nutrients necessary for normal plant growth and development. In the case of solid medium, it is mostly comprised of macronutrients, micronutrients, vitamins, other organic components, plant growth regulators, carbon source, and certain gelling agents. Murashige and Skoog media (MS medium) is the most widely used medium for in vitro vegetative growth of numerous plant species. The pH of the medium is also significant, since it influences both plant development and the action of plant growth regulators. It's been tweaked to a range of 5.4 to 5.8. Culturing may be done in both solid and liquid media. The composition of the medium, especially the plant hormones and nitrogen supply, has a significant impact on the first explant's reaction. Plant growth regulators (PGRs) are crucial in regulating how plant cells and tissues develop in culture media. Plant growth regulators such as

auxins, cytokinins, and gibberellins are the most frequently utilized. The hormones employed, as well as their kind and dosage, are largely determined by the plant species, the tissue or organ cultivated, and the experiment's goal. In plant tissue culture, auxins and cytokinins are the most often utilized plant growth regulators, and the quantity of each determines the kind of culture that is created or regenerated. A high concentration of auxins encourages the development of roots, while a high concentration of cytokinins favors the regeneration of shoots[5].

1.2 Somatic embryogenesis:

Somatic embryogenesis is an in vitro plant regeneration technique that is extensively utilized as a biotechnological tool for long-term clonal replication. It is the transformation of somatic cells or tissues into differentiated embryos. Somatic embryos may grow into full plants without going through the sexual fertilization process that zygotic embryos go through. Somatic embryogenesis may begin directly from explants or indirectly via the formation of a mass of disorganized cells known as a callus. Plant regeneration through somatic embryogenesis is accomplished by inducing embryogenic cultures from zygotic seeds, leaves, or stem segments, and multiplying the embryos. After that, mature embryos are cultivated for germination and plantlet development before being transplanted to soil[6].

Many plants, including trees and ornamental plants from many families, have been shown to have somatic embryogenesis. Some cactus species have been reported to exhibit this behavior. The generation and development of somatic embryos in cultured cells is influenced by a number of variables. When the tissues were grown in liquid medium, a very effective procedure for somatic embryogenesis on grapevine was discovered, which resulted in greater plant regeneration. In the regeneration and proliferation of somatic embryos, plant growth regulators play a critical role. Culturing nodal stem segments of rose hybrids on medium enriched with different PGRs alone or in combination resulted in the highest efficiency of embryonic callus. When cultured on abscisic acid (ABA) alone, this embryonic callus exhibited a high germination rate of somatic embryos. Somatic embryogenesis is considered as a useful tool for genetic modification as well as a method for regenerating plants for mass multiplication. The method may also be used to create plants that are resistant to a variety of stressors and to introduce genes through genetic transformation. A successful procedure for the regeneration of cotton cultivars resistant to Fusarium and Verticillium wilts has been established[7].

1.3 Organogenesis:

Organogenesis is the process of producing plant organs such as roots, shoots, and leaves, which may come directly from the meristem or indirectly from undifferentiated cell masses (callus). Plant regeneration through organogenesis includes changing the concentration of plant growth hormones in the nutritional medium to induce callus formation and organ differentiation of adventitious meristems. Skoog and Muller (Skoog and Miller, 1957) were the first to show that a high cytokinin to auxin ratio promoted shoot development in tobacco callus, whereas a high auxin to cytokinin ratio caused root regeneration[8].

1.4 Slow growth of cultured plants:

Slow growth is typically accomplished by lowering the culture temperature, adding osmotic agents and growth inhibitors to the culture medium, or eliminating growth promoters to decrease the material's cellular metabolism, with the goal of extending the time between subcultures.

Osmotic regulators, such as sucrose and mannitol, serve as growth inhibitors by putting the material under conservation under osmotic stress. When these carbohydrates are introduced to the culture medium, they lower the hydric potential and limit the amount of water available to the explants. Growth regulators, in addition to temperature and osmotic regulators, are often employed for in vitro germplasm conservation, with abscisic acid (ABA) being one of the most commonly used[9].

1.5 Cryopreservation of cultured plants:

Cryopreservation is a technique of storing plant genetic resources at very low temperatures, such as liquid nitrogen (LN; -196 °C). It's a technique of preserving plant genetic resources that's both safe and cost-effective. It is critical to prevent intracellular freezing and promote the vitrification state of plant cells during chilling in LN for effective cryopreservation. Furthermore, the cryopreservation technique should be a straightforward protocol that anybody can follow. Cryopreservation methods have been studied utilizing various plant organs, tissues, and cells since the 1970s. As a consequence, several cryopreservation techniques have been developed (for example, slow-prefreezing method, vitrification method, dehydration method).

1.6 In-situ conservation:

On-site conservation or conservation of genetic resources in natural populations of plant or animal species, such as forest genetic resources in natural populations of tree species, is known as in-situ conservation. In-situ conservation, according to Wikipedia, following technique are included:

1.6.1 Biosphere reserves:

Reserves of the biosphere Biosphere reserves cover vast swaths of land, often exceeding 5000 km². For a long time, they have been used to protect species.

1.6.2 National parks:

A national park is a protected area dedicated to the preservation of wildlife and the environment. It is usually a small reserve with a surface area of 100 to 500 square kilometers. One or more national parks may exist within biosphere reserves.

1.6.3 Wildlife sanctuaries:

A wildlife sanctuary is a protected area dedicated solely to animal conservation.

1.6.4 Biodiversity hotspots:

A region must meet two strict criteria, according to Conservation International, to qualify as a hotspot:

- It must have at least 1,500 endemic vascular plant species (or 0.5 percent of the world's total).
- It must have lost at least 70% of its original habitat.

1.7 Gene sanctuary:

Plants are preserved in a gene sanctuary. Biosphere reserves and national parks are also included.

1.8 Community reserves:

Community reserves are a kind of protected area established by the Wildlife Protection Amendment Act of 2002 to give legal backing to community or privately held reserves that are not classified as national parks or wildlife refuges.

1.9 Sacred groves:

Sacred groves are areas of woodland that have been set aside for the veneration and preservation of all the trees and animals that live there.

1.10 Ex situ conservation:

Ex situ conservation means "off-site conservation" . It refers to the process of preserving an endangered plant or animal species, variation, or breed outside of its native environment. For Ex situ conservation, the following technique is used:

1.10.1 Field gene banks:

It is a grouping of several plant species and their genetic diversity in a certain region. The plant components are kept safe and may be used for breeding, reintroduction, research, and other reasons. Long-lived perennials, trees, and shrubs may benefit from this approach. Field gene banks are often found in botanical gardens. Some endangered flora may be found in these gardens as well.

1.10.2 Seed banks:

For sexually reproducing seeds in long-term storage, seed banks are the most efficient and successful technique of ex situ conservation. It is a useful and compact storage technique, but it is reliant on a reliable power source, careful monitoring and testing of seed viability, and regeneration in instances when viability falls below a specific threshold. There are several seed banks throughout the globe that specialize in the nature of their collections, geographical region, taxonomic groupings, wild plants, forestry trees, and other topics.

1.11 In vitro storage:

In vitro storage refers to the preservation of germplasm in test tubes using meristem tissues. These techniques are well adapted to the long-term preservation of propagules of species that would otherwise be impossible to keep in seed banks.

1.12 Uses and values of Plants biodiversity:

Plants produce a wide range of goods, including food, medicines, and raw materials. Plant extracts are used in the production of glue, soaps, cosmetics, dyes, lubricants, and polishes, among other things. The plants are also a valuable source of renewable energy. Plant species are used for the following purposes:

1.12.1 Food plants:

Providing food for humans, domesticated and wild animals, and other creatures is one of the most basic benefits of plant biodiversity. Only approximately 3000 of the estimated 250,000 species of flowering plants on the planet are considered food sources, and only 200 of them have been domesticated. Newly domesticated plant kinds and primitive cultivars evolved from their wild parents in traditional agro-ecosystems. Occasional crossings between the crops and their wild cousins continued to occur, increasing genetic variety for future selection and development.

Without the exchange of genes between wild relatives and cultivated crops, many cultivated species may not have survived domestication.

1.12.2 Crop genetic resources:

Characters of crops and wild relatives that are genetically transmitted, such as fast growth and large yields, food quality, and stress (biotic and abiotic) tolerance in relation to environmental adaptations, have potential value for hybridization and breeding a desired kind of plant. In our crop development programmes, the differences exhibited by ancient land races are very important. Genetic erosion, or the loss of genetic variety, is a significant problem in terms of ensuring long-term global food security.

1.12.3 Medicinal plants:

Man has depended on medicinal plants for health and nutritional requirements since the beginning of time. Traditional applications of medicinal plants for treating and preventing diseases, as well as promoting physical and spiritual well-being in humans, have become more important. Herbal medicines are used all around the globe. Because of their gentle characteristics and minimal side effects, medicinal herbs are increasingly being used to alleviate and cure a variety of human illnesses throughout the globe. According to a World Health Organization study, approximately 70-80 percent of the world's population uses non-conventional medicine, mostly herbal sources, for basic health care. This study discovered that medicinal plants and trace elements have a significant role in illness therapy.

1.12.4 Environmental value:

Biological resources contribute to society's welfare and stability in an indirect way. Environmental functions assist economic activity by recycling essential components such as carbon, oxygen, and nitrogen, as well as serving as a buffer against extreme changes in weather, climate, and other natural phenomena beyond human control. The biological processes slow down as natural habitat diminishes. The abundance of biodiversity aids in the long-term viability/stability of life, as well as risk avoidance. As a result, ecologists and nature conservationists are acutely aware of the need of total biodiversity protection for long-term viability. Rangeland biodiversity variations under different types of use, from hay harvest protection to in situ grazing, offer clues to reversing the degradation process and bringing in the rehabilitation and stability of rangelands productive systems.

2. LITERATURE REVIEW

Oseni O et al. discussed Plant Tissue Culture in which they explained how Agriculture, horticulture, forestry, and plant breeding have all benefited from plant tissue culture. It's a kind of applied biotechnology that's utilised for things like bulk propagation, viral eradication, secondary metabolite synthesis, and plant in-vitro cloning. Plant tissue culture has recently been utilised for short and medium term conservation, also known as slow growth, and cryopreservation, also known as long term conservation, of endangered plant species. These techniques had been effectively employed to preserve plant species with refractory seeds or dormant seeds, and they outperformed traditional conservation approaches[10].

Sharma Get al. discussed General Techniques of Plant Tissue Culture in which they explained how Plant tissue culture is an important part of the plant biotechnology process. It also allows for

the widespread multiplication of elites as well as the reproduction and regeneration of new plants from genetically modified cells. The promising plant that results from this process may be easily replicated in aseptic cultures[3].

Singh C discussed Problems and it's Remedy in Plant Tissue Culture in which he explained how Plant tissue culture is the most effective way to reproduce rare, endangered, and essential plant species on a wide scale while also protecting them. Focusing on the protection of rare, endangered medicinal and economically significant plant species is critical. However, the success rate of propagation using this technique is low, especially for a few therapeutic plants. Researchers are also having difficulty propagating plant tissues and acclimating in vitro grown plants to their natural environment. There are many causes for these issues. This review addressed all of the challenges, from laboratory setup to field adaption of tissue grown plants, as well as solutions to all of the problems encountered in this method[2].

3. DISCUSSION

Many kinds of academic research, as well as many practical areas of plant science, require the use of plant tissue culture methods. Academic studies of totipotency and the functions of hormones in cytodifferentiation and organogenesis have hitherto relied on plant tissue culture methods. Currently, genetically modified tissue-cultured plants offer knowledge into plant molecular biology and gene control. Plant tissue culture methods are also important in cutting-edge fields of applied plant science, such as agriculture and plant biotechnology. Select plants, for example, may be cloned and grown as suspended cells, from which plant components can be extracted. Tissue culture techniques are also needed in the creation of somatic haploid embryos from which homozygous plants may be produced, as well as the management of genetically modified cells to make transgenic entire plants. Tissue culture methods have therefore been and continue to be popular in both academic and practical plant research. This paper also discusses several aspects of Plant Tissue Culture.

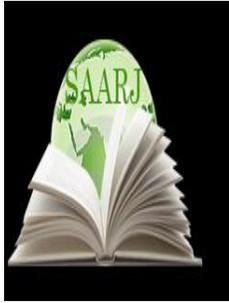

4. CONCLUSION

Plant tissue culture refers to the aseptic and regulated growth and multiplication of plant cells, tissues, and organs on specified solid or liquid medium. Micro propagation, in which fast proliferation is accomplished from in system cuts, axillary buds, and to a lesser degree from somatic embryos, cell clumps in suspension cultures, and bioreactors, is the most common commercial technique. The use of plant tissue in the protection of vulnerable and rare plant species aided in natural resource conservation and protection against natural catastrophes that may result in the extinction of the species, reducing biodiversity and harming the ecosystem. Tissue culturing is a critical component of applied biotechnology. The world's population will continue to grow in the next decades, requiring additional housing space and agricultural areas. Global climate change is also a factor to consider. Keeping this in mind, we must guarantee a peaceful, healthy, and hunger-free future for our children and grandchildren. There is no alternative to plant tissue culture for this.

SPOUSE OR PARTNER CONFLICT IN SAME-SEX GUY MARRIAGE

Ms. Shiwangi*

*SMAC Sanskriti University, Mathura,
 Uttar Pradesh, INDIA

Email id: shiwangi.sobas@sanskriti.edu.in

ABSTRACT

Violence is a poorly understood phenomena in homosexual interactions. While there is an increasing number of literatures on violence in women of the same sex, few published research explores violence in men of the same sex .Despite evidence of a high frequency of violence in Males same-sex relationships, very little known about the nature of this violence. The nature of male same-sex interpersonal violence was examined in this research. In an interview on their intimate relationships, 69 homosexual and bisexual males were picked at random from a community sample and told about at least one violent incident. The recorded interviews were used to classify the men's accounts of the most serious event in their most recent violent relationship. Intimate violence patterns ranged from moderate to severe, including unidirectional and bidirectional violent scenarios. In the overwhelming majority of instances, violence was an outburst of an ongoing dispute that included bidirectional emotional abuse and became more expressive than instrumental. Conflict resolution difficulties and attachment concerns seemed to explain violence more than the desire to dominate one's spouse.

KEYWORDS: *Homosexual, Intimate, Reciprocity, Same-Sex Relationships, Violence.*

1. INTRODUCTION

The limited research available indicate that violence is reported in 21-5% of homosexual males, which is similar to rates found in lesbian and heterosexual pairs. In one research, for example, which estimated the prevalence rates of violence in male homosexual interactions using a randomly chosen sample, 41% of males reported receiving violence from romantic partners; 35% reported committing romanticized violence against romantic partners. Sadly, despite the seeming frequency of interpersonal violence in homosexual male relationships, there is little information

about homosexual violence patterns. Theoretical discussion on the origins of intimate violence in male homosexual partnerships and therapeutic attempts to support the afflicted may be erroneous without a more comprehensive understanding. This research examined the overall nature of homosexual intimate violence against men. Several scholars have suggested that the view that acts of violence and who initiated a physical confrontation are inadequate and potentially deceptive, without addressing contextual variables. We studied the pattern of violence, the surroundings, the ensuing repercussions, the underlying reasons and recurring subjects in violent interactions in order to better understand the nature of physical and emotional aggressiveness in men's same sex encounters[1].

1.1 Intimate Molestation:

Researchers describe physical violence as "actions performed with the purpose or purpose perceived to cause bodily suffering or injuries to someone else." Whereas physics is relatively simple to describe and recognize, it is harder to quantify and measure emotional and psychological aggressiveness. Despite this difficulty, it is essential to include psychological aggressiveness. Studies of physical violence in same-sex couples found emotional abuse at rates greater than physical abuse by the majority of the participants. For example, researchers found that 83 percent of homosexuals in their samples suffered emotional abuse and 95 percent of their samples of lesbians and gays recognized verbally abusive techniques. Moreover, a qualitative research of homosexual men's experiences of intra-mate violence showed that both physical and psychological hostility were part of participants' definitions of domestic abuse. Physical and emotional violence in male homosexual relationships were investigated in this research[2].

1.2 Violence Reciprocity:

Victims and perpetrators of violence are referred to throughout the literature on domestic violence. The prior results, however, do not show this obvious difference between victim and perpetrator. Rather, interpersonal violence frequently seems to be bidirectional. Researchers have shown that prior violence is the greatest predictor of violence in heterosexual relationships between men and women. In addition, 2/3 of the women reported both being victims of violence and being aggressors in an earlier lesbian relationship. Strong correlations between partner accounts of same-sex aggression also provide indications of reciprocity. Finally, homosexual males were frequently referred to as both victim and offender in a qualitative research, making it difficult to classify them as victims or perpetrators.

Although numerous results show reciprocal violence in heterosexual and homosexual interactions, many studies have not addressed reciprocity, possibly because researchers have assumed that the role of victims and perpetrators is different. Iceland claims, for example, that mutual homosexual male intimate violence is not shared aggression; instead, a partner is a main aggressor continuously. Whilst they argue that homosexuals may respond violently to hostile actions against them, they are against the mutual fighting label. Island findings are based on their experience dealing with abused gay men and therefore inadequate generalizations in relations of violence from clinical samples to the entire community of homosexual men. This research will look at the direction of violence among homosexual male relationships in order to answer this issue.

1.3 Motives:

Research suggests that the form of interpersonal violence is not determined by the actual conduct, but rather by the reasons behind such behaviour. Violence used for self-defense or retribution is, in particular, fundamentally distinct from violence intended to dominate or retain authority over another. In line with this point of view, scholars argue that the desire to dominate a partner decides who the offender is rather than just who starts the violence. Researchers believe that the purpose for controlling the partner affects the form of the violence and offers a typology based on reciprocity and motivation differences. Common Couple Violence (CCV) defines the partnerships in which one or both spouses were aggressive, violent and controlling. This violence is usually modest and rare and occurs during a few of fights. Patriarchal Terrorism defines the interactions between a partner and his or her spouse in order to control and dominate.

This violence is unidirectional, persistent and often harsh and severe with the offender and the victim. Researchers suggest that CCV is frequently reported in surveys of domestic violence, whereas patriarchal terrorism is usually recorded in clinical samples. He also argues that the desire of males to control women stems from patriarchal terrorism. On the other hand, when both parties are aggressive and troll, mutual violence happens and violent resistance depicts links, when both partners are violent, but only one controls. In the latter group, women are suggested to resist violence and try to regulate violence by themselves. Although Johnson explains the origins of violence in the patriarchal dominance of males over women, this typology may apply to same-sex relationships only when definitions are taken into consideration and not the theoretical reasons.

Speculation about motivations falls along gender lines in most of family violence literature. As Johnson's typology reflects, men's violence is usually considered to be instrumental in nature and aims to gain dominance over women. A study of the relationships between high-school students showed that although both men and women reported the most wrath as the cause of violence, males were more likely than women to describe using violence to gain control over their partners. Researchers indicate that aggression by women against males may have comparable coercive or instrumental motivations to violence by men against women. Based on a sample of pairs in treatment, researchers discovered that although men's violence was more likely than women to be considered to be partly instrumental in nature, the violence of both men and women has frequently been driven by a mix of instrumental and expressive purposes. Given that motivating factors may explain the dynamics of intimate violence, and that violence against men and women may serve many purposes, the reasons behind the intimate violence of homosexual males need study.

1.4 Context:

Violent events may provide important information about the nature of violence. Researchers found that interpersonal violence is an out-of-conflict growth for around half of their pairs in treatment. These results contrast sharply with the notion that domestic violence is an unforeseen occurrence. In addition, the degree of tension in relationships is closely linked to both data violence and dating violence. We thus evaluated whether the alleged violence stemmed from an escalation of dispute.

1.5 Consequences:

The inability to link acts of physical violence to the repercussions of these actions is a recurrent critique of family violence studies. Since a slap varies from a lighthearted touch to an open blow with the entire weight of the offender, the resultant damage provides more information than just describing the act. Scholars argue that batterers differ from victims in choosing to hurt. The psychological effect of interpersonal violence may also vary significantly depending on the nature of the act of aggression. For example, when accompanied with a death threat, a slap is more frightening. We thus investigated the physical and mental repercussions of a certain incidence of violence to enable a comprehensive knowledge of interpersonal violence.

1.6 This Study:

The purpose of this research was to give an overview of interpersonal violence in homosexual ships. In a certain incident and throughout the partnership, we analyzed the direction of both emotional and physical violence. We also examined the reasons behind the violent conduct, if the continuing dispute was escalating and whether the violent event had the psychological and physical effects. As little is known about violence in homosexual ships among men, we also looked at themes and patterns in the accounts of their violent relationships by participants.

This research has been intended to enhance our capacity in homosexual relationships to reflect violence. We investigated homosexual intimate violence in a semi-structured interview style that provided flexibility and responsiveness needed to explore and comprehend the reactions of the participants. Our research focuses on the most serious violent incident in recent violent relations. These authors indicate that discussion of the worst incident of interpersonal violence is the most accurate reminder, since unpleasant experiences generate deeper cognitive treatment. Although concentrating on one particular incident provides more comprehensive information on the context and effects of violence, it is possible that a particular event does not represent the overall pattern of violence in connection. Violence was thus also studied inside the relationship as a whole.

The few prior research on violence among homosexual males focused on convenience samples such as news media reporters and community contacts. Consequently, the results of these research cannot be generalized to the broader homosexual and bisexual population. In contrast, participants in this research were selected via a random selection of participants in the West End Relationships Project (WERP).

2. LITERATURE REVIEW

The description of their relationship dynamics by participants was compared to the typology of violent partnerships by Johnson. 47 of the 69 relations explain the grouping of common couple violence (CCV), in which one or both members of a marriage are violent but neither controls (68 percent). CCV appeared to be an invasion group, since neither offenders nor beneficiaries tended to characterize violence or their interactions in terms of control. As previously stated, studies on motivational variables show that violence is driven not by utilitarian or control goals but by expressive purposes. Violence in the CCV group varied considerably and connections did not seem to be as consistent as possible. In the CCV group, for example, there were between 1 and over 40 violent events and the degree of violence varied from no injuries to serious injuries. Of the 47 CCV-classified partnerships, 20 had unidirectional violence and 27 had bidirectional violence. Furthermore, just 25 featured one violent event, often characterized as "one-time explosion." These participants considered violence to be an isolated occurrence that is typically

the consequence of frustrated communication and inadequate dispute resolution. One participant said, "I've experienced a violent moment when my rage was out of control, but this isn't a matter when this pattern is frequent"[3].

Domestic violence is often indicated by a desire to dominate one's spouse. But for just 6 of the 69 interactions, the idea of control and dominance seemed essential. In terms of Johnson's typology, only two ties were characterized with the category of patriarchal terrorism, including relations with one violent and dominant partner (3 percent). Both included fairly serious violence, as evidenced by injuries, although violence did not occur often in either relationship. Three relations characterized violent resistance, partnerships where both parties are aggressive but only one control (4 percent). The frequency of violent events varied from 1 to more than 20 among this group, with reports of moderate to severe bodily injuries. The description of reciprocal violence is one relationship: there was regular aggression by both spouses and both parties appeared to control or dominate conduct[4].

Several difficulties were identified with the application of Johnson's typology to this sample. First, there was significant diversity within the typology groups. Additionally, 16 participants' descriptions (23%) of their relationships cannot be categorized using the typology of Johnson. Six of these instances characterized the main beneficiary of violence as controlling. One participant for example characterized the emotional instigation of violent episodes as part of an overall pattern of manipulation and control of his spouse. Control-based groups provided minimal discrimination. There were only six links among the three groups including a controlling violent spouse, equal to the number of connections involving a controlling victim of violence[5].

A subject that became apparent in 36% (n 25) of participants' tales was that a demand/withdrawal interaction occurred in the dispute that was physical or typical of the communication style of the connection. This dynamic shows a pattern of engagement in which one party retires, while the other is requesting or demanding and engaged in interaction more openly. Those with a demanding job want closer relationships and may be more engaged, whereas retired people seek less intimacy and more detachment and thus seem to be less emotionally committed. The first offender was in the demanding position and the receiver was in the retirement role in 18 encounters. For instance, a participant was "weary to be emotionally ignored and pushed away" during a conversation by his withdrawing partner, so he attempted to have his partner listen, keeping him at one place. Another participant, who moved to another room to avoid confrontation, was pursued by and strangled by his companion. The men in the demanding position usually felt that their efforts to communicate and satisfy their emotional needs were hindered by the lack of availability of their partners[6].

The other seven males, who described the interaction between request and withdrawal, said that the receiver was the victim of the first violent act and that the offender was in the retreat. For instance, after his spouse retired to another room, a participant claimed to knock down a door and repeatedly asked, "What are you doing? Why are you not going to speak to me?" His companion shouted loudly, "Get away!" and responded aggressively at last. Another guy attempted to go when his companion remarked, "Oh yes, just like your dad did, desert me." This guy stated, "I believe it occurred because I felt completely trapped," regarding his aggressive acts. In these instances, retreating offenders were commonplace because they had "pushed button," were stuck and became violent when their efforts to get out of the conflict scenario

failed. Thus these guys characterized their aggression as caused by emotional maltreatment, or as a response when they felt that there was no alternative course of action. In these circumstances, the demanding victims often reported continuous efforts to communicate and unceasingly pursue their spouses during conflict. For instance, a participant said, "I [emotionally] pushed him. I wanted him to react. I wanted him to answer. I kept coming to him." I continued coming to him[7].

90 males (28 percent) characterized the relationship being one in which a partner is more emotionally involved than his partner and the more engaged spouse tends to be the starter of violence. For example, a guy who behaved aggressively was irritated and furious by his partner's reluctance to engage and would not spend as much time with him as he wanted. Several guys have stated that their spouses desire an open and thus less committed relationship while they seek a one-off connection[8]. Another frequent topic identified in 14 (20%) of the interviews was infidelity. Several violent instances happened when one partner met the other in a sexual encounter. Others described fighting over unfaithfulness when the argument escalated into physical violence. For these male same-sex partnerships, negotiation of a mutually pleasant relationship structure that specifies the degree of monogamy or openness was particularly essential[9]. The last topic was that violence happened frequently for the first time when the relationship ended. Sixteen men (23 percent) have reported violence after it became apparent that the relationship had taken its course during the disintegration or soon after the disintegration, when the men still had a certain level of connection. For instance, many males justified the start of physical violence by their partners because of their displeasure at the participants' efforts to leave the relationship[10].

3. DISCUSSION

The findings paint a picture of violence among male same-sex relationships in general. The majority of males said that violence in their relationships happened rarely, with 44 percent saying it happened just once. The physical and mental repercussions of the violence were, for the most part, minor. A significant minority of individuals, on the other hand, reported serious and regular violence. In all of the violent events, physical violence co-occurred with emotional abuse, and as reports of emotional abuse rose, so did the degree of physical and emotional damage. We wonder whether physical and emotional abuse should be regarded different entities, despite the fact that they entail distinct actions. Emotionally abusive methods may have an effect on the impact of physical aggression; for example, threats of bodily damage to oneself or others can cause receivers to worry for their physical safety regardless of whether actual violence is used.

In majority of the relationships reported, there was significant evidence of some degree of reciprocity of violence. Both members of the marriage behaved violently in a high percentage of violent episodes and throughout the relationship as a whole. In several of the cases, the males seemed to be committing about equal amounts of violence, while others were committing similar amounts of violence in distinct instances of unidirectional aggression. Emotional abuse reciprocity was particularly high, with reciprocal emotional abuse being reported in nearly every violent event. These results support experts' observations that aggressive couples often seem to mentally and physically attack one another, ultimately confining their disputes to violence-prone paths. As the participants' interpersonal disputes became more emotional and physical, their capacity to resolve them constructively appeared to deteriorate. It should be emphasized,

however, that a significant minority of individuals reported instances and relationships in which the abuse was mainly unidirectional.

Anger and dissatisfaction were often cited as motivators for participants' aggression. The idea that violence is used to create and retain power and control over a relationship is contradicted by these results. Participants who committed violence, on the other hand, often reported a loss of control in their relationships, as well as rage and dissatisfaction about the present state of their relationships. When we looked into these relationships further, we discovered that the overwhelming majority of them did not have a dominating spouse. Furthermore, there were just as many peaceful controlling partners as there were violent controlling partners. Our inability to apply the concept of control exemplifies the difficulty of characterizing violent relationships using broad generalizations. Because the nature of same-sex intimate violence may vary greatly, many elements of the violence and the relationship must be assessed in order to properly represent the various types of intimate violence. When we tried to put the tales of participants into a tightly defined typology, we discovered that the stories within each category varied significantly, and that 23% of the stories did not fit into any of the groups. Given these challenges, we came to the conclusion that no one relationship type could properly explain intimate violence in our sample. We discovered that documenting the various kinds of interpersonal violence by taking into account numerous continuous factors and analyzing patterns of relationship dynamics was more helpful.

We were able to represent the variety of violence we saw by using continuous variables such as emotional and physical repercussions, the number of episodes, and the degree to which the violence fulfilled instrumental and expressive purposes. We discovered underlying patterns by detecting motifs in participants' tales, which may assist to understand why disagreement develops into violence in certain relationships. Unmet or threatened emotional demands were the most common themes in participants' stories: conflicting requirements for intimacy vs autonomy, disappointed wishes for commitment and monogamy, and relationship loss. As a result, attachment theory may be a helpful lens through which to examine these results. Relationship violence, according to experts, may be an adult version of protest behavior—a maladaptive attempt to retain connection to a loved one when a relationship is endangered. Relationship violence has been repeatedly linked to attachment, especially the underpinning component of fear about desertion. Intimate violence was shown to be more probable when a person who was anxious about abandonment was paired with someone who avoided intimacy, a pattern that was comparable to the demand–withdrawal dynamic observed in our group. The authors' notion that violence may be employed as a pursuing or distancing strategy is consistent with our results that violence was committed by both demanding and withdrawing partners. Attachment anxiety and attachment protest actions may be triggered by being aware of a spouse's infidelity, seeing one's partner as less emotionally engaged, or being threatened with the loss of a relationship.

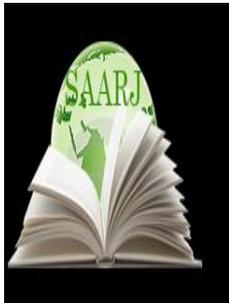

4. CONCLUSION

Finally, the homosexual and bisexual males in our sample reported a wide range of interpersonal violent encounters as well as responses to violence. The bulk of the reported violence was minor and rare, but there were some instances of serious violence. Violence was most common during interpersonal conflict, and participants often spoke about it in terms of endangered emotional needs. Furthermore, the majority of violence was expressive, and negative conflict strategies including shouting, criticism, and retreat were used in almost every violent event. As a result,

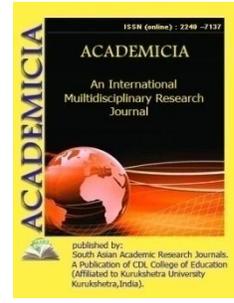

therapeutic and research efforts should be focused on understanding the conflict that leads to violence. The development of constructive communication skills that enable both the expressing and fulfilment of emotional demands should be given special emphasis. Our results also show how abusive interaction habits emerge in the setting of a relationship.

ABSTRACT

A total of 2,100 head of cattle of livestock farms in the regions of the Republic of Karakalpakstan and the Samarkand region revealed 167 heads of 7.9% of cows with hoof pathology, of which 38 animals had circular hoof phlegmon and this accounted for 22.7% of this total hoof pathology, in 54 heads (32.3%), hoof phlegmon was detected and a maximum of 75 heads (45%) of the animals had primary and clinical manifestations of the lamellar layer of the hooves, and in all animals with the processes of hoof pathology, the hoof part of one foot is injured, the hooves swell during phlegmonous processes, there is a strong pain, animals at rest keep injured legs slightly bent, severe lameness is observed when walking.

KEYWORDS: *Phlegmon Of The Hoof Circumference, Soft Phlegmon Of The Hoof, Lamellar Layer Of The Hoof, Capsular Phlegmon, Regeneration, Erosion And Deformation Of The Hooves, Tendonitis And Tendavaginitis, Pododermatitis, Phlegmon, Panaritium, Deformity Of The Hooves, Purulent Inflammation Of The Hoof Joints.*

INTRODUCTION

It is noted that the main cause of a number of diseases arises as a result of keeping, feeding, caring for and using new species of animals at the disposal of the newly created livestock farms of the country. In addition, in recent years, the disturbance of the ecological balance in our region, the deterioration of the composition of soil, water and plants also leads to the emergence of various diseases, including diseases of the fingers.

In recent years, many highly productive heifers from European countries have been brought to our country and distributed to farms specializing in animal husbandry. It should be noted that in order to provide healthy care for imported pedigree livestock, to obtain high-quality and environmentally friendly dairy and meat products from them, livestock premises must comply with zoological standards, have pastures and access zones must comply with veterinary and sanitary requirements.

The Holstein-Friesian breed is a large number of highly productive heifers imported from abroad. Almost in all regions of the country, feed complexes have been built for them without special screeds. These cows have a high milk yield and increase milk yield. Diseases of the distal part of the foot, i.e. the toes, have become a serious problem for many farmers and limited liability companies. Therefore, the prevalence of this pathology, the study of its etiopathogenesis is one of the urgent problems.

Foot diseases account for 20% of all non-communicable diseases of dairy cows on dairy farms [1].

In LLC "The Red Star" in the Ulyanovsk region of the Russian Federation, the incidence of cow fingers was 23.8%, and the highest incidence of animal diseases was recorded from April to June [4,5,6].

Improper flooring in lactating cows can lead to leg injuries, tendinitis and tendavaginitis, pododermatitis, phlegmon, panaritium, hoof deformities, purulent inflammation of the hoof joints and other diseases [2,3].

On farms, especially on livestock farms of cattle, purulent inflammation of the ankle joints is common among animals, which causes great economic damage to farms. For example, the frequency of purulent arthritis in cows is 6%, with a milk yield of 50%, and in fattening cattle - an increase in body weight by 20-30 kg per head and a decrease in the growth rate by 28-30% [7, 9].

The process of adaptation of imported cows to the conditions of our region is difficult, especially in winter and spring, when the complexes have high humidity, lack of pastures, poor conditions on pastures, lack of macro- and microelements in the diet and untimely clipping of hooves leads to the development of various diseases of fingers and hooves. A study of the hooves of sick cows showed that softening of the cornea was especially pronounced on the hind limbs: 84% of infected animals had injuries to the hind limbs and 16% had injuries to the front limbs [8].

Place, object and research methods. The cows of the "Panayiv Farmis" farms of the Republic of Karakalpakstan and "Pure milk", "Siab Shavkat Orzu" and "Tolkin Shizhoati" in the Akdarya district of the Samarkand region underwent clinical examination. At the same time, mainly dairy cows were examined using general and special methods. In clinical studies, the body temperature

of animals, the number of breaths and heart rate per minute, general condition, the location of the pathological lesion and the mechanism of the disease were studied.

The results obtained and their analysis. As a result of scientific research and experiments to determine the etiopathogenesis of suppurative inflammation of the distal part of the foot in livestock farms in the country, it has been established that the factors causing purulent inflammation of the hoof are different, that is, the mechanical factors arising in the hoof. For example, when the body is weakened, especially in winter, some physiological impressions, body secretions can also cause inflammation. Another factor causing the development of purulent inflammation in the distal part of the hooves of cattle was the ingress of microorganisms into the interstitial gland through the wound as a result of the action of various mechanical factors leading to the development of purulent inflammation, as a result of which the development of purulent pathological processes in the hoof area was revealed.

Studies have shown that the deeper the hoof injuries, the more severe the complications. In particular, the gassipol toxin in nutrients obtained during the processing of cotton, which is added to their diet in winter, is a substance that disrupts metabolic processes in the body and causes a toxic-allergic state, which leads to a decrease in immunobiological properties.

Studying the etiopathogenesis of purulent inflammation of the distal parts of the toes in cattle, among cattle present in livestock farms in our country, they are more common in pathology of the distal foot in the hoof, round leg and wrist joints. Due to the peculiarities of pedigree cattle hooves in our country, the development of modern methods of treatment and prevention of purulent inflammation of the hooves is of great scientific and practical importance.

When a surgical clinical examination of 2,100 cows was carried out at the "Panayiv Farmis" dispensary of the Republic of Karakalpakstan and "Pure milk", "Siab Shavkat Orzu" and "Tolkin Shizhoati" in the Akdarya district of the Samarkand region, 7.9% of cows have 167 heads in their hooves identified phlegmon around the circumference of the hooves, soft hoof phlegmon and diseases of the hoof laminae.

During a clinical examination of 200 animals from "Panayiv Farmis" farms in the Republic of Karakalpakstan, 14 heads (7%) were diagnosed with hoof pathology, including 3 heads (21.4%) of cows with hoof phlegmon, 4 heads (28.6 %) of animals the hoof is soft phlegmon and in 7 heads (50%) of cows hoofed laminitis was noted. Clinical examination of 1100 animals from the "Pure milk" farms in Akdarya district of Samarkand region revealed hoof pathology in 82 heads (7.5%), including 21 heads (25.6%) of cows with hoof phlegmon, in 27 heads (32.9%) animals were diagnosed with soft hoof phlegmon, 34 heads (41.5%) cows had hoof laminitis.

During the medical examination of 800 animals from the farm "Siyob Shavkat Orzu" of Akdarya district of Samarkand region, 64 (8%) were diagnosed with hoof pathology, including 14 heads (21.9%) of cows with hoof phlegmon, 20 heads (31, 2%) animals showed soft hoof phlegmon and 30 heads (46.9%) cows had hoof laminitis.

Clinical examination of 76 animals from 7 farms (9.2%) of the "Tolkin Shizhoati" livestock farm in Akdarya district of Samarkand region revealed hoof pathology in 7 heads (9.2%), including 3 heads (42.8%) of animals hoof phlegmon and in 4 heads (57.2%) of cows hoof laminitis.

It was noted that when inspections were carried out throughout the year, they were mainly observed during the winter and spring months. The main reason for this is the high humidity in the places where animals are kept and the lack of certain minerals and vitamins in the diet.

When a surgical clinical examination of 2,100 cows was carried out at the "Panayiv Farmis" dispensary of the Republic of Karakalpakstan and "Pure milk", "Siab Shavkat Orzu" and "Tolkin Shizhoati" in the Akdarya district of the Samarkand region, 7.9% of cows have 167 heads in their hooves identified phlegmon around the circumference of the hooves, soft hoof phlegmon and diseases of the hoof laminate. Of these, 38 heads of animals were diagnosed with circular phlegmon of the hooves, which accounted for 22.7% of the general pathology of the hooves, soft phlegmon of hooves was recorded in 54 heads (32.3%) of animals, and a maximum of 75 heads (45%) of animals were diagnosed with laminitis. hoofs, it was initially noted that there are clearly visible processes.

In animals with hoof pathologies, general weakness, increased body temperature, an increase in the contour of the hoof, contraction of cutaneous diverticula of the hoof, and severe pain on movement are manifested. Redness and local increase in temperature were noted on palpation of the injured hoof, limitation of hoof movement. The animal carefully steps on the ground with an injured hoof. The area around the hoof was swollen and reddened, with open wounds in some parts. A cyanotic purulent exudate flows from the puncture site of the wound.

TABLE 1 THE INCIDENCE OF PURULENT DISEASES OF COW HOOVES IN LIVESTOCK FARMS

s/n	The name of a farm specializing in animal husbandry.	Number of heads of reared cows on the farm	Sick animals		Phlegmon of the hoof circle		Phlegmon of soft hoof		Hoof laminitis	
			number	%	number	%	number	%	number	%
1	Livestock farm "Pure milk" in Akdarya region	1100	82	7,5	21	25,6	27	32,9	34	41,5
2	Livestock farm "Panayiv Farmis" of the Republic of Karakalpakstan.	200	14	7	3	21,4	4	28,6	7	50
3	Livestock farm "Siab Shavkat Orzu" in Akdarya region	800	64	8	14	21,9	20	31,2	30	46,9
4	Livestock farm "Tolkin Shizhoati" in Akdarya region	76	7	9,2	-	-	3	42,8	4	57,2
5	Total:	2100	167	7,9	38	22,7	54	32,3	75	45

In all animals that underwent the processes of phlegmon of the circumference of the hooves and soft hooves, the hoof part of one foot was injured, and the hooves that underwent phlegmon were swollen and severely painful. When the animal is at rest, the hoof rests on a slightly bent injured leg. When walking, severe lameness is observed, animals throw their injured legs to the ground, and the support is limp.

In animals, weakness, an average increase in body temperature of 0.5-1.0, the injured hoof is enlarged relative to the opposite foot and the loss of skin elasticity, as a result of the accumulation of pus in the hoof, it increases and contracts, the bulges of the hooves are difficult to feel, the arms are thickened, elasticity is passive movement of the lowered, injured hooves are limited and there is severe pain when the hoof is moved along the ground.

With soft hoof phlegmon, the size of the hoof increases and the inflammatory swelling spreads from the hoof capsule to the joint. The hoof span widened and hoof asymmetry was observed. The injured area is hot, tense and very painful to palpation. The animals' body temperature increased and their general condition worsened, and a strong limp appeared when moving. Some animals have discharge from the roundness of the hooves and soft hooves, and a bluish pus is secreted.

CONCLUSIONS

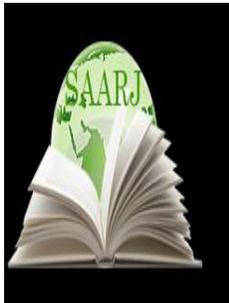

1. As a result of inspections, it was found that a total of 2,100 cows belonging to livestock farms in the regions of the Republic of Karakalpakstan and Samarkand region were infected with hoof pathology during surgical examination of 167 heads of 7.9% of cows, of which 38 animals had phlegmon hooves and this amounted to 22.7% from the general pathology of the hooves, 54 heads (32.3%) of the animals underwent soft phlegmon of the hooves and a maximum of 75 heads (45%) of the animals underwent processes in which the initial and clinical manifestations of layered hoof laminitis were evident.

2. In all animals with hoof girth and soft processes of hoof phlegmon, hooves of one foot are injured, hooves with phlegmon processes are edematous, severe pain is observed, when standing, animals hold injured legs with slightly bent legs, severe lameness is observed when walking.

ABSTRACT

In this article, we look at some of the concerns surrounding the scientific and practical use of monographies in the history of natural geography. The monograph's author divided the work into two halves, recognizing that natural geographical knowledge served as the foundation for general geography prior to the shift of natural geography to independent development. The scientific effort of the ancient Greek scholars Eratosthenes, Strabo, and Ptolemy resulted in the creation of geography as a separate science. There was a six-century era of decline in science following Ptolemy's geographical work. In order to get an idea of the integrity of an object, it must be examined comprehensively and in different ways. If the object of natural geography can meet the concept of a system, the science that studies it must also have a systemic structure.

INTRODUCTION

Associate professor of Bukhara State University H.R. Toshov staged an exhibition "Natural geography": History and certain theoretical concerns" (Bukhara. - " Durdona "publishing house. 2021. - p.520) on the eve of the Republic of Uzbekistan's 30th anniversary of independence festivities. Professor S.B. Abbasov and Doctor of Geographical Sciences M.T. Mirakmalov, Sh.S.Zokirov - editor, doctor of geographical sciences, prof. S.B. Abbasov and doctor of geographical sciences M.T. Mirakmalov were assessed by one of the foremost experts in the field of natural geography. There are 340 titles of used literature in the monograph.

The author's textbooks and monographs "Landscape" (2015, 2016), "History of Geography" (2015, 2018), co-authored with Sh.S.Zokirov in 2015 and 2018[1;2], can be considered a natural continuation of those works.

We felt compelled to comment on the value of the monograph in tackling complicated challenges facing our discipline after analyzing the substance of the monograph, namely the history of natural geography and some of its theoretical issues.

At the beginning of the pamphlet, well-known scientists in the field of geography X.R. Toshov, K.K. Markov, A.G. Isachenko, and N.K. Mukitanov stated that there has been extensive historical material in geography for centuries, but it has not yet been logically (theoretically) analyzed, and Professor A.N. Nigmatov stated that the development of history as an independent science and its introduction as a subject of study.

In the prologue, the author also claimed that his major goal was to shed light on the history of natural geography's birth and growth as a science, as well as to voice his views on various theoretical concerns in the field.

The monograph's author divided the work into two halves, recognizing that natural geographical knowledge served as the foundation for general geography prior to the shift of natural geography to independent development. It begins with a look at the history of general geography. G.R. Toshov focused on the history of the establishment and evolution of natural geography, as well as some theoretical concerns associated to it, primarily of methodological importance, in the second section. [4].

He taught research methods and practical aspects of natural geography as a separate topic. The author supplements the monograph's content with a number of works on scientists who have actively engaged in the modern state of geography, particularly natural geography, by contributing their ideas, thoughts, and opinions to the formulation of theoretical difficulties.

The monograph's first section is organized into 16 major themes and is titled "From the History of the Emergence and Development of Natural Geography as a Science." The second section, titled "History of Natural Geography and Some Theoretical Issues," is broken down into 26 major and minor sections.

We felt it was crucial to acknowledge the author's important implications for the history of science in the monograph's conclusion section.

1. The scientific effort of the ancient Greek scholars Eratosthenes, Strabo, and Ptolemy resulted in the creation of geography as a separate science. There was a six-century era of decline in science following Ptolemy's geographical work. In the Middle East, known as the Arab Caliphate, a renaissance of the sciences occurred in the mid-13th century.

2. Geography began to develop alongside mathematics, astronomy, history, and philosophy. Its apex occurred at the same time as the East's Cultural-Enlightenment Renaissance (IX-XII centuries). Our experts respect Central Asian scientists' strong engagement and leadership in the growth of science, particularly geography, throughout this time period. Here arose paths based on the process of description, but not found in ancient Greek science, such as "al-masolik and mamolik," "travelogue" (sayokhatnoma), and "lexicography." The global maps were produced in a circular shape, which is typical of Eastern geography.

3. Only in the 15th century, when Ptolemy's and Strabo's geographical writings were published in Latin, did Western European intellectuals' geographical ideas become scientific. Great geographical discoveries, on the other hand, expanded Europeans' understanding of the world. The earth's spherical shape was also established.

4. The work "General Geography" (Vareny, 1650), published in the middle of the seventeenth century, signaled the start of a new period in the history of geography. Geography was regarded as natural geography in this play. Later, in the early half of the nineteenth century, A. Khumboldt shared this viewpoint.

5. A. Khumboldt's groundbreaking insights also served as the foundation for the development of a new scientific type of natural geography. V.V. Dokuchaev advanced his innovative concepts about the "integrity of the universe," "the interplay of live and inanimate nature," and "natural zones" in the last quarter of the nineteenth century, bringing them to a new level. As a result, a new natural product, soil, was discovered. Soil science is a new field of study.

6. V. V. Dokuchaev's works developed the idea that "a new science is being formed that studies the constant and legitimate relationships and interactions that occur between the components of nature". Notions of the natural-geographical complex and landscape were formed and developed.

7. The concept of the Earth's outer crust was also added to the concepts that emerged in the first two decades of the twentieth century. The theory of natural geography began to take shape. In its development great merits are given by famous Russian geographers A. A. Grigoriev, L. S. Berg, S. V. Kalesnik, K. K. Markov, A. G. Isachenko, N. A. Gvozdetsky, N. I. Mikhailov, F. N. Milkov, N. A. Solntsev, V. B. Sochava. In addition to the theoretical foundations of natural geography and landscape, their scientific works cover methodological and practical aspects of the study of natural and geographical zoning, landscape mapping, their morphological structure, dynamics, development and existence. A number of new scientific trends, new branches of science have emerged. Natural geography itself has developed into a system of sciences as one of the major divisions of geography.

It is natural for the reader of the monograph to pay attention to the more than 10 terms in it, such as complex, system, geosystem, principle. Unsurprisingly, the author gave these words in his own words, as he thought it appropriate to keep their content (e.g. car, vehicle) in their own words.

Toshov paid particular attention to the question "The structural system of the natural and geographical sciences". In particular, he believes that the classification of natural geographical sciences should be based on the characteristics of the object of study, as in the classifications of other natural sciences. "If an object is a single product, the science that studies it must be a whole science. In order to get an idea of the integrity of an object, it must be examined comprehensively and in different ways. If the object of natural geography can meet the concept of a system, the science that studies it must also have a systemic structure. From this point of view, it is obvious to show natural geography as a subsystem within the system of geographical sciences [5]. In his monograph, he gave his classification scheme entitled "The Structural System of the Natural and Geographical Sciences" (Figure 15).

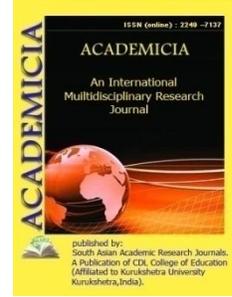

In conclusion, the monograph "Natural Geography: History and Some Theoretical Issues" by Kh. R. Toshov, Associate Professor at Bukhara State University, can be an important resource for students, young researchers and readers studying geography as well as the natural sciences.

AN OVERVIEW OF MACHINE LEARNING FROM THEORY TO ALGORITHMS

Mr Mrinal Paliwal*

*SBAS, Sanskriti University, Mathura,
 Uttar Pradesh, India, INDIA

Email id: mrinalpaliwal.cse@sanskriti.edu.in

ABSTRACT

The present SMAC (Social, Mobile, Analytical, and Cloud) technological trend points to a future in which intelligent machines, networked processes, and big data are all combined. The enormous quantity of data produced by this virtual environment is hastening the adoption of machine learning solutions and techniques. Computers can mimic and modify human-like behaviour thanks to machine learning. Each interaction, each action done, becomes something the system may learn and utilize as experience for the next time using machine learning. This paper provides an introduction of a data analytics technique that allows computers to learn and do what people do naturally, namely, learn from experience. It covers the fundamentals of machine learning, including definitions, terminology, and applications that explain what, how, and why it works. Machine learning's technological roadmap is explored in order to better comprehend and validate its potential as a market and industrial practice. The main goal of this paper is to explain why machine learning is the way of the future.

KEYWORDS: *Algorithms, Ensemble Learning, Instant Learning, Machine Learning, Supervised Learning, Unsupervised Learning.*

4. INTRODUCTION

Learning is the process of learning new behaviours, beliefs, information, abilities, or preferences, or altering old ones. The philosophy of personal learning, or how humans learn, is defined by behaviourism, cognitivism, constructivism, experientialism, and social learning. Machines, in contrast to humans, rely on data instead of learning through experience[1]. Machine learning (ML) is a type of artificial intelligence that allows computers to think and learn on their own, at its most basic level. It's all about getting computers to change their activities in order to increase their accuracy, with accuracy being defined as the number of times the chosen actions result in

right behaviours[2]. ML has been explicitly defined by researchers in the relevant literature. Arthur Samuel created the phrase in 1959, defining it as an area of research that allows computers to learn without having to be explicitly programmed. Tom Mitchell recently provided a "well-posed" term that has shown to be more effective in engineering set-up: If a computer program's performance on a task increases with experience, it is said to learn from experience with regard to that task and that performance metric.

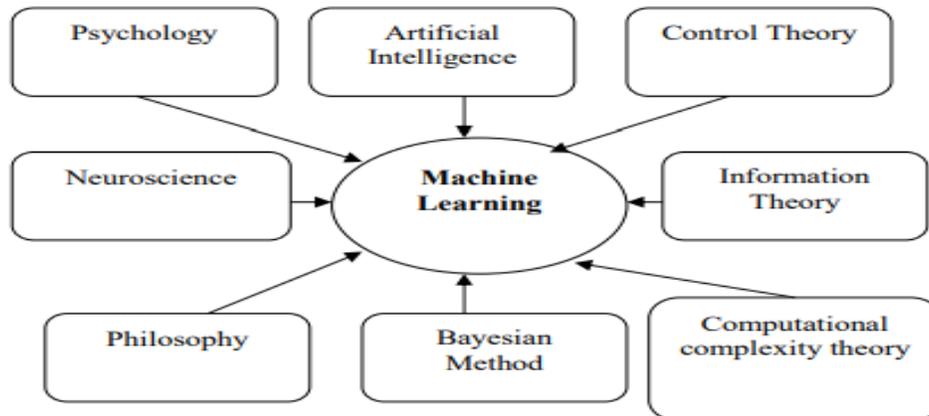

Fig. 1: The Multi-disciplinary Machine Learning (ML) fields[3].

Machine learning is a multidisciplinary area with a diverse set of study fields supporting it. As illustrated in Fig. 1, there are the following. Computational Statistics, whose major goal is to make predictions using computers, is closely connected to the simulation of ML models. It's also linked to Mathematical Optimization, a branch of statistics that deals with models, applications, and frameworks. The enormous complexity of real-world issues makes them ideal candidates for machine learning. Machine learning can be used to design and program explicit algorithms with high performance output in a variety of areas of computing, such as email spam filtering, social network fraud detection, online stock trading, face & shape detection, medical diagnosis, traffic prediction, character recognition, and product recommendation, to name a few. Machine learning is used in real-world applications such as self-driving Google cars, Netflix recommending movies and shows a person might like, online recommendation engines such as Facebook friend suggestions, Amazon's "more items to consider" and "get yourself a little something," and credit card fraud detection. The major goal of this paper is to provide an overview of Machine Learning's evolution to the current day, as well as numerous machine learning methods, applications, and problems. This paper provides an overview of machine learning, including its history, origins, and evolution over the decades to the current day. The research discusses the challenges in data science that machine learning techniques may solve, as well as the progress of machine learning to the present day. It also includes a description of the general model of machine learning, as well as an explanation of the machine learning process. It also goes through the major machine learning paradigms and methods, as well as a quick rundown of the ML difficulties.

5. DISCUSSION

5.1. Data Science Problems and Machine Learning:

Machine learning is necessary to make computers smart enough to do tasks without human involvement, based on learning and continuously expanding experience to comprehend the issue complexity and requirement for flexibility[4].

5.1.1. Tasks Performed by Human Beings:

Human people execute a variety of activities on a daily basis, but the key issue is to complete the duties flawlessly and according to a well-defined schedule. Cooking, driving, and speech recognition are among examples.

5.1.2. Tasks Beyond Human Capabilities:

Another group of activities that machine learning can effectively do is the analysis of big and complicated data sets, such as remote sensing, weather forecasting, ecommerce, and web search. It becomes extremely difficult for humans to forecast relevant data when there is a vast volume of data. Machine learning has demonstrated its ability to tackle data science issues on its own. Data science, according to Hayashi and Chikio, is a concept that combines statistics, data analysis, machine learning, and related methodologies in order to comprehend and analyze real-world events using data [5]. Before beginning to solve an issue, it must be properly classified so that the most appropriate machine learning method may be used. As illustrated in Fig. 2, any data science challenge may be classified into one of the five categories.

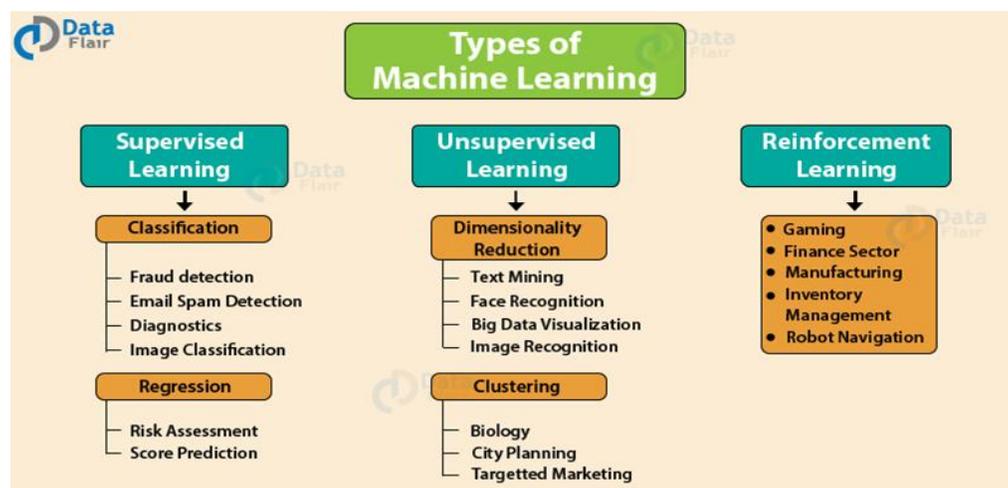

Fig. 2: Types of Machine Learning techniques along with the types of problems they are suitable for[6].

As a result, depending on the kind of challenge, a machine learning technique can be used. The following are the various categories:

- *Classification Problem:*

A classification issue is one in which the output can only be one of a set number of output classes known a priori, such as Yes/No or True/False. The problem might be a binary or multi-class classification problem, depending on the number of output classes.

- *Anomaly Detection Problem:*

This category includes problems that examine a pattern and discover changes or abnormalities in the pattern. Credit card firms, for example, employ anomaly detection algorithms to detect deviations from their clients' typical transaction behaviour and issue warnings whenever there is an unexpected transaction. Finding outliers is one of these challenges.

- *Regression Problem:*

When dealing with situations that have both continuous and numeric output, regression methods are utilized. These are typically used for situations involving queries such as "how much" or "how many."

- *Clustering Problem:*

Clustering is classified as an unsupervised learning technique. These algorithms attempt to learn structures inside the data and create clusters based on data structure similarities[1]. After that, the various classes or clusters are labelled. When the algorithm is trained, it adds fresh, previously unseen data to one of the clusters.

- *Reinforcement Problem:*

When a choice must be made based on previous learning experiences, reinforcement algorithms are utilized. The machine agent learns its behaviour by interacting with the constantly changing environment in a trial and error manner. It allows agents to be programmed utilizing the idea of rewards and punishments without having to explain how the job should be completed. Reinforcement learning is used in a variety of applications, including game play and temperature management.

5.2. Development of Machine Learning:

TABLE 1: ILLUSTRATES DEVELOPMENT OF MACHINE LEARNING (ML)[3].

Year	Development
1950	Alan Turing created "Turing Test" to check a machine's intelligence. In order to pass the Turing Test, the machine should be able to convince humans that there they are actually talking to a human and not a machine.
1952	Samuel created a highly capable learning algorithm than can play the game of Checkers with itself and get self-trained.
1956	Martin Minsky and John McCarthy with Claude Shannon and Nathan Rochester organized a conference in Dartmouth in 1956 where actually Artificial Intelligence was born.
1958	Frank Rosenblatt created Perceptron, which laid the foundation stone for the development of Artificial Neural Network (ANN).
1967	The Nearest Neighbours Algorithm was proposed which could be used for "Pattern Recognition".
1979	Stanford University students developed "Stanford Cart", a sophisticated robot that could navigate around a room and avoid obstacles in its path.
1981	Explanation Based Learning (EBL) was proposed by Gerald DeJong, whereby, a computer can analyze the training data and create rules for discarding useless data.
1985	NetTalk was invented by Terry Sejnowski, which learnt to pronounce English words in the same manner that children learn.
1990	The focus of Machine Learning shifted from Knowledge-driven to Data Driven. Machine Learning was implemented to analyse large chunks of data and derive conclusions from it.
2006	The term "Deep Learning" was coined by Geoffery Hinton which referred to a new architecture of neural networks that used multiple layers of neurons for learning.
2011	IBM's Watson, built to answer questions posed in a natural language, defeats a Human Competitor at Jeopardy Game.
2012	Jeff Dean from Google, developed GoogleBrain, which is a Deep Neural Network to detect patterns in Videos and Images.
2014	Facebook invented the "DeepFace" algorithm based on Deep Neural Networks capable of recognizing human faces in photos.
2015	Amazon proposed its own Machine Learning Platform. Microsoft created "Distributed Machine Learning Toolkit" for efficient distribution of machine learning problems to multiple computers to work parallel to find a solution. Elon Musk and Sam Altman, created a non-profit organization- CooeaAI, with the objective of using Artificial Intelligence to serve human beings.
2016	Google proposed DeepMind which is regarded as the most complex Board Game. Google AlphaGo program becomes the first Computer Go program to beat a professional human player. It is based on the combination of machine learning and tree searching techniques.
2017	Google proposed Google Lens, Google Clicks, Google Home Mini and Google Nexus based phones which use Machine Learning and Deep Learning Algorithms. Nvidia proposed NVIDIA

Artificial Intelligence (AI) and Machine Learning (ML) are not new terms. For more than 60 years, computer scientists, engineers, researchers, students, and industry experts have

investigated, used, used, and re-invented them[7]. Algebra, statistics, and probability are the mathematical foundations of machine learning. Researchers such as Alan Turing, John McCarthy, Arthur Samuels, Alan Newell, and Frank Rosenblatt contributed to the serious development of Machine Learning and Artificial Intelligence in the 1950s and 1960s. On the Optimizing Checkers Program, Samuel proposed the first practical machine learning model. Rosenblatt invented the Perceptron, a widely used machine learning method based on biological neurons that lay the groundwork for Artificial Neural Networks. The illustrious, expansive, and practical growth of machine learning is depicted in Table 1.

5.3. The Generic Model of Machine Learning:

Computer learning is used to tackle a variety of issues that need the machine to learn. There are three characteristics of a learning problem:

- The process of gaining experience.
- Performance measure to be improved.
- Task classes.

5.4. Machine Learning Paradigms:

5.4.1. Supervised Learning:

Prediction based on historical data may benefit from supervised learning. For example, a recognition system that identifies whether an item is a galaxy, a quasar, or a star given a coloured picture of an object via a telescope, or given a person's e-commerce browsing history, product suggestion by e-commerce websites.

5.4.2. Unsupervised Learning:

The goal of unsupervised learning is to recognize previously undiscovered patterns in data in order to generate rules from them. In situations when the data categories are uncertain, this approach is suitable. The training data is not labelled in this case. Unsupervised learning is a statistic-based learning method that addresses the issue of uncovering latent structure in unlabelled data.

5.4.3. Reinforcement Learning:

Because the algorithm is simply given a response that indicates whether the output is accurate or not, reinforcement learning is considered an intermediate kind of learning[8]. To arrive at the right result, the algorithm must investigate and reject out different alternatives. Because the algorithm makes no recommendations or answers to the issue, it is referred to as learning with a critic.

5.4.4. Evolutionary Learning:

Biological creatures that adapt to their surroundings are the source of inspiration. The algorithm learns from the behaviour and adjusts to the inputs, excluding solutions that are improbable. It proposes the optimal solution to the issue based on the concept of fitness.

5.4.5. Semi-Supervised Learning:

These algorithms provide a method for combining the benefits of both supervised and unsupervised learning. In the preceding two kinds of output labels, either all of the observations are labelled or none are labelled. Some observations may be labelled, but the bulk of observations remain unlabelled owing to the high expense of labelling and a lack of competent human knowledge. Semi-supervised algorithms are ideally suited for model development in such circumstances. Semi-supervised learning may be used to classification, regression, and prediction issues.

5.4.6. Ensemble Learning:

It's a machine learning model in which a large number of students (individual models) are taught to answer a common issue[9]. Unlike other machine learning techniques, which try to learn by constructing a set of hypotheses from the training data and combining them to make a prediction model in order to reduce bias, variance, or improve predictions, ensemble learning acquires knowledge by constructing a set of hypotheses from the training data and incorporating them to make a statistical method in order to reduce bias, variability, or improve predictions.

5.5. Machine Learning Algorithms:

In this part, we'll look at some of the most prominent machine learning algorithms from the various paradigms discussed before. Despite the fact that each paradigm has a large number of algorithms that have been published in the literature, we only look at a few of them in this research[10]. A handful of these algorithms are briefly explained in Table 2. These algorithms have a broad range of applications, some of which are discussed below. Table 3 illustrates machine learning applications.

TABLE 2: ILLUSTRATES MACHINE LEARNING (ML) ALGORITHMS[3].

Paradigm	Algorithm	Description
Supervised Learning	Decision Tree	The learned function is represented in the form of a decision tree in the Decision Tree method for approximating discrete valued target functions. On the basis of feature values, a decision tree classifies instances by sorting them from root to leaf nodes. Every branch indicates a potential value for that feature, whereas each node represents a choice on a property of the instance. The decision node, which is the root node, is where an instance's classification begins. The tree traverses down along the edge that corresponds to the value of the result of feature test based on the value of node. In the sub-tree led by the new node at the end of the preceding edge, this process continues. Finally, the categorization categories or the final choice are represented by the leaf node. When utilizing a decision tree, the emphasis is on determining which characteristic at each node level is the best classifier. For each node, statistical measures like as information gain, Gini index, Chi-square, and entropy are computed to determine its value. Decision trees are implemented using a variety of algorithms.

	Naïve Bayes	Bayes' theorem of probability is used by Nave Bayes to classify. The Bayes theorem determines the posterior probability of an event (A) given a prior probability of event B denoted by P(A/B).
	Support Vector Machines	SVMs are useful for both classification and regression issues. It's a learning algorithm that's supervised. It is based on the idea of calculating margins. Each data item is plotted as a point in n-dimensional space in this method (where n is the number of features we have in our dataset). Each feature's value is the associated coordinate's value. It divides the data into classes by identifying a line that divides the training datasets into categories. It operates by maximizing the margin between the closest data point and the hyper plane.
	Regression Analysis	Regression analysis is a kind of predictive modelling that looks at the connection between a dependent and an independent variable. It is a crucial tool for data analysis and modelling. We attempt to fit the line or curve to the data points in this technique to minimize the disparities in data point distances from the curve or line. Regression analysis is divided into three types: linear, logistic, and polynomial.
Unsupervised Learning	K-Means Clustering	For cluster analysis, K-means is a common unsupervised machine learning method. Its aim is to divide 'n' observations into 'k' clusters, with each observation belonging to the cluster with the closest mean, which serves as the cluster's prototype. The cluster's centre is determined by the mean of the observations in that cluster.
Instance based Learning	K-nearest Neighbours	It is a non-parametric classification and regression technique. The KNN method finds the k-nearest neighbours of an unknown feature vector whose class has to be determined given N training vectors.
Ensemble Learning	Random Forest	It's a classification and regression technique that uses ensemble learning. It creates a lot of decision trees using a random selection of data using a bagging technique. To create the final decision trees, the output of all decision trees in the random forest is merged.
Dimensionality Reduction	Principal Component Algorithm	It is mainly used to reduce the number of dimensions in a data collection. It aids in the reduction of the number of characteristics in the data collection as well as the number of independent variables. It converts correlated data into a collection of linearly uncorrelated variables called principle components via orthogonal transformation.

5.6. Applications of Machine Learning:

TABLE 3: ILLUSTRATES MACHINE LEARNING APPLICATIONS.

Application	Description
Playing Checkers Game	A computer program learns to play checkers game, improvises its performance as determined by its ability to win at various class of tasks involving the game, through experience obtained by playing games against itself.
Speech Recognition	The most sophisticated speech recognition systems these days deploy machine learning algorithms in some forms. Example: SPHINX system [20] learns speaker-specific sounds and words from speech signals. Various Neural Network learning methodologies for interpreting hidden Markov Models are highly effective for automatically customizing speakers, dictionary, noise etc.
Autonomous Vehicles	Machine learning models are these days being applied to drive autonomous vehicles like Cars, Drones etc. Example: Google Driver Less Cars, Tesla Cars. Machine learning techniques are also highly effective in controlling sensor-based applications.
Filtering Emails (Spam Emails)	Machine learning can be applied to filter spam emails. The machine learning based model will simply memorize all the emails classified as spam emails by user. When new email arrives in inbox, the machine learning based model will search, compare and based on the previous spam emails. If new email matches any one of them, it will be marked as spam; else it will be moved to user's inbox.
Robotics and Artificial Intelligence	Machine learning is regarded as improved approach to problem solving. Using base knowledge and training data with machine learning models, learning can be improved which will take robotics and AI to next generation levels.
Web and Social Media	<ul style="list-style-type: none"> • Naïve Bayes classifiers have been successfully applied in the field of text mining, may it be spam filtering or classifying the web page, an email or any document. • Facebook uses Naïve Bayes' to analyze status update expressing positive and negative emotions. • Document Categorization: Google uses Naïve Bayes algorithm for document categorization. • K-means clustering is used by search engines like Google, Yahoo to cluster web pages by similarity. • Apriori is used by websites such as Amazon or Flipkart to recommend which items are purchased together frequently. • Another common application of Apriori is the Google auto-complete. When a person types a word, Google search engine looks for other associated words that go together with the word earlier typed word. • Sentiment analysis on social networking sites is a typical text classification problem solved using application of variety of ML algorithms [21, 22, 23,24]
Medical Field	TRISS: Trauma & Injury Severity Score, which is widely used to predict mortality in injured patients, was originally developed by Boyd et al. using logistic regression. Many other medical scales used to assess severity of a patient have been developed using logistic regression.

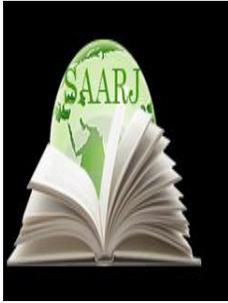

6. CONCLUSION

Digitalization and the Internet revolution have led to a mounting volume of structured and unstructured data which needs to be utilized for analytics. Machine learning as a key technology driver encompasses the intelligent power to harness the knowledge from the available data. Moreover, the adoption of machine learning solutions for complex real-life problems by both researchers & practitioners has made this field a dynamic area of research with an active participation across industries & countries. In this paper, a comprehensive review of Machine Learning process and algorithms is presented. The purpose is clearly to understand the role, advantage and scope of Machine learning as a technology-based solution. In near future machine learning is expected to be a part of almost every software application. There are some of the future predictions of machine learning applications: As machine learning helps computers understand the context and semantics of sentences using Natural Language Processing, so we do not have to wait long for a time when computers will learn to talk like humans. In the near future we can expect machine learning tools and techniques to connect to the internet and continuously

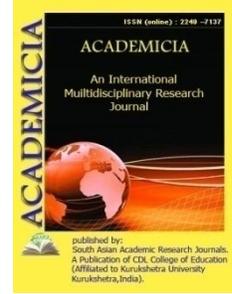

retain on the most relevant information. This will help algorithms in constant retaining of algorithms and there will be no need to train the systems time and again. Personalization could be enhanced and recommendations could be improved leading to more beneficial and successful experiences.

AN OVERVIEW ON ISSUES AND ENABLING TECHNOLOGIES IN IOT MIDDLEWARE

Ms Anuska Sharma*

*SOEIT, Sanskriti University,
 Mathura, Uttar Pradesh, INDIA
 Email id: anushka@sanskriti.edu.in

ABSTRACT

The Internet of Things (IoT) enables humans and computers to learn from and interact with billions of items such as sensors, actuators, services, and other Internet-connected gadgets. The implementation of IoT technologies will allow for seamless integration of the cyber and physical worlds, radically altering and empowering human interaction with the planet. Middleware, which is generally defined as a software system intended to be the intermediate between IoT devices and applications, is a crucial technology in the implementation of IoT systems. In this article, we first demonstrate the necessity for an IoT middleware by demonstrating an IoT application for real-time blood alcohol level prediction utilizing wristwatch sensor data. After that, a survey of the capabilities of current IoT middleware is conducted. We also undertake a comprehensive examination of the difficulties and enabling technologies in creating IoT middleware that embraces the heterogeneity of IoT devices while still supporting the key components of composition, flexibility, and security in an IoT system.

KEYWORDS: *Internet of Things, Middleware, Privacy, Service Discovery, Security.*

1. INTRODUCTION

The Internet of Things (IoT) is an area that, after the Internet, represents the next most exciting technological revolution. IoT will open up a world of possibilities and influence in every part of the globe. We can create smart cities with IoT, where parking, urban noise, traffic congestion, street lighting, irrigation, and trash can all be monitored in real time and controlled more efficiently. We can construct secure and energy-efficient smart houses. We can create smart ecosystems that monitor air and water pollution automatically and allow for early detection of earthquakes, forest fires, and other catastrophic catastrophes [1]. Manufacturing can be transformed by IoT, making it leaner and smarter. According to CBS News, over 600 bridges

have failed in the United States since 1989. Every state has a significant number of bridges that pose a serious threat to motorists. Sensors enabled by the Internet of Things can monitor vibrations and material conditions in bridges (as well as buildings and historical sites) and give early warning, potentially saving many lives.

In almost every business sector conceivable, the SQ.Z. Shang works at the University of Adelaide's School of Computer Science, SA 5005, and Australia timely manage objects to create seamless integration of the physical and cyber worlds. There are many IoT middleware and connection protocols under development, and the number is growing by the day. Popular connection protocols developed especially for IoT devices include Message Oriented Telemetry Transport (MQTT), Constrained Application Protocol (CoAP), and BLE (Bluetooth Low Energy) [2]. However, the variety of IoT connection protocols and middleware are making it difficult to connect IoT devices and understand the data they gather. The fact that each IoT middleware promotes a distinct programming abstraction and architecture for accessing and connecting to IoT devices adds to the confusion. The idea of virtual sensor, which is defined in XML and implemented with a matching wrapper, is given as the primary abstraction for creating and connecting a new IoT device in the Global Sensor Network (GSN) project, for example. The primary abstraction of the TerraSwarm project is an accessory design pattern implemented in Javascript. There is no high-level abstraction for encapsulating a new device type in the Google Fit project [3]. The system is pre-programmed to support a certain range of IoT devices that may be accessed through REST APIs. Extending Google Fit's FitnessSensorService class to accommodate an IoT device that isn't currently supported needs professional Java programming expertise. According to Zachariah et al. in their paper "The Internet of Things Has a Gateway Problem," the current state-of-the-art support for IoT application development is application specific, which is equivalent to the scenario where each IoT device requires a different web browser to connect to the Internet. In this article, we examine the most cutting-edge middleware options for implementing IoT applications. are some of the surveys on IoT middleware that have been published. To our knowledge, these studies only look at IoT middleware from a few angles, and none of them address the more recent trend of light-weight plug-and-play or cloud-based IoT middleware.

The goal of this study is to get a better knowledge of current IoT middleware research and difficulties. The following are the paper's major contributions. The rest of this paper is laid out as follows. We first argue for the necessity for an IoT middleware based on our experience developing a real-time BAC predictor utilizing data from wristwatch sensors .We next go through our observations on the three main software designs for IoT middleware and provide a comparison and contrast of the three architectures [4] . We survey eight existing IoT middleware systems to see how well they fulfill the key functionalities required by BAC-like IoT applications, such as device abstraction for data collection, composition for visualization and analysis, service discovery for opportunistic integration, security and privacy. We compare these three kinds of IoT middleware by showing how to use GSN, Google Fit, and Ptolemy Accessor Host to gather data from a Phidgets sensor. The main research difficulties in creating an IoT middleware that allows a scientist or a health professional to configure/compose a BAC-like IoT program that is flexible, open, and secure are then discussed [5]. Figure 1 shows infrastructure for data collection and analysis.

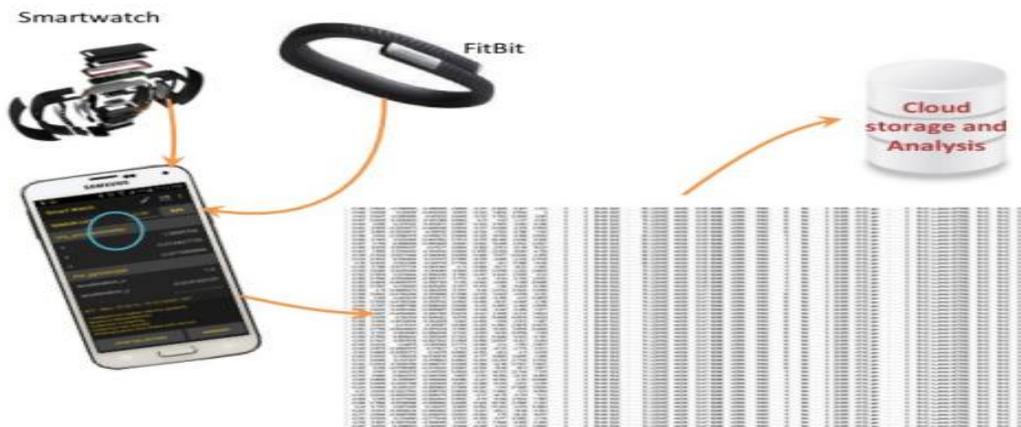

Figure 1: Infrastructure for Data Collection and Analysis.

Ambient data gathering and analytics, as well as real-time reactive applications, are two types of IoT applications. The first kind of application collects sensor data from a range of sensors (e.g., wearable devices), processes it offline to produce actionable information (e.g., a model), and then uses the model to forecast fresh data received from the sensor in the future. Real-time reactive systems, such as autonomous vehicles or industrial processes, fall under the second group of applications. These systems make real-time choices based on observed sensor readings. The first group of applications is quickly expanding, particularly in the healthcare sector, where customized health tracking and monitoring has become critical to providing better and more economical treatment.

Based on our experience developing an ambient data collecting and analytics IoT application that can predict Blood Alcohol Content (BAC) utilizing wristwatch sensor data, we justify the need for an open, lightweight, secure IoT middleware in this section. We'll go through the rationale for developing this IoT application, as well as how it, and all other IoT apps in this category, may benefit from an IoT middleware, in the sections below. Drunk driving is a serious issue that affects people all around the globe. This issue is a danger not just to intoxicated drivers, but also to pedestrians and other motorists. It may be difficult to assess one's own alcoholism at hazardous levels of drinking. It would be preferable to get a definite BAC measurement, or just a binary response: "drunk" or "not drunk". Infrastructure for Data Collection and Analysis is already available, however it is not discrete and requires the user to take intentional steps.

The second method is to manually calculate BAC using a Smartphone application, although this requires more effort from the user (remembering how many drinks they've had in a social environment). To be practical, some kind of non-invasive and accurate monitoring device that would alert users if they get too drunk would be beneficial. By connecting with the vehicle's ignition mechanism, this technology may also be used to alert friends and relatives, as well as prohibit the drinker's car from starting. We built a safe IoT application from the ground up to explore the prediction of intoxication. Ambient data gathering and analytics, as well as real-time reactive applications, are two types of IoT applications [6]. The first kind of application collects sensor data from a range of sensors (e.g., wearable devices), processes it offline to produce actionable information (e.g., a model), and then uses the model to forecast fresh data received

from the sensor in the future. Real-time reactive systems, such as autonomous vehicles or industrial processes, fall under the second group of applications.

These systems make real-time choices based on observed sensor readings. The first group of applications is quickly expanding, particularly in the healthcare sector, where customized health tracking and monitoring has become critical to providing better and more economical treatment. Based on our experience developing an ambient data collecting and analytics IoT application that can predict Blood Alcohol Content (BAC) utilizing wristwatch sensor data, we justify the need for an open, lightweight, secure IoT middleware in this section. We'll go through the rationale for developing this IoT application, as well as how it, and all other IoT apps in this category, may benefit from an IoT middleware, in the sections below. Drunk driving is a serious issue that affects people all around the globe. This issue is a danger not just to intoxicated drivers, but also to pedestrians and other motorists. It may be difficult to assess one's own alcoholism at hazardous levels of drinking. It would be preferable to get a definite BAC measurement, or just a binary response: "drunk" or "not drunk", compact breathalyzers are probably the best choice. Infrastructure for Data Collection and Analysis is already available, however it is not discrete and requires the user to take intentional steps.

The second method is to manually calculate BAC using a Smartphone application, although this requires more effort from the user (remembering how many drinks they've had in a social environment). To be practical, some kind of non-invasive and accurate monitoring device that would alert users if they get too drunk would be beneficial. By connecting with the vehicle's ignition mechanism, this technology may also be used to alert friends and relatives, as well as prohibit the drinker's car from starting. We built a safe IoT application from the ground up to explore the prediction of intoxication level using wristwatch sensor data. The gathered data must be able to be kept locally as well as sent to a cloud storage system for analysis. It's critical to have local storage to prevent the unexpected latencies that come with wireless data transfer to the cloud. Data must be protected not just while it is in storage, both locally and in the cloud, but also while it is in transit. From the periphery to the cloud data center, end-to-end security is required. Following data collection, the data is analyzed in the cloud to see whether there is any correlation between the sensor readings and the recorded BAC levels. To do this, the data must first be pre-processed and displayed. The gathered sensor data is then subjected to a variety of machine learning algorithms in order to provide the best accurate prediction [7]

The basic infrastructure for a generic data gathering and processing system is shown in Figure 1. The data collection application on the Smartphone (also known as the gateway) uses a set of Java classes to handle the low-level details of the data collection process, such as managing the various threads for collecting sensor values from the Microsoft Band smart watch (also known as the edge device) or other devices like Fit bit. Before transferring the gathered data to the cloud for archiving, the data collecting program does some aggregation. The data analyses is done completely in the cloud, which is equipped with a high-performance computing engine as well as a variety of big data analytics and visualization tools. Once a model has been created using data analytics, it is stored and used as a predictor in the BAC application. The gathered data must be able to be kept locally as well as sent to a cloud storage system for analysis. It's critical to have local storage to prevent the unexpected latencies that come with wireless data transfer to the cloud. Data must be protected not just while it is in storage, both

locally and in the cloud, but also while it is in transit. From the periphery to the cloud data center, end-to-end security is required.

Following data collection, the data is analyzed in the cloud to see whether there is any correlation between the sensor readings and the recorded BAC levels. To do this, the data must first be pre-processed and displayed. The gathered sensor data is then subjected to a variety of machine learning algorithms in order to provide the best accurate prediction. Once a model has been created using data analytics, it is stored and used as a predictor in the BAC application.

2. DISCUSSION

In order to connect and receive data from all possible sensors on the Microsoft Band wristwatch, it must first be virtualized as a software component to the BAC Smartphone application. In order to shield users from the low-level implementation details of networking protocols and communication capabilities of various physical sensors, a device abstraction component is required. The BAC application and the physical device must be able to communicate in real time. Data is often supplied from devices in endless streams in time-stamped order. As a result, a stream, event processing, or aggregation service is a critical component. Stream processing detects complicated events and converts the gathered data (which is typically in huge quantities) into usable information. Aggregation may help you get more useful data for your research. When gathering accelerometer data, for example, the three most recent values were averaged using linear weighting rather than simply taking the most recent value.

Users will require a monitoring or visualization service to monitor/control the status of the physical devices, as well as to regulate when and how frequently the gathered data should be archived to the cloud for future analysis or processing. This component should also offer notification and subscription services to customers in order to provide IoT status, in this instance an alarm for being drunk, on a timely basis. The security and privacy component is required to ensure the integrity of the collected data (stream) and to ensure that the user's privacy is not violated. An IoT application can generate large amounts of data that must be processed and archived, so a ubiquitous connection to a cloud infrastructure is required for data analytic and archiving. Users should be able to save gathered data to their preferred storage media and should only be able to connect to authenticated/certified IoT devices. A composition engine (also known as a rule engine in certain systems) is required to allow users to mix analytics services from the cloud, data services from other gateways (PhidgetInterfaceKit, Arduino), or other IoT devices (car's ignition device) without having to do any low-level programming data collecting and analytics system for monitoring environmental pollution in a building would use a similar set of computing units as the BAC prediction application, with the exception that the edge sensors would be Mica mote, and the gateway will be a desktop or laptop.

The information gathered will be sent to cloud storage or a backend database. For analytics, a comparable collection of analytical and visualization tools is required. In conclusion, the logical requirements for both environment and BAC monitoring are the identical. Having to build two distinct apps for each of the aforementioned applications with dedicated resources not only increases development costs and time, but also hinders the creation of new IoT applications for safe and privacy-preserving data and IoT device sharing. IoT Middleware on the Cloud for a Variety of Applications. As a result, an open, lightweight, flexible, and secure IoT middleware that acts as a bridge between various IoT devices and applications is required. Without any low-level programming, a scientist or a health professional may configure/compose a new secure IoT application for conducting data gathering and analysis appropriate to his or her context.

2.1. Application:

By creating a pluggable actor or downloading it from a common repository, you may create IoT middleware. Both service and actor-based IoT middleware designs do not impose a specific standard for interoperability across IoT devices, such as Restful API or BLE. By supporting a specific programming paradigm or device abstraction, they both welcome the variety of IoT devices. Interoperability in cloud-based architecture, on the other hand, is accomplished via the adoption of particular standards. When a cloud provider's service is terminated, cloud-based middleware may cease to function entirely. A good example of this is Google Nest .While all three designs enable security and privacy to some extent, cloud-based architecture necessitates users' confidence in the cloud provider to protect their data's privacy and integrity. Users aren't offered any other options beyond those recommended by the cloud. Users in service and actor-based architectures have control over how and where data is kept. Because the middleware cannot be integrated inside the physical device and data transferred between physical devices and the middleware may be hacked, there is a weak security connection between physical devices and the middleware in both service and cloud-based architectures. IoT applications are often used in a changing and unpredictable environment. IoT devices, for example, may run out of battery power and cease to function, and connection between devices and gateways may be severed at any moment. The middleware must have a service discovery component so that new services can be made accessible on demand and failing services may be dynamically replaced to ensure a particular level of service quality (QoS). If the present gateway is likely to lose connectivity, the physical devices may connect to a new gateway of comparable quality. Currently, only service-based middleware provides a restricted version of service discovery.

2.2. Advantage:

Web-based service Wrapping IoT devices as Web services with the SDK tool kit and training may restrict the kinds of IoT devices that can be deployed and controlled in this platform, since Web service is a heavy protocol to operate on energy and capabilities limited IoT devices. For processing and preservation, all gathered data is sent to the Hydra middleware. On IoT devices, no local processing or aggregation of acquired data is available. This is problematic for certain BAC-like applications that need real-time analysis of acquired data to identify crucial events (e.g., an old person's fall). Hydra IoT applications must be built by a programmer, and it is not a platform that allows users to easily find, build, and deploy BAC-style data gathering and analysis applications. Hydra is therefore more suited to enterprise-level IoT applications that establish a long-term and tight connection with a fixed set of IoT devices that the platform currently supports. The virtual sensor abstraction is the core idea, which allows users/developers to

declaratively define XML-based deployment descriptors for deploying a sensor. This is comparable to the deployment descriptors idea used in the J2EE server to deploy enterprise beans.

The GSN design is similar to that of J2EE, in that each container may host many virtual sensors, and the container offers functionality for sensor lifecycle management, such as persistency, security, notification, resource pooling, and event processing. One or more data streams are sent into the virtual sensor, which are then processed according to the XML standard. The sampling rate of the data, the kind and location of the data stream, the data's persistency, the data's output format, and the SQL processing logic for the data stream are all factors to consider. A wrapper is assigned to each input stream. When the physical sensor is initially started, the wrapper software defines i) the network protocol to use to connect, interact, and communicate with it, ii) what to do in order to read data from the sensor, and iii) what to do with the data after it is received from the sensor. If the virtual sensor's permanent storage property is set to "true" in the XML specification, GSN offers a SQL-based database that saves all raw sensor data. Furthermore, each virtual sensor has a key-value pair that may be found and registered in GSN.

The flexibility to build a platform-specific wrapper allows the system to work with a variety of sensors. To add a new kind of sensor to the platform, the user must first understand how to create an XML descriptor for the physical sensor and, if one is not already available, offer a Java wrapper implementation. To show the capabilities offered by GSN's device abstraction, we demonstrate the construction of Phidgets sensors in the next paragraph. Because we had prototype implementations of Phidgets sensors in all three kinds of middleware that we saw, we choose to present Phidgets sensors implementation for the remainder of the article. The light and sound sensor data we gathered in Phidgets are similar to sensor data acquired from a smart watch in terms of properties.

Adding a Phidgets sensor (IoT device) as a new virtual sensor in GSN requires the development of a deployment file (see Figure 6) and a wrapper class that can operate as a thread and consume stream data according to the settings provided in the XML deployment file. The storage media for the gathered data is specified by the virtual-sensor-name tag in the deployment file. The processing-class tag defines the virtual sensor's Java class, which in this instance is Phidget Virtual Sensor. The output-structure tag defines the data collection's structure. It's the music and the light in this instance, and they're both of the double kind. The stream tag defines how the program must enable real-time interaction between the physical device and the application. The sampling rate and the processing logic on the gathered data, for example, are defined using the attributes sampling-rate and query tag.

While GSN offers scalable servers for sensor data collecting and storage, it does not provide tools for composing or interpreting the data beyond displaying it on a Web application provided by GSN. It also doesn't allow multi-vendor device composition through the XML descriptor. The expanded GSN, which is part of the OpenIoT project, does, however, provide a limited composition capability. When data from different IoT devices has to be gathered and merged, a programmer must build a domain specific application in GSN. External applications may use Restful or Web service APIs to access virtual sensors stored on GSN. There is support for a rudimWeb-based service Wrapping IoT devices as Web services with the SDK tool kit and training may restrict the kinds of IoT devices that can be deployed and controlled in this

platform, since Web service is a heavy protocol to operate on energy and capabilities limited IoT devices.

For processing and preservation, all gathered data is sent to the Hydra middleware. On IoT devices, no local processing or aggregation of acquired data is available. This is problematic for certain BAC-like applications that need real-time analysis of acquired data to identify crucial events (e.g., an old person's fall). Hydra IoT applications must be built by a programmer, and it is not a platform that allows users to easily find, build, and deploy BAC-style data gathering and analysis applications. The sampling rate of the data, the kind and location of the data stream, the data's persistency, the data's output format, and the SQL processing logic for the data stream are all factors to consider. A wrapper is assigned to each input stream. When the physical sensor is initially started, the wrapper software defines i) the network protocol to use to connect, interact, and communicate with it, ii) what to do in order to read data from the sensor, and iii) what to do with the data after it is received from the sensor. If the virtual sensor's permanent storage property is set to "true" in the XML specification, GSN offers a SQL-based database that saves all raw sensor data. Furthermore, each virtual sensor has a key-value pair that may be found and registered in GSN.

The flexibility to build a platform-specific wrapper allows the system to work with a variety of sensors. To add a new kind of sensor to the platform, the user must first understand how to create an XML descriptor for the physical sensor and, if one is not already available, offer a Java wrapper implementation. To show the capabilities offered by GSN's device abstraction, we demonstrate the construction of Phidgets sensors in the next paragraph. Because we had prototype implementations of Phidgets sensors in all three kinds of middleware that we saw, we choose to present Phidgets sensors implementation for the remainder of the article[8]. The light and sound sensor data we gathered in Phidgets are similar to sensor data acquired from a smart watch in terms of properties.

Adding a Phidgets sensor (IoT device) as a new virtual sensor in GSN requires the development of a deployment file and a wrapper class that can operate as a thread and consume stream data according to the settings provided in the XML deployment file. The storage media for the gathered data is specified by the virtual-sensor-name tag in the deployment file. The processing-class tag defines the virtual sensor's Java class, which in this instance is Phidget Virtual Sensor. The output-structure tag defines the data collection's structure. It's the music and the light in this instance, and they're both of the double kind. The stream tag defines how the program must enable real-time interaction between the physical device and the application. The sampling rate and the processing logic on the gathered data, for example, are defined using the attributes

sampling-rate and query tag., which extends GSN's AbstractWrapper class and uses this XML descriptor as input [9].

While GSN offers scalable servers for sensor data collecting and storage, it does not provide tools for composing or interpreting the data beyond displaying it on a Web application provided by GSN. It also doesn't allow multi-vendor device composition through the XML descriptor. The expanded GSN, which is part of the OpenIoT project, does, however, provide a limited composition capability. When data from different IoT devices has to be gathered and merged, a programmer must build a domain specific application in GSN. External applications may use Restful or Web service APIs to access virtual sensors stored on GSN. There is support for a rudimentary kind of service discovery based on dictionary lookup. A login account protects user information. All captured data is sent to the middleware for processing and archiving, much as Hydra. GSN isn't intended to run on low-power, low-processing-power IoT gateways like Smartphone or Raspberry Pi, thus no local data processing or aggregation is done. Declarative sensor capability definition through XML descriptor file is a step in the right direction for fast development of BAC-like applications via automated wrapper class generation from the descriptor file [10].

It's a cloud-based IoT middleware that allows customers to manage their fitness data and create fitness applications all from one place. It aims to achieve the same objective as Apple's Health Kit. The system includes a fitness store, which is a cloud storage service that saves data from a number of devices and applications (similar to Firebase, a JSON-based document server). A sensor framework is a collection of APIs that allow third-party IoT devices to connect to its store. It offers APIs for subscribing to a certain fitness data type or source (e.g., Fitbit or Smartwatch), as well as APIs for accessing past data and permanent recording of the information. entary kind of service discovery based on dictionary lookup. A login account protects user information. All captured data is sent to the middleware for processing and archiving, much as Hydra. GSN isn't intended to run on low-power, low-processing-power IoT gateways like Smartphone or Raspberry Pi, thus no local data processing or aggregation is done. Declarative sensor capability definition through XML descriptor file is a step in the right direction for fast development of BAC-like applications via automated wrapper class generation from the descriptor file. A sensor framework is a collection of APIs that allow third-party IoT devices to connect to its store. It offers APIs for subscribing to a certain fitness data type or source (e.g., Fit bit or Smartwatch), as well as APIs for accessing past data and permanent recording of the information [10].

2.3. Working:

service on the web Wrapping IoT devices as Web services with the SDK tool kit and training may restrict the kinds of IoT devices that can be deployed and controlled under this platform, since Web services are a heavy protocol to operate on power and capabilities limited IoT devices. To be processed and archived, all gathered data is sent to the Hydra middleware. On IoT devices, there is no way to analyze or aggregate the data gathered locally. This is problematic for certain BAC-like applications that need real-time analysis of gathered data to identify crucial

events (such as an old person's fall). The Hydra IoT application must be handmade by a programmer, and it is not a platform that allows users to easily find, build, and deploy BAC-like data collecting and analysis applications. Hydra is therefore more suited to enterprise-level IoT applications that have a long-term and tight connection with a fixed set of IoT devices that the platform currently supports. GSN, is a service-based Internet of Things that seeks to offer a consistent platform for flexible integration, sharing, and deployment of heterogeneous IoT devices.

The virtual sensor abstraction is the core idea, which allows users/developers to define XML-based deployment descriptors declaratively to deploy a sensor. This is analogous to the notion of deployment descriptors in J2EE server, which are used to deploy enterprise beans. GSN's design is similar to that of J2EE in that each container may host many virtual sensors and the container offers functionality for sensor lifecycle management, such as persistency, security, notification, resource pooling, and event processing. One or more data streams are sent into the virtual sensor, which are then processed according to the XML standard. The data sampling rate, the kind and location of the data stream, the data's persistency, the data's output format, and the SQL processing logic for the data stream are all factors to consider. Wrappers are assigned to each input stream. When the physical sensor is initially started, the wrapper software defines (i) the network protocol to use to connect, interact, and communicate with it, ii) what to do to read data from the sensor, and iii) what to do with the data after it has been received from the sensor.

If the permanent storage property of the virtual sensor is set as "yes" in the XML specification, GSN offers a SQL-based database that saves all raw sensor data. Each virtual sensor also has a key-value pair that may be found and registered in GSN. The system can connect with sensors of various kinds thanks to the flexibility to install a platform-specific wrapper. To add a new kind of sensor to the platform, the user must first understand how to create an XML descriptor for the physical sensor, as well as offer a Java wrapper implementation if one is not already available. To showcase the capabilities offered by GSN's device abstraction, we'll show how to create Phidgets sensors in the next paragraph. Because we had prototype implementations of Phidgets sensors in all three kinds of middleware that we saw, we chose to present them for the remainder of the article. 2016 IEEE, 2327-4662 Personal use is allowed, but reprinting or dissemination needs IEEE approval. The light and sound sensor data we gathered in Phidgets are similar to sensor data acquired from a smart watch in terms of features. Adding a Phidgets sensor (IoT device) as a new virtual sensor in GSN necessitates the development of a deployment file, as illustrated as well as the construction of a wrapper class that can operate as a thread and consume stream data according to the settings provided in the XML deployment file. The storage media for the gathered data is defined by the virtual-sensor-name tag in the deployment file. The processing-class tag defines the virtual sensor's Java class, which is Phidget VirtualSensor in this instance. The output-structure tag describes the data collection's structure. It's the music and light in this instance, and they're both of the double kind. The stream tag describes how the physical device and the program must communicate in real time.

The sample rate and processing logic on the gathered data, for example, are defined using the sampling-rate property and the query tag. Figure 7 shows a portion of the wrapper class, which extends GSN's Abstract Wrapper class and takes input from this XML descriptor. While GSN offers scalable servers for sensor data collecting and storage, it does not provide tools for composing or interpreting the data beyond displaying it on a Web application. It also doesn't

allow for the XML descriptor to be used to compose multi-vendor devices. The Open IoT project's expanded GSN does, however, provide limited composition capabilities. When data has to be gathered and merged from a variety of IoT devices, a programmer must build a domain specific application in GSN. Restful or Web service APIs allow other applications to connect to virtual sensors stored on GSN. Service discovery based on dictionary lookup is supported to a limited extent.

A login account keeps user information safe. All collected data is sent to the middleware, which processes and archives it, much as Hydra. Because GSN is not intended for use in IoT gateways with limited power and processing capabilities, such as Smartphone or Raspberry Pi, no local data processing or aggregation is done. The automated development of the wrapper class from the descriptor file is a step in the right direction for fast building of BAC-like applications. IoT Middleware on the Cloud Google Fit is an open Internet of Things ecosystem. It's a cloud-based IoT middleware that allows customers to manage their fitness data and develop fitness applications all from one place. Apple's Health Kit has a similar objective. A fitness store is included in the system, which is a cloud storage service (similar to Firebase, a JSON-based document server) that saves data from various devices and applications. A sensor framework is a collection of APIs that allow third-party IoT devices to connect to a company's shop. APIs for subscribing to a certain fitness data type or source (e.g., Fit bit or Smartwatch), APIs for accessing previous data, and APIs for permanent recording of the s are just a few examples.

3. CONCLUSION

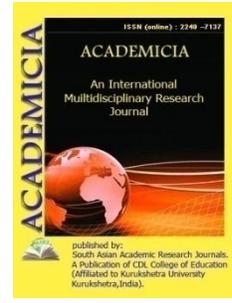

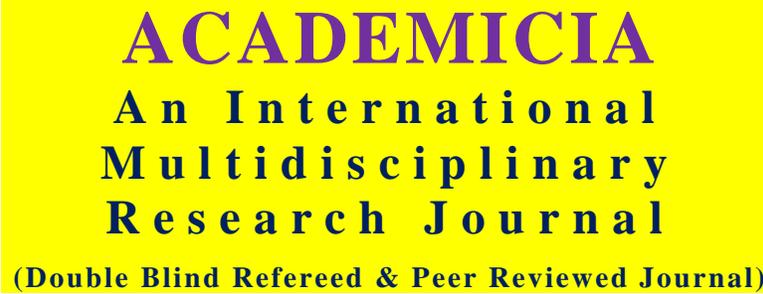

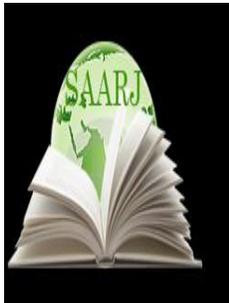

The World Wide Web has gone through many transformations, from traditional linking and sharing of computers and documents, to a platform for conducting businesses and connecting people via social media, and now the emerging paradigm of connecting billions of physical objects (Internet of Things) to empower human interaction with both the physical and virtual worlds in an unprecedented way. In this survey paper, we have analyzed three key IoT middleware architectures ranging from consumer centric cloud-based architectures, light-weight actor-based architectures, and heavy weight service-based architectures. We outlined four key challenges in developing an IoT middleware which are: 1) a light-weight middleware platform that can provide similar services when deployed on power constrained IoT devices as well as in desktop computers and cloud infrastructure; 2) a composition engine that is intuitive and not application specific; 3) a security mechanism that can operate in a resource constrained environment and yet can achieve similar guarantee as Internet security; and 4) a semantic-based IoT device/service discovery that goes beyond discovery of domain names and IP addresses. We elaborate on two non-ontological solutions for addressing key challenges in IoT service discovery. The first approach is adapted from existing works in Web service search engines and the second approach is based on machine learning and recommendation techniques. Finally, in the IoT security domain, we believe emerging techniques such as privacy by design, differential privacy, and light weight public key cryptography will form the building blocks for security in IoT middleware.

ABSTRACT

This article is devoted to the expression of indefiniteness in English and Uzbek languages by the modal means. We studied the representation of the modal means first, unlike other word groups, modality, first of all, shows the indefiniteness of the process; secondly, this categorical concept is not limited to the description of the process, but also of the subject.

KEYWORDS: *Modal Means, Indefiniteness. Expression, Parts Of Speech, Person, Object, Location, Direction, Cause, Object Symbol, Object Quality.*

INTRODUCTION

Modality is interesting from the following point of view: first, unlike other word groups, modality, first of all, shows the indefiniteness of the process; secondly, this categorical concept is not limited to the description of the process, but also of the subject: Maybe it is a walf (BARS), od adjective: It seems to me be green at night (BARS), of amount: Maybe they brought fifty books (BARS) and represents the indefiniteness of others:

It should be noted that modality is present in all levels of prism and in all languages, and its typological commonality in all languages is its characteristic feature.

In the context of the languages being compared, we observe the following methods or variations of the meaning of modality:

1) Modal words; 2) modal verbs; 3) modal forms.

Main part. In terms of their compatibility with the levels of the language hierarchy, they can be modified as follows: as lexical means (modal words, modal verbs); as morphological means (synthetic and analytical forms of conditional inclination); as synthetic means (modal expressions, intonation, phraseological units, etc.).

Maybe it is right (J.Fowles, Daniel Martin, 27). You don't believe me, perhaps (F.J.Cronin, Citadel, 254). They had probably noticed all the police of the big cities and ... (T.Dreiser, Sister Carrie, 267).

Chamasi Yo`ldosh ham tashqaridan kirib ularga qo`shildi (S.Anorboev, Qissalar, 35). Ajabmas, Sirojiddin ham kirib kelsa (R.Fayziy, Hazrati inson, 230). Ehtimol bir kuni borib yarashardik (A.Muxtor, Chinor, 170 – 171). Balki Mahkam to`g`ri aytar (P.Qodirov, Uch ildiz, 140). Ularning ham gapiga quloq solish kerak ekan, shekilli (A.Muxtor, Chinor, 176). – Menga qarang aka, - dedi yigit Azimjonga qarab, - siz nima oydan tushganmisiz? Shundoq bo`lsa ham Hazrat Navoiyni bilsangiz kerak hoynahoy (A.Muxtor, Chinor, 126). Bosmachilar yana bir qancha sho`ring qurg`urlarning yostig`ini quritdi, chog`i (K.Yashin, Tor – mor, 43). Aftidan, raisning jumagacha sabri chidamadi shekilli, ertasiga yana chaqirtirdi (J.Abdullaxonov, borsa kelmas, 232).

Modal words express the speaker's assumptions, probabilities, hesitations, and beliefs about the content of the sentence.

In both English and Uzbek languages, modal words that express some ambiguity can serve as words. This can be seen in the following examples:

Didn't you like it last Sunday? "Perhaps" (J.Fowles, Daniel Martin, 398). Zora yangi xushxabar eshita. Ehtimol (R.Fayziy, Hazrati inson, 47).

Fan nomzodi bo`lib olardingiz shu choqqacha. Balki (J.Abdullaxonov, borsa kelmas, 198).

In English the following modal verbs express the meaning of indefiniteness: can (could), may (might), shall (should), will (would), ought.

In Uzbek: kelmoqchi, yubormoqchi va hokazo.

He can be rather a clown, actually (J.Fowles, Daniel Martin, 309). – Would you marry me? – I might (J.Fowles, Daniel Martin, 398). Po`lat xo`jaev Ettinchi polkni chiqarib yubormoqchi (SH.Xolmirzaev, Qil ko`prik, 273).

In English: once upon a time, one day, one morning;

In the Uzbek language, when there is no, one day and other modal expressions represent indefiniteness

Once upon a time an artist who had painted a small and a very beautiful picture placed it so that he could see it in the mirror (American Satire, 48).

One day the following February he was sent on an errand to a large coal company's office (T.Dreiser, Sister Carrie, 435).

Kunlardan bir kun stansiyadagi do`konga non olgani borsa, o`sha kungi bukri shilpigni qovoqxonada ko`rib qoldi (A.Muxtor, Chinor, 318).

Bor ekanda yo`q ekan, och ekan, to`q ekan, bo`ri bakovul ekan, tulki yasovul ekan, hakka hakimchi ekan, chumchuq chaqimchi ekan, qarg`a qaqimchi ekan (Ertakdan).

Modal forms also represent indefiniteness. In English, conditional mood and expected action is expressed by simple words: be, were, know, etc., analytical forms: should come, would know, might have taken, and so on.

I should have warned you about the baggers (J.Fowles, Daniel Martin, 496).

His hands felt as if they must have something to do (T. Dreiser, Sister Carrie, 267).

O`zbek tilida esa bunday ma`noni o`qisa (biladi), kelsangiz (ko`rasiz), borsak (olamiz) va boshqa so`zlar, ya`ni “ – sa” affiksi orqali ifodalanadi:

Toshxo`janing hovlisi ichkari – tashqarili ertakda keng chorbog` yo`llar bilan boshqa hovlilarga tutashib ketgan bolalarining xonadonlari bo`lsa kerak (A.Muxtor, Chinor, 248). Necha ming yillardan beri dehqon ahli o`zining jamoa kuchini bu qadar bevosita his etmagan bo`lsa kerak (A.Muxtor, Chinor, 256 – 257).

Comparative expression of modal means schedule

Modal means	in English	in Uzbek
Modal words	+	+
Modal verbs	+	+
Modal expressions	+	+
Modal forms	+	+

Comparative modality is considered in separate works. Z.M.Saidova's dissertation is devoted to the expression of unreality in the English and Uzbek languages through forms of desire. The use of the structure of the functional-semantic field of possibility of modality, was studied in Z.M. Saidova's dissertation.

Problems of changing the methodological direction of the typological law of modality are studied in the dissertation of A. Parpiev.

CONCLUSION

Thus, in modern Uzbek and English, the meaning of indefiniteness is expressed in this way by modal means.

METHODS OF CHECKING FOR BRUCELLOSIS IN SHEEP AND PREVENTION MEASURES

Klichov Odil Ilkhomovich*; **Allazov Anvar Salokhovich****;
Nurgaliyeva Janar Sarsengaliyevna***

^{1,3} Assistants of the Department of Epizootology,
Microbiology and virology Faculty of Veterinary diagnostics and food Safety,
Samarkand institute of Veterinary medicine
UZBEKISTAN

ABSTRACT

In this article, the authors present the results of research work on the epizootological method for the diagnosis of brucellosis diseases. Static studies have been carried out to infect the population with brucellosis pathogens. Analysis of diseases in soil and plants used as animal feed. The conclusion consisting of the event is given.

KEYWORDS: *Pathogen, Source Of Disease, Epizootiology, Diagnosis, Serological Studies, Epidymitis, Orchitis, Vaginitis, Bursitis, Inflammation, Disinfection.*

INTRODUCTION

Importance of the topic. In this article, information on methods of Disease Control, prevention measures, occurrence of brucellosis pathogen in species, infectious diseases, advantages of serological methods of Investigation, Measures for the improvement of unhealthy Farms is given.

Sampling location for the study: In Khujaabad District of Payariq district, the population received blood from sheep number 20 and blood samples were placed in special sterilized probirks and sent to serology laboratory.

The location of the research. Samarkand region Payariq District State Center for the diagnosis of animal diseases and safety of food products, serology laboratory.

Laboratory diagnostics of disease serological, bacteriological, allergic and polymerase-chain reaction (PCR) tests are used.

Thrown into the laboratory are sent to the fetus, its veil, placenta or umbilical cord, slices from the liver, spleen, testicles, lymph nodes, milk. They are quickly sent to the laboratory without being consulted by a ticket letter. If there is no possibility to send the pathological material on the same day, it is required to conserve them (except for the fetus) on 40% li glycerin.

Serological research. Serological examination is based on the search for antibiotics from the composition of the blood serum with the help of a certain antigen.

AR - agglutination reaction for this purpose this method is for sheep, 1- test tube is injected 0.04 ml of blood serum, 2- test tube 0.02ml of blood serum is injected 1:20 from a special antigen is injected into a special probe 1ml and rinsed in tripod and put on 37c0-38c0 into the thermostat for 20 hours, after removal from the thermostat + + if the positive result and the liquid at the bottom of the test tube is in the tip-clear position, then the Against at the bottom will appear in the curving position. If the result is negative, then there will be no changes in the testicle.

Roz—Bengal reaction. 0.015 ml of blood serum of sheep on top, 0.015 ml of antigen is poured, 4 minutes are rotated in the converter, if there is a positive result, then Red small-large grains are added to each other, if there is a negative result, then there will be no changes in the plate recess.

As a result of the examination, 20 blood samples were examined in sheep and the result in AR and RBP was observed in a negative state and disease pathogens were not found.

Sheep owners were given specific information on brucellosis with notes and skills.

Prevention of the disease and fight against it. To prevent the disease, it is mandatory to carry out the following work on farms:

* to ensure that animals from other farms are not included in the farm without the permission of a veterinarian specialist, as well as transfer animals from one place to another in the farm;

- animals brought to the farm are taken for 30 days of preventative quarantine and they are serologically checked;
- do not include animals belonging to the farm and the population, even with other animals in the slope, in the place of general irrigation.

For the vaccination of sheep and goats against the disease, a vaccine made of the Rev-1 strain is used. Vaccine Br. it is made from a weak virulent strain of melitensis. With it, 4-month-old and older female sheep are vaccinated 2 months before their abduction. Vaccination thawed before use in a special solution or in a sterilized physiologic solution. After 30 minutes, 2 ml is sent under the skin. After 3 weeks, the immune system appears. This vaccine can also be used against epididymitis of Rams.

In case of detection of disease in the farm, by the decision of the governor on the basis of the act of the chief veterinarian of the district (city), this area is declared unhealthy on brucellosis and quarantine is installed in it.

In accordance with the required rules of quarantine, the following are prohibited:

- introduction of all species of animals, except for bulls;

* Separation, grouping of herds, flock groups without the permission of the veterinarian serving in the farm;

• in the farm, the organization of an insulator for long storage, temporary storage of sick animals;

For disinfection recommended 5% li active chlorine lime, 2-3% li corrosive sodium solution, 2% li formaldehyde. Gong neutralized by biotermic method.

Healthy development of an unhealthy farm. If brucellosis disease is noted, then immediately a quarantine is declared on the farm. The recovery of the farm is confirmed by drawing up a calendar work plan. Recovery is carried out using a vaccine or without a vaccine with the permission of the Department of Veterinary and Livestock Development.

In accordance with the requirements of quarantine, the following are prohibited:

Bringing and releasing animals from outside.

Division of sheep into groups without the permission of the veterinarian.

Milk withdrawal, nursery kindergarten, distribute it to schools, sell it on the market. Such milk must be pasteurized for 70 minutes at 30° C in the farm, milk from the unhealthy farm must be taken in special containers.

In dairy plants is a reference book in which the epizootological status of farms of the district chief veterinary physician is described.

After two months of storage, the poppy, which is surrounded by an unhealthy farm territory, is allowed to use.

Sheep can not be milked, it is forbidden to take a bag of the embryo, it is not allowed to prepare a rennet.

For disinfection, it is recommended to use chlorinated lime with 2% active chlorine, alkali solution with 2%, chlorinated lime with 20%, formaldehyde with 2%, etc. Gong neutralized by biotermic method.

There is a special method of recovery, in which a vaccine is not used. Healthy sheep are examined every 15-35 days by AR Rozebengal probe reactions. Serological examination is continued until a double negative result is obtained on the four groups. After obtaining a negative result, the sheep are put under veterinary control for 6 months. During this period, every 3 months, a serological examination is performed by the above method. If the result is negative, the farm is considered healthy.

Among agricultural animals, if the disease of brucellosis is caused, the following activities are carried out to save people from this disease:

Serving in sheep is allowed only to people who have been vaccinated against brucellosis. All employees of the farm are provided with special clothes. It is necessary to ensure that there are hand washers, towels, soap, medicine cans in each livestock building. Livestock workers must undergo a special medical examination.

CONCLUSION

1. Currently, with brucellosis, pets, wild animals, rodents, are infected with the disease. Therefore, as a result of conducting serological examinations of agricultural animals for the prophylactic purpose every three months in order to protect all animals from the disease, we will also preserve the health of animals and humans by timely identifying the disease and making the right diagnosis to it.

2. Through timely detection of brucellosis, correct diagnosis on it, separation of animals, through which we maintain economic efficiency.

3. By putting research on brucellosis, we protect the health of animals and humans by identifying the causative agent of the disease, conducting quarantine activities.

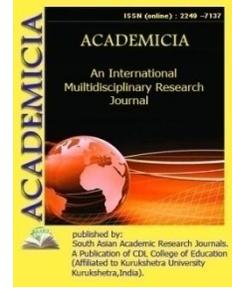

4. In the case of prevention of brucellosis it is necessary to conduct epizootic activities on time every 2 months, by conducting clinical examinations of Animals, sending pathological samples to laboratories and making the correct diagnosis, which is determined by special reactions.

AN ANALYSIS OF CHATBOT DESIGN TECHNIQUES

Mr Madhav Singh Solanki*

*SOEIT, Sanskriti University,
Mathura, Uttar Pradesh, INDIA

Email id: madhavsolanki.cse@sanskriti.edu.in

ABSTRACT

Conversational systems as a medium of communication between humans and computers have made significant progress recently. This interplay between humans and computers has paved the way for massive natural language processing methods. A chatbot is a computer program that enables people to communicate with computers using natural language. Chatbots are extensively utilized in a variety of fields, including business, education, healthcare, and many more. Chatbot design and development entails a wide range of methods. As a result, we provide an overview of the methods used to build Chatbots in this article. A few examples of chatbot design are also covered in order to provide a better knowledge of how chatbots operate and what kind of methods are available for developing chatbots. With the fast advancement of chatbot technology, it is anticipated that it would be able to supplement human limitations and increase productivity.

KEYWORDS: *Artificial Intelligence, Chatbots, Natural Language Processing, Robot, Technology.*

1. INTRODUCTION

In general, a bot is a computer system that can execute automated tasks. Bots may also be used in chat platforms and are referred to as Chatbots. Chatbots are identical to regular messaging apps, with the exception that one of the message recipients is a robot. To put it another way, the scenario is similar to when a person is talking with a robot (computer). Voice commands, text conversations, graphical interfaces, and graphical widgets may all be used to deliver the discussion message[1]. Chatbots are a popular technology these days, and they can help humans with a variety of tasks. There are many benefits to utilizing Chatbots, including the ability to aid human inquiry and provide feedback 24 hours a day, as well as the ability to increase efficiency by taking over activities for which people are not required. The capacity to reach a large audience via a messaging system and the ability to automate customized messages are the two

main benefits of Chatbots. Chatbots have been employed in a variety of sectors to provide information or execute activities such as forecasting the weather, making airline bookings, answering educational-related questions, and completing purchases. Telegram, Cortana, Slack, WeChat, Facebook Messenger, Google Assistant, and Siri are just a few of the popular apps that utilize these technologies[2].

In terms of Chatbots system development, many distinct design approaches are used to establish a medium of voice communication between a person and a machine. According to pattern matching, clever script, chat script, Artificial Intelligence Markup Linguistic (AIML), and language trickery are some of the most common design approaches used by developers. The most common method, however, is pattern matching, in which the bot matches sentences to terms in a pre-defined vocabulary. As a result, the purpose of this article is to examine several kinds of Chatbot design. In this article, there are additional examples of Chatbots systems. At the conclusion, the results are reviewed and conclusions are made[3].

Chatbots are intelligent systems that use artificial intelligence (AI) and natural language processing (NLP) techniques to communicate with users. It effectively interacts with people and responds to their questions. Organizations, government associations, and non-profit organizations are the most common users of dialogue/conversation operators. They are often communicated by financial institutions, such as banks and credit card companies, as well as organizations such as online retail outlets and new enterprises. These conversational experts are used in a wide range of businesses, from tiny start-ups to large partnerships. There are many code-based and interface-based chatbot development solutions on the market. However, they lack the flexibility and agility needed to develop genuine conversations. "Amazon's Alexa, Microsoft's Cortana, and Google's Google Assistant" are among the most popular intelligent personal assistants. These experts' components are limited. Currently, chatbots are built using rule-based methods, basic machine learning algorithms, or retrieval-based techniques, however they do not provide satisfactory results. This article offers a critical examination of chatbots, with current methods thoroughly examined and debated.

1.1 Background:

1.1.1 Chatbot System:

Chatbots, often known as Chatterbots or Chatter Robots, are computer systems that can interact with humans through messaging apps. They are capable of comprehending various questions posed by humans. They can also detect the difference between words with various meanings, such as emoticons. They must have a broad vocabulary of discussion among individuals in order to obtain the highest quality of Chatbots interaction[4]. Chatbots may seem to be ordinary chat apps, but they also include an application layer, a database, and APIs (Application Programming Interfaces) running in the background. The user interface is the interface that allows for simple communication with the user. While Chatbot is simple to use, it is difficult to accomplish in the background. The majority of chatbots save conversation logs, which are used by developers to better comprehend user demands. The logs are then utilized to enhance the discussion with the Chatbot. With the assistance of machine learning, the chatbot matches the query from the user. For example, if the user asks, "Show me the university program list" or "I need the program list," both imply the same thing. By providing the identical result, the developer may teach the Chatbot to comprehend both queries. The Chatbot is being taught, according to by analysing

hundreds of records from human conversations. The program will get more intelligent as more logs are added.

1.1.2 The Use of Chatbots:

The chatbot system is extensively utilized in a variety of fields. Chatbots are utilized in the education, healthcare, and business sectors, especially for marketing purposes, because to their versatility. For example, Facebook (Facebook Messenger), Google (Google Assistance), Apple (Siri), and Microsoft have all integrated Chatbots into their system environments (Cortana). Facebook, for example, has developed Facebook Messenger with the help of the Chatbot system. The Chatbot may help the business by acting as an automated client responder.

Aside from that, the chatbot system is also utilized in the area of education. According to a chatbot may serve as an intelligent teacher for online students. The Chatbot has the capacity to analyze natural language, which contributes to dialogue accuracy. When the discussion flow is correct, Chatbot becomes a useful educational tool. Chatbot, for example, may simultaneously answer problems and provide assistance to 100 students on an individual basis. In the healthcare sector, Chatbot are utilized to help healthcare professionals in providing assistance to patients through computer and application media. For example, the AI-Chatbot [9] acts as a conversational assistant to help people stick to health-promoting behaviours over time. In this instance, the bot acts as a bi-directional conduit between the healthcare professional and the user, advising the user on good eating habits, physical activity, food preparation, and buying to prevent the user from gaining weight.

However, recent study indicates that chatbot systems are widely used in industry, particularly for marketing purposes. Collect. Chat, for example, is an interactive chatbot designed to collect consumer data on a company's website. This chatbot may be used to gather information about product orders, surveys, client inquiries, registration, and reservations, among other things.

1.2 Review of chatbots design:

1.2.1 Chat.io:

This Chatbot technology aids companies in communicating with customers via various services in one system. It may also be linked to Facebook Messenger, allowing administrators to communicate with Facebook users. The Chatbot has a modular architecture that allows it to be connected with a website, app, native mobile app, or web-based application. The Chatbot was created using an artificial intelligence technology, which allows it to anticipate text suggestions and then give intelligent responses based on the conversation history.

1.2.2 Collect. chat:

This chatbot is used to provide marketing services. Collect. chat is a chatbot system in which the operations are focused on widget interactions with user inquiries rather than artificial intelligence. One of the benefits of utilizing a Chatbot is that it may convert a visitor into a client and engage them in a discussion without requiring them to fill out many forms. It made advantage of widget interactivity, in which visitors choose one of their goals by clicking on one of the many choices.

1.2.3 Cleverbot :

Cleverbot is an online chatbot that is similar to the one seen above. Cleverbot is a Cleverbot, an artificially intelligent chatbot. Rollo Carpenter, a British AI scientist, created it in 1997 as a chatterbot online application. Cleverbot's responses aren't hard-coded in any way. Instead, it learns from human input gathered throughout the discussion. When a user enters text, the system searches for all instances of that same phrase that match the input. It reacts to user input by determining how the user reacted to that input. This Cleverbot is also accessible on the Android and iOS platforms for mobile devices.

Cleverbot, in essence, responds to human questions by learning from past human replies. The user will enter their inquiry into the text field, and the system will search for any keywords or precise phrases that fit the query. Cleverbot will react to human after searching through its stored dialogues to see how human has previously responded to that input. Cleverbot has been updated to utilize GPU (Graphics Processing Unit) serving methods. A graphics processing unit (GPU) is a specialized electrical circuit designed to operate and change memory quickly in order to generate pictures and frame buffers for display. The portion of the engine that powers Cleverbot, as well as its API, is now accessible in the market for all developers.

1.3 Chatbots Design Techniques:

1.3.1 AIML

It is a fundamental method for utilizing markup language developed by Dr. Richard S. Wallace, which is widely utilized by developers. The primary goal of the AIML language is to convert conversational modeling into a stimulus response mechanism. This method is also known as frequent tagging. Because AIML does not require professional knowledge of a particular programming language, it greatly simplifies the creation of chatbots.

1.3.2 Pattern matching:

It is a method that many chatbots use. Essentially, this method used a matching pattern to produce suitable responses to user queries based on matching categories such as basic statements, natural language, or semantic meaning of the questions. Model of personal history, prefabricated answers, no logical conclusion, typing mistakes, and exciting key strokes are four common linguistic tactics. This approach in Chatbots utilized sentences, phrases, or paragraphs to provide diversity to the knowledge base, making it more believable.

1.3.3 Chatscript:

It is an authoring script, similar to cleverscript that helps developers create chatbots. When there are no matches in AIML, this method is employed. The focus of this approach is on providing the optimal syntax for constructing a reasonable default response[5].

1.3.4 Parsing:

It is a method of analyzing text or a string of symbols using either natural language or computer language. In addition, parsing is a method used in computational linguistics to break down a phrase or another collection of strings into its constituent components, which may include semantic or other information. This method made advantage of Python NLTK's NLP capabilities, such as trees.

1.3.5 SQL and relational databases:

These are a relatively new approach in chatbots for ensuring that bots remember past interactions. The SQL-based chatbot method was utilized to improve the capabilities of the chatbot's keyword and pattern matching by offering more storage options and increasing process speed[6].

1.3.6 Markov Chain:

This is a method for creating answers that are more relevant and, as a result, better. This method works by calculating the probability of letters or words appearing in a textual data collection.

1.4 How Chatbots Works:

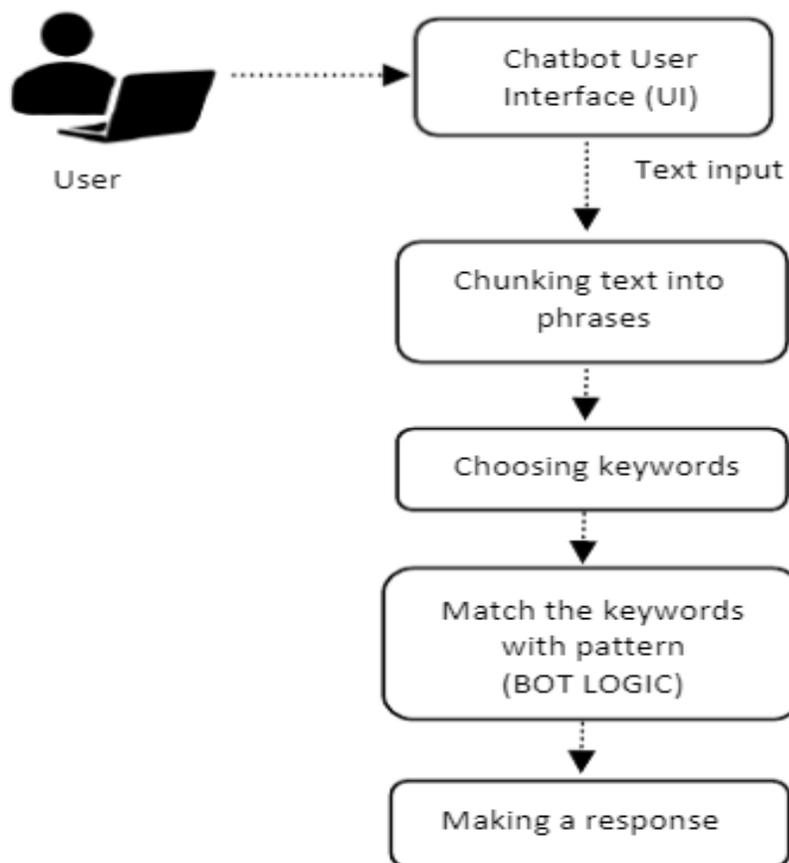

Figure 1: representation of several processes included in functioning of chatbot.

Figure 1 represents several processes included in functioning of chatbot. To begin, the user needs have access to a computer in order to utilize the chatbot user interface (UI). On the chatbot's UI, a text console will emerge, allowing users to enter text into the console. Second, the text supplied by the user in the form of a phrase will be chunked. The practice of dividing text into distinct words for tagging is referred to as chunking. The chunking procedure produces a number of significant phrases that will be utilized in the matching process later on. In the matching process, these sentences will serve as keywords. Finally, the chunking process' keywords are matched with the chatbot system's pattern. BOT LOGIC refers to the process of matching keywords to

patterns. The chatbot system's output is the programmed answer, which may be any other text or a template online form.

2. LITERATURE REVIEW

Dahiya M. presented review of chatbot in which he discussed how nowadays, chatbots are quite popular and gaining popularity as a computer communication tool. Some programs are clever enough to react in a human-like manner. A Chatbot is a kind of software like this. The design and construction of a Chatbot system are the topics of this article. We'll also look at another scenario in which Chatbots may be helpful, as well as the methods utilized to create one[7]. Atwell E et al. discussed Trials and outputs of ALICE chatbot in which they discussed how a chatbot is a conversational agent that uses natural language to communicate with users. There are many chatbots accessible to service in various areas. Chatbots, on the other hand, have a manually-coded knowledge base in their brains. This article gives an introduction of the ALICE chatbot, its AIML format, and our experiences using a corpus method to create various ALICE prototypes automatically. Along with detailing the various corpora we utilized, a description of created software that transforms readable text (corpus) into AIML format is provided. Our tests showed that viable prototypes may be created without the use of advanced natural language processing or sophisticated machine learning methods. These prototypes were used as aids for learning new languages, visualizing corpora, and answering queries[8].

Marimuthu K et al. discussed Comparative study of cloud platforms to develop a chatbot in which they discussed how There were bots before there were chatbots: The development of a chatbot ushered in a new age of technology: the conversation service era. A chatbot is a virtual person that, with the aid of interactive textual conversion skills, can successfully communicate with any human being. There are many cloud-based platforms available today for developing and deploying chatbots, including Microsoft bot framework, IBM Watson, Kore, AWS lambda, Microsoft Azure bot service, Chatfuel, Heroku, and many others, but each technique has its own set of drawbacks, such as built-in AI, NLP, conversion service, programming, and so on. This study compares all cloud-based chatbot systems, taking into account factors such as built-in AI, setup time, completion time, complexity, and so on. Finally, the comparison will reveal which cloud platform is the most efficient and appropriate for creating chatbots[9].

Miner a et al. discussed Psychological, relational, and emotional effects of self-disclosure after conversations with a chatbot in which they discussed how Abstract Giving another individual personal knowledge has positive emotional, relational, and psychological consequences. When people think they're talking with a machine rather than a person, such as a chatbot that can mimic human-to-human interaction, the results may be harmed, improved, or equal. In discussions with a fictitious chatbot or human, we looked at the downstream consequences of emotional vs factual disclosures. Whether participants believed they were revealing to a chatbot or a human, the consequences of emotional disclosure were the same. This research adds to our knowledge of disclosure and how technology affects it, bolstering the case for media equivalency as a key mechanism for the repercussions of revealing to a chatbots[10].

3. DISCUSSION

A chatbot is a dialog-exchanging system that generates a meaningful and empathic dialogue between a person and a machine by processing natural language input, which may be in the form of voice or text, and responding in the same language and expression as the human. These inputs

of speech from users may be analysed and intelligent answers from such system engines can be obtained to build up a human-like interaction utilizing various Natural Language Processing (NLP) methods using the python library, Natural Language Tool Kit (NLTK). The chatbot utilizes a fantastic algorithm to mimic a genuine human while having a restricted vocabulary. The chatbot can help you discover an entertaining companion and assist you in times of need. If a user asks a question to the chatbot, it will respond with a recommendation based on that query. The responses are relevant to the user's questions; nevertheless, if the user finds his answer to be incorrect, it will display a default message and alert the administrator. The method employed here has sophisticated reasoning built in and is intended to improve user interaction. This paper discusses several aspects of chatbots.

4. CONCLUSION

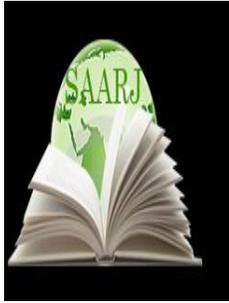

The majority of individuals are drawn to human-like systems. Many users are unaware that Chatbots may provide feedback in the form of text and voice commands, but that they can also provide interactive information via graphical interaction or graphical widgets. The primary advantage of utilizing chatbots is that they may reach a large audience even from a far distance using just messaging applications. Aside from that, these automated human-computer conversational platforms are beneficial in that they offer efficient service in a variety of fields, allowing humans to be served in a variety of ways. The reviews in this article have addressed a number of publications that have focused on chatbot design. Initially, we discussed the chatbot system and its applications in a variety of areas, including education, healthcare, and business.

Following that, we explain how certain chatbots are designed in today's market. The evaluation is based on the design effort, features, user interaction, and user interface. Finally, we demonstrate how the chatbot system works in general by presenting the chatbot system operations. Chatbots are a novel way to automate the delivery of personalized messages to users. If chatbots are properly developed and deployed, they may be used to increase user engagement and offer a positive user experience between humans and the field they serve. Designing and deploying chatbots, on the other hand, is not as simple as it may seem. Chatbot technology is rapidly evolving, with many enhancements and new functionality being introduced on a regular basis. The creation of chatbots should be meticulously planned, and selecting the right platform tools is critical since it may improve the chatbots' efficacy and efficiency.

 Mathura, Uttar Pradesh, INDIA
 Email id: mrinalpaliwal.cse@sanskriti.edu.in

ABSTRACT

The use of embedded systems has increased at an exponential rate in virtually every area, from cars to household appliances to ICT (Information Communication Technology). Embedded systems and embedded computer processors have received a lot of attention in recent years, even in desktop application environments. The inherent advantages of embedded systems over conventional desktop computers, as well as the rapid growth in the computing capacity of embedded processors, are driving this trend. Rural application platforms are designed to run applications that are needed to provide various e-services and self-help services in rural regions. In terms of power outages, irregular grid power circumstances, high temperature ranges, changing humidity, dusty atmosphere, and so on, the eco system existing in rural regions, particularly in developing nations, is mainly difficult. Although embedded systems have many benefits, they can have significant drawbacks, especially in the context of application platforms. We explore and evaluate many elements and difficulties related to the design of embedded systems for rural application platforms in this article. We also talk about how to deal with the difficulties that come with designing an embedded system for a rural application platform.

KEYWORDS: *Application Platform Embedded System, Hardware, Network, Software.*

1. INTRODUCTION

In virtually all aspects of ICT (Information Communication Technology), there has been extraordinary development and growth in the past few of decades. Many public and commercial organizations have launched e-services projects throughout the globe, and many of them have been successful. After a closer examination, it becomes clear that the bulk of these effective efforts are limited to metropolitan regions, with success rates in rural areas being much lower. This is due to a variety of technological and commercial constraints. Designing an effective

application platform that is appropriate for the rural eco-system is one of the main technological difficulties to overcome for a successful e-service project. A relevantly optimized embedded system may be developed to meet the needs of rural application platforms[1].

1.1 Embedded system:

An incorporated system is a computer-hardware system with software embedded as one of its most significant components. It's a computer-based system devoted to a certain application or product. It may be a stand-alone system or a component of a bigger system. It does not need secondary memory like a computer since its software is typically stored in ROM (Read Only Memory). Embedded systems are categorized depending on their complexity, functions, and other factors. Small scale (or low end) embedded systems, medium size embedded systems, and high end embedded systems are the three main categories of embedded systems. Small scale systems are built around a single 8- or 16-bit microcontroller, with simpler hardware and software, internal memory (both ROM and RAM), and no operating system. They run on a single thread. These are usually low-power, and some are even battery-powered. A single or a few 16- or 32-bit microcontrollers, DSPs, or microprocessors are often used in medium-scale embedded systems. These are complicated in terms of both hardware and software. The majority of them feature some kind of external memory. High-end embedded systems contain a lot of hardware and software complexity, thus they may require a cluster of processors or customizable processors and programmable logic arrays.

These are used for complicated applications that need co-designing and integrating hardware and software in the final system. These high-end computers will feature several Megabytes of external high-speed RAM (such as DDRs) and solid-state storage memory. To achieve better speed performance, some functionalities such as cryptographic algorithms, graphic processing algorithms, video decoders, discrete cosine transformation and inverse transformation algorithms, network protocols, and network drivers functions are implemented in hardware (via specialized co-processing units). These run a full-fledged operating system (in certain instances, Real Time OS) and, in many situations, can link to high-end display subsystems. As applications become increasingly computationally complex and sophisticated, there has been a lot of emphasis and research interest in this type of embedded system in recent years[2].

1.2 Application platform:

An application platform, by definition, offers services to apps. The application platform makes accessible everything needed to run/execute a program effectively. This usually comprises hardware, device drives, and operating systems, among other things. The services provided by the application platform vary depending on the application. Display support, network connection, graphic and video capabilities are all required by certain applications, such as e-services. The appropriateness of an application platform for a particular collection of apps in a certain eco system or deployment scenario is also critical to a system's success. Because an application platform has so many characteristics and so many competing needs, optimization is a big problem[3].

1.3 Requirement specifications of rural application platform:

There are a number of criteria that a system must meet in order to be used as a rural application platform. The rural eco system scenarios are very demanding, which makes the application

platform requirements highly stiff and, in many instances, contradictory. If we attempt to improve one parameter, it's possible that other values may drift out of the optimum range. As a result, in order to optimize the system as a whole, all of the parameters must be balanced in such a manner that overall system peak performance may be reached. This scenario may be accomplished by weighting and balancing the parameters properly; however, this does not necessarily imply that all of the individual parameters are at their optimal levels when examined separately. Table 1 lists the general criteria that the application platform must meet. In order to meet the overall system performance, all of these criteria are stated in broad terms. When needs are stated at a greater level of granularity, there are more scenarios that conflict, and overall performance goals suffer. Computing power is often stated in terms of MIPS (Million Instructions Per Second) or MFLOPS (Million Floating Point Operations Per Second), however these low-level metrics do not guarantee that the necessary functional requirements are fulfilled.

This is because the embedded system in question may include a SoC (System on Chip) and other components with specialized video decoding engines and Ethernet MAC engines. Even if the CPU raw horse power is low, this would be able to play YouTube videos in such situations. On the other hand, if the embedded system does not have specialized video decoding and Ethernet MAC engines, a higher CPU MIPS will not sufficient, and the high-level functional requirements will not be fulfilled. Some of the criteria listed in Table 1 are incompatible with others. Higher processing capacity, for example, is directly related to electricity consumption. CPUs with high computational power use more energy than CPUs with lower computational power (Pentium4 is around 60W vs Atom D510 is around 13 W)[4]. Point 8 (Software compatibility / Porting effort) in table 1 clashes with 4,5. Point 8 is readily satisfied by x86 architecture based CPUs (usually desktops), however points 4,5 are not. 1&8 are satisfied by an Atom D510 system, however some of the other criteria are not.

1.4 Evolution of embedded system from past to the present:

Even if there are an unlimited number of embedded systems, the principles of functioning of system components and design methods are basically the same in all of them.

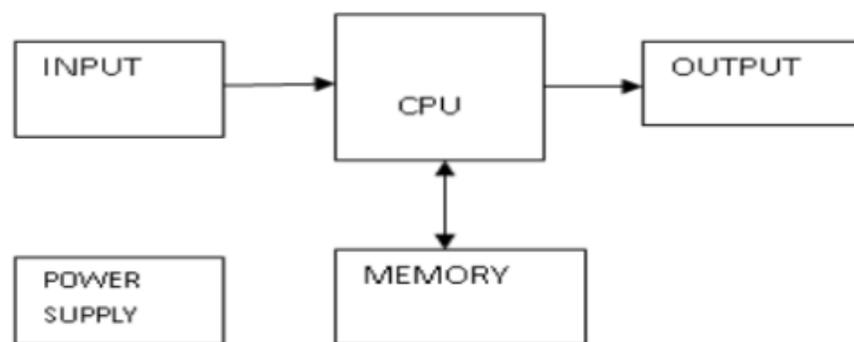

Figure 1: Representation of Generic Block Diagram of Embedded System.

Figure 1 represents generic block diagram of embedded system. Every embedded system, for example, includes a CPU and software that runs on the processor [2]. A microcontroller or a microprocessor may be used as the processor. Additionally, in order to have software, there must be a location to store the executable code as well as temporary storage for run-time data manipulations, which will be in the form of ROM and RAM, respectively. Small memory may

be housed on the same chip as the CPU in certain cases. Such configurations are common in microcontrollers. If this is not the case, one or both kinds of memory will be stored on external memory chips. Additionally, all embedded systems have some kind of inputs and outputs. Sensors and probes, communication signals, and control knobs and buttons are common inputs to the system. Displays, communication signals, and changes to the physical environment are all examples of outputs[5].

1.4.1. Evolution:

Embedded systems are made up of a CPU (which may be a microprocessor, microcontroller, DSP, or a mix of these), memory, and input/output subsystems. Every component of the embedded system has undergone a massive update. The Apollo Guidance Computer, developed by Charles Stark Draper at the MIT Instrumentation Laboratory in 1966, was one of the earliest widely acknowledged embedded systems. The Intel 4004 microprocessor was the first to be utilized in calculators. There has been a lot of change since then[6].

1.5 Design challenges:

Higher processing capacity is almost always inversely related to increased energy usage. High-performance computational CPUs use more electricity than low-performance computational CPUs. The Pentium 4 consumes approximately 60 watts and provides 9700 MIPS. The Atom D510 consumes approximately 13 W and provides 8400 MIPS, whereas the ARM Cortex A8 consumes less than a watt and provides 2000 MIPS. Desktop computers aren't built to withstand the elements mechanically or electrically. It has moving components in the hard drive and upgradeable RAM slots, among other things. Such components and designs are unacceptable in an embedded system. RAM slots are given in desktop computers in order to enable future memory upgrades, however this cannot be done in an embedded system since placing the RAM in slots is not a mechanically robust configuration and therefore lowers the mechanical strength of the system. As a result, the memory needs of an embedded system must be determined ahead of time, as field upgrades are not feasible. There is almost no realistic system that meets all of the criteria in their entirety. As a result, it is critical that the parameters/requirements be properly weighted. The importance of each metric is determined by the application and product/project contexts. Power consumption may not be as important as cost or program compatibility in certain situations. As a result, no set weighting factors exist, and they are context-dependent. The difficulty is in correctly balancing the factors and making engineering compromises as a result[7].

1.6 Dependency on eco system:

Building a sophisticated embedded system, especially for a rural application, is a difficult job in terms of both hardware and software architecture. The main design challenge here is to create an incredibly powerful system (in terms of functionality offered by the system to make it easy to use for rural people) with very low power consumption (less than 10 watts), minimal NRE cost, and while fulfilling all of the criteria stated in Table 1. In reality, in every embedded system, both the hardware and software must be co-designed. The main variables that influence the SoC selection are the total system cost, power consumption, performance, size, component availability, adaptability, software tools, and time-to-market, among others. Eco-system support, as well as SoC vendor support for both hardware and software components, are also essential for building a highly efficient system and play a critical part in the system design and development life cycle.

One of the most essential elements in designing a successful rural application platform that meets the difficult and, at times, contradictory criteria is environmental support. The following sections address the eco system's contribution to the design of an embedded system for a rural application platform[8]:

- *Dependency on eco system for Hardware design aspects:*

Various embedded system components, such as the processor or microcontroller, memory (ROM and RAM), and hardware and software interfaces (or environment peripherals), are key aspects that influence the overall design approach. In the embedded sector, the current tendency is for processors to evolve toward fully featured system on chips (SoC) that may be customized for a particular application situation. These SoCs are tailored to particular needs in order to create complicated systems with the necessary interface components. The design of an embedded system based on these SoCs requires extensive assistance from the eco system, most notably from the SoC vendor. The peripherals that are compatible with these SoCs are critical to the design's success. The vendor must supply all hardware interface information, routing instructions for high-speed important signals, packaging specifications, and assembly directions in sufficient detail. Because modern SoCs have such a high degree of integration, these principles are critical in ensuring the design of a fault-free system. Additionally, the PCB design tools needed to support SoCs are critical and play a key part in the entire hardware design cycle for an embedded system. It is necessary to confirm the availability of hardware interfaces that are particularly needed for an application platform[9].

- *Dependency on eco system for OS/Device Drivers/ BSP:*

Embedded system components affect and define how embedded software or firmware is planned and developed, regardless of whether the system is CPU or SOC based [6-8]. One essential feature of the Kernel in an embedded system environment is that it handles the board's startup and setup, memory and I/O resource management, and required drivers for both on-board hardware devices and external peripherals. For the whole embedded system, the Root File-system supplies all of the necessary run-time user-space as well as kernel-space libraries, system binaries, start-up scripts (including DDR initialization), and feature-specific configuration files. Most silicon manufacturers offer board support packages (BSPs) for their SoCs, which include boot-loaders, kernels, and rootfs. In an embedded system, these BSPs must be modified and ported in accordance with their unique hardware design in order to satisfy their specific needs. The Linux kernel, an open source operating system, supports the majority of processor architectures (x86, PowerPC, MIPS, ARM, SPARC, SuperH, and others) used in the industry for a variety of applications, with the ARM architecture having a large presence in the embedded sector. For improved system performance while using less power, Linux kernel sources provide architecture-independent, highly optimized device drivers, resource, and power management modules. Reusing the aforementioned software components is very helpful for building an optimized system since Linux offers eco system support. Only the architectural and board-specific codes must be changed to meet their design requirements. Proprietary drivers must be incorporated into the firmware; proprietary vendor support is essential and, in most instances, supplied by the vendor[10].

1.7 Approaches towards meeting the design challenges:

There are many obstacles to overcome while designing a rural application platform. There are a variety of ways to addressing the issues, however most of the time an engineering compromise is needed. The computer module (microprocessor/SoC) must be carefully chosen. By architectural design, RISC-based SoC/microprocessors are power efficient. The architecture choices are ARM and PowerPC, with ARM being the most popular in terms of penetration and eco system compatibility. The availability of necessary built-in interfaces also influences the computer module selection. Display interfaces are required for the rural application platform. As a result, SoCs with built-in display interfaces (VGA/HDMI) are an obvious option. The processing capacity of the microprocessor/SoC, on the other hand, must be adequately validated. The processing power of the row CPU in terms of MIPS/MFLOPS is not necessarily a reliable indication of performance and does not guarantee that the performance criteria will be met. The built-in hardware modules (for example, video decoders) have a significant influence in the overall performance. As a result, while choosing a microprocessor/SoC, the presence of built-in hardware engines/co-processing modules must be checked against the necessary capabilities.

It's also crucial to make sure that the necessary driver support for such co-processing modules is accessible and simple to incorporate. The memory section's design is similarly important. Because speedier RAMs (SRAM) are more expensive and power demanding, their use in designs must be restricted. For optimal performance and power consumption, low power DDR is an excellent option. The design of the power section has a significant impact on the system's total power efficiency. The use of more efficient regulators increases the system's overall power efficiency. Systems that allow sleep modes/power saving modes provide benefits in terms of power usage, however system reaction times must be checked and guaranteed to be within the necessary requirements in such designs. In an embedded system, there are also design difficulties with operating systems. In terms of the capabilities it offers and the architectures it supports, the Linux kernel has progressed considerably.

Despite the fact that Linux is monolithic in terms of architecture, all drivers may be dynamically loaded. The program sources are portable between platforms thanks to its system call interface (kernel-to-user space API). As a result, in order to use the linux kernel in any embedded system design, the kernel must be heavily customized in terms of the functionality it offers in order to eliminate resources for superfluous processes that may slow down the system. Kernel must be trimmed/customized by adjusting the whole Software interface and its modules both within and outside the SoC while keeping the HW design in mind. The necessary driver or resource management modules inside the kernel must be replaced with proprietary modules or open-source modules must be adapted for the target SoC and capabilities, according to the HW design requirements.

All modules, such as interrupt handlers, GPIO, and board-specific initialization sources for busses and peripheral interfaces like USB, I2C, SPI, and device drivers, must be modified, which presents a major barrier in effective driver and low-level software porting. The efficiency of these modules has a significant impact on the overall performance of the embedded system. There are architecture-dependent memory management and CPU-related codes; these are critical components that determine the system's functionality and performance. User-space programs and even libraries must be modified and developed for the necessary target in accordance with the HW environment. To minimize communication overhead, suitable protocols and networks/bus-

types must be carefully selected, as stated in. This allows the system to meet speed requirements while simultaneously limiting power consumption.

2. DISCUSSION

A programmed controlling and operating system with a specific purpose inside a larger mechanical or electrical system, typically with real-time processing limitations, is known as an embedded system. It's typically found as part of a larger gadget that includes physical and mechanical components. Many modern gadgets are controlled by embedded systems. Ninety-eight percent of all microprocessors are made as embedded system components. Cheap power consumption, compact size, robust working ranges, and low per-unit cost are some of the characteristics of common embedded computers as compared to general-purpose equivalents. This comes at the cost of restricted processing resources, which makes programming and interacting with them much more challenging. By building intelligence mechanisms on top of the hardware, taking advantage of possible existing sensors and the existence of a network of embedded units, one can both optimize available resources at the unit and network levels, as well as provide augmented functions far beyond what is currently available.

Intelligent methods may be used to control the power consumption of embedded systems, for example. Microcontrollers (i.e. CPUs with integrated memory or peripheral interfaces) are popular in modern embedded systems, although conventional microprocessors (using separate chips for memory and peripheral interface circuits) are also widespread, particularly in more sophisticated systems. The processor(s) utilized in each instance may be general-purpose, specialized in a certain class of calculations, or even custom-designed for the application at hand. The digital signal processor is a popular kind of specialized processor (DSP). Because the embedded system is devoted to a single job, design engineers may optimize it to decrease the product's size and cost while increasing its dependability and performance. Embedded systems are sometimes mass-produced to take advantage of economies of scale. Embedded systems include anything from small portable gadgets like digital watches and MP3 players to huge permanent installations like traffic lights and industrial controls, as well as more sophisticated systems like hybrid cars, MRI, and avionics.

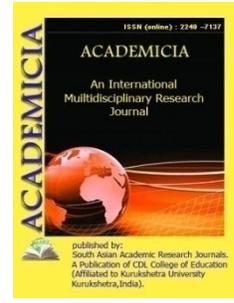

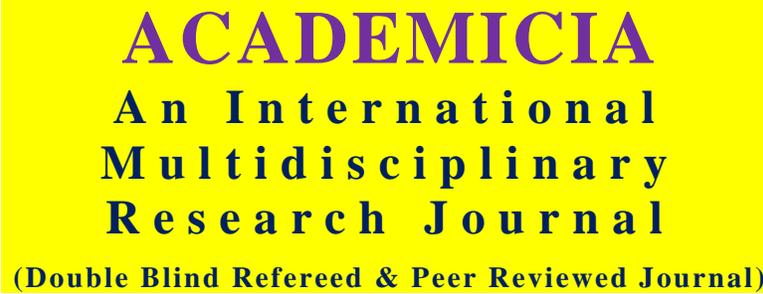

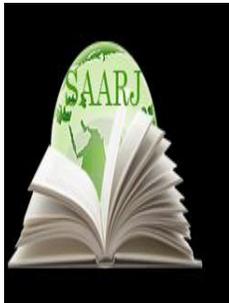

3. CONCLUSION

Embedded system design presents a number of difficulties, particularly for rural application platforms. We addressed the criteria that the rural application platform must satisfy, the difficulties that must be overcome in order to meet those needs, and future trends in embedded system design in this article. According to our findings, needs are inherently contradictory, and it is thus preferable to represent them at a higher degree of functional abstraction rather than at a highly granular level. This will be helpful in the design of embedded systems as well as in narrowing down optimization methods and analysis in the context of rural application platforms. In the future, we want to use statistical techniques and feature selection methods such as Principal Component Analysis to conduct quantitative analysis of optimization approaches for embedded systems.

ABSTRACT

This scientific article provides information about effect of the “Aktivil-3” probiotic on growth indicators, product quality, productivity, bloods hematological and morphological indicators of broiler chickens.

KEYWORDS: *Probiotic, “Aktivil-3”, Hematology, “Dekavit”, Vitamins, BIOBASE BK6190 Analyzer, Mindray BA-88A Analyzer, Erythrocyte, Hemoglobin, ESR, Hematocrit, Leukocytes.*

INTRODUCTION

Actuality. In order carry out the state requirements on “food safety” and to fulfill the tasks set for us in the provision of food, it is necessary to obtain high quality products from farm animals and poultry. To provide the population of our country with livestock products, we must pay great attention to the health, productivity and protect livestock and poultry from various diseases.

Today, our country produces a lot of mixed feeds for farm animals and poultry. It is important that their composition and nutrition, quality, safety and other parameters are responding to the state standards requirements.

We know that in addition to the growth and development of poultry based on physiological norms uses not only highly nutritious and safe feed to obtain quality meat products but also uses various vaccinations and antibiotics to prevent infectious and invasive diseases. This leads to change the quality of the products obtained from them, which has a specific effect on the body of chickens. Another example of this is that pharmaceutical preparations used in poultry primarily affect the gastrointestinal microflora, which leads to the death of beneficial bacteria involved in the digestive process.

Relevance of the topic. A lot of pharmaceutical preparations, biological additives and others used in poultry farming should prevent adverse effects on poultry and also obtain safe and quality products from them. The influence of probiotics on the complete assimilation of a variety of mixed feeds, vitamins and protein supplements to broiler chickens makes us pay special attention. As such a drug, the Ukrainian pharmaceutical company "Vetsintez" produced a probiotic in powder form "Aktivil-3".

The lack of scientifically based data on veterinary-sanitary assessment regarding to use new probiotic "Aktivil-3" in ration indicates the importance of learning effects of this probiotic on broiler chicken meat and veterinary-sanitary properties.

Scientific novelty of research. The experiment results of probiotic "Aktivil-3" on the quality and safety of broiler chicken meat are obtained, and on the basis of organoleptic, physicochemical, microbiological and biochemical indicators of broiler chicken meat scientifically assessed by veterinary-sanitary.

The effect of probiotic Aktivil-3 (produced by the Ukrainian pharmaceutical company "Vetsintez") on broiler chickens' meat and its veterinary sanitary assessment studied for the first time.

The purpose of the research. -To determine the positive effect of probiotics on general parameters of the broiler chicken's body used in veterinary practice of the Republic of Uzbekistan;

-Determination the effect of probiotic "Aktivil-3" on intensive growth of broiler chickens' weight.

Materials and methods of research

The research was conducted at "Mironqul Agrozoovetservis Scientific and Practical Center" of Samarkand city Kavsar street. For our research 90 Ross-308 broiler chickens were selected. The experimental chickens were divided into 3 groups of 30 heads each. Our research was started from the time the chicks were 7 days old.

The chickens were kept in the same conditions in accordance with all the requirements of optimal animal hygiene. Before the beginning of our experiments all chickens were clinically inspected and found healthy.

All 3 groups fed with fam ration produced at the enterprise "Afrosiyobparranda" in Samarkand on the basis of State standards 18221-2018. But irrigation was different. First group performed the control function. The second and third groups were experimental. The first group irrigated with water, without any additions. The second group irrigated with water and "Aktivil-3"

probiotic (10 L water/ 1 gr). And the last third group irrigated with water, “Aktivil-3” probiotic (10 L water/ 1 gr) and “Dekavit” vitamin (10 L water / 10 ml).

Morphological parameters of blood were determined using the hematological analyzer BIOBASE BK6190.

The results of research. The weekly weight, body temperature, and blood morphology of broiler chickens were routinely studied. The body temperature of broiler chickens in the experimental and control groups remained normal during the study. (40,5-42 ° C).

Dynamics of broiler chickens' weight

TABLE 1

Day	weight		
	1 st Control group	2 nd Experimental group	3 rd Experimental group
7	206±15,80	206±5,37	206±5,37
14	494±21,81	505±15,81	540±12,54
21	916±13,43	985±12,54	1040±21,81
28	1328±16,18	1485±20,12	1560±16,18
35	1718±20,12	1880±21,81	2010±10,43

The daily weight of broiler chickens increased by 8.1% compared to the control group of chickens when the probiotic Aktivil-3 was added to the main diet, and by 14% when the vitamin complex Decavit was given together with the probiotic.

It is known that blood parameters are the main indicators of metabolism in animals and birds. Many scientists considered that the composition of the blood depends not only on physiological state of the whole organism, but also on the condition of organs and tissues. Therefore, we performed a general blood test to compare blood parameters between control and experimental broiler chickens' groups. The number and composition of blood cells, the amount of hemoglobin and hematocrit in the erythrocyte, ESR (erythrocyte sedimentation rate) and others were determined.

The 2nd table shows information about hematological examination of broiler chickens' blood while using the probiotic "Aktivil-3" and vitamin complex "Decavit".

Morphological parameters of chicken blood

Indicators	1 st Control group	2 nd Experimental group	3 rd Experimental group
Erythrocytes, mln/mm ³	3,54±0,23	3.60±0,36	3,76±0,082
Leukocytes r, 10 ⁹ /l	22,16±0,33	21,74±0,85	21,68±0,6Z
Hemoglobin, g/l	109,16±2,97	111,12±1.79	112,05±5,10
Hematocrit	31,01±1,50	31,67±0,89	32,41±0,89
The amount of hemoglobin in erythrocyte, %	57.76±1,52	58,60±0,05	60,56±1,52
ESR, mm/soat	2,71	2,49	2,37

The table shows that the used combination of probiotics "Aktivil-3" and vitamin complex "Decavit" for broiler chickens had a significant effect on morphological parameters of the blood. However, we can note increasing amount of erythrocyte and hemoglobin concentration, reducing the number of leukocyte and ES Rindicated that the probiotics have a positive effect on metabolic processes and the clinical condition of broiler chickens.

According to our research, using of probiotics "Aktivil-3" increased the number of erythrocytes in the blood of broiler chickens by 1.69%, and the using of vitamin complex "Decavit" with probiotics increased by 6.21%. By the way, hemoglobin levels were 1.79% and 2.64% higher, than in control group. Number of leukocytes decreased by 1.90% in thesecond experimental group and by 2.17% in the third experimental broiler chickens group compared to controls. In experimental groups the ESR decreased till 0.22 to 0.34 mm /s. During theexperimental research no cases with disease or death have been reported. So, it means that probiotic "Aktivil-3" has no any bad effects to chicken's organism.

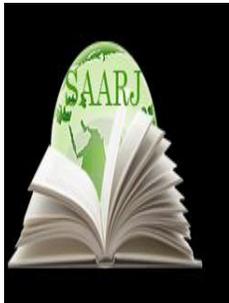

CONCLUSION

During the experiment we determined that using of Aktivil-3 probiotics by adding to broiler chickens' water increased their weight up to 8.1% compared to the control group, and also using vitamin complex "Dekavit" in combination with probiotics "Aktivil-3" increased their weight up to 14.8%.

ABSTRACT

This article studies and analyses political reality, which is of great importance, showing not only the basis of political ideology, but also the aspects of its formation. This requires, on the one hand, the study of the ideological processes taking place in the world, their content, and, on the other hand, the study of the linguistic paradigmatic features of political ideology. The role and importance of ideology in the life of society is important, it performs many functions in socio-political life. Indeed, ideology is important from an epistemological point of view in knowing society, human life, the essence of reality.

KEYWORDS: *Political Ideology, Political Language, Political Text, Discourse, Socio-Political Events*

INTRODUCTION AND LITERATURE REVIEW

The study of ideology from a historical point of view, through different perspectives, serves to shed light on the problem in all its aspects. Naturally, ideologies and political ideology have played an important role in the history of mankind. In the history of all the peoples of the world, there has been a struggle for religious or political beliefs to be replaced by knowledge derived from human life experiences. We know that geniuses such as Beruni, Khorezmi, Ibn Sina lived in Central Asia during the Renaissance or Enlightenment. But in our country, the Renaissance was limited to science, culture, and ethics, and this process, which began later in Western Europe, applied to all spheres of society. In the political sphere, it was manifested in such ideas as the emancipation of man, the equality of all men before the law. Each social group had the opportunity to propose their own philosophy and practice of building a social life based on their perceptions of the world, man, society. This was also largely due to the fact that politics came out of the shell of religion and acquired a secular meaning. As a result, various ideologies began

to struggle for the high position of religion in society and to determine the fate of people, communities, countries. While religions, by their very nature, sought truth and formed beliefs about it, ideologies sought ways to protect the interests of the classes or groups on which they relied.

There have been cases of separation of ideology and science, skepticism of the cognitive functions of ideology, their denial. In the early 20th century, Weber, M. (1916) introduced ideology and other ideological, religious structures into the realm of blind faith. In so doing, he denies the question of the scientificity of ideology. Mannheim, K. (1929) sees any ideology as a false, one-sided reflection of reality, a collection of ideas that consciously conceal the true state of events. Leaving aside the socio-historical sources of ideology, it is also common to interpret it as a weapon that unites the community (Lemberg, O., Parsons, T.). There are also cases when political ideology is represented by the psychology of individual groups and individuals (Paynes, R., Brown, D.).

The various approaches mentioned above suggest that ideology is a complex mental phenomenon. Political ideology is a peculiar form of political consciousness. It differs from political psychology in terms of its reflection on political existence. In political psychology, spontaneously formed, incomplete, unstructured feelings, passions, and in political ideology, theoretical elements, ideas, concepts of political consciousness predominate. In political ideology, the political entity is theoretically processed, specific programs are developed. Political ideology, by its very nature, is a rounded, systematized, logically coherent form of political consciousness that theoretically reflects political existence. In this sense, ideology seeks to recognize a particular model of society and political system, to theoretically justify certain types of ways and means of forming this model. In other words, along with wars and revolutions, ideas and ideologies also determine the development of humanity and culture. The fact that the twentieth century, which witnessed the most horrific wars and the bloodiest revolutions, is called the "age of ideologies" is a recognition that these wars were founded by ideological struggles that divided the world into two opposing poles.

In general, political ideology is a set of structured, logically coherent ideological views that represent and protect the interests of a particular social group, requiring the submission of people's thoughts and actions to specific goals and objectives of the use of power. In short, political ideology is a holistic ideological system that justifies the aspiration or use of power by a particular social group and envisages a specific strategy of political action.¹

Process and Development

Ideology not only reflects a new political reality through language, but also diagnoses it. Such an approach is an integral part of the ideological process, helping to express or understand reality through language, which is relevant to all spheres of socio-political life. This is the theoretical basis of political philosophy. The process of complex reflexes belonging to the theoretical field of political philosophy, and the construction of the meaning of individual words and phrases, is manifested in a peculiar way in the political linguistic paradigm. Today, the content of political philosophy is considered in the framework of the political-linguistic paradigm not only on the basis of a methodological device, but also with special attention to its paradigmatic aspects. In this regard, Bart, R. (1989) explains that in the expression of today's political reality, the paradigmatic object is seen in a similar and different relationship with another object within its

group.² I believe, reality as a human subject becomes an object of several spaces. That is why Bart, R. calls them "unit" because they are important in revealing the complex aspects of political life. This does not happen without a construction process that represents the meaning of the object. Because language plays a big role in political speech. Ferdinand De Saussure (1998), who developed the philosophy of language, describes this process as the "res-verba" based modeling. The model structure also emphasizes that the meaning of an object is comprehensive (ambiguous and plural).³ In my view, such an approach does not fully reflect the political reality. Because the political reality is fully manifested where the meaning arises, according to the "law of reproduction" inherent in the philosophy of language. Such a situation is revealed through a dialectical approach, such as the classifiers of political reality. Therefore, in the political linguistic paradigm, several objects can be divided into groups. For example, there are the following classifications of socio-political life:

- Political objects (president, government, party, specific political system);
- Social objects (social group, society, and situation);
- Cultural objects (theater, opera, ballet, literature, folklore);
- Economic objects (money, goods, price, demand, supply, capital, oligarch, small business, cooperative).

In the modern humanities, especially in political philosophy, it is accepted to divide principled ideas into two major general scientific paradigms. These are called modern (modernity) and postmodern (study of the past). In turn, their structure also differs chronologically. The modern period corresponds to the historical framework, and the concept of understanding the methodological apparatus is accepted as "ideology". Its chronological date dates back to the 19th century, when it entered the political arena with the concept of "adult" ideology, socialism, liberalism, communism, conservatism and similar conceptual ideas. Their work was based on an approach such as not mixing semantic sources with respect to the subject. Such an approach is expressed in the works of Tocqueville, Burke E., Millon the example of changes in socio-political reality.

The language of political ideology was strictly followed at that time, which is why T. Marcuse (2003) called it "open language".⁴ Its openness depends on the development of lexemes in the noun phrase in different ways and is explained by the fact that "the cut expresses a meaning contrary to its meaning". Here, it is about the classic word - ideology, used by the bourgeoisie and the proletariat, which was the dominant language in the XIX century. For the bourgeois conceptual conservatives and liberals, their sociality (the bourgeoisie explains "the subject of the technical process, the naming of nature, the creation of social wealth"), but for the socialists it led to the disruption of the social structure and general achievement tools.

Such openness is manifested in the ideological field in relation to the nature of language. Therefore, it can be understood only in terms of "other and others", unchanged. According to M. Bakhtin (1996), "in the theory of dialogue, those who have spoken before expect the right response."⁵ In this process, the character participates as an important component of the speech text. Because they regulate, modify, and transform social rhythm and value in the context of non-constant movement. Social value and their adequate connotation will change. Therefore, the linguistic field remains a source of interest in conflicts with heterogeneous education. Such

controversial points reflect the field of ideological struggles. Characters, on the other hand, are direct mediators of ideology, and without values and ideals, they remain a dead structure without a "guide to life".

All of Voloshinov's (1995) research on the philosophy of language leads to the conclusion that the word is an ideological phenomenon ("par excellence").⁶In everyday life, the word is combined with thought, forms a speech, but this is a socius language, not an individual language. According to V.Voloshinov (1995), the socio-political reality appears to be "common, accurate ideological phenomenon". A speaker's worldview, emotions and evaluation is determined, on the one hand by language structure, and on the other hand by the subject of speech. That is why M.Bakhtin (1996) and V.Voloshinov (1995) explained the language and opinion as the basis of "abstract subjectivism", the basis of the object of research, as ideological problem. In this case, they effectively use sociological laws. In particular, V.Voloshinov develops language theory in the sociological perspectives, M.Bakhtin puts the word on the first plan.

So today, it is of great importance to claim hegemony, to bring many realities to the scale of a polycentric political world, and to express political language in a multifaceted way. This not only encourages the development of diverse views, but also provides ample opportunity to fully express the political object defined from a modern perspective. This situation is recognized in science as a product of views within postmodern philosophy. That is why it is important to use the achievements of postclassical science in illuminating the linguistic paradigmatic features of political ideology.

Politics, language and time: future challenges and tasks

People communicate through a system of languages that helps to build a world of dominant social structures and interacting concepts. Personal thought is an action, a historical event. Determining the importance of the text, understanding what the author means, allows us to determine the discourse at the time the text is created. Any discourse involves the structure of linguistic conventions within constraints (a set of suspending cases) in which policy can be institutionalized and constitutionalized. Comparing the number of languages known to researchers in earlier and later times, J. Pocock describes himself as a discourse historian. At the heart of this work is not Foucault's method, but speech, literature (political), public appearance (mass method of self-expression). J. Pocock's early works are devoted to the ancient British constitution.

Pocock's major work was *The Machiavellian Moment*, which influenced modern political theory for many years, as it taught a different type of original language, the language of civic humanism or the language of classical Republicanism. The language originated in Florence in the 17th century and entered England through Harrington's *Oceana*. During the eighteenth century, civic humanism became the most acceptable language for opposition groups. Such language defined freedom as a factor of participation in civic life. A prosperous life is conceived in terms of general well-being. In this way, the language demanded the establishment of a republic with the help of honest people as a barrier against chaos and corruption.

J. Pocock identified several languages formed on the basis of modern political theory. Machiavelli pointed out that the language of civic individualism clashed with the languages that were being formed in the future. The language of civic humanism is manifested in the context of modern democratic ideology. In this case, the democratic system becomes the main model, the

political mentality of the peoples living in a democratic society is formed through the media, as most international legal documents (for example, the UN Declaration, the EU Declaration and the Charter) are written in the language of civic humanism (back to Pokok). In the logic of political science and the analysis of political processes, perceptions, all procedures are compared to democracy. In the 1920s, democratic figures were criticized, but this did not lead to a decline in the democratic goal. J. Pocock proved that the language of civic humanism, freedom in civil life, responsibility for the fate of self-sufficient citizens is determined on the basis of civil independence.

In conclusion, political text and discourse is a combination of perceiving the life from the viewpoint of conceptual-discourse methods, standards of scientific researches and activities. The primary form of analyzing a text identifies hidden factors of its political and ideological objectives as they reflect socio-political changes turning to setting the target for investigating, evaluating and selecting.

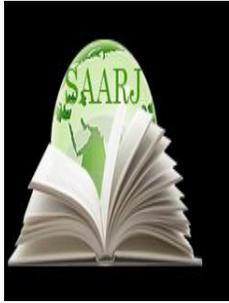

Currently, the prosperity of Uzbekistan has its reflection on the development of the Uzbek language and its application in people's lives. Language is the basis of political life, hence, political thinking remains unchanged unless national language develops. In this view, it's essential to investigate argumentative issues of the essence of political linguistics, the interrelation, the main idea that determines the notion of political discourse in terms of political-philosophical aspects. For this reason, the article mainly focuses on political language and its peculiar features. It clearly defines epistemic-linguistic problems and the frame of the tasks in developing national idea.

Political language constitutes different spheres of a culture, interpretation of the lexis delivered during propaganda and political events within various strata of population, as well as timeliness to strengthen the link with population.

A SYSTEMATIC REVIEW OF INTERNET OF THINGS APPLICATIONS

Ms Anuska Sharma*

*SOEIT, Sanskriti University,
Mathura, Uttar Pradesh, INDIA
Email id: anushka@sanskriti.edu.in

ABSTRACT

The Internet of Things (IoT) is a network of smart devices containing sensors, networking, and computing technologies that integrate and operate together to create an environment where smart services may be delivered to end users. The Internet of Things is bringing a slew of advantages to people's lives by creating an environment where smart services are available to use for any activity, anywhere and at any time. All of these features and services are delivered via a variety of IoT-based apps. Monitoring and, as a result, rapid decision making for effective management are the most essential services provided by IoT applications. In this article, we use the Systematic Literature Review (SLR) technique to survey several IoT application areas in order to understand the various methods in IoT applications that have recently been presented. The goal of this article is to classify and evaluate current research methods on IoT application approaches published between 2011 and 2018, both analytically and quantitatively. A technological taxonomy for IoT application methods is provided based on the content of current research chosen using the SLR process in this study, which include health care, environmental monitoring, smart cities, commercial, industrial, and general features in IoT applications. IoT applications are compared based on technical characteristics such as Quality of Service (QoS), suggested case studies, and assessment settings. Each study's accomplishments and drawbacks are addressed, as well as some suggestions for resolving their flaws and identifying future research difficulties and unresolved problems in IoT applications.

KEYWORDS: *Internet of Things, Quality of Service, Sensors, Systematic Literature Review, Smart Objects.*

1. INTRODUCTION

The Internet of Things (IoT) has pervaded most aspects of human life in recent years, including cities, homes, universities, industrial factories, organizations, agriculture environments, hospitals, and health-care centers. Through the IoT context, numerous capabilities such as produce/consume data and online services improve daily life and activities all over the world. The different applications that are conducted in the IoT environment carry out the facilities and smart services. Innovative apps for monitoring, controlling, and automating human activities are being developed as consumers' demands increase [1]. In addition, IoT applications use cloud service computing to create appropriate composite services for service-based applications in the IoT environment by composing existing atomic services. IoT scenarios are applied to smart device apps that consumers utilize in their everyday activities in a variety of areas. IoT applications also provide some advantages for users, such as the ability to choose the best option in any situation, as well as decision-making, management, and monitoring of environmental cloud resources. Regardless of the motives of the many application areas, they all have a similar goal: providing smart services to improve the quality of human life[2].

The satisfaction of Quality of Service (QoS) criteria is the primary focus of IoT applications. Smart services in IoT applications should support user requirements by covering QoS metrics such as security, cost, service time, energy consumption, reliability, and availability. There are several technical surveys and review articles that do not systematically focus on IoT applications. The primary goal of this study is to conduct a survey of various IoT applications in order to better understand the variety of methods that have recently been offered in IoT applications. Health-care, environmental monitoring, smart city, commercial, industrial, and general methods are among the main approaches of IoT applications that have been emphasized in chosen research[3]. We propose a technique for doing a Systematic Literature Review (SLR) and provide an overview of IoT application possibilities. This section provides a quick overview of the relevant work studies in IoT applications[4]. Existing networking standards in the IoT context should explain how they may meet the QoS requirements of objects to create a smarter IoT ecosystem.

In addition, a study of various applications and the danger of a lack of cross-domain integration in the IoT environment was given in order to achieve the interoperability and QoS criteria for delivering IoT services, such as availability, dependability, scalability, and security. The study's strength is in presenting a categorization of different current standards in the network layer and application layer in various sectors such as construction, transportation, smart city, business, and grid systems. The study's main flaws are the lack of statistical information about the discussed standards' application in various stated domains, as well as the lack of a statistic chart for the risk analysis of lack of interoperability between IoT objects and transport protocols to illustrate the judgments briefly[5]. Environmental and industrial agricultural uses of the Internet of Things Four areas are addressed in this review paper: prediction, monitoring, control, and logistics. Fig. 1, illustrates the taxonomy of internet of things, which present the proper working and implementation.

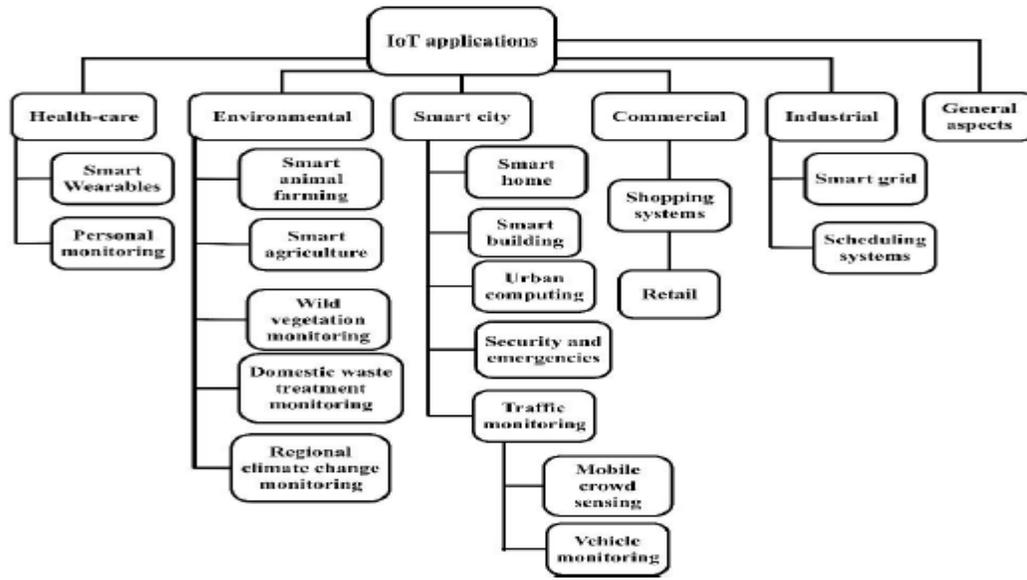

Fig. 1: Illustrates the taxonomy of internet of things, which present the proper working and implementation[6].

In this research, two significant topics are discussed and answered. The first is about the foundational technical efforts in IoT-based applications for agricultural, industrial, and environmental problems, and the second is about the infrastructures and technologies utilized in the solutions stated[7]. The majority of the articles were focused on monitoring (62 percent), followed by control (25 percent), logistics (7 percent), and prediction (7 percent) (6 percent).

In addition, according to the survey's second question, the majority of technologies and infrastructures used in IoT agroindustrial and environmental applications are divided into seven categories: visualization approaches, storage approaches, edge computing technologies, communication techniques, power sources, actuators, and sensing variables. The following problems are highlighted as outstanding issues in this review: robust standards, reduced power consumption, security, reusability of software and hardware components, cost reduction, suitable interoperability with current infrastructures, and scaling difficulties[8].

The authors proposed an architecture for IoT applications in agriculture, industry, and the environment. There are four layers in the model: application, service, communication, and physical layer. The benefit of this research is that it provides useful and complete data on studies and efforts in agroindustrial and environmental applications in the context of the Internet of Things. The paper's flaw is that it doesn't go into enough detail on the linked studies[9]. A look at the issue of service composition in smart Internet of Things (IoT) devices using the Internet Protocol (IP). The authors conducted a thorough study of smart IoT object systems, service modeling, target applications, target platforms, and service composition methods for IPs in the IoT. The survey's major flaw is that the assessment elements of availability, response time, cost, and scalability, all of which are significant quality criteria, were not examined. A survey on the Internet of Things was provided[10].

2. DISCUSSION

This research looks at issues including Service Oriented Architecture (SOA), Wireless Sensor Networks (WSN), health-care systems, and social computing. The study's major flaw is that it doesn't analyze assessment criteria like availability, energy consumption, cost, reaction time, and dependability as quality elements in this field. This part provides a thorough taxonomy on IoT applications that includes health-care, environmental, smart city, commercial, industrial, and general elements, as well as a technical evaluation of the chosen IoT applications for current research according to the applicable SLR procedure. We review papers that attempt to address some issues to support IoT applications in a specific domain, because in each type of IoT application, some problems may arise that should be focused on finding effective solutions to make IoT applications more efficient and applicable in real IoT environments. For example, important topics in smart city IoT applications include semantic-aware mobile crowd-sensing, vehicular monitoring, location finding, context-aware or QoS-aware service composition, scalable IoT platforms, handling scaled heterogeneous data streams, and many more.

As a result, the taxonomy provided in this article is based on several kinds of IoT applications in which certain subjectives were explored and addressed in the research papers chosen. In terms of difficulties and concerns in various categories of IoT applications, we first focus on the kind of IoT applications, and then attempt to analyze the primary context highlighted in the chosen articles. Because certain issues in IoT applications are universal, we add a category called "generic aspects" to our taxonomy to categorize articles that offer a solution to a particular difficulty for supporting any kind of IoT application. Of course, the suggested taxonomy's general features apply to all IoT application areas, such as applied and systematical software, assessment procedures, and IoT application performance prediction. To put it another way, the illustrated studies of the general features provided a new conceptual framework that could be used to build any kind of IoT application. A roadmap for IoT health-care service providers that was based on the consumers' perspective. Some key provided characteristics have additional effects on consumers' confirmation of such services, according to this research.

To qualify the services, a study was conducted to assess recommended criteria such as trust and risk sensitivity. The findings of this research, which focused on lifestyle illness, show that individuals in South Korea choose trustworthy and safe health-care services. The benefit of this study is that it provides a straightforward and innovative guidance for IoT health-care service providers, as well as increasing the dependability. The study's flaw is that the retrieved data is based on a fictional service description rather than a commercial service used by a health-care customer. The reaction time is also not assessed, which is another flaw a platform for developing a monitoring system in a residential setting to identify and prevent chronic medical problems such as diabetes, obesity, and depression. The problem of energy constraints is addressed in this study as a consequence of the associated expenses of recharging or replacing the batteries of wearable devices. Only solutions that are battery driven are considered in this article. The energy efficiency of wearable devices is enhanced as a result of implementing asymmetry of network resources. The suggested system is based on Bluetooth low power and is also a part of a home platform that is equipped with video cameras on the body and environmental sensors for detecting and making decisions using machine learning methods.

A prototype wearable gear and three prototype receiver units were used to test the proposed framework. The benefits of this article are that it improves the energy feeding of wearable

devices while also increasing the system's dependability. In addition, the RSSI accuracy and transmission power are assessed. The reaction time is not measured in this study, which is a flaw. In today's living in a home setting, a platform to build a monitoring system to identify and prevent chronic medical problems such as diabetes, obesity, and depression. The problem of energy constraints is addressed in this study as a consequence of the associated expenses of recharging or replacing the batteries of wearable devices. Only methods that concentrate on battery-powered devices are considered in this article. The energy efficiency of wearable devices is enhanced as a result of implementing asymmetry of network resources. The suggested system is based on Bluetooth low power and is also a component of a home platform that is equipped with video cameras on the body and environmental sensors for detecting and making decisions using machine learning methods.

A prototyped wearable gear and three prototyped receiver units were used to test the suggested framework. The benefits of this article are that it improves the energy feeding of wearable devices while also increasing the system's dependability. In addition, the RSSI accuracy and transmission power are assessed. The reaction time is not measured in this study, which is a flaw a prototype for an IoT health-care monitoring system that may be used for a longer period of time. The system was created using low-cost sensors and an existing IoT platform that is frequently found in houses. During the system execution period, the provided ad-hoc monitoring system analyzes the patient's biological variables and adds environmental data such as humidity and temperature detected by either existing sensors or new sensors. Smart phones are used as gateways in this study to gather the aforementioned data from sensors in the patient's surroundings. The proposed health-care monitoring system is used to gather business requirements in real-world scenarios in order to assess the prototype's performance and scalability.

The benefit of this study is that it makes use of low-cost sensors and low-energy-consumption devices that are often found in houses. The system's flaw is that it only provides the bare minimum of service in accordance with the gathered business needs an Internet-of-Things (IoT) system for remote mobile medical monitoring Using intelligent nodes, the authors proposed a model of human interaction and physiological characteristics. The provided solution is used to create effective emergency alert systems by storing important emergency data in a hospital database. The benefits of this study include increased speed and accuracy in physiological factor measurement, as well as the use of low-power devices. The work's flaw is that the expense was not taken into account a high-level adaptive security management method in terms of security metrics. The security objectives of E-health IoT applications, especially for the health of the elderly and the treatment of chronic illnesses, are examined in order to illustrate this concept.

In addition, the requirements of adaptive security management and decision-making are addressed in this article, which are required to establish security demands and implement adequate security controls in the face of changing security threats in such systems. Several security variables, such as security accuracy, effectiveness, efficiency, privacy level, and secrecy, are taken into account by the proposed method for adaptive security management. The major benefit of this research is that it will help to improve the security intents of E-health IoT apps. The lack of a thorough study of security metrics and adaptive decision-making algorithms in such E-health IoT applications is a flaw in this work. For IoT health-care applications, a layered context-aware data combination method is used. Context attainment, condition structure,

and implication are all part of the suggested method. Body Sensor Networks (BSN) or Wireless Body Area Networks (WBAN) that are usually positioned to the patient's body to collect physiological data for IoT health-care applications are described in this article. Because the data is gathered from various heterogeneous sources, a method known as "data fusion" is required to combine these datasets. In this article, a new method for displaying gathered data in a manner that aids in making timely precise decisions is given.

This research has the benefit of resolving issues such as sensor inadequacy, limited coverage, irregularity, and ambiguity. The paper's shortcoming is that it does not provide any particular method for evaluating the proposed solution for least error adjusted IEEE 802.15.4 transceiver for health-care applications in the Internet of Things. In this work, an improved frequency offset evaluator for IEEE 802.15.4 is proposed, with superior error modification performance than existing assessors. In comparison to the conventional design, the benefit of this research is a significant improvement in bit error amount and packet error frequency of the provided transceiver. Another accomplishment of this study is lower power consumption as a consequence of fewer retransmissions in each packet for successful packet broadcast an energy-efficient routing method for WSNs based on congestion and interference awareness. Because multiple IoT devices send their data to the same target, which is a common scenario in IoT monitoring applications, the suggested method was designed to function in networks with high traffic and interference on the connection between nodes.

The proposed algorithm employs a function for selecting the next party node that takes into account three factors: (1) the connection's signal to interference and noise ratio (SNIR), (2) the route's survivability parameter from the next party node to the endpoint, and (3) the congestion degree at the next party node. The simulation results indicate an increase in network throughput, packet broadcasting ratio, node energy consumption, and a decrease in the number of lost packets. a wireless sensor network-based online IoT monitoring system for henhouses to manage environmental variables such as temperature, humidity, CO₂, and NH₃. In this article, it is stated that in previous studies, the majority of the focus has been on building systems without considering the dependability of wireless data transfer. To address this problem, a wireless transport protocol based on the loss recovery method is proposed in this article. In order to estimate node data and increase the integrity of the proposed system, online lost data filling and duplicated data auto filtering are conducted. Furthermore, in order to meet the remote monitoring requirement, a web-based remote monitoring system was created to enable users to access the acquired information through smart phones or personal computers in order to manage the henhouse environment via an efficient interactive user interface. The primary benefit of this study is the novelty in providing an IoT-henhouse monitoring system that focuses on increasing wireless data transmission dependability. Other enhancements made as a result of this effort include increased data collecting accuracy and system integrity, as well as lower maintenance costs and upgrading. The major flaw in this study is that it does not assess energy usage.

3. CONCLUSION AND IMPLICATION

An SLR-based technique for IoT application is described in this study. This research provided a thorough knowledge of IoT applications as well as thoughts on outstanding problems. We demonstrated the SLR-based method in this literature by utilizing the exploration query on 185 articles published between 2011 and 2018. Finally, we looked at 72 articles that focused on Internet of Things applications. By 29 percent of quotas in the literature, the smart city strategy

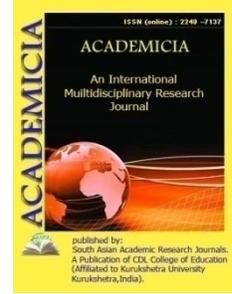

has the greatest proportion of application methods. Of course, health-care applications account for 20%, commercial applications for 14%, environmental applications for 12%, general features of IoT applications for 12%, and industrial applications for 10% of all IoT applications, according to AQ1. According to AQ2, QoS-aware methods have the highest proportion of research (21), followed by intelligent monitoring (17). In addition, we discovered that 24 percent of the research projects using the AQ3 have used the suggested method to build an IoT application. To compare the assessment factors, the reaction time factor has the highest percentage in the evaluation of the composition methods at 27%, followed by cost (18%), energy (18%), availability (14%), reliability (14%), throughput (5%), and security (4%). We may not have looked at all of the papers that are available for the SLR-based approach. Non-English, non-peer reviewed, and editorial papers, book chapters, and survey pieces were thus excluded. We conducted a thorough investigation of IoT application methods in this study, based on the results of more than 100 writers and various studies.

SOIL STABILIZERS MADE OUT OF DIFFERENT PLASTIC WASTES

Mr. Ponnu Rangam*

*SBAS, Sanskriti University, Mathura,
 Uttar Pradesh, INDIA

Email id: ponnurangam.civil@sanskriti.edu.in

ABSTRACT

The procedure known as soil stabilization for improving the physical characteristics of soil, through controlled compaction, the addition of appropriate admixtures, such as geo textiles, geo synthetics, and other materials, and other techniques. The modern soil stabilization strategy can be used to help address societal problems, such as reducing waste and extracting usable various types and other items were rapidly increasing, due to environmental concerns, using a cost-effective method to reduce the issue of plastic disposal while simultaneously boosting California Bearing Ratio (CBR). The current research is aimed at addressing problems in Amaravathi, the contemporary capital of the ancient state of Andhra Pradesh. The management of plastic trash without generating environmental risks is getting increasingly complex. As a consequence, utilizing plastic strips is cost-effective and efficient. There has been a positive impact on soil characteristics since adding plastic into the mix. Soil stabilizers may be manufactured out of plastic. An experimental programme was carried out for the Black Cotton Soils stabilization in Amaravathi, employing percentages of plastic strips (varying from 0 percent to 8 percent by weight) determined using the California Bearing Ratio Test.

KEYWORDS: *Bearing, Moisture Content, Plastic Waste, Properties, Shear Strength, Soil Stabilization, Water.*

1. INTRODUCTION

Soil is the most vital component of nature, since it supplies for all of life's basic requirements such as food, shelter, and clothes. Soil is a thin layer of soil formed by the weathering of rocks that covers the earth's surface. Soil is made up of organic matter, crystals, gases, liquids, and animals, all of which work together to support life. The Pedosphere is the Earth's soil body, and it performs four important functions: it is a tool for plant growth, a source of water preservation,

transport, and purification, a modulator of the Earth's environment, and a sanctuary for species. Soil is the result of the interplay between temperature relief, plants, and parent materials over time. It occurs throughout time as a consequence of a number of physical, chemical, and biological processes, including weathering and erosion. The soil is the most essential component of this ecosystem since it includes all of life's fundamental requirements, including food, shelter, and clothing. India's largest soil deposit is black cotton soil, which has a strong propensity for development. Soil stabilization is the technique of utilizing geo textiles, geo synthetics, and other materials characteristics[1].

Laterite soils include fine-grained light-textured residual soils with red, orange, and yellow colors, as well as nodular gravels and cemented soils. They can be as small as a clump of dirt or as big as a giant rock. The presence of iron and aluminum oxides or hydroxides, especially iron oxides, which give the soils their hues, differentiates them. In engineering, the word laterite refers to coarse-grained vermicular concrete materials such as major laterite. The novel soil stabilization method may be utilized to help address social problems including waste reduction and material extraction. The exploitation of plastic in many activities and other goods is accumulative, and its disposal has long been an issue owing to environmental concerns. The current study is aimed at addressing problems with Amaravathi, the capital of Andhra Pradesh's newly formed state[2]. Laterite soils mimic fine-grained sands, gravels, and soft rocks in their behavior. Laterite is usually transparent or vesicular in appearance. Under impact, some laterite particles seem to crush rapidly, disintegrating into a plastic-like soil material. When subjected to drying, laterite soils may self-harden, or they may include large amounts of hardened laterite rock or laterite gravel if they are not self-hardening. The present research used plastic garbage as a soil stabilizer to conduct an experimental project for the stabilization of Black Cotton Soils in Andhra Pradesh's newly formed Capital Region, namely Amaravathi. Plastic strips were added to the Black Cotton Soil in different amounts (from 0 percent to 8 percent by weight) [3]. The Eastern Ghat of Orissa, the Southern part of the Western Ghats, the Malabar Coastal Plain and Rathnagiri of Maharashtra, and certain regions of Andhra Pradesh, Tamilnadu, and Karnataka are also home to laterite soil. Laterite soil makes up approximately one-sixth of all soil on the globe, and it spans 2.48 million square kilometers in India[4],[5].

1.1. Needs of Stabilization:

- Enhanced tensile strength as well as stiffness of the material.
- Decline in pavement thickness.
- Enhanced resistance to the effect as well as durability of water.
- Decline in swelling potential.

1.2. Advantages of Soil Stabilization:

- It improves the strength of soil, thus, increasing the soil bearing capacity.
- Stabilization improves the workability and durability of soil.
- Reduce dust in work environment.
- Conserves aggregate materials.

- Reduce cost and conserves energy.
- It is also used to provide more stability to the soil in slope or other such places.

1.3. Disadvantages of Soil Stabilization:

- It does not destroy or remove the contaminants.
- It can be difficult to predict long term behavior.

1.4. Application of Soil Stabilization:

- The soil stabilization procedure can be used for the following purposes: • Reducing the permeability of the soil.
- Increasing the foundation soil's bearing capability.
- Increasing the soil's shear strength.
- Improving the durability of the product in high-moisture and high-stress environments.
- Improving natural soils in order to build motorways and airports.
- Controlling the grading of soils and aggregates in the building of roadway and airport bases and subbases.

1.5. Methods of Soil Stabilization:

- Mechanical stabilization
- Soil-cement stabilization
- Soil-lime stabilization
- Chemical stabilization
- Electrical stabilization
- Stabilization by grouting
- Stabilization by geotextile and fabrics
- Reinforced earth
- Using bio enzymes

1.6. Types of Stabilizers:

- Plastic
- Lime Cement-Fly Ash(LCF-A)
- Lime-Fly Ash
- Portland Cement
- Bitumen
- Lime

Plastic is a flexible organic substance that may be molded into solid structures and a range of synthetic compounds. Plastics are high-molecular-mass chemical polymers that also include other chemicals. Since plastic is utilized in a number of goods such as chairs, mugs, polythene containers, and polythene sheets, utilizing it as a soil stabilizer would alleviate the problem of disposing of the plastic while also improving the cost-effective way.

1.7.Importance of Plastic:

- It improves the soil's shear strength, tensile strength, and CBR.
- It may significantly enhance the characteristics of the soil used in road infrastructure construction.

It is becoming increasingly difficult to handle plastic trash without harming the environment. As a consequence, utilizing plastic strips is both cheap and dependable. Since putting plastic into the mix, the characteristics of the soil have improved. Plastic is able to be used to produce soil stabilizers. The addition of trash from plastic improves the laterite rock's unconfined compressive power. The CBR values rise when plastic trash is introduced. Plastics of a range of forms and sizes may be utilized. Stabilizers are available in a broad variety of forms and sizes. Limited concentrations of plastic may be detected. Plastics may be investigated in a number of soil types[6].The enhanced CBR advantage is designed to boost the natural ground subgrade and base courses beneath the new carriage building's load bearing capacity. Although recycling may help decrease trash that ends up in landfills, wetlands, and the environment, most local governments can only recycle a few kinds of plastic[7].

A permeable combination of soil particles is referred to as soil. Pores may hold both water and air. Voids are a word used to characterize pores. If the wet, and if the spaces are clear, the soil is termed dry. To evaluate moisture content, soil samples are dried to the point where only pore water evaporates. Calculate the liquid limit of a soil sample using the cone penetration technique. The water content is measured using the cone penetration method, while the depth of penetration of a typical 20 mm cone is acquired using the cone penetration technique. In five seconds, the depths to which a typical metal cone penetrates samples of soil paste produced with different water concentrations are evaluated. Normal and modified compact tests were conducted out on natural laterite soil. 3000g of oven-dried dirt was sieved at 20mm and compacted with a rammer in full. Weigh the mound and the sample, then enter the results on the data sheet. To evaluate the moisture content of the soil, a tiny sample was collected[8].

2. LITERATURE SURVEY

S. V. Singh *et al.* presented in the article that infrastructure is a major driver of the Indian economy's overall development. The cornerstone of any system is essential. The soil surrounding the foundation is important to its strength. Expansive soils, such as black cotton dirt, are infamous for creating foundation problems. Swelling, shrinking, and unjust settlement are the problems. Plastic pollution has been one of the world's most significant problems. Year after year, the usage of throwaway containers, bottles, and other plastic products increases rapidly. As a consequence, individuals are facing a range of environmental problems. The objective of this analytical study is to focus on soil stabilization utilizing waste plastic goods. To evaluate the changing properties, tests such as the liquid limit, plastic limit, regular proctor compaction measure, CBR test, and unconfined compressive strength (UCS) were conducted out[9].

S. Saravanan *et al.* articulated in the article describes a technique for characteristics of soil, through the use the addition of lime, as well as waste materials such as fly ash, phosphogypsum, and other minerals. This contemporary soil stabilization technique may be utilized to assist solve societal problems such as trash reduction and the extraction of useable polythene containers, bottles, and other similar things. The usage of polythene containers, bottles, and other similar products is on the increase, resulting in a plethora of environmental problems. As a consequence, disposing of plastic trash without harming the environment has become a serious issue. Since good quality soil for embankments is rare, utilizing plastic bottles as a soil stabilizer is a cost-effective option. This study includes a comprehensive examination of the use of discarded plastic bottles for soil stabilization. Plate load studies on soil reinforced laden bottles divided in half at one-third locations of the tank were utilized to conduct the research. When the test results were compared, it was found that applied pressure was the source of the issue. The proper percentage of plastic strips in the soil was calculated, and plate load tests were carried out using this proportion. The bottle strips have a direct effect on increasing soil strength[10].

3. DISCUSSION

The increased CBR rating reflects the natural ground subgrade and base courses beneath the existing carriage building's intended capabilities. While recycling may help to reduce the quantity of trash that gets up in land fields, rivers, and the environment, most local governments can only recycle a few types of plastic. The IS: 2720 defines a method for measuring the specific gravity of soils, which may be used to estimate the degree of saturation and unit weight of soils. In soil engineering, unit weights are needed for pressure, settlement, and stability issues. The Figure 1 illustrates Pycnometer is a gadget that is used to measure specific gravity.

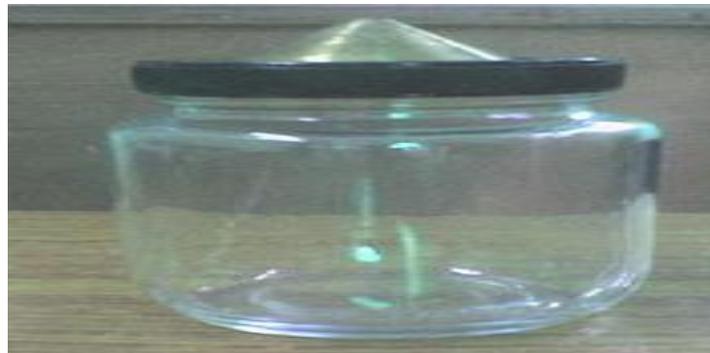

Figure 1: Pycnometer Which Is Used To Determine Specific Gravity.

Boulder > 300 mm, Cobble < 300mm and > 80mm, Gravel (G) < 80mm and > 4.75mili-meter, Coarse gravel = 80mili-meter to 20mili-meter, Fine gravels = 20mili-meter to 4.75mili-meter.

Sand (S) < 4.75mili-meter and > 0.075mili-meter.

Coarse sand = 4.75mili-meter to 2mili-meter, Medium sand = 2mili-meter to 425 μ , Fine sand = 425 μ to 75 μ .

Silt > 75 μ and < 2 μ and Clay < 2 μ .

A porous mixture of soil particles is referred to as "soil." Pores may hold both water and air. Voids are a word used to characterize pores. If the gaps are filled with water, the soil is regarded saturated, and if the spaces are empty, the soil is considered dry. To assess moisture content, soil

samples are dried to the point where only pore water evaporates. Calculate the given soil sample using the cone penetration technique. The cone penetration technique is used to determine the water content of a soil sample when the extent is assessed. The depths at which a regular may be recognized in five seconds.

For natural laterite rock, both conventional and modified compact tests were conducted. A total of 3000g of oven-dried dirt was sieved at 20mm and compacted using a rammer. Weigh the mould with the sample and write down the findings on the data sheet. A tiny sample of soil was collected to assess the moisture content.

$$V_b = \frac{W_1 - W_2}{\gamma}$$

Where, W_1 is equal to the Weight of mould with

w is equal to the moisture content

W_2 is equal to the Weight of empty mould.

V is equal to the Volume of mould.

The dry density of the soil is calculated as follows

$$\gamma_d = \frac{\gamma_b}{1+w}$$

Where, γ_b is equal to the wet density of the compacted soil

The Optimum moisture content (OMC) as well as the maximum dry density (MDD) of natural soil are calculated, and the quantity of soil required for CBR is measured using the matching dry density. The soil specimen was put in the mould, and the surcharge weight was placed on top of it. The samples are loaded and examined in both unsoaked and wet circumstances. The load for 2.5mm and 5mm penetration is recorded, as well as the CBR for 2.5mm penetration. The main aim of this, according to the Indian Standards (IS) standard on techniques of test for soils. The IS: 2720 provides a formula for calculating the basic gravity of soils, which may be used to calculate the degree of saturation and unit weight of soils. In soil engineering, unit weights are required for strain, settling, and stability issues. The Table 1 displays Pycnometer which is used to measure specific gravity. In this current case study, the technique researchers have utilized is Mechanical stabilization method for soil stabilization.

$$\text{Specific gravity of soil} = \frac{\text{Density of Water at 27 c}}{\text{Weight of water of equal volume}}$$

The relative proportions of different grain sizes in the soil are determined using the standard grain size measuring test. Plotting the Figure 2 shows the percentages of grit, sand, silt, and mud. The results were disputed.

TABLE 1: CASAGRANDES METHOD UNDER CONSISTANCY LIMITS. FOR PRESSURE, SETTLING, AND STABILISATION PROBLEMS IN SOIL ENGINEERING, UNIT WEIGHTS ARE NEEDED.

No of blows	43	41	36	30	26	18
Moisture content determination	26%	28%	30%	32%	34%	36%
Weight of container	10	10	10	10	10	10

(W1)						
Weight of container + wet soil (W2)	20	20	20	20	20	20
Weight of container + dry soil (W3)	17.42	17.56	18.01	18.38	19.02	19.42
Moisture content (w) $w = \frac{W_w}{W_d}$	34.77	32.28	24.84	19.33	10.87	6.16

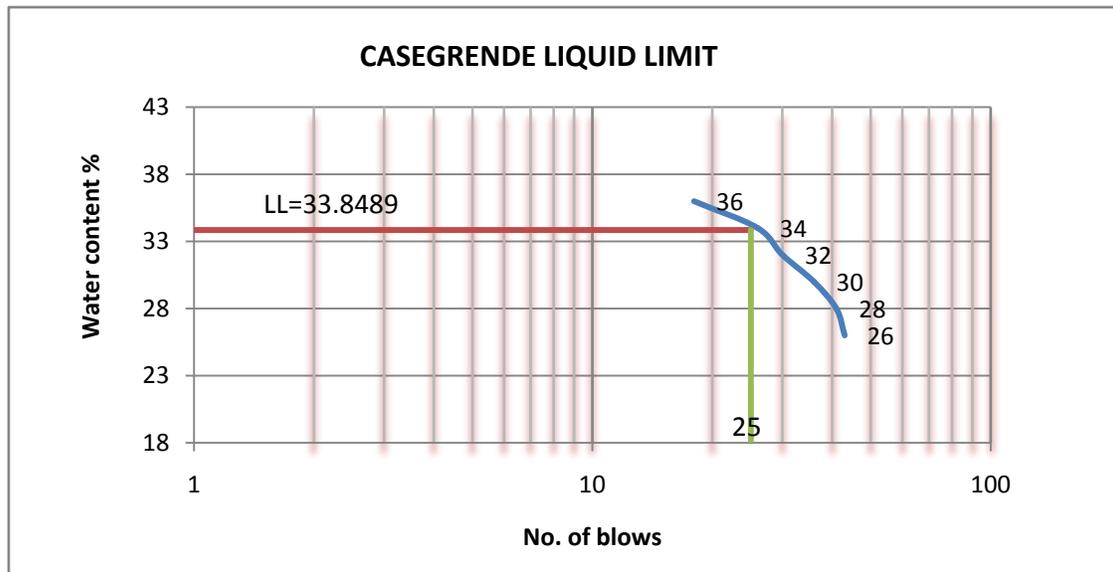

Figure 2: Casagrende's Liquid Limits. The Basic Grain Size Estimation Test Determines The Relative Proportions Of Different Grain Sizes In The Soil.

Result achieved for the technique used and formulas performed is stated as Liquid limit of the soil = 33.8489 percent

The soil is the most crucial component of this ecosystem, since it supplies for all of life's basic requirements such as food, shelter, and clothing. One of India's major soil deposits is black cotton soil, which has a high tendency changes. Plastic is a pliable organic chemical combining of components into stable structures. Since plastic is utilized in a variety of products such as benches, mugs, polythene bags, and polythene sheets, utilizing it may solve while also raising a cost-effective manner.

1. Types of Plastic:

- Polystyrene (PS)
- Polypropylene (PP)
- Low-density polyethylene (LDPE)
- Polyvinyl chloride (PVC)
- High-density polyethylene (HDPE)
- Polyethylene terephthalate (PET or PETE)

- Other types of plastic

Out of these plastics people have used Polyethylene sheet of plastic as a soil stabilizer.

Advantages of Plastics are Durability, it does not get rust or corrode, Good insulators, Resistance to chemicals, Can be formed into complex shapes whereas Disadvantages of Plastics are Expensive, Not friendly to the environment, Energy needed to produce them, don't break down or degrade easily.

2. *Plastic Characteristics:*

- Plastics have a lengthy life span.
- Plastic is a reusable and recyclable material.
- Plastics are less expensive than tin glass and steel.
- Plastic has a high degree of mechanical strength.
- Plastic may be formed into a wide range of forms and sizes.
- Plastic has great optical properties
- Plastic is strong, light, flexible, and durable.

3. *Applications of Plastics:*

- Good chemical resistance.
- Good dimensional stability.
- Good electrical insulation.
- Good for friction and wear.
- Good weathering and bearing.
- Easy to weld, bond and fabricate.
- Auto-clavable and Heat Sealing.

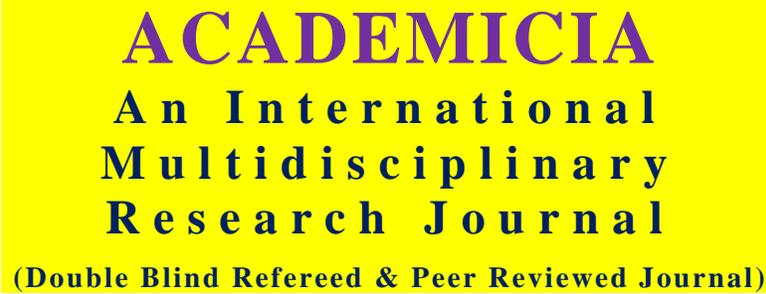

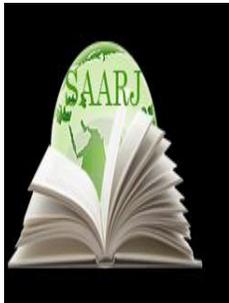

4. CONCLUSION

The soil is the most important component of this ecosystem since it holds all of life's needs, including food, shelter, and clothing. Black cotton soil, which has a strong propensity for swelling and shrinking owing to changes. Soil stabilization is a method for improving bearing capacity, through the use of geo synthetics, geo fabrics, and other materials. Soil stabilization approach is utilized to help solve societal issues including waste reduction and the extraction of valuable materials different tables, cups, and other products has been exponentially growing, always due to environmental issues, using would lessen the issue of plastic dumping while increasing a cost-effective manner. The management of plastic trash without generating environmental risks is getting increasingly complex. As a consequence, utilizing plastic strips is cost-effective and efficient. There has been a positive impact on soil characteristics since adding plastic into the mix. Soil stabilizers may be manufactured out of plastic. The inclusion of plastic trash improves the unconfined compressive strength of laterite rock. With the buildup of trash from plastic, the CBR values increase. Plastics of different kinds may be utilized. Stabilizers

come in a range of forms and sizes. Plastic may be found in tiny quantities and it can be evaluated for usage in different kinds of soil.

LEXICO-SEMANTIC FIELDS OF “EYE” IN ENGLISH AND UZBEK LANGUAGES

Gadoeva Mavlyuda Ibragimovna*

*Docent of the English linguistics department,
Bukhara State University
UZBEKISTAN
Email id: gadoyevamavlyuda59gmail.com.

ABSTRACT

The article deals with the structural and semantic features of the constituent lexemes of the lexical-semantic fields of “eye” in modern English and Uzbek. The semes adjacent to it will be considered its variants. Elements in this system are in a hierarchical relationship to each other.

KEYWORDS: *Lexical-Semantic Field, Archaism, Lexeme, Dominant, Center, Periphery, Surface Structure, Deep Structure, Thematic Groups*

INTRODUCTION

Modern linguistics is characterized by an enhanced interest in the problems of the comparative study of linguo-pragmatic and cognitive features of the languages of the various morphological systems.

This article makes an attempt to illuminate this issue in terms of semantic analysis of the structure of the concept “eye” in English and “ko`z” in Uzbek. The importance of the study of this scientific article is determined by the progress of intercultural interactions.

Particular importance is the fascination of the material of the English and Uzbek languages belonging to different linguistic groups to the comparative semantic research, the identification of both common features - universals and distinctive features essential in any language.

The interaction of the languages of the Germanic and Turkic groups has been little studied, and therefore it is most attractive and relevant in the context of expanding the boundaries of communication and searching for new ways of dialogue between various world cultures.

The lexico-semantic field of “eye” performs an important information function in the process of communication, since it has an extensive network of semantic fields. At present, “linguistics” has appeared and is purchasing the rights of citizenship all over the world – “pragmatic linguistics”.

The term “pragmatic linguistics” could be very suitable in order to draw attention to one of the branches of our science, until now remained overlooked and not revealed in any of the dissimilar and different old and new “linguistics” [2, 27] one of the unexplained complications of pragmatic linguistics is the problem of correlating semantics and pragmatics.

By the lexical-semantic field of “eye” we mean a system of linguistic units integrated around the invariant of archaism “eye”, having their semantic function in this field, differing in morphological and syntactic structure, being in semantic connection with each other, to varying degrees or polyfunctional, being in paradigmatic or syntagmatic connection with each other, active and passive in function, having different emotional and expressive colours in terms of expression [3, 20].

Like any linguistic field, the lexico semantic field of “eye” has a plane of expression and a plane of meaning.

By the plan of the meaning of the field, we mean the general archaism “eye”, as well as, in varying degrees of understanding, the complex of semes.

By the plan of expression of the field, we mean different lexical units formed within the structure of the phonetic, lexical, grammatical rules of the language, essentials of oral and written speech, having visual and auditory forms and united in the opposite direction of the common meaning of “eye” [4,5].

The study of the linguistic properties of the linguistic units, constituting separate paradigmatic series and combined in one of the field based on the common meaning of “eyes” has both theoretical and practical significance.

The analysis of lexemes given in the explanatory dictionaries of English and Uzbek, illustrated that the lexeme “eye/ko`z” in all the languages is polysemantic and, moreover, as in a single case and as part of phrases and phraseological units, consumptions different meanings[9,11].

In this case, it is necessary to determine from a number of meanings, associated with the lexeme “eye”, an invariant which has a common meaning in the languages being compared.

Taking this circumstance into consideration, we have analyzed the lexical unit “eye” in the form in which it is verified in the dictionaries, and also analyzed the units that have morphological and syntactic structures associated with the given lexeme [10,5].

It is noted in the Webster's Third New International English Dictionary that “eye”, being a noun, is related to the lexemes “eage” in old English, “eie” in medieval English, “ouga” in Old German, “oculus” in Latin, “oscs” (two eyes) in Greek and “aksi” in Sanskrit, its direct and main meaning is “an organ of sight” .

By translating, we have established other meanings of the word “eye” in the categorization in which they are given in the dictionary:

1) “Eye” is both protective, supporting, close-located eyelids, eyelashes, eyebrows; the inner space of the eye and the place surrounding it.

2) The lens of the eye (a girl with blue eyes);

3) See with the eye or distinguish (imagine, anticipate), as if seen by the eye (a keen eye for a significant detail), see with the power of physical and mental perception (a good eye for what is essential), the ability to see through the imagination (on eye for beauty, He has on artists eye).

4) look (in the public eye);

5) look closely, observe at close range (under the eye of the employers);

6) point of view: an opinion about something (in the eye of the law);

7) a thing that looks like an eye:

a) a hole in the needle (eyelet);

b) a hole for a rope, a hook, in particular, in a tool of labour:

a hole for a hammer, an ax;

c) the tip of the plant (beans, soybeans).

So, the lexeme “eye” in English has more than 20 meanings. In the explanatory dictionary of the Uzbek “eye” has 4 meanings.

The word “eye” is enumerated the following basic meanings as a noun: [4 ,4]

The organ of vision of a living being:

Кўз косаси (eye socket) Қарға қарғанинг кўзини чўқимайди (A raven will not peck out a raven's eyes);

Look and gaze: Мансур ҳамон индамас, кўзларини бир нуқтадан узмас эди. (Mansour was still silent, without taking his eyes off from one point);

The ability to see: Cloudy eye. Blind. “I used to sew skull-caps, now it is beyond the power of my eyes”.

”Some locations of things, objects (in a figurative meaning). Window glass. The place where the spring comes from.

In all of the above dictionaries, the lexeme “eye” in the basic meaning is understood as “organ of vision of a living being” Other distant principles head-to-head to it are given in sequence.

In addition, in the process of an analysis conducted among informants (specialists in the English and Uzbek languages, as well as young people belonging to different social strata were involved as informants), when asked what the word “eye” means, 90–95% of respondents answered that the “eye” is an organ of vision, then they enumerated other meanings [7,340].

Based on the above, we have chosen the meaning of “the organ of vision” as the archaic of the lexeme “eye”. The semes adjacent to it will be considered its variants. Elements in this system are in a hierarchical relationship to each other.

This relationship can be considered a stepped relationship. The variant values are connecting to the archsite “eye”. Close variants express the meaning of “eye” and associated meanings corresponding to its tasks [8.812].

For example, in the English language - sight, vision (look, glance, gaze, point of view), scrutiny (close), point of view, something having on appearance suggestive of on eye.

In the Uzbek language:

ko`z qismoq (to blink an eye, that is, to give any sign or signal to close one eye);

ko`z oldi, ko`z o`ngi (before the eyes),

ko`z tashlamoq (cast a glance; look, take a look),

ko`zdan qolmoq (to lose the ability to see),

ko`zi xira (cloudy eye - poorly seeing).

For example,

in English, an eye for an eye (as far as causing suffering, so punish;

an eye for an eye, blood for blood);

to see eye to see (with) (completely agree, have a similar point of view);

to give an eye to (to patronize, look after), my eye (expresses surprise and discontent);

in Uzbek:

uzukning ko`zi (eye of the ring);

ko`z ostiga olmoq (to take into account);

ko`zi yorimoq (to give birth);

ko`zini yog` bosmoq (do not admit other people, even those they know; be arrogant);

If in lexemes with a distant meaning the archaism “eye” is weakly expressed, in lexemes with a similar meaning it finds its expression with varying degrees of accuracy.

For example, the idiom “look out of the corner of the eye” means looking from one side of the eye.

This circumstance is also observed in English: Keep an eye on him. The archiseme “eye” and its variant meanings can be manifested through lexical units that have different morphological structures: simple, complex, paired compositional combinations, phrases, phraseological units.

We have established that in English the meaning of lexeme “eye” (noun), “eye” (verb) is expressed:

1. through consequent words:

eyeglass, eyewitness (noun, verb),

complex eyed (adjective),

eyedness (noun),

eyeful (noun),

eyeless (adjective),

eye some (adjective),

2. by compound words:

eye mindedness (noun),

eye – popper (noun),

eye – server (noun),

3. through word combinations:

to close ones eyes;

in public eyes,

to keep one’s eyes on;

4. by phraseological units:

all the eye,

to cut on eye,

up to one’s eyes;

5. through slang:

“in a pigs eye”.

In the Uzbek language, the main meaning of the lexeme “eye” and its variants are expressed through morphologically simple words:

ko`z - eye (noun);

ko`z ostiga olmoq - to mark (verb);

ko`z anak - deepening (noun);

derived words:

ko`z munchoq - beads (noun);

ko`z oynak - glasses (noun);

ko`z boylogich - a magician, trickster (noun);

ko`z bo`yamachi - an eyewash (noun);

ko`z li - with an eye;

ko`z siz - without an eye;

ko`z-ko`z - to show others;

word combination:

ko`z quloq - to look out, to be a watchdog;

ko`z dan kechirmoq – to inspect;

ko`z qiri bilan qaramoq - look out of the corner of your eye, to inspect out of the corner of the eye;

ko`z olaytirmoq - to stare at the eyes;

ko`z-ko`z qilmoq - showing off, showing to others, show others;

ko`zi ochilmoq - sober up, reveal the true state of affairs, etc.

We divided the lexemes of the field based on the “eye” archaism into semantic groups:

1) The lexemes expressing the movement of the eye as an organ of vision: catch, cry, shed a tear, blink, quit, throw, run, take a look, stare, look back, to cry, to win, to gaze, to look, to store, to have a look at, to sere wanes eyes, to peep, to blinn.

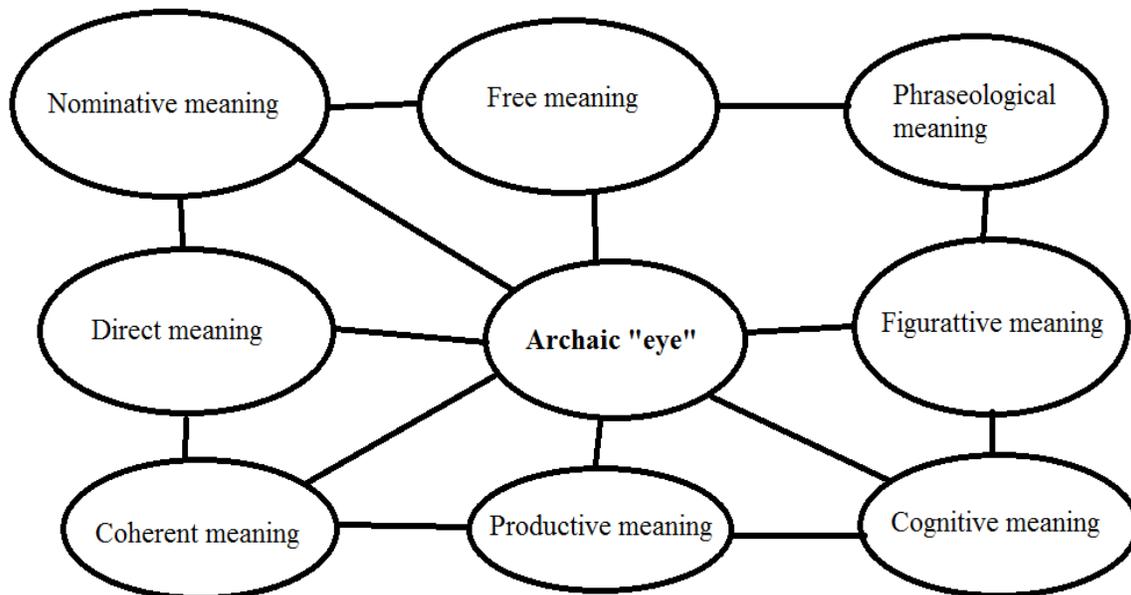

2) Lexemes expressing the colour of the eye as an organ of vision: black, green, blue, red, turned blue, reddened.

3) Lexemes expressing the shape and size of the “eye” as an organ of vision: large, small, beautiful, narrow, oblique, deer, bulging, languid, screw, round, big, wide, narrow.

4) Lexemes not directly related to the tasks of the “eye” as an organ of vision: look, tip, ulcer, spring, board, wood, ring, hungry, not satiated, give birth, leave life with open eyes, notice, stare, close, gawk, needle eye, the opening of a spring well.

5) Lexemes expressing the state of the eye as an organ of vision, as well as the ability to see in general: blind, open, closed, sharp, good, bad, weak, invisible, distant, further, clear, dull, narrow-minded, shadowy, obscure, big cross-eyed, strabismus (знание), lop-sided — eyed, cross — eyed, long — sighted, far — sighted, presbyopia (medical), weak, short — sighted, near — sighted, myopic (medical), shortsightedness.

6) Anatomy of the eye as an organ of vision and related medical terminology: glasses, ophthalmologist, cut, remove, place, microscope, lens, retina, pupil, cataract, apple, ciliary body, orbit, protein, eye pit, eyehole, oculist, eye piece, (ocular), iris, eye ball, ophthalmologist. On the basis of the conducted scientific analysis, we have established the following meanings of the “eye” archiseme, which are presented below [6,5].

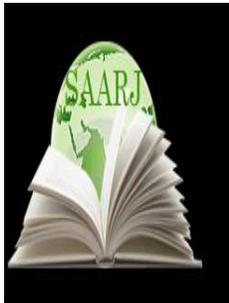

Analysis of the linguistic material shows that the semantic field of the “eye” consists of three parts:

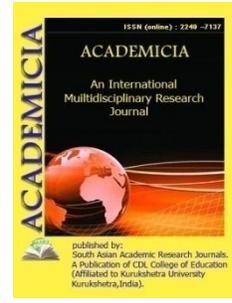

1. The lexeme with the archaism “eye” is its dominant;
2. Lexemes with similar meanings make up its core;
3. Lexemes with distant meanings form its margin.

ABSTRACT

The article presents the results of the study of the level of helminthiasis in ungulates in Samarkand, Jizzakh, Kashkadarya, Surkhandarya, Navoi, Bukhara regions and the Republic of Karakalpakstan. and intestinal stenosis (delaphondiosis, alfortiosis, steniliosis, and trichonematosis) accounted for an average of 64%, with cestodes 7.86%, parascarids 14.6%, and strongylates (41.6%).

KEYWORDS: *Cestode, Oncosphere, Egg, Nematode, Strongylata, Strongylus (Delafondia) Vulgaris, Strongylus (Alfortia) Edentates, Strongylus (Strongylus) Equines, Trichonema, Larvae, Eggs, Larvae, Geohelminths, Palliative, Helminths.*

INTRODUCTION

In recent years, the agrarian system of the Republic of Uzbekistan pays special attention to animal husbandry. The first President of the Republic I.A. Karimov's PP-308 of March 23, 2006 "On measures to encourage the increase of livestock in personal assistants, farmers and farms" and April 21, 2008 "On personal assistants, farmers and farmers" Resolutions PQ-842 "On additional measures to increase incentives for livestock breeding and increase the production of livestock products" are an important factor in the development of animal husbandry. The Decree of the President of the Republic of Uzbekistan "On the Strategy of Actions for the Further

Development of the Republic of Uzbekistan" has become an important basis for ensuring the rule of law, human rights and freedoms, an atmosphere of interethnic harmony and religious tolerance in society, the conditions for a decent life of our people, the realization of the creative potential of our citizens - five priorities for 2017-2021 The Strategy of Action in the direction of However, helminthiasis of ungulates, especially anoplocephalidosis, parascaridosis, and intestinal ciliatosis (delaphondiosis, alfortiosis, strongylosis, trexonematosi), among other diseases, are somewhat hindering the increase in the number of livestock. Diseases of horses anoplotcephalidosis, parascaridosis and intestinal strongylatosis (delafondiosis, alfortiosis, strongylosis, trexonematosi) occur in all districts and regions of the Republic. In particular, in Samarkand, Jizzakh, Kashkadarya, Surkhandarya, Navoi, Bukhara regions and the Republic of Karakalpakstan, an average of 46-50% of horses examined suffered from parascaridosis, 58-65% from intestinal strongylatosis and 12-15% from anoplocephalidosis. detected.

With this in mind, we set ourselves the goal of studying the prevalence of intestinal cestodes, parascaridosis and intestinal stenosis in horses in Samarkand, Jizzakh, Kashkadarya, Surkhandarya, Navoi, Bukhara regions and the Republic of Karakalpakstan.

Materials and methods

Our research examined feces of horses from the population of Samarkand, Jizzakh, Kashkadarya, Surkhandarya, Navoi, Bukhara regions and the Republic of Karakalpakstan by Fulleborn and Berman-Orlov methods, and identified and analyzed the level of damage to horses. A total of 89 samples from the above regions were tested.

Results and their analysis

The results of the study of the incidence of anoplotcephalidosis, parascaridosis and intestinal styliatosis (delaphondiosis, alfortiosis, strongylosis, trexonematosi) in horses are given in Table 1.

When we examined the feces of 13 horses in the Samarkand region, we found helminth eggs in 9 of them, which is 69.3% of the damage. Anoplocephala eggs were found in 1 head of horse manure, and parascarid eggs were found in 3 heads. Intestinal strongilyat eggs were found in the feces sample of 5 head horses. In order to determine which of the eggs found were stubborn eggs, the eggs in the fecal sample were incubated in a thermostat at 37–38oC for 48 h and then accurately diagnosed based on the number of intestinal cells of the larvae formed. The larvae of Strongylus (Delafondia) vulgaris were found in one head of horse manure, the larvae of Strongylus (Alfortia) edentates in one head of horse manure, the larvae of Strongylus (Strongylus) equines in one head of horse manure and the larvae of Trichonema intensivas of 2 head horse manure. made 5-7 copies in one viewing area.

The helminths of the tested horses degree of infestation with

T/r	Provinces	Number of horses tested	Number of head of Infected horses	That's it							Degree of damage %/°
				Anoplotcephaly	Paranoplotcephaly	Parascarisidosis	Delafondioz	Alfortioz	Strongylosis	Trichonematosi	
1.	Samarkand	13	9	1	-	3	1	1	1	2	69,2
2.	Jizzakh	12	7	-	-	2	1	-	-	4	58,3
3.	Kashkadarya	16	12	1	-	2	2	1	2	4	75,0
4.	Surkhandarya	14	11	1	1	2	2	1	1	3	78,6
5.	Navoi	9	5	-	-	1	1	1	-	2	55,5
6.	Bukhara	10	6	1	1	-	1	1	-	2	60,0
7.	The Republic Karakalpakstan	15	7	1	-	3	2	-	-	1	46,7
	Total:	89	57	5/5,6	2/2,2	13/14,6	10/11,2	5/5,61	4/4,49	18/20,2	64,0

When we examined the feces of 12 horses in the Jizzakh region, we found helminth eggs in 7 of them, with a damage rate of 58.3%. Including parascarisid eggs in a sample of 2 head horse manure found in the feces of 6 head of horses. The intensity of the invasion was 3-5 copies in each field of view of the microscope.

Examination of faeces from 16 horses in Kashkadarya region revealed helminth eggs from 12 horses, with an infestation rate of 75.0%. Anoplocephala perfoliata eggs were found in 1 horse dung sample, Parascaris equorum eggs were found in 2 horse dung samples, and intestinal strongilyat eggs were found in 9 horse dung samples. The intensity of the invasion ranged from 2 to 5 copies in each field of view of the microscope.

When we examined the feces of 14 horses in the Surkhandarya region, we found helminth eggs in 11 of them, with an infestation rate of 78.6%. Anoplocephala magna was found in 1 horse manure, Anoplocephala perfoliata eggs were found in 1 horse manure, Parascaris equorum eggs were found in 2 horse manure samples, and intestinal strongilyat eggs were found in 7 horse manure samples. The intensity of the invasion was 4-7 copies in each field of view of the microscope. When we examined the feces of 9 horses in the Navoi region, we found helminth eggs in 5 of them, with an infestation rate of 55.5%. In particular, parascarisid eggs were found in the beginning of the 1st. Intestinal strongilyat eggs were found in the feces sample of 4 head horses. The intensity of the invasion was 3-5 copies in each field of view of the microscope. When we examined the feces of 10 head of horses in the Bukhara region, we found helminth eggs in 6 heads, ie the infestation rate was 60.0%? formed. In particular, Anoplocephala magna

was found in 1 head of horse manure, *Anoplocephala perfoliata* eggs, *Parascaris equorum* eggs were not found in one head of horse manure, intestinal strongilyat eggs were found in 4 head of horse manure. The intensity of the invasion ranged from 1 to 3 copies in each field of view of the microscope. When we examined the feces of 15 head of horses in the territory of the Republic of Karakalpakstan, we found helminth eggs in 7 of them, the infestation rate was 46.7%. *Anoplocephala magna* was found in 1 horse dung sample, *Parascaris equorum* eggs were found in 3 horse dung samples, and intestinal strongilyat eggs were found in 6 horse dung samples. The intensity of the invasion was 3-5 copies in each field of view of the microscope. Thus, 57 of the 89 horses tested had helminth eggs found, with a lesion rate of 64.0%. In particular, *Anoplocephala magna* was found in the feces of 5 horses (5.6%), *Anoplocephala perfoliata* eggs were found in the feces of two horses (2.2%), and *Parascaris equorum* eggs were found in the feces of 13 horses (14.6%). *Strongylus (Strongylus) equines* eggs in 5 head specimens, *Strongylus (Alfortia) edentates* eggs in 5 heads (5.61%), *Strongylus (Strongylus) equines* eggs in 4 heads (4.49%) and 18 heads (20.2%) *Trichonema* eggs were found. The intensity of the invasion averaged 5-7 copies per microscope field of view.

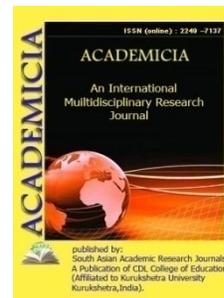

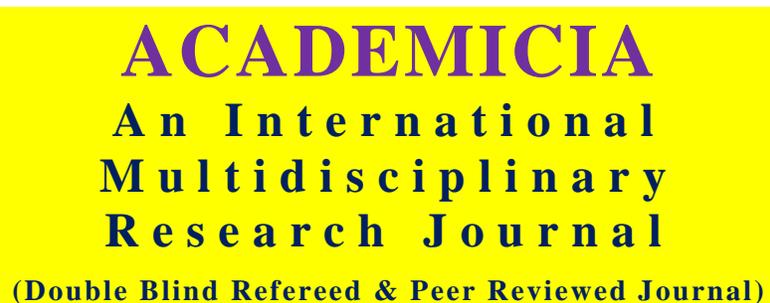

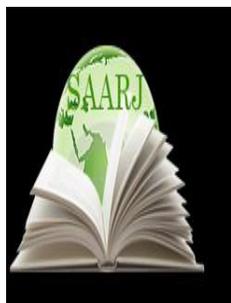

CONCLUSION

As a result of our research, we came to the following conclusions:

- Parasitic diseases of horses are one of the most common invasive and parasitic diseases in the country, causing great economic damage in the field of horse breeding;
- The incidence of anoplocephalidosis in horses examined was 12.3%, parascaridosis 22.8% and intestinal strongylatosis 64.9%.
- In our study, the proportion of equine anoplocephalidosis, parascaridosis, and intestinal strongylatosis was significantly higher (64.0%), with trichonemias (20.2%) leading the way.

DETERMINATION OF ADULTERANTS IN HONEY

Dr Vishal Balramnavar*

*SOP, Sanskriti University,
Mathura, Uttar Pradesh, INDIA
Email id: hod.sprc@sanskriti.edu.in

ABSTRACT

In this article, an analysis is done based on different studies conducted across the globe on the topic of the use of adulterants in honey. The adulterant of choice for my sample is sugar cane and corn syrup, which is one of the most common adulterants utilized in a variety of honey products. Honey adulteration is a complicated problem in the globe in general and in our nation in particular, according to most studies, and it has a significant economic effect. It may be caused by the introduction of different inexpensive foreign elements. Contamination of honey alters the physiochemical besides rheology of honey, decreasing its nutritional and medicinal properties. As a consequence, methods of adulterate identification and accurate measurement of adulterants would have been utilized to create high grade honey devoid of any foreign addition. Numerous approaches used for honey adulteration detection by maximum researchers, such as, Liquid Chromatography (LC) and Gas Chromatography (GC) analysis, protein characterization, Near Infra-Red (NIR) spectroscopy, Fourier Transform Infrared (FTIR) spectroscopy with Attenuated Total Reflectance (ATR), High Performance Anion Exchange Chromatography with Pulsed Aerometric Detection (HPAEC-PAD), High Performance Liquid Chromatography Coupled to Isotope Ratio Mass Spectrometry (HPLCIRMS), calorimetric methods, Stable Carbon Isotope Ratio Analysis (SCIRA), Fourier Transform (FT), Raman spectroscopy and microscopic detection techniques are appropriate as well as deliver valuable knowledge. However, to get a complete besides dependable result, individuals must not concentrate only on each method, but rather utilize a mix of them.

KEYWORDS: Adulteration, Analysis, Food, Honey, Methods, Sugar, Syrup.

INTRODUCTION

Bees and other insects create honey, which is a sticky, viscous food substance. Honey bees store honey in wax structures called honeycombs in which the honey from the Honey bee is the most well-known, owing to its extensive agricultural output and human usage. Bee keeping, or apiculture, is the skill of gathering honey. Honey's taste originates from the mono saccharides fructose and glucose, and it's equally as delicious as sucrose. When used as a sweetener, attractive biochemical characteristics for baking and a unique flavor[1]. Honey does not mature most germs, thus sealed honey does not deteriorate, even after thousands of years. Honey is produced by bees that collect nectar to utilize as carbohydrates to maintain muscular metabolism during scavenge or to be digested as a lasting food supply. Part of the nectar collected by bees is utilized to boost metabolic operation of flying physiques while foraging, with the rest of nectar together meant for spewing, digesting, plus storage as honey. Mature and larval bees use stored honey as nourishment in cold environment or when other food sources remain scarce. People have been able to semi-domesticate bee swarms and harvest excess honey by persuading them to dwell in man-made hives[2].

Honey is classified into groups depending on the floral source and the manufacturing and processing techniques employed. Honeys from various regions of the nation are also mentioned. Honey is also categorized in the United States according to standards for colour and optical density. In general, honey is classified according on the floral base of the syrup used to produce it. Honeys may be produced from specified types of floret nectars or blended together once they've been gathered. Pollen in honey may be traced back to a floral source, and therefore to a particular location[3].

Honey is made up of sugar (approximately seventy-six percent), water (eighteen percent), and other components (about 6 percent). (Roughly 6 percent). Honey's main characteristic (sweetness) is supplied by sugar, which is followed by water (the liquid), and small quantities of other components determine the differences between various kinds of honey. Color, smell, and taste are examples of these differences. Honey includes three kinds of sugar, rather than a single species. Fruit sugar (fructose) has one of the greatest amounts (41 percent) followed by glucose, which has approximately thirty-four percentage, and sucrose, which has between one and two percentage. The proportion of one type of sugar to another is controlled by the floral pasture, supply, and to a smaller degree by the enzyme inverses, which breaks down normal sugar in grapes and fruits as well as in the body of the worker[4].

The following are the constituents:

- Undetermined matter
- Acids
- Proteins
- Minerals

The proportions vary the next. Minerals contribute for 3.68 percent of the total. Minerals in honey grow, despite the fact that the honey does not make up an essential quantity. The elements potassium, arsenic, Sulphur, calcium, sodium, phosphorus, magnesium, silicon, iron, manganese, and copper are all present in honey. Dark honey has a greater mineral content than lighter honey,

based on the measured mean quantity. It was previously believed that bees injected bee venom into honeycomb cells from their stomachs, maintaining the honeycomb. It was believed that honey included formic acid since formic acid is one of the major components of bee spite. Because of this, some individuals encouraged others not to use honey. According to research, honey is made up of a range of acids, the majority of which being apple and lemon acids[5].

Vitamins in honey are in extremely tiny quantities, insufficient for the organism's requirements. Vitamin C and a few B complex vitamins make up the gaps (riboflavin, pantothenic acid, pyridoxine, biotin, nicotinic acid) (riboflavin, pantothenic acid, pyridoxine, biotin, nicotinic acid). Honey has a unique smell that is generated by essential oils. These chemicals are unstable and evaporate quickly when honey is heated. Proteins are present in honey as a consequence of nectar and pollen, which are also natural components of plants. Honey proteins may accept structures or basic chemicals, such as amino acids[6].

Honey fraud is achieved by mixing corn syrup, rice syrup, and cane sugar, each of which can be recognized. Chromatography and mass spectroscopy are employed to monitor the syrup combination. In this situation, infrared and near-infrared measurements are considerably simpler. It is feasible to anticipate that NIR may be utilized to verify the authenticity of high-value single pollen honey, such as Manuka honey, in single pollen honey detection. Principle component analysis, or PCA, may be used in this instance to estimate the honey's origin and species quickly and without the requirement for sample preparation. This has been utilized for a number of food kinds, but not for a thorough study of honey[7].

LITERATURE SURVEY

F. Ulberth presented that honey is a natural product with a long history of medical usage and has been appreciated for its sweetening properties since ancient times. Honey can only be slightly processed to satisfy internationally accepted standards by centrifugation, mild heating, and, if required to avoid foreign matter, filtration. Honey may be adulterated (extended) by adding syrups (e.g., high fructose corn syrup) that mimic honey's natural sugar content, or it may be mislabeled as to its botanical or floral origins. To identify contaminated honey, detection techniques based on different measuring concepts, such as spectroscopic and chromatographic approaches, as well as combinations thereof, have been developed. To evaluate if honey corresponds to its label statement, multivariate statistics are usually applied to the obtained results[8].

S. Soares *et al.* honey is a popular natural food, not only because of its taste and because of the health advantages it offers. Honey may be classified as a premium product due of characteristics unique region or local climate and flora. Honey is generally regarded as a desirable commodity because of its appealing smell and flavor. As a consequence of improper or fraudulent production techniques and mislabeling sources, honey has become a victim of adulteration. Honey authentication is split into two categories: processing, which involves problems. Both of these issues are addressed in this research, with a focus on techniques for detecting different types of honey adulteration. Honey authenticity has been challenging owing to its dynamic nature and numerous types of adulteration, spurring the development of several advanced analytical methods. As a consequence, a fresh, critical, and thorough evaluation of current or authenticity is given, as well as non-target fingerprint methods. The most current advances in

chemistry, reviewed, with a focus on the benefits and drawbacks of each for identifying botanical and geographical roots[9].

1. Uses of Honey

- Many of the ancient applications of honey are being verified by contemporary study.
- Honey has been utilized to heal wounds and burns because of its supposed fitness welfares. Honey has been proven to have therapeutic benefits in the treatment of wounds in many instances. Honey may be able to help heal wounds, according to a research released.
- Honey has been proven to decrease the frequency and extent of diarrhea. Honey also stimulates you to consume more water and potassium, which is helpful when you have diarrhea.
- Honey has been proven to reduce the increasing inflow of abdominal acid then undigested food by coating the oesophagus besides stomach, according to current research.
- In 2010, experts from the University of Amsterdam's Academic Medical Center claimed in the magazine that honey's capacity to kill germs is attributable to a protein called defensin-1. Study released showed that Manuka honey, a type of honey, may be helpful in treating infections.
- Honey is suggested by the World Health Organization (WHO) as a safe cough treatment for reducing cold and cough symptoms. Honey is also suggested by the Pediatrics as a cough treatment.
- Honey's mild flavor makes it an ideal complement for sugar in the meal. Sugar in the meal adds extra calories to the diet with no health benefit. This will lead to a gain in body mass, which raises the risk of hypertension and diabetes.

2. Adulteration in Honey

A legal word for a food substance failing to satisfy federal or state standards is adulteration. Sugar syrups and molasses inverted by acids or enzymes from rice, sugar cane, sugar beet, and syrups of natural origin such as maple syrup have been discovered in falsified honeys. Honey is indirectly contaminated by feeding artificial sugars to honeybees at the time when broods become spontaneously apparent. Indirect adulteration is one of the most frequent forms of adulteration. Adulteration techniques are constantly developing, and most honey adulteration methods are undetected by the official (legislative) evaluation of honey consistency criteria. Furthermore, while honey's popularity among consumers continues to grow, its worldwide supply is uncertain. Honey is indirectly contaminated by giving synthetic carbohydrates to honey bees when their broods become naturally apparent. It's difficult to detect such accidental adulteration[10].

This page offers an overview focusing on many research performed across the globe on the use of adulterants in honey. Cane sugar and corn syrup, which is one of the most frequent adulterants utilized in a range of honey products, are the adulterants of choice for my research. According to most sources, honey adulteration is a complex issue in the globe in general and in our nation in particular, and it has a major economic effect; it is produced by the addition of different inexpensive foreign ingredients. Honey that has been contaminated loses its physiochemical and

rheological characteristics, decreasing its nutritional and therapeutic potential. As a consequence, adulterate discrimination techniques and precise adulterant quantification may have been utilized to produce high-quality honey that was devoid of any foreign addition. These techniques are helpful and provide significant information on each aspect of honey authenticity; furthermore, in order to obtain a comprehensive and accurate result, individuals should utilize a blend of them rather than relying solely on one.

The Honey Formulation and Development Directive offers standard principles for the formulation and processing of honey. DSC has been explored for application in identifying alteration or adulteration, as well as regulating food hygiene. This technique is used to examine thermal behavior, which is essential for choosing its purity alongside detecting manipulated or contaminated honey. Corn syrup, rice syrup, and cane sugar, each of which can be identified, are used to produce honey scam. The syrup mixture is identified using chromatography and mass spectroscopy, although infrared and near infrared measurements are considerably simpler in this instance.

DISCUSSION

1. Detection Techniques for Adulterated Honey:

Adulteration techniques are constantly developing, and most honey adulteration methods are undetected by the official (legislative) evaluation of honey consistency criteria. Furthermore, while honey's popularity among consumers continues to grow, its worldwide supply is uncertain. Honey is indirectly contaminated by giving synthetic carbohydrates to honey bees when their broods become naturally apparent. It's difficult to detect such accidental adulteration.

Internal norm $^{12}\text{C}/^{13}\text{C}$ isotope fractionation mass spectrometry was used to analyze twenty Australian honeys and their associated protein extracts, each from a different floral source. An artificial honey is also confirmed then used for successive dilution of an unadulterated honey to examine how much adulteration might be discovered, resulting in measured apparent adulterations of 2 to 5 percent. The samples are not deemed contaminated because the variances are smaller than the globally accepted threshold of 1 (7 percent adulteration).

Although the lesson established baseline values for specific Australian honeys and showed the applicability of this method, National Residue Survey (NRS) is unable to continue additional study in this area. NRS, on the other hand, will be able to provide scientific resource performing honey study to determine the degree analogue honey reliant on C_4 plant sugars. The Australian Honey Bee Industry Council (AHBIC) contacted NSR in February 1999 with the request to undertake finding analogue honey. AHBIC funded the project costs, which were anticipated by NRS to be approximately \$1000. The original NRS plan also anticipated that testing each honey sample using $\text{C}_{13}\text{-C}_{12}$ isotope ratio mass spectrometry would be required to identify adulteration.

The natural differences that utilize C_3 as well as C_4 photosynthetic processes are used to identify tainted honey using the isotope method. $\text{C}_{13}\text{-C}_{12}$ isotope levels, commonly known as isotope C_{13} values, vary from 8 percent to 13 percent in C_4 plants, such as maize, whereas C_3 species, such as nector plants, ranges from 22 percent to 30 percent.

The approved institution contacted to perform the honey protein extractions. However, because the C_{13} values of honey from different floral sources may vary considerably, there is a broad

range of C13 values within which no definite conclusion about the pureness of the honey can be made devoid of further testing. To solve the problem, C13/C12 isotope ratio method for detecting honey adulteration with c4plant was developed. As a consequence, NRS concluded that this method was suitable in order to detect honey contamination with cane sugar or corn syrup.

As a consequence, when it was discovered that isotope ratio method, it was decided to investigate a range of deliberately contaminated honey samples to determine if similar levels of adulteration could be detected in this study.

2. *Advances in the Detection of Honey Adulterations:*

Aside from the Codex Alimentarius (1981) definition of honey, several nations' and the European Union's (EU) laws have other interpretations. Honey comes in a range of physical forms and formulas. Acidity, water-insoluble particles, moisture, mineral content, 5-hydroxymethylfurfural (HMF) concentration, and apparent reducing sugar alongside apparent sucrose are among the compositional criteria specified in the current honey directive.

Honey adulteration initially appeared on the worldwide market in the 1970s, when the firm introduced high-fructose corn syrup. Since mono saccharides fructose and glucose (85-95 percent) are the most prevalent, the provided honey is largely dictated by the nectar source. To identify adulteration of honey, a variety of analytical methods have been developed, including isotopic, thermal analysis, trace element approaches, spectroscopic, as well as chromatographic. Any of these methods stand time overwhelming, while others are expensive.

Differential Scanning Calorimetry (DSC) is a tool with a broad variety of applications. It's a fantastic method to characterize of them. DSC processing is fast and simple, requires a limited (less than 100 mg), while did not need the usage of solvents. It was used to measure thermal activity in a range of nourishments, even in circumstances wherein heat alteration does not take place. DSC is a useful tool to employ in combination with chemical analytical methods to highlight the limitations of physicochemical findings. DSC has been investigated for identifying alteration or adulteration, as well as for food quality monitoring. Thermal behavior, energy variance during phase transition, transition temperatures, and the water content relationship in honey were all investigated using this technique. For evaluating honey quality and identifying adulteration or alteration, a comprehensive knowledge of its thermal characteristics is required.

The lower glass transition temperatures and greater fusion enthalpies. Honey and syrups have unique Tg locations and intensities, which may be utilized to distinguish them. Pure compounds have a unique owing to their complicated structure. Aside from the Codex Alimentarius (1981) definition of honey, several nations' and the European Union's laws have additional meanings (EU) (EU). Honey comes in a range of physical forms and formulations (crystallized). A proposal to amend Council Directive 74/409/EEC on honey has been approved by the European Commission (EC). This Directive sets broad criteria for the formulation and manufacturing of honey. Honey and honey products have become increasingly popular during the past several decades.

In recent years, honey from the Far East has lately been exposed to a significant adulteration problem. The potential to be deliberately tampered with, expensive besides cultivated under severe, such as honey, are particularly susceptible.

3. *Infra-Red Spectroscopy of Honey Adulterations:*

While many people are aware of the risks of accidental contamination in the food supply chain, purposeful food adulteration for economic gain has only lately come to light. The melamine pandemic in China in 2007/08 showed this, when a rise in the frequency of kidney failures in dogs and cats alerted authorities to a problem in the pet food supply chain. People now know that the reason was a mixture of melamine and cyanuric acid contained in the pet food. However, the story is not new; fraud and adulteration have been detected as far back as ancient Rome, with wine supposedly contaminated with water. Globalization of supply chains has increased volatility and reduced risk for different parts of the chain in recent years, aggravating the problem. The following are the most common types of honey scam. Corn or rice syrup may be added. For low grade ingredients, single pollen honeys are faked. There aren't current instances, like other types of food theft. Honey was the most contaminated product in the world, according to Dr. Harvey W. Wiley, the first head chemist of the United States Department of Agriculture, in 1889. Wiley brought a bottle of contaminated honey before the United States Congress in favor of the Pure Food and Drug Act, along with a dead bee on top of the thick jelly. He explained that the bee was there to mislead consumers into thinking the honey was 100 percent delicious. Instead, the sweet liquid concealed a variety of harmful chemicals from consumers, according to Wiley. As a consequence, in recent years, considerable focus has been placed on detecting whether honey includes high fructose corn syrup and whether high-value honeys, such as Manuka, are pure and authentic.

Chromatography and mass spectrometry are excellent at detecting adulterants in various types of fraud. Infrared and near-infrared systems, on the other hand, are easier to handle, operate, and speed up, as well as being less expensive, making them an ideal option for honey processing. NIR Spectra of the following pure samples were examined to show the capacity of NIR spectroscopy to detect sugar contamination into various honey kinds. Honey from clover, wildflowers, orange blossoms, organic honey, corn syrup, and rice syrup. It is feasible to anticipate that NIR may be utilized to verify the authenticity of high-value single pollen honey, such as Manuka honey, in addition to identifying corn syrup adulteration. While many people are aware of the risks of accidental contamination in the food supply chain, purposeful food adulteration for economic gain has only lately come to light. Honey fraud is achieved by mixing corn syrup, rice syrup, and cane sugar, each of which can be recognized. Chromatography and mass spectroscopy are employed to monitor the syrup combination. In this situation, infrared and near-infrared measurements are considerably simpler. It is feasible to anticipate that NIR may be utilized to verify the authenticity of high-value single pollen honey, such as Manuka honey, in single pollen honey detection. Principle component analysis, or PCA, may be used in this instance to estimate the honey's origin and species quickly and without the requirement for sample preparation. This has been utilized for a number of food kinds, but not for a thorough study of honey.

CONCLUSION

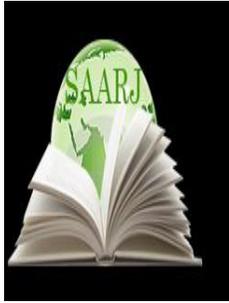

After the conclusion of all tests, on honey adulteration, it was found that Honey is not always pure, it may be tampered with in a number of ways and identified in a variety of ways. People have a simplistic idea that pure honey can never deteriorate spontaneously, and this is a common truth. But, when honey is poisoned, it merely shows that it was entirely adulterated. Since the isotope method for identifying contaminated honey depends on natural changes in isotopic ratios between C13 and C12 isotope ratios, the approved institution was first called to perform honey

protein extractions. As a consequence, the internal standard isotope ratio method may be used to identify honey that has been contaminated with C4 plant sugars.

A proposal to modify the council regulation on honey has been approved by the European Commission. This directive sets standard criteria for the formulation and manufacturing of honey. DSC has been investigated for identifying alteration or adulteration, as well as for food quality monitoring. Thermal behavior (crystallization), were all investigated using this method. Understanding the thermal characteristics of honey is important for evaluating its consistency and detecting adulterated or manipulated honey. Honey fraud is achieved by mixing corn syrup, rice syrup, and cane sugar, each of which can be recognized. Chromatography and mass spectroscopy are employed to identify the syrup mixture, however infrared and near infrared techniques are considerably easier in this scenario.

MOBILE AD-HOC NETWORK (MANET) ROUTING PROTOCOLS: A COMPARATIVE ANALYSIS

Ms Anuska Sharma*

*SOEIT, Sanskriti University,
Mathura, Uttar Pradesh, INDIA
Email id: anushka@sanskriti.edu.in

ABSTRACT

Routing in a Mobile Ad-hoc Network (MANET) is a dynamic and difficult problem that has gotten a lot of attention from academics all over the world. To address this issue, a variety of routing classes have been developed, and the number continues to grow exponentially day by day. It's difficult to predict which protocols or routing classes would perform well in a variety of network situations, such as network volume and topology. We provide an overview of a vast number of current routing classes in this paper, with an emphasis on their uniqueness and usefulness. In addition, the judgment is based on the routing capability, and data is utilized to construct routing decisions. There is also a discussion of all of the routing protocols or classes. Furthermore, this research will aid academics in compiling a list of current classes and recommending which protocols would perform better in certain network situations.

KEYWORDS: *Ad-hoc Network, Delay, MANET, Mobile Ad-hoc Network, Routing protocol.*

7. INTRODUCTION

In the modern era, one of the most notable fields for study and growth of the wireless network is mobile ad-hoc networks (MANETs). As the MANET popularity grows, so does its use. In the wireless network, it has now become one of the most energetic and athletic communication areas. MANETs are self-configuring, decentralized networks with minimal infrastructure[1]. There are no requirements for these nodes to join the network or depart. Nodes may move around freely and often alter their connections with other devices or nodes. Because of the wireless networking environment, MANET offers a routable method for transferring packets from one node to another. Mobile Ad-Hoc networks are characterized by the absence of physical infrastructure and are highly dynamic[2]. Mobile Ad-Hoc Network's functionality uses routers to discover and maintain routes. Nodes in such networks may move and communicate with one

other. MANET nodes function as both hosts and routers, forwarding packets to intermediate nodes, and have the unique ability to self-configure and self-club, allowing it to quickly create a new network. Because such networks are quick and simple to set up, they may be used in military applications, disaster recovery, and other situations when physical infrastructure is lacking.

MANETS are used for a variety of applications, ranging from commercial to private sector to military and emergency response. Business applications, military applications, emergency operations, home, office, educational applications, and wireless sensor networks are just a few of the significant MANET applications[3], [4]. The main problems with Ad-hoc routing protocols are the routing method to be employed, which is either unicast or multicast routing, dynamic network topology, which changes when mobile nodes travel from one BSS to another, and mobile node speed. Quality of Service (QoS) is another critical MANET performance characteristic for traffic flow management. Other issues with MANETs include frequency of updates or network overhead, scalability, and security. Routing based on mobile agents, energy efficient/power-aware routing, and secure routing.

Section 1 is an introduction to MANET, Section 2 is a literature review, Section 3 is a discussion of MANET features as well as a comparison of various routing protocols in MANET, and Section 4 is the conclusion.

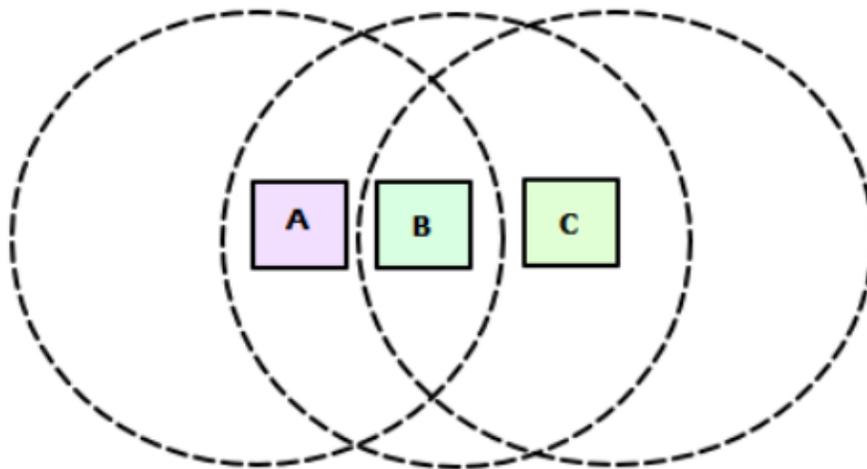

Fig. 1: A Mobile Ad-hoc Network (MANET)

8. LITRATURE REVIEW

The present concept in the area has been evaluated using several pieces of important literature in the subject of MANET routing protocols. Maghsoudlou et al. investigated unlike face routing algorithms, dissimilar face routing strategies, and greedy routing algorithms in the context of the MANET geographical routing protocol[5]. The geographic routing protocols, according to the authors, are based on greedy forwarding, in which data is delivered to the target's closest node, although the data may be tainted at times. If there isn't an immigrant node in close proximity to the target. The authors also suggested ways to enhance recovery strategies, concluding that the most frequent method for recovering from the void state is the faced routing algorithm, which employs planner graphs.

AODV, DSR (reactive), and DSDV (proactive) routing protocols were evaluated by Arora et al[6]. These are calculated using the Packet Delivery Ratio, a typical end-to-end latency under various mobility models with variable mobile speeds. These routing methods are efficient and quantifiable. Network Simulator-2 (NS-2) is used for simulation. When it comes to mobility, AODV outperforms DSR and DSDV. AODV has a high packet delivery ratio in both random walk and random direction. However, the AODV protocol had a very long end-to-end latency. As a result, DSR outperforms AODV and DSDV in both the random walk and random direction mobility models.

In this paper, Khan J. et al. not only review the efficiency of ad-hoc routing protocols in order to determine their accuracy, effectiveness, traffic load, and end-to-end delay in an energetic intermediate nodes scenario, but they also use the OPNET simulator to test the AODV and DSR routing classes[7]. Instead of separate presentations of both AODV and DSR routing classes and also in intermediate nodes data transport rate from source to target, the author proposes using the Opnet simulator to observe performance with respect to different parameters that changes mobility models have a significant effect on the overall performance of both AODV and DSR routing class could be the most excellent solution in MANET.

Sllameet al. used the simulation program OPNET modeler 14.5, to compare MANET routing protocols such as GRP, AODV, OLSR, and DSR on the basis of end-to-end latency, network load, retransmission attempts, and throughput[8]. The authors discovered that AODV and DSR work better than other protocols. When AODV and DSR are compared to other protocols, the throughput of AODV and DSR is higher, and the latency of AODV is lower.

Menon et al. looked at how various geographic routing methods performed in high mobility situations[9]. The performance of various geographic routing protocols was compared using performance measures, and the advantages and demerits of these protocols were stated using these performance criteria. The various parameters involved in designing and selecting a routing protocol were addressed by the authors.

Using the simulation tool NS2, Aggarwal et al. compared different geographic routing protocols such as Location-aided routing, Greedy perimeter stateless routing, and Energy-aware geographic routing on performance metrics such as system lifetime, end-to-end delay, packet delivery ratio, and energy utilization[10]. When the topology varies dynamically and mobility is high, the authors found that geographic routing provides a higher packet delivery ratio, better energy usage, and longer network lifespan than other protocols.

9. DISCUSSION

9.1. Characteristics of MANETs:

Because of the many network constraints, designing a routing protocol for MANET is difficult. MANET has had to deal with a variety of network resource constraints, including as energy, bandwidth, processing, and storage. The following are the major elements of difficulties in sensor networks.

9.1.1. Dynamic Topology:

The topology of the network changes unexpectedly since nodes are free to migrate in any direction.

9.1.2. Limited Bandwidth:

Wireless network bandwidth is often lower than that accessible on wired networks. Due to different disturbances and fading effects, the throughput of these networks is usually poor.

9.1.3. Energy Constrained Operation:

The nodes are battery-powered gadgets that may be carried around. This is the MANET's most significant design factor.

9.1.4. Security:

Threats are more common on wireless networks than on wired networks. The heightened risk of different security threats such as eavesdropping and Denial of Service (DoS) must be properly managed. MANET performance is determined by the routing protocol and the node's battery usage. Various quality of service characteristics, such as bandwidth delay, jitter, and throughput, have an impact on performance. Because the bandwidth supplied to the nodes at one moment in time becomes unavailable if the nodes migrate from one location to another, dynamic topology routing is a significant challenge for these networks. Routing also has an impact on the performance of these networks. As a result, an effective routing protocol must be designed to address all of these issues. On the basis of route discovery, MANET routing protocols are divided into three categories: (i) reactive, also referred to as on-demand routing protocol, (ii) proactive, also referred to as table driven protocol, and (iii) hybrid protocol. Routing protocols are further classified as flat-based, hierarchical-based, or location-based on the basis of network structure. All nodes in a flat-based protocol are equal, which means they all perform the same function in the network. Various nodes perform different functions in hierarchical protocols, and different cluster leaders are selected among cluster members. Nodes in a location-based protocol depend on and communicate with each other using location information.

9.2. Routing Protocols for MANET:

Routing is the process of moving data from a source point to a destination point inside a network. At least one intermediary node in the network is contacted throughout this procedure. The concept of routing essentially entails two activities: first, finding the best feasible routing routes, and second, moving data across a network. There are two kinds of routing: static routing and dynamic routing. The term "static routing" refers to a manual routing strategy. The administrator maintains a routing table in static routing. The state is the most important factor in dynamic routing. Dynamic routing is available in mobile ad hoc networks. As illustrated in Fig. 2, these procedures may be classified into three categories: proactive, reactive, and hybrid. This categorization of routing protocols is based on their route discovery techniques, such as hop count, link status, and QoS. In the hop count approach, each node's routing table includes information about the next hop to the destination. While link state routing protocols maintain a routing table for absolute topology, which is built up by determining the shortest route of link costs, link state routing protocols preserve a routing table for relative topology. QoS routing is the process of choosing the route that a flow's packets will take depending on its QoS criteria, such as bandwidth, latency, and so on.

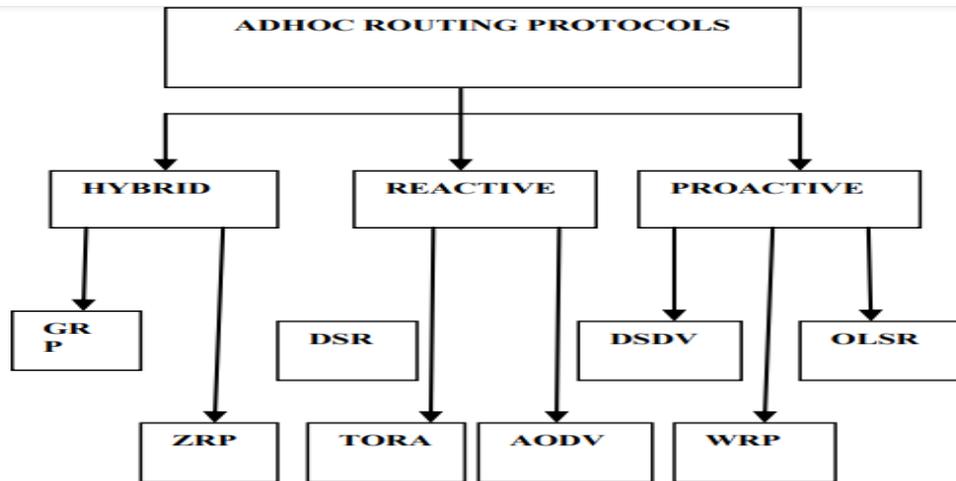

Fig. 2: Illustrates Routing Protocols in MANET

9.2.1. Proactive Routing Protocol:

Each ad hoc node in table-driven routing protocols has a topology table that includes the most up-to-date information about network node interactions. The proactive protocols are also known as table-driven since this table is constantly updated. Each node maintains one or more routing tables, which are regularly exchanged in order to communicate topological information with other nodes and keep a consistent network picture. A transmission will occur without delay if a route has already been established before traffic arrives. Otherwise, traffic packets should wait until the node gets routing information for their destination. Wireless Routing Protocol (WRP), Destination-Sequenced Distance Vector (DSDV), and Optimized Link State Routing (OLSR) are just a few of the proactive routing technologies available.

- *Destination-Sequenced Distance Vector (DSDV):*

Perkins and Bhagwat designed the DSDV protocol, which is a proactive routing class. The DSDV routing class stands for Destination-Sequenced Distance Vector. The Routing Protocol Class is based on the Bellman-Ford Routing Algorithm's concept, but with significant enhancements such as making it loop-free. Due to issues such as count to infinity and bouncing outcomes, the distance vector routing class is less resilient than the link state routing class. Each system maintains a routing-related database that contains entries for all of the network's policies. To maintain the routing table completely rearranged at all times, each device sends various routing communications to its neighbours on a regular basis. When a neighbour device gets the sender's broadcasted different routing message and knows the device's current relation cost, it compares this value to the associated value stored in its routing database.

- *Optimized Link State Routing (OLSR):*

OLSR is a proactive class that uses multipoint relaying, a competent link state packet forwarding system. The clean link state routing class is optimized. Optimizations may be accomplished in two ways: first, by decreasing the amount of control packets, and second, by tumbling the number of associations utilized for promoting link state messages. As you may know, each node maintains the network's topology information by regularly replacing link state communication among the other nodes. The three processes that make up the OLSR routing class are neighbour

sensing, capable flooding, and calculating an optimal route utilizing a variety of shortest-path algorithms. Neighbour sensing is the assessment of changes in the node's immediate vicinity. Using this topological knowledge, each node determines the optimal route to every known destination and records it in a routing table. The most constructive route is then calculated using the shortest path method. When data broadcasting starts, routes to all destinations are immediately accessible and stay so for a certain amount of time until the information is finished.

- *Wireless Routing Protocol (WRP):*

The Wireless Routing Protocol is a table-based protocol that replaces the Bellman-Ford Algorithm's assets. It belongs to the DSDV class. The primary goal is to preserve routing information about the quickest route to each destination among a variety of nodes in the network. WRP (Wireless Routing Protocols) is a class of loop-free routing protocols. WRP is a path-searching method that avoids the count-to-infinity catastrophe by requiring each node to do consistency checks on all of its neighbours' precursor information. Each node in the network has a set of four tables that provide more detailed information. The distance table (DT), routing table (RT), link-cost table (LCT), and message retransmission list (MRL) tables are the ones to look at. In the event that a connection between two nodes fails, the nodes start new communications to their neighbours. With one notable exception, WRP belongs to the class of path-finding algorithms. It overcomes the count-to-infinity problem by requiring each node to perform consistency checks on all of its neighbours' precursor information. This eliminates looping situations and allows for faster route convergence in the event of a connection breakdown.

9.2.2. *Reactive Protocols:*

On-demand routing protocols do not always replace routing information, but instead rely on flooding to acquire data when it is necessary for a node to transmit a data packet. A route request is broadcast to all nodes in the network by the host node that needs to broadcast packets to a network destination. Before sending packets, the host node will wait for the network nodes to respond with a route to the destination. During the route finding process, they construct a route. Route request packets are flooded across the network, beginning with the source's near neighbours. The route discovery procedure is completed after a route is created or several paths for the destination are discovered. A route maintenance procedure ensures that the route remains stable for the duration that it is required from the source. DSR, AODV, and TORA, for example, are examples of source-initiated routing protocols.

- *Ad hoc on-demand Distance Vector (AODV):*

The AODV routing class is a key component of the Reactive protocol, and it constructs routes using a route request/route reply query sequence. A source node sends a route request (RREQ) packet to the network when it seeks a route to a destination for which it does not already have a path. Nodes receiving this packet update their information for the source node and create backward references in their route tables to the original node. The RREQ contains the most recent series number for the target for which the source node is alert in addition to the source node's IP address, current series number, and broadcast ID. If a node receiving the RREQ is either the target or has a route to the destination with an equivalent series number higher than or equal to the one limited in the RREQ, it may send a route reply (RREP). It unicasts an RREP back to the source node if this is the case; otherwise, it retransmits the RREQ. Nodes save the source node IP address of the RREQ and broadcast the ID of a better route. If they get an RREQ

that they have previously completed, they reject it and do not continue with it. The route will be maintained as long as it remains active. A route is considered energetic if data packets are moving from source to destination at some point along the route. The connections will time out and eventually be removed from intermediate node routing tables once the source node stops transferring data packets. If the source node still wants a route after getting the RERR, it may restart route discovery.

- *Temporally Ordered Routing Algorithm (TORA):*

The routing class Temporally-Ordered Routing Algorithm (TORA). Park and Corson came up with the idea. The Temporarily Ordered Routing Algorithm (TORA) is a kind of discrete routing algorithm that is genuinely adaptive and loop-free. It is based on the notion of connection turnaround. It explains the pathways either upstream or downstream using directed acyclic graphs (DAG). To provide this capability, TORA requires node synchronization, which limits the protocol's functionality. TORA routing class is a fairly complicated protocol, but its primary feature of broadcasting manage messages just around the point of crash when a connection stoppage occurs makes it distinctive and essential. When a link fails in the evaluation, all other protocols must re-initiate route detection, but TORA would be able to patch itself up around the point of failure. TORA can scale to larger networks thanks to this feature, although it has a greater overhead for smaller networks. TORA is responsible for four essential operations: route creation, preservation, removal, and optimization. Because every node must have a height, any node that does not has one is considered a deleted node, and its height is null. To improve the connecting structure, nodes are sometimes given additional heights. This is referred to as route optimization.

- *Dynamic Source Routing (DSR):*

DSR is one of the most pure instances of an on-demand routing system based on the source routing idea. It was created with multi-hop ad hoc networks of mobile nodes in mind. It enables the network to self-organize and configure itself without the requirement for any existing network infrastructure or management. DSR, unlike AODV, does not send frequent routing messages, reducing network bandwidth overhead, conserving battery life, and avoiding massive routing changes. Instead, DSR requires MAC layer assistance to detect connection failure. Route Discovery and Route Maintenance are two methods in DSR that operate together to enable nodes to find and maintain source routes to arbitrary destinations in the network. By virtue of source routing, DSR has a distinct benefit. Routing loops, whether short or long-lived, cannot develop since they can be identified and removed instantly because the route is part of the packet itself. This feature allows for a number of helpful protocol improvements. The shortest route is not guaranteed by either AODV or DSR. The first route may be the shortest if the destination can only respond to route requests and the source node is always the route request initiator.

9.2.3. *Hybrid Routing Protocol:*

The hybrid routing protocol is divided into two types. The first is a proactive class, while the second is a reactive class. Proactive and reactive routing methods are combined in hybrid routing systems. Both proactive and reactive routing methods have benefitted from hybrid routing protocols. Because the first nodes contain tables, it acts like a proactive routing protocol. When nodes realize they don't have any routes to target, they begin route discovery and operate as reactive routing protocols. ZRP is the hybrid protocol. Zone Routing Protocol is a protocol that

combines the advantages of both methods (ZRP). Each node in ZRP has a zone surrounding it that contains all of its neighbours. If the destination node's location is inside the source's zone, proactive routing is used; otherwise, reactive routing is used.

- *Zone Routing Protocol (ZRP):*

Zone routing class was proposed by Haas and Pearlman. ZRP It's a hybrid routing class for mobile ad hoc networks that divides nodes into smaller networks (zones). It has the characteristics of both on-demand and proactive routing classes. Proactive Networks limit nodes into sub-networks within each zone (zones). It combines the benefits of reactive and on-demand routing methods. Within each zone, the proactive routing class is changed to improve communication in areas where neighbours are present. To minimize needless communication, the inter-zone interaction employs on-demand routing classes. According on the distance between mobile nodes, the network is divided into routing zones. Given a hop distance d and a node N , all nodes within a communication hop distance of at least d from N are included in N 's routing zone. N 's peripheral nodes are the nodes in its routing zone that are precisely d hops distant from N . One of the most difficult aspects of zone routing is determining the zone's size. Independent Zone Routing (IZR), a superior zone routing system that allows adaptive and flexible reconfiguration of the zone's decreased size, is presented. Furthermore, the IZR class's adaptive nature improves the ad hoc network's scalability. Each node is seldom interested in updating the zone's routing information. Additionally, each node does some limited route optimization, which includes the following actions: removing unnecessary routes, shortening routes, and detecting connection failures.

9.3. Comparison:

Comparison of Routing Protocols in MANET are illustrated in Table 1 below.

TABLE 1: COMPARISON OF ROUTING PROTOCOLS IN MANET

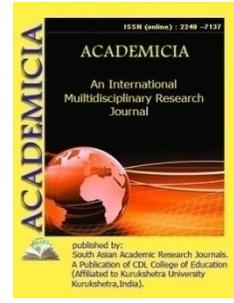

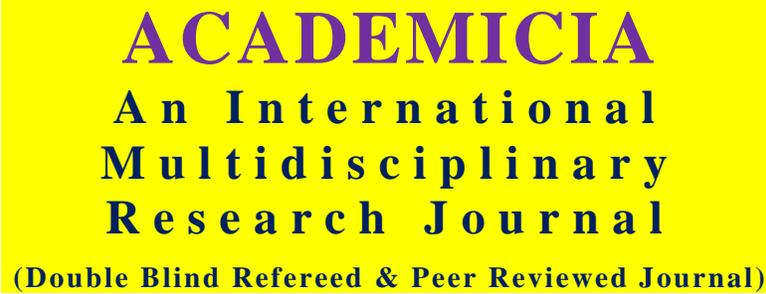

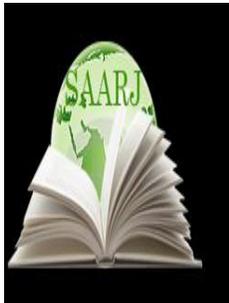

Parameter	DSDV	WRP	OLSR	AODV	DSR	TORA
Routing structure	FLAT	FLAT	FLAT	FLAT	FLAT	FLAT
Routing overhead	HIGH	HIGH	LOW	HIGH	HIGH	HIGH
Caching overhead	MEDIUM	HIGH	HIGH	LOW	HIGH	HIGH
Throughput	LOW	LOW	HIGH	HIGH	LOW	LOW
Loop Free	YES	YES	LOW	YES	YES	YES

10. CONCLUSION

This article explained how to classify various routing systems based on their routing approach. Some key features of the three routing methods, such as reactive, proactive, and hybrid protocols, were addressed. There are a few distinctions between them, as seen in Table 1. In this article, an attempt has been made to focus on a comparison of DSDV, AODV, DSR, TORA, OLSR, WRP, and DSDV. Furthermore, since a single routing protocol cannot perform optimally in all circumstances, routing protocol selection should be based on the needs of the particular application. Our future research effort will concentrate on proposing an extension of current conventional routing protocols that will be superior in terms of security, throughput, efficient resource usage, and service quality.

ABSTRACT

This article contains a number of theories of dissonance in translation as an alternative to “pragmatic failure”. The aim is to try to prove whether the term “pragmatic failure” which is so widely used and settled in the field of intercultural studies could be appropriately substituted by the term “dissonance” which derives from the theory of “cognitive dissonance” as of the field of cognitive linguistics and social psychology.

KEYWORDS: *Cognitive Dissonance, Theory Of Cognitive Dissonance, Literary Translation, Contextual Translation, Proportionality In The Knowledge System, Proportionality Of Form And Content.*

I. INTRODUCTION

Over the last decades, relationships among language, culture and identity have become a favourite topic in social science, due to this fact, some scholars have lately begun to pay systematic attention to many areas in the field of pragmatic failure, and however, little research has been devoted to Cognitive Dissonance in Intercultural Communication. This has become an important aspect of analysis as it is in its infancy.

A key term should be kept in mind before carrying on with this introduction, that of linguistic etiquette defined by Kasper as “the practice in any speech community of organizing linguistic action so that it is perceived as appropriate/harmonious within the frame of ongoing communication event” [1,27].

Once having this term in mind, the problems arise when the linguistic etiquette is not respected in a conversation due to a wide range of different factors.

A pragmatic failure could be defined as “the inability to understand what is meant by what is said”, however, as it will be explained in the literature review, this term springs two other terms, such being sociopragmatic failure and pragmalinguistic failure [2,25]. Nonetheless, for the purpose of this paper we will try to prove how a dynamic term which encompasses both ideas can be used in order to narrow down the analysis of any intercultural communication process, this is: “cognitive dissonance”. Dissonances can display different degrees of intensity, have rather unpredictable consequences and are strictly bound to contextual conditions and to individual judgments. When going deep into the term “dissonance” we find ourselves facing different types of the latter: intentional, unintentional, intra-cultural and intercultural. However, the scope to which this paper extends will focus on unintentional intercultural dissonance [4,2871].

II. Main part

A dissonance occurs in any circumstance in which speakers, deliberately or not, organize the linguistic action in such a way that hearers perceive it as grammatical but conflicting with the harmonious flow of the conversation [7,110].

In order to expand the concept of Cognitive Dissonance enclosed in the frame of social psychology to intercultural encounters four articles have been selected which stand out in importance for this research paper. It must be held in mind that it is a growing field that of adding up cognitive dissonances to intercultural studies and therefore, the amount of data regarding such is limited; therefore, the reason of choosing these articles will be explained afterwards: Festinger and Carlsmith.

Going Beyond Pragmatic Failures: Dissonance in Intercultural Communication.

Regarding these four articles it is important to note down how they can be divided into sets of two, those dealing with intercultural communication and those dealing with social psychology and science. On one hand, the articles dealing specifically with cognitive dissonance in intercultural communication are those written by Olga Leontovich and Chiara Zamborlin – both deal with the implementation of cognitive dissonance into intercultural communication. Zamborlin uses as her base of research 6 utterances produced by her during her stay in Japan and analyses the dissonances found at the time of the encounter by expanding the theory to a more intercultural approach. Leontovich on the other hand sets her study based on another perspective. While Zamborlin exemplifies her theory through a more quotidian perception, Leontovich intends to assert the need for a high level of intercultural competence for interpreters, translators and intercultural communication specialists in order for them to take cognitive dissonance into account in the intercourse of their professional activities. On the other hand, the articles written by Festinger and Carlsmith and Blackwell et al. deal specifically with Cognitive Dissonance but only at a psychological level which will be tried to be correlated with the other two in order to reach common points and outcomes. Festinger and Carlsmith (1957)'s main hypothesis is “what happens to a person’s private opinion if he is forced to do or say something contrary to their opinion?” and base their research on an experimental work based on this question. Their aim was to create dissonance in the mind of their participants and try out how they would react based on

economic enhancements, this is, if the sample they gathered of people would fight back the dissonance created in their minds based on economic remunerations [5,509]. The fourth and last article, although focusing mainly in political science, allows to this review paper to select certain important and curious factors they outline which could be implemented in intercultural studies, which are those of socialization and empathy and ethnic attitude and violence decisions. Its main focus is to prove how actions can induce changes in preference.

In the following section, these four articles will be intertwined by means of the literary review afore presented in order to reach common points overlapping the knowledge they all pose in order to reach a final conclusion as to whether the term cognitive dissonance is appropriate as a more dynamic continued overall umbrella substitute for pragmatic failure in intercultural studies.

III. RESULTS AND DISCUSSION

Festinger (1957) claims in his work dealing with social psychology, under certain conditions, the private opinion of a person can change as to bring it closer to the overt behaviour that person has been obliged to perform. This is, as an example, if at a debate a person is forced to improvise a speech to support a certain point of view which they do not agree with, their private opinion will move towards the position taken in the speech. Therefore, the changed opinion of that person will naturally experience a greater change than that of the people listening or reading it. Stating it in a different manner, as Blackwell et alli (2017) pose, actions may be chosen for various reasons as may be because of imitation, experimentation or habit.

In terms of social psychology, let us say a person believes in “X” but as a result of the pressure put on them, publicly claims to believe in “not X”. Such person therefore now holds two cognitions which psychologically do not fit together. In other words, their cognition of private belief is dissonant with that they claim to have. Nonetheless, the claim of believing in “not X” comes with cognitive associations that that person corresponds with such belief as to cognitive elements of reasons, pressures, promises or rewards which lead that person to state that they believe in “not X”. So to speak, that person is left now with consonances and dissonances about the same cognitive matter [6, 69]. The only way for that dissonance to be reduced is for that person to change their private opinion as to bring it into correspondence with what they have said. Consistently, that private opinion will fluently change in order to finally correspond one way or another with what they have stated. It should be noted that the observed opinion would change the greatest when the pressure upon were sufficient to justify such beliefs.

As Festinger and Carlsmith [16,122] claimed, the more important the subjects tended to believe their experiment was or the more money they would give the participants the less dissonance they would encounter in the results when obliging them to claim something they did not believe in.

As an overall come out of Festinger and Carlsmith [16,128]they clearly admit that cognitive dissonance does not only take place at a small cognitive intrapersonal level as they had tried to demonstrate with their experiment, but rather enlarges to many other areas in life, stating it differently, cognitive dissonance might be operating in many real- life situations, and, indistinctively and more obviously in intercultural relations. However, it could all be summed up as “the consequences of preferences” as Blackwell et alli (2017) define it, still leaving open that such preferences are affected by action choices.

One of the factors which takes part in the whole intercultural situation pulled from the psychological field is that of consequences as has been stated before. When taking this concept to the frame of intercultural communication, stereotypes begin to play an important role. The overt public pressure of cognitive dissonance will be greater the greater the stereotype or lower, if such stereotype is that of a positive one. Preference change will always depend on the individual's tendency to minimize costs, this is, in intercultural communication, a certain person will try to "maximize utility given costs" [9,102]. Although the aim of the paper written on "preferences from behaviour" only deals with action inducing change of preference through cognitive dissonances, it can be stated, as shown in the other three research papers under discussion, that dissonances and change in preference is not only induced and caused by a choice in actions but by many other external factors as will be explained. One of the key points implemented is that cognitive dissonance should not only be seen as a problem as it usually happens since it is associated with pragmatic failure or pragmatic errors in intercultural studies. The simple word "failure" or "error" induces the student to straight ahead ponder it as a mistake, but it is rather a "shaper" to my account [9,103]. All these remarks dealing with social psychology can certainly be expanded to intercultural studies and magnify the scope of understanding many situations which occur in interculturality as Leontovich, O. and Zamborlin [19,68] attempt to and develop in their respective papers.

Dissonances can happen interculturally, according to Zamborlin across three pragmatic domains, being Illocution when the utterance is perceived as a face threatening act being to direct or indirect, Style when the utterance is perceived inappropriate due to the choice of lexis, syntax or formulae and in Discourse when utterances are noticed when an unexpected topic is chosen. As well, related to these, come into play the factors which can trigger a dissonance, being linguistic (due to language transfer), sociolinguistic (when speakers do not conform to the sociolinguistic norms) or pragmatic when speakers only act on the limited encyclopaedic pragmatic knowledge they hold. A lot of work people invest in "relational work" goes unnoticed in the conversation and many other factors apply such as rudeness and politeness. Based on this, Leontovich [18,139] clarifies these are the reasons through which the discrepancy between the ways of categorizing and conceptualizing reality through the prism of different cultures and languages causes cognitive dissonance, still, adding up dissonances in such exchanges cannot only be limited to pragmatic levels but also to the cognitive and semantic strata [7,108].

It is necessary, thus, for people, if they are to have a high level of intercultural competence, to have the ability to find the reasons, types, and effects for cognitive dissonance and the tools to bridge such intercultural dissimilarities when interacting with representatives of an alien culture. The background, encyclopaedic knowledge of a person expands when confronting dissonances while being open to its consequences. The old beliefs clash with the new beliefs contradicting someone's values, morals or convictions and, if responded appropriately the personal encyclopaedia is to expand and advance and progress are accumulated and reached. Zamborlin [19, 97], as has been explained before, defines the possible ways in which cognitive dissonance can take place in intercultural encounters. However, Leontovich [19,145] 5 extends the theory by defining how harmonization can be achieved through four different means: "attempting to explain the inexplicable, [...] minimizing the regret connected with irrevocable choices, [...] justifying their own behaviour which goes against their own principles" and "aligning their perception of other individuals with their own actions

towards them". A point which should be noted as an overall summary of causes is the following gathering of factors which can cause breakdown and cognitive dissonances in intercultural instances: divergence of background knowledge, implicit meanings, violation in the order of speech interaction, extralinguistic factors (gender, age, status, level of intellect, profession, ethnicity), equivocation and uncertainty, use of euphemisms, political correctness, pseudonomination, shift of emphasis, silence, avoidance of response as well as non-verbal (gestures), some provisions of diplomatic protocol and etiquette, the sphere of interpersonal relations, of a person and their environment and the sphere of regulation of people's activity related to the cultural values they are creating.

The search for retrieving consistency as a way out of cognitive dissonance can serve as a proof of an individual's communicative competence. Leontovic [18,123]

To my belief, a proper third-culture person should be able to adapt instantly, if not, naturally and intrinsically to all these situations and have the potential to avoid cognitive dissonance as an innate capacity. Every theory here presented in this review paper poses the solution of one individual changing their actions, their way of acting and responding to certain situations, to change your own beliefs, meaning, to rationalize your action, to change the way you view, perceive and remember your deeds, liquefying the dissonance if you might. However, I do not believe in change, but in expansion adding a more intercultural view on the matter, adapting or expanding your beliefs, taking in your stride the other person's axiology, this is, rather than changing them, actually expanding and acquiring all beliefs, values, morals and standards possible in order to extend the scope and cognitive continuum, becoming dynamic and allowing oneself the option of choosing among a vast field of intercultural encyclopaedic background knowledge.

IV. CONCLUSION

This paper has only dealt with intercultural un-intentional dissonances. However it might be safe to state that cognitive dissonance is appropriate as a more dynamic continued overall umbrella substitute for pragmatic failure in intercultural matters. One of the underlying outcomes is that insufficient knowledge of a foreign language (misunderstanding of polysemy, homonymy, puns and so on) can lead to cognitive dissonance among cultures and languages.

It can also lead, not only to positive outcomes or manipulation intercultural encounters, but also to negative ones, cognitive dissonance could lead to people rationalizing the choice of immoral actions to their own mental benefit and well-being. Pragmalinguistic failure is fairly easy to overcome. It is simply a question of highly conventionalized usage, which can be taught quite straightforwardly as "part of the grammar". Sociopragmatic failure is much more difficult to deal with, since it involves the Student's system of beliefs as much as his/her knowledge of the language. I presume to sum them up under the umbrella term cognitive dissonance. The world view depends on the way reality is conceptualized and categorized in a certain culture where many factors which play a certain role are to be kept in mind: gender asymmetry, local standards of beauty, feelings of offence, perplexity, vexation, norms of behaviour, political, religious, ecological, other types of discourse, embarrassment, identity crisis, amazement, indignation, and frustration. It is not only a nice dynamic continuum to substitute pragmatic failure but it also leaves a wide seam of new research on the open.

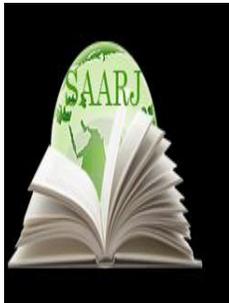

To conclude, self-persuasion is to be mentioned, the self plays a major role in the control of

what happens around oneself, the intention to change yourself, manner of filtering information, simplifying information, combining and restructuring it, being prone to filling in blanks, inclination for self-analysis, everything leads to one conclusion regarding intercultural cognitive dissonance: the pursue of an overall achievement of consonance.

ABSTRACT

The article discusses that acute inflammation of the middle ear is an inflammatory infectious process that captures all parts of the middle ear: the auditory tube, tympanic cavity, mastoid process. According to statistics, over the past 25 years, the incidence of acute otitis media in the population does not tend to decrease. Complication and treatment of acute otitis media.

KEYWORDS: *Chronic Suppurative Otitis Media, Mastoiditis, Pathology, Complications, Treatment.*

INTRODUCTIONS

Acute inflammation of the middle ear develops as a result of damage to the mucous membrane of the tympanic cavity by both bacterial flora and influenza viruses. Microbiological studies of exudate from the tympanic cavity show that most often acute otitis media is caused by various types of streptococci, staphylococci, pneumococci and haemophilus influenzae, less often anaerobes and gram-negative microbes are found. It should be noted that the development of acute otitis media in most cases is preceded by an acute respiratory infection, in which the protective and transport functions of the ciliated epithelium of the auditory tube are disrupted, which contributes to the penetration of pathogenic flora from the nasopharynx into the tympanic cavity. Therefore, in the etiology of acute otitis media, a pathogenic combination of a respiratory virus and a bacterial agent plays a certain role.

Pathogenesis and pathological anatomy of acute otitis media

The pathogenesis of acute otitis media is closely related to the entry of pathogenic flora into the middle ear cavity. There are three main ways of infection of the tympanic cavity:

1. tubular;
2. hematogenous;
3. transtympanic.

The tubal pathway is the main one. Respiratory viral infection, which, as already noted, in most cases precedes the development of otitis media, affecting the mucous membrane of the auditory tube, disrupts the ventilation and drainage functions of the latter. As a result, the intra-drum pressure decreases and the process of exudation of fluid from the vessels of the mucous membrane of the middle ear begins, followed by the penetration of pathogenic microflora and the development of the inflammatory process. The inflammation in the middle ear is usually suppurative. However, the degree of its severity depends on a number of factors, such as:

1. Type and virulence of pathogenic flora.
2. The state of the general reactivity of the organism.
3. The existing pathology of the nasal cavity, paranasal sinuses, nasopharynx.

The inflammatory process in acute otitis media begins with edema and leukocyte infiltration of the mucous membrane, followed by the formation of exudate. The stage of serous inflammation is replaced by a catarrhal one, in which, due to the increased secretion of cells of the integumentary epithelium, the exudate becomes more viscous. Subsequently, with increased infiltration of the mucous membrane by segmented leukocytes, the latter, mixing with exudate, give it a purulent character. With the breakdown of leukocytes in the exudate, lysosomal enzymes are released, which, having proteolytic activity, are capable of disrupting the integrity of the tympanic membrane. The described changes are observed not only in the tympanic cavity, but also in the cells of the mastoid process. As purulent inflammation develops, all the air spaces of the middle ear are filled with edematous, infiltrated mucous membrane and purulent exudate. The mobility of the auditory ossicles is limited. The accumulated exudate puts pressure on the tympanic plexus and eardrum. When the tympanic membrane is perforated, otorrhea-discharge from the ear appears. The release of the tympanic cavity from exudate can also occur when the

drainage function of the auditory tube is restored. As the inflammation subsides in the middle ear, reparative processes begin (the proliferative stage of inflammation), in which there is a migration of mononuclear cells from the vessels into the tissue of the middle ear. The outcome of acute otitis media is largely associated with this stage of the disease. The perforation of the tympanic membrane can be completely healed when all three layers are regenerated. If the mucous and epidermal layers grow together at the edges of the tympanic membrane defect, then a persistent perforation remains. Under certain conditions, infiltration of the tissues of the middle ear, the presence of exudate lead to the development of an adhesive process in the tympanic cavity. The hematogenous pathway of entry of pathogenic flora into the middle ear is observed in infectious diseases (scarlet fever, measles, influenza). A feature of the course of acute otitis media with scarlet fever and measles is the necrotic nature of changes in the mucous membrane, ligaments and walls of the tympanic cavity. Necrotic changes in tissues are associated with thrombosis of the vessels of the middle ear and a sharp violation of trophism. In this case, necrotic destruction of the tympanic membrane leads to the formation of extensive perforations, as a result of which the inflammatory process passes, as a rule, into a chronic stage.

With influenza otitis media, a specific hemorrhagic form of inflammation develops, in which there is a sharp expansion of the blood vessels of the middle and outer ear, followed by the formation of extravasates due to rupture of the vascular walls. Extravasates are filled with hemorrhagic exudate and can be localized in both the outer and middle ear.

The transtympanic pathway of entry of pathogenic flora is observed with injuries of the tympanic membrane of various origins. Violation of the integrity of the tympanic membrane leads to the elimination of the tissue barrier between the middle and outer ear and the penetration of a virulent infection into the tympanic cavity.

Features of the course of acute otitis media.

The disease usually lasts 15-20 days. With certain features of the inflammatory process, the duration of the stages of the process may change. In many cases, acute otitis media ends at the stage of catarrhal inflammation, without turning into a purulent stage, and the duration of the disease is significantly reduced (7-10 days). Due to a decrease in the general reactivity of the body, irrational antibacterial therapy, the inflammatory process can take on a protracted nature both at the pre-perforated and perforated stages. The prolonged course of catarrhal inflammation of the process in the middle ear, as a rule, leads to the formation of adhesions and stiffness of the auditory ossicles. Prolonged otorrhea in acute otitis media may be associated with the involvement of the mastoid process in the inflammatory process, as well as with the proliferative nature of inflammation with the formation of granulations in the middle ear. It should be borne in mind that acute otitis media can occur with damage to the inner ear, especially of influenza origin.

In children of younger age groups, there are significant clinical differences in the course of acute otitis media, which must be known, given the frequency of this pathology. The following factors contribute to the development of acute otitis media in childhood:

1. Structural features of the middle ear: in early childhood, the auditory tube is located more horizontally, has a larger diameter and shorter length, which facilitates the penetration of infection by the tubogenic route. The middle ear cavity contains myxoid tissue, which can quickly become involved in the inflammatory process.

2. Frequent inflammatory diseases of the lymphadenoid tissue of the pharynx and its hypertrophy, especially of the pharyngeal tonsil (adenoids).
3. Predisposition to childhood infectious diseases: measles and scarlet fever.
4. Lack of formation of acquired immunity.

In children of the first year of life, the disease begins violently. The temperature rises to 39-40 C, the child is restless, sleeps and eats poorly, cries constantly, vomiting and diarrhea may appear. In some cases, symptoms of meningism are observed due to the penetration of the infection through the ungrown fissurapetrosquamosa. In children under 6 months of age, otoscopic identification points are indistinct, the eardrum is thicker than in adults. It is not always possible with acute otitis media to see a bright hyperemia of the tympanic membrane or its protrusion. Therefore, otoscopic diagnosis in children is more difficult than usual.

Treatment of acute otitis media

Treatment of acute otitis media has features depending on the stage of the disease. Both general and local treatment is used. General treatment is associated with antibiotics. There is an opinion that at the pre-perforative stage the doctor does not have data on the type of pathogenic flora and its sensitivity to antibiotics, in addition, in 30-40% of cases, the exudate is sterile, therefore, the prescription of antibiotics should be based on data on the most common causative agents of acute otitis media, which are considered pathogenic strains of streptococci and staphylococci. In this regard, the most effective drugs for the treatment of acute otitis media are antibiotics of the penicillin series: benzylpenicillin, phenoxymethylpenicillin, ampicillin, ampiclox, oxacillin; augmentin. Benzylpenicillin is used only parenterally and requires multiple injections to maintain the required concentration. Phenoxymethylpenicillin is administered enterally; for adults, its dosage is 500 mg 3 times a day. Oxacillin belongs to semi-synthetic penicillins and is protected mainly from staphylococcal lactamases, therefore it is considered a less effective antibiotic for streptococcal infection. Of the penicillins, oral aminopenicillins have the broadest spectrum of action: amoxicillin and ampicillin. It should be noted that ampicillin creates insufficiently high concentrations in the blood serum due to the peculiarities of absorption. The most effective drug of the penicillin group is currently considered amoxicillin. It is better absorbed, has a longer half-elimination period, so it can be prescribed 2-3 times a day. Currently, a feature of the bacterial flora is the growing resistance to antibacterial drugs, especially in children who previously received antibiotics, which is reflected in the choice of antibacterial agents. In this regard, the most effective drugs are considered to be a combination of amoxicillin with beta-lactamase inhibitors, which are produced by gram-positive and gram-negative strains of anaerobic and aerobic bacteria. One of the most famous drugs in this group is augmentin, which is a combination of amoxicillin with clavulanic acid. Clavulanic acid prevents the destruction of amoxicillin by beta-lactamases. The drug is available in the form of tablets (375mg, 625mg, 1g), syrup for children (156mg-5ml) for oral administration and injection vials (0.6g, 1.2g). In severe acute otitis media, it is advisable to prescribe antibiotics of the cephalosporin series: cefazolin, cephalexin, cefazemin, claforan, zinacef, ceftriaxone, suprax. In acute otitis media, the appointment of aminoglycoside antibiotics is not recommended, since this increases the risk of their ototoxic action. Clinical data and cytological studies prove that antibiotic therapy shortens the duration of treatment, which has a beneficial effect on the

condition of the mucous membrane of the tympanic cavity and does not lead to the proliferation of fibroblasts.

The use of pain relievers is also a common treatment. Their arsenal is large enough. Basically, the most common drugs in this group are derivatives of metamizole: analgin, baralgin, pentalgin, sedalgin and others. Currently, metamizole and preparations containing it are not recommended by WHO due to the risk of agranulocytosis and are banned for use in more than 30 countries around the world. In this regard, non-steroidal anti-inflammatory drugs, one of which is Nurofen, are widely used. The action of nurofen is associated with the prevention of the synthesis of prostaglandins - mediators of pain, temperature reaction and inflammation. Nurofen is available in the form of tablets (200mg) and for children under 12 years of age in suspension for oral administration. In acute otitis media, the nurofen course is rather short (2-3 days), so side effects are extremely rare.

At the preperforative stage, thermal procedures are actively used as a local treatment in the form of warming semi-alcohol compresses, heating pads, and Solux lamps. To improve the drainage function of the auditory tube, vasoconstrictor nasal drops are prescribed: naphthyzin, galazolin, nasal, otrivin, nasol and vasoconstrictor ointments: sunaref, Simanovsky's ointment, Fleming's ointment. In the external auditory canal at the pre-perforative stage, it is recommended to instill ear drops: carboglycerol drops (5% solution of carbolic acid in glycerin), otipax, otinum, sofradex, garazone. All of the above drugs have anti-inflammatory, local anesthetic and antiseptic effects. However, they cannot be used at the perforating stage for various reasons: otipax contains 95% ethyl alcohol, sofradex is an aminoglycoside antibiotic (neomycin), carbolic acid has a cauterizing effect on the epithelium of the tympanic cavity. The appointment of UHF at the pre-perforative stage in the absence of an outflow of purulent exudate can lead to the development of complications due to the weakening of natural tissue barriers to the spread of infection from the middle ear to the inner ear and cranial cavity. If the perforated stage does not occur in a timely manner, and the patient has severe ear pain, high fever, there is a protrusion of the tympanic membrane, then on the 4th-5th day of illness, it is necessary to perform paracentesis of the tympanic membrane. The incision of the tympanic membrane is performed with a special paracentesis needle in the postero-inferior quadrant of the tympanic membrane. In children, this intervention should be carried out under Rausch anesthesia, in adults under local anesthesia. At the perforated stage, an important element of treatment is to ensure the outflow of purulent exudate from the middle ear cavities and to prevent possible inflammation of the external auditory canal. Local treatment at this stage is reduced to the introduction of sterile gauze turundas into the external auditory canal, impregnated with antiseptics (dioxidin, rivanol, sodium sulfacyl solution, nifucin), aqueous solutions of antibiotics, as well as the use of ear drops: otofa, cypromed. First, the turundas are changed 6-8 times a day, as the otorrhea decreases up to 2-3 times. At the perforated stage, UHF has a good effect.

After the otorrhea stops, the perforation of the tympanic membrane heals with the formation of a scar. If conductive hearing loss persists after the closure of the perforation, then a course of treatment is carried out aimed at preventing the development of the adhesive process in the middle ear: blowing and catheterization of the auditory tube, pneumomassage of the tympanic membrane, endaural electrophoresis of lidase.

Complications of acute otitis media

Mastoiditis

Mastoiditis develops as a complication of acute otitis media and is an inflammation in the bone cells of the mastoid process. The pathogenic flora, as a rule, are the same pathogens that caused the development of acute otitis media. Inflammation of the mucoperiosteum of the mastoid cells is always observed with purulent inflammation of the middle ear, however, the transition of the inflammatory process to the bone tissue with its subsequent destruction is associated with the following reasons: a decrease in general and local immunity, high virulence of the pathogenic flora and impaired outflow from the mastoid process through aditus ad antrum, due to edema of the mucous membrane. Pathological changes in the mastoid process begin with inflammation of the mucoperiosteum and the formation of serous or serous-purulent exudate in the cells of the mastoid process. In the future, the process involves bone intercellular bridges, which, due to osteitis, are destroyed with the formation of cavities filled with pus. Along with purulent fusion of bone tissue, granulation tissue appears in the cells. It should be noted that destructive changes do not occur simultaneously in different groups of air cells, therefore, during the operation, a thorough revision of all parts of the cellular system is required.

Clinical course of mastoiditis

By the end of the second week, a patient with acute otitis media shows signs of deterioration: the body temperature rises again, pulsating pain in the ear and profuse purulent discharge appear. In the blood test, neutrophilic leukocytosis, a shift in the leukocyte formula to the left, an increase in ESR are noted. During otoscopy, the following symptoms are observed: a large amount of thick, pulsating pus, which quickly fills the ear canal; the tympanic membrane is sharply hyperemic and infiltrated; overhang of the posterior-superior wall of the external auditory canal in the bony section due to inflammation of its periosteum. Of the local symptoms, soreness on palpation of the mastoid process, smoothness of the skin fold behind the ear, pasty soft tissues of the behind the ear region are important.

In the diagnosis of mastoiditis, radiography of the temporal bones in the projections of Schüller and Mayer and computed tomography of the temporal bone in axial and coronary projections are of great importance.

The clinical course of mastoiditis can have many features. So, in the elderly, an atypical course is often observed, when otorrhea and pain on palpation of the mastoid process are absent.

Treatment of mastoiditis

Mastoiditis is a surgical complication of acute purulent otitis media. Conservative treatment is possible only at its initial stages and it does not fundamentally differ from treatment at the perforated stage. From antibiotics, preference is given to drugs of the cephalosporin series and lincomycin.

With mastoiditis, a surgical intervention is performed - antromastoidotomy. Operation antromastoidotomy is sanitizing and is aimed at eliminating the focus of purulent inflammation in the region of the base of the skull. Local infiltration anesthesia is considered the preferred type of anesthesia for middle ear surgery, since during the intervention, control over facial function is necessary to prevent injury to the facial nerve. In children, patients with severe concomitant

pathology: diabetes mellitus, hypertension, coronary heart disease, mental disorders, the operation is performed under general anesthesia. An incision in the behind-the-ear region is made parallel to the behind-the-ear fold, 0.5 cm away from it. With the help of a raspator, the mastoid area is separated so that all the contours of the Shipot triangle (temporal line, spina Henle, apex of the mastoid process) are indicated. Trepanning is carried out using Voyachek's chisels, chisels or a special drill. At the first stage of trepanation, the antrum is opened, at the second stage, a thorough revision of all the cells of the mastoid process is performed, during which pathologically altered tissues (granulation, softened walls of bone cells) are removed. As a result of the operation, a cavity is formed, which heals by secondary intention, so the wound is not sutured. In case of large destruction and, accordingly, the formation of a large cavity, in some cases, it is possible to perform "plastic surgery" with a muscle-fascial flap taken from the temporal muscle. The postoperative period in patients with mastoiditis lasts for a month, when the postoperative cavity closes, purulent discharge from the ear stops and hearing is restored.

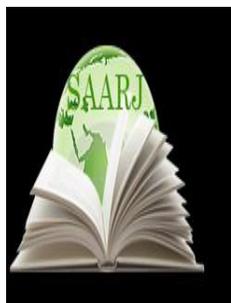

With special forms of mastoiditis, antromastoidotomy has its own characteristics. With squamite and zygomaticitis, surgical revision of the cells of the zygomatic process and scales of the temporal bone is necessary. The most difficult surgical approach for petrositis, when it is necessary to open perilabyrinth inflammation foci. With special forms of mastoiditis, associated with the breakthrough of pus into the soft tissues of the neck, along with antromastoidotomy, an opening of the neck phlegmon is performed with a thorough revision of all purulent leaks and the setting of drains.

Features of the defeat of the mastoid process in children are associated with the fact that the latter is formed by the age of 3, and only antrum is involved in the inflammatory process before this age. The course of antritis can be complicated by a subperiosteal abscess. Antritis treatment can be conservative and surgical. With conservative treatment, along with antibiotic therapy, it is recommended to perform anthropuncture for therapeutic and diagnostic purposes. Surgical treatment is associated with performing an antrotomy operation.

DETERMINATION OF CADMIUM POISONING IN SKIN WHITENING CREAMS

Dr. Anil Ahuja*

*SOP, Sanskriti University,
Mathura, Uttar Pradesh, INDIA
Email id: principal.ips@sanskriti.edu.in

ABSTRACT

This article is based on an examination of different studies conducted across the globe on the topic of heavy metal impurities in skin-whitening or lightening treatments. Cadmium (Cd) was chosen as the heavy metal for this study since it is one of the most frequently detected contaminants in a variety of cosmetic products, yet studies on Cd alone are scarce. The acid-digestion procedure is utilized to prepare samples in the majority of tests. Atomic Absorption Spectrometry (AAS) is the most frequently utilized confirmatory method, with the exception of one study that employed inductively coupled plasma atomic emission spectrometry (AES). The difference between AAS and AES is that AAS measures electromagnetic radiation absorption whereas AES tests radiation output. In this study, the World Health Organization (WHO) detection cap or their own nation regulation is utilized as a reference. According to studies, the use of some cosmetic ingredients exposes consumers to tiny quantities of dangerous heavy metals, which may create health issues if they remain in biological processes over time. It was also found that, although the usage of heavy metals in some brands is below the legal limit, they nevertheless represent a considerable risk to people. Both of these tests are being performed in order to identify which brands of cosmetics sold in our sector are in violation of the regulations and to bring this to the notice of the authorities.

KEYWORDS: Cadmium, Concentrations, Cosmetics, Heavy Metals, Lightening Creams, Products, Samples, Skin, Whitening.

INTRODUCTION

Poisoning is a sickness or process in which a living creature is intentionally harmed or affected by a toxic substance or animal venom. Acute poisoning occurs when a toxic substance is introduced in a single event or over a brief period of time. Chronic Poisoning is a repeated or continuous exposure to a toxic substance in which symptoms do not develop immediately or after each presentation. Poisoning symptoms may resemble a number of diseases, including seizures, inebriation, stroke, and insulin response. Poisoning symptoms and adverse effects may include[1].

- Burns or redness around the mouth and lips
- Breath that smells like synthetic chemicals, for example, gas or acetone
- Vomiting
- Difficulty in breathing
- Sleepiness
- Confusion or other altered mental status

The term "heavy metal" refers to any metallic material product with a high thickness that is dangerous or toxic at low quantities. Heavy metals are widespread on the planet's surface. They can't be contaminated or destroyed. They join our bodies in tiny quantities via eating, drinking water, and breathing. Some heavy metals (such as copper, selenium, and zinc) are needed for human digestion to operate correctly. Nonetheless, in greater quantities, they may cause harm. Mercury (Hg), cadmium (Cd), arsenic (As), chromium (Cr), thallium (Tl), and lead are examples of heavy metals (Pb). Heavy metals are hazardous because they seem to build up in the body. Bioaccumulation refers to the expansion of a substance's convergence in a natural living form through time, as opposed to the compound's fixing in the soil. When living things are taken up and put away quicker than they are isolated (used) or discharged, mixes develop. Cadmium is a silvery white metal buried in the crust of the planet. It is isolated during the manufacture of metals such as copper, silver, and zinc, for example. Cadmium is found in some foods and is disseminated through the usage of petroleum derivatives such as coal and gasoline, smoking tobacco, and eating trash. Batteries, make coatings, and metal coatings all utilize it[2].

Cadmium is categorized as a human cancer producing agent because of its detrimental effects on the renal, skeletal, and respiratory systems. It is typically found in the earth's crust in low quantities. Whatever the situation may be, human migration has significantly increased such quantities. Cadmium can travel a great distance via air from the source of discharge. It rapidly accumulates in a number of living types, including mollusks and scavengers. Vegetables, peas, and drab roots have lower concentrations. Human presentation is mainly induced via the consumption of contaminated food, the active and passive breathing of cigarette smoke, and the inhalation of nonferrous metal workers. Long-term exposure to lower levels of Cd has been related to kidney damage, bone malformation, and the propensity of bones to fracture. Cadmium poisoning has been observed in various areas of the globe. It is a global medical issue that affects a range of organs and may result in a number of fatalities each year. Cadmium has an effect on cell proliferation, separation, and apoptosis. These actions operate in combination with Deoxyribonucleic Acid (DNA) fixing tools, the age of reactive oxygen species (ROS), and

apoptosis recruitment. Cadmium attaches to mitochondria and, at low concentrations, may impair both cell respiration and oxidative phosphorylation[3].

A cosmetic is a material that is added to the human body in order to enhance, restore, or change the beauty or appearance of the skin, hair, nails, lips, eyes, or teeth, or to cleanse, colour, condition, or secure the skin, hair, nails, lips, eyes, or teeth. Archaeologists found the earliest cosmetics, which were utilized for eye make-up and the usage of scented lotions. Cosmetics are the most frequently used product among people nowadays, particularly among adolescent females. People's aesthetic consciousness has generated a need for cosmetics in today's market. As a consequence, the cosmetic business has expanded considerably, creating a broad variety of cosmetics for the treatment besides prettification of teeth, nails, hair, skin, and the body, such as sindoor, and eye shadows, among other things. People's wellness awareness, on the other hand, has drawn physicians and academics to find out what's causing their negative effects. Heavy metal poisoning was found to be the core of the issue. The most common pollutants in beauty items are heavy metals such as lead and cadmium[4].

The significance was first identified in 1912, due to Gourbin's fingernail scrapings (accused of strangling his love) then found that the arrangement of the punitive powder on Marie's neck (a handmade restorative). Emile was found guilty of intentional murder by the jury following corrective evidence and other findings.

Despite the fact that demonstrated, it wasn't until the 1980s that scientific professionals started to examine cosmetic samples in detail. Different nations control the usage and acceptance of different methods. The FDA governs the use of these chemicals in cosmetics in the United States, whereas the European Union (EU) Cosmetics Directive controls their use in European nations.

The guideline in India adhered to the EU Cosmetic Directive, as well as the standards established by the Drugs and Cosmetics Rules 1945, the Drugs and Cosmetics Act 1940, and the Bureau of Indian Standards (BIS). The Drugs and Cosmetics Act of 1940 is an Act of the Indian Parliament that governs the import, manufacturing, and distribution of pharmaceuticals in India. The demonstration's primary aim is to guarantee that the prescriptions and cosmetic care items supplied in India are safe, efficient, and satisfy governmental quality standards. Cosmetics, as defined by the Act, are any article intended to be scoured, poured, sprinkled, or splashed on, or acquainted with, or generally applied to the human body or any part thereof for the purpose of purifying, embellishing, advancing the engaging quality, or modifying the appearance, and includes any article intended for use as a section of restorative but excludes cleanser. Cosmetics are controlled in India by the Central Drug Standard Control Organization (CDSCO), which is governed by the Drug and Cosmetic Act 1940 and Rules 1945 (updated up to Dec. 31st 2016). Norms of value in connection to skin care products where the restorative pledges to such standards as may be approved. A cosmetic may be deemed misbranded if it creates an inappropriate shade, or if it isn't marked in an approved method, or if the name, holder, or anything else connected with the restorative contains some explanation that is inaccurate or deceptive in any way[5].

The desire for lighter skin tones has been handed on through the centuries. This is the reason behind the constantly growing frequency of skin lightening treatments. The predominance of skin lightening cosmetics in the beauty business increased as a consequence of this popularity.

Asia has the greatest demand for skin whitening products. Not all skin lightening cosmetics are unlawful, however some creams from outside the EU include ingredients that are banned by safety regulations. Mercury and hydroquinone, for example, have been linked to overdose, skin damage, and liver and kidney failure in long-term usage, as well as corticosteroids, which are only accessible by prescription in the United Kingdom (UK). Misuse of corticosteroid creams has been associated to skin thinning, an increased risk of skin cancer, and, counterintuitively, skin darkening. Skin whitening is utilized to make your skin lighter than it was when you were born. Skin bleaching is another name for this. Creams, washes, pills, and even injections designed to prevent the release of melanin are among the skin lightening medicines available. According to a World Health Organization (WHO) study, 40 percent of Chinese women use skin whitening treatments on a regular basis, compared to 61 percent in India and 77 percent in Nigeria[6].

LITERATURE SURVEY

J. E. Onojah *et al.* explained in the article that long-term exposure to consumer products like cosmetics and hygiene may induce heavy metal poisoning in people. The degree of occurrence of fatal metals in different cosmetics products sold in local stores in Anyigba, Kogi State, Nigeria, were assessed in this research. Five skin lightening creams and five medicated soaps were among the cosmetics tested. After digestion with condensed acids (HNO_3 : H_2SO_4 in a 2:1 ratio), these cosmetics were tested for heavy metals (Cd, Pb, Cr, and Hg). Using a Varian Flame AAS, the concentrations of the selected hazardous heavy metals were measured in triplicate. Chromium was detected in measurable levels in all of the samples examined, with values ranging from 0.0020 to 0.0190 ppm. The concentrations of chromium in samples A (Dettol), B (Fashion fair), C (Septol), D (Tura), and I (Fashion fair) varied from 0.0003 to 0.0027 ppm, whereas the concentrations of chromium in samples F (Fair and White), G (Neurotone), H (Hot Movate), and J (Clear tone) was below the detection threshold. In addition, samples B (Fashion Fair), D (Tura), F (Fair and White), G (Neurotone), and H (Hot movate) contain a measurable volume of lead with concentrations ranging from 0.0063 to 0.0521 ppm, while samples A (Detol), C (Septol), E (Crusader), I (Fashion fair), and J (clear tone) have lead concentrations below the detection level. A detectable amount of mercury was detected in all of the samples examined, ranging from 0.0030 to 3.7022 ppm. The present study clearly demonstrates that the usage of some cosmetic products exposes consumers to tiny amounts of radioactive heavy metals, which may stance health risks if they build in biological processes over time[7].

J. G. Ayenimo *et al.* presented in the article that numerous discovered different there are few or no reports in personal care products, which have biotic effects. Using atomic absorption spectrophotometry, the quantities assessed five different substances commonly used in Nigeria. Many of the medicines contained substantial levels of Cd, Cr, Cu, and Zn. Hair cream contains amounts of Cd and Cu, while primarily responsible for Cr and Zn. It's difficult to tell whether the metal sample are because no cap for cosmetic goods exists; nevertheless, Cd and Cr are prohibited in cosmetics in any amount. The use of these components in soaps and creams for a long period of time may be detrimental to human health and the environment[8].

A. A. Alqadami *et al.* explained in the article, hazardous heavy metals such as metalloid arsenic (As), lead (Pb), titanium (Ti), mercury (Hg), bismuth (Bi), and cadmium (Cd) were identified in using AES. A mixture of hydrofluoric acid, hydrogen peroxide, and nitric acid was employed to completely digest cosmetic samples. The target chemicals were measured using a conventional

addition procedure. Excellent consistency parameters were achieved, such as detection limits, Ti (4.3 ppb), Pb (3.8 ppb), Hg (3.3 ppb), Cd (0.45 ppb), Bi (7.9 ppb), As (4.6 ppb) linearity ($r > 0.999$), as well as the run-to-run besides day-to-day precisions of relative standard deviations of <3 percent [9].

T. Ahmadi-Jouibari *et al.* articulated in the article that for the detection of cadmium in cosmetic samples, Continuous sample drop flow-based micro-extraction (CSDF-ME) in conjunction with graphite furnace atomic absorption spectrometry (GFAAS) has been developed as a high-performance pre-concentration method. A few microliters of an organic solvent are moved to the bottommost of a conical sample cup in this procedure. As it travels through the organic solvent, administered by a syringe needle is transformed into droplets. As a result, extracts matrix. The conical sample cup is transferred to the GFAAS instrument after utilizing an auto sampler, 20 μ L of the extraction solvent is put into the graphite furnace under optimum circumstances, The method's intra-day as well as inter-day repeatability and reproducibility is 3.2 percent and 4.5 percent, respectively, based upon 7 repetitions. As a consequence, the newly developed method was successfully utilized to extract and quantify cadmium ions in lipsticks, eye shadows, and hair colors, giving acceptable results[10].

DISCUSSION

This study is based on a review of many research on heavy metal contaminants in skin-whitening/lightening creams performed throughout the globe. Cadmium (Cd) was selected as the heavy metal for my research since it is one of the most frequently identified toxins in a range of cosmetic items, and there are few studies on Cd alone. The majority of studies utilize the acid-digestion technique to prepare materials. With the exception of one research that utilized inductively coupled plasma atomic emission spectrometry, atomic absorption spectrometry is the most frequently used confirmatory technique. The distinction between AAS and AES is that AAS measures the absorption of electromagnetic radiation whereas AES measures the output of radiation. The WHO detection limit or their own nation legislation was utilized as a reference in this research. According to research, wearing such cosmetics produces exposing customers to small amounts of deadly heavy metals, which may create healthiness problems if they stay in biological systems for extended periods of time. It was also discovered that, although certain brands' usage of heavy metals is within the legal limit, they still represent a considerable danger to people. Both of these tests are being carried out in order to identify which cosmetics products marketed in our sector are in violation of the regulations and to bring this to the government's notice.

As a result, establishing metals in cosmetic goods regulation limitations is essential. Low-quality materials should be avoided, especially for long-term continuous usage, because heavy metals are readily absorbed via the skin. Following the results, strongly recommended creams be checked for metal being marketed. Certain materials, both local and non-local, breached the rules by utilizing excessive quantities of heavy metal impurities, causing deterioration. The research examined the concentrations of various metals as well as a metal's concentration in different brands. Cadmium poisoning may have a variety of adverse effects, including cell death and enhanced cell proliferation, all of which can lead to cancer. It also has an impact on the blood flow, skeletal muscle, brain, lungs, and kidneys, resulting in heart attacks, liver illness, hypertension, immune system suppression. People who use skin-lightening treatments may be

more susceptible to greater amounts of heavy metals, according to the research. The two studies looked at were both done in Nigeria and showed higher levels of heavy metal toxicity.

Doctors warn that using a whitening cream containing topical steroids for a long period would induce hypertension, high blood pressure, and suppression of the body's natural hormones. Any adverse effects, such as stretch marks, may endure a lifetime. Hydroquinone has been identified by many physicians as the perpetrator in instances of abuse. A blue-black discoloration of the skin is an uncommon adverse effect of abusing hydroquinone. Since poisonous heavy metals are known to persist in organic settings, utilizing these cosmetic products exposes consumers to small quantities of deadly heavy metals, which is competent to offer a health risk.

Each touch departs as indicated by Lockard's trading guideline. As a consequence, traces of cosmetic products are frequently found at a law-breaking scene. The evidentiary value of such follow evidence will be decided by the kind of test technique employed. The optimal competency should be non-ruinous, reproducible, and capable of evaluating a limited number of trials with little to no example preparation. In practice, the system's capacity to break down puzzling. About five-thousand different materials have been recognized as having been utilized in cosmetics. As a consequence, various techniques are required for the efficient separation of restorative displays obtained in criminal cases. For example, chromatographic methods are commonly utilized to separate shade specialists in skin care products, while spectroscopic techniques are used to dissect other natural and inorganic mixes. The methods for assessing different components included in cosmetic displays are shown in the following figure.

1. Metal Contamination from Moisturizing and Skin Lightening Creams:

The amounts of 10 metals (Al, Zn, Mn, Fe, Co, Cu, Cr, Ni, Pb, and Cd) were tested in many frequently used products, as well as unknown beauty care goods, to give insight into the potential of metal harm from their usage. After corrosive absorption, the metal content of these materials was measured by AAS. The dynamic components of beautifying agents are selected depending on the item's expected use. As a result of the methamphetamine manufacturing process, any of the components in these cosmetics were inadvertently used and employed in beautifiers. However, some metals are deliberately employed as remedial treatments. Metals such as lead (Pb), nickel (Ni), mercury (Hg), cobalt (Co), chromium (Cr), cadmium (Cd), arsenic (As), and antimony (Sb) are restricted in beautifiers owing to their toxicity. People's skin is exposed to the majority of these cosmetic care products. Despite the fact that the skin acts as a barrier to the outside world, some medicinal synthetics may permeate the epidermis and disseminate to critical interior organs, causing short- and long-term poisoning.

Cadmium is a cell toxin that causes a range of consequences, such as cell death or enhanced cell growth. As a consequence, Cd is categorized as a category 2A carcinogen by the International Agency for Research on Cancer (IARC) (IARC). Other metals, including Al, Zn, Mn, Fe, and Ni, are essential to humanity since they play a part in a number of biological processes. Notwithstanding the importance of these metals to humans as well as other animals, their presence in ornamental produce offers a major well-being danger. Skin-lightening lotions are in great demand in industrialized nations. Sunscreen filters must be employed in the formulations designed to inhibit the formation natural protection opposed to ultra-violate (UV) rays.

The cream brands selected were intentionally chosen to reflect the brands used by individuals of different socioeconomic levels. To study the variations in elemental concentrations single brand,

an entire of five samples of dissimilar consignment numbers besides manufacturing dates were acquired inside each form or brand. By flame atomic absorption spectroscopy, the entire eaten samples were examined in triplicate for Al, Zn, Mn, Fe, Co, Cu, Cr, Ni, Pb, and Cd (Perkin Elmer, Analyst 200, Norwalk, and USA).

The quantities of the metals examined varied substantially ($p < 0.05$) across brands. Additionally, within a single brand, there are significant differences ($p < 0.05$) in the quantities of some metals. The variations in metal content in these goods are related to variances in raw materials and manufacturing techniques. Batch-to-batch variations in packing, variances in product built-up processes, and contamination from external sources are all possible foundations of irregularity. In contrast to the moisturizing creams, these two testing levels of Cd. The permissible limit in Canada is 3.0 $\mu\text{g/g}$. In this study, three tests with abnormally high Cd quantity, the other body cream samples examined had lower Cd amounts. They discuss creams in this study article. They compared the metal content of skin whitening and moisturizing lotions. They also compared the incidence and composition of each metal under study in creams from different brands and nations. To assess the degree of toxicity, they tested the metal concentration in creams and compared it to the reference level. They also talked about the negative effects of each metal at greater quantities in our body. Except for Ni, the results showed that have tested, indicating that individuals instead of moisturizing creams may be exposed to greater metal concentrations.

2. *Microwave Digestion Used To Determine Heavy Metals:*

The target chemicals were measured using a conventional addition procedure. Cosmetics are recognized to be a vital part of everyday body care. By adding these things to human skin, they create local exposure to certain variables. Cosmetics include a broad variety of ingredients, some of which are potentially hazardous. When breathed, ingested, or absorbed by the skin on topical therapy, it poisons the body, producing various illnesses. It also has a tendency to remain in the body. Cd, Hg, and Pb levels were found to be greater than the WHO's permissible limits in a research performed.

In this study, by utilizing a microwave-assisted acid digestion procedure, the levels were measured and compared to certified findings. The cosmetics samples were gathered in Riyadh, Saudi Arabia, from different beauty aid stores and pharmacies. Strong metal concentrations (Ti, Pb, Hg, Cd, Bi, and As) were detected in 15 cosmetics samples. The accuracy of the method was demonstrated in this article by estimating the amounts of chemicals in cosmetics samples after spiking with specified concentrations of compounds. Heavy metal recovery levels in cosmetic samples were found to be between 87 and 105 percent.

The suggested method's limit of detection (LOD) is designed using a signal-to-noise (S/N) ratio of 3:1. For Cd, a LOD of 0.45 $\mu\text{g/l}$ was obtained. By examining $n = 8$ samples of the same quantity of 0.1 $\mu\text{g/l}$ for Ti, Pb, Hg, Cd, Bi, and As, the precisions of the suggested technique were determined. The values of standard deviation (SD) obtained varied from 1.41 to 2.6 percent. Cd was utilized in six of the investigated samples, with amounts ranging from 0.20 to 0.6 $\mu\text{g/kg}$ of sample. Cd was found in lower quantities in the examined samples. Sample-10 showed the greatest amounts of Cd, while sample-07 had the lowest values. Out of the 15 samples examined, nine were determined to be below the LOD. The WHO has set a Cd limit of 0.3 mg per liter in cosmetology. The quantity of Cd in 11 samples were found under the WHO acceptable limit using this technique. Using statistical MATLAB tools, the usual addition graphs

were produced by displaying the strength in contradiction of the solution of the applied sum alongside the solutions of the computed samples. The results of this research showed that hazardous heavy metal content was present in cosmetics in various amounts. Strong metal (Cd) quantity in cosmetics samples ranged between 0.20 and 0.6 (g1) on average. As a consequence, recommended goods be tested for heavy metals requirements before being sold.

They estimated the quantity of heavy metals in all of the examined samples in this study. Samples were selected at random from the industry, with no limits or selection barriers in place. They determined the spectrum of metals present in the material in this study. They were able to differentiate between samples that were below and above the reference point. They linked the concentration to the WHO's permitted limit. Based on the results, it was decided that the method may be utilized.

Poisoning is a sickness or process in which a living creature is intentionally harmed or affected by a toxic substance or animal venom. Acute poisoning occurs when a toxic substance is introduced in a single event or over a brief period of time. Chronic Poisoning is a repeated or continuous exposure to a toxic substance in which symptoms do not develop immediately or after each presentation. Poisoning symptoms may resemble a number of diseases, including seizures, inebriation, stroke, and insulin response.

CONCLUSION

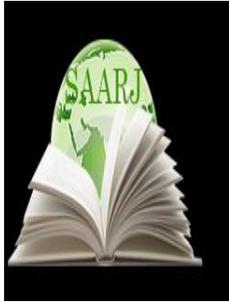

The findings of a study of all research on heavy metal toxicity in skin whitening or skin lightening cosmetics show that harmful heavy metal content (Cd) was present in different concentrations in the cosmetics, with certain products beyond the WHO's permissible limits, potentially causing lethal effects on human health. People hold the notion that if there is poisoning, it can only be found in local items and not in branded ones. However, after evaluating different tests, it is found that non local cosmetic goods have greater levels of heavy metal toxicity than locally marketed products in certain instances. Cadmium poisoning may result in a number of consequences, all of which can lead to cancer. It also affects the blood vessels, cardiac muscle, kidney, lungs, and brain, causing heart attack, hypertension, liver damage, immune system suppression, and other symptoms. According to the results, individuals sensitive to greater amounts of heavy metals. The two investigations that were evaluated were performed and showed a significant degree of heavy metal toxicity.

As a consequence, setting regulatory limits for metals in beautifying yields is essential. Since heavy metals are readily absorbed via the skin, low-quality fabrics should be avoided, especially for long-term continuous usage. As a consequence of the study, it is highly recommended creams be tested for heavy metal stages prior being sold. Certain goods, both local and non-local, violated the regulations and utilized excessive amounts of heavy metal impurities, resulting in pollution. The studies examined the concentrations of different metals as well as the concentration of a metal in various brands. There have been research performed to evaluate the health hazards linked with its toxicity.

A TAXONOMIC STUDY OF STRATEGY APPROACHES

Sh Sachin Gupta*

*SMAC, Sanskriti University,
 Mathura, Uttar Pradesh, INDIA
 Email id: chancellor@sanskriti.edu.in

ABSTRACT

Authors offered many methods to strategy development, and instead of the word "approach," they used terms like "schools of thought," "perspectives," "frameworks," and "models." Planned strategy, emergent strategy, positioning strategy, and other mutually incompatible categories have been used to classify strategy, resulting in ambiguities in the taxonomy. The goal of this research is to see whether author groups are completely distinct or if they can be condensed into a few dominating methods, and the analysis relies heavily on Mintzberg's terminology. This research discovered that there are about six methods into which most of the groupings may be condensed after analyzing the categorization system provided by 13 renowned writers. Fit approach, Planning approach, Emergent approach, Positioning approach, Resource based approach, and Stakeholder approach are the methods. The act of collapsing reduces the number of groups, allowing for a more focused knowledge of strategy while also making the term more manageable from a researcher's perspective.

KEYWORDS: *Emergent Approach, Planning Approach, Positioning Approach, Stakeholder Approaches, Strategic Approach.*

INTRODUCTION

Any organization's success is largely determined by the strategy it has chosen. As a result, organizations, consultants, researchers, and planners are always on the hunt for the right approach to help them succeed. Despite its apparent significance and the fact that it is one of the most studied and thought-about concepts, strategy is simultaneously one of the most misunderstood. The underlying discipline of Strategic Management may also be blamed for the increased complexity of the strategy idea. This is due to the fact that, on the one hand, the roots of the Strategic Management area are varied and can be linked to a variety of disciplines, while, on the other hand, the literature on the topic has grown at an exponential pace. Various methods

to strategy development have been suggested by researchers at various times in the history of Strategic Management[1]. The availability of literature expressing differing points of view has resulted in a wide range of opinions on strategy among various writers. There has been an ongoing attempt to identify distinct schools of thought on strategy formed around different sets of beliefs and assumptions held by such groupings throughout the development of the theory of strategy. The fundamental concepts of certain author categories are the same, according to this article, even if the nomenclatures are different[2]. On the one hand, variety among schools of thought enriches research within the area of study, but on the other hand, it indicates a lack of consistency and coherence. However, they noted that each school's feature explains a particular contribution to the strategic management area, referring to 10 schools of thought. They went on to say that each of the schools represents a distinct perspective or approach to strategy development. Several academics have tried to organize concepts in the same way as Mintzberg did. It implies that academics have also recognized strategic methods, such as those used in their classifications. Authors have traditionally offered various views on the nature and conduct of strategy via categories, which are sometimes known as schools of thought, perspectives, methods, or models[3]. However, since strategy relies on a variety of perspectives and disciplines by its very nature, no one school of thought has been able to offer a full or final explanation. The Mintzberg categorization of 10 schools of thought is believed to be more thorough and generally recognized. Nine of these ten schools of thought address various elements of strategy development, with the tenth not being a strategy in the traditional sense. Many other writers have attempted to describe the idea of strategy in a similar manner, although many have used different terminology. The following categories demonstrate that the development of strategy research is closely linked to the creation of a wide range of paradigms[4]. Each of the categories, which include terms like schools of thought, perspectives, models, and methods, reflects the breadth of the study and the variety of viewpoints on the notion of strategy. The first and second goals of this article are to figure out what the fundamental topic of strategy is in each of the many classifications established by different writers and to find out which points of view are similar. In order to discover the tactics used by businesses, 25 Indian companies were examined[5]. The research found that, in order to thrive, businesses use a variety of strategies throughout the course of their existence. However, the authors found that the majority of businesses choose one of the six most common methods. Because the authors' approach for understanding the nature of strategy differed from the thirteen research included in this article, they were not classified in this analysis. However, as will be shown later in this research, there are six main methods to strategy development that are comparable to the ones. As previously mentioned, this article methodically examines many schools of thinking based on a categorization established by the author. His 10 schools of strategy were selected first because they were more complex or complete. Furthermore, it is based on results from over 30 years of research. Second, each school of thought is created from the spectrum of ideas of a particular set of scholars in the area of Strategic Management, as stated by. The authors claimed that the substance, method, and environment of strategy development are clearly distinct from the characteristics of each school. Finally, each of the nine schools reflects a unique perspective or approach to strategy development[6]. The fundamental subject of the strategy process in each of the nine schools of thought is identified, and each school of thinking is assigned to a particular strategic approach. After the strategic approaches have been identified, classifications by other writers are interpreted. The viewpoints that are

comparable to the previously selected strategic approaches are then put together. It may be deduced that if a certain strategy is backed by a large number of research or academics, that strategy is deemed dominant. The views comparable to the core topic of each of the strategic approaches are discovered and grouped in the following part in order to identify similarities in approaches[7].

Design school's primary slogan is "establish fit," which means that strategy making aims to achieve a match, or fit, between internal capabilities and external possibilities. In this school of thinking, strategy is concerned with assessing the organization's strengths and weaknesses in light of opportunities and dangers in its environment (SWOT). As a result, the fundamental concept of strategy in this method is to match or fit internal company variables like strengths and weaknesses with external ones like opportunities and threats, which is why it's called the fit approach to strategy. Below are some more writers that have discovered this element of strategy development in their research[8]. The fit elements of strategy were described using the 'adaptive' paradigm. According to her concept, the primary aim of strategy is to create a feasible match between the external environment's possibilities and dangers and the organization's skills and resources for exploiting such opportunities. Successful strategies seem to have adapted themselves to the environment, according to the evolutionary perspective, and the job of managers in this approach is to create strategy that best matches the volatility in the environment. As a result, he was alluding to the strategic fit. Similarly, the Harvard policy framework has addressed the issue of fit. They regarded strategy to be concerned with a systematic evaluation of the strengths, weaknesses, opportunities, and threats (known as the SWOT analysis) and it is relevant to both profit and non-profit organizations under a framework they called Harvard policy framework. In his 'prescriptive method,' he seems to have incorporated both planning and fit elements. His strategy emphasizes long-term planning to achieve a 'fit' between an organization and its surroundings. The suggested 'planning' school of thinking examines methods emerging from a regulated, deliberate, and sequential process of formal planning in which goals, budgets, programs, and operation plans are given close consideration. Furthermore, the planning school views strategy as a planned and logical process that falls primarily within the purview of senior management. In the 'linear' paradigm, the planning process emphasizes systematic, sequential, and directed action, suggesting a logical decision-making process, and senior management plays a prominent role. As a result, planning school and Chaffee's linear model have a lot in common[9].

The '8Ps plus Environment' framework was created to describe the many stages of the strategy development. He addressed the planning process in his first 'P,' which he called 'process of decision making.' The strategy in this approach stressed a sequential, linear decision-making process that included senior management. The function of an analysis-driven strategy process and implementation procedure with full dependence on organized action plans, budgets, and balanced scorecards in the 'planning' method. As a result, his method stresses the need of planning. Similar viewpoints may be found in the rational' school of thought's 'planning process approach' and 'planning process framework'. Porter is a member of Mintzberg's "positioning school," which supports strategy development as an analytic process that situates the company in its industry. Porter, the primary proponent of this school of thinking, believed that a company must evaluate both the attractiveness of an industry and its competitive position within that industry using the five forces framework in order to thrive. As a result, he shifted the focus of

rivalry from the business to the industry. In his positioning school of thinking, Mintzberg addressed this issue. Porter developed four basic strategies that aim to put a company in a well-defined 'position' in the economic market-place, dubbed the 'Positioning Approach' to strategy. In the 'strategy as position' viewpoint, the positioning method has been the key concept. According to him, the goal of the company is to acquire a competitive advantage by occupying an appealing and productive position in its surroundings. The study of the competitive environment using Porter's five-force framework is at the heart of the "competitive positioning method." This method aids businesses in determining an industry's potential profitability and selecting a general approach for gaining a competitive edge. As a result, Mintzberg's positioning school of thinking was backed in his competitive positioning strategy [10].

One of the primary responsibilities of the strategist in a competitive setting is to choose an appealing market and maintain a winning position in the marketplace. This element has been explored in the context of "market attractiveness/strategic position," which views a good strategy to be one that allows a company to identify its place in the industry. As a result, he was referring to the process of determining an acceptable industry position or the positioning approach to strategy. Strategies may emerge in all sorts of odd locations and in unique ways in the "learning school," thus they can't be planned. Managers, according to this school of thinking, incorporate their organization's "lessons learnt" into their overall strategy. Managers launch modest projects based on their organizational experiences and pay careful attention over time to what works and what doesn't. Managerial successes generate streams of experiences that may converge into patterns and emerge as emergent strategies. Thus, in contrast to the planned method, which focuses on future activities, 'emergent strategies' reflect previous patterns. In the context of the discussion of emergent elements of strategy. According to this viewpoint, strategy is the result of a steady modification of regular operations in the organization in response to changes in the environment. As a result, strategy is often not pre-planned, but rather develops through time as a result of a variety of forces inside the organization. As a result, the primary concept of this method corresponds to Mintzberg's learning school.

DISCUSSION ON STRATEGY TAXONOMY

A recognizable pattern emerges as a result of comparable effective methods combining to form a pattern of activity. In his 'strategy as pattern' approach, he included this emergent element of strategy. The 'emergent (or learning) approach' has represented the emergent element. In reaction to changes in the environment, he proposed that strategy develop and evolve gradually through time. In their classifications, all of the aforementioned scholars have addressed the emergent element of strategy. Considered strategy is formed in the 'power school' by a process of negotiation between business power holders and/or between the company and its external stakeholders. He highlighted that certain key stakeholders may influence or negotiate plans in their favor via the use of power and politics. As a result, the method in this form is known as a "Stakeholder's approach." Stakeholders are defined as "any group or person who is impacted by or has the potential to influence an organization's goals." Managers should design and execute procedures that satisfy all and only those parties that have a stake in the company, according to the stakeholder approach. They also said that the primary job in this strategy is to manage and integrate stakeholder relationships and interests, which is critical for the firm's long-term performance. The stakeholder method is linked to a 'power' school of thinking, where he argued that strong stakeholders may influence organizational activities and can also use their power to

decide what the company will do. According to this school of thinking, strategy necessitates expertise in stakeholder analysis and the creation of a good political bargaining process that will entice stakeholders to contribute to the organization's growth. That approach, according to her "interpretive" concept, is aimed at motivating stakeholders to behave in the organization's best interests. In this approach, strategy is created via a process of consensus among stakeholders' interests and organizational goals. In this paradigm, she was referring to a stakeholder approach to strategy. How many clusters should be used? This is one of the most important issues in cluster analysis. The research used the dendrogram and agglomeration coefficient to estimate the number of clusters, despite the fact that there were only a few companies examined, and the Lehmann's rule ($n/30$ and $n/60$) was obviously inapplicable. A significant rise in the agglomeration coefficient, expressed as a percentage change, suggests a suitable cutoff point. From three to two clusters and two to one cluster, the coefficients indicate a significant rise. Three clusters had the greatest disparity in percentages of change. The companies were clearly divided into three categories based on their production strategies, according to a visual examination of the hierarchical dendrogram. The proper number of clusters was eventually determined to be three based on the dendrogram and the change in agglomeration coefficients. The k-means clustering algorithm was used to fine-tune the findings from the hierarchical process after setting the number of clusters as three.

When the non-hierarchical and hierarchical cluster solutions were compared, it was discovered that both techniques put 100% of the cases in the same cluster. This demonstrated the cluster solution's dependability and stability. This cluster differentiation strategy's connection is very apparent. This cluster's methods and levels of capabilities are aimed at meeting customer requirements via product and market differentiation, with a strong focus on service, quality, delivery, and flexibility. Differentiators was the name given to the first cluster. They also have some similarities to Sum et al. (2004)'s differentiator group in terms of cluster means, but not in terms of relative rankings. Seven companies make up the third cluster, which accounts for the lowest proportion of the total sample (22.5%). With the exception of cheap pricing, this cluster has the lowest significance meaning of the three clusters. For all of the capabilities, it varies from at least one of the other two clusters. In terms of cheap price, there is no statistical difference between this cluster and the other two. Even while cheap pricing seems to be the most important capacity for this cluster, quality capabilities are quite near to it in terms of significance. Within the cluster, performance and compliance characteristics are ranked second and third, respectively. After-sales service ranks 5 with a mean of 3.00 and delivery speed (rank 6) with a mean of 2.85 are both somewhat important to this cluster. They also put a disproportionately low value on capability-based flexibility. The researchers utilized a cut-off value of 0.30 to determine which skills provided the most value to each canonical discriminant function. Although there are no hard and fast rules regarding how excellent these values are, cut-off values over 0.30 are generally regarded as adequate and sufficient. The multiple discriminant analysis' normalized discriminant function coefficients, discriminant loadings, and group centroids. Vectors were used to show the high structural loadings of variables (more than 0.30), as well as the group centroids. The features of the three strategic kinds are shown in this graphical representation of structural loadings and group centroids. Both discriminant functions offer excellent separation between the three groups, as shown by the Wilks Lambda value and comparison of the group centroids. Two independent variables, (i) after-sales service and (ii) delivery speed, have a strong positive association with the first function. This function distinguished the manufacturing strategy groups

based on the relative significance of service and speed. Figure 2 shows that the tight correlation between the service and speed vectors and the first function suggests that the first discriminant function emphasizes after-sales service and delivery speed. This dimension is the same as the third dimension discovered in the data from Western Europe. Depending on the competitive skills highlighted, the writers regarded this function as "after-sales service/delivery." As a result, the research will be dubbed "market dependability." The first function is the main source of difference between clusters 1 and 2 vs cluster 3 when the centroids at the plot are examined. High positive coefficients for after-sales service and delivery speed indicate that clusters putting a greater priority on these skills will be allocated to the "market reliability" dimension's high end (positive side). Clusters that place a lesser emphasis on service and speed, on the other hand, will be allocated to the negative side of the dimension. High-end companies strive to compete by providing better after-sales support and closer client relationships, as well as timely delivery of their goods, in order to set themselves apart from their competitors. The second discriminant function showed only a highly significant connection on low price capabilities, implying that it differentiated manufacturing strategy groups based on their relative significance placed on price. While this dimension has a high price coefficient, there is no statistically meaningful connection with any of the other capacities.

As a result, the second function may be understood as the dimension of "market price leadership." This function is used to split clusters. Clusters that put a high value on low prices will likely to be on the high end of the market price leadership dimension, whereas clusters that place a lower value on low prices will be on the low end. The clusters on the figure represent the clustering procedure's manufacturing strategy group assignment. A closer look at the group centroids reveals that differentiators and intermediaries place a premium on client orders and quick answers to their after-sales requests, putting them at the top of the market dependability scale. Intermediators are positioned at the upper end of the market price leadership due to their significant focus on pricing. In other words, inter-mediators fight for market price leadership as well as market dependability. The "lowers" place a lower value on service and quickness due to their position at the bottom of the market dependability. Price, on the other hand, is given less weight due to their position on the bottom end of the market price leadership. Despite the fact that the "lowers" have no significant manufacturing plan, it is clear that pricing capabilities is valued more than differentiators. It has been noted that the Turkish automobile sector has a large number of joint venture and foreign-owned companies. When the distribution of businesses by ownership structure was examined, it was apparent that the overall percentage of firms in the sample with foreign ownership and joint ventures was 51.6 percent. Only 48.4 percent of the companies in the study are Turkish-owned. Tests were conducted to see whether there was a substantial variation in company ownership structure across strategic kinds. It's conceivable that comparable profitability among groups is due to variations in the quality of the execution of the highlighted competitive skills. However, in this view, the lowers put a greater focus on activities such as marketing and finance than on production, and therefore differentiators and intermediators reach a comparable degree of profitability. The reason for this is because the growth record of differentiators and intermediators is statistically better than that of the lowers, despite the fact that the Turkish economy suffered a market contraction due to instabilities unique to the economy soon before the survey period. Total sales in the Turkish automobile industry fell by approximately 25% in the second half of 2006 as a consequence of the recession

(TAYSAD, 2009). Despite this reduction, manufacturing may explain the increase of their market share and sales of differentiator and intermediary companies.

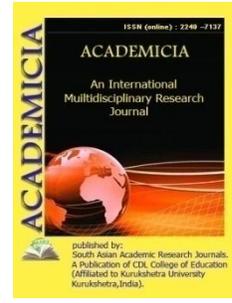

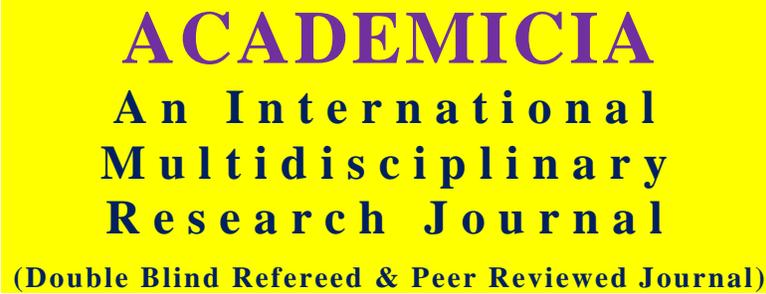

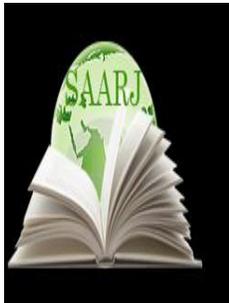

CONCLUSION AND IMPLICATION

The strategy formulation process has developed in a variety of ways, and as a result, academics have represented the strategy process in a variety of ways. Several academics have tried to organize their views on strategy development into a unified paradigm, or school system. Different views on strategy development or strategic methods have been detected by these schools of thought or comparable categories. Researchers looked at Mintzberg's 10 schools of thought and concluded that each one offered unique approaches to strategy development. Mintzberg went into great detail on the 10 schools of thinking, which served as a great beginning point for deciphering the strategic approaches' ideas. Mintzberg's categorization was used to determine the various approaches to strategy in this research. The basic principles of the strategic approaches acquired from Mintzberg's classifications were compared to those given by other writers, and six approaches to strategy were discovered. Fit approach, Planning approach, Emergent approach, Positioning approach, Resource based, and lastly Stakeholder approach are the methods. Each of these strategic approaches to strategic management has its own features and focuses. It was also discovered that planning, positioning, and emergent methods featured in the majority of the classifications, and these techniques may be called dominant strategic approaches. This conclusion, however, needs to be experimentally verified.

PROCEDURE FOR DEVELOPMENT OF ENTERPRISE FINANCIAL STRATEGY

Saidnazarov Firdavs Abdulloevich*

*Tashkent State Economic of University,
UZBEKISTAN

ABSTRACT

In the current economic situation in Uzbekistan, a large number of enterprises need the most effective financial activities based on the scientific methodology of planning their main directions and forms, as well as the development of financial activities. At the same time, the most important tool for the implementation of long-term management of the financial activities of the organization is the formation of a more effective financial strategy.

KEYWORDS: *Financial Strategy, Goals And Objectives, Elements, Sequence, Component Strategies.*

INTRODUCTION

The financial strategy of the enterprise is a general action plan to provide it with the necessary amount of funds. This type of enterprise strategy includes issues that are an integral part of the formation of finance, their planning and implementation of measures to address the problems that ensure a high level of financial stability of the enterprise in modern conditions.

Theoretical aspects of the formation of financial strategy describe the objective laws of doing business, the survival of the enterprise in a constantly changing environment, develop the basic forms and methods of preparation and implementation of strategic financial transactions.

It should be noted that today it is an important resource factor in business, such as investment and innovation policy, which can be identified in terms of existing opportunities of enterprises in modern conditions and the introduction of goods (services) to a highly competitive market.

Covering the entire total activities of the enterprise, the financial strategy of the enterprise forms measures for the optimization of fixed and working capital, more efficient management of capital, optimization of taxation, development of more efficient directions of profit distribution and use. These areas of the company's financial activities are the objects of its financial strategy.

The objects of development and implementation of the financial strategy of the enterprise are the total revenues and receipts of funds, expenditures and payments of funds, relations with tax authorities, budgetary and extra-budgetary funds, relations in the field of lending (Figure 1).

Taking into account the financial capacity of the enterprise, an objective assessment of the external and internal factors of the enterprise, the financial strategy allows to ensure the effective adaptation of the economic and financial capabilities of the enterprise to current conditions. If these factors are not taken into account in the formation of the financial strategy, the enterprise may go bankrupt.

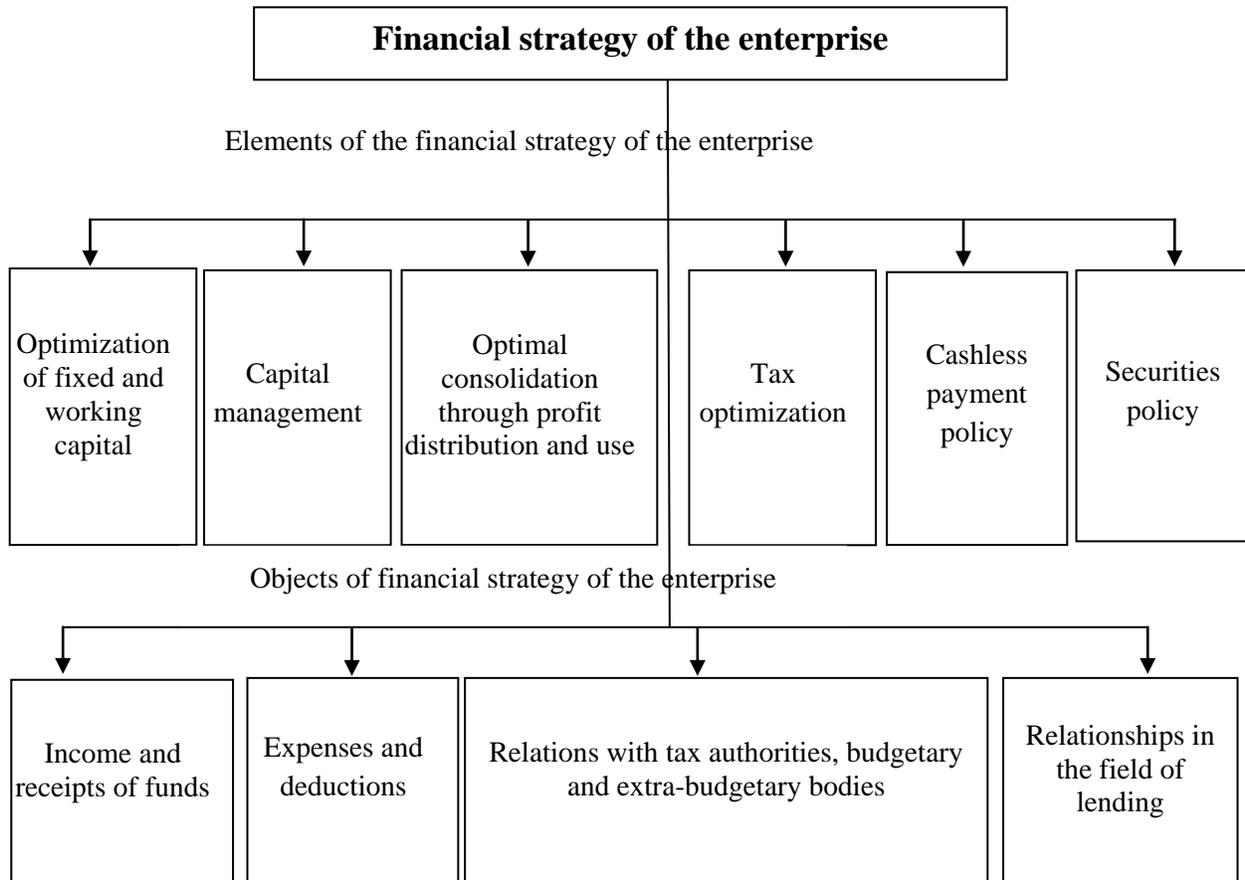

Figure-1. Elements and objects of the financial strategy of the enterprise

Source: developed by authors

Enterprises can formulate the following types of financial strategies: a strategy for achieving general, operational and individual strategic goals (a strategy for achieving specific goals).

The overall financial strategy determines the direction of the enterprise over a much longer but predictable period of time, such as a year. This strategy includes relationships with budgets at all levels, the creation and use of enterprise revenues, determines the level of need for financial resources and finds the necessary sources for their formation.

The operational financial strategy of the enterprise defines the overall overall financial strategy in a short period of time and implements a separate part of the main objectives set out in the

overall strategy. This type of financial strategy can be developed for a month or a quarter, while it creates a strategy for the current maneuvering of financial resources. The operational financial strategy is aimed at controlling the expenditure of funds and the development of possible internal reserves, which is an even more urgent goal in the context of the stagnation of the modern economy.

Operational financial strategy includes total income and cash receipts (accounts with customers for products sold, proceeds from lending to the organization, income from securities transactions) and total expenses (payments to suppliers, payment of wages, liabilities to credit institutions) regulates. This allows for all planned turnovers to receive and spend funds. The operational financial strategy is created within the framework of the overall financial strategy, however, it describes it in detail over a period of time.

Although the strategy for achieving individual strategic goals (strategy for achieving specific goals) is limited to solving a specific or a single strategic task or goal, there are no restrictions on the amount of time that planning can cover. This type of strategy is the effective implementation of financial transactions aimed at ensuring the implementation of measures to achieve the main strategic goal. Thus, in a certain way, the strategy of achieving personal goals is “put on top” of the overall or operational financial strategy and does not conflict with the goals set in them.

The main purpose of the formation of the financial strategy of the enterprise is to provide it with sufficient and necessary financial resources. Thus, the company's financial strategy provides:

- formation of the necessary level of financial resources and their strategic management;
- identification of important areas of the enterprise and focus on their implementation, the use of reserves at the level of financial management of the enterprise;
- gradual achievement of certain tasks;
- the adequacy of the financial activities of the enterprise to its economic situation and capabilities;
- implementation of objective accounting of the financial and economic condition of the enterprise for the current month, quarter, year;
- formation of necessary strategic reserves;
- taking into account the economic and financial capabilities of the enterprise and its main competitors;
- to find the main threat from competitors, to mobilize the necessary efforts to eliminate it and to choose directions more wisely for financial measures;
- the struggle for initiative to gain a significant advantage over competitors.

In accordance with the existing market requirements and the capabilities of this organization, the main strategic goal is to develop and implement the financial strategy of the enterprise, where the main tasks and main activities of financial management are formed through the executors.

The objectives of the financial strategy of the enterprise are:

- study the basic laws and essence of financial management in the enterprise;

- development of various options for the formation of financial resources of the organization in the context of crisis or unstable financial situation and the basic conditions for the preparation of financial management activities;
- forming financial relationships with major buyers and suppliers, credit institutions, tax authorities or budgets;
- identification of reserves and formation of enterprise resources for more rational use of available capacities, fixed and working capital;
- providing the organization with the necessary financial resources;
- implementation of measures for effective investment of temporarily vacant funds of the enterprise to obtain the maximum possible level of profit;
- finding ways to implement an effective financial strategy for the use of financial resources, the development of new types of goods and comprehensive training of employees of the organization;
- formation and implementation of measures to ensure the necessary level of financial stability, the formation of financial strategic vision of potential competitors, their financial, production and economic potential;
- to identify ways out of the current crisis situation, to use the methods of managing the employees of the enterprise in low financial condition and to mobilize the capabilities of the whole team to overcome it.

In developing a financial strategy, the most important attention should be paid to the completeness of the definition of cash income, the mobilization of internal resources of the enterprise, minimizing the cost of production, efficient distribution and use of net profit, determining the required level. The financial strategy has been developed taking into account the risk of non-payment, rising inflation and other force majeure. This strategy must be fully consistent with the production objectives, as it needs to be corrected and modified. Monitoring the implementation of the financial strategy examines the required amount of revenue, their rational and economical use. Proper financial control allows you to identify internal reserves, increase the level of profitability of the enterprise, increase cash flow.

The most important component of the financial strategy is the formation of internal standards, which are used, for example, the main methods of distribution of profits of the enterprise, the limits of liquidity ratios, the marginal value of the ratios. The value of equity and debt capital, the level of accounts payable and receivable, which is used in practice in Russian and foreign enterprises.

The effectiveness of the financial strategy of the organization is manifested by balancing the theory and practice of applying the financial strategy, fully coordinating the financial strategic goals with the availability of real economic and financial capabilities of the enterprise in a clearly centralized manner. Financial strategic management relies on changes in the financial and economic situation in market enterprises operating simultaneously with the flexibility of its application.

The financial strategy is the planning of the most important indicators of the financial condition of the enterprise - the level of liquidity, creditworthiness, the probability of bankruptcy, as well as the ratio of financial results. In order to achieve maximum efficiency in formulating a financial strategy, it is necessary to follow a certain sequence of actions. The sequence of formulating the financial strategy is shown in Figure 2.

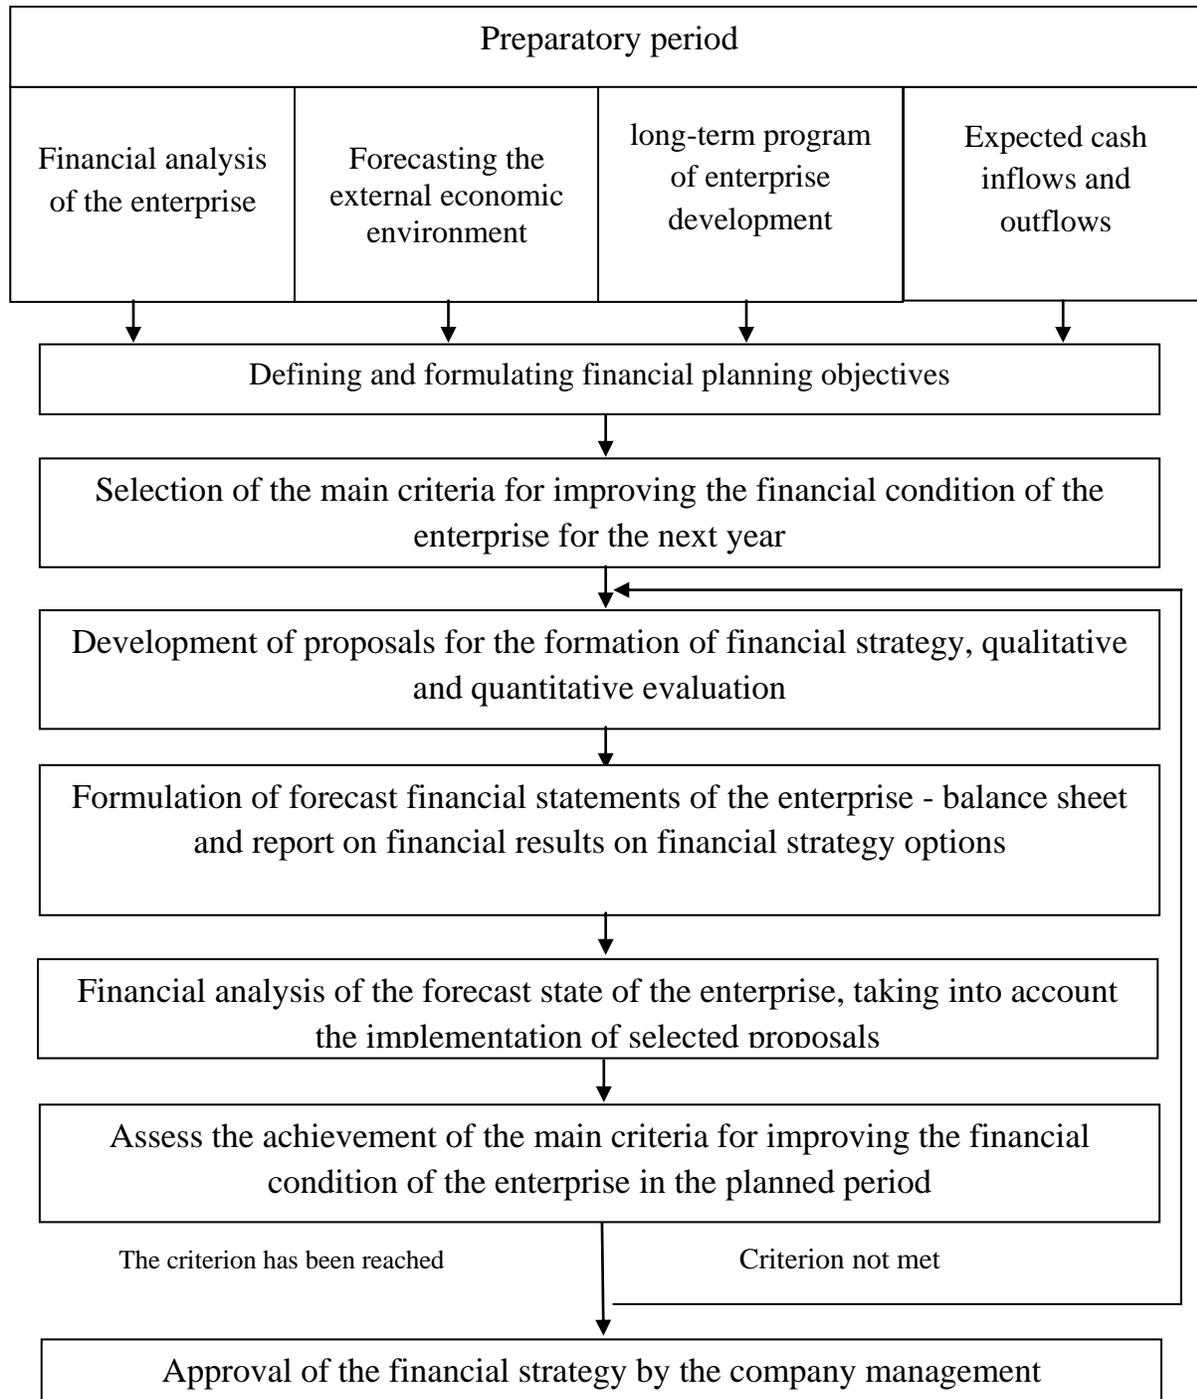

Figure 2. Sequence of formation of the financial strategy of the enterprise

Source: developed by authors

As shown in Figure 2, the process of developing an organization's financial strategy begins with the preparatory phase, in which the organization's financial analysis, forecasting and formation of the external economic environment is a long-term program of business development, taking into account the expected revenues and expenditures of financial resources. According to the results of financial analysis of activities during the reporting period, the necessary level of financial resources, financial planning goal is created based on the assessment of the existing financial situation in the enterprise, taking into account possible changes in the external environment.

Proposals for the formation of the financial strategy of the organization are developed on the basis of conclusions drawn from the results of financial analysis. Proposals can be formed by objects and in several versions can form the overall financial strategy of the enterprise, which is characterized by a mandatory quantitative assessment of proposals and an assessment of the financial results of the degree of impact of proposals on the balance sheet and report. For each option of creating a financial strategy, a forecast balance sheet and a report on financial results are prepared, taking into account the quantitative and qualitative evaluation of the proposals included in the financial strategy.

Depending on the availability of external conditions, the implementation of a particular option of forming an overall financial strategy, an operational financial strategy is formed on a quarterly basis, taking into account the financial performance achieved in the previous period. If an enterprise needs to address a specific overdue financial problem, a strategy to achieve personal goals for a month, quarter, year is formed.

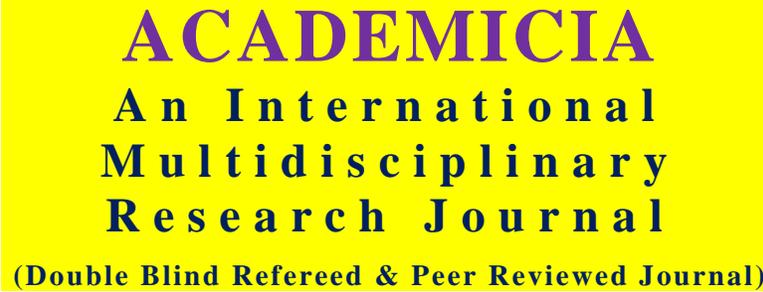

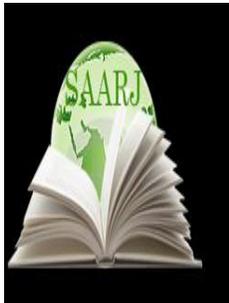

Then, the main criteria for improving the financial condition of the enterprise for the planned period are formed, several options of proposals for the formation of the financial strategy of the enterprise are created, their quantitative and qualitative evaluation in the future. proposals will be implemented, resulting in the selection of key proposals that meet the key criteria for improving the financial condition of these organizations.

Thus, in the formation of financial strategy, special attention should be paid to the justification of the volume of financial resources, the composition of their formation and the direction of expenditure, which defines the tasks and objectives associated with forecasting changes in financial resources. The financial strategy allows to predict the growth of production volume in order to achieve high economic efficiency. The creation of a rational financial strategy should be based on the assessment of real needs, the ability to raise capital, as well as the attraction of debt sources.

THE ROLE OF TEACHERS IN BUILDING THE FOUNDATION OF A NEW DEVELOPMENT PERIOD OF UZBEKISTAN

Yuldasheva Saodat Mamasakhatovna*

*Teacher,
Department of Psychology,
Chirchik State Pedagogical Institute, Tashkent region,
UZBEKISTAN

ABSTRACT

This article discusses the problems between teachers and students and their solutions to the ongoing reforms in the field of pedagogy. They want to have a social style of their own. The process of person-centered education is of special importance not only because it is organized taking into account the external situation of the student, but also the tendencies and aspirations of his inner world. Under the concept of pedagogical support of students is understood the activities of teachers with high professional skills. Because they can provide alert prompt assistance to students.

KEYWORDS: *Teacher, education, ability, creativity, Teacher, upbringing, school, reform, problem*

INTRODUCTION

“We are the representatives of an enlightened people who have always respected the teacher as great as the father. When I say teacher, I mean people who are most dear and respected to me, intelligent and modern, sincere and kind. Because this teacher taught us all and brought us up among our loving parents. Today, we are laying the foundation for a new era of development in Uzbekistan. Our closest assistants are teachers and coaches, scientific and creative intellectuals, ”the President said at the meeting.

It was emphasized that every family, every child's life is connected with school, this issue is the most important work of the state, society. “We all entrust the lives and destinies of our dear children to teachers and coaches. We must pay due respect to these honorable people, the guardians of such incomparable wealth, the builders of the future, ”ShavkatMirziyoyev.

Professional skills are also formed on the basis of acquired knowledge, activity skills and life experience.

In order to acquire high moral and ethical qualities and a high level of professionalism, a person must be able to set a goal and constantly seek, study to achieve it. In a traditional education system, the teacher responds only to the external actions of the students. They strive to help students' behavior quickly. For example, they punish warlike children, react to their appearance, their treatment of those around them, or call their parents. Science teachers, on the other hand, take the easy way out by complaining to their class leaders or giving them advice along with the school community.

In most cases, teachers also advise parents to transfer their children to other schools. At first glance, the teacher's approach seems correct and purposeful. They seem to care about the students' health, their lives, their ability to communicate with their peers, their free education, and their maturity.

Their goals are actually the same, but in the process, teachers are unable to choose convenient and effective forms of support for students. They often give orders to students, intimidate them, and as a result, receive a rude response from the student. The help they seek to provide begins to hinder students' development. It hinders active collaboration with other classmates. That is why such help from the teacher does not give the expected effect.

The internal contradictions between the teacher and the students, the anguish in the heart of the student, cause them to become malicious, suspicious of adults. As a result, such students begin to look down on teachers and distance themselves from school.

They look for ways to protect themselves from teachers. They try to adapt to the situation, to move away from themselves. They want to have a social style of their own. The process of person-centered education is of special importance not only because it is organized taking into account the external situation of the student, but also the tendencies and aspirations of his inner world. In this process, the teacher's task is to find the means and ways to realize the individual potential of the students. To do this, they must first understand the problems of the students, not force them to follow the rules they have introduced.

Because of the comprehensive support of the growing and developing person, the idea has been emphasized by many educators and psychologists. Under the concept of pedagogical support of students is understood the activities of teachers with high professional skills. Because they can provide alert prompt assistance to students. The solution to this unique problem is also important for students' mental and physical health, communication, academic achievement, their place in life, and their professional orientation.

At the heart of the concept of pedagogical support is the student's personality. The most acute problem today is the formation of a full-fledged personality. To do this, the educational process must be focused on the individual student. To this end, theorists and practitioners are looking for the same answer to the question of how to sustainably develop the student in the current changing environment.

“At the solemn ceremony dedicated to the inauguration of the President of the Republic of Uzbekistan on November 6, 2021 in Tashkent, President of the Republic of Uzbekistan ShavkatMirziyoyev spoke about the priorities for the next five years. - Taking into account the

demands of our people, we have developed a strategy for the development of New Uzbekistan and held it in a special public discussion during the election process, - said the head of state.

In order to ensure the continuity and continuity of our reforms in this important conceptual document, it was recognized that the principle "From the Strategy of Action to the Strategy of Development" was put on the agenda as the main idea and main criterion. It was noted that this development strategy consists of seven areas.

According to the fourth direction, the issue of quality education will be in the center of attention. To this end, it is planned to gradually increase the monthly salary of teachers and by 2025 to reach \$ 1,000. A national education program will be developed to build new schools, strengthen the existing material and technical base, and ensure continuity between all stages of the industry”
5

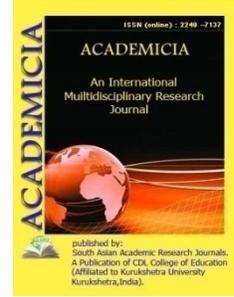

In response, the pedagogical teams of educational institutions are required to work consistently in this area.

MATHEMATICS: INTEGRAL PART IN COMPUTER SCIENCE FIELD

Dr Vipin Kumar Solanki*

*SOEIT, Sanskriti University,
 Mathura, Uttar Pradesh, INDIA
 Email id: hodmaths@sanskriti.edu.in

ABSTRACT

Despite the many connections across disciplines, there is evidence that computer science practices need little or no mathematical knowledge. This disconnect between the practical and intellectual roles of mathematics in computer science results in an awkward position for mathematics in computer science curricula, which necessitates math courses that are poorly aligned with computer science needs and students who use a lot of math but very little computer science. As a result, computer science graduates are hesitant and unable to utilize mathematics on the job. Fortunately, modest local changes may have an instant impact on the problem's major players. Although everyday practice needs little, if any, mathematics, computer sciences, software engineering, and mathematics are nevertheless linked, according to this article. Our primary concern is the education of computer professionals, the majority of whom are still educated via a curriculum that calls itself "informatics." Rather of referring to a single subject, the term "informatically science" is commonly used. Both software and computer science are addressed in our rationale and results. This research will help engineering students concentrate on the most essential topics in the curriculum.

KEYWORDS: *Computer science, Discrete mathematics, Mathematics, Science, University.*

1. INTRODUCTION

In general, science and engineering are intimately linked to mathematics. Natural science makes mathematical models of the phenomena they investigate; natural sciences and social sciences rely on statistics to tease raw data meaning; in all phases of systems design, building and maintenance, engineers depend on mathematical models. Computer science and software engineering seems to be a few of exceptions to this norm. The usage of mathematics is low in practising software developers[1]. Yet it would be surprising if relationships were as loose as it

looks between computer science, software engineering and mathematics. In the worst possible case, it would be rather harmful for disciplines to reject techniques that characterise areas with the titles they use. The only non-maths of the S&E family would be computer science and software Engineering[2].

In their working life, computer scientists utilise math in many ways. Firstly, mathematics offers the theoretical foundation for many computer sciences subfields, and for others key analytical tools; computer scientists therefore apply specific mathematical themes to specific computer issues[3]. More generally, mathematics gives a framework to discuss computers and computing issues and provides a mental discipline to solve these problems more widely. In view of the condition of each participant, the student's identities as computer scientists were linked to their mathematical viewpoints. This study concentrated on a few student histories. This study also showed that students' perceptions of maths and their study programmes, each affecting the other, are interwoven.

Understanding how mathematics training may affect the views and identity of a student, in particular at an early age in CS, is vitally linked with an important problem present in the field of computer education: diversity. Outline of the current ACM computer science bachelor's programme instruction is broadly based on its mathematical needs, and many CS programmes are deliberately constructed early in the course of the study with a mathematical component. The link between these two disciplines must be understood in order to grasp the significance of mathematics for students who study computer science (CS) and software engineering (SE). This essentially minimises the difference between science and engineering[4]. The distinction between chemical engineering and chemistry or between physics and electrical or engineering is understood by many. One is science, which primarily advances disciplinary knowledge, and the other, which consists largely of applying this information to the achievement of humanity's technical requirements.

In their first mathematical course, the students are generally exposed to the principle of mathematical induction. Recursion and iteration are key philosophical and informatics principles for implementation. However, the connections between mathematical induction, recursion and iteration are not well understood by many graduates. Most basic CS textbooks and data structures / algorithms literature give a minimum of induction math since the classes are not usually preconditioned by discrete mathematics[5]. Some curricula require mathematics as the basis for the course on the data structures to establish these important connections.

In order to succeed, the teachers of these two courses must coordinate carefully and deliberately. The mathematics faculty, who may not be well aware of the linkages and/or could feel that discrete mathematics is a difficult subject, which requires many preconditioned classes, usually teaches CS/SE students' Mathematics courses. This creates an even larger gulf for CS/SE students who are already a little mathematical phobic. The Mathematical Association of America (MAA) acknowledged these problems and dealt with them in its 2004 guidelines for curricula[6].

The qualities of a graduate in computer science could hardly, as taught today, be distinguished from those of a graduate in software. The latter might have some additional software engineering courses; both are, however, mostly trained in programming entry-level roles. It is not really science or engineering, actually.

ABET, an accrediting board for engineering and technology, has been established in the United States to certify the undergraduate programmes in computer science and software engineering. Below is the definition of engineering by the US Engineering and Technology Accreditation Board[7]: The following: “Engineering is a profession where math and natural science is used with judicial judgement and learnt the materials and strengths of nature in the interest of a cost-effective method”.

Typical curriculum for education in computer science do not cover discrete mathematics and software. University programmes generally need discrete math and software engineering courses, but they are often given as an alternative if the place they merge—courses in the field commonly termed formal methods. Standard discrete math courses offer minimum motivation and application of materials.

The conventional courses in Software Engineering do only use a little if any discrete mathematics, and the formal courses in computer science normally are optional and late. These factors lead to pupils having a minimal education in current software theory and practise based on mathematics. In addition, pupils are not given an opportunity to evaluate the usefulness and value of this content and to ask, literally, why they should attend discreet maths classes. A rich background is the discreet mathematical teaching.

This definition is not very well met by computer engineering. What is "natural science" or "natural materials and forces?" it is believed that think computer science, a man-made discipline, is the foundation of software engineering, that "materials" are mostly physical rather than conceptual and that "natural forces" are truly "universe laws." The alternative definition could therefore be as the profession of engineering in which knowledge of fundamental mathematics and sciences, acquired through study, experience and practise, are applied to the development of ways to use the materials, concepts and laws of the universe economically in the interest of the human race.

Fundamental mathematics and science" appear to represent this connection and dependence better and more generally. The following graphic containing basic mathematics as discrete Mathematics, including Logic, may be shown for software engineering. The approach is being developed largely by the Bachelor of Informatics as preparation for the graduate studies in advanced knowledge and as a professional track in software systems design/development[8]. Graduates of both programmes, while this would not be their major professional route, should be skilled programmers. Programmers are essentially technicians, and experts who are able to achieve their objectives without a thorough grasp of the basic mathematics or physics behind them.

In earlier parts of this article, the validity of a recursive or iterative pattern was argued in the context of a mathematical induction. The linkages are seen to be essential to the motivation of students may, and must be established in the first year. Mathematical induction is widely acknowledged a challenging topic for pupils. This was examined by mathematical educational scientists[9].

In the first discrete mathematics course, the classical technique to the teaching of mathematical induction is to use multiple numerical examples and problems as a modular unit. For CS/SE major induction, other courses generally touch on mathematical induction (e.g., algorithm analysis, theory of computation, etc). This is considered insufficient for students to comprehend

and utilise induction and to establish the required relationships with CS. A person with knowledge of HOW will always have a job, but the individual with knowledge of HOW will always be his boss[5].

Training vs education! Training versus education! Most students try rather than to grasp the basis for the information they have to obtain a career (HOW) as well as (WHY). This is the idea of education "to fill a vessel, "those which is also a component of the software-practitioner knowledge survey. The driving factor behind many professions' curriculum growth is frequently knowledge rather than understanding, mostly owing to the demand of companies, managers and students. Knowledge-based courses are also more easily taught and evaluated by students.

1.1 Who Should Teach Mathematics?

This is a question more significant than the substance of the course. Most CS/SE departments can do discrete work just as much as most physical departments can teach calculus. CS/SE departments are professors. (This would not be pushed too far into analogies, as physicists frequently know the topic of the calculus enough well to teach it, but few have a broad mathematical perspective or background to accomplish this properly. On the other side, CS/SE faculty members frequently have the necessary perspective and background, although this may not be true much longer.)

Anyway, CS/SE professors have as many teaching courses directly inside the subject as their colleagues in physics without strictly teaching extra mathematical courses. In general, physicists are quite pleased to teach their prospective pupils' mathematics, especially since, at least in the past, they swung enough weight to ensure that calculus courses covered the necessary materials[10]. Thus, CS/SE may almost dictate the curriculum for such courses, because they are by far the major customer departments for those courses.

In addition, the mathematical departments are certainly hungry enough to be willing to teach the courses at least in theory. For their design and operation, the modern systems depend heavily on software. Specification, design and execution of reliable software with rigorous development procedures must be simple for the next generation of developers. To assist prepare this generation, we designed a teaching strategy and two-fold-focused materials: to increase the knowledge and enjoyment of discrete mathematical structures (DM) that underlie software engineering theory (SE).

However, it was true that a decade ago, very few mathematics faculty departments were sufficiently aware of computer science and that they had to give them a decent mathematical course for students who were going to participate in CS or SE programs. Does that continue to be true? (It is usually accurate, with certain quality institutions of tiny liberal arts being possibly the primary exceptions.)

In any events, CS/SE programmes should certainly strive for their mathematics courses in maths. It is a long-term objective of the CS/SE programmes. If your Department of Mathematics is still unable to provide you excellent enough work, it is certainly advantageous to urge your Mathematics Department to employ discrete mathematicians to accomplish that.

1.2 Arguments Favouring Mathematics in CS/SE Curricula

Some practitioners are going to need some arithmetic. However, not a single specialised math course in CS/SE curriculum can reasonably be justified by either the number of mathematicians or the quantity of mathematics they will need. However, excellent reasons exist for incorporating a CS/SE curriculum in some mathematics classes. Here is a couple here.

- Its impact on the mind is the important yet unproven reason for mathematics instruction at any school level. In other words, study mathematics improves pupils' learning skills. Mathematics is very crucial for students of CS/SE as the logical thought contained in all mathematical ideas is so close to the logical idea necessary in all the construction of software.
- Some, but not many of the CS/SE graduates will pursue professions where math is required. This number can rise as and when developers of software are usually more formal than they are today so that they begin to be utilised more extensively, for example in The Science of Programming.
- A few CS/SE graduates will attend a graduate school in CS, although very few. Some of them, maybe far more mathematically based on what they learn than anything else in CS/SE undergraduate curricula.

1.3 Mathematics and Reasoning

Many computer tasks need practitioners to rationally and thoroughly analyse issues and their solutions – frequently using mathematical tools and methodologies. For instance,

- Whenever issues or solutions are offered, users should question what assumptions and how they might affect whatever results they have gotten or programme behaviour.
- When a problem solution is suggested to an algorithm, developers and researchers must assess if the method is proper and efficient in using resources.
- When software is proposed as algorithm implementation, testing organisations and users can verify that the software complies with the requirements stated both formally and experimentally. (The formal verification necessary exists in instances.
- The requirement to be fair in mathematical terms has been established by electronic gambling devices in some jurisdictions[1]. A position announcement by an amateur gaming firm was recently received from one author seeking "to create, test and analyse new games," and "to compose mathematical evidence for game submissions to regulators".)
- If multiple possible solutions to a problem are presented, practitioners should under different assumptions can assess the relative advantages and drawbacks of these options.

In this issue, many of the following topics are included in my article entitled "Mathematical Reasoning in Software Engineering Education." They are presented with further reasons for their completeness. They are thorough, yet they understand that there are many viewpoints on these problems.

- Abstract software.
- Mathematics and Software Engineering are commonly associated with notations, symbols, abstractions and accuracy.
- For modelling and software system behaviour, mathematics is crucial.
- Mathematically based are many fields of application (engineering, science, economics, etc).
- For most issue solving, mathematical reasoning is crucial, notably the construction of software systems.

1.3.1 Software is abstract:

The fundamental form of mathematics was one of the earliest abstractions our ancestors devised. Since the beginning, mathematics is now the fundamental instrument for humans. For non-physical objects, such as software, abstract reasoning requires no greater tool than mathematics. A software system may thus be seen as a model for a desired process or calculation that is mathematically accurate. Software experts largely agree on the abstract nature of software, but appear to prefer to use alternate, non-mathematical methods to describe, design, build, test, debug and manage software systems. This will progressively change, as systems get bigger and more complicated, mathematical instruments (e.g. modelling and model checks) become accessible, and graduates are more mathematically knowledgeable and more aware of the mathematical potential as a reasoning tool.

1.3.2 Notes, symbols, abstracts, precise

All four of them rely largely on the software. For ordinary objects and concepts, notations and symbols are abstractions. This is why $y = ax + b$ is known from algebra and the programming count = 0. In their context of use, both are widely understood and accurate. Students are encouraged to master programming language notations, symbols, accurate syntax and semantics. Actually, this is none other than mathematics, which is generally easier to understand. Students, however, regard mathematics as static and rotary. Programming is seen as dynamic and exciting, attractive to our operating brains. Other computer languages and tools deliver comparable delights when instructors find and embrace them. These include standard ML, Miranda and Haskell languages, language design and testing, and languages like Maple, Mathematica or Axiom programming mathematics. Their usage is wide and is suitable for pupils who acquire a declarative thinking style. They employ notes, symbols, abstractions and accuracy.

1.3.3 Software modelling systems:

Before any item begins to be built, a model, even a conceptual one, must be developed. Today software development is more of an art in which the initial concept takes shape slowly – like melting a piece of clay. However, for projects in which more accurate understanding of the desired item is necessary before building, such adhoc techniques are not acceptable. The first solution is to construct, analyse and test a "mathematical" model. New tools, languages and approaches for modelling software are changing whose use will once become the standard. Languages are now available for system specification.

1.3.4 Domains of application:

Mathematics is a rich global, inclusive language for communication across different communities. Accordingly, the programme offers software practitioners a tool for efficient communication of mathematical underpinnings to customers and associates of all disciplines (ingeniers, scientists, mathematicians, statistics, actuarials, and economics).

2. DISCUSSION

The understanding of details (i.e. jargon, true tables, formal rules of logic) and understandings (i.e. paraphrasing formal rules), and rudimentary applications usually start at the beginning of Bloom's taxonomical processes inside a learning environment. Computer science is no exception, whether or not in its mathematical elements. This is the basis for thinking about Algorithms, programmes, systems etc. This basic work is necessary. This basic level of reasoning and comprehension, however, is insufficient to actually make practical use of computer science. Students need to understand more than the routine mechanics. Such learning occurs when subsequent courses are based on introductory courses and practise in both organised and open settings at a more profound level of analysis. Although this analytical analysis may not be included in every topic discussion in higher levels, students must regularly and in many different circumstances encounter it. If undergraduate programmes do not work with the mathematics that they demand, they restrict the capacity of graduates to apply mathematics in later studies or jobs.

There are (and have been) a number of methods to bridging the gap between the role of mathematics in informatics and the way it is taught in computer science undergraduate education. However, none of these indications shows a clear promise of success.

Mathematical requirements are applied more efficiently. Although most informatics curricula provide room for different mathematics courses, few actually teach mathematics, which is critical to the field. However, correcting this inefficiency is difficult. Under explicit or implicit pressure, prerequisite structures in mathematics departments may require computer science students to take basic, but not directly applicable, programs in engineering schools and computer programs to include maths that are traditional to physical sciences, even if they are not critical to computer science.

Mathematics may be included in computer science courses, and vice versa. The primary issue, which has been addressed in a number of ways, is the underuse of mathematics in the computer science curriculum. Henderson taught a first course for IT majors in the 1980s and 1990s that focused on the foundations of informatics research in terms of mathematical reasoning and problem solving. In the early 1990s, further efforts to integrate discrete concepts with mathematical disciplines, such as Foundations of Computer Science, were part of the curriculum. In the late 1990s and early 2000s, Baldwin and Scragg developed a course that introduced many of the discrete mathematical skills required by computer scientists in elementary algorithm design and analysis; today, curricula of software engineering that emphasize mathematical technologies to produce accurate programs are used. However, none has gained momentum beyond its creators. They have been seen as interesting, and perhaps even commendable, by the computer science community, but not as paradigm-shifting innovations that must be adopted.

3. CONCLUSION

The computer science is frequently used to simulate the phenomena it examines, like conventional areas of engineering. In addition, computational and mathematical thinking are intimately linked. Paradoxically, though, many graduates of computer science and software engineering perform effectively as professionals without mathematics explicitly being applied to their job. This contradiction leads mathematics to be discomfort able in IT courses: while the majority of these programmes include suitable mathematics, they frequently include a lot of non-computer-based mathematics, yet they often ignore other applications when teaching certain mathematical applications. This odd approach of computer science mathematics has surprisingly long remained resistant to revision. Although the exact causes varies each school, we feel that the overall explanation is because the faculty of computing just does not consider the issue as a matter of urgency. In addition, in fact the problem appears to be small, as long as graduates of computer science find work or employment in graduate schools in the subject and the area itself grows. However, there is cause for alarm from a longer perspective. Slowly mathematical instruments and procedures are adopted by software development and testing and today's graduates must be adapted over their careers to such tools and processes. As graduates go through their professions, they become responsible for system design, assessment of test findings or quality metrics, architectural choices or algorithms and similar actions requiring quantitative examination of data and comparison of possibilities.

Mathura, Uttar Pradesh, INDIA

Email id: kqureshi.cse@sanskriti.edu.in

ABSTRACT

Order to increase the accuracy of sustainable energy forecasting is important to power system planning, management, and operations as renewable energy becomes more prevalent in the worldwide electric energy grid. According of the sporadic and unpredictable nature of renewable energy data, this is a difficult job. To date, a variety of approaches have been developed to enhance the forecasting accuracy of renewable energy, including physical models, statistical methods, artificial intelligence techniques, and their hybrids. Deep learning has been widely described in the literature as a potential form of machine learning capable of finding intrinsic nonlinear characteristics and high-level invariant structures in data. This article offers a thorough and in-depth examination of deep learning-based renewable energy forecasting techniques in order to assess their efficacy, efficiency, and application potential. Deep belief network, stack auto-encoder, deep recurrent neural network, and others are the four categories of extant deterministic and probabilistic forecasting techniques based on deep learning. To enhance forecasting accuracy, we also analyze viable data preparation approaches and error post-correction procedures. Various deep learning-based forecasting techniques are thoroughly examined and discussed. Furthermore, we look at the present research efforts, difficulties, and study and future research orientations in this field.

KEYWORDS: Artificial intelligence, Deep learning, Network, Renewable, Technique.

INTRODUCTION

Fossil fuels have always been the world's most significant source of energy today. Hydrocarbons or its derivatives, such as coal, oil, and fossil fuels, are examples of fossil fuels. Fossil fuels take many generations to produce, and existing stocks are destroyed far quicker than new fossil fuels are created. Simultaneously, fossil fuels produce greenhouse gases, which exacerbate climate change also including global warming, putting people's livelihoods in jeopardy[1].

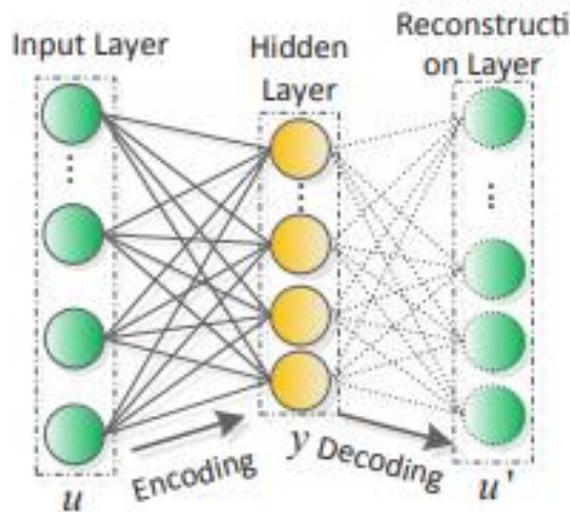

To begin with, renewable energy resources are plentiful and renewable across the globe, and they are unrenewable. Furthermore, renewable energy is clean, green, and low-carbon, making it good for environmental protection. In particular, renewable energy may efficiently decrease sulfide, carbide, and dust emissions, lowering the danger of air pollution and the greenhouse impact. Furthermore, the usage of renewable energy may help to decrease the use of natural fossil fuels while also achieving the goal of environmental protection. As a result, renewable energy has exploded in popularity in recent years. But even though renewable energy is seen as the another very promising alternative to fossil fuels because it is clean, green, and naturally replenished over a large geographic area, it also introduces schedulable uncertainty, which jeopardizes energy system reliability and stability, particularly with massive renewable energy integration. On the one hand, renewable energy is characterized by high volatility, intermittent nature, and unpredictability, all of which will certainly raise the reserve capacity of electric energy systems, raising the cost of power production. The utilization of renewable energy, on the other hand, necessitates a high number of power electronics, which lowers the power system's rotational inertia and therefore diminishes the system's stability margin. As a result, renewable energy forecasting is critical for reducing associated uncertainties, which is beneficial to electrical power and energy system planning, management, and operation. Due to the intermittent, chaotic, and unpredictable character of renewable energy data, reliable renewable energy forecasting remains a difficult job. Various methods for providing accurate renewable energy forecasts for the next several minutes in these next few days have been described in the literature. Physical approaches, statistical models, artificial intelligence techniques, and their hybrid methods are generally classified into four groups[2].

Physical technologies are based upon numerical weather prediction algorithms that simulate atmospheric dynamics using physical principles and boundary conditions to simulate atmospheric dynamics. Limited area models, such as in the fifth-generation mesoscale model and high resolution fast refresh, are included in NWP models, as are global models, including the global forecast system and integrated forecast model. Temperature, pressure, jaggedness, and orography are only a few of the climatic and geographical variables that go into NWP. Physical techniques are effective in predicting atmospheric dynamics, but they need a lot of computing resources since they require a variety of material to calibrate. This becomes much more problematic when physical techniques make unanticipated mistakes during prediction[3].

1.1. Basic structures of deep learning

This section will explain the fundamentals of deep learning, which in itself is important for improving forecasting accuracy for renewable energy sources. In general, three major kinds of deep learning were presented in this report: stacking auto-encoder, deep belief network, while deep recurrent neural network. Furthermore addition, forecasting models are developed based on stacked extreme learning machines, deep reinforcement learning, and convolutionary neural

networks have been described. We'll now go over their fundamental architecture and the training processes that go with them[4].

1.1.1. Stacked auto-encoder

A stacked auto-encoder is a fully convolutional network made up of several layers of auto-encoders, with each layer's outputs linked to the parameters of the next. As portrayed in Figure. 1, each auto-encoder (AE) is made up of an encoder and a decoder, with the goal of reconstructing its own inputs unsupervised. The AE is trained to minimize the reconstruction error across the input space using predefined distributional assumptions. The conventional squared error and cross-entropy objective functions may be utilized as the minimization objective function in general. Only its latent information in the hidden layer is used in the decoding process to recreate the inputs, suggesting that the latent variables already retain a lot of information from the input. As a result, the encoder and decoder's nonlinear transformation may be regarded as a sophisticated feature extractor capable of maintaining latent abstractions and invariant structures in input. After then, an SAE is created by discarding the decoder and stacking the encoders hierarchically. The first layer of an SAE is trained as an independent AE, with the input serving as the training dataset. Even before the first auto-training encoder's process is over, the first AE's hidden layer and the second hidden layer are regarded as a new AE. The training procedure is same to that of the first AE[5]. Multiple auto-encoders may be layered hierarchically in this manner by executing the encoding rule of each layer in a bottom-up order, and an SAE is formed as a result. Previous research has shown that SAE has a promising and stable performance for high-level feature abstractions and representations.

1.1.2. Deep belief network

Hinton was the first to create the deep belief network, which has since been used in a number of fields. It's a generative graphical model made up of unsupervised, basic networks (limited Boltzmann machines) with bidirectional and symmetrical connections across layers. As

presented in Fig. 2, a limited Boltzmann machine works as a stochastic neural network and comprised of one layer of Boolean visible neurons and one layer of binary-valued hidden units, with the first and b indicating their respective biases. A RBM's main goal is to learn a probability distribution across its input data space in order for its configuration to have desired characteristics[6]. The allocation is discovered by minimizing an energy model that is built as a function of network characteristics using thermodynamics.

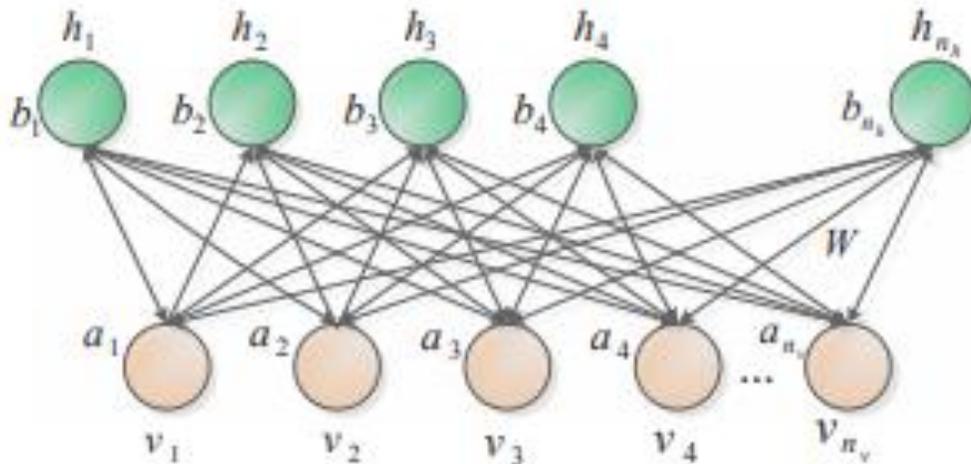

Figure 2: Illustrate the basic unit of Boltzmann machine works as a stochastic neural network

The clustering algorithms may then be determined by repeatedly estimating the engagement probability of the hidden layer supplied the visible layer and indeed the probability of the visible layer given the hidden layer. The estimate procedure, on the other hand, necessitates the calculation of reconstructed-data-driving probabilities across visible and concealed layers, which is very difficult in practice. Applying alternating Gibbs sampling to any stochastic state of the neurons until a particular convergence criteria, such as k -steps, is met is one viable approach.

The unsupervised greedy method is used to pre-train the network parameters in the DBN training process. The 4 major stages are as follows:

- a) Using an alternating Gibbs sampling and contrastive divergence method to adequately train the first RBM;
- b) Configuring that the very first RBM's network parameters and thresholds, then utilizing the hidden neurons' results as the second RBM's input vector;
- c) As much as the second RBM is completely trained, stacking it atop the first RBM;
- d) Following the processes, stacking the remaining RBMs one by one. DBN's training process and binary construction make it highly successful for feature extractions, which makes it appealing in a variety of applications including time series forecasting.

1.1.3. Deep recurrent neural network

The term "deep recurrent neural network" comes from the term "recurrent neural network," which is a kind of artificial neural network in which nodes are connected to form a directed

graph [64]. It uses feedback connections to remember the brain states at earlier time steps to simulate the temporal dynamic behaviors seen in time series data. Figure 3 depicts an RNN's usual structure. Unlike feedforward neural networks, RNNs can handle time series sequences of inputs using neural internal states, making them suitable for renewable energy forecasting[7].

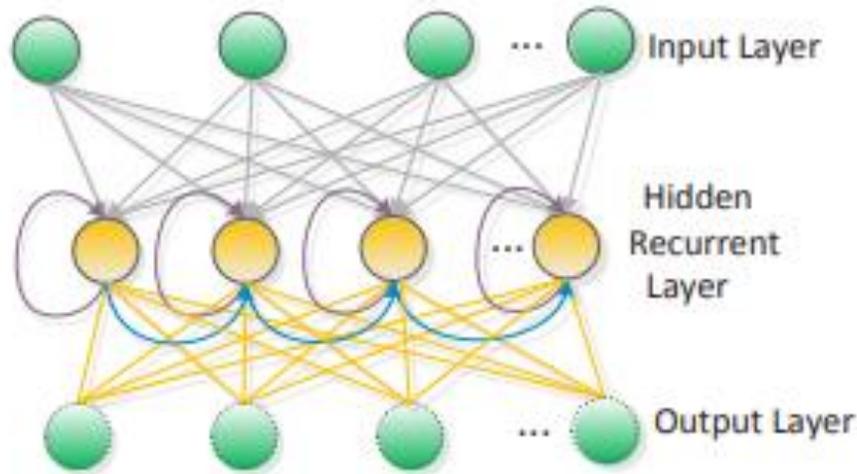

Figure 3: Schematic diagram shows the typical structure of a recurrent neural network

Deep RNN may be expressed in four distinct ways when compared to ordinary RNN. The first method is to deepen the input-to-hidden equation to learn additional non-temporal structure from either the inputs. This approach, rather than the affected by the following, tends to flatten the manifolds within which the data concentrations and untangle the underlying variation components. Because the connection between representation characteristics can be represented more simply, the deep information structure enables learning the temporal correlation between many times steps simpler. The second characteristic of deep RNN is to deepen the hidden-to-output function, which allows for more compact hidden states. One of most significant advantage of this formulation is its great efficiency in summarizing the history of prior inputs, making real-time output prediction simpler.

1.1.4. Additional deep learning structures

Many alternative deep learning structures, including deep convolutional neural networks, stacked extreme learning machines, and generative adversarial networks, have been suggested for feature extraction. Based on translation invariance features and shared-weights architecture, the deep convolutional neural network serves as a variant of multilayer perceptions with minimum preparation. It must have been motivated by biological information processing, in which the connection arrangement between neurons mimics the visual structure of animals. DCNN is made up of a series of alternating convolution and pooling layers. The low-level maps with local characteristics are mapped into multiple high-level maps with global features via the convolution layer, which uses a convolution operator. Weight sharing is often used in the convolution layer to minimize memory footprints and the amount of network parameters, making the feed forward and back propagation process easier. With this method, all neurons in the same output map have the same weight and bias, even if their inputs come from different places. The pooling layer is a

more condensed version of the input maps. It lowers data dimensionality by turning input layer neuron clusters into a single output layer neuron.

1.2. Forecasting models based on deep neural networks

Numerous deep learning models are examined. These systems, on the other hand, are employed for feature extraction and can also be directly accustomed renewable energy forecasts. This section explains the basic framework of deep learning-based deterministic and probabilistic renewable energy forecasting.

1.2.1. Models of deterministic forecasting

In summary, Figure 4 depicts a deep learning-based objective forecasting system for renewable energy. It includes data preparation approaches, a deep learning-based feature extractor, regression algorithms, and error post-processing tools, as demonstrated. The raw renewable energy time series analysis is first decomposed into various components with varying frequencies using data preparation methods. Outliers and behaviors are better in each component than in the original data. Then, for each component's forecasting, a feature extractor and a regressor are built separately. Using current optimization methods, the network topologies and model parameters may be fine-tuned. The forecasting findings are then rebuilt by adding all of the predicted components together. Finally, to rectify the rebuilt forecasting findings, different error post-processing methods may be used.

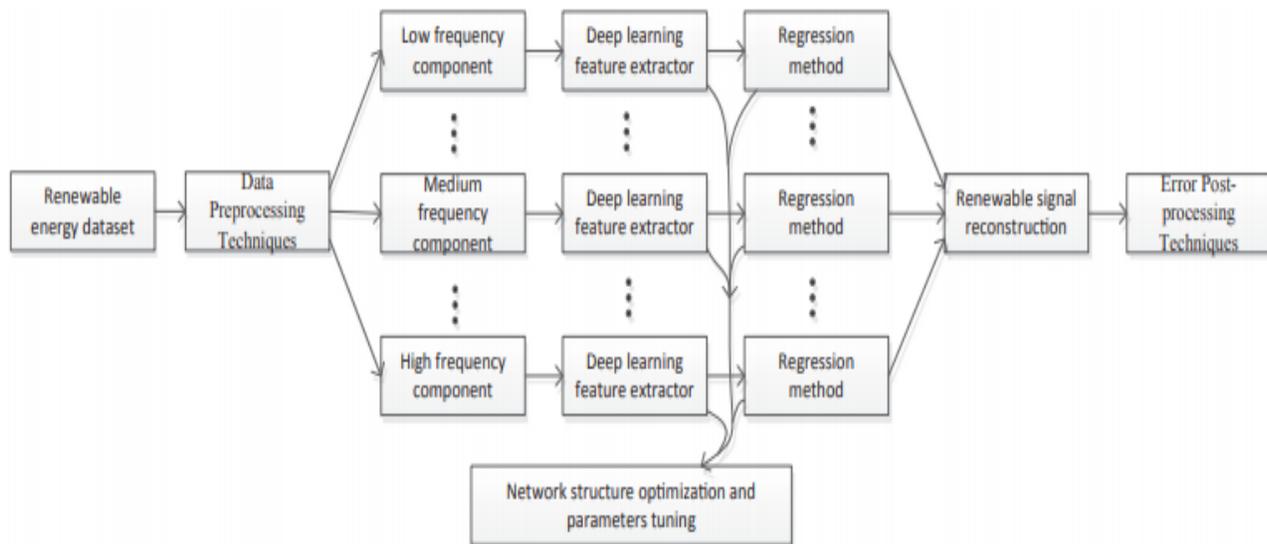

Figure 4: A general framework for renewable energy forecasting

1.2.2. Techniques for data preprocessing

Raw renewable energy information is prone to a wide range of irregularities, including fluctuation and spikes. The forecasting performance is harmed by these irregularities, which have nonlinearity and non-stationarity characteristics. As a result, a number of data preprocessing schemes have been developed to biodegrade the renewable energy signal up into multiple components with better information variance and isolated occurrence behavior. The adverse consequences of irregularities on forecasting accuracy can indeed be appropriately mitigated

with the help of all these data preprocessors. Wavelet decomposition but instead empirical mode decomposition were indeed two of the most prominent used methods in the literature. Those certain decomposition methods have also been reported, including Fourier transform, seasonal adjustment method, and vibrational mode decomposition. Wavelet transform and wavelet packet decomposition make up WD. Two components are used to perform multi-resolution time series data analysis in the time and frequency domains. The approximate and detail subseries are obtained using a low-pass and high-pass filter, respectively. The variation between wavelet transform but instead wavelet packet decomposition is that even the former consists of dividing the original signal into several minimum and maximum frequency components, whereas the latter divides it into several high and low frequency components. WD techniques have been shown to be very useful in forecasting performance improvement because the decomposed thread always have fewer outliers and lower uncertainties[8].

LITERATURE REVIEW

Considering electric infrastructures are aging, traditional power grids are being updated into smart grids that allow two-way communications between consumers and utilities, making them more susceptible to cyber-attacks. However, owing to the assault cost, the attack method may change significantly from one operating situation to the next from the adversary's viewpoint, which has not been taken into account in prior research. As a result, two-stage sparse cyber-attack models for smart grid with full and partial network information are presented in this article. Then, in order to efficiently identify existing cyber-attacks, a defensive mechanism based on interval state estimation (ISE) is created in a novel way. The lower and upper limits of each state variable are represented as a dual optimization problem in this mechanism, with the goal of maximizing the system variable's variation intervals. Finally, a common deep learning algorithm, known as a stacked auto-encoder, is intended to extract nonlinear and non-stationary characteristics in electric load data. These characteristics are then used to enhance electric load forecasting accuracy, resulting in a narrower range of state variables. A parametric Gaussian distribution is used to represent the uncertainty in predicting mistakes. Comprehensive testing on different IEEE benchmarks have proven the validity of the suggested cyber-attack models and defensive mechanisms[9].

Laura Frías-Paredes et al. studied the wind and solar energy generation have grown in popularity in recent years, and it is anticipated that these energy sources will account for a significant portion of overall energy output in the future. They do, however, have intrinsic unpredictability, which means that energy production fluctuates in unpredictable ways. As a result, forecasting mistakes have a significant influence in the costs and effects of renewable energy integration, management, and commercialization. This research makes a significant contribution to the problem of evaluating prediction models, particularly in the time component of prediction error, which improves on earlier pioneering findings. In order to evaluate the accuracy of energy forecasting, a novel technique for matching time series is developed. This technique is based on a novel set of step patterns, which are an important part of the algorithm for calculating the temporal distortion index (TDI). This family reduces the transformation's mean absolute error (MAE) in comparison to the reference series (the actual energy series) and also provides for precise control of the prediction series' temporal distortion. The use of Pareto frontiers as characteristic error curves is enabled by the simultaneous consideration of temporal and absolute mistakes. To demonstrate the findings, real-world wind energy predictions are utilized[10].

DISCUSSION

Along with its capacity to deal with large amounts of data and high-performance computing power, deep learning management systems have grown rapidly. There's now a lot of research on using deep learning to predict renewable energy. Deep learning-based forecasting models, on the other hand, face two major issues. Conquering these obstacles will aid in improving the deep learning prediction model's accuracy. There seem to be a large couple of published on deterministic renewable energy prediction to date. However, deep learning-based probabilistic forecasting models have received insufficient attention. The probabilistic forecasting model can quantify the uncertainties in renewable energy time-series data numerically. As a direct consequence, probabilistic renewable energy forecasting is critical for the economic operation and day-to-day management of the electric power and energy system. This article's comparative analysis can assist renewable energy forecasting professionals in determining which deep learning algorithm can help them improve their forecasting tools. This publication fills in the gaps in order to explore the potential of deep learning in the context of renewable energy forecasting.

CONCLUSION

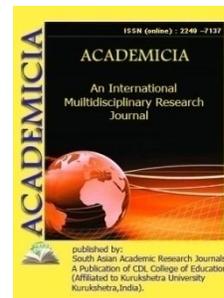

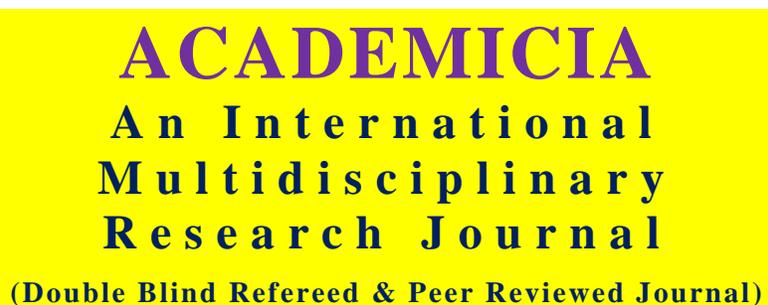

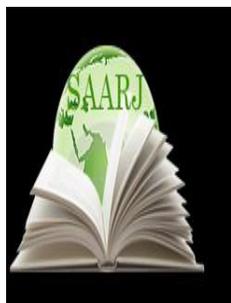

The above paper presents a comprehensive review of recent deep learning-based renewable energy forecasting models. A multi-layer perceptron with multiple hidden layers is what deep learning is. It mainly a consequence features to create more abstract high-level features or characterizes attribute categories to learn about the input data's inherent nature. Deep learning-based forecasting models are classified into the following categories in this paper: DCNN, DRNN, DBN, SAE, and other deep learning models. Either every type of forecasting model is explained in great detail. In furthermore, some data preprocessing and post processing techniques are presented in this report in order to improve prediction accuracy. The publication then goes on to show a large number of simulation results that demonstrate the feasibility and effectiveness of deep learning-based forecasting models. Ultimately, we go over some of the challenges that deep learning-based prediction models face, as well as some of the future research directions that could be pursued. This article's comparative analysis may aid renewable energy forecasting experts in determining which deep learning algorithm can help them improve their forecasting tools. This publication fills in the gaps in order to explore the potentials of deep learning in the context of renewable energy forecasting.

ABSTRACT

The article deals with the formation of oxidized particles during oxidative roasting of molybdenum sulfide concentrates and cakes, as well as under-oxidized cinders and dust of molybdenum production. In the course of the work, various factors influencing the oxidative roasting process, parameters and requirements for the supplied and discharged material were investigated. The results of the analyzes are summarized and conclusions based on them are drawn.

KEYWORDS: *Multiple Hearth Furnace, Intensive Roasting, Cinder, Sulfides, Molybdenum, Cake, Soda Leaching, Oxidative Roasting, Concentrate, Desulfurization, Oxidation State.*

INTRODUCTION

An industrial method for extracting molybdenum includes roasting its concentrate, purifying the obtained calcine by a hydrometallurgical method to MoO_3 , and reducing trioxide with hydrogen to metal. Although this method is the main method for the production of molybdenum and has been used for a long time in the industry, research on its application to various concentrates, as well as the kinetics and mechanism of roasting, is ongoing. still in short supply [1]. However, as a result of the well-known disadvantages of pyrometallurgical extraction of molybdenum, hydrometallurgical processes are becoming more and more attractive. Among them, nitric acid

leaching, pressure oxygen leaching, electro oxidative extraction, sodium chlorate and hypochlorite leaching, and bioleaching are more popular. [2].

Objects and methods of research

We have studied the kinetics and mechanics of the solid-state reaction between MoS_2 and MoO_3 for the formation of MoO_2 in an atmosphere with a nitrogen content of 450-700 ° C using untreated samples of molybdenum production, pressed melange samples and pure MoS_2 and MoO_3 dumplings with the contacting side. The results show that, for untreated samples, the reaction reaches a maximum conversion of 67.3% at 650 ° C in 75 minutes, while for compressed samples, the conversion under similar conditions reached 96.1% in 75 minutes, which reflects the effect of physical conditions of both types of experiments on reaction kinetics [3]. The calculated values of the activation energy for the two experimental conditions are coherent with an average value of -44.2 ± 1.9 kJ, which is in the range of reactions in the solid state, controlled by diffusion [4]. For samples with a contacting face above 923 k, the results seem to indicate that molecular diffusion in the solid state and MoO_3 in opposite directions in the newly formed crystal structure of MoO_2 can occur with the established diffusion coefficients of MoS_2 in MoO_2 and MoO_3 in MoO_2 at 923 to 1.08×10^{-6} and 7.78×10^{-6} cm^2 / s , as well as with constant diffusion coefficients of MoS_2 in MoO_2 and MoO_3 in MoO_2 at 650 ° C 1.08×10^{-6} and 7.78×10^{-6} cm^2/s 973 k de 10^{-5} and 1.13×10^{-5} cm^2/s , respectively[5].

RESULTS AND DISCUSSION

There are four known molybdenum sulfides: Mo_3S_4 , Mo_2S_3 , MoS_2 , and MoS_3 . Sulfide Mo_3S_4 is formed from aqueous solutions and decomposes at about 120°C to $\text{MoO}_3 \cdot n\text{H}_2\text{O}$ and sulfur. Trisulfide MoS_3 usually contains an excess of sulfur in the form of $\text{MoS}_3 + x$, in which $x = 0-0.7$. When heated in an inert atmosphere between 527 and 573K, it decomposes into MoS_2 and sulfur. Molybdenite (MoS_2) decomposes to Mo_2S_3 and gaseous sulfur in a neutral atmosphere above 1673 K [6]. There are two known molybdenum oxysulfides, MoO_2S and MoS_2 , but they are very unstable and decompose to MoS_2 and oxygen. Several molybdenum oxides have been identified with oxidation states from 2 to 6, most of which are non-stoichiometric, and only two (MoO_2 dioxide and MoO_3 trioxide) are stoichiometric, stable compounds.

Sem_BED-C_001

200 μm

Some others, such as Mo_5O_{12} , Mo_3O_8 , Mo_2O_5 , Mo_4O_{11} and Mo_9O_{26} , have been found in small amounts in multi-hearth furnaces and appear to be solid solutions of MoO_2 and MoO_3 in various proportions [6-8].

A general chemical analysis of samples was carried out over the entire surface of each sample to determine the possible components of the studied objects, which are shown below in the figures below..

The results of the analysis show that the leaching cake sample contains mainly different iron oxides, and molybdenum sulfides is 6.8%. This proves that after soda leaching of molybdenum concentrates, up to 4% of molybdenum remains in the sludge.

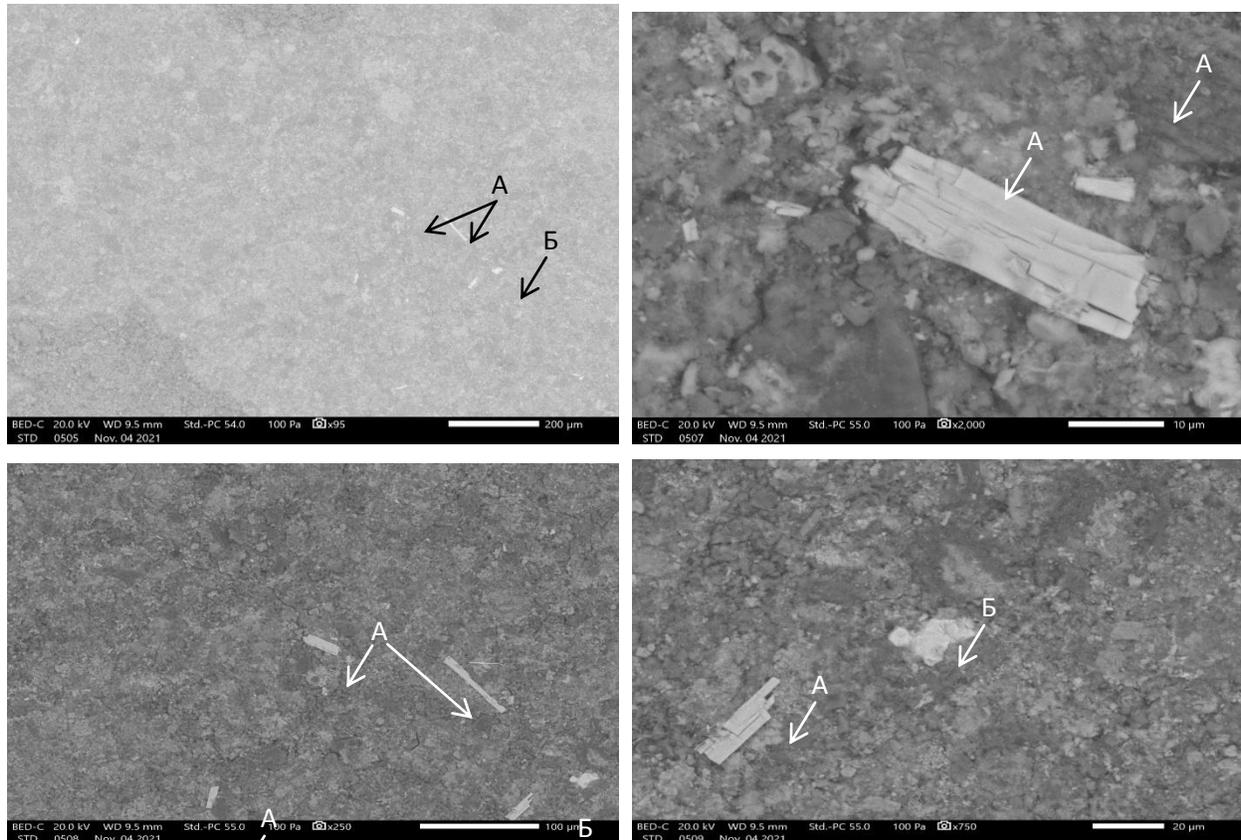

Fig. 3. Scanning electron microscope images (leaching sludge)

Figure 3 shows images of a scanning electron microscope of the leach cake. The figure shows molybdenum particles bound by oxygen and sulfides, and the main part of the surface is filled with iron oxides. Determined by the values of A - molybdenum oxides, B - sulfide particles of molybdenum, and the rest, mainly iron oxides. In a scanning electron microscope, heavy particles are shown brighter, since the brighter the particles, the heavier. From the above, it can be concluded that the main surface of the sample is iron oxides. These conclusions are confirmed by the data in Table 1. Table 1 shows that the sample contains 20.83% Fe and 42.10% oxygen.

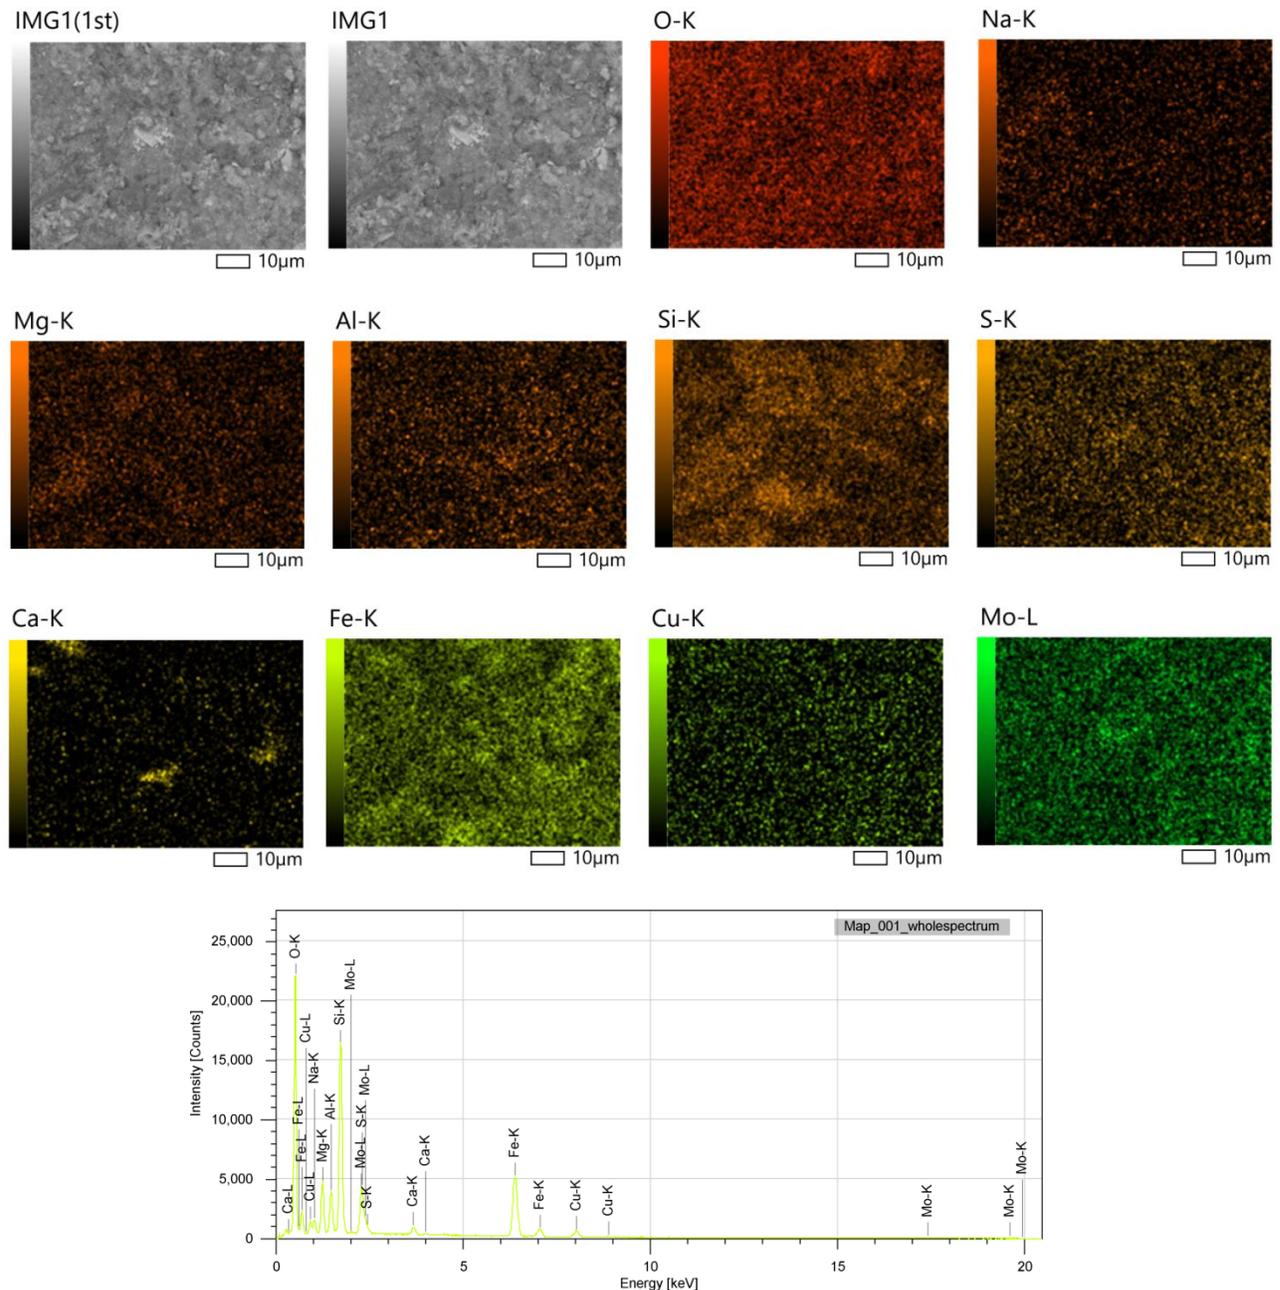

Fig. 4. Results of EDS analysis of leaching cake samples

Next, an EDS analysis was performed to study the complete surface map (mapping method) (Figure 4.). This method determines in what part of the sample the constituent elements are located. Figure 4. states that the sample contains mainly oxygen, and where there is oxygen, the signals of Fe and Si shine through. The signals of molybdenum and sulfur are very close, so the patterns of the L-line of molybdenum and the K-line of sulfur are almost the same. The energy resolution of the energy dispersive spectrometer is 130 eV. But the difference between the $L\alpha$ line of molybdenum and the $K\alpha$ line of sulfur is almost 14 eV[7]. Therefore, when analyzing an energy dispersive spectrometer, it shows molybdenum and sulfides in one peak.

A general analysis of a sample of a molybdenum middling product was carried out to determine the elemental composition.

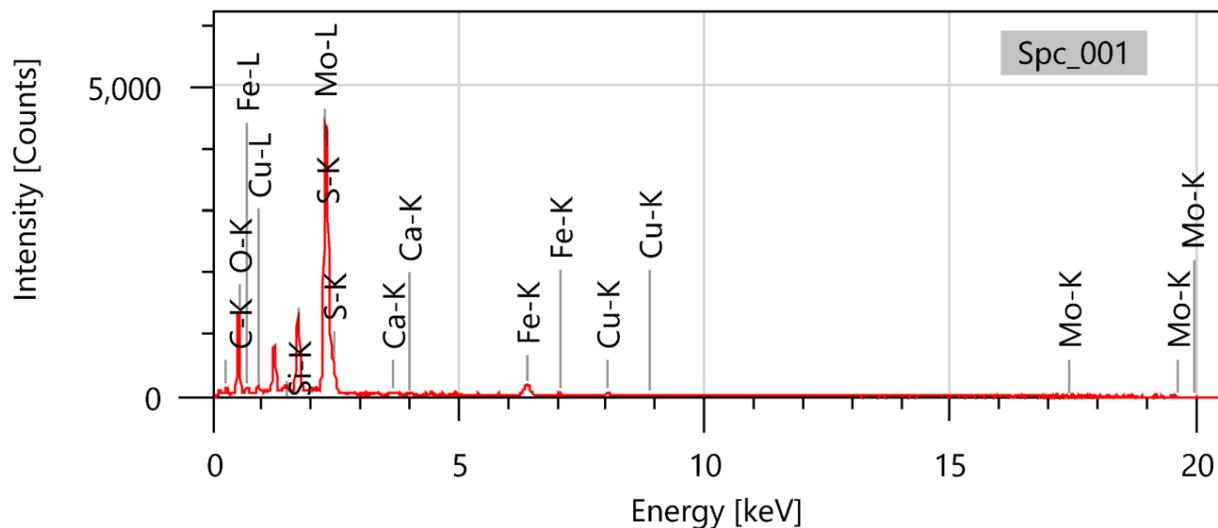

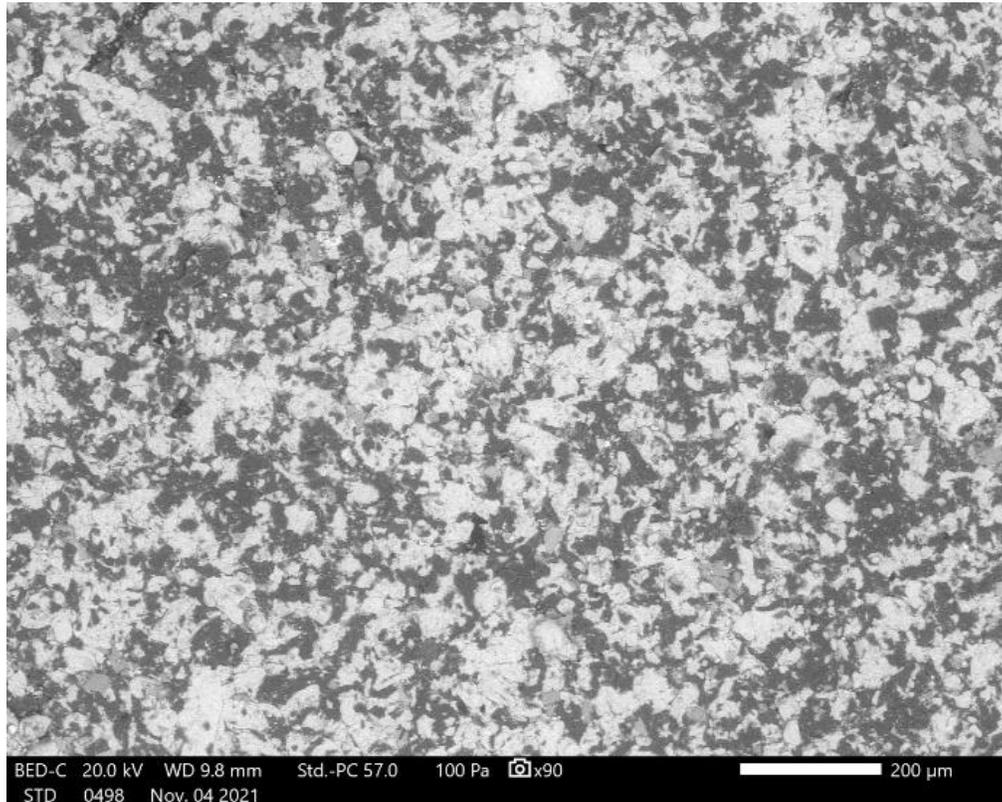

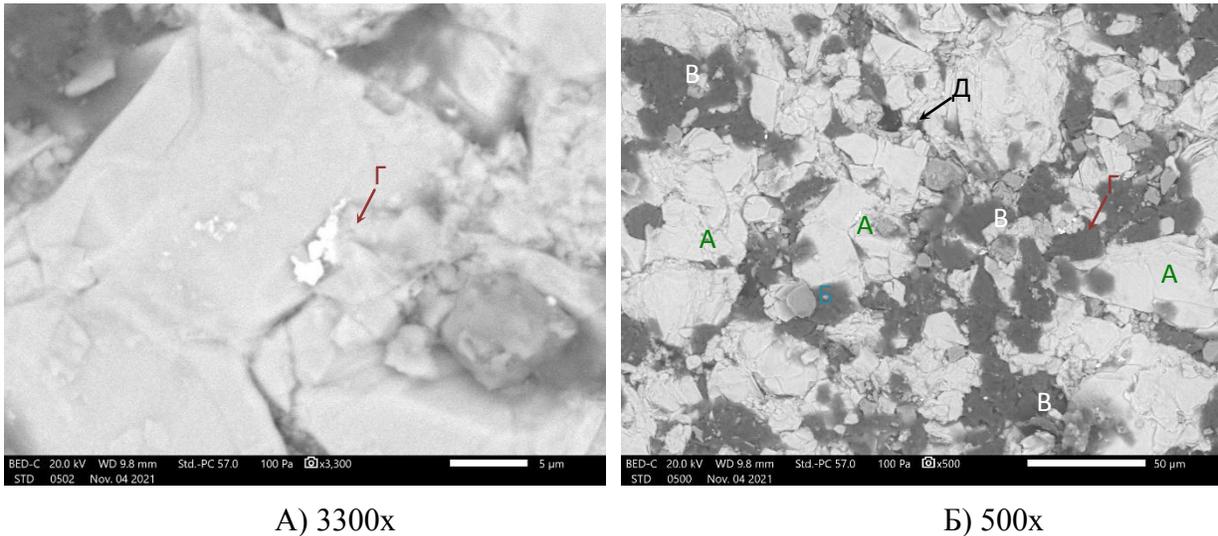

Fig. 4 General elementary analysis of the entire surface of a sample of molybdenum production middlings.

As a result of the analysis, the elementary composition of the molybdenum middling product was determined. Based on the analysis results, it can be seen that molybdenum in the sample is 25.5%, S - 18.54%, Si - 6.12%, Cu - 8.9%, O - 31.18%, Fe - 3.74 %. For a more accurate

determination of the structure of samples of middlings of molybdenum production, several images were taken in different magnified states from 90x to 3300x.

The work of Sooeun Shin and Eunsoo Kim [8-12] shows the structural analysis of molybdenum oxides, which shows the mineral is an acicular state. Based on the literature data on the structures of minerals, it is possible to determine visually which minerals are in the sample based on the table of data on the elemental composition of the analyzed object.

A) 3300x

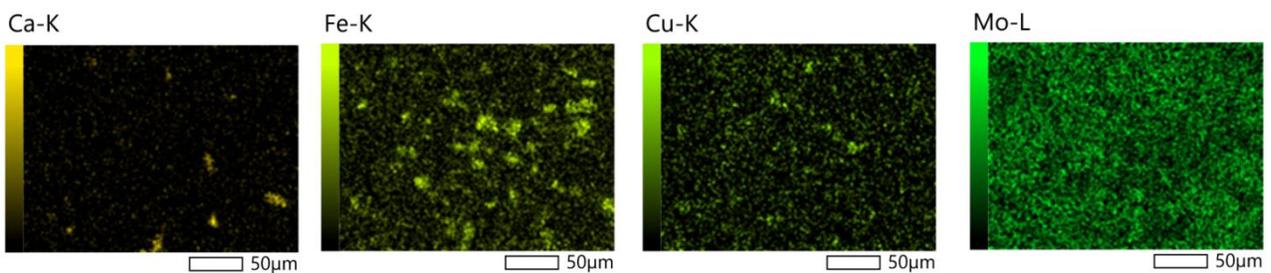

B) 500x

Fig. 5. Images of a scanning electron microscope with a magnification of 90x and 500x

From the images and the data table, it can be determined that the sample of molybdenum middling contains mainly molybdenum sulfides, chalcopyrite, pyrite and various iron sulfides, as well as SiO_2 and iron oxides. The 500x image definitely showed which particles are at which points on the surface. For example, A - molybdenum sulfides, B - silicates, C - iron oxides (hematite, goethite, etc.), D - possible heavy metals (Pb, Pd), E - carbon compounds. Figure 5. And for a detailed determination of heavy metal, the image was enlarged to 3300x and the elementary composition of this area was determined.

The elemental composition of this area shows that there is 17.38% Pb in this area.

Further, by the mapping method, the state of the elements in the object under study is determined.

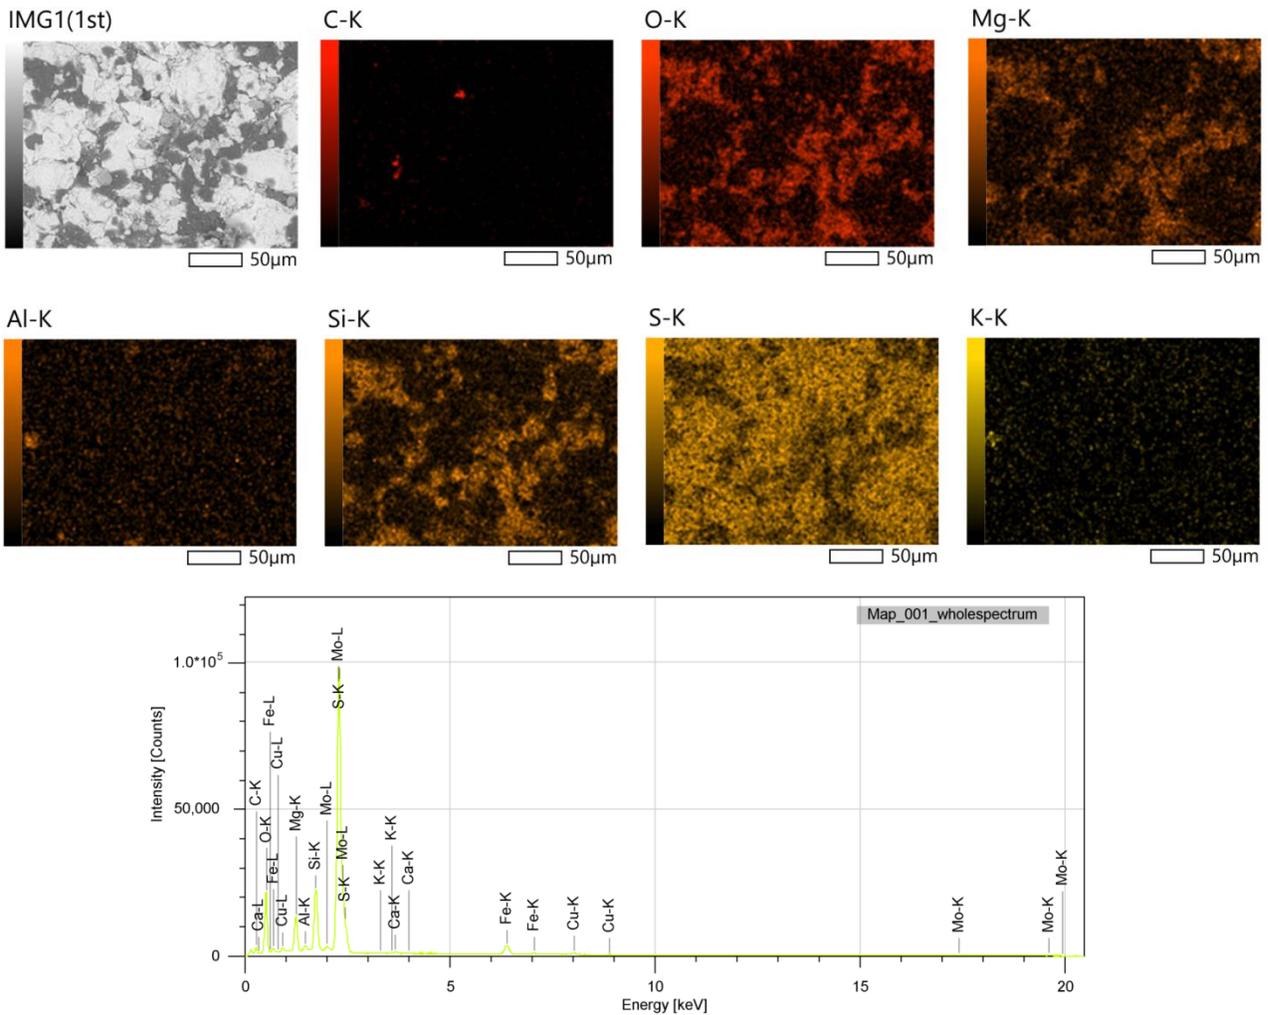

Fig.6. Results of EDS analysis of samples of molybdenum middlings

The above analyzes state that a sample of molybdenum middlings contains molybdenum in sulfide compounds and Al, Fe, Mg and Si in the form of oxides. When determining the structure of molybdenum middlings, the content of chalcopyrite, pyrite and iron sulfides was determined. Analyzes of individual sample sites for the determination of heavy metals are presented in the appendices.

Analyzes for determining the elemental composition of a sample of cinders of molybdenum production middlings have been carried out. In the course of the work, images of the scanning electron microscope of the sample were obtained.

In contrast to the middlings of molybdenum production in cinders, the bulk of molybdenum sulfides is formed by molybdenum oxides. From Figure 2.8. it can be seen that bright particles expressing molybdenum compounds are shown as an acicular structure and this states that the main part of sulfides during oxidative roasting is oxidized.

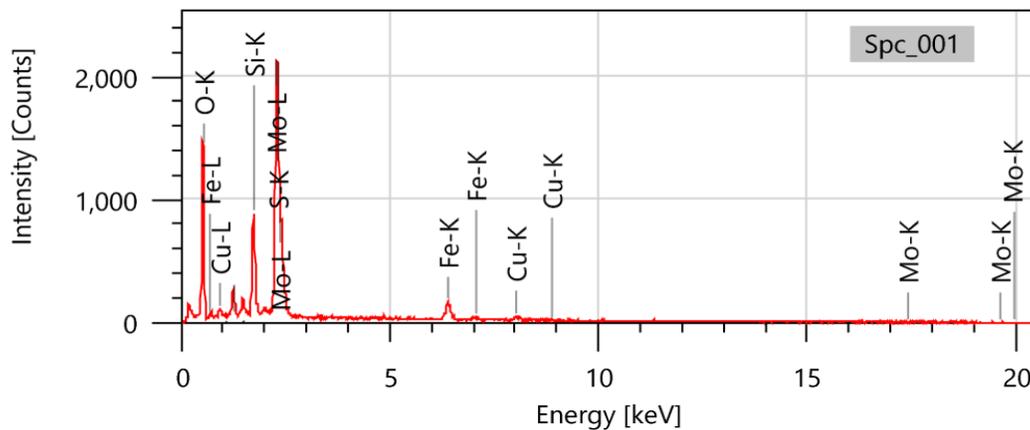

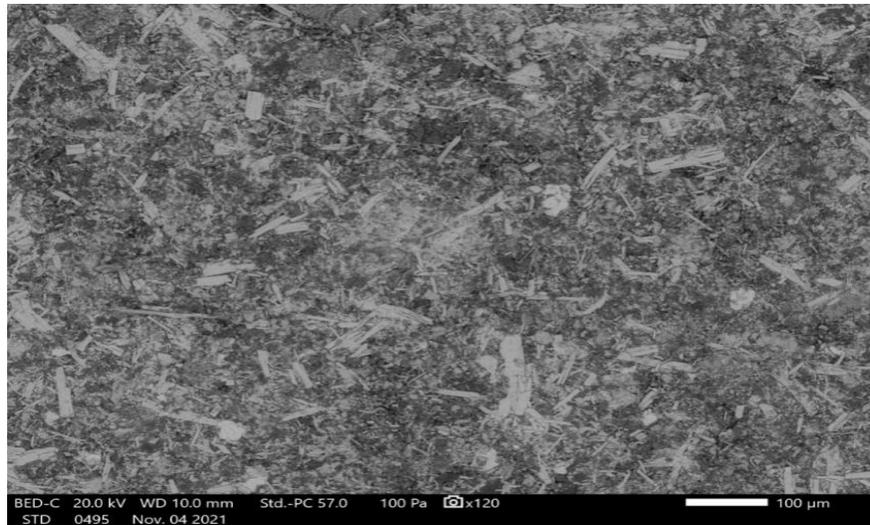

Figure 7. General elementary analysis of the entire surface of the sample of the middlings of molybdenum production

Figure 7. shows that oxidized molybdenum particles have a size of up to 100 μm . However, the presence of molybdenum sulfide compounds is also impossible to refuse. In Table 1 it is possible to compare the sulfur and molybdenum contents, which indicate the oxidation of sulphide particles. Table 2 it is shown that the sulfur content in the middlings of molybdenum production is 18.54%, and 4.69% sulfur remains on the cinder (Table 2.).

TABLE 2 ELEMENTARY COMPOSITION OF THE TOTAL AREA OF THE SAMPLE OF CINDERS OF MOLYBDENUM MIDDLING PRODUCT

Element	Line	Mass%	Atom%
O	K	42.45 \pm 0.45	73.12 \pm 0.82
Mg	K	1.84 \pm 0.07	1.34 \pm 0.10
Al	K	1.03 \pm 0.05	2.20 \pm 0.09
Si	K	5.94 \pm 0.11	1.52 \pm 0.07
S	K	4.69 \pm 0.16	6.10 \pm 0.12
Fe	K	4.26 \pm 0.13	4.29 \pm 0.10
Cu	K	2.00 \pm 0.13	0.77 \pm 0.06

Mo	L	37.79 ± 0.49	10.67 ± 0.11
Total		100.00	100.00
Spc_001		Fitting ratio 0.0478	

Figure 8 shows the change in the structure of molybdenum middlings after oxidative firing. An increase in the mass fraction of oxygen and a decrease in sulfides indicate the quality of the oxidative roasting process. By studying the mechanisms of oxidation and determining the parameters of oxidative firing, it is possible to determine the optimal firing conditions, this is discussed in the following chapters of the thesis.

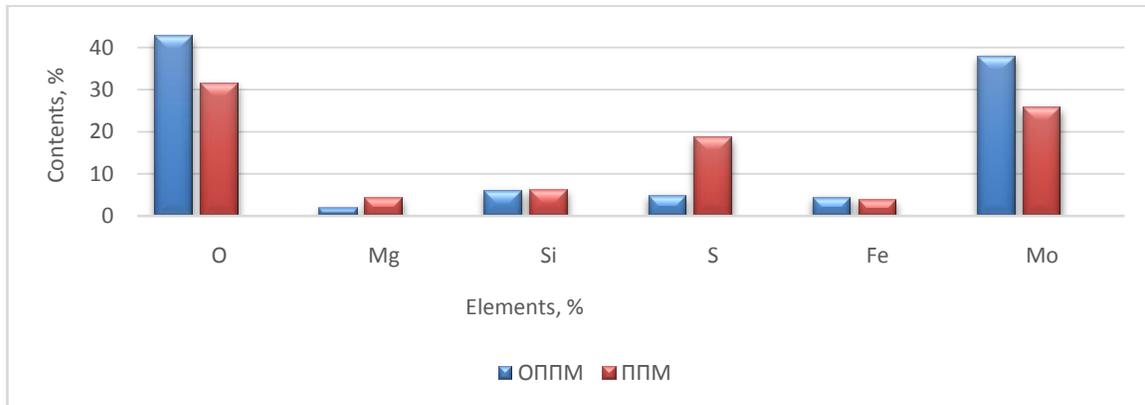

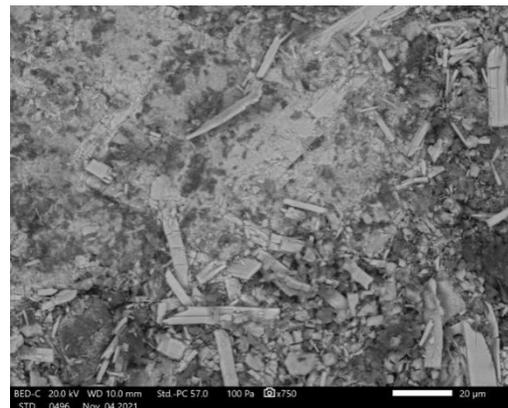

Fig. 8 Changes in the structure of molybdenum middlings during oxidative firing.

Figure 9. shows the structures of an oxidized sample, sulfide particles are contained in an insignificant amount. The main part of the sample is covered with molybdenum oxides, also in table 2 it is indicated that the sample contains 42.45% oxygen and 37.79% molybdenum, up to 5-6% additional components such as Fe, Cu, Si, Al and Mg.

A) 950x

B) 750x

Fig 9. Images of a scanning electron microscope with a magnification of 90x and 500x

Several photographs and elementary analysis of dust samples from oxidative roasting of molybdenum production were made. Below, in Figure 10. a 60x enlarged photograph of molybdenum dust under an accelerating voltage of 20.0 kV and low vacuum is presented.

The elemental composition of the dust was determined to further clarify the shape of the state of the elements in the sample. The composition of the dust contains much more sulfur than cinders of molybdenum middlings. This is due to the fact that the volatilized dust is under-oxidized, molybdenum in it remains in the sulfide form up to 7-8%. To refine the analysis results and find the shape and structure of minerals in the sample, electron dispersive spectral analysis was performed using a JEOL IT200 scanning electron microscope.

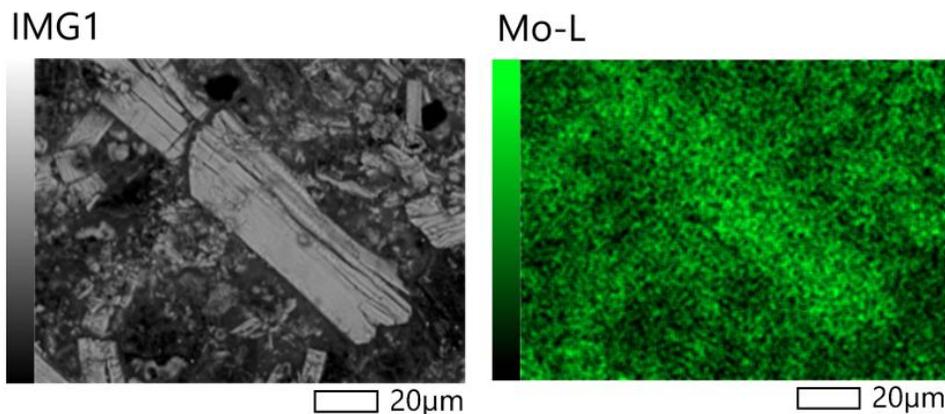

Fig. 10. Determination of mineral particles by the EDS method

Figure 10 shows that the large acicular particle contains molybdenum as a whole, and the particle is brighter than the rest of the areas. The needle-like structure of this mineral means that this mineral is molybdenum oxide, now you can compare the results of oxygen indicators, since the picture with oxygen may confirm this opinion. Figure 12 compares the signals of the $L\alpha$ line of molybdenum and the $K\alpha$ line of oxygen.

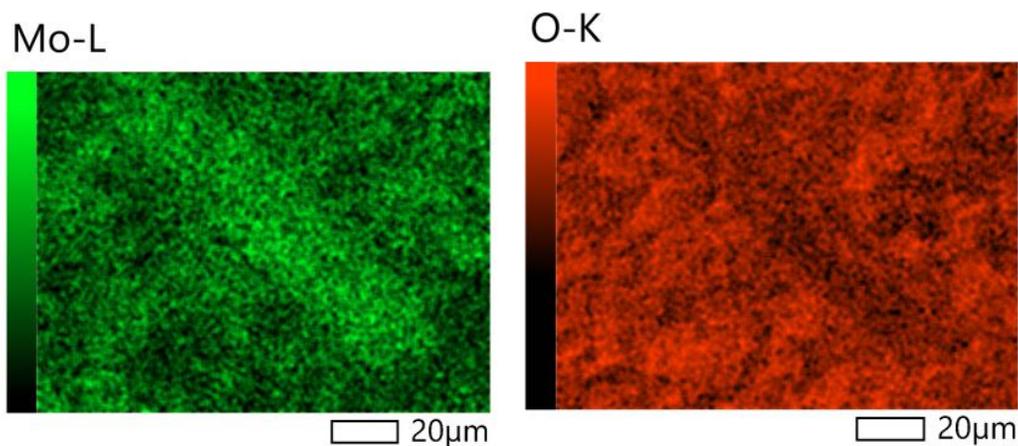

Fig. 12. Comparison of mineral particles by the EDS method (Mo-O)

The traces of the selected particle are almost the same in both figures, which means that in this area of the sample, oxygen and molybdenum are bound, or it can be inferred that molybdenum is in an oxidized state here.

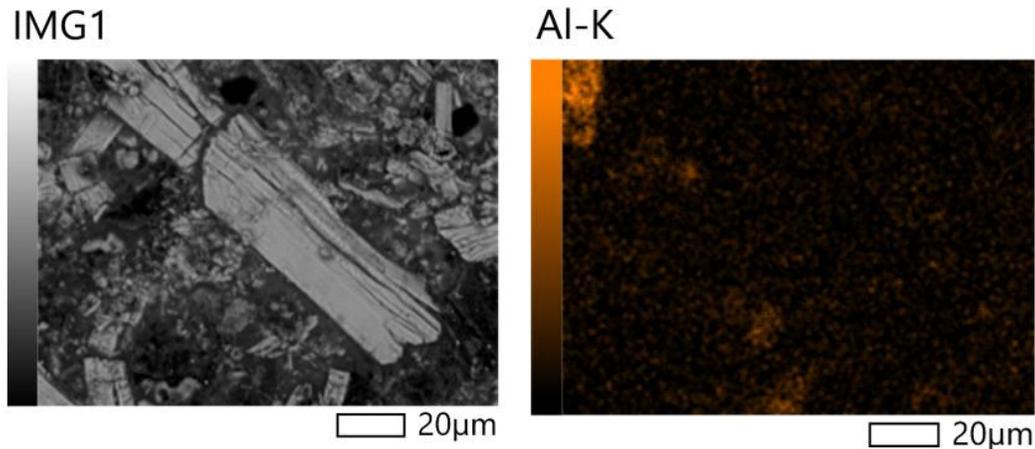

Fig.13. Determination of the form of finding aluminum by the EDS method

By comparing the pictures, you can see the points where the aluminum is. Aluminum is a lightweight non-ferrous metal, so it appears darker in images.

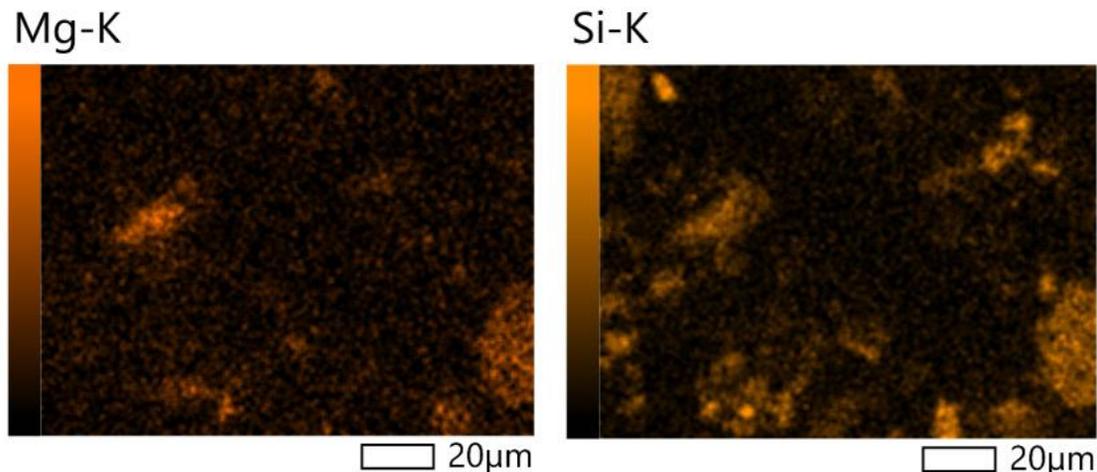

Fig. 13. Determination of the form of finding minerals Mg-Si

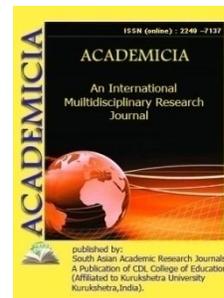

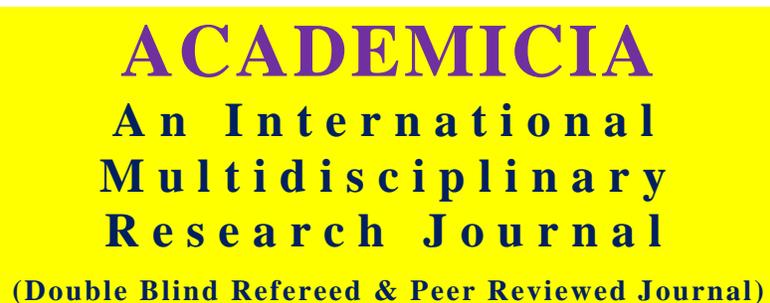

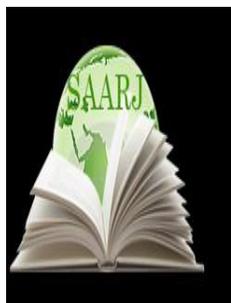

Figure 13 indicates the presence of talc ($\text{Mg}_3\text{Si}_4\text{O}_{10}(\text{OH})_2$) in the sample. Translucence of magnesium and silicon is located in basically the same places on the surface.

CONCLUSIONS

The kinetics and mechanism of the solid state reaction between MoS_2 and MoO_3 with the formation of MoO_2 in a nitrogen atmosphere between 450 and 700°C were studied using bulk mixed samples, mixed compressed granules and pure granules of MoS_2 and MoO_3 with a single contacting surface. The results show that for bulk samples the reaction reaches a maximum conversion of 67.3% at 650 ° C in 75 min, while for compressed samples the conversion under similar conditions reaches 96.1%, which indicates the effect of the physical characteristics of both types of experiments on diffusion coefficient of MoS_2 and / or MoO_3 through the newly formed crystalline layer of MoO_2 . The calculated activation energies for both experimental conditions agree with an average value of -44.2 ± 1.9 kJ, which is in the range of diffusion-controlled reactions. The literature has not reported any other value for this reaction.

PAINTING: CREATIVE SOURCE FOR CONTEMPORARY ART

Dilzoda Alimkulova*

*Senior teacher, Doctor of philosophy in art history (PhD),
National Institute of Arts and Design named after Kamoliddin Behzod,
Tashkent, UZBEKISTAN

ABSTRACT

In the formation of the national school of fine arts of Uzbekistan, painting in the 1920s and 1930s was a kind of foundation and creative basis that determined subsequent trends. This article reveals the dependence and close relationship of the artistic process of the 1920-1930-years from the historical and political events of the time, that this period was an important factor in the formation of national identity of art and that art is a creative source for contemporary art.

KEYWORDS: *Artistic Process, National School, Contemporary Art*

INTRODUCTION

In the formation of the national school of painting of Uzbekistan the painting of the 1920s-1930s served as a kind of Foundation determining the trends of its development. A characteristic feature of the creative process of this time was the coexistence of various artistic styles and trends — both realistic and avant-garde. Although the study of fine art of this period is a topical problem of art criticism, many aspects of this phenomenon have not received proper coverage. An important source for studying the creative processes of that time are poorly researched or unpublished works of artists stored in museums in Uzbekistan but not introduced into scientific use.

Currently, the State Museum of Arts of Uzbekistan stores a large number of poorly studied works by Alexander Volkov (about 50 paintings, 90 graphics), UstoMumin (more than 20), Oganés Tatevosyan (more than 500), Nikolai Karakhan (more than 30) and Ural Tansykbayev (more than 60 works).

Painting of the 1920s and 1930s is important in understanding the origins of the formation of the national identity of modern fine art in Uzbekistan. The unusual interpretation of the national heritage of the East the mutual influence of the traditions of the East and the West in the art of this period make it consonant with the artistic processes of our time.

The main results and findings

In 1934, the State Museum of Oriental art (Moscow) hosted a major exhibition called "Artists of Uzbekistan". Some of the works on display at the exhibition surprised Moscow experts as the color and General artistic features were signs of the Eastern rather than Western avant-garde. "The paintings showed the influence of the European avant-garde including the Cubo-futurists — but at the same time the medieval culture of Central Asia with its monumental architecture, ornaments and the Asian sun breathed on the canvases, refracted by all the avant-garde colors" (1, p.5).

As a result of the Russian colonization of Central Asia Western culture began to penetrate the States of the region beginning in the middle of the XIX century. The first Russian artists who came here mainly painted pictures of an ethnographic everyday nature. This situation was observed at the very beginning of the twentieth century. But already in the painting of the 1920s and 1930s, we can distinguish several groups of artists who differ in style principles.

The group of A. Volkov included artists such as U. Tansykbayev, N. Karakhan, A. Podkovyrov, P. Shchegolev. Their creativity was formed on the basis of a combination of avant-garde with national traditions. They saw the rhythm and flatness characteristic of the avant-garde in the samples of local applied art: carpets, embroidery products, colored silk fabrics.

The second group included artists N. Kashina, M. Kurzin, E. Korovai, V. Ufimtsev who chose the directions of futurism and supremacism. These trends were close to the Russian art of the 1920s. Futurists did not recognize the past and in their work did not refer to the traditions of the East. The artists of this group reflected the realities of modern Uzbekistan.

There was another group of artists consisting of followers of P. Benkov who brought the trends of impressionism to the painting of Uzbekistan.

Since the mid-1920s the pressure of the Communist ideology has been increasing and artists have had to change their creative principles and approaches by checking with the authorities. The state's policy in the field of art was aimed at establishing such postulates as partisanship, collectivity and nationality. Repression began against artists who adhere to freedom of creativity. Two years before the opening of the exhibition "Artists of Uzbekistan "in Moscow on April 23, 1932 "the Decree on the restructuring of literary and artistic organizations" was adopted and the process of liquidation of various art groups, primarily avant-garde ones began. The fight against formalism was launched in the country and the above-mentioned exhibition was the last of its kind. Some of the paintings displayed at the exhibition "Artists of Uzbekistan" were left in the collection of the Moscow State Museum of the peoples of the East. These works were kept in the secondary scientific and auxiliary Fund of the Museum for many years were not exposed to the public.

Violent disputes over various trends of traditions and schools (avant-garde, impressionism, realism) which unfolded in the 1920s by the mid-1930s weakened under the ideological pressure of social realism. Due to its distance from the center Uzbekistan has become a kind of reserve for such trends and trends in the fine arts as the avant-garde and impressionism. But when the wave of struggle against formalism swept over Uzbekistan artists were forced to comply with the requirements set. And yet although they moved to the position of social realism in their works there are not only features that meet the requirements of social realism but also some features of

avant-garde. The subject matter in the fine arts has changed: it has appeared story compositions related to modern times such as multi-figure works reflecting field work (cotton picking) holidays, portraits of workers and dehkans. In the genre of portraiture attention was paid not so much to the person portrayed as to the creation of a generalized image of a contemporary. In the works of many artists forced to work in line with social realism their inner sense of discontent is noticeable. In the works of A. Volkov and U. Tansykbayev tried to paint pictures in accordance with the artistic method of social realism the closeness of their work to the avant-garde in artistic form and color is noticeable.

Such paintings by Alexander Volkov as "Self-Portrait", "Mountain landscape", "Factory workers", "construction of a brick factory", "Foundry work at the Selmash plant", "Blue day" created in the 1920s-1930s but not shown until now can serve to reveal the originality of his work and deserve a separate study. The artist has been searching for his creative path for many years. In his paintings "The sound of camel bells" (1917-1924), "Camel Caravan" (1920) in the guise of heroes — Eastern people in the movement of carts and camels, the rhythm of life is clearly felt. In the composition of A. Volkov's paintings the harmonious arrangement of details (caravan, carts, musicians, etc.) is particularly highlighted. The artist working on the form and color scheme of paintings first wrote sketches for each cycle of works again and again referring to the chosen topic. The result of creative search was the creation of such paintings as "Pomegranate teahouse" (State Tretyakov gallery Moscow, Russia), "Dance", "Evening in Bukhara" (state Museum of art of Uzbekistan). Summing up the many years of creative search that preceded the creation of these paintings A. Volkov wrote in his article that these searches laid the Foundation for achieving the individuality of his painting of artistic skill (2, p. 18).

Decorative Convention serves as the basis for Ural Tansykbayev's paintings. His works ranging from small sketches to large paintings have taken their rightful place among the exhibits of various museums. His works are considered examples of a kind of national art school of the early twentieth century. The artist's works created in the late 1920s and early 1930s indicate that he reached creative maturity and inner potential that served as the basis for further creative development of the artist. A. Tansykbayev found his own unique writing style and showed incredible creative activity. Due to many internal and external factors U. Tansykbayev quickly learned the basics of avant-garde art.

Such paintings as "Foundry works", "Factory workers" are radically different from his other works. Despite the socialist theme in these works the former painting techniques of A. Volkov are felt: bright juicy colors, flatness of style and static compositional solutions. Still Life of U. Tansykbayev "Kumgan" (1935) which is stored in the Nukus state Museum of art named after I. Savitsky belongs to a number of unique works in terms of color and artistic solutions. Although this still life resembles the works of A. Matisse, its Eastern colorfulness and symbolism is marked by the seal of the unique and incomparable style of U. Tansykbayev. The alternation in the arrangement of the opposite: a warm fire and the cold blue tones — gives it a brightness. The background is multi-colored embroidery. This kind of image is almost never found in the future of his work. The plot of "Streets of Tashkent" by U. Tansykbayev (1935) is made in two versions one of which is stored in the State Museum of arts of Uzbekistan and the second — in the Nukus state Museum of arts named After I. Savitsky. In the paintings, the street appears in different angles. The first work shows trees along the road and shows the end of the street while the

second shows only part of the same street. These works are similar in color scheme: they have a common gray scale and are written in an impressionist manner.

In his works Alexander Nikolaev (UstoMumin) whose work is distinguished by a special grace harmoniously combined the features of the art of the European Renaissance of Russian iconography and Eastern philosophical views. UstoMumin drew on the deep foundations of fine art and created new traditions based on the legacy of the past. UstoMumin's work "Rowers" (from the Fund of the State Museum of arts of Uzbekistan) is painted in unusual style for his work and differs from his other works. The work is done with bright colors applied with a brush in separate broad strokes. The work is fragmentary and not fully depicted. At the bow of the boat is one standing man in a boat-three bare-chested rower. Water is shown by horizontal lines consisting of immiscible paint strokes from blue to turquoise shades. The picture is supplemented with an image of mountains and the sky. The figures of the rowers are not written graphically in the manner typical for UstoMumin but in broad spots of color. However, the arrangement of images and color scheme shows that this work belongs to the brush of UstoMumin.

Comparing the works of the above-mentioned masters makes it possible to determine the goals of creative searches of artists of that time and show the originality of their styles. These searches serve as a vivid example for contemporary artists. And Museum collections give an opportunity to take a fresh look at the work of artists of the 1920s and 1930s and understand how wide the traditions of Uzbek fine art are. But the main thing is that these artists managed to harmoniously combine the traditions of the East and the West in their works which is very important for modern art.

Although the heyday of fine art at the beginning of the last century takes a very short period, it also has a fruitful influence on modern art. The political system of the 1930s affected not only the fine arts but also other areas of art. Despite the fact that a lot of time has passed since then the art of the beginning of the last century has changed to a certain extent its philosophical artistic, ideological, formal and other features continues to live in the work of modern artists. The appeal to the art of the beginning of the last century can be observed in the fine arts of the 1980s that is after the change of several generations.

In 1988 at the initiative of a group of artists who expressed in their works the public mood caused by the processes of reconstruction the "Association 23" was created. The members of the organization were B. Zhalolov, Zh. Umarbekov, A. Mirzaev, A. Nur, V. Akhunov, A. Turdiev, A. Sharzhanov, K. Yusupov, E. Mansurov, M. Tokhtaev, N. Shin, B. Boboev, G. Kodirov, B. Makhkamov (Tashkent), U. Boltaboyev, Sh. Toshboev, S. Alibekov (Ferghana), A. Krikis, A. Isaev (Samarkand), M. Abdullayev, Z. Saidzhonov, R. Shodiev (Bukhara). Later the members of the Association joined by M. Smith and F. Ahmadaliev. In the Declaration adopted by the Association it was declared that schematism is a superficial reflection of the truth, etc. The text of the Declaration also noted the need to pay special attention to the creative development of the fine arts of Uzbekistan in the 1920s and 1930s. "Association 23" continued to operate until 1992. During this time, he organized and held about ten exhibitions in Tashkent and Samarkand. The works created during this period make it possible to trace the formation of plastic traditions in the fine arts. These works marked the beginning of the development of fine art in the years of independence (3, p. 14-16).

Since the 1990s, changing socio-economic conditions have led to a renewal of not only society but also the consciousness of artists. New trends in the fine arts of Uzbekistan were expressed on the one hand in the rejection of the principles of social realism, on the other hand, in increased attention to the cultural heritage and traditional culture of Uzbekistan and their interpretation. The influence of works created at the beginning of the last century on modern fine art and their connection can be seen in addition to the works of the above-mentioned painters and in the works of such artists as H. Mirzaakhmedov A. Ikromzhonov, H. Zagonov, M. Karabayev, T. Karimov, B. Ismoilov, D. Rahmankova.

Painting by A. Mirzaev "Connection of times. Images" (2004) was undoubtedly influenced by the image of a teenager in UstoMumin's "Quail lover" (1928). Next to the teenager is a modern woman. Zh. Umarbekov's painting "The Youth of Tahir and Zuhra "(2005) shows a stylistic affinity with the work of UstoMumin "The Boy in the fur hat". And in the characters of the work of Zh. Umarbekova's "Teenagers" (2005) also shows a stylistic affinity. The painting shows three teenagers holding birds in the lap of nature. The similarity of this work is most noticeable in the compositional structure and the image of the characters in this work the artist used brighter colors. In the landscapes of Zh. Umarbekov written at the beginning of his creative activity the compositional structure characteristic of the work of U. Tansykbayev and in further works-compositions characteristic of the work of A. Volkov. The stylistic and semantic meanings inherent in the works of the beginning of the last century are clearly visible in the works of today's artists. They create unique paintings through the use of new artistic means. But in the works of modern artists there are almost no paintings close to the technical skill of UstoMumin that there are no works written on paper in tempera and resembling miniature works.

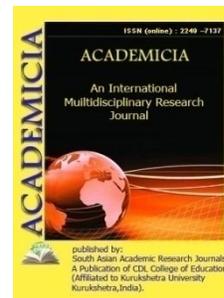

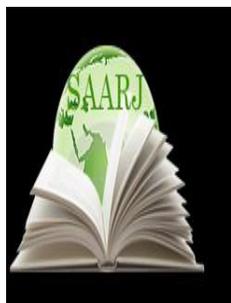

An artist of any era based on his own vision and the requirements of the time is searching for the appropriate form and style. The interest in the philosophy of art in the work of artists of that time testifies to the harmony of the work of today's generation of artists with the art of the 1920s and 1930s. In the process of understanding historical and political changes and gaining national identity, artists turn to the trends of the avant-garde in the fine arts and to the aesthetics of the East in order to study the artistic heritage.

CONCLUSION

In conclusion, it should be noted that many works created in the 1920s and 1930s and still remain unknown to the public are important evidence that in the fine arts of Uzbekistan in the 1920s, under the influence of Western modernism, Russian avant-garde, Eastern decorative art and many other trends a peculiar phenomenon called "Uzbek avant-garde" was born. The fine arts of Uzbekistan in the 1920s and 1930s, along with a harmonious combination of Western and Eastern art traditions, were influenced by the trends of realism and impressionism. On this basis a kind of local painting appeared in Uzbekistan. Due to the remoteness of Uzbekistan from the center in the 20s of the last centuries the traditions of the avant-garde and other trends continued to live in the fine arts. Despite the triumph of the canons of social realism in 1928-1929 the art of avant-garde and impressionism continued to exist almost until 1935. The traditions of the "Uzbek avant-garde" have not died out after almost a century and still have a fruitful influence on painting and graphics. They are clearly manifested in the rapidly developing process of modern art.

REVIEW ON DETERMINATION OF HEAVY METALS IN PAN MASALA/SMOKELESS TOBACCO

Ms. Rinka Juneja*

*SOP, Sanskriti University,
Mathura, Uttar Pradesh, INDIA

Email id: rinka.pharmacy@sanskriti.edu.in

ABSTRACT

This study is based on an examination of numerous studies on the topic of heavy metal in pan masala/smokeless tobacco. Heavy metals have been utilized in a variety of pan masala/smokeless tobacco products. The acid-digestion procedure is utilized to prepare samples in the majority of tests. Atomic Absorption Spectrometry is the most frequently employed confirmatory method, although inductively coupled plasma Atomic Emission Spectrometry was utilized in certain studies. According to studies, the use of some cosmetic products exposes users to tiny quantities of dangerous heavy metals, which may create health issues if they remain in biological processes over time. Certain companies went beyond the regulations and utilized high quantities of heavy metal impurities, causing toxicity. The studies examined the concentrations of different metals as well as the concentration of a metal in various brands. The investigations performed to evaluate the health hazards connected with its toxicity. It was also found that, although the usage of heavy metals in some brands is below the legal limit, they nevertheless represent a considerable risk to people. Both of these studies are being performed in order to identify which brands of pan masala offered in our market are in violation of the regulations and to bring to the notice of the authorities. As well as educating young people, both men and women, of the risks it presents to their health.

KEYWORDS: *Blood, Heavy Metals, Lead, Pan Masala, People, Poisoning, Symptoms, Smokeless Tobacco, Toxicity.*

INTRODUCTION

Forensic research is the study of crime using empirical concepts, methods, and procedures. Anything contentious or disputed is a lesser known definition of the term "forensic". Some ideas in forensic science include.

- The application of science to the resolution of legal issues.
- A scientific study with the purpose of reaching a judgment in a court of law. Saying something was forensically determined, for example, indicates that the evidence was collected scientifically with the purpose of being examined (and argued) in a court of law[1].

Forensic chemistry utilizes chemical ideas and concepts in a legal setting to evaluate forensic data. Forensic chemistry is concerned with the physical and chemical characteristics of a substance. Unknown items found at a crime scene may be identified with the assistance of a forensic chemical expert. To assist in the identification of unknown chemicals, specialists in this field utilize a range of methods and equipment. Examples of these techniques include superior fluid chromatography, gas chromatography, mass spectrometry, nuclear ingestion spectroscopy, Fourier change infrared spectroscopy, and thin layer chromatography. Because of the potentially hazardous nature of some devices and the vast number of unknown chemicals that may be discovered at a scene, it is essential to use a range of methods. In order to preserve proof, forensic chemists favor non-destructive methods. Chemistry researchers, especially their forensic colleagues, testify in court as expert witnesses to their findings[2].

Areca nut, slaked lime, catechu, and other flavour ingredients are mixed in Pan Masala (PM) (PM). It is widely accessible and utilized by individuals from all walks of life in India. Since it promotes sibling chromatin exchange and chromatin abnormalities, it is geno-toxic. It is a major cause of oral sub mucous fibrosis in humans, which also leads to oral cancer. It induces neoplastic tumors in the lungs, liver, and stomach in laboratory animals. It is hepatotoxic, producing an increase in enzyme levels as well as improper glucose and lipid metabolism. It produces increased creatinine and sperm abnormalities in the kidneys and testes, respectively. PM is a highly hazardous substance that affects virtually all organ systems, therefore a national policy banning the production, transportation, selling, and marketing of PM is urgently required. Betel quid pan masala (PM) is betel leaves combined with areca nut, while pan masala is tobacco mixed with areca nut, catechu, and lime and blended with gulkhand. This medicines are frequently utilized by both young and old individuals. To explore the link between long-term PM consumption and health concerns, a preliminary toxicity and chemical analytical assessment conducted undertaken[3].

A main example of Indian PM contained 13 polycyclic sweet-smelling hydrocarbons (PAHs), benzene hexa chloride (BHC), 1,1-trichloroethane, and 2, 2, bis-pchlorophenyl isomers. Furthermore, nitrosamine, heavy metals (lead, cadmium, nickel), and pesticide toxins have been shown to be hazardous in PM. An increase in the rate of sister chromatid exchange (SCE) and chromosomal abnormalities in mouse bone marrow cells from the Chinese hamster ovary (CHO) cell line indicates PM components' geno-harmful potential. Different PM brands' aqueous and ethanol extracts were found to have mutagenic capabilities. According to early studies, PM has the potential to be carcinogenic, tumorigenic, teratogenic, and mutagenic. As a consequence, the toxicology of PM effects in unadulterated purebred Swiss mice was studied using various PM brands. The use of smokeless tobacco, which is commonly used all over the world, produces oral

sub mucosal fibrosis (OSMF), a long-term and debilitating illness of the oral cavity with the potential for danger. This study will concentrate on the intake of smokeless tobacco, such as dish and gutkha, as well as the function of these chemicals in the recruitment of OSMF and, eventually, oral malignant growth. The list of articles to be assessed was created using PubMed, Scopus, and Google Scholar's reference finding tools. The fibrosis of the submucosal tissue is produced by continuous biting of the dish and gulping of gutkha. OSMF is caused by a number of causes, the most well-known of which are smokeless tobacco and its additives, such as betel quid, areca nuts, and slaked lime, which are used in container and gutkha tobacco[4].

In South Asian countries, women are more likely than males to get oral cancer. For human oral epithelial cells, the slaked lime in the betel quid, whether with or without areca nut, exhibits cancer-causing and geno-harmful effects. In smokeless tobacco, chemicals such as 3-(methylnitrosamino) - proprionitrile, nitrosamines, and nicotine induce fibroblast, deoxyribonucleic corrosive (DNA), and deoxyribonucleic corrosive (RNA) annihilation, as well as cancer-causing effects in tobacco users' mouths. The metabolic enactment of nitrosamine in tobacco by cytochrome P450 molecules may result in the improvement of N-nitrosornicotine, a significant cancer-causing agent, and micronuclei, which are indicators of genotoxicity. These results result in increased DNA damage and, ultimately, oral disease. The betel leaf is used to package a variety of fixings. Tobacco, nuts, stale lime, tastes, and areca nut wrapped in betel quid are the most frequently utilized container fixes. In both developed and developing countries, tobacco is frequently used alongside other drugs. A tobacco business developed in India approximately three decades ago, producing gutkha, which is made composed of catechu, spices, chewing tobacco, areca nut, and slaked lime wrapped in pouches or tins[5].

LITERATURE REVIEW

J. Vini Mary Antony *et al.* explained that the investigation's primary aim was to discover clue metals in the largest generally names were selected predicated upon people's widespread usage of publicly accessible items on the Internet. All cases were tested for follow metals, such as Cadmium (Cd), Nickel (Ni), Chromium (Cr), Lead (Pb), and Arsenic (Ar), using an AES method. The total metal focuses for cadmium, chromium, arsenic, nickel, and lead were all less than 0.1 mg/kg in each of the four instances. The testing may show that the amounts of following metals in the examples above, such as Cadmium (Cd), Nickel (Ni), Chromium (Cr), Lead (Pb), and Arsenic (Ar), are considerably less harmful and unlikely to cause sickness[6].

S. K. Nigamet *al.* presented in the article that tobacco is mixed with areca nut, catechu, and lime in betel quid dish pan masala (PM), whereas skillet masala is tobacco combined with areca nut, catechu, and lime then blended with gulkhanda. This medication is frequently utilized by both young and elderly individuals equally. A preliminary chemical study and poisonousness assessment of PM in mice were done to explore the connection between long-term PM exposure and health concerns. Compound assessment of various types of PM was done using HPLC, GLC, AAS, ES, TLC, GCMS, and sequential extraction for PAH, toxins, metals and minerals, electrolytes, medicines, and xenobiotics. Throughout the IP and PO regimens, trained Swiss mice were utilized to evaluate ethanolic PM extricates. In Rajaniganda and Pan Parag Zarda, which are regarded xenobiotics for pre-harmful damage, PAH levels were somewhat higher ($p < 0.01$). High fixations ($p < 0.01$) of DDT and BHC isomers, which mainly impact nerves and muscles, were also found in PM. The increased metal and mineral content of PM promotes considerable oral fibrosis. PM contains a high concentration of chemicals, particularly nicotine, which may

cause issues in the gastrointestinal system. In mice fed various amounts of simple and mixed PM for 16 and 90 days, researchers observed no impact on blood and organ loads (kidney, heart, spleen, and liver), but they did detect limited testis. The mice that were administered the PM-Zarda combo and cared for it for 90 days had the greatest chromosomal damage in their bone marrow. Among the chromosomal abnormalities found were ploidy, misfortune, parts, openings, erasures, and trades in ring chromosomes. The PM caused sperm head abnormalities (limited, obtuse, three-sided, and banana morphologies), as well as odd, undefined, tailless, and simple sperm, with the greatest impact in the three-month-care group. The levels of glucose, cholesterol, and protein in the testis were all found to be substantially higher ($p < 0.01$). In the 16-day local area, red blood corpuscles (RBC), white blood corpuscles (WBC), hemoglobin, and erythrocyte sedimentation were unaffected[7].

S. Verma *et al.* articulated that convergences of seven main metals, namely Zn, Fe, Cu, Cr, Pb, Ni, and Cd, were resolved in 30 samples of diverse brands of five distinct tobacco item categories easily accessible in Indian commercial sectors. Cigarettes, stogies, and bidi are the three kinds of tobacco consumed by smoking, while biting tobacco and snuff are ingested independently by biting. The metal material was intended to accept both smoking and non-smoking kinds, brands, and components. In the non-smoking area, biting tobacco samples showed more heavy metals than snuff samples. When compared to cigarettes and stogies, Bidi includes the least amount of metal content of all the smoking methods. This could be ascribed to the addition of metal to completed items during both material and actual processing; bidi is the most basic and smallest component. Because each brand's assembly innovations are distinctive and recognizable, intra-brand differences often imply something very similar. With a few exceptions, the findings are virtually indistinguishable from previous records. Creator recognize that, despite the negative consequences of direct tobacco smoking on human health, the smoke and debris produced may be a significant booster of metal load in the ground, air, and water[8].

O. E. Orisakwe *et al.* pointed to the fact that smokeless tobacco is gaining popularity as a healthier alternative to smoking. Data on the negative consequences of smokeless tobacco is limited in Nigeria, as it is in much of Sub-Saharan Africa. This study analyzes the significant metal hazards of the smokeless tobacco types widely accessible in Nigeria. A commercial container convention was utilized to investigate thirty Nigerian smokeless tobacco variants. By adding 10 mL of a combination of nitric and hydrochloric acids (HCl: HNO₃, 3:1) to the blend and drying it, assimilation was enhanced. After that, the mixture was combined and separated with 20 mL deionized water. The groups of lead, cadmium, chromium, cobalt, and nickel in the filtrate, which was set up in a standard volumetric carafe, were determined using nuclear ingestion spectrophotometry. The dietary admittance and the aim danger remaining were both handled. Nickel, cobalt, besides chromium had convergences of 0.02-0.07 g/g, 0.01-0.03 g/g, then 2.77-11.40 g/g, respectively, while cadmium with lead had convergences of 0.00-2.48 and 0.01-0.17 g/g, respectively. Individual admissions for nickel, cobalt, besides chromium were from 2-7 g/day, 1-3 g/day, and then 277-1140 g/day. Lead and cadmium admissions were usually 0-248 and 1-17 g/day, respectively. Even if there was no apparent danger when each element was evaluated and handled individually, the perceived hazard may be increased when all heavy metals are taken into consideration. Heavy metal is common in Nigerian smokeless tobacco, which may be harmful to people's health[9].

DISCUSSION

Metallic components having a thickness higher than that of water are referred to as significant metals. Due to the assumption that substantiality and poisonousness are related, heavy metals too include metalloids like arsenic, which may cause damage at low levels of exposure. Environmental poisoning of these metals has lately been a rising issue for the climate and global well-being. Human openness has also grown as a consequence of a substantial growth in their usage in a range of commercial, agricultural, homebrew, and specialist applications. The climate has identified geogenic, mining, ranger service, synthetic, indigenous effluents, and air sources as wellsprings of heavy metals. Mines, foundries, and smelters, as well as other metal-based assembly activities, are especially polluted. According to research, metals including copper (Cu), cobalt (Co), iron (Fe), chromium (Cr), manganese (Mn), magnesium (Mg), nickel (Ni), molybdenum (Mo), zinc (Zn) and selenium (Se) are necessary nutrients for a range of biochemical and physiological processes. Insufficiency infections and diseases are caused by a lack of key micronutrients. Fundamental heavy metals perform biochemical and physiological roles in plants and animals. They are key components of many primary compounds and play a vital part in oxidation-reduction processes. Copper is needed as a cofactor for a few oxidative pressure-related proteins, including superoxide dismutase, catalase, cytochrome oxidases, peroxidase, monoamine oxidase, ferroxidases, plus dopamine-monoxygenase. As a consequence, it's an essential supplement for metalloenzymes involved in hemoglobin creation, carb digesting, catecholamine biosynthesis, and collagen, elastin, and hair keratin cross-connection. Cu proenzymes engaged in redox processes take use of copper's propensity to cycle between an oxidized state, Cu (II), and a deficient state, Cu (I). Nonetheless, since the shift from Cu (II) to Cu (I) would usher in the era of superoxide and hydroxyl radicals, is it conceivable that copper is poisonous? Excessive copper toxicity has also been related to cell damage in humans, leading to Wilson disease. A few extra necessary components, such as copper, are needed for natural function; however, excessive quantities of these metals damage cells and tissues, resulting in a range of undesirable consequences and human diseases. There is a small range of fixations amid beneficial and harmful effects for particular components, such chromium and copper. Different metals with no realized organic capacities incorporate uranium (U), vanadium (V), titanium (Ti), tin (Sn), thallium (Tl), tellurium (Te), strontium (Sr), silver (Ag), platinum (Pt), mercury (Hg), lithium (Li), lead (Pb), indium (In), nickel (Ni), gold (Au), germanium (Ge), gallium (Ga), cadmium (Cd), bismuth (Bi), beryllium (Be), barium (Ba), arsenic (As), antimony (Sb), and aluminum (Al) have no settled natural capacities and are considered as superfluous metals. Various instruments, some of which are not well-known, mix heavy metal-induced harm and cancer-causing properties. Each metal, on the other hand, is believed to guarantee unique qualities besides physical including chemical aspects which add to its own toxicological systems of exploit. The research focuses at the environmental effect, advancement, and usage of arsenic, cadmium, chromium, lead, and mercury, as well as the potential for humanity permeability plus atomic pathways of genotoxicity, toxicity, plus cancer-causing nature. As poisonous centralizations of heavy metals accumulate in the body's delicate tissues, excessive metal damage ensues. Depending on the metal burned-through, the side symptoms and actual aftereffects of substantial metal harmfulness vary. Several important metals, including as zinc, copper, chromium, iron, and manganese, are needed in tiny quantities for physical work. Nonetheless, if the metals collect in the body in high enough quantity to foundation damage, serious injury will follow. Pollution, air or water pollutants, food variations,

medicines, poorly covered food holders, and the use of toxic paints are all potential of inflicting severe metal damage.

Lead production line representatives, welders, battery plant workers, then fasteners can be exposed to Pb if suitable insurance is not obtained. While Pb is contained in the bones, it may damage the structure of any organ. Lead poisoning has various consequences based on the age of the individual and the quantity of lead they've been exposed to. The severity of lead poisoning in children includes a broad spectrum of symptoms. Individuals who have been poisoned are unable to exhibit any signs or symptoms. Side effects typically emerge after three to a month and a half of therapy. Overexposure to lead leads youngsters to become less lively, rebellious, argumentative, and moderate (lazy). Migraines, tiredness, stomach discomfort, anorexia, blockage, slurred speech, changes in renal capacity, notably large amounts of protein in the blood, plus an oddly insipid complexion (paleness) owing to a lack of iron in the red platelets are just a few of the symptoms (pallor). Neurological indications linked with lead poisoning include a reduced ability to regulate intentional signals (ataxia), enlargement of the optic nerve, seizures, spasms, cerebrum damage, and impaired cognition. Any of the children who are affected have learning or behavioral difficulties, as well as mental obstacles and particular impairments in language, perception, coordination, conduct, and academic performance. In certain circumstances, manifestations may be dangerous. Lead poisoning in adults may cause greater circulatory strain and harm to the reproductive organs. Fever, migraines, sickness, lethargy (fatigue), regurgitating, anorexia (a lack of hunger), stomach pain, clogging, knee pain, loss of recently learned abilities, incoordination, languor, trouble sleeping (a sleeping disorder), fractiousness, hindered cognition, mental trips, or seizures are a few of the additional signs that can occur. Low iron levels in red platelets (paleness), fringe neuropathy, and, in rare instances, cerebrum discomfort may also be signs of the illness (encephalopathy). Individuals who have been affected have experienced decreased endurance besides muscular strength, renal disappointment, wrist drop, plus social changes like hostility, sorrow, or uneasiness. In some instances, the adverse effects may be hazardous. It's also found in things like blood, nails, sweat, spit, and bosom milk.

Rendering to the World Health Organization (WHO), adults and children are exposed to 25g/kg/week of lead. Net intake of lead is 40 percent from dietary sources, 10 percent from drinking water + food, then up to half via inward breath of Pb compounds (JECFA) (JECFA). This implies that with a daily intake of 5 g/kg bw, lead maintenance in the body produces an increase in blood Pb levels, impacting the hematological and immunological systems.

Cadmium is utilized in a number of applications, including electroplating, high-capacity batteries, fume lamps, and a few patches. It's conceivable that the signs don't show until two or four hours after the doors open. Inordinate openness may result in weakness, headaches, sickness, vomiting, stomach cramps, loose stools, and fever. Furthermore, emphysema (reformist reduction of lung function), pneumonic edema (abnormal buildup of fluids within the lungs), and windedness (dyspnea) may be present. Increased salivation, tooth yellowing, a random heartbeat (tachycardia), reduced degrees of iron in red platelets (weakness), light blue coloring of the mucous plus skin films, or a lessened sense of smell are all potential side effects in certain individuals (anosmia) (anosmia). People with cadmium poisoning may also have abnormally high intensities of protein in their urine, minor variations in liver occupation, or bone relaxing

owing to the unexpected function of the kidney trenches (renal cylindrical fracture) (renal cylindrical breakage).

According to the WHO-JECFA, individuals should eat 3.5 g/kg bw/week of cadmium. A criterion of 0.19-0.99 g/kg bw/day is set in light of the collecting characteristic plus the long natural 1/2-life of Cd. For a 60-kg individual, this amounts to 30 g Cd per day. The amount of Cd absorbed after oral infiltration is affected by physiological limits like age plus the quantity of Zn, Ca, besides Fe deposited in the physique. Rendering to the board of trustees, disc utilization from daily food and drink is approximately 12-25 g, of which 0.6-1.3 g/day is actually consumed, and net inhalator intake from the climate is 0.149 g/day, from which 0.04 g/day is truly swallowed.

Arsenic is a synthetic chemical that is used to produce pesticides. Arsenic gas has a few commercial applications. Excessive exposure may induce migraines, lethargy, wretchedness, seizures, and even death. Injuries to the cerebrum (encephalopathy), fringe neuropathy (nerve breaking at the borders), precapillary hemorrhages in the white matter, plus degradation or insufficiency of the oily casings surrounding the nerve strands are all frequent neurological symptoms. Skin problems include cross-over white groupings on the fingernails with substantial liquid development in the fragile layers of tissue beneath the skin. Gastrointestinal indications include a flu-like illness, which is characterized by retching, fever, stomach discomfort, and sometimes bloody loose fasces. Hemolysis (the breakdown of hemoglobin in red platelets), fragility (platelets), plus a low pulse are just a few of the symptoms (hypotension). Anyone may have a garlic-like taste that is noticeable on their breath. Shortcomings, body pains, chills, and fever are all typical symptoms of continuing damage. Arsenic poisoning symptoms typically emerge two to two months after the opening.

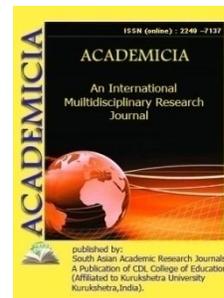

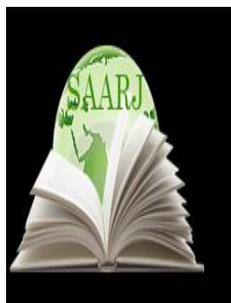

CONCLUSION

The results of all studies on heavy metal toxicity in pan masala/smokeless tobacco indicate that hazardous heavy metal content was found in pan masala in different amounts, with some items above the WHO's permitted limit, possibly having fatal consequences on human health. Pan Masala, on the other hand, is just as hazardous, according to health experts, to a human body, if not more. The only difference between the two is that gutka contains tobacco in it whereas pan masala does not. Experts claim that about 40 chemicals contained in these materials, in addition to nicotine, are considered to be toxic. These materials, according to studies, contain significant amounts of toxic heavy metals such as lead, copper, and zinc, which are possibly more hazardous than cigarettes. Many of these heavy metals harm the kidneys and the liver. A person may potentially develop liver cirrhosis or acute tubular necrosis, a kidney illness defined by tubular cell damage. Precancerous lesions (little white spots) and ulcers in the mouth or on the tongue are symptoms of persistent copper poisoning, opening the mouth completely. But are not only carcinogenic, they also have the potential to induce cardiac problems. Additionally, pregnant women who consume these foods may have a shorter gestation time, a greater chance of stillbirth, and a lower birth weight for their kid. Toxic metals may damage DNA directly or indirectly, raising the risk of cancer. Heavy metals wreak havoc on physiological processes in two ways: first, they build up and impede functioning in key organs and glands, and second, they displace dietary elements that are necessary for biological function. The toxic ingredient of pan masala is more hazardous than cigarettes. Pan Masala products should be banned since heavy metals are readily absorbed by the skin after long term usage. As a consequence, it is highly

recommended that smokeless cigarette products be tested for heavy metal requirements prior to commercialization.

A STUDY ON BIOMASS ENERGY RESOURCES, POTENTIAL, RENOVATION AND RULE IN INDIA

Dr Durgesh Wadhwa*

*SBAS, Sanskriti University,
Mathura, Uttar Pradesh, INDIA
Email id: hodchem@sanskriti.edu.in

ABSTRACT

The biofuel production resource, potential, energy conversion, and strategy for promotion adopted by the Indian government are addressed in this message. As of March 31, 2013, India's total installed capacity for electricity production was 2666GW. Renewable energy accounts for 10% of total generation, with biomass accounting for 12% of total power production. India has a surplus of agricultural and forest land, resulting in an annual biomass availability of approximately 500 million metric tons. The overall capacity of biomass power production in India is 17,000 MW. At the moment, 2660 MW of electricity is produced, with 1600 MW coming from cogeneration. This study also discusses the different types of biomass in India. According to the study, India has a huge potential for bio mass feed supply from several sources. The Indian government implemented several policies and initiatives for biomass power production. Such regulations have covered the whole biomass energy industry, including biogas, biodiesel, and other biofuels. With strategic strategy and program, the Government of India has concentrated on the deployment and promotion of biomass energy, which is a significant part of this research study.

KEYWORDS: *Biomass, Energy, India, Renewable, Power.*

INTRODUCTION

Biomass energy production has been encouraged in many developed and developing nations via well-designed laws and financial incentives. Feed-in tariff systems were established by several governments as a policy tool to encourage investment in the renewable energy industry. India is a rapidly expanding nation, and its energy consumption is rising in tandem with its economic and industrial development[1]. Oil and coal are the primary sources of energy for India. India's

energy consumption from conventional sources is 150 GW (coal, fossil fuels, and oil), 4.78 GW (nuclear energy), 29.40 GW (hydropower), and 26.52 GW (sustainable sources). Fig. 1 illustrates India's large percentage of different energy resources as of March 31, 2013.

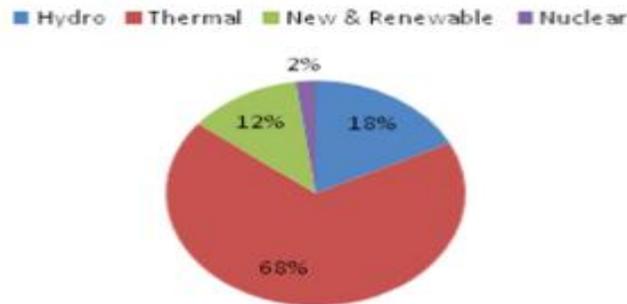

Figure 1: Illustrate the percentage share of various energy resources in India up to 31st March 2013

Due to a lack of knowledge and acceptance of renewable energy sources by electricity consumers in India, non-renewable fuels have been utilized often. There are many drawbacks to utilizing nonrenewable energy resources, including their limited availability in the environment, lack of environmental friendliness, and cost, since India imports all of these types of energy supplies[1]. As a result, it's critical to look into a variety of alternative sustainable energy sources. Biomass energy is one of the non-conventional sources that can supply grid-quality electricity. Biomass is a sustainable energy source that is made up of a complex mixture of carbon, nitrogen, hydrogen, and oxygen[2]. This content's biomass is derived from live or dead plants, agricultural residues, timber, and agro-based industries. In India, biomass energy consumption has been practiced from ancient times. It's found in cow dung cake, firewood, husk, and a variety of other natural feedstocks. Direct use of biomass in solid form, on the other hand, was neither safe nor painless since it produced a lot of smoke and ash[3].

As a result, the Indian government is encouraging biogas plants since they emit no smoke and are therefore pollution-free. Many incentives are available for the construction of a biogas plant. New biomass gasification technology is being developed. Technology has been developed that transforms biomass into more efficient syngas. Following the evaluation of biomass's potential, technology applied biological and thermochemical conversions in order to use biomass to generate fuel gases[4]. These fuel gases may be utilized to generate electricity. Biomass-based energy production is currently significantly on the increase. It is mostly due to rising electricity consumption in rural areas, as well as a lack of alternative fuel options. It is now critical to supply energy for civilization's progress via biomass. Global warming, resource depletion, and other worldwide problems have led to the choice of sustainable development in the current situation. In the electricity industry, one of the most important green sources is renewable energy, such as biomass[5].

The technique used by MNRE to provide subsidies is based on co-generation and biomass gasification generation. The biomass potential of India is identified state by state in this study. The different types of biomass found in India, as well as their conversion methods, are briefly discussed. The scope, potential, and situation of biomass power deployment in India were addressed in this article. It is stated that India has a policy of giving subsidies for biomass

electricity. With strategic strategy and program, the Indian government has concentrated on the deployment and development of biomass energy, which is a significant part of this communication.

India's biomass resources are enormous

Biomass is described as a bio residue produced by water-based vegetation, forest or organic waste, agricultural production waste, or trash from the agro- or food-processing industries. In India, many biomass resources are accessible in various forms. Grass, woody plants, fruits, vegetables, manures, and aquatic plants are only a few examples of how they are categorized in nature. Algae and Jatropha are currently utilized in the production of bio-diesel[6]. Agricultural crop residue, energy plantation, and municipal and industrial waste are the three main sources of biomass energy. The different classifications of biomass available in India are shown in Figure 2.

Residue of agricultural crop

Because India has such a large agricultural land area, it produces a lot of residue. These residues have the potential to be used as a biomass feedstock for energy production. Agricultural residue refers to all organic components generated as a by-product of the processing harvesting of agricultural crops[7]. There are two types of agricultural residues: main and secondary residues. Field based or primary residue is that which is acquired in the field at the time of yield, while processing based or secondary residue is that which is assembled during processing. Primary residues include rice straw, sugar cane tops, and bagasse, while secondary residues include rice husk and bagasse. Animal feed, fertilizers, and other products are made from primary residues. As a result, its energy use potential is limited. Secondary residues, on the other hand, are abundant at the yielding site and may be confined as an energy source.

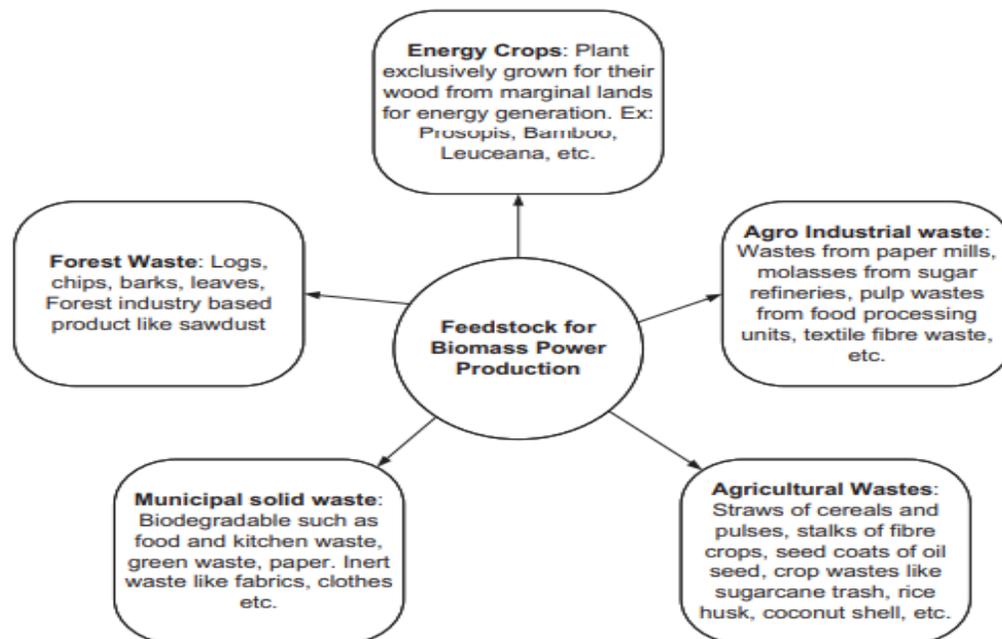

Figure 2: Illustrate the diagram shows the classification of available biomass resources in India

Agricultural feed-stocks-energy plantation

Cattle and animals thrive on a big scale in India due to the vast population's reliance on agriculture. As a result, many types of biomass potential are available in Indian communities. Corn, sugarcane, cereals, pulses, rubber, and other crops have all been utilized to generate biomass power. Dry and wet biomass are residues from crop collected as biomass for energy use. These crops are distinguished by a number of characteristics that allow them to be considered as biomass potential, such as calorific value, moisture content, carbon proportion, ash content, and so on[8]. These characteristics are important for converting both wet and dry biomass into usable energy.

Large amounts of different biomass wastes are accessible in India, making biomass waste a viable fuel for biomass power generation. Bio-chemical and thermo-chemical conversion processes may be used to transform these wastes into energy fuels known as bio-fuels. Industrial wastes and wastewaters: Water and soil contamination are caused by sewage and other pollutants. Dumping may have severe consequences. Organic matter seeps into ground water or escapes to surface waterways through organic decomposition of wastes on land, spawning pollution that causes health issues and fish death. Black liquor from the paper and pulp industry, milk processing facilities, breweries, the vegetable packing business, and animal dung are all examples of discharges.

- Food sector wastes: Hotel, restaurant, and community kitchens generate a lot of waste, such as vegetable flay, stale food (e.g. uneaten bread, rice, veggies, etc.), and fruit and vegetable rejections from the dish washer. Similarly, the confectionery business generates a significant quantity of trash. Fruit and vegetable scrap, nonstandard food, pulp and fiber produced from sugar and starch extraction, filter sludge, and other solid wastes are generated by these businesses. All of these solid wastes may be used to generate biogas via anaerobic digestion. Typically, these wastes are disposed of in landfills. Fruit and vegetable waste, meat washing waste, poultry and fish cleaning waste, and wine making waste are all examples of liquid waste.
- Animal wastes: Organic matter, moisture, and ash make up the majority of animal manure. Animal dung may decompose in either an aerobic or anaerobic setting. CO_2 and stable organic molecules are generated under aerobic circumstances, whereas additional CH_4 is produced under anaerobic ones. India has a high potential for CH_4 generation owing to the increased output of animal dung, which allows for a large energy potential.
- Municipal solid trash: Each year, thousands of tons of residential garbage are collected, the overwhelming majority of which is dumped on open fields. Paper and plastic make up the majority of municipal solid trash in India, accounting for 80% of total MSW. Anaerobic digestion or indirect combustion may both be used to transform municipal solid waste into electricity. Natural decomposition produces methane and carbon dioxide in a 1:1 ratio on waste sites. These gases are extracted from the stored material, swabbed, and cleaned before being fed into IC engines or gas turbines for energy generation. In a high-rate biomass digester, the organic fractional portion of MSW may be stabilized anaerobically to produce biogas for steam and power production.
- Sewage: Comparable to other livestock manure, sewage is however a source of biomass energy. Using the anaerobic digestion process to produce biogas, energy may be extracted from sewage.

Biomass energy conversion technologies

Different feedstocks are accessible for conversion to bio-fuels including for power generating purposes, as shown by India's biomass potential. The kind and amount of biomass feedstock, as well as the environment and economic circumstances, all influence biomass conversion processes. Biomass is converted to energy utilizing two major process technologies: thermochemical and biochemical/biological. Mechanical extraction, such as rapeseed methyl ester bio-diesel, is the third method for generating energy from biomass. Pyrolysis, biomass gasification, combustion, and liquefaction are the thermal conversion processes.

Thermochemical transformation

The thermo-chemical biomass is converted is accomplished via three major processes: combustion, gasification, and pyrolysis.

- Combustion

Combustion processes of burning biomass in air to transform the chemical energy contained in biomass towards heat, mechanical power, and electricity via various processes and equipment such as furnaces, stoves, steam turbines, boilers, and so on. Although any kind of biomass may be burned, combustion is only practical for biomass with a moisture level of less than 50%, unless the biomass is pre-dried. Biomass with a high humidity is more adapted to biological conversion.

- Gasification

Gasification is the partial oxidation of biomass at extreme heat, usually in the region of 800–900 LC, to produce a combustible gas mixture. The gas generated has a low calorific value (CV) and may be immediately burned or utilized as a fuel for gas engines and gas turbines. This generated gas may be utilized as a feedstock (syngas) in the manufacture of compounds such as methanol.

- Pyrolysis

Pyrolysis is the process of converting biomass into liquid, solid, and gaseous components in the absence of oxygen. If flashing pyrolysis is utilized, pyrolysis may be used to create bio-oil, allowing for an efficiency of up to 80% in the conversion of biomass to bio-crude. The bio-oil may be utilized in engines and turbines, and it is also being explored as a feedstock for refineries. However, certain issues need to be resolved, such as corrosiveness and low thermal stability. For only certain applications, upgrading bio-oils by reducing the oxygen content and eliminating alkalis via hydrogenation and catalytic cracking of the oil may be needed.

Conversion of natural chemicals

Fermentation and biomass gasification are the two major processes utilized, with a third process produced by mechanical extraction/chemical conversion being used less often.

- Fermentation

Fermentation is widely utilized commercially to generate ethanol from sugar crops (such as sugar cane and sugar beet) and starch crops in a variety of nations (e.g. maize, wheat). The biomass is crushed down, and enzymes convert the starch to sugars, which yeast subsequently converts to ethanol. Distillation is an energy-intensive stage in the ethanol production process,

with 1000 kg of dry maize yielding approximately 450 l of ethanol. The solid waste from this procedure may be fed to cattle, and the bagasse from sugar cane can be utilized for further gasification or as a fuel for boilers.

- Anaerobic digestion is a kind of digestion that occurs in the absence of oxygen

Organic matter is immediately transformed to a gas called biogas during anaerobic digestion. It is mostly composed of methane and carbon dioxide, with minor amounts of other gases including hydrogen sulfate. Bacteria transform biomass in an anaerobic environment, producing a gas with an energy content of 20–40% of the feedstock's lower heating value.

LITERATURE REVIEW

Subhes C. Bhattacharyya studied India is home to a quarter of the population of the global total who do not have access to electricity, and approximately 40% of those who do not have access to modern energy. Despite a number of efforts and regulations aimed at assisting low-income families, this scenario persists. The administration, alarmed by the severity of the issue, has lately launched an ambitious rural electrification initiative. This article examines India's energy access issue and argues that, due to the low penetration of electricity in the poor's energy mix, rural electrification by itself is difficult to address the problem[9].

Shonali Pachauri et al. studied India and China are both in the midst of an energy transformation. Through the study of both aggregate data and nationally representative household surveys, this article analyzes the home energy transitions in different countries. In many ways, the two nations are diametrically opposed. In aggregate, China's residential energy usage is double that of India. Furthermore, in China, virtually all homes have access to electricity, while in India, almost half of rural families and 10% of urban households do not. In comparison to urban Indian homes, urban Chinese households get a higher proportion of their total energy from liquid fuels and grids (77 percent) (65 percent). Nonetheless, Indians get a somewhat higher share of their total household energy requirements from liquid and grid sources than Chinese with similar incomes at every income level. Despite these disparities, the countries' energy consumption patterns and the variables affecting a transition to modern energy are comparable. Urban homes in both countries use a disproportionately high percentage of commercial energy and are considerably further advanced in the transition to modern energy than rural households. However, because of a continuing reliance on inefficient solid fuels, which account for approximately 85 percent of rural household energy requirements in both nations, overall energy consumption in rural homes surpasses that in urban households. In addition to urbanization, income, energy costs, energy access, and local fuel supply are also important drivers of the shift in both countries[10].

DISCUSSIONS

In India, agencies and businesses are experimenting with converting various waste biomass to energy and reporting positive results. MNRE displayed a massive amount of installed capacity and excess biomass data. Thermo-chemical and bio-chemical technologies are now being utilized to transform biomass into energy. The kind of biomass conversion technology used is determined by the form of energy needed, such as heat, mechanical, or electrical energy; pyrolysis, fermentation, and mechanical extraction create liquid fuels appropriate for use as transportation fuels, and so on. Syngas was created via the gasification of biomass. Different biomass power

generating plants have been built in various Indian states to meet the country's energy needs via biomass gasification.

CONCLUSION

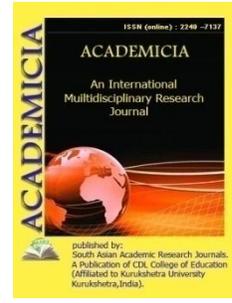

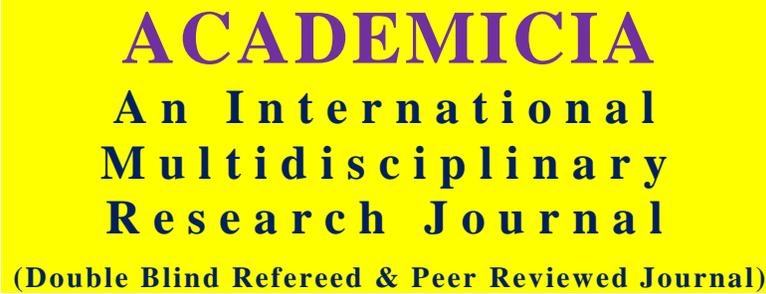

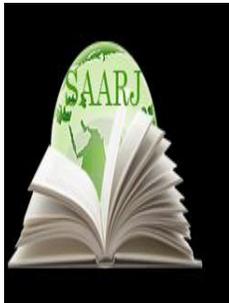

A thorough examination of biomass resources and possibilities has been provided. It may be stated that India has a great potential for exploring existing biomass and converting it to electricity. In India, there are many resources in a broad range of forms of biomass. Waste biomass may be obtained from a variety of sources, including agricultural waste, food waste, and large-scale industrial wastewaters, indicating a shift to non-conventional energy sources. Bagasse cogeneration, which utilizes sugar mill waste to generate electricity, is also used by the states. In India, a number of power generating projects based on gasification-based cogeneration rural electrification facilities have already shown to be effective. These plants have not only addressed the rural electrification issue for distant communities, where infrastructure expenses for traditional electricity might have been very expensive, but they have also reduced the cost of power production. The government's main goal in giving subsidies or financial aid is to promote the use of non-conventional energy sources, which aids in the nation's long-term growth.

ARTISTIC-PSYCHOLOGICAL DESCRIPTION AND CLASSIFICATION OF LONELINESS IN LITERATURE

Mekhriniso R. Kilicheva*

*Doctor of Philosophy (PhD),
Department of English literature and stylistics,
Bukhara State University, UZBEKISTAN
Email id: mekhrishafate@mail.ru

ABSTRACT

The article discusses literary-philosophical essence, artistic-psychological description and classification of loneliness concept. The appeal to the problems of human aloneness and the alienation of social relations is due to the increasing role of telecommunication technologies in the life of people. The relevance of this topic is due to the need for theoretical understanding of the phenomenon of loneliness of a person. Loneliness is a versatile concept. Its causes, forms, manifestations, mental states and external factors are different. Therefore, it is studied in philosophy as a concept, in psychology as a psychological state, in medicine as a disease, in tasavvuf as a means of reaching God.

KEYWORDS: *Loneliness, State, Mental, Psycho-Social, Classification, Depression, Aesthetic, Emotional*

INTRODUCTION

In most works of art it is observed that human emotions, people's mental attitude to life realities are expressed in a unique poetic, symbolic way. This, of course, is intended to increase the aesthetic impact of that work. In order to reveal the symbolic-semantic aspects of various human mental states, which are embodied in the literature and have a symbolic nature, it is important to study the socio-vital, psychological basis of their occurrence.

DISCUSSION

The problem of society and man has always been one of the main themes in the literature of the people of the world. In particular, it is emphasized and described that the isolation of a person from society, people is a tragic situation. Because loneliness condemns a person to despair,

depression, and throws him into a whirlpool of endless mental anguish. In loneliness, a person can either lose his identity or realize his identity. Because a lonely person who has not found another person to communicate with dares to talk to himself or to express his thoughts to a bird, an animal, or a tree, even if the process goes on for a long time, it can lead to mental disorder. But in solitude, a person also makes a self-examination, thinking about the factors that caused him to fall into a state of loneliness. In the process, a person speaks to himself and through his monologues confesses inwardly his faults and shortcomings, which cannot be revealed openly in front of others, and whose pride or arrogance does not allow him to speak openly.

Man differs from other beings in terms of experiencing various processes, events, situations, states depending on the nature of the natural-spiritual, divine phenomena associated with him. Therefore, the psychological phenomena and situations that a person experiences are basically grouped into three categories:

1. Mental processes - in which a person forms and understands the basic ideas about the reflection of the environment around him, on this basis, creates a system of concepts in the brain. The mental process describes the changing state of a person. It embodies a system of states that reflects the sequence of human transition from one state to another.

2. Mental traits are the most common traits in a person, which determine his personality and the level of behavior. Mental characteristics can be either normal or transient in a person. They arise through certain mental states.

3. Mental states are certain mental manifestations of a person's level of activity at any given moment and the quality of the implementation of these mental processes.

ANALYSIS

A number of words and phrases have been formed in language to express mental states, and in speech a person expresses curiosity, concentration or dispersion of thought, inability to concentrate, hesitation, thoughtfulness, and a number of other states. They are also related to human cognitive activity and are often referred to as "mental abilities".

Based on the above, human mental states can be classified as follows on the basis of various criteria. Including:

a) mental states;

b) emotional states;

c) volitional mental states.

Human psychological states are usually studied into three major groups according to whether they are **positive or negative, or specific**. It has been proven that a person's positive psychological state is influenced by joy, happiness, love and other positive aspects of daily life, while negative psychological states are caused by bad states such as grief, hatred, confrontation, conflict, obstruction, depression, despair.

Bright patterns of mental states are often observed in connection with the emotional side of life. Because in psychology, the so-called "emotional states", such as emotions, depressed or high moods, desires, etc., can change the whole psyche of a person in a certain way in a certain time.

By now, loneliness as a communicative state of mind has become one of humanity's global problems. Because loneliness results from a person's lack of communication with those around them. Therefore, the concept of loneliness is subjectively considered unacceptable. In recent years, many psychologists are trying to study not only the socio-cultural, religious, political, psychological factors associated with the origin of loneliness, but also its scientific, philosophical and artistic descriptions, to distinguish it from other mental states. According to psychologist R.S. Nemov: "Loneliness is a difficult state of mind, usually a bad mood and a painful emotional experience" [6; 718]. Russian scientist L.A. Karpenko, on the other hand, considers loneliness to be one of the factors influencing the emotional state of a person who is isolated from other people or in an unnatural, changing environment [7; 496].

In general, psychologists distinguish four types of loneliness:

- 1. Cosmic loneliness** - a person's departure from the essence of "all-encompassing": a) nature, space, world; b) God.
- 2. Cultural loneliness** is the incompatibility of human values, ideas that occur in a particular cultural environment, the understanding and worldview of those around them. Such inconsistencies are usually due to the following factors: a) migration; b) the rapid orientation of society to new values (often associated with revolutions, major reforms); "conflicts between fathers and children" representing old and new cultures are typical; c) the rapid intellectual development of a person, the problem of communicating with people close to each other, and so on.[8]
- 3. Social loneliness** is the loneliness of a person due to exclusion from a particular group. Dismissals, resignations, retirements, falling into a new work environment, breaking up with old friends are examples of this.
- 4. Personal loneliness** is the loss of emotional connection with a self-esteeming person (close relative, friend, lover).

In general, when a person's relationship with others does not develop at all, a state of loneliness occurs. Such a person cannot establish a relationship of friendship or love with those around him. Not only does he become indifferent to people, but he also causes others to ignore him.

The following **socio-psychological** factors of loneliness are observed in literature:

- Loss of a friend or lover due to death;
- Rejection, abandonment by a living parent;
- orphan hood;
- Inability to communicate with people;
- Fear of public interference;
- Change of residence;
- going to a place where people are completely absent (such as space, a deserted island);
- falling into a new, unfamiliar area where communication is inconvenient;
- Transition to the next stage of mental development;

- Infidelity and divorce;
- rupture of personal relationships with family members;
- incurable disease, disability;
- disorders of consciousness, emotional trauma, mental disorders, insanity;
- strict devotion to religion;
- some religious ceremonies and rituals;
- commitment to science;
- devotion to art;
- grief from unrequited love;
- race;
- betrayal, treachery;
- committing a crime;
- rejection by society: exile or imprisonment;
- negative impact of current events;
- alienation from society, inability to accept society;
- retirement;
- poverty;
- despair, uncertainty about the future;
- dislike of the human race, hatred of people, love of animals rather than them, and so on.

Thus, loneliness is a complex psychological process, along with various emotional experiences. But often loneliness in a person's life is caused by the annoyance, infidelity, betrayal, indifference, oppression of the people around him, especially those closest to him. In addition, the negative traits of human nature, such as selfishness, indifference, arrogance, conceit, cowardice, skepticism, impatience, ingratitude can also contribute to the formation of loneliness in his personality [10]

There is also a category of people in life who prefer to be free and independent, who see loneliness as the best way to achieve this. In this sense, loneliness is positive for some and negative for others.

Of course, the benefits of loneliness are also undeniable. This is recognized by those who have chosen loneliness as a way of life for themselves. However, there are those who feel remorse and guilt for living their lives alone.

However, the negative perception of loneliness is also known from the fact that it is used in the form of deportation, imprisonment, and other forms of punishment, such as forced social isolation. Such convicted persons are deprived of their civil rights under the laws of society and are prohibited from acting in person.

The above considerations indicates that there are two types of loneliness: a) volunteer; b) mandatory.

According to the goal of voluntary solitude, self-improvement will be focused on overcoming spiritual difficulties. It takes into account the internal concentration of mental decline and its problems.

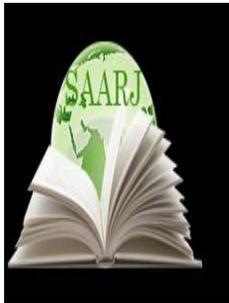

Compulsory loneliness results from the deprivation of liberty, social and political rights, imprisonment, deportation, or forced marriage, and so on.

CONCLUSION

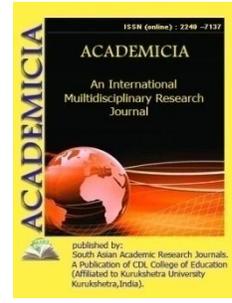

The feeling of loneliness has a great impact on a person's emotional state, mental state. It plays two different roles in a person's life, depending on how a person reacts to loneliness: positive or negative. On the one hand, loneliness is a very unhappy, isolated state caused by negative feelings such as despair, fear, suffering, impatience, lack of self-confidence or sadness that prevent a person from making the necessary connections with others, on the other hand, loneliness is a person living his life by himself, a deep understanding of their behavior, the time given to understand, is an opportunity experienced. On the other hand, man achieves peace, tranquility, tranquility in solitude. Most importantly, during this opportunity, a person clarifies his thoughts, decisions, realizes the essence of his personal existence.

ANALYSIS OF SPIRITUAL NEEDS

Jabbarov Jamshid Azimovich*

*Karshi DU Base Doctorate,
 UZBEKISTAN

Email id: jamshidshoh@gmail.com,

ABSTRACT

The article covers the fact that spiritual needs are a factor determining the level of development of society, moral ideals, goals and interests. Also, the importance of the system of spiritual needs in the creation of the third Renaissance Foundation has been scientifically analyzed. It is possible to raise the level of knowledge of society, expand its worldview and through it influence the development of the country. Systematic work has been carried out in the country on the acquisition of knowledge and the acquisition of knowledge by people. Failure to meet the spiritual needs can lead to the emergence of various destructive ideas in the stable life of society, in some cases to pose a serious threat to the life of the state and society.

KEYWORDS: *Third Renaissance, Spiritual Need, Self-Realization, Morality, Aesthetics, Cognition, Society, Personality, Material Need.*

INTRODUCTION

The needs that arise in the life of a person – motivate him to creative activities. The creative activity of man is manifested in two directions: material production and spiritual production (cultural products designed to meet spiritual needs are created). Spiritual needs are more diverse and more complex in relation to substances.

The fact that human spiritual activity is aimed primarily at rational practical and theoretical knowledge of existence, if necessary Inti-emotional, euristic Knowledge, Discovery, is one of the important signs of spiritual production or intellectual labor, creativity. This process is the process of satisfying the spiritual needs of a person through the creation of ideas, knowledge, theories, artistic images and other spiritual values, as well as the development of spiritual consciousness, worldview.

"Spiritual needs is a concept that expresses the desire of the state, society and the individual to meet spiritual demands, interests and needs other than material needs in a stable life," the Explanatory Dictionary of the basic concepts of spirituality says. Spiritual needs are clearly manifested in social, political, philosophical, scientific, moral, religious, legal and other directions. Failure to meet the spiritual needs can lead to the emergence of various destructive ideas in the stable life of society, in some cases to pose a serious threat to the life of the state and society. Therefore, with the gradual satisfaction of requirements and interests, manifested in the style of spiritual needs, it is possible to overcome many ideological-social problems.

Satisfied spiritual needs are the cause of the rise in the life of the individual and society, leading it towards development. In the essence of spiritual needs, first of all, the internal most important interrelations of things and phenomena, interests and aspirations, their legal relevance are expressed. Spiritual and cultural needs material and social requirements of a developed nation, requirements for a comfortable and free life, science and new advanced technologies are also high. The spirituality, science, literature and art of the people whose economy has developed, the opportunities to raise the culture of life, the cultural level will be high. These are, in turn, democratic freedoms, the opportunity to develop civil society.

Independence is ensured, the state of danger (satisfaction of the need for security) makes it easier for people living in a society to develop by employing their creative abilities. Spiritual needs are perceived in the form of manifestations of the parties, connections, characteristics that make up these things and phenomena. In its essence, a person emerges from self-expression and understanding by striving for knowledge, perfection, following high ideals. Spiritual needs indicate the level of development of society, moral ideals, the character of what goals and interests are oriented towards ideas. In its essence, it has concentrated the potential of creativity, creativity and creativity, and the satisfaction of spiritual needs becomes a tool for the development of society, social, economic, political improvement.

Spiritual needs are considered a high need, they can be divided into a number of groups:

The need for self-awareness (national self-awareness). One of the most difficult problems a person has is the realization of his own. Self-awareness is inherent in a person who knows his dignity, the feeling of appreciating others is also strong. It is considered that a person who knows his ancestry, his place in life and in society, his rights, responsibilities, civil duty, understands his own. Also, self-awareness expresses itself as a representative of the nation, a sense of belonging to his fate, aspirations, goals, and a sense of responsibility, pride in his native language, national culture, that is, a healthy pride. Self-awareness is an important spiritual need that is encountered at a time when the human mind begins to recognize it. National self-awareness is a deep understanding of what opportunities a person has for the prosperity of Vatan and the rise of society, the ability to mobilize himself for the emergence of these opportunities.

For people who do not understand themselves, reject humane ideas and views, demands and norms, do not know their place in the life of society, their rights, responsibilities, civil duty, there is no need for Renaissance or cultural development at all. In such a society, various problems arise: alienation among people, dependence on technical devices, weakening of human ideas, the degradation of values, the disappearance of material cultural and spiritual items.

Today, for the purpose of national self-awareness, the educational system has been radically changed, spiritual sciences have been enriched, our national values and cultural heritage have

been restored, people have been given extensive information about the scientific achievements, inventions and discoveries of great scientists. With the help of media, systematic programs on the spiritual life of society, its foundation, national self-awareness are being developed and delivered to the audience. So, without realizing our national identity, we must understand that our views on the creation of the third Renaissance, the measures that are being taken, are futile.

Cognition, acquisition of knowledge – is manifested in everyday life as the spiritual need of man. This need, as a form of spiritual activity, has been passing through certain stages of development from the time of the appearance of society to the present day. Through knowledge, a person acquires information and imagination about the surrounding world, deals with a certain type of activity.

In modern society, people are required to be educated. It is possible to raise the level of knowledge of society, expand its worldview and through it influence the development of the country. Systematic work has been carried out in the country on the acquisition of knowledge and the acquisition of knowledge by people. The president noted that the role of knowledge in creating a huge spiritual wealth in the country during the new awakening, making the life of the people comfortable and leaving a worthy legacy for future generations is incomparable: "the greatest wealth is intelligence and knowledge, the greatest legacy is good upbringing, the greatest poverty is ignorance."

The need of people to have a moral culture and to manifest them in a holistic manner is the basis of human activity and movement in today's society. Moral norms have a positive effect on the mood, behavior, everyday life of people, fulfilling motivating (stimulating) and restrictive (prohibiting) functions.

While morality forms the basis of human spirituality, moral needs also form the basis of people's spiritual needs. When people enter into a relationship in society, they need a variety of moral norms (Hello alik, shame, honesty, deceptions, correctness, honesty, respect, consideration of each other's interests, reconciliation, mutual assistance, kindness, fear of the Forbidden, negative attitude towards those who are deceitful, fraudulent, arrogant, etc.). Norms of morality are accepted by society and meet the moral needs of people, in turn, the satisfied moral needs are dictated by the creation of new, higher moral standards. It serves for the development of the spiritual environment of society.

Through the norms of morality – in the family, in the neighborhood, in labor, in production, in the person, in the group, even in the nation, etc., relations between people are regulated. It relies not on socio-political power (the power of state and administrative bodies), but on public opinion. For this reason, people are voluntarily subject to moral demands and norms. Moral ideas, norms, principles have a universal social meaning, and for all representatives of a particular culture, Kat.

In order to introduce the idea of the third Renaissance put forward by the president into life, an important role is played by the formation of honesty and decent living in society, the achievement of respect and attention of people, the good behavior, treatment of a person, the avoidance of lies, forgery and many other positive and moral qualities.

The aesthetic needs of a person are inextricably linked with the creative activity, which is the product of this activity. In the process of man's creative activity, an aesthetic goal, an aesthetic

ideal is formed. Hunarmad takes into account the tastes of people, the requirements of beauty in the work that he creates, in the product of the factory production, the bust created by the sculptor is beautiful, with elegance ishlangan, the state of rudeness, the person depicted seeks to describe the character, harmony, harmony, symmetry.

Aesthetic needs also form the basis of spirituality, like morality. Aesthetic needs are formed in the basis of the aesthetic consciousness of society and people, aesthetic needs, in turn, fall into the system of spiritual needs. When society develops aesthetic consciousness, aesthetic needs also rise accordingly. For example: if the work created by a writer, sculptor, singer, artist corresponds to the requirements of aesthetic taste, elegance, the projection of events in them is illuminated in proportion, harmony, if the behavior of the heroes of the work is not a fake, it is perceived as a great achievement in the field of art, and is respected among readers, viewers, observers, because their aesthetic And the satisfied need gives an "order" to create a new spiritual product.

The rise in the spiritual needs of people contributes to the development of the spiritual life of society. Although aesthetic categories are perceived as one for people (Beauty and honor, tragedy and comedy, elevation and depth), people can approach some products consumed in the spiritual life of society in different ways, and their spiritual needs can also be distinguished from each other: the national mentality of people, the religious-moral, the system of national values, individual tastes, the general spiritual-cultural level of For example, pornographic films, which are sold in film stores of many foreign countries, are highlighted as products that satisfy the spiritual needs of the population, more precisely, the needs for certain information, knowledge. Since it does not fit into our national mentality, this situation is assessed by our people as a source of dirt, not a product that satisfies the spiritual and aesthetic need.

Aesthetic taste is a manifestation of a person's thoughts, thoughts, behavior, behavior, behavior, behavior, behavior, material and spiritual products, on the basis of which lies the ability to distinguish beauty from vanity, to enjoy. The person who has developed an aesthetic taste will visit the various works that are exhibited in the visions not only for "just Tamasha", but also to see the beauty, elegance, artistic idea in it.

One of the main reasons why the rich cultural and spiritual heritage created in the "period of awakening" has not lost its value even today is that the products created by the creators have been created in a beautiful, harmonious way in all respects, without shortcomings, created with taste, to the extent that they can meet the spiritual needs of man.

Giving a person an objective and positive knowledge of the essence, meaning of true beauty, the need to strive for beauty is an important factor in the formation of his aesthetic consciousness, the development of his aesthetic needs, the raising of his spirituality by growing up, turning real beauty into the ideal of man. And this is one of the main requirements of the third Renaissance.

The need for creativity. Creativity is a constructive activity of a person aimed at creating innovation. In the process of creativity, the emotional (emotional perception, perception, imagination, emotion, passion, etc.) of the human psyche is formed.k.), rational (intelligence, understanding, ingenuity, attention, memory) and informal (intuition, spiritual guidance, etc.) unsurlari being in a mutually active relationship, this manifests the researcher's knowledge, skills, experience and talent. Creativity is also a manifestation of creativity, the activity of creating spiritual products. Representatives of writers, poets, artists, sculptors, illustrators,

illustrators, singers, dancers, directors and other people of creativity create their own products taking into account the "talabi of the era".

The need to master the craft. One of the most important things for Man is to master the craft. To understand the essence of any thing, to know the good and bad side of the world's events, to correctly understand the value of people, to properly organize the comfortable life of the family, to learn the craft in order to be an excellent person in all respects, to be skillful is a necessary need for a person.

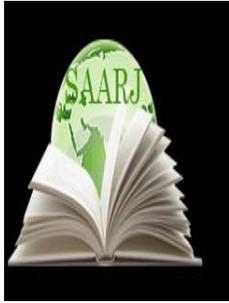

Social feelings, which are formed under the influence of the external environment together with the external feelings of a person, are again perfected by upbringing: responsibility, humanity, love for people, morality and aesthetic tastes, with the help of which man finds content in his spiritual needs.

Contemplation and creative imagination are also the main criteria that shape spiritual needs, like feelings. Because with the help of creative imagination, people create a foundation for thoughts, views, ideas, theories. For example, artists, poets, musicians, etc. famous works of art, which appeared in their creative imagination as an idea before, will later become a source that satisfies the spiritual needs of people.

In conclusion, the spiritual needs of Man are manifested in many ways depending on the level of material and spiritual development of society. The spiritual need of a person creates spiritual interest, it is manifested in the process of the activity of a person, and as a result, spiritual value arises. Spiritual value, in turn, is the basis for the decision-making of a higher spiritual need. This cycle of spiritual development lasts forever.

ABSTRACT

Glaucoma is a quiet vision thief. Early detection of glaucoma is almost difficult, and there is currently no treatment for glaucoma in its latter stages. This research looked at a variety of automated glaucoma detection methods. A thorough review of the literature was performed on preprocessing, feature extraction, feature selection, Machine Learning methods, and data sets utilized for testing and training. Automated glaucoma prediction is critical, but sadly, only a small amount of work has been done in this area, and only a minimal level of accuracy has been reached. However, automated glaucoma detection has progressed to the point that most machine learning methods can correctly identify 85 percent of glaucoma patients. Glaucoma can be predicted successfully using Optical Coherence Tomography.

KEYWORDS: *Glaucoma Detection, Glaucoma Prediction, Feature Selection, Feature Extraction, Machine Learning.*

INTRODUCTION

Glaucoma is a medical disease in which the optic nerve is damaged, and it is the second most common cause of visual loss. It's called the "quiet thief of sight." The illness of glaucoma was first discovered in the 17th century. Its significance as a cause of blindness has been recognized since the nineteenth century. The first understanding of its etiology and therapy dates from the twentieth century. Its averting will, ideally, be a task for the twenty-first century. Glaucoma is derived from the ancient Greek word glaucoma, which means cloudy or blue-green tint. It was most likely used to describe someone who had a swollen cornea or was quickly developing a cataract, either of which would have been caused by chronic (long-term) increased pressure within the eye. Glaucoma may be automatically diagnosed based on a number of clinical findings by various eye-care specialists. It is a collection of illnesses with certain similar

features, rather than a single disease. The ophthalmoscope was a significant innovation that made it feasible to identify glaucomatous abnormalities in the fundus. Glaucoma simplex is a condition that causes blindness due to high intraocular pressure. The development of the tonometer and the perimeter, as well as the usage of cocaine, helped to advance glaucoma diagnosis. The first successful surgical glaucoma therapy[1].

Various Machine Learning methods have been used to automate the diagnosis and prediction of glaucoma during the past few decades. Neural networks, decision trees based on ID3 methods, Vector Support Machine, Naive Bayes classifier, k- closest neighbor, Canny edge detector, active contour model, linear regression, and Fuzzy min-max neural network were used to accomplish automated glaucoma diagnosis. There has been very little work done on automated glaucoma prediction, with just two methods being used: fuzzy logic and linear regression[2].

1.1. Glaucoma detection method that is automated

Figure 1 depicts a general automated glaucoma detection method.

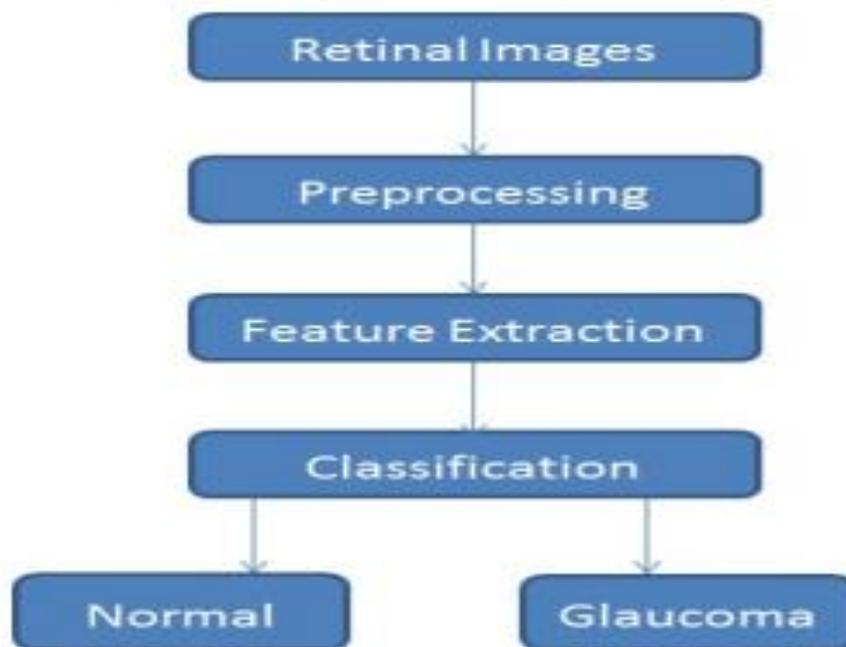

Figure 1: Illustrate the diagram shows the generic Process for Automated Glaucoma Detection

The initial step in the identification of glaucoma is to obtain a digital picture of the retina. Then, in order to equalize anomalies with pictures, preprocessing is needed. Feature extraction is the process of reducing the number of resources needed to properly describe a big data collection. A feature is a significant piece of information that may be used to classify anything[3]. The study of an image's characteristics is referred to as classification. The dataset is divided into two groups based on the results of the analysis: normal and glaucoma-affected.

1.2.Types of glaucoma

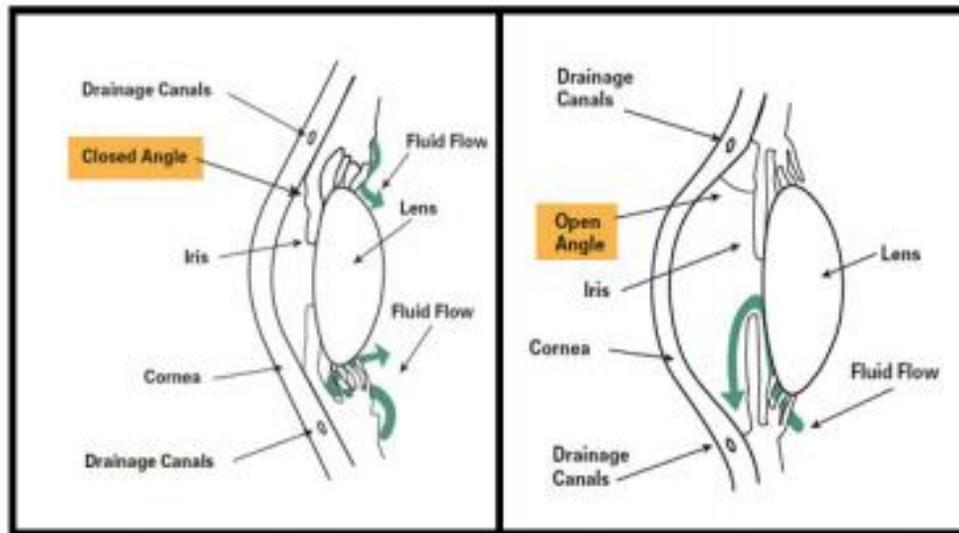

Figure 2: schematic diagram shows the types of glaucoma: (a) and (b) represents, angle-closure glaucoma and open-angle glaucoma respectively.

Transparent glaucoma and Angle-Closure glaucoma are the two most common forms of glaucoma. The much more prevalent kind of glaucoma, open-angle glaucoma, accounts for at least 90% of all glaucoma cases. Glaucoma is caused by an increase in ocular pressure in both types of glaucoma. Angle-Closure glaucoma has a small angle between the IRIS and the cornea, while open-angle glaucoma has a broad angle[4]. Angle-closure glaucoma (a) and open-angle glaucoma (b) are shown in Figure 2. Angle-Closure glaucoma develops rapidly and has noticeable symptoms, while open-angle glaucoma develops slowly and has no noticeable symptoms.

1.3.Technologies for ophthalmic imaging

The most significant factor in glaucoma detection is the ophthalmic imaging technology utilized to collect images for glaucoma detection. The more comprehensive and crisp the picture under observation, the more precise the detection and prediction will be. Fundus pictures, Confocal Scanning Laser Tomography, and Optic Coherence Tomography are among the ocular imaging technologies used to acquire images for the diagnosis and prediction of glaucoma. Fundus pictures are basic digital photographs that do not include any of the eye's interior features[5]. A laser light is used in CSLT. Confocal imaging is the technique of using a focused laser beam to scan an object part by part and collecting the reflected light via a tiny opening called a confocal pin hole. The interior features of the eye are captured via OCT, which utilizes light and generates a picture based on reflected light. Figure 3 depicts an overview of work done to identify and forecast glaucoma using various imaging methods. It can be observed that only a small amount of work has been done in glaucoma prediction, with the majority of work being done utilizing fundus images.

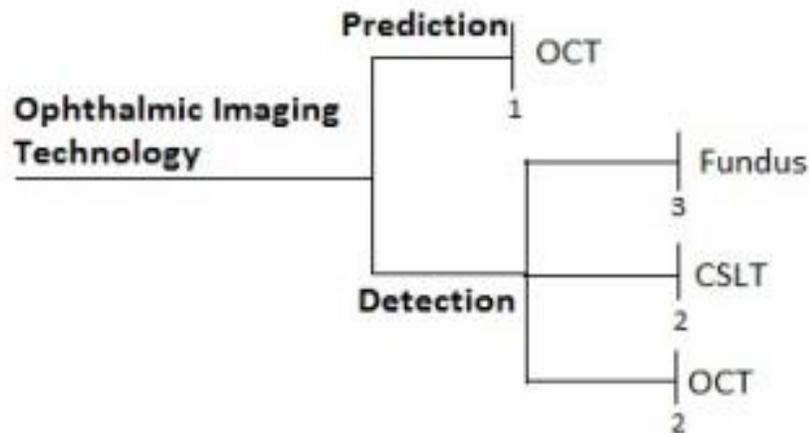

Figure 3: Overview of Ophthalmic Imaging Technologies used for detection and prediction of glaucoma

1.4. Techniques for preprocessing

For error-free glaucoma diagnosis, several preprocessing methods have been used to pictures. Figure 4 depicts several glaucoma detection preprocessing methods.

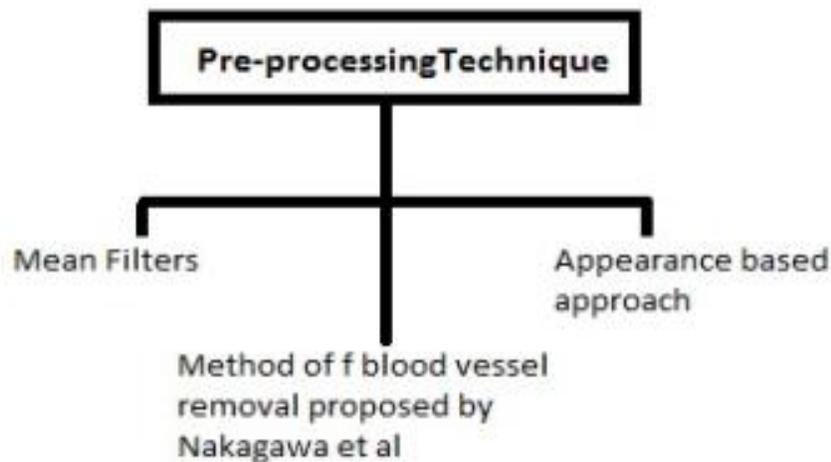

Figure 4: Illustrate the diagram shows the preprocessing Techniques used in detection of Glaucoma

Appearance based approach was implanted in to segment blood vessels and spatially in paint them to a vessel free image.

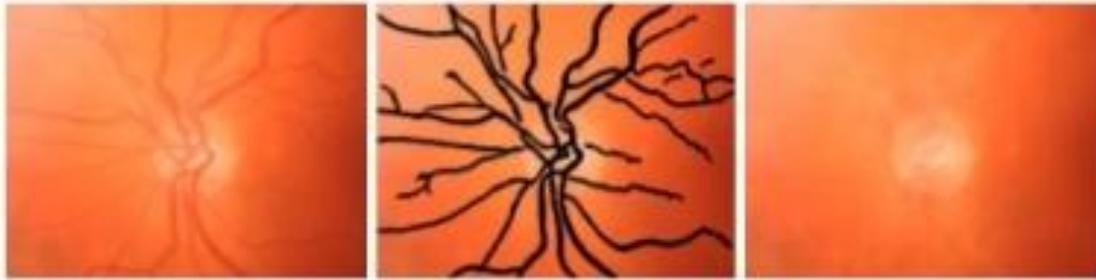

Figure 5: Illustrate the Vessel in painting on color fundus Image after preprocessing

After preprocessing, Fig. 5 displays a vessel-free picture. The methodology of blood vessel elimination suggested by Nakagawa et al. was used in preprocessing[6]. Color convention, scaling the picture, and noise reduction from the original image were all done using mean filters in the pre-processing of OCT images.

1.5. Techniques for extracting features

The most important activity is feature extraction. The accuracy of the system is mostly determined by its features. Various automated feature extractions were utilized to make the glaucoma detection procedure effective. Figure 6 depicts a few methods utilized in the glaucoma detection procedure, as well as the method approach used to identify feature Mean and Variance. Luminance and translation invariance size were included in several extractions such as Pixel Intensity Value, Textures, F Pixels Intensity, and Histogram Model[7]. Utilized the P-tile threshold technique to identify color and form. Macular Cub was used in to extract characteristics such as the macula thick sequential FMM in the painting technique module to detect features such as the cup to disc ratio, configuration, and vessel distribution information. Feature Extraction Techniques for Detection (Fig. 6).

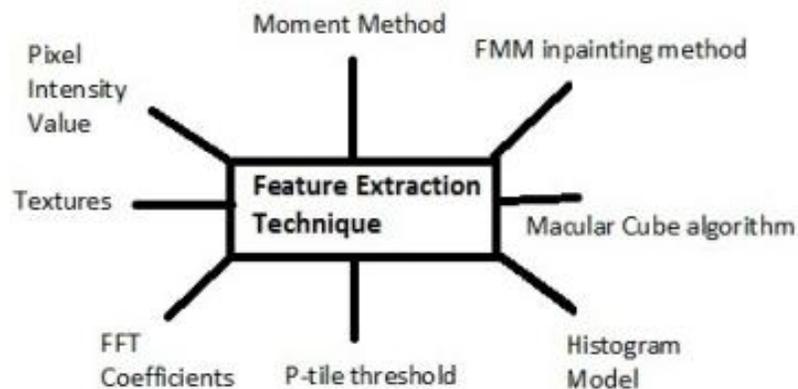

Figure 6: Feature Extraction Techniques used in detection of glaucoma

1.6. Technique for selecting features

The process of choosing a subset of relevant characteristics for use in model building is known as feature selection. Various feature selection methods utilized in glaucoma detection are shown

in Figure 8. Principle Thirty of the 950 dimensions were identified using the component analysis method.

1.7. Glaucoma detection using a referential detection feature

Glaucoma is a word that refers to a collection of illnesses rather than a specific condition. Glaucoma is detected using a variety of referral detection features. Different referential detecting characteristics that have been utilized in glaucoma detection are mentioned in Fig. 7.

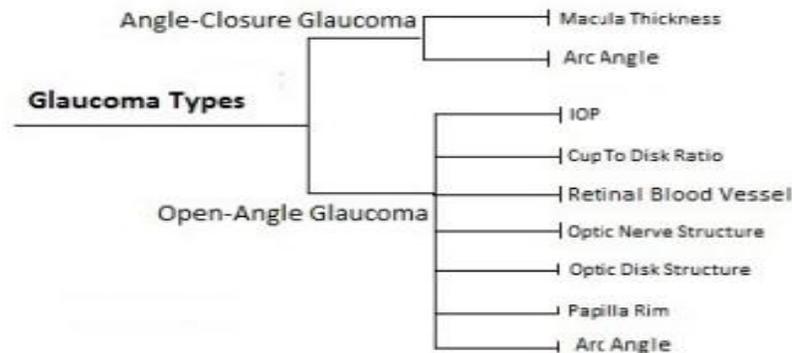

Figure 7: Indication of Recommendation Detection Feature for glaucoma

Angle-closure glaucoma was detected using Macula Thickness. Inter Ocular Pressure (IOP) was utilized as a detecting method. For the purpose of detection, the retinal blood vessel was utilized. The structure of the optic nerve was utilized. The rim of the papilla was utilized to detect activity. The arc angle was utilized to determine if the patient had open-angle or angle closure glaucoma[8].

REVIEW OF THE LITERATURE

In the framework of clinical vision research, Miguel Caixinha investigated the role of machine learning methods for diagnosis and illness monitoring. Many eye disorders that lead to blindness may be prevented or postponed if identified and treated early on. New sources of data for early illness diagnosis and patient management are now accessible because to recent advances in diagnostic equipment, imaging, and genomics. Machine learning methods first appeared in the biomedical sciences as clinical decision-support tools to enhance the sensitivity and specificity of illness diagnosis and monitoring, allowing clinicians to make more objective decisions. This paper provides an overview of machine learning methods for multimodal ocular illness diagnosis and monitoring. Machine learning algorithms are used to identify complicated patterns in a dataset automatically. When a group label is provided for each instance, these methods allow for the creation of homogenous groups or the creation of a classifier that predicts group membership of new cases. To guarantee that machine learning methods work well in a particular dataset, all potential sources of bias should be eliminated or reduced. The second part of this article will describe and explore the use of machine learning methods in ocular disease detection and monitoring[9].

Machine learning is involved with the creation and implementation of algorithms and methods that enable computers to “learn” patterns in data via repeated processes. CHRISTOPHER

BOWD researched it. Observed or unobserved processes may be used. Machine learning classifiers are not bound by statistical assumptions, making them flexible to a wide range of data. Recent applications of MLC approaches to the identification and monitoring of glaucoma using visual field and optical imaging data indicate that these methods can outperform existing methods. This paper covers MLC methods as they have been used to visual function and optical imaging in glaucoma research. It also offers some background on the classification problem in glaucoma and the construction and assessment of MLCs[10].

DISCUSSION

This article discusses some of the most common machine learning techniques used in vision science. However, in order to develop unbiased prediction models in clinical vision sciences, a number of issues must be resolved. The selection of the training sample is one of the main issues with prediction models in eye disorders. For patient diagnosis or illness prediction, predictive models should be developed. The majority of published studies only examine one eye per patient, which is chosen at random, based on the patient's right or left eye, or based on the patient's worse or better eye. New methods must be developed to build a prediction model that considers eye specific variables within each patient rather than each eye separately. Clustering-based approaches may be able to solve this issue. Because the model was trained solely for glaucoma or non-glaucoma prediction, a glaucoma detection model deployed in a patient with diabetic retinopathy may fail to recognize the patient's eyes as sick.

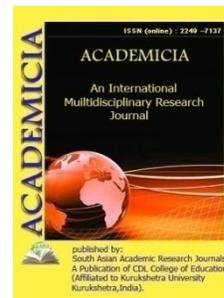

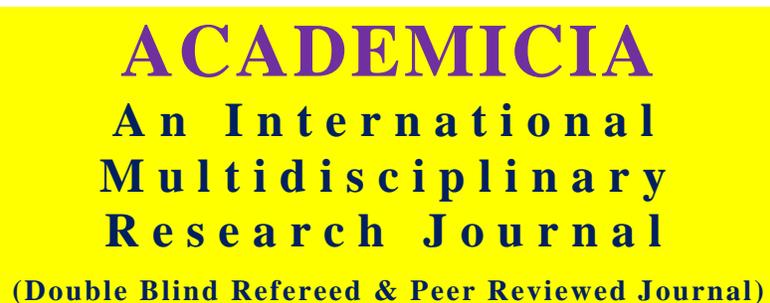

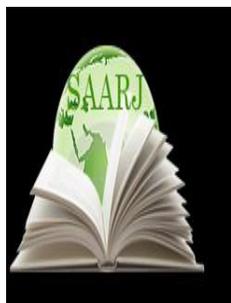

CONCLUSION

Glaucoma steals vision invisibly and causes irreversible loss to vision without being detected in its early stages. Glaucoma has no symptoms until it has progressed to the point where it is chronic, and there is currently no treatment for the illness in its advanced stages. Early identification of glaucoma has received little attention. However, automated glaucoma identification utilizing machine learning has shown to be an effective approach, with an 80 percent success rate. Because of its capacity to extract comprehensive and in-depth internal structures of the eye, OCT pictures may be utilized to accurately anticipate glaucoma symptoms. Existing prediction models, on the other hand, are often based on a training set consisting of one of the patient's eyes, with the selected eye being normal or sick. For example, proposed a nonparametric method in which each eye is treated as a sub-unit of a cluster, i.e. the patient. Furthermore, while employing the predictive models in the real world, the patients' eyes may be in a different state from the one that was taken into account when the models were being trained. Glaucoma patients with early detection and recovery.

AN OVERVIEW ON PYROLYSIS OF PLASTIC TRASHES

Dr. Gopal Arora*

Mathura, Uttar Pradesh, INDIA

Email id: drgopalarora.chem@sanskriti.edu.in

ABSTRACT

Due to the many uses of plastics in a variety of industries, worldwide plastic manufacturing has grown throughout time. The constant demand for plastics resulted in the buildup of plastic trash in landfills, which took up a lot of space and contributed to the environmental issue. Because plastics are a petroleum-based substance, increased demand for plastics resulted in the depletion of petroleum as a non-renewable fossil fuel. Recycling and energy recovery methods are two options for managing plastic trash that have been explored. However, the recycling technique had several disadvantages, such as high labor costs for the separation process and water pollution, which made the practice less sustainable. As a result of these flaws, researchers have shifted their focus to the energy recovery technique to offset the high energy consumption. Plastic waste conversion to energy was created after significant study and technological development. Because petroleum was the primary source of plastic, the conversion of plastic to liquid oil via the pyrolysis process had enormous potential, as the oil produced had a high calorific value comparable to commercial fuel. The pyrolysis process for each type of plastic was reviewed, as well as the main process parameters that influenced the final end product, such as oil, gaseous, and char. Temperatures, reactor type, residence time, pressure, catalysts, fluidizing gas type, and flow rate were among the key parameters discussed in this study.

KEYWORDS: *Energy recovery, Fuel, Liquid product, Plastic wastes, Pyrolysis.*

INTRODUCTION

For much more than 50 years, plastic has played an important part in improving people's quality of living. It is essential for the development of numerous goods in a variety of industries, including construction, healthcare, electronics, automotive, packaging, and others. The increasing expansion of the global population has raised the need for commodity plastics. Plastic

output peaked at about 299 million tons in 2013 and has continued to rise. The ever-increasing demand for plastic has resulted in an annual increase in trash buildup[1]. This demonstrates that the proportion of plastic trash that ended up in the landfill was still extremely high, occupying a significant amount of space. Plastics may take billions of years to naturally breakdown. They disintegrate gradually because plastic is made up of molecular bonds including hydrogen, carbon, and a few additional elements like nitrogen, chlorine, and others that make it extremely durable. Continuous landfill dumping of plastic would undoubtedly pose a significant environmental threat.

Pyrolysis is the process of using heat and pressure to break down long chain polymer molecules into smaller, less complicated ones. The procedure requires high heat for a brief period of time in the absence of oxygen. Oil, gas, and char are the three main products generated during pyrolysis, and they are important in sectors such as production and refineries. Many researchers selected pyrolysis because it produces a large quantity of liquid oil, up to 80 weight percent, at a modest temperature of 500 degrees Celsius. Furthermore, pyrolysis is very adaptable, since process parameters may be tweaked to maximize product yield depending on preferences[2]. The liquid oil generated may be utilized in a variety of applications, including furnaces, boilers, turbines, and diesel engines, without the need for further treatment or upgrading. Pyrolysis, unlike recycling, does not pollute water and is considered a green technology when the pyrolysis waste, which is gaseous, has a significant calorific value that may be utilized to offset the pyrolysis plant's total energy demand. Because it does not need an expensive sorting procedure, the process handling is also simpler and more flexible than traditional recycling methods.

1.1 Pyrolysis of plastics

Various kinds of plastics feature different compositions, which are often described in terms of their proximate analysis. Proximate analysis is a method for determining the chemical characteristics of a plastic composite using four specific elements: moisture content, fixed carbon, volatile matter, and ash content. The main variables that affect the liquid oil output in the pyrolysis process are volatile matter and ash content. High volatile matter promoted liquid oil production, while high ash content reduced liquid oil production, resulting in higher gaseous output and char formation. These features suggest that plastics have a great potential for pyrolysis to generate significant amounts of liquid oil. Because the findings of the plastics proximate analysis are so compelling, the next discussion will concentrate on the pyrolysis process factors that have a significant impact on liquid output[3].

PET (polyethylene terephthalate) has emerged as a popular plastic packaging material for a variety of food items, including drinks such as mineral water, soft drink bottles, and fruit juice containers. This is owing to its inherent characteristics, which make it ideal for high-capacity, lightweight, and pressure-resistant containers. Electrical insulation, printing sheets, magnetic tapes, X-ray and other photographic film are some of the additional uses for PET. The widespread usage of PET would result in a build-up of PET trash in landfills. The current practice for dealing with accumulated plastic waste was to recycle PET waste. However, the bulkiness of the containers results in frequent collections, which raises transportation expenses. PET trash must be separated into various grades and colors to facilitate recycling, which makes recovery inefficient and uneconomical[4]. As a result, additional options for PET recovery, such as the pyrolysis method, have been investigated, and the product yield has been evaluated by a number of researchers.

Polyethylene with a high density

HDPE is defined as a long linear polymer chain with a high degree of crystallinity and little branching, resulting in great strength. HDPE is extensively utilized in the production of milk bottles, detergent bottles, oil containers, toys, and other items because to its high tensile characteristics. The different uses account for approximately 3% of the plastic waste category, which is the third most common kind of plastic found in municipal solid trash. HDPE wastes have a lot of promise for pyrolysis since they may generate a lot of liquid depending on the setup conditions. Many research on HDPE pyrolysis at various operating settings have been performed to determine the product yield[5].

1.2. Polyvinyl chloride (PVC) is a kind of plastic.

PVC is unique because it is made up of 57 percent chlorine and 43 percent carbon, unlike other thermoplastics such as polyethylene, polystyrene, and polypropylene, which may be softened by heating and are exclusively produced from oil. PVC has a high fire resistance due to its chlorine content, making it ideal for electrical insulation. PVC is a versatile material since it may be combined with a variety of additives. Wire and cable insulation, window frames, boots, food foil, medical equipment, blood bags, automobile interiors, packaging, credit cards, synthetic leather, and other uses of PVC are common. Despite its broad range of uses, research on PVC pyrolysis has been limited in the literature owing to the hazardous chemical that it tends to produce when heated to high temperatures[6].

1.3. Polyethylene with a low density

LDPE has greater branching than HDPE, which leads in a weaker intermolecular force and therefore lower tensile strength and hardness. LDPE, on the other hand, has greater ductility than HDPE because the side branching makes the structure less crystalline and easier to shape. It has high water resistance and is therefore extensively used in plastic bags, packing foils, garbage bags, and other applications. All of these products are ubiquitous in our everyday lives, and as a result, LDPE trash has accumulated to the point that it is now the second most frequent plastic waste in MSW, behind PP. Pyrolysis of LDPE to oil product has recently garnered a lot of interest from researchers as a method to recover energy and minimize waste.

- *Polypropylene*

PP is a chemically and thermally resistant saturated polymer having a linear hydrocarbon chain. PP, unlike HDPE, does not melt at temperatures below 160 degrees Celsius. It has a lesser density than HDPE, but it has a greater hardness and stiffness, making it a better choice for the plastics sector. PP accounts for approximately 22% of the plastic wastes category, which contains the most plastics in MSW. Flowerpots, office files, vehicle bumpers, pails, rugs, furniture, storage boxes, and other items are among the many uses. Because of the increasing need for PP in everyday life, the quantity of PP wastes grows each year, pyrolysis of PP is one of the energy recovery techniques available. Several studies have looked at the pyrolysis of PP at different temperatures and pressures to determine the liquid oil production and characteristics.

- *Polystyrene*

PS is composed up of styrene monomers derived from petrochemical liquids. A lengthy hydrocarbon chain with phenyl groups linked to every other carbon atom makes up the structure.

PS is colorless by nature, but it may be tinted using colorants. Its heat resistance, as well as its acceptable durability, strength, and lightweight, make it suitable for a wide range of applications, including food packaging, electronics, construction, medical, appliances, and toys. The enormous quantity of PS in MSW collected each year is reflected in the broad variety of uses. PS is unfortunately not accepted in the roadside recycling program, which only accepts glasses, papers, cans, and certain plastics[7]. Despite the fact that there is a plastic category, most individuals do not place foam food packaging in the plastics recycling bin and instead place it in the general trash. Because of its low density polystyrene foam, PS is usually not separated and is difficult to collect for recycling. As a result, the only option to completely use PS waste is to use the pyrolysis process to convert it into a more valuable oil product rather than letting it sit in landfills indefinitely.

- *Mixed plastics*

As noted previously, the pyrolysis process offers an advantage over recycling in that it does not need a thorough sorting procedure. Most plastics are incompatible with one another in the recycling process and cannot be processed together. For example, a little quantity of PVC contamination in the PET recycling stream would damage the whole PET resin, turning it yellow and brittle, necessitating reprocessing. This demonstrates that the recycling process is so sensitive to contamination that all plastics must be separated by resin type, color, and transparency. However, since liquid oil can still be generated from the mixed polymers in the feedstock, the pyrolysis method seems to be more sustainable. Several researchers who studied the pyrolysis of mixed polymers have run across this problem.

1.4. The condition of the process parameters

In every process, parameters play a critical role in maximizing product yield and composition. The generation of ultimate end products such as liquid oil, gaseous, and char may be influenced by critical process factors in plastic pyrolysis. Temperature, reactor type, pressure, residence duration, catalysts, fluidizing gas type, and rate are some of the most significant factors. Controlling the parameters at various levels may result in the desired product. The subsections that follow go through the operational settings in more detail.

- Temperature

Temperature was among the most important operational factors in pyrolysis since it affects the polymer chain's breaking response. The Van der Waals force attracts molecules together, which prevents them from collapsing. When the temperature of a system rises, the vibration of molecules within the system rises, and molecules prefer to evaporate away from the object's surface. When the energy generated by the Van der Waals force along polymer chains is higher than the enthalpy of the C–C bond in the chain, the carbon chain is broken.

1.5. Reactors' types

The kind of reactor has a significant effect on the mixing of polymers and catalysts, residence duration, heat transmission, and reaction efficiency in producing the desired end product. In the lab, most plastic pyrolysis was done in batch, semi-batch, or continuous-flow reactors such fluidized bed, fixed-bed reactor, and conical spouted bed reactor. In the next subsections, the benefits and drawbacks of each reactor will be addressed.

- *Reactors, both batch and semi-batch*

During the reaction, a batch reactor is essentially a closed system with no input or outflow of reactants or products. One of the benefits of batch reactors is that they may obtain high conversion by keeping the reactant in the reactor for a long period of time. Batch reactors, on the other hand, have the drawbacks of product unpredictability from batch to batch, high labor costs each batch, and difficulties in large-scale manufacturing.

- *Reactors with fixed and fluidized beds*

Although it is simple to construct, there are certain limitations, such as the uneven particle size and form of plastics used as feedstock, which may create problems during the feeding process. Furthermore, the reaction's access to the catalyst's accessible surface area is restricted. Several studies, however, opted to utilize a fixed-bed reactor for plastic pyrolysis.

- *Reactor with a conical spouted bed*

The CSBR (conical spouted bed reactor) offers excellent mixing and can handle a wide particle size range, bigger particles, and different particle densities. CSBR was utilized by several researchers in their plastic catalytic cracking studies. When treating sticky materials, it also had a significant heat transfer between phases and a slight DE fluidization issue. However, a number of technical issues have arisen during the operation of this reactor, including catalyst feeding, catalyst entrainment, and product collection, making it less desirable.

- *Microwave-assisted technology*

Microwave technology has recently gained popularity, and it now provides a new method for waste recovery through the pyrolysis process. A microwave-absorbent substance, such as particulate carbon, is combined with the waste products in this procedure. The microwave absorbent absorbs microwave radiation to provide enough thermal energy to reach the temperatures needed for extensive pyrolysis. Microwave radiation has many benefits over traditional pyrolysis, including faster heating, higher manufacturing speed, and cheaper prices. Microwave energy is delivered directly to the material via molecular interaction with the electromagnetic field, unlike traditional techniques, thus no time is spent heating up the surrounding region.

1.6. By-products of the plastic pyrolysis

As a by-product of the pyrolysis of plastics, char and gas are produced. In pyrolysis, many factors such as temperature, heating rate, pressure, and residence duration have a significant impact on the percentage of by-product. The following is some information on the by-products produced:

In the pyrolysis process, char production is aided by a slow heating rate at a very low temperature and a lengthy residence period. Even though char production in the rapid pyrolysis process is often minimal, the characteristics and uses of the char should be considered to fully realize the promise of plastic pyrolysis. The char characteristics produced from the pyrolysis of HDPE plastic waste were investigated. The major components of the char were determined to be volatile matter and fixed carbon, whereas moisture and ash were minority, according to the proximate analysis.

The optimum conditions for maximizing gas generation in the pyrolysis process were gas, high temperature, and extended residence time. These circumstances, on the other hand, are diametrically opposed to the characteristics that optimize oil output.

LITERATURE REVIEW

J.F. Mastral et al. studied the scientific life at the moment bed reactor was used to catalytically breakdown high density polyethylene in order to achieve a high yield of gas fractions at moderate temperatures between 350 and 550 C. Nanocrystal line HZSM-5 zeolite was employed as the catalyst. The gas fractionation, which were mostly made up of olefins, had high yields of butanes. Waxes were entirely made up of linear and branched paraffin with C10 to C20 components. The impact of temperature and the polymer-to-catalyst proportion on product yield was investigated. When the operating temperature was modest or the polymer to catalyst ratio was high, gas conversion was significantly reduced. The gas as well as wax compositions substantially changed, indicating that a portion of the HDPE was thermally decomposed, increasing the olefin content in the waxes. Experiments with high polymer to catalysis ratios, achieving a 50 percent olefin content in the waxes, revealed the similar variance. Thermal and catalytic degradations may both be blamed for the variations in product distributions[8].

MochamadSyamsiro et al. studied the goal of this study was to look into the manufacture of fuel oil from municipal plastic trash using a series of pyrolysis and catalytic reforming methods. In Yogyakarta, Indonesia, three types of municipal plastic trash were collected from the ultimate disposal site and a small recycling business. In this research, commercial Y-zeolite and natural zeolite catalysts were utilized. The findings indicate that feedstock types have a significant impact on product yields and quality of liquid and solid outputs. The liquid percentage from HDPE trash was the highest. The addition of catalysts decreased the liquid fraction while increasing the gaseous fraction. In addition, pyrolysis of municipal plastic wastes generated greater heating value solid products than biomass and relatively low level coal[9].

Yusaku Sakata et al. studied the thermal decomposition of polymeric polymers into fuel oil in the presence of a mesoporous silica accelerator has been studied. The yields, composition, frequency rate of degradation of polyethylene using KFS were compared to those obtained using a solid acid catalyst and non-catalytic heat degradation. PE degraded just as quickly over KFS, which has no acid sites, as it did over silica–alumina, and the output of liquid products was greater. These results indicate that the mesoporous enclosed by the silica sheet may serve as a flask for keeping radical species for a long period, and that long-lived radicals therefore accelerate the breakdown of polymers[10].

DISCUSSION

This analysis revealed that many studies have been conducted to examine the possibility of the plastic pyrolysis process for producing valuable goods such as liquid oil, with promising findings. This method has many benefits, including improving waste management, decreasing reliance on fossil fuels, expanding energy sources, and preventing environmental pollution. The method may be used with a variety of settings, resulting in a variety of liquid oil production and quality. Aside from that, this method provides more flexibility and economic feasibility in terms of process management and product variability. At various circumstances, summarized the optimal temperature needed to maximize liquid oil production in thermal and catalytic pyrolysis.

The kind of reactors, pressure, heating rate, and pyrolysis time for each form of plastic are also impacted. The fluidizing media used in all of the tests was nitrogen gas.

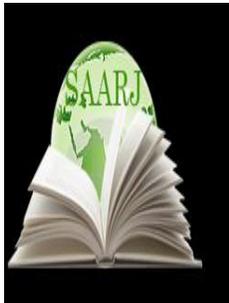

CONCLUSION

This study offered a brief overview of plastic pyrolysis for each kind of plastic, as well as a discussion of the key influencing factors for optimizing liquid oil production. According to studies in the literature, most researchers selected the pyrolysis process because of its ability to convert the most energy from plastic trash into useful liquid oil, gaseous, and char. As a result, it is the greatest option for converting plastic waste and is also the most cost-effective in terms of operating. Adjusting the settings to obtain the flexibility it offers in terms of product choice is possible. Pyrolysis may take place in a thermal or catalytic process. With the appropriate catalyst selection, the catalytic process offered a lower operating temperature and a higher output of liquid oil for most polymers. The process's long-term viability is clear, given that the quantity of plastic trash accessible in each nation is in the millions of tons. Waste management becomes more efficient using the pyrolysis technique, which requires less landfill capacity, produces less pollution, and is also more cost effective. Furthermore, because of the availability of the pyrolysis technique for decomposing plastic into useful energy fuel, the reliance on non-renewable energy sources such as fossil fuels may be decreased, thus alleviating the increase in energy demand.

FORMATION OF A MECHANISM OF STATE SUPPORT FOR INNOVATIVE DEVELOPMENT IN THE SERVICE INDUSTRIES

Ruzieva Nigina Bakhtiyorovna*

*PhD- doctoral student,
Samarkand Institute of Economics and Service
UZBEKISTAN

ABSTRACT

The article discusses issues related to innovative development in the service industries, as well as the formation of a mechanism for state support. It also provides definitions and opinions of scientists, through which the formation of a mechanism of state support for innovative development in the service sectors is determined.

KEYWORDS: *Economy, State, Service Sector, Innovation, Mechanism, Reforms, Competition, Development.*

INTRODUCTORY PART

An important factor in the growth of the competitiveness of any country is its gradual transition to an innovative path of development. According to authoritative experts, "in solving the entire spectrum of strategically important problems of various countries in the 21st century, a key role is assigned to innovations, innovative activities and a knowledge-based economy or an innovative economy." Indeed, world experience shows that the transition to the path of sustainable development of such highly developed countries as the United States and Japan, a number of countries of the European Union and Southeast Asia, was achieved mainly through the expansion of innovation processes in the real sector of the economy.

The main factor in the effectiveness of innovation is the presence of an economic mechanism called by K. Freeman "national innovation system". It is precisely at its formation that in recent decades the activities of the governments of a number of states intending to achieve significant success in world markets in the face of tougher competition have been aimed.

Main part. In Uzbekistan, innovation activities are supported by the state. This is done through the regulatory system, government and departmental funds, large projects and investment programs, taxation, and other instruments. After independence, one of the first normative

documents in this area are the Decree of the President of the Republic of Uzbekistan "On state support of science and the development of innovative activities" dated July 8, 1992, and the Decree of the Cabinet of Ministers "On measures of state support for the development of science and innovation" of July 21, 1992, which created the basis for stimulating the country's innovative development.

In accordance with the Resolution of the President of Uzbekistan "On measures to improve the coordination and management of the development of science and technology" dated August 7, 2006, reforms in the field of management and financing of domestic science, focusing its efforts on priority areas for the country were continued. Thus, the Decree of the President of the Republic of Uzbekistan "On additional measures to stimulate the introduction of innovative projects and technologies into production" dated July 15, 2008, in accordance with which structural reforms were carried out in the system research management.

In the period 1992-2017. in accordance with the adopted legal acts, responsibility for the implementation of innovative projects under priority state programs was assigned to the Committee for the Coordination of Science and Technology Development under the Cabinet of Ministers (later renamed the Agency, since 2018 - the Ministry of Innovative Development), and the promotion of science-intensive technologies in production - to the Ministry of Economy.

The gradual development of the science management system made it possible to improve the mechanism for promoting research: from fundamental and applied developments to innovative works aimed at their practical application. Annual republican fairs of innovative ideas, technologies and projects have become one of the important tools for the implementation, as well as the commercialization of research results, ensuring a closer connection between science and production, manufacturers of innovative products and their consumers. Thus, during the fairs, more than 4 thousand innovative ideas, developments and technologies were demonstrated. Over 3 thousand contracts were signed with a total value of over 110 billion soums. As a result, more than \$ 1.0 trillion worth of new products was produced. soums.

Discussions and results. The measures taken over the years of independence to form an innovative economy as a whole contributed to the development of productive forces through a deeper use of intellectual resources and the results of fundamental and applied work. At the same time, a significant role in the formation of an innovative economy belongs to the Academy of Sciences and its research institutes, centers and other structures, through whose efforts many large innovative projects have been introduced into production.

Today, one of the priority tasks can be identified in the sphere of high technologies, in the sphere of innovation activity from the transfer of the domestic industry to a raw material orientation. With the help of which it is possible to quickly increase the competitive potential of the economy by increasing its comparative opportunities in science, high technologies and education, as well as to increase welfare and, on the basis of, use new sources of economic growth.

State regulation of current innovation activity and prospective development should be carried out both at the local and at the sectoral level by observing the basic principles, forms and implementation of methods of such regulation, which are regulated by regulatory legal acts.

The purpose of innovation policy is to create favorable conditions for innovation activities, to overcome the low level of innovation security, on this basis, sustainable economic growth, as well as stable social development.

It should be noted that state regulation and support of innovative entrepreneurship is implemented in specific areas through the use of methods and implementation mechanisms. It is important to emphasize that the effective functioning of a well-functioning mechanism of state regulation and support is formed with a full-fledged innovative entrepreneurial activity.

After reviewing the opinions of some scientists, it was concluded that the degree of state regulation decreases after overcoming the crisis and the formation of innovative entrepreneurship, but at the same time its quality improves. Based on this, it can be noted that in order to support and develop innovative entrepreneurship in the region of districts and cities, it is imperative to develop a concept of state regulation of innovative entrepreneurship in the service sector.

The main directions of innovative development, sectoral components, business entities of the service sector, are also that the management decisions taken should have a significant impact on the effectiveness of innovative projects and programs, while contributing to a constant increase in the amount of funds allocated for the development of and the introduction of innovations by business entities of the sectoral components of the service sector.

Conclusion. Thus, we propose an organizational and economic mechanism for supporting and developing innovative entrepreneurship in the service sector, which is developed on the basis of an analysis of practical experience in the Republic of Uzbekistan and other countries.

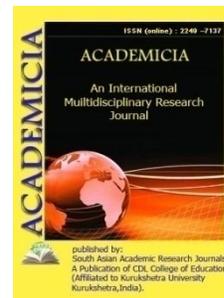

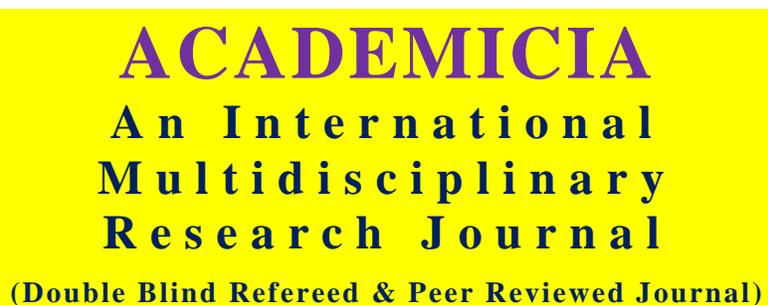

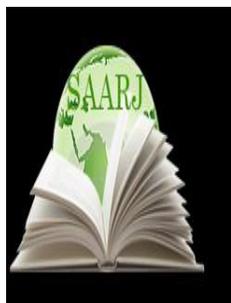

The peculiarity of this mechanism lies in the fact that the main role is offered to organizations and enterprises in the service sector, and the mechanism is aimed at participating in the implementation of the business, where it is taken into account that its interests are aimed at developing demand and for innovation from the enterprise of the region, district and city. This mechanism for its implementation determines the guidelines for their initiatives and activities, i.e. organize conditions for the development of partnerships between business and science.

THE ROLE OF WORLD LITERATURE IN THE DEVELOPMENT OF ABDULLA ORIPOV'S POETIC THINKING

Davlatova Adiba Rakhmatovna*

*Associate Professor,
Chirchik State Pedagogical Institute of Tashkent region,
UZBEKISTAN

ABSTRACT

The article discusses the roots of poetic thinking, creative concept and philosophical observation, which are the basis of the poetry of Abdulla Aripov, one of the great representatives of Uzbek literature. The author scientifically proves the role of world literature in the development of the poet's literary and aesthetic world with the help of examples. Abdulla Aripov's attitude to Dante's work, in particular, analyzes issues related to the translation of "Divine Comedy", draws valuable theoretical conclusions.

KEYWORDS: *Poet, World Literature, Translation, Genre, Aesthetic View, Trend, Artistic Analysis.*

INTRODUCTION

There will, of course, be the geniuses of a particular nation who have left their mark on world literature, who have influenced the socio-aesthetic views of mankind with their works in which human ideas are uniquely expressed. The great creators of Eastern and Western literature and the best works they have left are proof of our point. Since the advent of written literature, several books have seen the face of the world, but only a handful have had a strong influence on the consciousness of the whole earth. The sentences "100 best works", "10 great writers and works" were not in vain. In addition, it is natural that great artists have contributed to the global prestige of any nation. For example, Cervantes is Spanish, Shakespeare is English, Alisher Navoi is Uzbek, Goethe is German, Tolstoy is Russian, and Chingiz Aitmatov is the pride and visiting card of the Kyrgyz nation.

Mana Italiya - Dante Diyori,

Tagor shuhratiga noil Hindiston.

Farzandlar o'z yurtin nomusi, ori,

Bulbulim bor deydi har qanday bo'ston.

The literary heritage they left had a positive impact on the development of world literature in many ways. The deep intellect, philosophical conclusions, logical thinking, figurative style of expression, modernity of the ideas propagated by the highly talented have made a great contribution to the determination of the nature of the subsequent fiction.

Garchi zaminda ko'p har hil xoru xas,

Tog'larga mengzashar dunyo tomini.

Ayonki, to'rt-beshta yomonlar emas,

Yaxshilar tanitar yurtning nomini.

There are many factors that contributed to the formation of the phenomenon of Abdulla Aripov. The poet fell in love with literature even before he went to school. At first, under the influence of fairy tales, songs, and legends told by his mother, he was fascinated by the mysterious charm of literature, but later his goal was to get acquainted with the masterpieces of world literature in his brothers rich library. As the future poet points out in his autobiography, it is true that Abdurazzaq's brother sent exercises to various editors and was aware of the content of the responses from the editors, which in a sense served him as a literary school. "The work of genius talents should be analyzed in the context of national and world literature and art. Then the uniqueness of their thinking and works, their contribution, the scale and potential of their talent will be more clearly revealed. Otherwise, the opinions expressed about him will become a collection of unproven, lofty praises "[10.21]. Indeed, a poet is brought up by a certain nation, and if he is truly gifted, his writings are of universal significance. As the poet himself noted, the great scientist, writer, creator does not have a nation, everyone accepts it as his own. Representatives of world literature, science and civilization are proof of our opinion. Abdulla Aripov's acquaintance with the works of the world's leading artists, inspired by his artistic thinking, certainly influenced his creative process. The ancient philosophical way of thinking, the feelings of humanity and nationalism have now made their way to topics at the level of world literature.

Abdulla Aripov's works are full of works on the most topical issues of space and world art. Among them, "Face to Face" is spiritually close to the search for answers to such questions as Sophocles, Dante Alighieri, Shakespeare's fate, human dignity, human perfection. Through the work, Adam is confronted with man. Emotions such as lust, greed, and jealousy have completely destroyed the innocence of the beginning. At the beginning of the work, the poet turns the pages of an old notebook and remembers the past one by one. And for some reason the fact that the lyrical protagonist is closer to the natural world attracts the reader's attention. In fact, although the human child touches the animal in the womb, the poet looks at the mammoths with compassion, not at his predecessor. Instead, he calls people "wild crowds".

Dunyo ham bir vaqlar mamont talashib,

Adashib ketgandi yo'lidan menday.

For centuries, the world, which the poet blamed, was divided into “wild crowds.” The lust that first destroyed nature together then preyed on the fate of the mammoths. The ancient custom emphasized by the poet has been broken and has not yet been healed. The arrogant laughter of the oppressors and the cries of the oppressed still haunt this world.

Asrlar shundayin tentib o'tdilar,

Yer uzra hukmron g'am bo'ldi faqat! [5.61]

This grief was the cry of the representatives of world literature, sometimes expressed in the form of comedy, sometimes tragicomedy, sometimes tragedy.

Nahot o'sha Freyd haq bo'lsa yohu,

Nahot qotil bo'lsa, o'sib chaqaloq?!

In addition, a deep acquaintance with world literature and admiration for the artists of the word paved the way for the emergence of rare translations in the works of Abdulla Aripov. Aligeri Dante, a unique representative of world literature, skillfully translated the “Hell” part of the “Divine Comedy” into Uzbek.

The translation was made available to a wide readership in 1975. Thanks to the poet's philosophical thinking and eloquence, our people also benefited from Dante's “Uzbek grace”, his thoughts on world civilization and man, society, destiny, humanity. “If artistic skill is added to thinking on a cosmic scale, it will raise any work to a higher level, bring international fame to the artist. This can be seen in the example of high art and classical literature.”[10.23]

The Divine Comedy was in fact an echo of Dante's genius, the reflection of Western philosophy on the world, life, and people. As the poet began his translation, he first became acquainted with the trends in world literature, his aesthetic views, and the content of selected works on the Western worldview. In order to “recreate” this literary and philosophical work in the Eastern spirit, of course, a strong scientific and philosophical handbook was needed. Abdulla Aripov's love for world literature from a young age, his constant acquaintance with the unique works of world writers, and his personal way of thinking helped to translate such a magnificent work. In contrast to Dante's personality and work, the writer's deep cosmic thinking, his search for meaning in coming and going, his logical conclusion that every action must have an answer, and the consolidation of these views with religious literature require serious preparation for reading. From the content of the work, we feel more clearly that humanity has the same roots, the same aspirations, but we also realize that the features of lust and ambition are the same. It took a great deal of skill to fully unravel Dante's creative catharsis, his heartaches, his bitter laughter over the people and the society they formed. Abdulla Aripov skillfully performed this difficult and arduous task. Because when the poet entered the work with big dreams, as a result of the attitude of his “teachers”, “great word artists” who tried to mislead him, even at the beginning of the great path, his conclusions were stabilizing. Seeing the real faces of the people around him, the tragedy of the ideal and real clash, the streak of lines on the portrait of the imaginary man, of course, left a mark on the poet's psyche. Perhaps that is why the poet did not feel complete satisfaction in his heart even after the translation of “Divine Comedy”. He was determined to sing the pain of the earth surrounded by humiliation and ignorance against the background of the “other world”. Just as Dante's heroes were his contemporaries, the characters in the dramatic epic The Road to Heaven were no strangers to Abdulla Aripov. Speaking about this epic, the poet said

that he had seen all the people in the work in his life, for example, the image of a friend, a well-known literary scholar, my friend Begali Kasimov. The poet also noted that in the epic he tried to reveal the inner and outer world of the heroes as much as possible, in fact there is no word or paint to describe in detail the people in Hell and Arosat.

According to a U.S. press release, the great genius Alighieri Dante's Divine Comedy, written between 1307 and 1321, was recognized as the first of the top ten books created in the West in the last millennium. Among these ten books of the last millennium are Thomas Aquinas's Scale of Theology (1463), Thomas More's Utopia (1616), Immanuel Kant's Critique of Pure Consciousness (1781), and Friedrich Nietzsche's "Zoroaster says so" (1883-1885) and Sigmund Freud's Interpretation of Dreams (1900). [8.43]

Another great poet, Goethe, wrote of Dante: "Dante seems great to us, but behind him lies the culture of many centuries." [9.318] Philosopher Najmiddin Kamilov, as a researcher who has done a lot of research on the interaction, integration processes and effects of Eastern and Western literature, also emphasizes the influence of Muslim oriental scholars on Dante's work. The celestial bodies depicted in the Divine Comedy, their statements about their motion and properties, and their measurements of distance are all taken from Al-Farghani. Following Al-Farghani, who explained the motion of the planets in terms of human ability and activity, Dante writes: "Venus rules our souls and other qualities because of the generosity of those who move them" (Bazm, II, 2). When speaking of other planets, the poet presents the ideas of the Uzbek scientist as truth." [3.74] Thus, the synthesis of Eastern and Western thought is reflected in the creation of a great work.

Lekin paydo bo'lib oftob shu mahal

Yulduzlar to'dasin ortga kuzatdi:

Ilohiy muhabbat misol dastavval,

Sitoralar to'pin bu yon uzatdi.

(Dante Aligeri. Hell, I, 37-40. Translated by Abdulla Oripov)

When we read these verses, we instinctively remember that Alisher Navoi provided the universe and planets with deep astronomical knowledge. Abdulla Aripov, in the example of Dante's work, imagines that he began to translate this work because he saw the respect and recognition of the Western world of thought in the East.

Kozimni uzoqqa yugurtdim shunda:

Xisobdon Evklid, Batlimus, Galen,

Gippokrat, Ibn Sino, Ibn Rushd Paydo -

Yangi Koyalarni tartib etgan chin.

(Dante Aligeri. Hell. IV, 142)

Yes, Dante was looking for the truth - to find ways to purify people from the sins of hell, to lead them to perfect moral purity. [4.85] The whole essence of Abdulla Aripov's poetry was to sing of perfection, sincerity, faith, honesty, piety.

Bu olam shunaqa qurilgan o'zi,

*Hidlashib ko'rish hatto hayvonot.
 Qur'oniy kalomdir "Assalom" so'zi,
 Do'zaxi sanalur takabbur har zot. [7.17].*

The poet writes that the question of arrogance is harsh, that people live within the divine precepts. He is horrified that some of the people around him are completely losing their image of humanity in the pursuit of lust, envy, pride, wealth, career. He even likens it to the signs of the Hour.

*Idrok odamlarni butkul tark etgan,
 Go'daklar ko'zida yovvoyi bir his.
 Avliyolar ko'kka bosh olib ketgan,
 Xukmini o'tkazar har qanday joyda Iblis.[6.69].*

The fragments above seem to fit perfectly into the landscape that Dante has been writing about for centuries. This means that over the years, the poets' expressions of the heart's feelings, moods, and sufferings have remained the same.

The first epic contains 34 songs, and the second and third epics contain 33 songs. Each stanza of the song consists of three lines, and these three are both rhyming with each other and the content is connected like a chain. This sequence continues from the beginning to the end of the song [8.43].

During the translation, the poet reviewed, analyzed and compared other translations of the work. But the poet's creative perfection, philosophical depth, and instinctive knowledge served to convey the structure, scheme, and idea of the work in its original form. In order to preserve the rhythm of the work, special attention was paid not only to the word, but also to the presence of vowel, consonant sounds. The translation turned out perfectly for the poet's good understanding that even the sounds play a role in illuminating the spiritual world of the lyrical hero, his inner world, and that the melody is also symbolic.

The philosophical concepts reflected in artistic creation can be of two basic types. The first of these, traditionally, stems from the philosophical ideas that preceded and contemporaries the creator. This form of philosophical artistic interpretation is of a relatively universal nature. The second form of philosophical-artistic interpretation cannot be completely devoid of the above elements. At the same time, individual leadership is at stake. The authors of works of this nature are among the most philosophical. They are a factor in drawing philosophical conclusions from any universal reality [2.97]. Based on the above considerations, the fact that both Dante and Abdulla Aripov draw philosophical conclusions, with an original way of thinking, is fully consistent with both classifications.

The influence of world literature on the work of Abdulla Aripov continued in the form of reading, translation, composition, compliments. During the translation of the Divine Comedy, the poet managed to preserve the rhythm, the essence, the spirit of Dante. Such literary influences later continued in a series of poems and the dramatic epic The Road to Paradise.

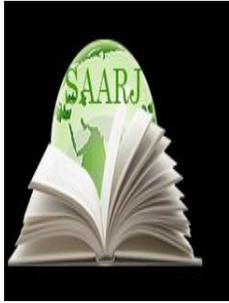

The last 30-40 years of Uzbek literature have been influenced by Abdulla Aripov's poetry. [11.238]

Abdulla Aripov has made creative trips to many countries around the world. Series such as The Book of Hajj, The Voices of Japan, The Book of Geneva, and Impressions of Italy are proof that the poet sang the universal ideas of life in his own words, in his own voice [1.131]

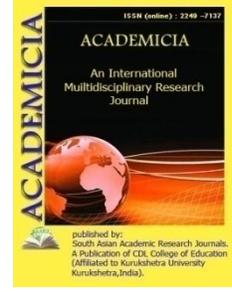

In short, the great poet of the Uzbek people Abdulla Aripov, while diligently and steadily studying the advanced creative experience of world literature, enriched them with new artistic discoveries. Through his lyrical poems and epics, he was able to demonstrate how high individual poetic thinking is. Through this, he made a worthy contribution to the development of not only Uzbek literature, but also the literary and aesthetic thinking of the peoples of the world.

REVIEW ON AUTOMATIC RAIN WATER HARVESTING

Dr. Jyotsana Pandit*

*SBAS, Sanskriti University,
 Mathura, Uttar Pradesh, INDIA
 Email id: jyotsna.sobas@sanskriti.edu.in

ABSTRACT

The purpose of this article is to examine several kinds of long-term water collecting techniques from air fogs and dew. We report on the water collection performance of different fog collectors from across the globe in this article. In addition, we look at the technical elements of fog collector feasibility studies. The increases in efficiency Bioinspired technology is often used in modern fog collecting technologies. Fog Global fog incidence clearly limits harvesting technologies. Dew water harvester, on the other hand, is it's ubiquitous, but it needs a cooled condensing surface to work. The collecting of dew water is discussed in this review. Rainy water harvesting utilizing a radiative cooling surface, solar regenerated desiccant systems, and active condensation technology are the three types of systems. All of these methods have one common goal. is the creation of an atmospheric water collector capable of producing water regardless of humidity, geographical position, cheap cost, and supplies that may be found locally.

KEYWORDS: ARM7 (Advanced Reduced Instruction Set Computer), LCD (Liquid Crystal Display), ROM (Read-only Memory), Rain.

INTRODUCTION

About $\frac{2}{3}$ of the earth surface is covered with water. However, the amount of usable water is very small. The growing population and growing industries and agricultural practices needs lots of water. The huge consumption of water is causing reduction of available water. We need to think about various ways to save and conserve water resources. One of the very important inventive measures for conservation of water is rain water harvesting. Basically water comes on the surface with rain, however it gets collected in the rivers which ultimately flows into the ocean. Which means that the usable water is lost in the ocean[1]. We can catch the rainwater and prevent it from flowing into the ocean, this is rainwater harvesting.

There are mainly two methods for rainwater harvesting:

- Rooftop rainwater harvesting: during raining rain water gets collected on the rooftop. It can be transferred to a storage tank through a pipe. Often water contains soil particles and other impurities in such case water should be filtered to remove these impurities. Water stored in this storage tank can be used to fulfill our water needs. Instead of storage tank water can also be transferred to a pit in the ground from where it saves into the soil. The saved water gets added to ground water and so the level of water increases. In both ways we can prevent water from flowing away[2].
- Roadside drains: Rainwater falling on the road gets collected in the drains. The drains can be modified so that the water entering in them get seeped into the soil or this water can be collected in a storage structure as well[3].

The classification of atmospheric water collecting methods is shown in Figure 1. Harvesting water from fog, or visible cloud water droplets or ice crystals floating in the air at or near the Earth's surface, is the first type. It usually happens as a result of more moisture in the air or a drop in the ambient air temperature[4]. Methods may be classified into two categories: conventional and contemporary. Water vapor collection is the second kind of collecting. While fog may be seen with the naked eye, water vapor is created by the evaporation of liquid water or the sublimation of ice. Dew water is produced when water vapor condenses on a surface that has been cooled below the dew point temperature of atmospheric water vapor. While fog water collecting systems are more conventional in nature, utilizing a mesh-like structure, dew water harvesting techniques use a variety of technologies. Early experiments used passive systems with radiative condensers, but due to their poor efficiency, researchers used solar-regenerated desiccant techniques to improve moisture sorption and desorption. However, this has not shown to be adequate on its own[5]. Dew water harvesting research also includes integration with active cooling condenser technology, which includes the use of traditional vapor compression air conditioning systems and, more recently, thermoelectric coolers. Due to the high efficiency of active cooling condenser systems, readers will be provided with a selection of commercially available water harvesting technologies incorporating active cooling condenser systems at the conclusion of this article.

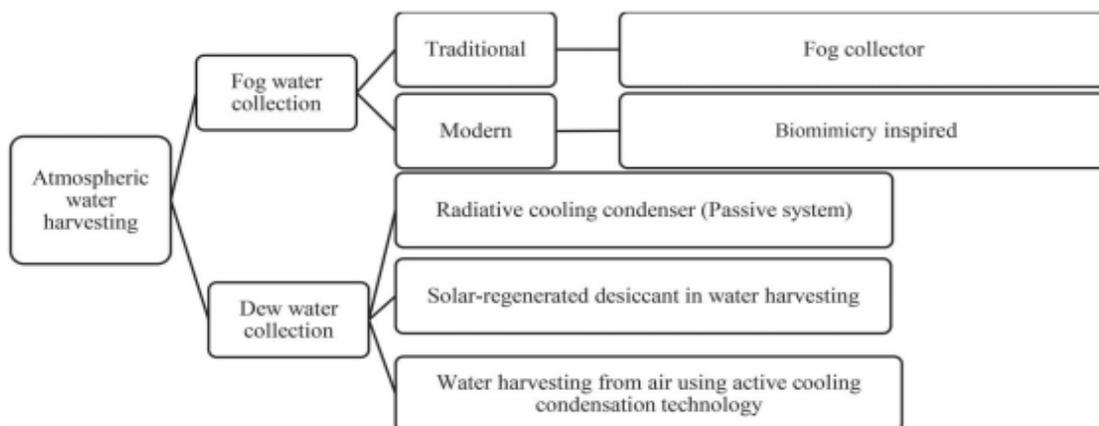

Figure 1. Illustrate the categories of atmospheric water harvesting techniques

Apart from the above methods Aqua space rainwater harvesting is one of the larger rainwater harvesting systems which can be constructed using a sub-surface rainwater exchange system[6]. This system is a revolutionary design that combines a recirculating decorative water feature with a sub-surface rain water harvesting storage system. The clean, filtered water that is stored in the sub-surface can be stored for irrigation or to maintain the water level in the decorative water feature[7]. To make this Aqua space rainwater more effective an LPC2148 controller which is an ARM7 based microcontroller with high performance of 32-bit RISC microcontroller with thumb extensions 512KB on-chip flash ROM with in-system programming and in-application programming, 32KB+8KB of data memory is used along with a raindrop sensor, LCD and an alarm, wherein the raindrop sensor will sense the rain water moisture, LCD is attached to the sensor to display whether the droplets is rain drop or not. An alarm to alert the presence of rain. Once the presence of rain is detected an input is sent to the controller and the controller makes the motor to open the valve of the pump. Then the water passes through the pump and we can further proceed to the harvesting process[7].

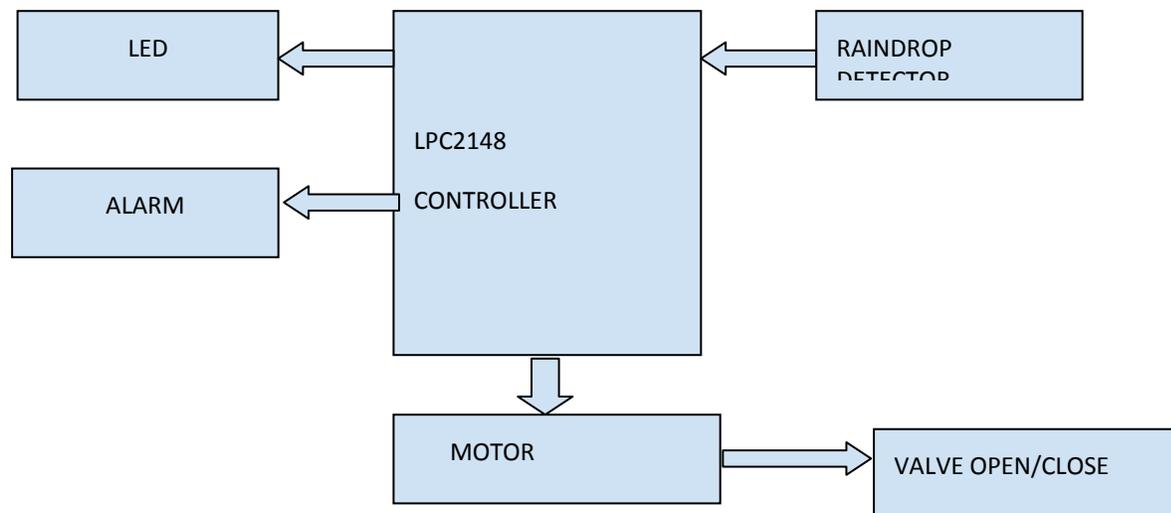

Figure 4: This figure shows the block diagram of rainwater detection and storage process wherein a LPC2148 controls the entire process of rainwater detection system. Once the detector detects the rainwater the motor opens the valve to store the water for further use[8].

This are the component used in my research paper to complete the Aqua space rainwater harvesting system using ARM7 comptroller:

1. Lpc2148
2. Raindrop sensor
3. Led
4. Alarm

Harvesting dew water

When fog droplets collide and intercept with the collecting surfaces in fog water harvesting, water is collected. However, the worldwide fog occurrence, which is highly reliant on geographical and metrological variables or circumstances, is the primary limiting factor in

collecting water from fog droplets. Only a small number of locations have climatic circumstances that allow moist air to spontaneously cool below its saturation temperature, resulting in fog[9]. As a result, fog is believed to be even less accessible than saltwater as an alternate supply of freshwater on a worldwide scale. Because water vapor is widespread in the atmosphere, freshwater may be collected at a variety of places if it is condensed by cooling. Nonetheless, the condensation process is more thermodynamically complex than fog harvesting, since it includes a large amount of heat release. Dew water is made up of water droplets that form when water vapor condenses on a surface at a temperature below the dew point temperature.

Dew water collecting methods are classified into three categories in this paper:

1. Passive (radiative) cooling condenser,
2. Desiccant renewed by the sun and
3. Active cooling condensation technique for water collection from the air.

Projects from the last 30 years to the present

Fog harvesting is prevalent in dry and semi-arid regions near the coast, where clouds develop over the water and are driven towards the mainland by the prevailing winds. When the clouds collide with the surface of the hills near the sea, they turn into fog. Various fog collection installations exist in various locations, including the Namib Desert in Africa, for both research and real-world uses[10]. The desert is well-known for its ability to gather water through fog collecting. A fascinating study was conducted to determine the quality of Namibian fog water. Three Topnaar communities in the Namib Desert were researched for fourteen SFCs. Klipneus community has the highest water collection. In terms of water quality, the first washing of SFCs produces murky, brackish water containing NaCl following a no-fog period. The water was deemed unfit for human consumption on a case-by-case basis. Despite this, the water recovered after the first washing was determined to be quite clean and low in salt concentration. In the 1980s, fifty fog catchers were used in a study experiment in Chile's Coquimbo area.

The design of fog catchers

The prevailing wind exerts pressure on the mesh in LFCs, which subsequently exerts stresses on the supporting structures, weakening or breaking the foundation. Meanwhile, UV light and other external conditions may harm the mesh and other components of LFCs. The failure of LFCs in severe weather is mostly due to a lack of a logical or designed design approach. This seems to explain the fog collector maintenance problem that the locals are having. Robust materials for fog collectors were developed utilizing stronger stainless steel mesh, coupled with poly material, to meet various environmental circumstances, such as for extremely windy locations.

Studies on the efficacy and practicality of fog collectors

A fog water collector would serve as a wind-driven fog barrier. However, the fog water collector does not disturb a part of the fog. Despite the fact that the fog collector collides with the fog, it is unable to catch all of the liquid water present in the fog.

There seem to be losses as a result of:

1. Fog circling the fog water collector.
2. Fog flowing through the mesh apertures.
3. Droplets bouncing back into the wind.

Fog interception effectiveness refers to the percentage of fog collected by the fog water collector. The caught water droplet mixed, moved to the bottom portion of the fog collector, and was delivered to the water tank through the water gutter. However, there is the possibility of re-entrainment at the water gutter, where water may return to the air flow or some water from the mesh slack, wrinkles, and folds may enter the gutter and be collected at the water tank.

Pyramid collector made of glass

- desiccant beds on shelves,
- glass pyramid collector
- A slanted wall covering
- A collecting cone
- A condenser portion affixed to the pyramid's top, shielding it from the sun. As desiccants, sawdust and cloth soaked with CaCl_2 were explored.

Overnight, the beds' coverings are left open to allow the desiccant to collect water vapor from the air. During the day, the covers are closed, allowing the beds to be heated by solar radiation, which condenses on the sides and, in particular, at the pyramid apex, where it is collected by a central cone and travels via a tube to an external container as shown in figure 1. The cloth bed system outperformed the sawdust bed system in terms of water yield.

Surface is corrugated

Introduced the use of an integrated desiccant/solar collector to harvest water from humid air, based on the concept of desiccant moisture absorption at night and simultaneous desorption and water vapor condensation during the day. During the evenings, they utilized a tiny air circulation fan to push ambient air into the glass-enclosed solar collection. A thick layer of corrugated fabric was employed as the desiccant bed in the collector as shown in figure 2. During the absorption/desorption process, the usage of a corrugated surface was intended to enhance the heat and mass transfer area.

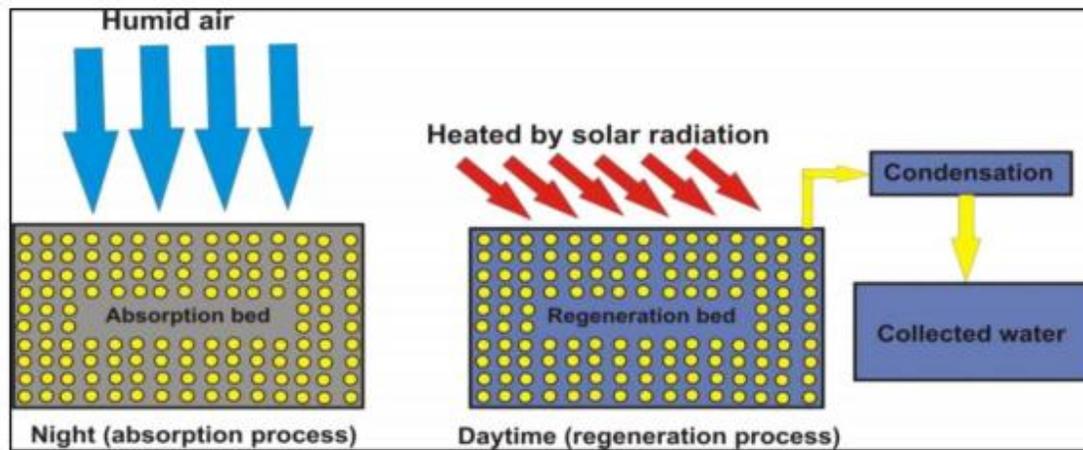

Figure 1: Wet desiccant technique for water production from atmospheric air

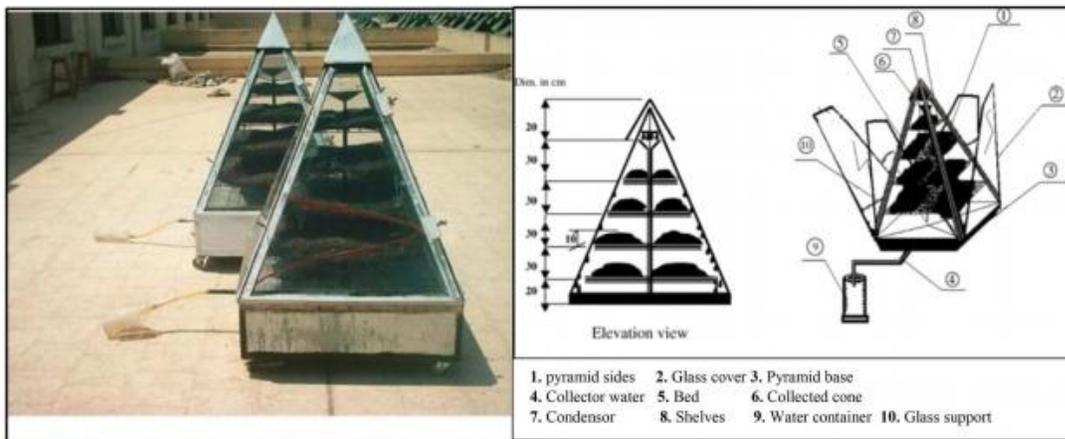

Figure 2: (a) Photograph of the system used. (b) Pyramid with glass covers open at night (right)

In this literature an lpc2148 microcontroller is interfacing with a raindrop sensor which will detect the rain, an LED to display whether the moisture is rain drop or not and an alarm attached to make an alert. The rain water detector is used in the irrigation field, home automation, communication, automobiles etc. The drawback of this literature is it just detects the raindrop not showing the method of harvesting[11]. This paper disclose creates a truly sustainable water feature using all rain water. The underground reservoirs comprise of the aqua box storage units, this are made from recyclable plastic and the modular nature of this unit allows it to put together in such configuration to meet the sight requirements for any size projects. The best thing about this system is we can drive heavy equipment over the top of the system once it is buried under the ground, it is very useful for commercial application. Aquaspace snorkel vault and centipede has a high efficiency pumping system and provides a convenient access point for inspection and maintenance. The rain exchange comes in free packets, easy to use kits and can also be customized for the larger or more unit projects. This entire process helps us to capture, filter and reuse rainwater.

DISCUSSION

One of the beautiful and easy technique is used in this project to harvest rainwater i.e. Aqua space rain water harvesting. By this technique we can capture, filter and reuse rainwater. The best thing about Aqua space rainwater storage system is it adds beauty to our home. If each and every home follows this technique, we can give rise to a green environment as green earth is degrading day by day also we will be able to store large amounts of water for our daily use. In this research paper Aqua space rainwater harvesting is successfully done using an ARM7 controller. The process starts with the detection of rainwater, once the rain water is detected an input signal to the LPC2148 controller. Then the controller converts the received input analog signal to digital signal. An output from the controller allows the LED to display the status whether the moisture is rainwater or not. If the detected moisture is rain water, then an alarm gives an alert to the authorized person and the controller sends a signal to the motor to open the valve. The open valve allows the rainwater to flow through the pipe and passes through the filtering process called Aqua space downspout filter.

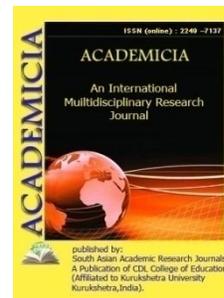

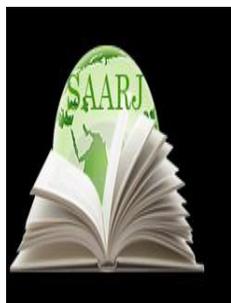

CONCLUSION

Water is a basic need in everyday life. So saving water and using it in a proper manner is very important. Here is a project by which we can check the rainwater status, so that if the water status is confirmed motor valves get activated and rain water gets harvested. This filter is located at the base of the downspout and has a 300-micron bag located inside of it. It is made for the easy removal and capture of all the leaves, twigs, sediments and seeds that are generated from the roof. From here the water goes through a pipe system into the underground modular reservoir. The revolutionary design of a rain change system combines the modular underground reservoir with a decorated water feature. The benefit of that is we get the sight and sound of the water feature combined with aeration and filtration aspects of the moving water also gives us more usable water. This creates a truly sustainable water feature using all rain water. The underground reservoirs comprise of the aqua lox storage units, this are made from recyclable plastic and the modular nature of this unit allows it to put together in such configuration to meet the sight requirements for any size projects. The best thing about this system is we can drive heavy equipment over the top of the system once it is buried under the ground, it is very useful for commercial application. Aqua space snorkel vault and centipede has a high efficiency pumping system and provides a convenient access point for inspection and maintenance. The rain exchange comes in free packets, easy to use kits and can also be customized for the larger or more unit projects. This entire process helps us to capture, filter and reuse rainwater.

ABSTRACT

An elite fluid chromatographic interaction with brilliant recognition for simultaneous examination of certain benzodiazepines (BZDs) is developed for legal screening of tainted non-cocktails. The cases were examined following a required cycle of pH correction and separation. It was done at 45°C with a variable advance of 15mM phosphate support: methanol (50:50 v/v) at a stream rate of 1.4 mL/min on a C18 segment (250 mm × 4.6 mm, 5μm). An Ultra Violet (UV) detector tuned to 245 nm was used to evaluate the column eluent. The eluting peaks were promptly discovered, recognized, and measured as a consequence of this. Calibration curves for all medicines in the 0.510 μg/mL range with a linear regression coefficient higher than 0.996. The BZDs showed recovery rates that varied from 93.7 to 108.7 percent. In addition, the detection limits were 0.03-0.05 g/mL. The detection limits were found to be between 0.01 and 0.02 μg/mL. For all BZDs at all focuses in the range of 0.45 to 7.69 percent, the coefficients of differentiation within and between days were resolved. The technique will offer an unmistakable, responsive, and fast way for screening six BZDs in contaminated sodas in legal assessment.

KEYWORDS: Alcohol, Analysis, Benzodiazepines, Chromatography, Effects, Samples, Whiskey Cream, Zolpidem.

INTRODUCTION

Non-benzodiazepines, commonly known as "Z Pills", are psychoactive medicines that are used by doctors to treat a range of sleep disorders. It is also used to relieve anxiety, relax muscles, and promote relaxation. They have benzodiazepine-like characteristics in nature. Non-benzodiazepines exhibit chemical characteristics that are different or totally separate from benzodiazepines, and are thus molecularly unrelated to them. Non-benzodiazepines are classified

into three molecular classes. Non-benzodiazepines are attractive to criminals because of their availability and synergistic interaction with alcohol. They have a strong predisposition for hypnosis, anterograde amnesia, and muscle relaxing induction. Overdose symptoms include depression in the central nervous system (CNS), impaired balance, ataxia, and slurred speech. Because of these qualities, it is a potent weapon used by criminals to lace the drinks of unsuspecting women and men in pubs and bars in order to rob, sexually harass, or kill them later[1].

Drug-Facilitated Sexual Assault (DFSA) and Drug-Facilitated Crime (DFC) are on the increase globally, including in India. Because of their availability and synergistic action with alcohol, non-benzodiazepines are attractive to offenders. Hypnosis, anterograde amnesia, and muscular relaxation induction are all prevalent among them. Depression in the central nervous system (CNS), poor balance, ataxia, and slurred speech are all signs of an overdose. It is a potent weapon used by criminals to lace the drinks of unsuspecting women and men in pubs and bars in order to rob, sexually abuse, or murder them later[2].

Drug-Assisted Sexual Assault (DFSA) and Drug-Facilitated Crime (DFC) are on the increase all over the globe, including in India. Valium and Xanax are two well-known brands. In the United States, they are among the most frequently used medicines. When individuals who don't have a prescription obtain these drugs and utilize them for their sedative effects, it's termed harassment. Since they may substantially suppress and even abolish functions that normally urge a person to avoid or even want to fight sexual harassment or abuse, benzodiazepines have been used as a "date rape" drug. The number of individuals arrested and convicted of this crime has increased significantly in recent years. The chemical is frequently added in powder or liquid form to alcoholic beverages or even soft drinks, and it has a bitter taste[3].

The actions of benzodiazepines on the synapse gamma-amino butyric acid (GABA) at the GABA receptor include calming, anticonvulsant, and muscle relaxant, hypnotic, plus anxiolytic. High dosages of some of the more limited acting benzodiazepines may potentially induce anterograde amnesia and dissociation. Long-term consequences of benzodiazepine use may include mental degeneration, as well as emotional and social problems. Feelings of choppiness, inability to think effectively, lack of sex-drive, agoraphobia and social fear, anxiety and discouragement, loss of confidence in sports activities and hobbies, and trouble to feel or express emotions are all conceivable[4].

High-Performance Thin Layer Chromatography (HPTLC) proven to be a more sophisticated kind of thin layer chromatography (TLC) that provides superior division. HPTLC definition includes established qualitative and quantitative measuring methods, as well as fulfilling all consistency requirements for usage in fully supervised settings. HPTLC is unaffected by sample type, chromatogram growth, or detection. HPTLC offers the following benefits over other chromatographic techniques[5].

- Less time spent inspecting, 3 to 20 minutes for a good division.
- Recognition affectability is 5 to 10 times better than conventional TLC.
- Quantitative examination needs highly repeatable, crisp groupings.
- Easy coupling with bioassays, making it especially suitable for impact-coordinated analysis.

- After assessment, specified zones may be consumed by mass spectrometry (MS), so there's no need to record each run, including grid and foundation.

LITERATURE SURVEY

U. Busto *et al.* explored that to compare the pharmacology and habit auction of bretazenil, a fractional benzodiazepine agonist, across various sections to the immediate effects of diazepam and alprazolam. A fake treatment, within subject, randomized, twofold visually impaired preliminary aroused the interest of 28 male volunteers. They were non-subordinate CNS depressant buyers at this time, competent to identify 150 mg secobarbital from fake treatment with fantastic emotional benefits. Subjects were given fake treatment and the two center dosages of diazepam, bretazenil, and alprazolam for the first 7 days of the trial, followed by either the most severe or least portion of each medication for the following 3 days, depending on their clinical response. To quantify pharmacological results, researchers utilized goal measures (e.g., psychomotor execution), subject-appraised questionnaires (e.g., Profile of Mood States), and spectator-evaluated scales. Every one of the three prescriptions could be identified from fake treatment in the majority of tests. When it comes to portion-related psychomotor and memory impairment, bretazenil beats diazepam and alprazolam. Both alprazolam and diazepam raised subject and eyewitness evaluated sleepiness and like in a portion dependent way, while bretazenil increased sedation and loving in a part independent method. The results of the research supported the hypothesis that bretazenil has an incomplete agonist pharmacological profile. Bretazenil has a lower probability of misuse than diazepam and alprazolam, as shown by abstract effect estimates, which are important for assessing maltreatment responsibility[6].

G. Darcourt *et al.* presented in the article that zolpidem refers to a novel class of hypnotic medicines with a neuro pharmacological profile different from those previously accessible. In rats, it produces soothing or mesmerizing effects at much lower doses than relaxant effects. Zolpidem is used to address a sleeping problem for a short length of time in therapeutic treatment. When given several times absence of dynamic short course of movement lasting effects experimental. Polysomnographic data indicates that zolpidem produces a sleeping pattern that is similar to physiological sleep, and that abrupt cessation has minimal or only mild impacts on sleep architecture. During its clinical development and post-marketing experience, data from active volunteers and patients, both adult and elderly, were utilized to study elements of zolpidem's general safety. When administered according to the prescription recommendations, zolpidem tends to be well tolerated in adults and the elderly. According to the current data, the likelihood of aggression or dependence in these circumstances is extremely low[7].

G. Famigliniet *al.* articulated in the article that Benzodiazepines (BDZs) are frequently utilized in clinical practice as tranquilizers and antidepressants. However, due of their extensive availability and synergistic effects with alcohol, they are attractive to criminals. In certain instances, analyzing alcohol buildups from a crime scene is needed to identify criminal conduct for legal purposes. Milk-based beverages (bourbon creams) are becoming more popular owing to their decreased alcohol level and great taste. Traditional analytical methods may be unable to distinguish the presence of opiates or other chemicals owing to the complexity of this instance, which includes proteins and unsaturated fats. Due to these features, bourbon creams are suitable for illicit applications. In this research, eight BDZs were identified from bourbon cream and broken down using MS. The QuEChERS convention is fast, simple, compact, powerful, robust, and safe, and it can effectively remove much of the grid from the target mixture while still

obtaining acceptable recovery rates. The technique described is simple and fast, and it has been evaluated for accuracy, consistency, and recovery. Individually, the ID and evaluation limits were 0.02-0.1 mg/mL and 0.1-0.5 mg/mL. Bourbon cream drinks were gathered and tested in the wake after being maintained with business prescriptions at a convergence of 20 mg/mL, demonstrating the method's usefulness in forensic research[8].

M. G. Griswold *et al.* pointed towards the fact in the article although alcohol use is a major cause of mortality and injury, its overall connection with health is complex owing to the possible preventative benefits of moderate alcohol intake on certain diseases. The Global Burden of Diseases, Injuries, and Risk Factors Study 2016 utilized our quantitative method to deal with health bookkeeping to increase evaluations of liquor utilization, liquor inferred passing, and handicap altered more seasoned. Utilizing six-hundred-ninety-four data wellsprings of individual plus populace level liquor use, as well as 592 planned and review concentrates on the danger of liquor use, the creator assessed the commonness of current drinking, abstention, the dissemination of liquor use among current consumers in standard beverages every day (defined as 10 g of unadulterated ethyl liquor), and liquor inferred passing. Unlike earlier predictions, the inventor made many methodological advances. To begin, creator revised liquor marketing forecasts to account for unrecorded and guest use; second, creator led impacts connected to liquor use; then third, creator developed a new method to evaluate the degree of liquor use that lowers the anticipated danger to a person's prosperity. Ends: In 2016, alcohol consumption was the seventh largest cause of death and disability-adjusted life years (DALYs) worldwide, accounting for 22 percent (95 percent vulnerability span (UI) (1.5-3.0) old enough normalized female passing and 68 percent (5.8-8.0) old enough normalized male passing. In 2016, alcohol consumption was the main cause of mortality among people aged 15 to 49 years old all over the globe, accounting for 38 percent (95 percent UI 32-43) of female fatalities and 122 percent (108-136) of male deaths. In the population aged 15-49 years, female inferable DALYs were 23 percent (95 percent UI 2.0-2.6) and male inferable DALYs were 89 percent (7.8-9) inferable. Tuberculosis (14 percent (95 percent UI 1.0-1.7) of total passing), car accidents (12 percent (0.7-1.9), and self-injury (11 percent (0.6-1.5)) were the three main causes of inferred passing across this age range. In 2016, malignancies accounted for a substantial percentage of all liquor inferable passing, accounting for 27.1 percent (95 percent UI 21.3-233.3) of all out liquor inferable female passing and 18.9 percent (15.3-22.6) of all absolute liquor inferable male passing in populations aged 50 and older. Zero standard drinks for seven days was the measure of liquor consumption that produced the least degree of harm in terms of all wellbeing characteristics (95 percent UI 0.0-0.8). (95 percent UI 0.0-0.8). Liquor misuse is a significant contributor to worldwide illness burden and has far-reaching implications for one's health. Creator found that the danger of all-cause mortality, especially malignant growths, increases with rising levels of usage, with zero being the lowest degree of use that lowers health hazards. These results indicate that worldwide alcohol control efforts should be refocused on methods to decrease overall population-level consumption. The Bill and Melinda Gates Foundation is getting money[9].

H. K.J. *et al.* explained in the article that zolpidem is an imidazopyridine that is used to treat a sleeping disorder (recommended dosage: 10 mg/day in adults, 5 or 10 mg/day in the elderly or patients with hepatic impairment) for a short length of time (<four weeks). Information indicates that zolpidem's mesmerizing adequacy is similar to non-benzodiazepine, triazolam, temazepam,

nitrazepam, flurazepam, plus flunitrazepam, as well as benzodiazepines captivating experts like elderly besides grown-up individuals with a sleeping problem. The practicality of zolpidem and zaleplon, a newly accessible non-benzodiazepine hypnotic medication, determined. There is no evidence of insusceptibility mesmerizing set of preparatory lessons that lasted a half year. A few of people who have been taking the drug at higher doses for a long time have acquired resistance. Zolpidem is extremely well accepted by people with sleeping problems, with the most well-known adverse effects being queasiness, discombobulation, and drowsiness. Despite the fact that zolpidem had approximately memory aside psychomotor side effects in no effect the following day (remembering impacts on day-time prosperity and morning coordination). It was comparable to or similar to flunitrazepam and flurazepam in people with sleep loss, precisely as different benzodiazepines. In general, zolpidem has a minimal risk for abuse. Zolpidem is safe sleep deficit, particularly the elderly. When given at night, impact affects memory then psychomotor function the following day. Furthermore, there is no substantiation of protection from the attraction of bounce back sleep deprivation or withdrawal symptoms following cessation of the medication, whether managed as recommended or for longer durations[10].

GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)

Smaller, volatile compounds like benzenes, alcohols, and aromatics, as well as basic molecules like steroids, fatty acids, and hormones, are best examined using GC/MS. It may also be used to examine fluid, vaporous, and strong occurrences. Only a few of the benefits of utilizing GC/MS for compound research include the capacity to separate complex blends, measure analyses, and evaluate follow measures of natural pollutants. In GC/MS, the gas chromatograph is where the material is volatilized. The example (the gas stage) is substantially fragmented and separated by a hair like segment loaded with a fixed (strong) stage. The mixtures are driven by an inactive transporter gas such as argon, hydrogen, or nitrogen. As the segments get restricted, they elute from the section at different intervals, which is referred to as their maintenance times. After the materials leave the GC section, the mass spectrometer utilizes electron or substance ionization sources to ionize them. Ionized particles are first propelled into the instrument's mass analyzer, which is typically a fourfold or particle trap. Particles are divided here according to their mass-to-charge (m/z) ratios. The following stages in the process involve particle identification and examination, with compound pinnacles forming as a consequence of their m/z proportions.

HIGH PERFORMANCE LIQUID CHROMATOGRAPHY (HPLC)

Fluid chromatography with a high aim is basically a more sophisticated form of section chromatography. Instead of letting a fluid to flow normally into a portion, it is pushed through at high pressures of up to 400 airs. Following that, it turns out to be significantly faster. It also enables you to select a smaller molecule size for the section pressing material, giving in a greater surface area for interactions with the stationary stage and the particles moving through it. This makes segmenting the blend's parts a lot simpler. The methods for discovery that may be utilized are also a major advance over segment chromatography. This technology is extremely automated and flexible. Fluid chromatography (LC), fluid strong chromatography (LSC), and fluid chromatography (FC) are all examples of HPLC. Superior fluid chromatography is the most current technique. The fixed stage on a strong help can be either a strong or a fluid. The cycles involved for stage spread include surface ingestion, particle trading, relative solubility, and steric effects. According to the Economic Times of India, the country's law enforcement authorities seized a significant amount of prescription medicines in 2015, including Alprazolam pills,

Zolpidem Tramadol tablets, and Sildenafil tablets. According to the Narcotics Control Bureau, the quick availability of illicit narcotics in India, as well as the country's weak regulations, makes it simple for them to be transported to other nations.

DISCUSSION

1. Determination of Six Benzodiazepines in Spiked Soft Drinks at the Same Time:

An elite concurrent assessment of all benzodiazepines (BZDs) is developed for quantitative showing of contaminated non-cocktails. The instances are investigated following a significant interaction of pH rectification and segment (250 mm×4.59 mm, 5m) at 45oC with a flexible advance of 15 mM phosphate.

The cradle was evaluated using a UV identifier at 245 nm and methanol (50:50 v/v) at a stream rate of 1.4 mL/min. The eluting tops were rapidly detected, differentiated, and evaluated as a consequence. Adjustment bends for all medications having a straight relapse coefficient higher than 0.996 in the 0.5-10 g/mL range. The recovery rates for the BZDs varied from 93.7 percent to 108.7 percent. As far as possible, the values were determined to be between 0.01 and 0.02 g/mL. The coefficients of contrast within and between days for all BZDs at all fixations in the scope of 0.45 to 7.69 percent were resolved. In scientific evaluation, the approach will offer an unmistakable, responsive, and quick method for screening six BZDs in contaminated soda pops. GC is one of the most frequently utilized techniques, although it takes time and requires hydrolysis before study. These methods surpass immunological procedures as well as colorimetric and spectrophotometric approaches in terms of accuracy and sensitivity, and are typically more suited for thermally labile substances than GC. HPLC is typically quicker than GC and does not require derivatization or hydrolysis prior to inspection.

An Agilent chromatograph was utilized for the HPLC study. The chromatographic framework comprises of dissolvable syphon, segment broiler, UV-Visible finder (G1314B, Agilent), and information framework. With simple sample preparation, this method is accurate, precise, sensitive, and linear. This method may be utilized in clinical and forensic toxicology to evaluate BZD residue at different concentrations.

2. Rapid Benzodiazepine Measurement in a Milk-Based Alcoholic Beverage:

This research shows a straightforward technique for detecting and measuring eight common BDZs in a bourbon cream refreshment for business. The instances were extracted using the quick, simple, (QuEChERS) convention, which resulted in acceptable recoveries. This method lowers lattice results, resulting in an inject able concentrate with appropriate inspection fixations. Using GC-MS in chosen particle checking mode, quantitative estimations of BDZs were achieved without analytic derivatization. The method was evaluated utilizing medazep to verify repeatability, alongside restoration testing on sustained bourbon cream mixed drink testing. MEs (structural effects) were also examined and found to be helpful. The QuEChERS method, which was used to evaluate BDZs in milk-based cocktails, offers a fast, accurate, and reasonable tool for scientific toxicological evaluations. The technique may be utilized to validate the identification of additional BDZs identified in DFC bourbon cream deposits. To guarantee cycle created may be used upon deposits beginning with part of bourbon revitalized with different business medicines including BDZs. These synthetic samples are nearly similar to real DFC sample remnants used in forensic investigations. This is because the BDZ were purchased as

industrial preparations at a pharmacy. Except for flunitrazepam, which was available in capsules, others were in liquid solution form. The built-up BDZ convergences were 20 mg/mL, which was greater than the fixations observed in DFC instances. While larger focuses may be detected in police records, it was not considered essential to spike the instances in our study fixations soon faded. For convention alongside GC-MS testing, sustained bourbon cream tests were dissected. The recovery data was utilized to update the examples' most recent findings. This approach required the accurate identification and assessment of the increased BDZs in all instances. The results are consistent with the amounts of BDZs observed in a bourbon cream flavored with cayenne pepper.

3. Determination of Six Benzodiazepines in Spiked Soft Drinks at the Same Time:

The use of benzodiazepines in the treatment of neuropsychological disorders is widespread. They're also utilized to treat abstinence from alcohol and narcotics. They are occasionally used as recreational drugs and may result in accidental or intentional poisoning. They're also utilized as food and alcohol adulterants, as well as a tool in drug-assisted sexual assaults and crimes. The most common method for analysis is gas chromatography (GC), however GC is time intensive and needs hydrolysis or derivatization of the material. A fast, delicate, and simple HPLC technique with brilliant identification was utilized to synchronise the assurance of six benzodiazepines (chlordiazepoxide, clonazepam, diazepam, flurazepam, lorazepam, and midazolam) in non-alcoholic organic product based drinks for measured use. The HPLC method amounts of every BZDs given separately at three dissimilar fixations (10.0 g/mL, 4.0 g/mL, and 1.0 g/mL) to testing matching the usual load of the specific BZDs focuses. The recovery of these medicines was also evaluated in samples containing 120 percent, 100 percent, and 80 percent BZDs, respectively.

There is no incursion from the blank sample matrix in this instance. With simple sample preparation, this method is accurate, precise, sensitive, and linear. This method may be utilized in clinical and forensic toxicology to evaluate BZD residue at different concentrations. HPTLC is considerably more expensive than other chromatographic techniques. However, unlike GC-MS, which requires derivatization or hydrolysis, no sample preparation is required here. The method identifies and calculates the content of benzodiazepines in beverages with excellent sensitivity and accuracy.

4. Rapid Benzodiazepine Measurement in a Milk-Based Beverage:

The study's aim was to quantify the quantity of benzodiazepines in a milk-based cocktail. In this instance, the extraction method utilized was QuEChERS. The instrumentation equipment utilized in this research was a GC-MS. The aim of this research was to look at the relevance of benzodiazepines as a date assault medication as well as a therapy for DFSA and DFC.

Non-designated compounds in the grid may have a substantial effect on analytic assessment, producing signal degradation or improvement, benchmark uproar, and other annoyances. The Framework Effect (ME) refers to the effect that co-eluting compounds have on ionization ability. While ME are more well-known study, because to the high degree of example lattice complexity in particular industries, it is better to remember ME evaluation for the framework approval measure. As a consequence, unwanted obstructions from network objects or other interfering combinations may be minimized. Following the tests were gathered using QuEChERS plus evaluated using GC-MS. The bulk of compound recovery rates are in the 50 percent range,

which is normal with QuEChERS for a highly challenging lattice. Despite this, the repeatability is high in the present scenario, as shown by the percent. Only bromazepam showed a helpless recovery (8.89 percent) (8.89 percent). Despite this, the focus is considerably smaller than that observed in DFC testing. Bromazepam's degree of recovery is similar with that of the other BDZs. The findings indicate that QuEChERS is eager to put to use, and that it may easily be automated to recover a few samples rapidly. Other extraction techniques employed on this grid produced a much more negative outcome for the compounds selected. Despite the fact that the findings produced with QuEChERS aren't ideal, the speed, reproducibility, and simplicity of use make this method acceptable for this application when severe affectability isn't required. It's important to highlight that anticipated fixations in real-world circumstances are much higher than our method.

In this study, the QuEChERS technique of extraction was shown to be extremely simple and efficient. This method may be used to examine even extremely tiny amounts of material, which are typical of the quantity of sample found at a crime scene. This method may be used to remove benzodiazepines from various beverages, such as energy or fruit drinks. The chromatograms indicate that there are no interferences that may produce erroneous results. As a consequence, GC-MS may be utilized as a trustworthy tool for detecting and quantifying benzodiazepines in milk-based alcoholic drinks. When coupled with QuEChERS, GC-MS is a powerful instrument. Other techniques, like as HPTLC, offer better accuracy and performance. In contrast to other methods, the sensitivity is low. Some matrix molecules, on the other hand, produce less interference.

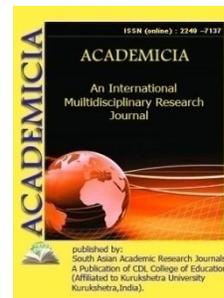

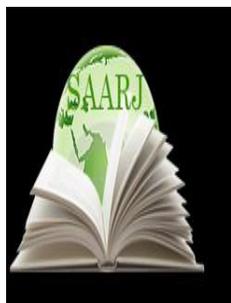

CONCLUSION

The findings of this article, based on an analysis of numerous studies on the identification, isolation, assessment, and quantification of benzodiazepines and zolpidem in beverages, show that, while there are various methods for extracting and estimating BZDs and zolpidem from beverages, most of the approaches have advantages and disadvantages. The various methods have varying degrees of accuracy and sensitivity. Several methods have been proposed. When comparing HPLC and HPTLC techniques to GC-MS and TLC methods, it was found that HPLC and HPTLC techniques are the most effective approaches. TLC and GC-MS are both cheap and simple to use, however they are not particularly sensitive. Furthermore, with these techniques, the quantity of matrix chemicals that interact with quantification is considerably greater. These may have a delirious effect on the result of the research. Since the accuracy of the data is essential, HPLC and HPTLC are the most effective techniques. Hydrolysis or any other kind of derivatization is also required for GC. TLC is in the same boat. HPTLC and HPLC, on the other hand, require little or no sample planning.

The cost of HPLC and HPTLC is considerably greater than that of TLC and GC. They are more adaptable and require less experience. In these procedures, the accuracy of the findings is considerably higher. More research on identifying benzodiazepines and non-benzodiazepines (zolpidem) in drinks is needed. This is how they are being utilized at an unprecedented speed for drug-assisted sexual abuse and drug-assisted crimes. They're also utilized for both purposeful and accidental poisonings. The combination of alcohol and BZDs is very dangerous. It is essential to develop new techniques for better determining and quantifying these medicines in drinks. Which will help law enforcement and forensic specialists in identifying them in a cost-effective, time-saving, and simple manner.

ABSTRACT

An elite fluid chromatographic interaction with brilliant recognition for simultaneous examination of certain benzodiazepines (BZDs) is developed for legal screening of tainted non-cocktails. The cases were examined following a required cycle of pH correction and separation. It was done at 45°C with a variable advance of 15mM phosphate support: methanol (50:50 v/v) at a stream rate of 1.4 mL/min on a C18 segment (250 mm × 4.6 mm, 5μm). An Ultra Violet (UV) detector tuned to 245 nm was used to evaluate the column eluent. The eluting peaks were promptly discovered, recognized, and measured as a consequence of this. Calibration curves for all medicines in the 0.510 μg/mL range with a linear regression coefficient higher than 0.996. The BZDs showed recovery rates that varied from 93.7 to 108.7 percent. In addition, the detection limits were 0.03-0.05 g/mL. The detection limits were found to be between 0.01 and 0.02 μg/mL. For all BZDs at all focuses in the range of 0.45 to 7.69 percent, the coefficients of differentiation within and between days were resolved. The technique will offer an unmistakable, responsive, and fast way for screening six BZDs in contaminated sodas in legal assessment.

KEYWORDS: Alcohol, Analysis, Benzodiazepines, Chromatography, Effects, Samples, Whiskey Cream, Zolpidem.

INTRODUCTION

Non-benzodiazepines, commonly known as "Z Pills", are psychoactive medicines that are used by doctors to treat a range of sleep disorders. It is also used to relieve anxiety, relax muscles, and promote relaxation. They have benzodiazepine-like characteristics in nature. Non-benzodiazepines exhibit chemical characteristics that are different or totally separate from benzodiazepines, and are thus molecularly unrelated to them. Non-benzodiazepines are classified

into three molecular classes. Non-benzodiazepines are attractive to criminals because of their availability and synergistic interaction with alcohol. They have a strong predisposition for hypnosis, anterograde amnesia, and muscle relaxing induction. Overdose symptoms include depression in the central nervous system (CNS), impaired balance, ataxia, and slurred speech. Because of these qualities, it is a potent weapon used by criminals to lace the drinks of unsuspecting women and men in pubs and bars in order to rob, sexually harass, or kill them later[1].

Drug-Facilitated Sexual Assault (DFSA) and Drug-Facilitated Crime (DFC) are on the increase globally, including in India. Because of their availability and synergistic action with alcohol, non-benzodiazepines are attractive to offenders. Hypnosis, anterograde amnesia, and muscular relaxation induction are all prevalent among them. Depression in the central nervous system (CNS), poor balance, ataxia, and slurred speech are all signs of an overdose. It is a potent weapon used by criminals to lace the drinks of unsuspecting women and men in pubs and bars in order to rob, sexually abuse, or murder them later[2].

Drug-Assisted Sexual Assault (DFSA) and Drug-Facilitated Crime (DFC) are on the increase all over the globe, including in India. Valium and Xanax are two well-known brands. In the United States, they are among the most frequently used medicines. When individuals who don't have a prescription obtain these drugs and utilize them for their sedative effects, it's termed harassment. Since they may substantially suppress and even abolish functions that normally urge a person to avoid or even want to fight sexual harassment or abuse, benzodiazepines have been used as a "date rape" drug. The number of individuals arrested and convicted of this crime has increased significantly in recent years. The chemical is frequently added in powder or liquid form to alcoholic beverages or even soft drinks, and it has a bitter taste[3].

The actions of benzodiazepines on the synapse gamma-amino butyric acid (GABA) at the GABA receptor include calming, anticonvulsant, and muscle relaxant, hypnotic, plus anxiolytic. High dosages of some of the more limited acting benzodiazepines may potentially induce anterograde amnesia and dissociation. Long-term consequences of benzodiazepine use may include mental degeneration, as well as emotional and social problems. Feelings of choppiness, inability to think effectively, lack of sex-drive, agoraphobia and social fear, anxiety and discouragement, loss of confidence in sports activities and hobbies, and trouble to feel or express emotions are all conceivable[4].

High-Performance Thin Layer Chromatography (HPTLC) proven to be a more sophisticated kind of thin layer chromatography (TLC) that provides superior division. HPTLC definition includes established qualitative and quantitative measuring methods, as well as fulfilling all consistency requirements for usage in fully supervised settings. HPTLC is unaffected by sample type, chromatogram growth, or detection. HPTLC offers the following benefits over other chromatographic techniques[5].

- Less time spent inspecting, 3 to 20 minutes for a good division.
- Recognition affectability is 5 to 10 times better than conventional TLC.
- Quantitative examination needs highly repeatable, crisp groupings.
- Easy coupling with bioassays, making it especially suitable for impact-coordinated analysis.

- After assessment, specified zones may be consumed by mass spectrometry (MS), so there's no need to record each run, including grid and foundation.

LITERATURE SURVEY

U. Busto *et al.* explored that to compare the pharmacology and habit auction of bretazenil, a fractional benzodiazepine agonist, across various sections to the immediate effects of diazepam and alprazolam. A fake treatment, within subject, randomized, twofold visually impaired preliminary aroused the interest of 28 male volunteers. They were non-subordinate CNS depressant buyers at this time, competent to identify 150 mg secobarbital from fake treatment with fantastic emotional benefits. Subjects were given fake treatment and the two center dosages of diazepam, bretazenil, and alprazolam for the first 7 days of the trial, followed by either the most severe or least portion of each medication for the following 3 days, depending on their clinical response. To quantify pharmacological results, researchers utilized goal measures (e.g., psychomotor execution), subject-appraised questionnaires (e.g., Profile of Mood States), and spectator-evaluated scales. Every one of the three prescriptions could be identified from fake treatment in the majority of tests. When it comes to portion-related psychomotor and memory impairment, bretazenil beats diazepam and alprazolam. Both alprazolam and diazepam raised subject and eyewitness evaluated sleepiness and like in a portion dependent way, while bretazenil increased sedation and loving in a part independent method. The results of the research supported the hypothesis that bretazenil has an incomplete agonist pharmacological profile. Bretazenil has a lower probability of misuse than diazepam and alprazolam, as shown by abstract effect estimates, which are important for assessing maltreatment responsibility[6].

G. Darcourt *et al.* presented in the article that zolpidem refers to a novel class of hypnotic medicines with a neuro pharmacological profile different from those previously accessible. In rats, it produces soothing or mesmerizing effects at much lower doses than relaxant effects. Zolpidem is used to address a sleeping problem for a short length of time in therapeutic treatment. When given several times absence of dynamic short course of movement lasting effects experimental. Polysomnographic data indicates that zolpidem produces a sleeping pattern that is similar to physiological sleep, and that abrupt cessation has minimal or only mild impacts on sleep architecture. During its clinical development and post-marketing experience, data from active volunteers and patients, both adult and elderly, were utilized to study elements of zolpidem's general safety. When administered according to the prescription recommendations, zolpidem tends to be well tolerated in adults and the elderly. According to the current data, the likelihood of aggression or dependence in these circumstances is extremely low[7].

G. Famiglietti *et al.* articulated in the article that Benzodiazepines (BDZs) are frequently utilized in clinical practice as tranquilizers and antidepressants. However, due of their extensive availability and synergistic effects with alcohol, they are attractive to criminals. In certain instances, analyzing alcohol buildups from a crime scene is needed to identify criminal conduct for legal purposes. Milk-based beverages (bourbon creams) are becoming more popular owing to their decreased alcohol level and great taste. Traditional analytical methods may be unable to distinguish the presence of opiates or other chemicals owing to the complexity of this instance, which includes proteins and unsaturated fats. Due to these features, bourbon creams are suitable for illicit applications. In this research, eight BDZs were identified from bourbon cream and broken down using MS. The QuEChERS convention is fast, simple, compact, powerful, robust, and safe, and it can effectively remove much of the grid from the target mixture while still

obtaining acceptable recovery rates. The technique described is simple and fast, and it has been evaluated for accuracy, consistency, and recovery. Individually, the ID and evaluation limits were 0.02-0.1 mg/mL and 0.1-0.5 mg/mL. Bourbon cream drinks were gathered and tested in the wake after being maintained with business prescriptions at a convergence of 20 mg/mL, demonstrating the method's usefulness in forensic research[8].

M. G. Griswold *et al.* pointed towards the fact in the article although alcohol use is a major cause of mortality and injury, its overall connection with health is complex owing to the possible preventative benefits of moderate alcohol intake on certain diseases. The Global Burden of Diseases, Injuries, and Risk Factors Study 2016 utilized our quantitative method to deal with health bookkeeping to increase evaluations of liquor utilization, liquor inferred passing, and handicap altered more seasoned. Utilizing six-hundred-ninety-four data wellsprings of individual plus populace level liquor use, as well as 592 planned and review concentrates on the danger of liquor use, the creator assessed the commonness of current drinking, abstention, the dissemination of liquor use among current consumers in standard beverages every day (defined as 10 g of unadulterated ethyl liquor), and liquor inferred passing. Unlike earlier predictions, the inventor made many methodological advances. To begin, creator revised liquor marketing forecasts to account for unrecorded and guest use; second, creator led impacts connected to liquor use; then third, creator developed a new method to evaluate the degree of liquor use that lowers the anticipated danger to a person's prosperity. Ends: In 2016, alcohol consumption was the seventh largest cause of death and disability-adjusted life years (DALYs) worldwide, accounting for 22 percent (95 percent vulnerability span (UI) (1.5-3.0) old enough normalized female passing and 68 percent (5.8-8.0) old enough normalized male passing. In 2016, alcohol consumption was the main cause of mortality among people aged 15 to 49 years old all over the globe, accounting for 38 percent (95 percent UI 32-43) of female fatalities and 122 percent (108-136) of male deaths. In the population aged 15-49 years, female inferable DALYs were 23 percent (95 percent UI 2.0-2.6) and male inferable DALYs were 89 percent (7.8-9) inferable. Tuberculosis (14 percent (95 percent UI 1.0-1.7) of total passing), car accidents (12 percent (0.7-1.9), and self-injury (11 percent (0.6-1.5)) were the three main causes of inferred passing across this age range. In 2016, malignancies accounted for a substantial percentage of all liquor inferable passing, accounting for 27.1 percent (95 percent UI 21.3-233.3) of all out liquor inferable female passing and 18.9 percent (15.3-22.6) of all absolute liquor inferable male passing in populations aged 50 and older. Zero standard drinks for seven days was the measure of liquor consumption that produced the least degree of harm in terms of all wellbeing characteristics (95 percent UI 0.0-0.8). (95 percent UI 0.0-0.8). Liquor misuse is a significant contributor to worldwide illness burden and has far-reaching implications for one's health. Creator found that the danger of all-cause mortality, especially malignant growths, increases with rising levels of usage, with zero being the lowest degree of use that lowers health hazards. These results indicate that worldwide alcohol control efforts should be refocused on methods to decrease overall population-level consumption. The Bill and Melinda Gates Foundation is getting money[9].

H. K.J. *et al.* explained in the article that zolpidem is an imidazopyridine that is used to treat a sleeping disorder (recommended dosage: 10 mg/day in adults, 5 or 10 mg/day in the elderly or patients with hepatic impairment) for a short length of time (<four weeks). Information indicates that zolpidem's mesmerizing adequacy is similar to non-benzodiazepine, triazolam, temazepam,

nitrazepam, flurazepam, plus flunitrazepam, as well as benzodiazepines captivating experts like elderly besides grown-up individuals with a sleeping problem. The practicality of zolpidem and zaleplon, a newly accessible non-benzodiazepine hypnotic medication, determined. There is no evidence of insusceptibility mesmerizing set of preparatory lessons that lasted a half year. A few of people who have been taking the drug at higher doses for a long time have acquired resistance. Zolpidem is extremely well accepted by people with sleeping problems, with the most well-known adverse effects being queasiness, discombobulation, and drowsiness. Despite the fact that zolpidem had approximately memory aside psychomotor side effects in no effect the following day (remembering impacts on day-time prosperity and morning coordination). It was comparable to or similar to flunitrazepam and flurazepam in people with sleep loss, precisely as different benzodiazepines. In general, zolpidem has a minimal risk for abuse. Zolpidem is safe sleep deficit, particularly the elderly. When given at night, impact affects memory then psychomotor function the following day. Furthermore, there is no substantiation of protection from the attraction of bounce back sleep deprivation or withdrawal symptoms following cessation of the medication, whether managed as recommended or for longer durations[10].

GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)

Smaller, volatile compounds like benzenes, alcohols, and aromatics, as well as basic molecules like steroids, fatty acids, and hormones, are best examined using GC/MS. It may also be used to examine fluid, vaporous, and strong occurrences. Only a few of the benefits of utilizing GC/MS for compound research include the capacity to separate complex blends, measure analyses, and evaluate follow measures of natural pollutants. In GC/MS, the gas chromatograph is where the material is volatilized. The example (the gas stage) is substantially fragmented and separated by a hair like segment loaded with a fixed (strong) stage. The mixtures are driven by an inactive transporter gas such as argon, hydrogen, or nitrogen. As the segments get restricted, they elute from the section at different intervals, which is referred to as their maintenance times. After the materials leave the GC section, the mass spectrometer utilizes electron or substance ionization sources to ionize them. Ionized particles are first propelled into the instrument's mass analyzer, which is typically a fourfold or particle trap. Particles are divided here according to their mass-to-charge (m/z) ratios. The following stages in the process involve particle identification and examination, with compound pinnacles forming as a consequence of their m/z proportions.

HIGH PERFORMANCE LIQUID CHROMATOGRAPHY (HPLC)

Fluid chromatography with a high aim is basically a more sophisticated form of section chromatography. Instead of letting a fluid to flow normally into a portion, it is pushed through at high pressures of up to 400 airs. Following that, it turns out to be significantly faster. It also enables you to select a smaller molecule size for the section pressing material, giving in a greater surface area for interactions with the stationary stage and the particles moving through it. This makes segmenting the blend's parts a lot simpler. The methods for discovery that may be utilized are also a major advance over segment chromatography. This technology is extremely automated and flexible. Fluid chromatography (LC), fluid strong chromatography (LSC), and fluid chromatography (FC) are all examples of HPLC. Superior fluid chromatography is the most current technique. The fixed stage on a strong help can be either a strong or a fluid. The cycles involved for stage spread include surface ingestion, particle trading, relative solubility, and steric effects. According to the Economic Times of India, the country's law enforcement authorities seized a significant amount of prescription medicines in 2015, including Alprazolam pills,

Zolpidem Tramadol tablets, and Sildenafil tablets. According to the Narcotics Control Bureau, the quick availability of illicit narcotics in India, as well as the country's weak regulations, makes it simple for them to be transported to other nations.

DISCUSSION

5. *Determination of Six Benzodiazepines in Spiked Soft Drinks at the Same Time:*

An elite concurrent assessment of all benzodiazepines (BZDs) is developed for quantitative showing of contaminated non-cocktails. The instances are investigated following a significant interaction of pH rectification and segment (250 mm×4.59 mm, 5m) at 45oC with a flexible advance of 15 mM phosphate.

The cradle was evaluated using a UV identifier at 245 nm and methanol (50:50 v/v) at a stream rate of 1.4 mL/min. The eluting tops were rapidly detected, differentiated, and evaluated as a consequence. Adjustment bends for all medications having a straight relapse coefficient higher than 0.996 in the 0.5-10 g/mL range. The recovery rates for the BZDs varied from 93.7 percent to 108.7 percent. As far as possible, the values were determined to be between 0.01 and 0.02 g/mL. The coefficients of contrast within and between days for all BZDs at all fixations in the scope of 0.45 to 7.69 percent were resolved. In scientific evaluation, the approach will offer an unmistakable, responsive, and quick method for screening six BZDs in contaminated soda pops. GC is one of the most frequently utilized techniques, although it takes time and requires hydrolysis before study. These methods surpass immunological procedures as well as colorimetric and spectrophotometric approaches in terms of accuracy and sensitivity, and are typically more suited for thermally labile substances than GC. HPLC is typically quicker than GC and does not require derivatization or hydrolysis prior to inspection.

An Agilent chromatograph was utilized for the HPLC study. The chromatographic framework comprises of dissolvable syphon, segment broiler, UV-Visible finder (G1314B, Agilent), and information framework. With simple sample preparation, this method is accurate, precise, sensitive, and linear. This method may be utilized in clinical and forensic toxicology to evaluate BZD residue at different concentrations.

6. *Rapid Benzodiazepine Measurement in a Milk-Based Alcoholic Beverage:*

This research shows a straightforward technique for detecting and measuring eight common BDZs in a bourbon cream refreshment for business. The instances were extracted using the quick, simple, (QuEChERS) convention, which resulted in acceptable recoveries. This method lowers lattice results, resulting in an inject able concentrate with appropriate inspection fixations. Using GC-MS in chosen particle checking mode, quantitative estimations of BDZs were achieved without analytic derivatization. The method was evaluated utilizing medazep to verify repeatability, alongside restoration testing on sustained bourbon cream mixed drink testing. MEs (structural effects) were also examined and found to be helpful. The QuEChERS method, which was used to evaluate BDZs in milk-based cocktails, offers a fast, accurate, and reasonable tool for scientific toxicological evaluations. The technique may be utilized to validate the identification of additional BDZs identified in DFC bourbon cream deposits. To guarantee cycle created may be used upon deposits beginning with part of bourbon revitalized with different business medicines including BDZs. These synthetic samples are nearly similar to real DFC sample remnants used in forensic investigations. This is because the BDZ were purchased as

industrial preparations at a pharmacy. Except for flunitrazepam, which was available in capsules, others were in liquid solution form. The built-up BDZ convergences were 20 mg/mL, which was greater than the fixations observed in DFC instances. While larger focuses may be detected in police records, it was not considered essential to spike the instances in our study fixations soon faded. For convention alongside GC-MS testing, sustained bourbon cream tests were dissected. The recovery data was utilized to update the examples' most recent findings. This approach required the accurate identification and assessment of the increased BDZs in all instances. The results are consistent with the amounts of BDZs observed in a bourbon cream flavored with cayenne pepper.

7. Determination of Six Benzodiazepines in Spiked Soft Drinks at the Same Time:

The use of benzodiazepines in the treatment of neuropsychological disorders is widespread. They're also utilized to treat abstinence from alcohol and narcotics. They are occasionally used as recreational drugs and may result in accidental or intentional poisoning. They're also utilized as food and alcohol adulterants, as well as a tool in drug-assisted sexual assaults and crimes. The most common method for analysis is gas chromatography (GC), however GC is time intensive and needs hydrolysis or derivatization of the material. A fast, delicate, and simple HPLC technique with brilliant identification was utilized to synchronise the assurance of six benzodiazepines (chlordiazepoxide, clonazepam, diazepam, flurazepam, lorazepam, and midazolam) in non-alcoholic organic product based drinks for measured use. The HPLC method amounts of every BZDs given separately at three dissimilar fixations (10.0 g/mL, 4.0 g/mL, and 1.0 g/mL) to testing matching the usual load of the specific BZDs focuses. The recovery of these medicines was also evaluated in samples containing 120 percent, 100 percent, and 80 percent BZDs, respectively.

There is no incursion from the blank sample matrix in this instance. With simple sample preparation, this method is accurate, precise, sensitive, and linear. This method may be utilized in clinical and forensic toxicology to evaluate BZD residue at different concentrations. HPTLC is considerably more expensive than other chromatographic techniques. However, unlike GC-MS, which requires derivatization or hydrolysis, no sample preparation is required here. The method identifies and calculates the content of benzodiazepines in beverages with excellent sensitivity and accuracy.

8. Rapid Benzodiazepine Measurement in a Milk-Based Beverage:

The study's aim was to quantify the quantity of benzodiazepines in a milk-based cocktail. In this instance, the extraction method utilized was QuEChERS. The instrumentation equipment utilized in this research was a GC-MS. The aim of this research was to look at the relevance of benzodiazepines as a date assault medication as well as a therapy for DFSA and DFC.

Non-designated compounds in the grid may have a substantial effect on analytic assessment, producing signal degradation or improvement, benchmark uproar, and other annoyances. The Framework Effect (ME) refers to the effect that co-eluting compounds have on ionization ability. While ME are more well-known study, because to the high degree of example lattice complexity in particular industries, it is better to remember ME evaluation for the framework approval measure. As a consequence, unwanted obstructions from network objects or other interfering combinations may be minimized. Following the tests were gathered using QuEChERS plus evaluated using GC-MS. The bulk of compound recovery rates are in the 50 percent range,

which is normal with QuEChERS for a highly challenging lattice. Despite this, the repeatability is high in the present scenario, as shown by the percent. Only bromazepam showed a helpless recovery (8.89 percent) (8.89 percent). Despite this, the focus is considerably smaller than that observed in DFC testing. Bromazepam's degree of recovery is similar with that of the other BDZs. The findings indicate that QuEChERS is eager to put to use, and that it may easily be automated to recover a few samples rapidly. Other extraction techniques employed on this grid produced a much more negative outcome for the compounds selected. Despite the fact that the findings produced with QuEChERS aren't ideal, the speed, reproducibility, and simplicity of use make this method acceptable for this application when severe affectability isn't required. It's important to highlight that anticipated fixations in real-world circumstances are much higher than our method.

In this study, the QuEChERS technique of extraction was shown to be extremely simple and efficient. This method may be used to examine even extremely tiny amounts of material, which are typical of the quantity of sample found at a crime scene. This method may be used to remove benzodiazepines from various beverages, such as energy or fruit drinks. The chromatograms indicate that there are no interferences that may produce erroneous results. As a consequence, GC-MS may be utilized as a trustworthy tool for detecting and quantifying benzodiazepines in milk-based alcoholic drinks. When coupled with QuEChERS, GC-MS is a powerful instrument. Other techniques, like as HPTLC, offer better accuracy and performance. In contrast to other methods, the sensitivity is low. Some matrix molecules, on the other hand, produce less interference.

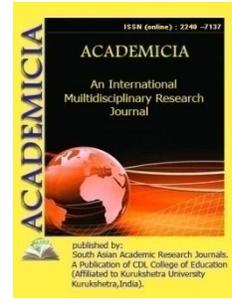

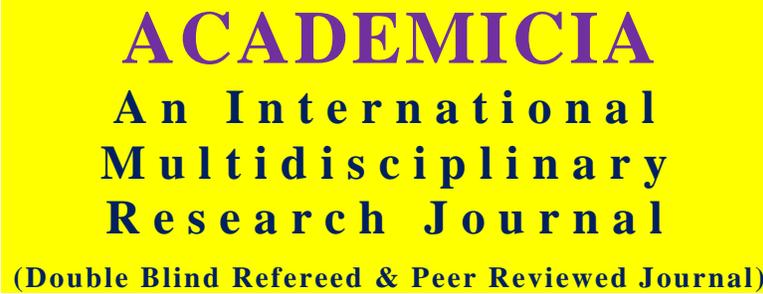

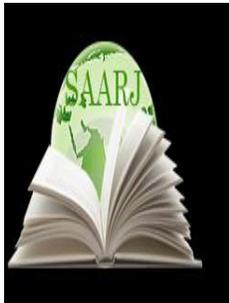

CONCLUSION

The findings of this article, based on an analysis of numerous studies on the identification, isolation, assessment, and quantification of benzodiazepines and zolpidem in beverages, show that, while there are various methods for extracting and estimating BZDs and zolpidem from beverages, most of the approaches have advantages and disadvantages. The various methods have varying degrees of accuracy and sensitivity. Several methods have been proposed. When comparing HPLC and HPTLC techniques to GC-MS and TLC methods, it was found that HPLC and HPTLC techniques are the most effective approaches. TLC and GC-MS are both cheap and simple to use, however they are not particularly sensitive. Furthermore, with these techniques, the quantity of matrix chemicals that interact with quantification is considerably greater. These may have a delirious effect on the result of the research. Since the accuracy of the data is essential, HPLC and HPTLC are the most effective techniques. Hydrolysis or any other kind of derivatization is also required for GC. TLC is in the same boat. HPTLC and HPLC, on the other hand, require little or no sample planning.

The cost of HPLC and HPTLC is considerably greater than that of TLC and GC. They are more adaptable and require less experience. In these procedures, the accuracy of the findings is considerably higher. More research on identifying benzodiazepines and non-benzodiazepines (zolpidem) in drinks is needed. This is how they are being utilized at an unprecedented speed for drug-assisted sexual abuse and drug-assisted crimes. They're also utilized for both purposeful and accidental poisonings. The combination of alcohol and BZDs is very dangerous. It is essential to develop new techniques for better determining and quantifying these medicines in drinks. Which will help law enforcement and forensic specialists in identifying them in a cost-effective, time-saving, and simple manner.

PROBLEMS OF USING INFORMATION AND COMMUNICATION TECHNOLOGIES IN THE PROCESS OF LANGUAGE TEACHING

Akhmedova Mukaddas*

*Associate Professor,
Candidate of Pedagogical Sciences,
National University of UZBEKISTAN

ABSTRACT

The article discusses the use of modern information and communication technologies (ICT) in the teaching of language disciplines at the university. Information competence, which has become one of the main indicators of quality education, is one of the main conditions of modern education, and its formation directly depends on the active activity of students in an open information and educational environment. Modern ICT allows you to create unique didactic conditions for the development and ordering of individual educational trajectories in teaching language disciplines at the university.

KEYWORDS: *Information And Communication Technologies (ICT), Language And Speech Competence, Visibility, Motivation, Computer Literacy.*

INTRODUCTION

The modern stage of human society development goes in parallel with the informatization of all spheres of its activity. This is reflected in the education system. Informatization provides for the mandatory use of computer technology in higher education, which requires improving the information and computer literacy of students and teachers. Especially productive is the joint activity of a teacher and a student in learning a foreign language and, in particular, Russian as a foreign language (RCT).[1]

The progressiveness of teaching using ICT is proved by the fact that, firstly, their inclusion in the educational process significantly accelerates the continuity of social experience and knowledge from generation to generation; secondly, ICTs contribute to a more mobile and successful adaptation of students to changes taking place in the social sphere; thirdly, the use of

ICT in the education system allows you to update and "modernize" learning in accordance with the social order of society. In addition, the chosen subject area is mastered by students at various levels, skills and abilities for solving typical practical tasks are developed, the speed of decision-making in non-standard problem situations, abilities for certain types of activities are developed.[2]

The use of modern information technologies in the learning process allows to intensify and improve the quality of teaching Russian (as a foreign language) and disciplines of the natural science cycle, to increase the number and volume of training and control programs presented to students by reducing the time for their development and implementation, to develop interest in educational activities and diversify it. It should be noted that the use of information and communication technologies (ICT) in the educational process is an effective way to increase students' motivation to study academic disciplines. The use of a computer as a means of displaying clarity and supporting the learning process has a number of unique features, facilitating students' perception and understanding of lexical and grammatical material. The computer allows you to expand the possibilities of presentation and consolidation of educational material, to involve students in the course of the educational process, increasing the motivation of the process of obtaining new knowledge. The computer qualitatively changes the approach to monitoring the classroom and independent work of students, while providing flexibility in managing the learning process and making it objective and accessible.[3]

The visibility of the presented material increases the degree of its assimilation, since the visual and auditory channels of students' perception of external information are involved. This task is successfully solved using repeatedly tested and widely used multimedia technologies.

Multimedia is a joint representation of text, graphic, numeric and audio and video information. The graphical representation of the educational material allows students to focus on the key points of the topic being studied, allows the teacher to increase their motivation and increase interest in learning and memorizing new material, i.e. to implement the fundamental didactic principle of teaching - the principle of visibility.

For example, when studying the topic "The expression of object relations in simple and complex sentences (Lexical topic: Personality and profession)", a multimedia presentation is used. In the process of developing multimedia presentations, a number of problems were solved, in particular, with the introduction of new vocabulary and lexico-grammatical constructions for students. When studying the text "Choice of profession", the classification of professions and their names are displayed on the monitor screen in Russian with simultaneous pronouncing by the speaker. The multimedia manual implements the possibility of multiple repetition of the text and individual phrases, which allows students to better understand the material being presented and, if necessary, pronounce individual words and phrases. The multimedia manual contains several blocks of additional material that contributes to a more complete assimilation of educational material by students.

The use of modern teaching technologies in combination with multimedia materials adapted to the specifics of students' education, as well as educational resources available in free access, allows to increase the motivation, level and quality of students' training in the study of a practical course of the Russian language. A special role in the formation of motivation is played

by the novelty and form of presentation of the information received by the student, as well as their inclusion in search, creative activity.

It should be noted that one of the trends of the modern stage of informatization of education is the desire to integrate hardware and software of ICT. Russian as a foreign language (because in the Republic of Uzbekistan, the subject of Russian is studied as a foreign language in national groups of universities), which is inextricably linked with the improvement of its teaching methods, will be considered in more detail.

At the initial stage of training students of national groups, the purpose of such activity is the developed didactic system for the formation of skills of working with the use of ICT both in the Russian language and in the disciplines of the natural science cycle. The previously used formula of work "student - teacher - book" has been supplemented with the formula "student - teacher - computer", which has acquired special significance at the initial stage of training, when tasks are being formed "from simple to complex". Here, maximum visibility and convenience of work, the possibility of self-control are important, ensuring optimal development of the curriculum.

When teaching Russian as a foreign language, Microsoft Office 2010 features are widely used, which allow you to create text, graphic and other materials that contribute to the visual and effective introduction and consolidation of new vocabulary and grammar.

An effective and efficient form of presenting new material is presentations made in Microsoft PowerPoint or Open programs Office.org Impress, which in its capabilities is not inferior to Microsoft PowerPoint and is its free alternative. Methodically correctly selected, structured and clearly presented on the slides of the presentation educational material contributes to improving the efficiency of perception and memorization of lexico-grammatical and other material.

Let's try to systematize where and how it is advisable to use information technology in teaching, given that modern computers allow you to integrate texts, graphics, sound, animation, video clips, high-quality photographic images, rather large volumes of full-screen video, the quality of which is not inferior to television, within one program:

- 1) when presenting new material — visualization of knowledge (demonstration and encyclopedic programs; Power Point presentation program);
- 2) consolidation of the presented material (training — a variety of training programs, practical work);
- 3) control and verification system (testing with evaluation, control programs);
- 4) independent work of students (training programs such as "Tutor", encyclopedias, educational programs);
- 5) if it is possible to abandon the classroom-based system: conducting integrated lessons using the project method, the result of which will be the creation of Web pages, teleconferences, the use of modern Internet technologies;
- 6) Training of the student's specific abilities (attention, memory, thinking, etc.).

Summing up the above, we can conclude that the use of modern computer technology and information technology allows us to successfully solve the following tasks:

- To provide an individual trajectory of students' learning;

- provide visualization of educational information;
- To provide real-time self-monitoring of the degree and quality of assimilation of educational material;
- To strengthen the motivation of learning due to the novelty of working with modern computing equipment and training programs.

Information technologies make it possible to significantly change the organization of the educational process, use the capabilities of computer technology and electronic teaching and control materials in order to build an individual trajectory of students' learning.

Using the capabilities of existing software, in particular Microsoft PowerPoint, allows you to create colorfully designed and informative presentations that have extensive opportunities for teaching students phonetics, vocabulary of the Russian language and understanding grammatical rules. The presentation of lexical and grammatical rules in the form of text material, as well as tables and diagrams contribute to improving the efficiency of mastering theoretical material, activating mental activity, developing logical and abstract thinking of students. It should also be noted that when using presentations, time losses are significantly reduced, for example, there is no need to record educational material on the blackboard. When using training tests, the possibility of repeated repetition of the same test is realized, the possibility of using textbooks and reference materials without limiting the time allotted for its implementation. When performing a control and training test, the student can see the dynamics of the results of mastering the educational material.

Having analyzed the experience of using ICT in conducting training sessions in Russian (as a foreign language) and independent work of students, it can be concluded that ICT accelerates the learning process, increases students' interest in the discipline being studied, improves the quality of learning, allows individualizing the learning process and provides the possibility of objective assessment. The volume increases and the quality of students' knowledge improves, the motivation for learning increases, the learning process becomes more visual and understandable.

EFFECTS OF ALCOHOL AND CANNABIS ON DIFFERENT TYPE OF SENSORY MEMORY

Dr. Anil Ahuja*

*SOP, Sanskriti University,
Mathura, Uttar Pradesh, INDIA
Email id: principal.ips@sanskriti.edu.in

ABSTRACT

The objective of this research was to investigate how cannabis and alcohol usage impacted people's memory. The study recruited 60 individuals, with 34 of them getting independent screening tests for cannabis (Severity Dependence Scale) and alcohol (Alcohol Dependence Scale) abusers (cannabis abusers and alcohol abusers). Prior to concentrating on alternative medicines that regulate the cannabinoid receptor, it is important to first grasp how this process is related to mental disease symptoms. The memory scale was developed to assess cognitive output and test memory factors. When the t-value was calculated, it was discovered that marijuana and alcohol users showed a substantial difference between distant memory and immediate recollection. Information is stored in sensory memory unknowingly and unintentionally as it is interpreted. The null hypothesis was accepted since the conditions driving memory variables exhibited minimal significant change as opposed to the effects of cannabis and alcohol dependence on the other variables. Researchers discovered a link between cannabis and alcohol addicts in distant memory, attention and perception, delayed recall, instantaneous recall, verbal retention for dissimilar pairings, visual recognition, and identification after evaluating the association. Since of the effect of cannabis and alcohol dependence, the null hypothesis was rejected because there is a link between the factors affecting memory variables. Longitudinal and retrospective study of data from other drug users and from different areas of the globe may be conducted to create a wide frame of reference.

KEYWORDS: Alcohol, Cannabis, Drugs, Effects, Information, Memory, Recall, Short, Term, Time.

INTRODUCTION

Memory is the process through which individuals retain and remember information from the past in order to utilize it in the present. Memory refers to the complicated mechanisms for encoding, storing, and remembering information about past events as a process. Encoding, preservation, and retrieval are three typical memory processes described by cognitive psychologists. Each action corresponds to a memory processing level[1].

- Encoding is the process of converting sensory data into a conceptual image.
- In storage, encoded data is kept in memory.
- By retrieving material from memory, it takes it out or uses it. A new model was suggested of memory that divided it into three types of memory stores:
- A sensory store that can only store a small amount of data for a short period of time.
- A short-term store with a small size and the ability to store information over extended periods of time.
- A large-capacity long-term store capable of storing data for very long periods of time, perhaps forever.

1. *Sensory Memory:*

Tactile memory is the shortest term memory component. It's the ability to remember bodily sensations after the improvements have been finished. It serves as a buffer for impulses generated from the five senses of sight, hearing, smell, taste, and touch, which are sufficiently protected but only for a brief time[2].

Our talents detect improvements that may either be overlooked, in which case they disappear immediately, or they may be seen, in which case they are preserved in our concrete memory. This does not require any planned strategy and is frequently considered as totally beyond the control of the conscious mind. Data is unintentionally and accidentally stored in tactile memory as it is viewed. The tactile memory is utilized to represent visual improvements, echoic memory for auditory enhancements, and haptic memory for touch enhancements. Smell is more tightly connected to memory than other senses, maybe because the olfactory bulb and olfactory cortex are basically next to the hippocampus and amygdala, separated by only two or three synapses[3].

2. *Short Term Memory:*

Short-term memory is the capacity to recall information that is being stored at the time. It is defined as the ability to concurrently remember and process information. It maintains a small quantity of information in memory (usually around 7 items or even fewer) in an accessible, readily-available condition (generally from 10 to 15 seconds, or occasionally up to a minute).

It is generally thought that short-term memory decays with time, usually in the range of 10 to 15 seconds, although depending on the substance, things may be retained for up to a minute. It may, however, be extended by replication or rehearsal, enabling the information to re-enter the short-term storage and be retained for a longer length of time[4].

When multiple items are stored in short-term memory at the same time, they actively compete for recall. As a consequence, whether older information is intentionally protected from

interruption by rehearsal or by calling attention to it, new content ultimately pushes out older content. Every outside interaction threatens to interrupt short-term memory retrieval, which is why individuals also have a strong desire to complete activities stored in short-term memory as soon as feasible[5].

3. *Long Term Memory:*

Long-term memory is a type of memory that retains data, changing visual storage memories constantly. That a person performing almost any task, it is frequently called as reference memory. Long-term memory is split in two types: the implicit memory as well as the explicit memory [6].

4. *Semantic Memory:*

Stored in semantic memory, which is used to store information learned from books, education, locations, facts, and concepts on what is likely to occur in specific circumstances[7].

5. *Episodic memory:*

In roundabout memory, more contextualised memories are retained. They are typically recollections of actual occurrences or situations from a long time ago. As a consequence, they contain not only the "who, when, where, and why" of the case, but also the accompanying feelings and emotions.

Personal memory (remember for specific events in one's own life) is generally regarded as either a subset or an approximation of long-term memory. A flashbulb memory is a highly informative, stunningly vivid "preview" that survives independently of everything else and circumstances in which a digit of astounding and important (or really stirring) news was received[8].

LITERATURE REVIEW

I. M. Birnbaum *et al.* presented in the article that among non-alcoholic individuals, the impact of alcohol intoxication on the recovery of information from memory was investigated. Alcohol intoxication impaired free-recall learning of a 60-word, categorized list in Experiment 1. Intoxicated individuals recalled fewer categories and words within categories, and providing group cues after the third trial enhanced memory somewhat more for intoxicated than for sober respondents. It was found that although alcohol intoxication may have hindered retrieval processes, changes in the intensity of memory traces may also explain for observed disparities in recall. Experiment 2 equated storage in order to evaluate the effect of alcohol on retrieval processes alone. Free-recall and paired-associate lists were experienced sober and recovered in either a sober or intoxicated condition one week later. Alcohol intoxication had no impact on pace, accuracy, or the amount of gain given by prompts, but it did impair new learning. Alcohol has minimal effect on the retrieval stage of memory, according to the results[9].

S. R. Doyle *et al.* pointed to the fact in the article that the main aim of this study was to offer a comprehensive assessment Alcohol Dependence Scale's (ADS) underlying factor structure. Objectives evaluating the overall subscales as well as ADS resultant investigations of variables related to alcoholism, as well as ADS stages. Participants in two large randomised Behavioural Interventions Study were invited to complete the ADS. Validity coefficients were obtained using both exploratory and confirmatory factor testing. Analyses revealed a connected, three-factor answer that included lack of behavioural control and excessive drinking, psych observed across

both trials. Other indications of dependence intensity, confidence in one's desire to not drink circumstances, intensive habits, concerns about hazardous alcohol-related consequences, and impression of problems drinking were all significantly linked to the ADS. These findings support its ability to consistently and accurately assess the concept of alcohol dependence[10].

EFFECTS OF CANNABIS AND ALCOHOL ON MEMORY

1. *Cannabis:*

Cannabis was initially utilized in the third millennium BC, according to historical sources. Cannabis is currently utilized for medical reasons as well as religious and spiritual ceremonies. Cannabis has been subject to legislative restrictions since the early twentieth century, with possession, use, and sale of psychoactive cannabis products being banned in most nations. Memory isn't something that can be measured fast. There are many kinds of memory, each of which is examined in a distinct way. Second, there are transitory (short-term) memory symptoms as well as possible long-term consequences. Finally, how cannabis affects memory is affected by dosage, frequency, and strains. THC attaches to receptors on brain cells that usually respond to natural THC-like substances. These natural substances help the brain develop and operate properly. Marijuana over stimulates the neurons in the brain that contain the most of them. People feel a "high" as a consequence of this.

Cannabis use throughout years and decades tends to produce long-term memory and cognitive deficits, particularly when cannabis use begins in youth. Chronic THC use appears to reduce the amount of CB1 receptors (i.e. "down-regulates" these receptors) in brain areas involved in memory and perception, according to the neurobiology of the cannabinoid system. Early drug use has been related to the development of serious mental health issues later in life, including addiction, major depression, anxiety, and psychiatric illnesses like schizophrenia. High amounts of marijuana may cause short-term acute psychosis, which includes hallucinations, paranoia, and a loss of sense of self-identity. Cannabis is a very stimulating chemical that is nearly as addictive as alcohol and lasts even longer in the body.

2. *Alcohol:*

Ethyl alcohol, or ethanol, is the active component in beer, wine, and liquor. It is also known as alcohol. $\text{CH}_3\text{CH}_2\text{OH}$ or $\text{C}_2\text{H}_5\text{OH}$ are chemicals. Alkanol is the formal name for alcohol in terms of chemical consistency. The amount of carbon atoms present in the solution and the position of the "OH" bond in the formula determine the kind of alcohol that will develop. The most common source of alcohol is ethanol. Via gas bubbles, carbon dioxide exits the process, leaving behind a combination of water and ethanol.

Over the years, a lot of study has been done on alcohol and its effect on perception and general cognitive functioning. Alcohol is a depressant that impacts the whole central nervous system, but it also affects particular areas of the brain. When brain cells are destroyed as a consequence of excessive drinking, the damage may be permanent. As alcohol interferes with substances in the brain that help transmit signals from one neuron to another, information from both short and long-term memory is recalled with difficulty.

With a complete absence of drinking, most physical and mental health problems worsened by alcohol abuse vanish quickly. Speech and hearing difficulties, movement issues, reflex and

reaction slowdown, skin discoloration and slackening, fatigue, nausea, panic episodes, and blackouts are all signs of Parkinson's disease.

METHODOLOGY

To identify the influence of cannabis and alcohol abuse and its effect on human memory.

1. Objective:

- To identify the effect of drug abuse and alcohol abuse on human memory.
- To identify the variables that leads to memory deficits when influenced by cannabis and alcohol abuse.
- To estimate whether there is any significant difference existing among variables of memory due to the influence of cannabis and alcohol abuse.

2. Design:

2.1.Hypotheses:

There is no significant difference among the factors affecting the variables of memory due to the influence of cannabis and alcohol abuse. There is no relationship existing among the factors affecting the variables of memory due to the influence of cannabis and alcohol abuse

2.2.Variables:

- Independent variable: Memory
- Dependent variable: Cannabis and Alcohol.

2.3.Inclusion Criteria:

- Individuals who use cannabis everyday were considered after screening them using Severity Dependence Scale (SDS).
- Individuals who use alcohol everyday were considered after screening those using Alcohol Dependence Scale (ADS),
- Current residence of Bangalore.
- Individuals who can read and write Basic English language,
- Respondents between the ages 20-30 years.

2.4.Exclusion Criteria:

- Individuals who consume both alcohol and cannabis together were eliminated.

3. Sample Size:

- 17 cannabis abusers -7 females, 10 males
- 7 alcohol abusers - 5 females, 12 males

4. Sample Collection:

Two groups of 30 alcohol abusers and 30 cannabis abusers were selected via purposive sampling method. After obtaining their permission, Severity Dependence Scale was given on 30 cannabis

abusers as a screening test and only those who scored more than 5 were included for the research since this score indicated significant participation in misuse of substances. Only 17 individuals were determined to be suitable for the research and subsequently Post Graduate Institute (PGI) Memory Scale was given on the chosen 17 cannabis abusers.

Similarly, Alcohol Dependence Scale was given to 30 Alcohol abusers as a screening test. After obtaining assent, those who scored more than 22 indicated an indication of Substantial degree of alcohol dependency (3rd quartile) and those who scored more than 31 showed an indication of severe level of alcohol dependence. PGI Memory Scale was given to the chosen 17 alcohol addicts.

5. *Tools:*

- Severity dependence scale
- Alcohol dependence scale
- PGI memory scale

The test has been extensively utilized in the evaluation of cognitive functioning in drug abusers, yoga practitioners, depressives, psychotics, neurotics, and suffering from brain dysfunctions. It is equally applicable for all genders as well as the literate and the uneducated individuals. Thus, it is applicable to both research and clinical contexts.

6. *Reliability and Validity for PGIMS:*

For the validity, correlations with Boston Memory Scale and Wechsler Memory Scale were determined to be 0.71 and 0.85 respectively. Age wise older individuals got substantially lower scores than the younger ones. Cases suffering from organic brain disease and functional psychoses score considerably less than normal and neurotics. It has strong connection with education and low with Intelligence quotient (IQ). It has good cross validity and gives quartile norms and a profile. Scores of individuals suffering from organic disease, functional psychoses and neuroses fell in the lowest 2nd and middle quartiles accordingly. Separate norms are provided for three educational levels which is 0 to 5th, 6th to 9th, and above 10th years of schooling.

7. *Administration and Scoring for PGIMS:*

It consists of three components. First item is alphabet that are scored 3 if all correct within 15 seconds, scored 2 if all correct after 15 seconds, scored 1 irrespective of time needed with one error/omission and scored 0 if more than one error/omission. Second item is counting backward (20-1) and the score will be the same as in item 1. Third item is counted backward by subtraction. The score is 3 if all accurate within 30 seconds, scored 2 if all correct after 30 seconds, scored 1 irrespective of time needed with one error/omission and scored 0 if more than one error/omission. Thus, maximum score would be 9.

In Verbal Retention for Similar Pairings sub exam there are 5 noun-noun pairs. Second noun is to be questioned after reading first noun to the subject. 1 mark for each correction of the related word of the pair is to be provided. The overall maximum score on this subtest is 5.

RESULTS AND DISCUSSION

From the Table 1, we can infer that the mean value obtained for both cannabis and alcohol abusers for remote memory was found to be 5.47, recent memory was found to be 4.97, mental balance was found to be 5.74, attention and concentration was found to be 10.24, delayed recall was found to be 9.29, immediate recall was found to be 8.50, verbal retention for similar words was found to be 5.00, verbal retention for dissimilar words was found to be 12.71, visual retention was found to be 7.09 and recognition was found to be 8.56.

TABLE 1: MEAN VALUE OBTAINED FOR THE FACTORS OF MEMORY AMONG CANNABIS AND ALCOHOL ADDICTS. THE MEAN VALUE OBTAINED FOR BOTH CANNABIS AND ALCOHOL ABUSERS FOR REMOTE MEMORY WAS FOUND

Variables	N	Mean
Remote Memory	34	5.47
Recent Memory	34	4.97
Mental Balance	34	5.74
Attention and Concentration	34	10.24
Delayed Recall	34	9.29
Immediate Recall	34	8.5
Verbal Retention for Similar Words	34	5.00
Verbal Retention for Dissimilar Words	34	12.71
Visual Retention	34	7.09
Recognition	34	8.56

From the Table 2, we can infer that the Karl Pearson correlational value obtained for both cannabis and alcohol abusers for remote memory was found to be 0.556 and significance value obtained was found to be 0.00, since the significance value is less than 0.05 level of significance, we can infer that there is a positive correlation/relationship existing among cannabis and alcohol abusers with respect to remote memory at 0.01 level of significance. The Karl Pearson correlational value obtained for attention and concentration was found to be 0.453, and significance value obtained was found to be 0.00, since the significance value is less than 0.05 level of significance, we can infer that there is a positive correlation/relationship existing for both cannabis and alcohol abusers with respect to attention sand concentration at 0.01 level of significance. The Karl Pearson correlational value obtained for delayed recall was found to be 0.433 and significance value obtained was found to be 0.01, since the significance value is less than 0.05 level of significance, we can infer that there is a positive correlation/relationship existing for both cannabis and alcohol abusers with respect to delayed recall at 0.01 level of significance.

TABLE 2: SHOWING KARL PEARSON CORRELATION VALUES FOR VARIABLES OF MEMORY AMONG CANNABIS AND ALCOHOL ABUSERS. THE KARL PEARSON CORRELATIONAL VALUE OBTAINED FOR BOTH CANNABIS AND ALCOHOL ABUSERS FOR REMOTE MEMORY WAS FOUND

Variables	Correlation value	Significance Value
Remote Memory	0.556	0.00

Recent Memory	0.263	0.13
Mental Balance	0.123	0.49
Attention and Concentration	0.453	0.00
Delayed Recall	0.433	0.01
Immediate Recall	0.681	0.00
Verbal Retention for Dissimilar Words	0.485	0.00
Visual Retention	0.672	0.00
Recognition	0.355	0.04

The Karl Pearson correlational value obtained for immediate recall was found to be 0.681, and significance value obtained was found to be 0.00, since the significance value is less than 0.05 level of significance, we can infer that there is a positive correlation/relationship existing for both cannabis and alcohol abusers with respect to immediate recall at 0.01 level of significance. The Karl Pearson correlational value for verbal retention for dissimilar words was found to be 0.485 and significance value obtained was found to be 0.00, since the significance value is less than 0.05 level of significance, we can infer that there is a positive correlation/relationship existing for both cannabis and alcohol abusers with respect to verbal retention for dissimilar words at 0.01 level of significance. The Karl Pearson correlational value for visual retention was found to be 0.675, and significance value obtained was found to be 0.00, since the significance value is less than 0.05 level of significance, we can infer that there is a positive correlation/relationship existing for both cannabis and alcohol abusers with respect to visual retention at 0.01 level of significance. The Karl Pearson correlation value for recognition was found to be 0.355, and significance value obtained was found to be 0.04, since the significance value is less than 0.05 level of significance, we can infer that there is a positive correlation/relationship existing among cannabis and alcohol abusers with respect to recognition at 0.01 level of significance. From the Karl Pearson Correlation it was discovered that recent memory (0.263) and mental balance (0.123) were shown to have no connection existent among cannabis and alcohol addicts. Since, there is connection existing among the factors influencing the variables of memory owing to the effect of cannabis and alcohol addiction, we reject the null hypothesis.

The objective of this study was to look at the factors that affect memory variables in 17 individuals who were under the influence of cannabis and 17 people who were under the influence of alcohol. The research found that there is a significant difference in memory characteristics such as distant memory and immediate recall between individuals under the influence of cannabis and alcohol after obtaining the t-value. Bad episodic memory is expected among cannabis and alcohol users, according to the results. During the intervention program, there was a significant shift in different areas of memory on the memory scale. Between the research and control groups, there was a significant difference in recent memory, distant memory, visual recall, and verbal retention. Cannabis was related to results of neurological diseases in a short-term and internally cued prospective study. Working memory and verbal episodic memory have been investigated lately for their poor transcription, preservation, manipulation, and retrieval processes of long-term cannabis memory.

The findings of this study provided insight on the effect of both alcohol and cannabis dependency on different elements of human memory. The findings revealed that while there is no substantial variation in human memory variables related to cannabis and alcohol dependence,

there is a significant association with memory variables such as previous memory, focus and concentration, delayed recall, immediate recall, verbal retention for dissimilar pairs, visual retention, and recognition.

CONCLUSION

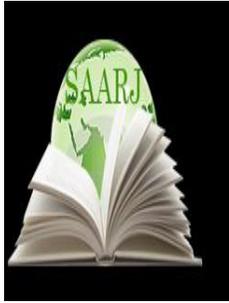

The objective of this study was to investigate the effect of cannabis and alcohol dependency on human memory. A total of 60 individuals were eligible for the research, with separate screening tests for cannabis (Severity Dependence Scale) and alcohol (Alcohol Dependence Scale) abusers administered to 34 people (17 cannabis abusers and 17 alcohol abusers) (17 cannabis abusers and 17 alcohol abusers). The Memory Scale was used to evaluate 10 memory variables and quantify cognitive output. It was found that marijuana and alcohol users had a significant gap between distant memory and immediate recall. The null hypothesis was accepted because there was no significant variance in the factors underpinning memory variables compared to the effects of cannabis and alcohol dependency in the other variables. After assessing the relationship, researchers found a connection between cannabis and alcohol abusers in distant memory, attention and awareness, delayed recall, instantaneous recall, verbal retention for dissimilar pairings, visual remembrance, and recognition. The null hypothesis was rejected because there is a connection between the components underpinning memory variables owing to the impacts of cannabis and alcohol dependency. Longitudinal and retrospective study should be conducted utilizing data from other alcohol abusers and from different areas of the globe in order to create a wide frame of reference.

ABSTRACT

In the world more than 200,000 leprosy cases are being registered in every passing year. But the situation has changed from the past few years. In 1982 when multi-drug therapy was introduced then the leprosy cases started reducing from the popularity rate of 57.8/10000 population in 1983 to 1/10000 population in the year 2005 i.e. 296,499. Wherein the popularity state of leprosy was 219,826 in the starting of 2006 and by the year 2018 the percentage rate of leprosy reduced to 0.67/ 10, 000. Though India was highest saddle of leprosy, but with the World Health Organization instruction the National leprosy eradication programmer (NLEP) is interposing single-dose rifampicin for post-exposure prophylaxis in the entire high-autochthone localities of the nation. The main objective of this paper is to evaluate the cost-productiveness of single-dose rifampicin post-exposure prophylaxis in various leprosy ailment encumbrance circumstances. Wherein the cost-productiveness devolves on the measures by which the disability can be reduced. However, the medication is befitting cost-effective for the longer use, an everlasting perforation is being devoted.

Keywords: *Leprosy, Single-dose rifampicin (SDR), Post-Exposure Prophylaxis (PEP), Cost-effective.*

INTRODUCTION

Leprosy is a severe illness caused by Mycobacterium leprae. This disease mostly affects the exterior nerves and epidermis, and if not treated properly, it may cause long-term disability. There are three levels of impairment: category-0 (C0D), category-1 (C1D), and category-2 (C2D), with the latter being the costliest since it involves visual deformities. In 2018, a total of 208,619 cases of leprosy were identified throughout the world [1]. The Table 1 shows the below table represent the Leprosy case detected in various country in the below mentioned year.

TABLE 1: THE BELOW TABLE REPRESENT THE LEPROSY CASE DETECTED IN VARIOUS COUNTRY IN THE BELOW MENTIONED YEAR

Countries	Years				
	2014	2015	2016	2017	2018
India	11365	11389	11792	10287	9227
Brazil	2341	1942	1696	1718	1705
Bangladesh	197	327	166	235	220
Indonesia	1894	1930	1923	1755	1861
Nepal	3046	2751	3054	3215	3249
Myanmar	2877	2571	2609	2279	2214
Nigeria	2983	2892	2576	2500	2095
Ethiopia	482	563	360	351	292
DRC	407	486	436	373	334

Figure 1 depicts a bar graph of leprosy cases identified in different countries during the year in question. This bar graph depicts the highest number of leprosy cases identified in India in each year.

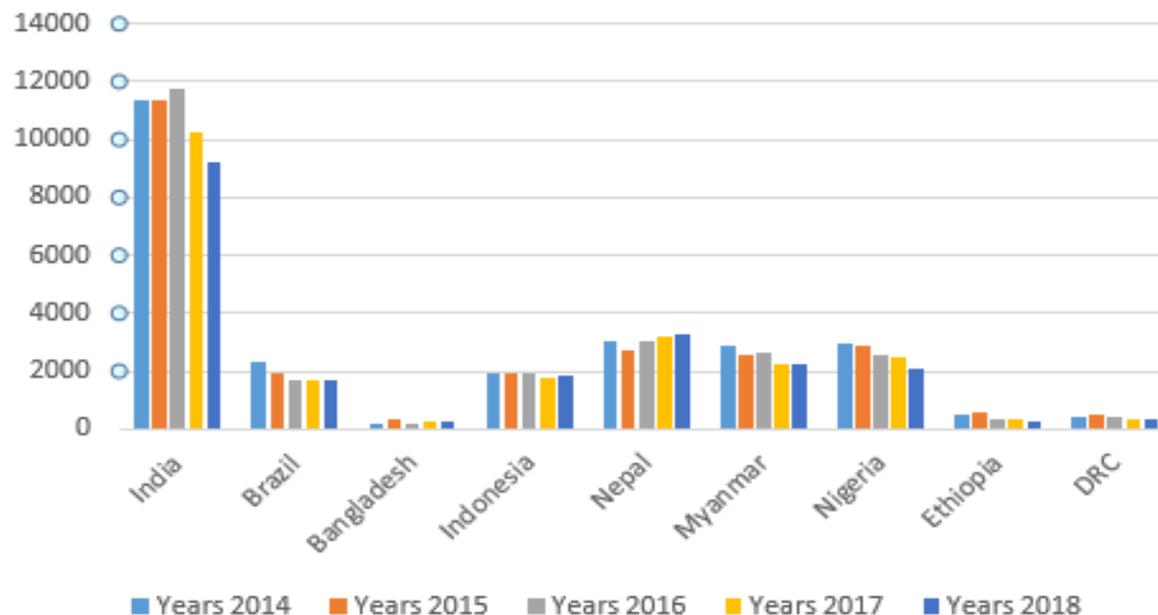

Figure 1: Bar Graph of the Leprosy Case Detected In Various Country in the Below Mentioned Year.

Germs may be transferred from one body to another because a diseased body stays symptomless and undiagnosed for a longer period of time owing to prolonged delitescence. In the 1980s, multi-drug therapy was developed, which effectively decreased the prevalence of condition, but the number of new cases remained stable. As a result, in this scenario, the goal of eliminating leprosy and previous endowment is jeopardized [2]. The districts in India continue to report an increasing number of leprosy cases on a daily basis, and the National Leprosy Eradication

Program is being conducted to eliminate the cases in these districts. On the other hand, there are a number of significant obstacles to preventing the spread of *Mycobacterium leprae* [3]. Present leprosy encumbrance is underrated thus it requires correct calculation by including the secluded cases.

The technique or procedure for the previous disclosure and recovery must be properly established in order to identify the current active instance. With its advancement, the procurable blockage method known as post-exposure prophylaxis with single-dose rifampicin (SDR-PEP) would be impacted. Some variables, such as expected results, cost-effectiveness, persistence of achievement, and obscurities, must be understood in order to create this method. Then, as part of the Leprosy Post-Exposure Prophylaxis (LPEP) method, single-dose rifampicin is used to treat post-exposure prophylaxis. LPEP procedure is pre-mediated to estimate the practicability along with the influence of identifying, assessing, and managing people who have been exposed to a disease to prevent onward infection transference [4] and SDR-PEP to symptomless connection of leprosy cases. The obligatory supplemental mechanism to the conventional leprosy curriculum is less contact, masking, and so forth. Furthermore, LPEP (Leprosy Post-Exposure Prophylaxis) also heightened the consequences of cases in the association [5].

The apportionment of post-exposure prophylaxis through single-dose rifampicin is presently uninterrupted, heretofore as a scheduled occupation subordinate National Leprosy Eradication Programmed (NLEP) [6]. The Leprosy Post-Exposure Prophylaxis (LPEP) technique methodically apprehended an appropriate information that can govern the enlargement of the arbitration. Despite the significant impact of single-dose rifampicin for post-exposure prophylaxis, it is difficult to include in a few year curriculum due to the surviving buildup of leprosy patients. As a result, arithmetical modeling is used to assess the long-term impact of single-dose rifampicin as a post-exposure prophylactic on the National Cardiovascular Data Registry (NCDR). The primary goal of the study is to determine the long-term cost-effectiveness of single-dose rifampicin for post-exposure prophylaxis in different leprosy disease encumbrance conditions. The result will then encourage both administrative and non-administrative institutions to forecast speculation for leprosy control. Finally, it presents the global speculative case for leprosy eradication.

Detection in Advance:

Prior disclosure is required to prevent additional infection transmission and to reduce the risk of permanent deterioration. The Leprosy Research Initiative will support the development of a curriculum that examines processes, methods, systems, or instruments in order to improve previous case disclosure. This system will include health-care processes to promote community knowledge, proper patient health-care behavior, and access to help, as well as the testing of laboratory-supported equipment for detecting an infection or illness at an early stage. If the following will be a barrier to previous disclosure in a consecution, this method also includes arbitration to minimize associated blemish.

NERVE FUNCTION Deterioration AND COUNTERACTION: Neurological and ocular destruction are the primary reasons why individuals suffer from leprosy-related problems. As a result, the Leprosy Research Initiative supports the curriculum of procedure and arbitration for earlier obstruction of neurological and ophthalmic destruction, technique to improve disclosure and arbitrations, and drug administration to improve nerve function destruction prediction and leprosy counteraction.

Incorporation:

The main worry and oppressive ramification of leprosy is exclusion from society. This condition arises when people are separated from their homes and must deal with divorce or other sensitive circumstances such as degradation, news mongering, cautiousness, and so on. The Leprosy Research Initiative supports studies that promote the inclusion and participation of individuals with leprosy in any part of the community. Relationships, as well as weddings and the elevation of biogenetic and conceptual fitness and stimulated people's freedoms, subsistence and labor contribution, erudition, and participation in civil organizations, such as handicapped people's groups, are the most common circumstances. The role of excited individuals in leprosy aid is gaining traction, and it deserves careful study.

Disease of the Obstructive System:

One of the most important aspects of leprosy assistance is disability prevention. Although certain appropriate methods and equipment have existed in the past, they have not been used often or adequately. In general, disability prevention adjudications or undertakings are carried out in a leprosy-like way, but comparable arbitrations and undertakings would benefit a variety of people facing similar problems. The Leprosy Research Initiative will support accomplishment studies that examine or contribute to opportunities to improve the utilization of current techniques and apparatus for disability prevention, consolidation of disability prevention arbitrations in the National Leprosy Eradication Program (NLEP), and consolidation of leprosy-related POD in imprecise injury and extremely conceited injury.

Years of disordered life: Fitness Disorder Adjusted Life Years are used to calculate paraphernalia (DALYs). The global burden of disease research (GBD) was used to calculate the burden of leprosy disorders, with a result of 0.011 for C1D and 0.067 for C2D. Because disorder is unchanging, leprosy does not cause impermanence; therefore, the definition of a DALY is the number of years spent living with disorder. The term DALYs is defined as follows: -

$$DALY(t) = \sum_{a=1}^{n_a} I_{C1D}(a, t) \cdot D_{C1D}(a) + (I_{C2D}(a, t) \cdot D_{C2D} \cdot L(a))$$

n_a = It is referred to as the number of generations (0–4, 5–14, 15–44, 45–59, 60+ years);

$I_{C1D}(a, t)/I_{C2D}(a, t)$ = It is referred to as number of cases with C1D / C2D per 100,000 in generation (a) at time (t);

D_{C1D}/D_{C2D} = D is determined as a Disorder burden for C1D/C2D;

$L(a)$ = Life anticipation of generation(a). Data calculated and resulted from SRS is dependent on Life Table 2011–15, enumeration of India.

The total count of new leprosy cases emitted with both the category C1D and C2D in the post-exposure prophylaxis through single-dose rifampicin (SDR-PEP) arbitration and ordinary circumstances were estimated using by utilizing multibacillary (MB) and paucibacillary (PB) leprosy cases every year. Subsequently, no data is present on the dimension of another cases with C1D and C2D surrounded by PB and MB leprosy cases, some of assumptions to measure the total number of leprosy cases with C1D and C2D are: -

- With the report statistics on leprosy in India C2D have 3.6% of leprosy cases; all C2D cases emerge from MB leprosy cases.
- Surviving MB leprosy cases have C1D.
- 50% of the total PB leprosy cases have C1D.
- Surviving PB leprosy cases have no disorder.

Though the post-exposure prophylaxis through single-dose rifampicin (SDR-PEP) arbitration circumstances involve present connection blue-print and masking, it seems that the time when the diseases will be decreased and prevent disorder. To account for this in the SDR-PEP arbitration, DALYs under three assumptions of disorder obstruction will be calculated such as: Obstruction of all C1D cases, Obstruction of C1D in PB cases only, no additional obstruction same as ordinary circumstances[8].

REVIEW OF LITERATURE

P. Narasimha Rao et. al. had reviews the present world-wide as well as Indian leprosy situation to bring out its achievements and successes. It is also including the influence of Leprosy Case Detection Campaigns (LCDC) on increasing of leprosy cases. The foundation and expected benefits of recent introduction of chemo and immune-prophylaxis in the programme are also discussed. It also discusses the shortcomings, the areas of concern, and the need for an inclusive strategy in the Indian leprosy programme that includes an intersect oral collaboration within the country for reaching the desired goal of leprosy eradication[7].

Seilan Anbu Scott Christian studied the physician, nurse, and allied health professions provide services for the prevention, treatment, and management of disease, as well as the maintenance of mental and physical well-being. According to the World Health Organization, health care includes "preventive, curative, and palliative treatments, either directed to people or populations," as well as "precautionary, curative, and palliative interventions, whether directed to individuals or populations." A health care system may be formed by the organized supply of such services.

M Choksh et. al. studies Health systems and policies have an important role in influencing how health services are provided, used, and impact health outcomes. Because health is a state issue, despite the federal government's recommendations, the states retain ultimate authority over the execution of infant care programs. This article provides a short overview of the country's public health system and chronicles the development of key health programs and initiatives, with an emphasis on infant health.

DISCUSSION

This paper discusses about the Mycobacterium leprae causes leprosy, which is a serious disease. This illness mostly affects the epidermis and nerves on the outside of the body, and if not treated correctly, it may result in long-term impairment. Category-0 (C0D), category-1 (C1D), and category-2 (C2D) are the three degrees of disability, with the latter being the most expensive due to visual abnormalities. In 2018, a total of 208,619 leprosy cases were reported throughout the globe. Because a sick body remains symptomless and undetected for a longer length of time due to prolonged delitescence, germs may be transmitted from one body to another. Multi-drug treatment was established in the 1980s, and it successfully reduced the prevalence of the disease,

but the number of new cases remained constant. As a consequence, the objective of eradicating leprosy and past endowment is endangered in this situation.

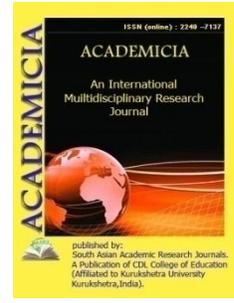

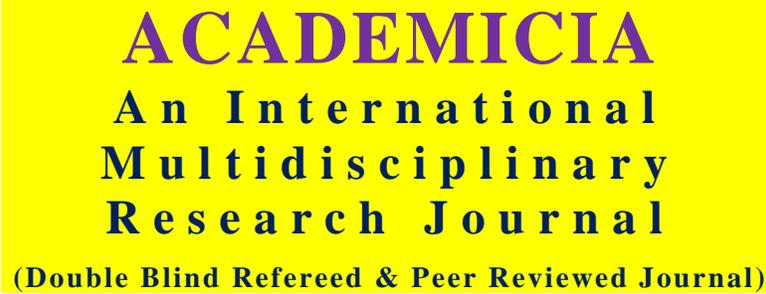

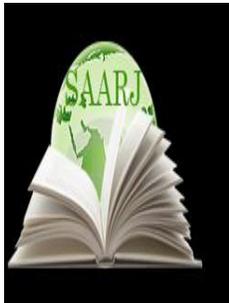

On a daily basis, India's districts report a growing number of leprosy cases, and the National Leprosy Eradication Program is working to eradicate the disease in these areas. On the other hand, limiting the spread of *Mycobacterium leprae* has a number of major challenges [3]. The current leprosy burden is underestimated, necessitating accurate calculations that include isolated patients. In order to identify the present active instance, the method or process for the prior discloser and recovery must be correctly developed. The readily available blocking technique called as post-exposure prophylaxis with single-dose rifampicin (SDR-PEP) might be affected by its development. In order to develop this technique, several factors must be understood, such as anticipated outcomes, cost-effectiveness, persistence of accomplishment, and obscurities. After then, single-dose rifampicin is used to treat post-exposure prophylaxis as part of the Leprosy Post-Exposure Prophylaxis (LPEP) technique.

CONCLUSION

The connection listing, selection, and prescription of post-exposure prophylaxis via single-dose rifampicin (SDR-PEP) is a cost-effective method in both provisional and permanent leprosy control, according to this study. The cost-effectiveness of single-dose rifampicin (SDR-PEP) post-exposure prophylaxis is determined by the degree to which disorder may be prevented. Despite the fact that the arbitration becomes more cost-effective over time, this article recommends a long-term commitment to the arbitration's completion.

SPIRITUALITY OF YOUTH IN SPEECH ACTIVITY

Akhmedova Muyassar Khadimatovna*

*Associate Professor,
Candidate of Psychological Sciences,
Tashkent State Pedagogical University,
UZBEKISTAN

ABSTRACT

Today it is important to study the features of speech, a language that is considered a means of communication. Currently, attention is being paid to the scientific study of the peculiarities of the national language. This article examines the jargons used by young people in the process of daily treatment in the Uzbek language. The slang words of representatives of the younger generation, who are considered the main stratum of society, as well as the importance and necessity of studying their jargon were also given. The psycholinguistic features inherent in jargon words are analyzed from a scientific point of view. It was also taken into account the fact that, in connection with the development of society, new words appear and, accordingly, jargons in the language increase.

KEYWORDS: *Language, Jargon, Psycholinguistics, Speech, Vocabulary, Social, Society, Functional, Communication, Speech Activity, Vocabulary, System, Youth, Identity, Civilization, Group.*

INTRODUCTION

It is known that the factor separating man from the animal world and turning him into a conscious higher being is language. The highest products of human mental activity, the "fruits" of contemplation, arise through language and speech.

Language is a blessing of nature, which is given to humanity, it carries out the interaction of members of society, accumulates and communicates from them knowledge about all events occurring in the material and spiritual life of a person; language is being formed and will exist for centuries in the same sense. This means that a person develops a feature of thinking by mastering his native language. If a person learns more different languages other than his native language, then the peculiarities of thinking, consciousness, contemplation are further improved.

Economic, socio-political, cultural and technical changes taking place in society lead to a sharp increase in the number of words included in our national language, that is, the Uzbek language, and some changes in the essence of the meaning.

The environment affects language, everyday speech, and this can lead to a decrease in their level. But even a high-level, pure, spiritual language, in turn, can and should influence the environment with its formation, improvement, spiritual enrichment and change.

In modern psycholinguistics and linguistics, the fact that the national language is a phenomenon with different characteristics and is realized in the form of the presence of language, the formation of a stratifying structure of nature is considered a social phenomenon. Each language serving a very diverse and socially developed community of people is represented in the form of various manifestations: basic - literary language, speech, general speech and territorial dialects; secondary - social dialects (argot, jargon, slang), professional languages are considered.

It is known that as a result of the rapid development of mass communications, a number of new words are being added, reflecting new political and social changes. It is not denied that in the conversational process, new incoming terms can be expressed in non-literary speech. It is known that non-standard words include "argo", "jargon", "slang", etc. These words have long been used in the process of communication. Usually new slang words appear to update old concepts. Jargon is used in everyday life, even in the educational process. It is especially often used in the speech of young people: students, schoolchildren.

Jargon (French jargon is a word of a certain group). Words and phrases characteristic of a certain social or professional group, only those who understand them themselves and differ from the literary language, are described in the Explanatory Dictionary of the Uzbek language [10.74].

Jargon contradicts the "right" life. Jargon tends to increase the speed of speech, for which abbreviations, abbreviations, abbreviations, etc. are used. Although argot and jargons are included in the lexicon with a limited volume of consumption, their value in enriching the Uzbek language is very important. But the word "slang" is not described in the literature of Uzbek linguistics [2.56].

L.A.Vvedenskaya, L.G.Pavlova, commenting on the uniqueness of youth jargon, warned against their broad definitions: "This colloquial phenomenon cannot be called jargon, because it has no social roots. Young people, especially teenagers, use words and phrases that differ from the generally accepted norm of speech in order to achieve "confirmation" of themselves without exception. In such speech, various elements of the language are used, words that are foreign, belong to the profession of a specialist, are specific to vulgarism, dialectics [4.120].

Slang words of young people are psychologically and socially justified, and for all linguistic communities they serve as a continuous form of completely independent speech. In addition, jargon forms a wide layer in the corresponding dictionaries.

The reasons for the appearance of youth jargon in the process of communication are their desire to demonstrate their independence, that is, to show their belonging to the same group, for example, to a group of fans of a musician, to sports fans, etc. Here is another function characteristic of social dialects in such conditions - the function of social solidarity: the use of slang units is a sign of the separation of interlocutors into "friends" and "strangers".

Psychologists note that slang "reduces the distance between interlocutors, introducing all members of the group with the help of common signs of communication", "we show the effect of feeling", it does not matter whether the speech of young people is completely slang or includes 5-7 units. The main thing is that these words exist in the group and become its wealth, go beyond the usual norms of morality, get rid of normative decency and give a sense of freedom in dialogue [8.367]. Since the slang here performs the function of "a sign (or password) of a certain socio-communicative status of speakers," E.N.Gut describes it as a function of determining this function, saying that when there is an intention to approach the heart, the same function of using jargonisms will prevail, "it will overcome the semantics of naming and evaluation [3.23].

In this regard, according to the results of the study, we pay attention to the jargon used when expressing the word man: harip - a stupid person; goat - a fool, lazy; bro - brother; latta - a soft person; lokh - an unsuspecting, simple person; gol - an inept person; somsa - a woman of easy character; soska (nipple) - a prostitute; Bratva - friends; asalm - a beloved, sweet girl; chumo - a fool, a person who does not understand the word; kaptar (pigeon) - a loved one; balbes - a blockhead is a stupid person, a fool; andi - is a cunning woman; tonka - is a lazy person; zhigar (liver) - is a relative; sutak - is a coward; churban (a blockhead) - is a stupid, uneducated person; chortkesar - is an evil person; uralman - is a nomadic people; turshak (dried apricots) - is a thin, skinny person; lagan - is a sycophant; stupid is crazy; galvars - is crazy; dub (oak) - is a stupid, unintelligent person; shoptoli (koki) - is a thin person; hoshim - is an independent person; piska - is narrow-eyed; chmochnik - is stingy, etc.

It is known that slang words are used both in a positive and negative sense. From the above examples, it can be concluded that words in which facial expressions in jargon mean a more negative meaning. They also have more pronounced comparative, comparative properties. Vocabulary borrowed from other languages is often found. To collect additional information about this, it would be desirable to seriously consider the social and age characteristics of national language jargons.

Jargon is not typical for people with a predisposition to depression. He shows life through his speech competition. And, of course, this is the most important factor of society: at the level of deviation from the norms of the language, including literature, it will be possible to immediately determine the main personality traits of the interlocutor.

In youth communication, as well as the reflection of the peculiarities of the national language directly depends on the individuality of the person who cares about. It is a part of a personal language in which one can express individuality in contrast to the semantic level of speech.

Thus, we can talk about the peculiarities of the linguistic characteristics of the world inherent in native speakers of the national language and identified as the linguistic characteristics of the individual world.

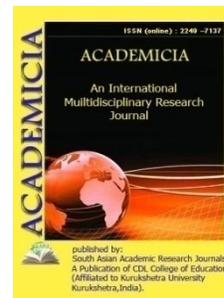

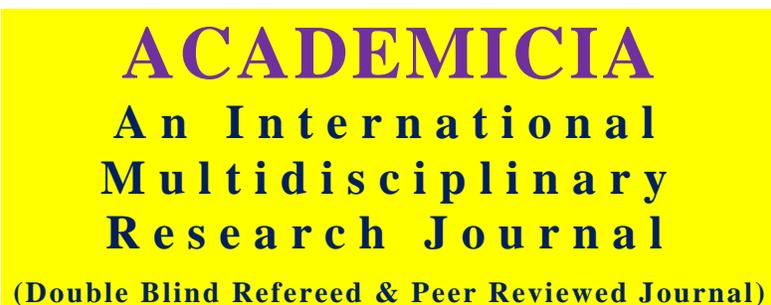

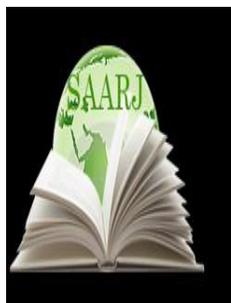

Linguistic features of the world the linguistic level of an individual's reflection in language, unlike oral speech, is at the semantic level, perhaps part of its inherent rarity in the manifestation of individuality. Also, the composition of the dictionary, in which a person clearly understands and can use the meaning of each word in his speech, shows how much this person's speech has grown.

In the process of education and training of the younger generation, teachers and specialists in the field of speech activity are mainly considered to be a model in all aspects: a linguist, a journalist, a psycholinguist. Therefore, they are not people who follow the students, but on the contrary, they will have to follow the teacher (as well as specialists) in particular. But the educator should be aware of the jargon of the school, university. Because none of their statements can remain incomprehensible. It is especially desirable that a word or phrase in the process of communication is not ignored.

The world of young people who are aware of their spirituality initially from their speech activity, deep penetration into their circle allows them to communicate effectively. It is advisable to bring teachers closer to yourself and be aware of all the words that are used in their communication in order to find the right way to their heart.

National University of Uzbekistan named Mirzo Ulugbek,
UZBEKISTAN

ABSTRACT

This article discusses the use of interactive methods in Russian language classes. Interactive teaching methods provide solutions to educational problems in various aspects. The interest in interactive methods is caused by the need to improve the modern system. The use of interactive methods makes it possible to organize independent cognitive activity of students during the lesson. The possession of interactive learning technology and its use in the educational process, including in Russian language lessons, will undoubtedly contribute to the development of students' qualities that correspond to the processes taking place in life today.

KEYWORDS: *Interactive, Technology, Creative Approach, Communication, Active Methods, Interaction, Game Method, Discussion.*

INTRODUCTION

The use of new technologies in the learning system is a prerequisite for the intellectual and creative development of students. New technologies include multimedia complexes and interactive learning with the use of gaming technologies.

Interactive learning is primarily a dialogue learning, during which the interaction of the teacher and his student is carried out. The concept of this technology is based on an understanding of the social interaction of people in interpersonal communication, the most important feature of which is the ability of a person to accept the role of another, to imagine how he is perceived by a communication partner[1]. The essence of interactive learning is that the learning process is organized in such a way that almost all students are involved in the process of cognition. In an organized environment (interactive environment), they have the opportunity to understand and reflect on what they study, learn, do, know and think.

Interactive training is aimed at the formation of communicative competence in Russian. Effective learning tools can be maps, slides, films, computer simulation (this is the closest to reality simulation of management and decision-making processes), role-playing (business) games, project methodology.

When teaching the Russian language, various business games are of no small importance.

Active teaching methods are divided into two large groups: group and individual.

Group ones are applicable simultaneously to a certain number of participants (group), individual ones - to a specific person who carries out his general, special, professional or other training outside of direct contact with other students.

Various authors classify active teaching methods (AMO) on different grounds, highlighting a different number of groups of active methods.

For example, Golubkova O.A. and Prilepo A.Yu. classify interactive teaching methods based on their communicative functions, dividing them into three groups[7]

1. Discussion methods:

- Dialogue;
- Group discussion;
- Analysis and analysis of life situations.

2. Game methods:

- Didactic games;
- Creative games, including business, role-playing games;
- Organizational and activity games;
- counterplay.

3. Psychological group of interactive methods:

- Sensitive and communicative training;
- Empathy.

According to experts, interactive methods used in the educational process should meet the following requirements:

- Active, creative, proactive participation of students in the process of obtaining knowledge;
- Formation, accumulation and development of skills in the process of group and individual classes;
- Maximum approximation of learning outcomes to the field of practical activity;
- Cooperation of students and the teacher in planning and implementing all stages of the learning process.

Yu.N. Emelyanov suggests conditionally combining active group methods into three main blocks: a) discussion methods (group discussion, analysis of incidents from practice, analysis of

situations of moral choice, etc.); b) game methods: didactic and creative games, including business (managerial) games, role-playing games (behavioral learning, game psychotherapy, psychodramatic correction); counterplay (transactional method of awareness of communicative behavior).[5]

S.V. Petrushin suggests the main methods of active learning to be divided into the main directions: [5]

By the nature of educational and cognitive activity, methods of active learning are divided into: imitation methods based on imitation of professional activity, and non-imitation. The peculiarity of simulation methods is their division into gaming and non—gaming. The methods in the implementation of which the trainees must play certain roles belong to the game. At the same time, non-gaming ones include analysis of specific situations (ACS), actions according to instructions, etc. The peculiarity of non-simulation methods is the absence of a model of the process or activity being studied.

According to the type of activity of participants in the search for solutions to problems, methods based on:

- ranking by various attributes of objects or actions;
- optimization of processes and structures;
- design and construction of objects;
- choosing tactics of actions in management, communication and conflict

Situations;

- Solving a research, managerial or socio-psychological task;
- demonstrations and training of attention skills, invention, originality, quick thinking and others.

According to the number of participants, there are: individual, group, collective methods.

Voronova A.A. identifies three main types of active learning methods: [6]

A method for analyzing specific situations. Situations can be different in didactic orientation and are used in accordance with the task that the presenter sets for the group: a situation is an illustration, a specific case proposed by the presenter to demonstrate theoretical material; a situation is an exercise where participants must highlight and memorize some elements; a situation is an assessment in which the proposed problem has already been solved, and participants are invited to evaluate it; a situation is a problem, a number of questions are posed to the group that need to be analyzed and solved.

Game simulation or simulation games. Games (simulation) are divided into business, where a simulation model is set in advance, and organizational, where participants themselves choose a system of solutions. There is also a classification of active teaching methods, which involves dividing them into four groups, combining group and individual forms of classes, with the primacy of the former.

Discussion methods (free and directed discussions, meetings of specialists, discussion of life and professional incidents, etc.), built on live and direct communication of participants, with a passively detached position of the moderator performing the function of organizing interaction, exchanging opinions, if necessary, managing the processes of developing and making a group decision.

Game methods (organizational-activity, imitation, role-playing games, psychodrama, sociadrama, etc.), using all or several of the most important elements of the game (game situations, roles, active playback, reconstruction of real events, etc.) and aimed at gaining a new experience that is inaccessible to a person for one reason or another.

Rating methods (efficiency ratings, popularity ratings) that activate the activity of students due to the effect of competition.

Each group of active teaching methods assumes a specific organization of interaction of participants who are in the position of students, and has its own specific features. Thus, there is currently no single view on the problem of classification of teaching methods, and any of the classifications considered has both advantages and disadvantages.

In modern society, the question of improving educational methods is becoming more acute. Modern children need a different approach to learning. Today's time requires a new level of education of students. Students should become, first of all, socially adapted personalities, and all the knowledge gained at school should have a practical outlet into adulthood. Therefore, it is right now to talk about improving education.

One of the ways of such improvement is the introduction of the Singapore methodology of education. Thanks to this method, we can:

- increase the level of knowledge acquisition by students;
- to introduce students to a new form of presentation of the material;
- increase students' interest in the subject.

New things are always perceived by students with special attention. The Singapore methodology is no exception. Its essence consists in group learning (Cooperative learning). For students, entertaining work in groups. Everyone feels the support of the team, and at the same time, individual responsibility is assigned to everyone. Students have more opportunities to show themselves, express their opinion, make their choice. They may be feeling the importance of their point of view for the first time. In the Singapore education system, students have more independence, and the teacher is no longer the center of the lesson. He only needs to be able to direct and organize the activities of students.

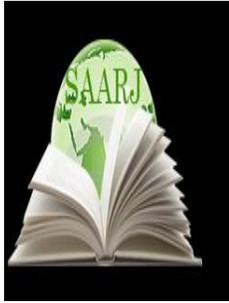

In order for our students to really become successful, we need to teach them the skills of effective communication, cooperation and teamwork. They also need to master the skills of critical and creative thinking to find solutions to the problems they will have to face in a world unlike ours. Lessons should be aimed at this. When working in groups, when they move around, everyone is involved in this process, they are interested and the information is easily remembered.

Interactive learning allows you to solve several tasks at the same time, the main of which is the development of communicative skills and abilities, helps to establish emotional contacts between students, provides an educational task, because it teaches you to work in a team, listen to the opinion of your friends. The use of interactive forms in the learning process, as practice shows, relieves the nervous load of students, makes it possible to change the forms of their activities, switch attention to the key issues of the topic of classes.

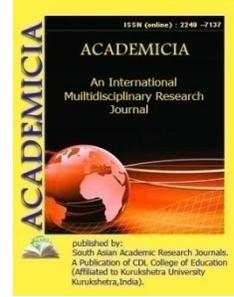

The combination of active methods, means and forms of education allows to optimize the educational process, improve the quality of education, provide conditions for self-education of students, organize joint activities of a student and a teacher aimed at self-realization of students. Active learning, which is carried out with the help of active methods, contributes to the formation of cognitive interest in the acquisition of knowledge and educational activities.

HANDWRITTEN DIGIT RECOGNITION BASED ON MACHINE LEARNING ALGORITHM

Dr. Kashif Qureshi*

*SOEIT, Sanskriti University,
Mathura, Uttar Pradesh, INDIA

Email id: kqureshi.cse@sanskriti.edu.in

ABSTRACT

OCR is a broad field of study that focuses on pattern recognition. Advanced structures that can identify unique typefaces and have high reliability and accuracy are becoming more popular, and they support a wide variety of report codecs and image formats. Handwriting movement analysis may be utilized as a source of information for handwriting recognition. This will improve the end-to-end process's correctness while also increasing its dependability. One of the most practical problems in pattern recognition is text recognition. Digit recognition is used in a variety of applications, including postal mail sorting, bank processing, and data input. The problem stems from the possibility of creating an algorithm that can identify handwritten numbers and send the data to a scanner, tablet, or other digital device. The article discusses different machine learning-based methods to off-line handwritten digits. The most essential aim of the article is to ensure that effective and reliable methods for recognizing handwritten numbers are developed. For digit recognition, many machine learning methods were employed, including Multilayer Perceptron, Support Vector Machine (SVM), Bayes Net, and Random Forest.

KEYWORDS: *Digital processing, Digit Recognition, Machine Learning, SVM.*

1. INTRODUCTION

Intelligent picture analysis is a fascinating area of Artificial Intelligence study, and it's also critical for a variety of different open studies issues. Handwritten digit recognition is a well-studied subfield that uses mastering models to distinguish pre-segmented handwritten digits. It is one of the most important problems in data mining, machine learning, pattern recognition, and many other artificial intelligence fields[1]. Over the last decade, the most common application of

device mastering strategies has proven effective in conforming decisive structures that compete with human overall performance and achieve far more than manually written classical artificial intelligence systems used in the early days of optical recognition technology. However, not all of the exact models' capabilities have been previously examined[2].

One of the most important jobs in the area of a digit machine is digit identification. In pattern recognition, specialized location sampling methods are utilized to identify such regions. The task of handwritten digit identification is complicated by the large number of different writing styles. To enhance the performance of a handwritten character recognition device, robust function extraction is essential. Because of its usefulness in a variety of areas, handwritten digit recognition has attracted a lot of attention in the world of pattern recognition devices. In the future, a human recognition system may be used to help create a paperless environment by scanning and processing existing paper documents[3].

In recent years, text detection and recognition has become a necessary annoyance. This trend has been fueled by advancements in the fields of computer vision and machine learning, as well as an increase in applications based on textual content identification and recognition. On a global scale, several workshops and seminars, such as the International Conference on Document Analysis and Recognition (ICDAR), are being held, providing a comparable boost to trends in the field of textual content processing from images. Text detection and identification from video subtitles and web pages are also gaining popularity. Text recognition and extraction from real-world situations and images have gotten a lot of attention. There are a variety of optical character recognition methods available as well. Text detection and identification is still a problem that hasn't been addressed completely. Text segmentation and extraction from natural situations are still challenging to do.

In the field of handwritten character identification, pattern recognition and image processing play an important role. The findings in cover a variety of function extraction strategy classifications, including structural function-based methods, statistical function-based strategies, and international transformation approaches[4]. Statistical methods are used to determine how records are chosen. It relies on the statistics of the image's statistical distribution of pixels. The article described an offline handwritten digit recognition device based on SVM[5].

1. Image Acquisition

The acquisition of images is the initial stage, as illustrated in Figure 1. The experiment is carried out on images of the shapes taken using a scanner or a camera on a mobile phone. Following scanning, the photo is subjected to pre-processing to remove historical noise and binarization to produce pixels in 0s and 1s.

2. Pre Processing

On color, grey-degree, or binary record pictures with textual content and/or images, pre-processing techniques are used. Size normalization is one of the stages in pre-processing, when interpolation is performed for the same old sized image. Binarization is the process of converting a grayscale image to a binary image via the use of thresholding. The pixels in a binary picture have both a 0 and a 1 value. White pixels make up the backdrop, while black pixels make up the foreground. The erosion and dilation techniques are used to smooth the edges of things. Dilation is used to monitor opening clean away erosion. To remove tiny objects from the foreground,

filtering is used. The final filter to dilate is the closing filter, which is accompanied by an erosion mechanism. It fills in tiny gaps in the foreground and moves small sections of background into the forefront. Because they remove the margins of characters, edge detection using morphological gradient operators is used in area detection.

3. Segmentation

To distinguish text from backdrop and retrieve bounded textual information from an image, the segmentation technique is employed. Integrated methods that concentrate on phrase matching/recognition often combine or replace sophisticated segmentation with recognition, while stepwise approaches utilize segmentation to extract characters that may then be fed to recognition algorithms. Character segmentation may be handled using horizontal histogram profiles (for line segmentation), vertical histogram profiles (for word segmentation), and associated problem analysis. The picture is broken down into its constituent parts. Handwritten sentences are scanned to find valid segmentation points between characters using a basic heuristic segmentation method. The segmentation is based on the discovery of minima or arcs between letters, which is not uncommon in handwritten cursive writing. Lines, words, and characters are separated from the pre-processed image.

To divide the textual content lines, line segmentation is used. Word Segmentation calculates the distance between words, whereas Character Recognition calculates the space between characters. For character recognition, a variety of neural network methods, including SVM (Support vector machine), are employed. Essentially, the output of both sets of rules produces nearly equal accuracy, and they may be used to educate and compare accuracy.

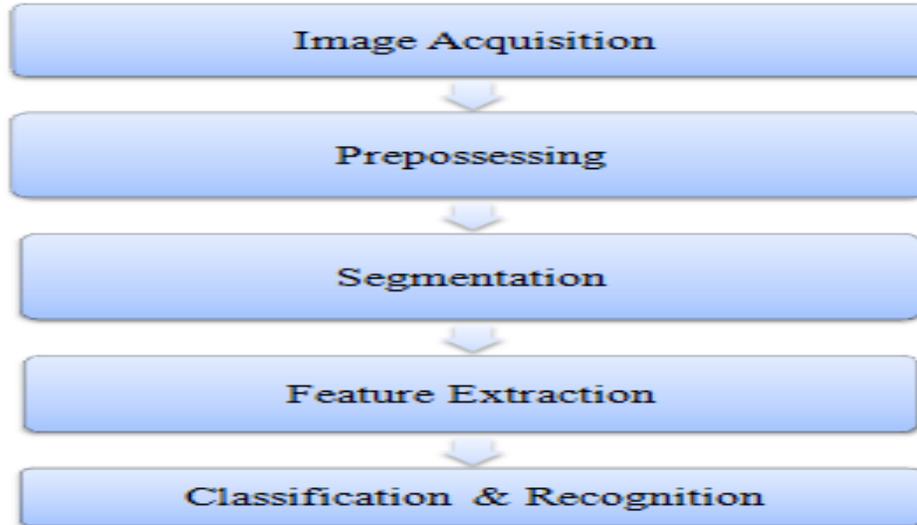

Figure 1: Illustrates the Processes involved for Digit recognition

4. Feature Extraction

Character Geometry-based Feature Extraction extracts the kind of line that creates a particular character. The picture is divided into windows of equal length, and a feature is applied to each window's starters—the pixel at the intersection of two windows has many neighbors. Gradient Feature Extraction. The Sobel operator is used to extract variations in depth of tiny neighbor

pixels. Each pixel's gradient vector is obtained, and the gradient picture is deconstructed using chain code. Crossings and Distances is a common statistical function that counts the number of times a contour is crossed by a line segment in a certain direction. The character's body is divided into a number of regions in different directions, and then characteristics from each are retrieved. Projections in which the characters are represented by projecting pixel gray values onto traces in a variety of ways. This depiction converts a two-dimensional photo into a one-dimensional signal that may be used to represent the character image in Figure 2.

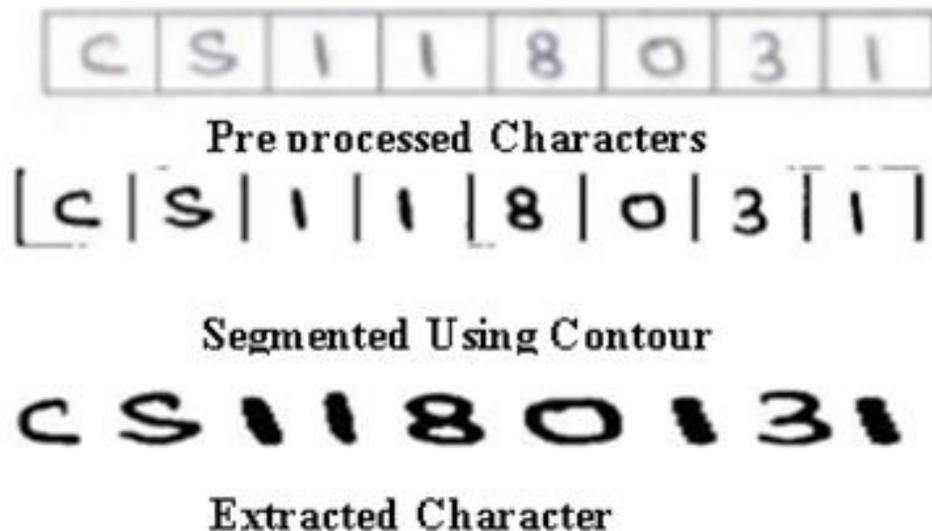

Figure 2: Illustrates the extraction of character processes

Border Transition Technique (BTT): In the border transition method, each character is assumed to be oriented vertically. Each character is divided into four identical quadrants. In each department, the scanning and computation of zero-to-one transitions in vertical and horizontal instructions takes place.

Graph Matching Technique: In a graph matching method, a structural feature of the man or woman is used. Altering the typeface or rotation is a helpful approach. These three characteristics are specified. First, a basic one-pixel endpoint is connected, which contains location statistics. Then a department factor with feature information linked to the branch is assigned to more than three pixels.

5. Classification

Non-text areas next to text regions may be included as positives after text detection and localization degree output. Using class algorithms, the classification step validates text areas and removes non-text parts. This level is also known as verification. Both supervised and unsupervised classification methods exist. The characteristics of text, such as color, size, texture, and so on, are elaborated by supervised algorithms. Unsupervised algorithms don't have any previous knowledge of text characteristics. Type algorithms that are supervised need to be educated before they can be used in class. These algorithms go through a procedure that enables them to extract functions from the text to categorize and utilize them in the category section.

Edge proximity restrictions, as well as area, top, and width limitations on the block obtained at the detection level, are utilized[6].

Unsupervised categorisation algorithms are no longer processed. In contrast to supervised categories, they only extract text functions during the class segment, and they reuse capabilities extracted in prior types for future types. This is similar to adaptive mastery. Wavelet transform, which provides successive approximation through low-bypass clean out and edge and feature information from an excessive-bypass filter. It splits an image into 1616 sized windows and extracts 36 characteristics from each windowed picture for unsupervised categorization of textual and non-textual information. Features like variation of stroke width, difference between contrast of text and historical past, and aspect ratio of bounding box are utilized in the method to create connected components that may be classified utilizing a k-means based entirely classifier. These are global functions taken from a picture that has been split into sub-areas[7].

An effective information modelling method capable of capturing and representing complicated input/output connections is an artificial neural network approach to be used. The desire to create an artificial machine that could do "intelligent" activities comparable to those performed by the human brain motivated the creation of neural community technology. Neural networks are similar to the human brain in that the neural network's information is stored in synaptic weights, which are the intensities of interneuron connections. Because the relative roles of the fields may vary in form, the characteristics of an image are extracted separately to educate the community. This allows it to split the picture into distinct blocks and monitor the neural community on each block.

5.1.Support Vector Machine (SVM)

Support vector machines (SVM) are supervised learning models with related algorithms that analyze data for classification and regression assessment in machine learning (ML). An SVM method creates a version that assigns fresh instances to one of two categories, making it a non-probabilistic binary linear classifier, given a collection of training examples tagged as belonging to at least one or the opposite of two classes (although techniques consisting of Platt scaling exist to apply SVM in a probabilistic type setting). An SVM version is a representation of the instances as points in space, mapped in such a way that the examples of the different classes are separated by as large a distance as feasible. New instances are mapped into the same space and assigned to a category depending on whatever feature of the space they fall into.

SVM (Support Vector Machine) is a kind of supervised machine learning method that aims to categorize data components by maximizing the margin between training in a high-dimensional space[8]. SVM is a representation of instances as components in space, mapped with the help of a reasonable gap as large as feasible between the examples of different courses. Following that, additional instances are mapped into the same space and assigned to a category depending on where they lie on the map. The technique is developed through a "training" phase in which training statistics are used to increase an effective set of rules for discriminating between companies previously described with the help of the operator (e.g. patients vs. controls), and a "testing" section in which the algorithm is used to blind-predict which organization a new belief belongs to. It also generates adequate search area for the right class of future data parameters and delivers a fully accurate class overall performance over the training information[9]. As a result, it

always guarantees a set of parameter combinations based on a realistic subset of the data. In SVM, it is usually preferable to scale the statistics, since this greatly improves the outcomes.

5.2. Multilayer Perceptions

The handwritten digits are classified using a neural community-based fully classifier known as Multilayer perception (MLP). Enter layer, hidden layer, and output layer are the three special layers of a multilayer perceptron. Every node in a layer is linked to all other nodes in the next layer, and each layer may contain a certain number of nodes, also known as neurons. As a result, it's often referred to as a feed forward community. The number of nodes in the input layer is determined by the number of characteristics in the dataset. The number of nodes in the output layer is determined by the dataset's broad range of evident classifications. It's difficult to identify the most practical range of hidden layers or the most practical number of nodes in a hidden layer for a certain annoyance. But, in general, these figures are arrived at via trial and error. The connection between nodes in a multilayer perceptron is based on a weight. It essentially learns the proper weight adjustment that corresponds to each link throughout the educational system. It employs a supervised learning technique known as Back propagation set of rules for the goal of acquiring information[10].

5.2.1. Random Forest (RF) Algorithm

Random forest is an ensemble of unpruned regression or category trees generated from bootstrap samples of the training data using the tree imitation technique's random characteristic selection. The forecast is produced by combining the ensemble's predictions for each category using superiority balloting. It generates a generalization error charge and is more noise-resistant. RF, like maximum classifiers, may be plagued by the curse of learning from a highly unbalanced training data set. It will tend to concentrate more on the prediction performance of the bulk class, which consistently results in poor accuracy for the minority class, since it was designed to reduce the overall mistake price.

5.2.2. Bayes Net

Bayesian networks are a powerful probabilistic depiction, and its use to categorization has gotten a lot of attention. It represents the states of a simulated portion of the world and explains how those states are linked via probability. The Bayesian community is a graphical representation of the probability connections between various variables. The graphical form offers many advantages for records assessment when used in combination with statistical methods. One, since the version encodes all variables' dependencies, it can easily manage circumstances when certain data entries are absent. Two, a Bayesian community may be used to learn causal connections and, as a result, can be utilized to acquire knowledge in a problem area and anticipate intervention outcomes. The conditional probability of each characteristic given the class label is learned from education statistics by this classifier. The comparison of different methods is shown in Table 1.

TABLE 1: COMPARISON OF CORRECT AND INCORRECT INSTANCES OF VARIOUS ALGORITHMS

ALGORITHM	CORRECT INSTANCES	INCORRECT INSTANCES
MULTILAYER PERCEPTRON	90.47	9.53
SUPPORT VECTOR MACHINE	87.87	12.13
RANDOM FOREST	85.77	14.23
BAYES NET	84.30	15.70

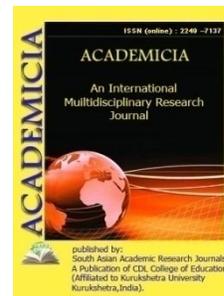

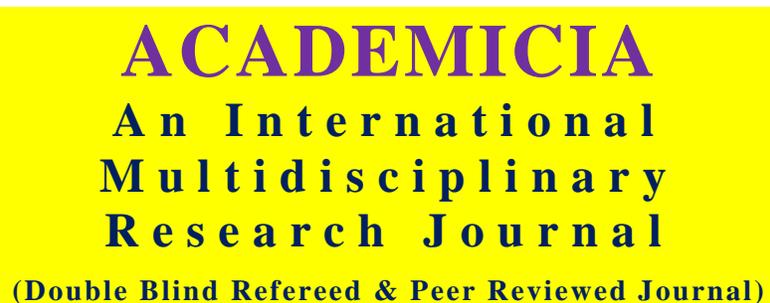

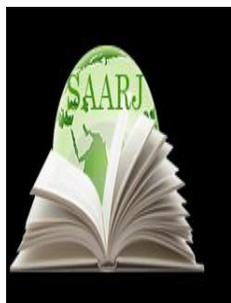

2. DISCUSSION & CONCLUSION

It is hypothesized that image processing expertise coupled with machine learning may be utilized to extend a system to recognize different types of handwritten writing. This solution may be used to automate data input systems, among other things. This may be advanced for a variety of benefits and applications with appropriate training and a huge quantity of data sets. The purpose of this article is to find a representation of handwritten digits that may be used to recognize them. Various remarkable machine learning techniques have been used and applied in this work for the recognition of handwritten digits. The most difficult issue in any recognition system is dealing with feature extraction and proper type strategies. The suggested method, which uses machine learning algorithms, attempts to deal with each of the components accurately and quickly. The recognition technique using Multilayer Perceptron has the best overall accuracy of 90.47 percent.

DRUG DISCOVERY: A COMPLETE REVIEW

Ms. Rinka Juneja*

*SOP, Sanskriti University,
Mathura, Uttar Pradesh, INDIA

Email id: rinka.pharmacy@sanskriti.edu.in

ABSTRACT

The drug business is one of the main actors driving the growth of the medicines, biotechnology & pharmacology sector. Drug discovery is the process through which medicines are discovered and developed. It is a technique which aims at finding a chemical therapeutically helpful in healing & treating illness. The process of drug discovery includes the identification of candidates, synthesis, characterisation, screening & tests for therapeutic effectiveness. Once a molecule has proven its usefulness in these tests, it will begin the process of medication development prior to clinical trials. Developing a new medication is a laborious & costly endeavor, despite exciting discoveries and multibillion dollar expenditures for new drug development is silently facing turmoil. Currently, all current treatments collectively reach only about 400 distinct pharmacological targets. It is predicted that there are at least 10 times as many potential pharmacological targets that could be explored for future therapeutic treatment in the future.

KEYWORDS: *Clinical trial, Clinical trials, Drug discovery, Drug development, Potential drug targets.*

1. INTRODUCTION

Drug discovery is a procedure, which aims at finding a compound therapeutically helpful in treating and curing a condition. Typically a drug discovery effort targets a biological target that has been shown to have a role in the development of the illness or begins from a molecule with intriguing biological activity[1].

The process of drug development includes the identification of candidates, synthesis, characterisation, screening, and tests for therapeutic effectiveness. Once a molecule has proven its usefulness in these tests, it will begin the process of medication development prior to clinical

trials. Drug discovery and development is a costly process due to the high expenses of R&D and human clinical testing. The average total cost of medication development ranges from US\$ 897 million to US\$ 1.9 billion. The average development period is 10-15 years. The developing world bears the main burden of infectious illness, but the range of medicines available for the treatment of many infectious diseases is restricted. In the past most medicines have been found either by identifying the active component from traditional treatments or by serendipitous discovery. At now a new strategy is being tried to understand how illness and infection are regulated at the molecular and physiological level and to target particular entities based on this information[2].

2. LITERATURE REVIEW

[Helmut Giersiefen](#) in his study discloses about present and future drug development techniques and tactics are reviewed in chronological sequence throughout the drug discovery process. Many of these methods are discussed in greater depth in the other chapters of this book. We refer only to tiny organic compounds and not therapeutic proteins ("biologicals"), for which the situation may be very different[3].

[J Drews](#) in another study discloses about the emergence of molecular biology and, in particular, of genomic sciences is having a profound effect on drug development. Recombinant proteins and monoclonal antibodies have significantly expanded our therapeutic armamentarium. Genome sciences, coupled with bioinformatic techniques, enable us to analyze the genetic foundation of complex illnesses and to identify the most appropriate areas of attack for future medications, thus expanding the number of therapy choices. The significant rise in the complexity of drug development is imposing changes in the institutional foundation of this multidisciplinary effort. The biotech sector is establishing itself as the discovery arm of the pharmaceutical industry. In bridging the gap between academia and big pharmaceutical corporations, the biotech firms have proven successful vehicles of knowledge transfer[4].

[Shenliang Wang](#) in yet another study discloses about reliable methods for addressing target identification and validation are the basis of effective medication development. Microarrays have been widely used in genomics/proteomics methods for gene/protein expression profiling and tissue/cell-scale target validation. Besides being used as an essential step in analyzing high-throughput experiments such as those involving microarrays, bioinformatics can also contribute to the processes of target identification and validation by providing functional information about target candidates and positioning information to biological networks. Antisense technologies (including RNA interference technology, which is lately extremely 'hot') allow sequence-based gene knockdown at the RNA level. Zinc finger proteins are a DNA transcription-targeting form of knockdown. Chemical genomics and proteomics are developing techniques for producing phenotypic alterations, thereby leading to target and hit identifications. NMR-based screening, as well as activity-based protein profiling, are attempting to fulfill the need of high-throughput target discovery[5].

3. DISCUSSION

1.1 Step 1: Target identification:

Target identification is the first important step in the drug discovery pipeline. Generally speaking, a drug target is the particular binding site of a drug in vivo via which the molecule performs its effect. A specific pharmacological target may have the following characteristics:

- The therapeutic target is a biomolecule(s), usually a protein that could exist in solitary or complex form.
- The biomolecules have unique places that match other.
- The biomolecular structure may alter when the biomolecule binds to tiny molecules and the changes in structure normally are reversible.
- Following the change in the biomolecule's structure various physiological reactions occur and cause control of the cell, organ, tissue, or body state.
- The physiological reactions produced by the changes in biomolecule structure play a significant part in complicated regulation and have a therapeutic impact on pathological diseases.
- The expression, activity, and structure of the biomolecule might change throughout the course of the disease process.
- Small molecules attaching to the biomolecules are medicines.

As is clear from the preceding explanation, a therapeutic target is a key molecule engaged in a particular metabolic or signal transduction pathway that is unique to a medical state or a specific illness. However, the phrase 'drug target' itself has many limits and is debated within the pharmaceutical industry. In this regard, several points should be kept in mind.

First, a drug target is a relative concept. For starters, a drug target is, just like other biomolecules, also a biomolecule involved in a transduction pathway. The difference between the two is only in their location and role in the transduction pathway. Another aspect is that a drug target is disease-dependent, that is, every target is involved in a special spectrum of diseases.

Second, most human diseases are rather complicated and involve many risk factors, so there are clearly many different drug targets with respect to a specific disease. Targeting a specific target could not conceivably cure a kind of disease. However, the involvement of many targets in a disease does not mean that each target shares equally in the pathogenesis of the disease and thus drugs targeting these targets would not be equally effective in the therapy of the disease.

Third, drug targets can change, which means that with the development of insights into biomolecules and their role in the pathogenesis of a certain disease, drug targets might be not as important as or may be much more important than currently believed. In fact, the establishment of drug targets is based on understanding of the pathogenesis of the disease.

Fourth, there are many drugs targeting the same target and one drug may have more than one target. The relationship between a drug and its target is not one-to-one but one-to-many or many-to-one.

Fifth, when a new drug target is discovered and validated, researchers usually hope to obtain more specific drugs targeting the target. However, a key understanding to keep in mind is that

the body is a subtle organism and a more specific drug might disrupt the homeostasis of the body. Compared to aspirin, rofecoxib is a specific COX-2 inhibitor. However, studies had shown that rofecoxib increases cardiovascular risks, resulting in rofecoxib's withdrawal from the drug market.

Sixth, a therapeutic target typically refers to a specific biomolecule. According to whether there are medicines available, a drug target can be divided into two classes: established drug targets and potential drug targets. The former are those for which there is a good scientific understanding, supported by a lengthy publication history regarding both how the target functions in normal physiology and how it is involved in human pathology. Furthermore, there are many medicines targeting this target. The latter are those biomolecules whose activities are not fully understood and which lack medicines targeting them. Potential targets offer possibilities for entirely new therapeutic development[6].

1.2 Step 2: Target Validation:

New target validation is the foundation of totally new drug exploration and the first stage of drug development.

New drug target validation may be of tremendous assistance not only to new drug research and development but also offer additional insight into the pathophysiology of target associated illnesses [3]. Basically, the target validation process can comprise six steps:

1. Discovering a biomolecule of interest.
2. Evaluating its potential as a target.
3. Designing a bioassay to assess biological activity.
4. Constructing a high-throughput screen.
5. Performing screening to discover hits.
6. Evaluating the hits.

The drug discovery process begins with the identification or growing evidence of, biological targets that are thought to be connected to a specific disease or pathology. Information supporting the involvement of these targets in disease modulation may come from a number of sources [4]. Traditionally, the targets have been researched and mainly found in university labs, and to a lesser degree in the laboratories of pharmaceutical and biotechnology companies. Primary research into understanding the fundamental, essential mechanisms for communication inside and between cells and their disruption in circumstances has been the basic method for establishing prospective targets appropriate for therapeutic intervention[7].

1.3 Step 3: Lead Discovery:

Once a disease- associated molecular target has been identified and validated in disease models, in the lead generation phase, compounds are identified which interact intact animals or disease-related cellbased models that can provide information about the integrative response of an organism to a pharmacological intervention and hereby help to predict the possible profile of new drugs in patients.

This is done mainly using knock-out or knock-in animal models; small molecule molecular target in vitro typically precedes the validation of the therapeutic idea in vivo; combined this defines its clinical potential. Validation includes research in molecular target in vitro typically progresses with the target protein and modify its activity. Libraries of substances that are either synthetic chemicals, peptides, natural or designed proteins, or antibodies are exposed to the target in a way that will identify and isolate those members of the library that interact with and, ideally, have an impact on the target [5-8]. The chemicals chosen are termed “leads”. Initially screening may be done by looking for compounds that bind to the target, however binding is not sufficient for therapeutic action. More recent screening methods incorporate an activity-based readout as part of the first screening test. For example, if the aim is to block a protein that is involved in triggering the expression of a particular gene or group of genes, the assay may include readout to determine whether the expression of the gene is decreased by the chemical. Such assays may be cell-based, but more frequently they are enzymatic assays that can be conducted in a high-throughput way for compounds that bind to the target, but binding is not sufficient for therapeutic action. More modern screening methods incorporate an activity-based readout as part of the first screening test. For example, if the goal is to block a protein that is involved in triggering the expression of a specific gene or group of genes, the assay may include readout to determine whether the expression of the gene is decreased by the chemical.

Such assays may be cell-based, but more frequently they are enzymatic assays that can be conducted in a high-throughput way[8].

1.4 Step 4: Lead Optimization:

Lead optimization is a procedure that starts with a compound that exhibits an intriguing biological activity and concludes with the identification of the best analog. Molecules are chemically modified and then analyzed in order to produce molecules with suitable characteristics to become a medication. Leads are evaluated with respect to pharmacodynamic characteristics such as effectiveness and potency in vitro and in vivo, Physiochemical properties, pharmacokinetic properties, and toxicological aspects.

Potency - refers to the quantity of medication needed for its specific effect to occur.

Efficacy - quantifies the maximal intensity of the effect itself, at saturating medication concentrations.

Pharmacokinetics - influences the destiny of xenobiotics. It explains about “What the body does to the drug”. It typically divided into sections evaluating the amount and rate of adsorption, distribution, metabolism, and excretion (ADME) (ADME).

Pharmacodynamics–It defines the biochemical and physiological effects of medicines, the mechanism of drug action and the relationship between drug concentration and effect. It talks about “What the medication does to the body”.

This procedure ideally involves the simultaneous optimization of multiple parameters and is therefore a time intensive and expensive phase.

This is typically the tightest bottleneck in drug discovery. However, by turning a physiologically active molecule into an effective and safe drug, lead optimization contributes significantly towards added value in the drug development process[9].

1.5 Step 5: Pre-clinical and clinical development:

Pre-clinical development: The pre-clinical development includes the following: create large scale synthesis; animal safety research; carcinogenicity testing; drug delivery; elimination and metabolism studies; drug formulation experiments; dose-ranging studies in animals. Wide range doses of the compounds are introduced to the cell line or animal in order to gather preliminary effectiveness and pharmacokinetic information.

The NIH divides clinical trials into 5 distinct types:

- Treatment trials: evaluate experimental therapies or a new combination of medicines.
- Prevention trials: seek for methods to prevent an illness or prevent it from recurring.
- Diagnostic trials: discover improved test or methods for diagnosing a disease.
- Screening trials: test ways of identifying illnesses.
- Quality of life trials: investigate methods to enhance comfort & quality of life for people with a chronic disease.

Pharmaceutical clinical trials are usually divided into 4 stages.

Phase 0-A recent classification for exploratory, first in human trials intended to accelerate the development of potential therapeutic agents by demonstrating early on whether the drug behaves in human subjects as was expected from preclinical research.

Phase 1-A small sample of healthy volunteers (20-80) are selected to evaluate the safety, tolerability, pharmacokinetics, & pharmacodynamics of a treatment. Normally include dosage ranging studies so that doses for clinical usage may be set adjusted.

Phase 2-Performed on bigger groups (20-300) & are designed to evaluate the activity of the treatment, & continue phase 1 safety assessments.

Phase 3-Randomized controlled trials on large patient groups (hundreds to thousands) aiming at becoming the final evaluation of the effectiveness of the new treatment, in contrast with conventional therapy.

Side effects are also examined. It is generally anticipated that there be at least two successful phase 3 clinical studies to gain approval from the FDA. Once a medication has proved acceptable, the trial results are manufacturing methods, formulation information, shelf life, etc.

This material is submitted to the FDA for evaluation.

Phase 4 - Post-launch safety monitoring & continuing technical support of a medication may be required or started by the pharmaceutical company intended to identify uncommon or long term side effects across a large patient population & timeframe than was feasible during clinical trials[10].

4. CONCLUSION

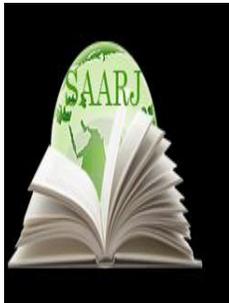

It is very challenging to discover novel chemicals that will lead to new medicines. Drug discovery is a time demanding and expensive process, the top twenty pharmaceutical firms spend ~ \$16 billion on research and development per year. But, recent discovery methods and techniques have decreased the bottleneck in finding high affinity ligands for therapeutic targets.

The availability of biological reagents, new techniques, technologies and computational tools is changing the way we conduct biological discovery and is allowing new ways to find novel targets for drug discovery and development.

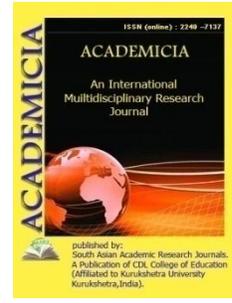

Today, the pharmaceutical sector is under tremendous pressure to generate a robust medication pipeline characterized by improved productivity, variety and cost effectiveness. But conversion of biological information to disease knowledge, validated target mechanisms, & novel treatments will certainly make the coming century an age of biomedical revolution. Human creativity will again prove to be the pharmaceutical industry's ultimate engine in finding therapy for previously treatable illnesses.

PROBLEMS OF TEACHING A SPECIALTY LANGUAGE IN TEACHING RUSSIAN AS A NON-NATIVE LANGUAGE

Ten Svetlana Konstantinovna*; Rakhimova Alla Innokentievna**

*Senior Lecturer,
 National University of UZBEKISTAN

**Senior Lecturer,
 National University of UZBEKISTAN

ABSTRACT

Proficiency in the language of the chosen specialty in a non-native language provides foreign-language scientific and professional communication when studying at a university. The main idea of teaching the language of the specialty and professional scientific speech is based on the statement that one should study the language not for the sake of formal knowledge, but for practical mastery of it. To speak a language means to have skills and abilities in all types of speech activity.

KEYWORDS: *Specialty Language, Professional Speech, Text, Communication, Connectivity, Speech Units.*

INTRODUCTION

The concept of "specialty language" defines such an aspect of teaching Russian as a non-native language in modern conditions, which provides interethnic educational, scientific and professional communication and in-depth study of the chosen specialty while studying at a university. Naturally, the knowledge of the language of the chosen specialty in a non-native language is secondary for a first-year student and is based on general knowledge of the Russian language and knowledge of the specialty as such, obtained when studying at a university in their native language.

The main principle of modern methods of teaching Russian as a non-native language is the communicativeness of learning, chosen in this study as the basic direction of linguodidactics - a communicative-activity, as well as a personality-oriented approach and innovative technologies as the main means of achieving educational goals. A meaningful attitude to language is based on an understanding of the deep communicative mechanisms of language and orientation on the

ability, based on the communication situation, to choose language means, as well as to understand the intention of the author of the finished speech work and evaluate the content presented by him. It is possible to fully implement this principle of communicative learning only if the training is based on such linguistic provisions that, firstly, will allow to realize and typify the semantics of the structures that make up the text, and secondly, to assess their communicative potential in relation to the professional sphere and the specific situation of communication. Therefore, the approach to grouping, selection and description of language material should be recognized as the most important moment in the implementation of the communicative-activity approach in teaching and the creation of a methodological system based on the principles of innovative pedagogical technologies.

The main idea of teaching the language of the specialty and professional scientific speech is based on the statement that one should study the language not for the sake of formal knowledge, but for practical mastery of it. To speak a language means to have skills and abilities in all types of speech activity. Teaching productive (speaking) and receptive (listening) types of speech activity are presented in this paper in a ratio that depends on the initial level of students' proficiency in Russian. In practical grammar, which should ensure the active speech actions of students, we distinguish first of all the constitutive units of the language. At the main stage (in groups with poor language training) - this is a proposal and a training text (model), and at the advanced stage (in groups with fluent Russian) - a special text.

The idea of communicative learning, following a number of researchers (S.N.Rubinstein, A.N.Leontiev, I.A.Zimnaya (psychological foundations); (T.A. Ladyzhenskaya, M.T. Baranov, G.A.Kitaygorodskaya (methodological foundations); M.P. Aliyeva, A.A.Reshetarov, T.A.Teplyakova (domestic linguodidactics)), we understand as the orientation of learning to the end result. The final result of the training, we see an exit into speech, into a correctly formed statement or text, whether it is a sounding or written version of it. Thus, recognizing the key positions of the text in the developed coherent speech, as well as in the motivation and organization of educational and professional activities in the chosen technology, we logically come to the conclusion that it is the text that should be given the status of the main unit of training.

According to the structure of the new pedagogical teaching technology stated in the first paragraph, chosen by us for this study, in order to diagnose the level of assimilation of educational material and the selection of students into groups with a homogeneous level of language and professional knowledge and experience, we divide groups of students into those who speak Russian well and those who do not know it well, offering the appropriate methodology. The stages of work on the text as a key unit of learning are presented for linguistically weak groups as the main material for speech development, and for strong groups as advanced. At the main stage, according to the RCT methodologists, the main task is to form a view of the text as a linguistic unit, when, perceiving someone else's coherent statement on an educational or professional topic or creating his own, the student clearly sees and highlights textual characteristics, distinguishes the text from the context, is aware of the functional purpose of each category of text. At the advanced stage, attention is focused, on the one hand, on stylistic varieties of speech and genres (form), on the other - on the structure of the text content (subject competence plus identification of patterns of thought structuring).

The first stage is basic for the whole system. It is best provided linguistically. Here we have outlined a range of key concepts from the theory of text, the knowledge of which will ensure the success of training and will allow us to form a scientifically based system of work on the development of coherent and specific scientific speech.

Why is scientific speech and text in the specialty so important in modern conditions? In our opinion, in order to streamline the learning process, it is advisable to bring the educational situation closer to the situation of real communication, to ensure the similarity of educational material and educational speech activity with the real language and real speech professional activity of the student. Modeling the communication process and taking into account the specialty is only one side of the matter. The research of psychologists has proved the fact that a person's speech is an act of activity and therefore should be considered in the system of his activity in general; a specific act of activity, which includes specific speech acts, should end with the achievement of the goal. Speech is one of the means to achieve this main ultimate goal. [1] A high motivational level will be maintained and will greatly contribute to the adequacy of the transfer of the skill if the development of a certain speech skill in Russian language classes is part of larger units of educational action that allow such an orientation of goals that would be related to the goals of vocational training, and the speech act itself will be put in a clear connection with a larger functional unit of speech correlated with the specified educational action.

Once again, it should be emphasized that the strategic goal of teaching Russian as a language of science in modern conditions is to acquire and improve relevant knowledge for students, which is why it is necessary to study the language of the specialty. Future specialists need to know perfectly professional speech, scientific text with all the features of its functioning in scientific, educational, scientific and professional fields of activity. Therefore, a special text is taken as a unit of training.

What is an educational text as a linguodidactic concept? From our point of view, any didactic or methodical construction should be based on a solid theoretical foundation. For the correct orientation of the methodological system, we consider it necessary to analyze the main theoretical provisions concerning the text.

V.A. Bukhbinder and E.D. Rozzanov, researchers of text structure in theoretical linguistics, note that "an integral feature of a text is its coherence" [2]. Connectivity is understood as "the result of the interaction of several factors. This is primarily the logic of the presentation, reflecting the correlation of the phenomena of reality and the dialectic of their development; this is a special organization of phonetic, lexico-semantic and grammatical linguistic means, taking into account also their functional and stylistic load, this is a compositional structure - the sequence and proportionality of parts that contribute to the identification of the content; and, finally, the content of the text itself, its meaning. All these factors, harmoniously combined in a single whole, ensure the coherence of the text". [2]

Such an understanding of the coherence of the text, on the one hand, covers a system of factors, but on the other hand, these factors are not only linguistic. The most adequate for our work is the understanding of the coherence of the text, stated by Kotyurova M.P. The coherence of speech is considered here as a functional-semantic category that covers the content, logical, compositional

aspects of speech and expresses the connection of the elements of content and the logic of presentation through lexical-grammatical and functional-syntactic means.[3]

It is assumed that the elements of the content can be expressed by a sentence, a complex syntactic whole and such structural and compositional units of speech as a paragraph, paragraph, chapter, part, section. Each of these units, despite their diversity, can express a single thought. According to N.I. Zhinkin“ "ultimately, in any text, if it is relatively complete and consistent, one basic idea, one thesis, one position is expressed. Everything else leads to this idea, develops it, argues, develops”.

Scientific creative thinking finds expression in the scientific text, in it all three aspects - logical, psychological and linguistic - are presented most clearly and clearly. Here scientific knowledge correlates with the structure and process of thinking. Therefore, as E.S.Troyanskaya writes, when reading the text, we seem to get into the sender's thinking laboratory, revealing step by step the course of his thoughts, which contributes to the “thinking” of the “recipient of information and its sender” at each stage of the presentation.[4]Communication constructs and functional-syntactic means of expressing the coherence of speech have such a contextual function. The expression of the coherence of speech in a scientific text is conditioned by two opposite tendencies - the completeness of the expression of the content and the conciseness of the expression of the thought process. In accordance with the prevailing manifestation of a particular trend, the content, compositional and logical aspects of speech coherence find expression. The more complex the units of speech, the more widely the relationship between them is expressed.

The expression of the content aspect of connectivity is characterized by significant stability in different types of science. At the same time, the compositional and logical aspects of connectivity, as shown by the analysis of theoretical sources, are characterized by a significant range of quantitative indicators characterizing the use of its means of expression. Scientists explain this by the degree of generality, abstractness of the content and the way of presentation (type of speech), which is mainly characteristic of a particular type of science.

We selected precisely these linguistic facts in the theoretical representation of a scientific text because, having identified formal indicators of coherence through lexico-grammatical and functional-syntactic means in a scientific legal text, it is possible to organize a methodology for studying the content side of the text on their basis and teaching the construction of a coherent statement on a professional topic. Having considered the theoretical provisions defining the scientific text, it is necessary to dwell in more detail on its linguodidactic interpretation as most fully meeting the objectives of this study. An educational scientific text or an educational text on a specialty in Russian linguodidactic science is defined as a certain segment (segment) a speech chain, which in its minimal limits consists of two sentences (phrases) connected in a certain way, going beyond the scope of one conclusion in content. [5] In classical linguistic literature, a text is defined as a sequence of sign units united by a semantic connection, the main property of which is coherence and integrity.[6]

As we can see, the methodological definition of the text is based on the theoretical one, while, for example, Motina puts forward the formalnological criterion, which in this work must be taken as a basis, since we are interested not just in the text, but in the scientific text. Another definition of the text deserves attention. Text is a product, a result of speech activity, a work of speech - oral or written. The text, as a rule, has a unity of theme and intent, relative

completeness, internal structure, syntactic, compositional and logical. The text implements the functionality of the language, the laws of its syntax, vocabulary, and stylistics. The text is always characterized by its relation to one or another style: scientific, journalistic, colloquial-everyday. The text should not be identified with a work of literature. Text is a term denoting the linguistic fabric of a literary work. [7]In our work, we will rely on the definition of the text given in the methodological and linguodidactic literature, since it most fully covers all aspects of the text as a linguodidactic concept. So, the subject of study at the university in the practical course of the Russian language should be a scientific text.

How are texts classified by specialty or special texts in linguodidactic science? There is no definite answer to this question yet. Different authors have different approaches to the differentiation of texts according to different criteria. Any one criterion (functional-semantic, etc.) is put forward as the basis. It is necessary to agree with L.P. Klobukova that the typology of texts in the specialty should meet the objectives of training and it is necessary to classify texts, taking into account both intra-textual and extralinguistic features.[8]

So, the academic scientific text in the specialty can be classified by types: description, narrative, reasoning.

The goals of teaching Russian in are, firstly, using it as a means of communication in a bilingual environment in the republic, and secondly, using it, as has already been said, as a means of obtaining special scientific information and, ultimately, improving one's professional level.

Communication is both a process and an activity, and an attitude in which interactions, mutual influences, mutual understanding of interlocutors are realized, one of whom speaks, the other listens or one writes, the other reads: in the first case, direct communication, in the second - mediated by graphic text.

In this regard, the main task of teaching gifted students the Russian language as a means of communication in the scientific and professional sphere of speech is to form their language skills of using certain language tools at the level of automated actions. At the same time, students should be well aware of the ways of expressing their thoughts and perceiving others' thoughts both orally and in written scientific speech.

The development of each type of speech activity is the unity of three components: language as a means of forming thoughts in the text, speech as a way of expressing thoughts in the text and extralinguistic factors (motive, situation, context).

Experience shows that trainees experience the greatest difficulties not when choosing the right word or sentence, but when expressing thoughts in coherent speech, i.e. at the level of a micro-thematic and thematic utterance, ideally, communication participants are only fully aware of the text when they understand and evaluate the communication situation from social, political, professional positions, as well as the motives for which the thought is expressed, the text is constructed.

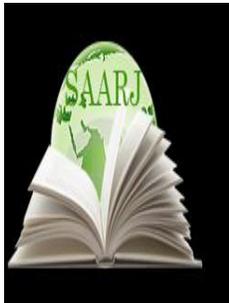

A motive is something that motivates a person to work to achieve a certain goal. The actual basis of the motives that motivate a person to work in a certain direction, in this case, to learn a language, is called motivation. The development of cognitive motivation of students in teaching the Russian language largely depends on the pedagogical skills of the teacher, his ability to

encourage the mastery of speech. So the answer to the first question is closely interrelated and mutually conditioned by the answer to the following two.

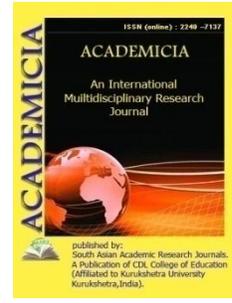

In connection with the determination of the motives and effectiveness of teaching the Russian language in the new conditions, the problem of optimizing the learning process and creating a special methodology arises. An important role here is played by the systematization of the proposed didactic material, the allocation of stages and methods of work on each language unit. At the beginning of the course, as practice shows, it is advisable to offer specially selected microtexts with pronounced textual characteristics (integrity, coherence, structure, communicative goal setting, etc.). Then you need to proceed to the analysis of real texts from textbooks in the specialty or scientific periodicals.

PERSONALITY OF THE POETICS OF STORY A. P. CHEKHOV “LIFE IN QUESTIONS AND EXCLAMATIONS”

Xatamova Dilfuza Abduvaxabovna*; Altundag Moxigul**

*Associate Professor,
 Candidate of Philological Sciences,
 UZBEKISTAN

**PhD Student,
 National University of UZBEKISTAN

ABSTRACT

This article analyzes the poetics of the story of A.P. Chekhov "Life in questions and exclamations." By disclosing the means and methods of the poetics of the story, conceptual semantic-forming dominants of the literary text, meaningful categories of the work.

KEYWORDS: *Story, Poetics, Dominant, Conceptuality, Methods And Means, Artistic Analysis Of The Text, Content And Form.*

INTRODUCTION

The peculiarity of the genre originality of A.P. Chekhov's work is the object of close attention of many critics and literary scholars. In particular, V.I. Tyupa, L.M. Gromov, E. Zenkevich, Esin B.I., V.B. Kataev and a number of other researchers addressed the problem of studying the specifics of Chekhov's stories. Hundreds of dissertations have been written. For example, in the dissertation of E.S. Afanasyev explores the formation of an ironic modus in Chekhov's prose, in the work of V. B. Kataev. the philosophical and artistic conceptuality of Chekhov's prose, in the study of Petrovskaya N.I. problems of intertextual inclusions in the writer's epic works, forms of the author's narration in the works of Chekhov Morgulova O.I. and you can list many more other works on the study of the work of the genius of Russian small prose. Our close attention was attracted by the work of VI Tyupa "The Artistry of Chekhov's Story", published in 1989. From our point of view, it was this study, carried out in the prism of new trends in literary science, that most fully presented and reflected the entire depth of Chekhov's stories. In the future, when analyzing the poetics of Chekhov's story "Life in Questions and Exclamations", we will adhere to the point of view of this researcher of Chekhov's work.

MAIN PART. It is well known that A.P. Chekhov is the consummate master of the short story. There are enough works devoted to the analysis of the writer's work on the modern literary platform. Our attention was drawn to one of the early stories of the great classic "Life in Questions and Exclamations." This one-sheet story is unique and original in terms of conceptual expression.

In 1882, a young, twenty-two-year-old Chekhov published a miniature story "Life in Questions and Exclamations" in the satirical magazine "Alarm Clock". Young, but already with a claim to genius, the narrator Chekhov puts the entire story of human life from beginning to end on one single sheet. Involuntarily, you wonder how a novice writer manages to do this? It is noteworthy that only simple interrogative and exclamation-type sentences are used in the miniature. Is this a coincidence? In a literary and artistic work, the master of the word never uses a single word or sign without a certain conceptual fullness, which will subsequently constitute the semantic structure of the text. Knowing the handwriting and writing style of the writer, we understand that in Chekhov's short stories, nothing is accidental! All this prompted us to try to understand the poetics of this work.

So, reading the reviews of literary critics and researchers about Chekhov's stories, in particular, the work of V.I. Tyups about the means and methods of depicting the artistic world by the writer, we are faced with the author's idea that Chekhov managed to reunite two mutually exclusive beginnings of the anecdotal and parable¹. In our opinion, these two principles are perfectly embodied in the story we are examining. Let's try to prove this idea.

First of all, there is a gravitation of the story to the genre of the short story. The story gravitates towards the short story, since the plot is dynamic, the plot itself, the event is important in it (not even the event, but the author's view of it). the result, which cannot end with "nothing", hence the intensity of the plot in terms of the dynamics of development. Human life in the prism of the writer's observations is divided into six significant episodes, which are united by a common plot and compositional component. That is, a person is born if a boy is a continuation of the family, according to religious rites, they must baptize or fulfill other conventions required by religion or mentality, adore, grow, receive criticism or punishment, go to school, and so on along a certain predetermined circle of human life. The story is characterized by brevity, accuracy, expressiveness, undeveloped individual psychology of characters, situational and at the same time generalized plot, uncomplicated composition. Here, the fusion of the very anecdotal and parable about which Tyupa speaks is clearly expressed: "The innovation of the genius storyteller consisted primarily in the interpenetration and mutual transformation of the anecdotal and parable beginnings - two seemingly mutually exclusive ways of understanding reality"².

Analyzing the poetics of this story, we come to the conclusion that the unusual style of presentation, episodic plot, originality, "momentary" situations, staging and at the same time deep reflection, reliability, persuasiveness, expressiveness of pseudo dialogues is an anecdotal beginning in the poetics of the work. The parable beginning is reflected in the ability and wisdom to grasp the most important and indicative elements of life, in the special philosophical observation expressed by interrogative sentences; in the depths of the statements conveyed by means of exclamation sentences, the universality, the universality of the story being told, the instructive meaning of which is long-lasting.

In the story, Chekhov uses colloquial speech ("don't drop it, mother!"), Which is distinguished by great semantic capacity, colorfulness, gives liveliness and expressiveness, naturalness, relaxedness and emotionality to the narration. The speech method is used for transmission,

spoken or internal speech. As the role of inner speech increases, the ways of its transmission become more diverse. As a result of this, the character's inner plane grows and the outer becomes immersed in the inner.

It is known that fragments of someone else's speech can be reflected in the character's inner speech. As observations of Chekhov's style show, the inner speech of the characters can also include non-personified (individual) speech, reflecting the collective point of view; external speech of another character, characterizing a third person; collective speech and so on. In the story "Life in Questions and Exclamations", where the organizing role belongs to one character, his inner speech includes echoes of someone else's speech. Thanks to the interaction of different points of view, Chekhov's story acquires that stereoscopicity that is characteristic of large narrative forms: (He already knows how to walk, You are not small !, It is a shame to cry out to such a big one, What will be the nominative plural? Add and subtract! When I stop you Get out of the classroom! In your years I didn't know anything like that, You're not enough! Already tore your boots? Borrow me a hundred rubles! !, Let's drink? Uraaaa, finished the course! Marry? Never, Nine without trump cards! Seven worms! Son or daughter? All in ... father! I assure you that I do not know her, I am bald? Do not itch, mother-in-law! Son or daughter? I'm drunk, Carolynchus, Are we going to the water? Marry him, my daughter! Stupid? Enough! Dancing badly, but lovely legs! One hundred rubles for ... a kiss, You, son, that ... immoral, Where are you , what time? Daddy, give me a watch! Dropsy? Really? Kingdom of heaven! Relatives crying? And mourning is coming to her! He smells of peace! to your ashes, honest worker!). Through succinct and concise phrases thrown by the character, the author conveys the very semantic and deep generalization that is characteristic of the above epic forms of narration.

The quote can be repeated in the inner speech of the speaker, rethought by another character, link the speech of two characters, as well as the speech of the character and the author. At the same time, it can be a fact of the spoken speech of another character and a means of assessing the situation. The following phrases can serve as a vivid confirmation of this: Son or daughter? I'm getting married, father! But I gave my word! Where did you spend the night? Marry? Never, Oh, if only you knew how I love her! She is a deity! Oh, if you only knew how much I love you! Yes or no? Yes? Oh my darling! To the neck! Leave a smoke! I get drunk after three glasses, I'm already drunk! I'm dying, doctor! I'm drunk, Carolinchen!, Champagne, Champagne).

The compositional technique of repetition creates the illusion of a vicious circle, when the son follows in the footsteps of his father, thereby repeating his fate. From a compositional point of view, in Chekhov's works an important role is played by the technique of repetition - plot and verbal: "the simplest, most widespread and obvious type of repetition in Chekhov's prose is the cross-cutting characteristics of the characters. With the help of repetitions, an external characteristic is given - a portrait detail, a gesture, and an internal characteristic, in particular, the psychological dominant of a certain scene"³. In this story, repetition is also used as a way to characterize characters, since it is he who is the most important principle of organizing the text. The technique of repetition is specific to the Chekhov story in principle. This principle is elaborated in detail in the early short stories of the writer and, in particular, "Life in questions and exclamations." Different types of repetitions can also be complicated by comparisons: a character with a character, a character with himself, a character with several characters, in our case a father and a son, the hero himself at different periods of life. Thanks to this technique, correspondences are established between different fragments of the text, not only immediately following each other, but also torn off from each other. In depicting the character in

the story, Chekhov uses not only repetition, but also contrast. The repetition of a quality or action gives the character's image stability and certainty. At the same time, the person in the image of Chekhov can be bifurcated, combining opposite traits or a property to change over time. In this regard, the idea is held that this Chekhovian character also contrasts with himself. Thus, the writer, through repetition and opposition, creates contamination, which leads to a circular composition, expressed in the reflection of the closed circle of life, a mirror image of the fate of Russian nobles in the fate of their descendants. A mirrored composition and plot are created that reliably and truthfully reflect Russian life and embody the author's intention.

The originality of Chekhov's repetition lies exclusively in the prosaic form. The transition from affirmation to denial is a stable method of organizing a given text, which remains throughout the entire content of the story.

At the same time, for the style of A.P. Chekhov and, in particular, the story "Life in Questions and Exclamations" is characterized by both intra-text and inter-text repetitions, which determine the connections between the parts separated from each other by chronological frames. This finds its expression in the text, namely, in the plot and composition. Reception helps to logically complete the work of an illogical and absurd human life.

Interrogative sentences in the given text act as motivating ones. Separate comments deserve statements, at the context-semantic level, close to prescriptive constructions, which, as you know, include such forms of motivation as order, order, permission, prohibition, instruction, prescription, threat: Don't cry! Read to me "Demyanov's ear"! Get a tailcoat! You, son, of that ... immoral!

The originality of the syntactic structure, namely the use of interrogative and exclamation sentences, allows us to conclude about the high degree of emotiveness of statements in the given text. Interrogative sentences are not so much a clarification of information received from the interlocutor, as expresses sincere surprise at a value judgment. This is evidenced by the lack of an adequate response to the questions. The semantics and structure of these sentences help to establish the expression of general emotionality, as well as to specify the emotion expressed by the given sentence. Emotional states of bewilderment and surprise most often accompany the main meaning of the question - the request for information. Perplexity, surprise signal mistrust, doubt, ignorance, etc., that is, the meanings that the question includes. In this regard, the communicative status of an emotionally evaluative interrogative sentence can be defined as intermediate, interrogative-narrative. Similar emotional states of surprise, bewilderment and exclamation are the most typical, since they are close to the meaning of the question. The text uses interrogative sentences to convey the hero's internal dialogue. The author uses them to display the polemical nature of the situation under consideration, or provides information in parts with the multidimensional nature of the problem. Usually, after such constructions, a direct answer does not follow, since in their semantics they approach an assertion, doubt, assumption or clarification. In this example, the narration is in the first person, and the inner world of the hero is revealed in the content of the internal dialogue. In the work, these sentences are used to give different emotional nuances to the story. They have a pronounced expression and in this they are similar to rhetorical sentences. As you know, rhetorical questions are one of the types of interrogative sentences. A rhetorical question does not require an answer. It is put in such a way that the answer to it follows from the question itself, and the answer is quite definite. The rhetorical question in the given text performs two main structuring functions: it is an expressive beginning and is realized in the form of the last sentence of syntactic unity, and at the same time it has the meaning of inference. The

rhetorical question at the end performs the function of deriving syntactic unity and conveys meaningful information in a reduced form. Such a question can be easily transformed into a declarative sentence. With the help of interrogative sentences in the monologue type of text, a stylistic effect of dialogic speech is created, they add expressiveness and emotionality to the content of the text. In the given text, interrogative sentences are also involved in question-answer unities, where their position is not rigidly fixed. In the story, interrogative sentences are the semantic center, have a resultant and causal meaning.

The exclamation points in this text are indicators of the emotional component. And this emotive state is expressed, firstly, through interjections, which, thanks to the property of directly indicating an emotion, without naming it, create the effect of a sincere emotional reaction, are an effective means of explicating emotivity. Interjections are a concentrated expression of the emotional and evaluative state and create vivid and convincing images of the characters.

The writer also conveys emotiveness and dynamics with the help of verbs. The verb accumulates a huge potential power of expression, since it has wide possibilities for describing life in its development and movement. The verb in all the richness of its semantics, with its characteristic meanings of grammatical forms and the possibilities of syntactic connections, with a variety of stylistic methods of figurative use, is an inexhaustible source of expression. The verb is used in the story primarily to convey a movement that expresses the dynamics of the surrounding world and the spiritual life of a person. Chekhov wants to display a picture of human life in which spiritual development is reversed. The most important stylistic function of a verb is to add dynamism to descriptions. Using the verbs of movement, Chekhov manages to reveal the intersection of two oppositely moving principles of human life. Life goes forward, a person grows up, gets old, and spiritual development, on the contrary, does not progress over time, but degrades, and the soul itself is morally decayed. Such is the vicious circle of the Russian nobility and humanity as a whole. Depicting the hero through his actions, the writer not only creates a real image, but also penetrates into his psychology, the inner world, since individual actions form the behavior of a person, and feelings, desires and even secret thoughts are reflected in him.

CONCLUSION

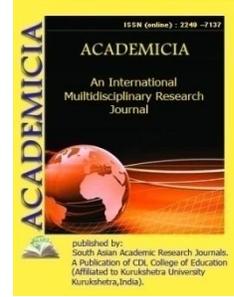

Exploring the genre and stylistic features of the work of the genius writer A.P. Chekhov, using the example of the story "Life in Questions and Exclamations", we come to the conclusion that in this story, in an anecdotal aspect, the specificity of Chekhov's images is revealed, which are never fully revealed, in the non-typical nature of their actions and the unpredictability of the end. "The hero of Chekhov is fundamentally atypical," as Chudakov put it in the work "The Poet of Chekhov". This is a kind of personality in the beingness of the real world. Chekhov, creating an individual image, takes as a basis the ordinariness, everyday life, similarity to others, which is clearly reflected in the story we are analyzing. Reading and plunging into the artistic convention of the author, each reader sees first of all his own life, pieces of his biography. Here it is appropriate to end with the words of I.N. Sukhikh. that the form of manifestation of the hero becomes for him that which inevitably enters the life of everyone. This is the presence of the parable in the literary convention of the writer, about which Tyupa writes.

AN OVER VIEW OF SATELLITE COMMUNICATION

Mr. Rishi Sikka*

*SOEIT, Sanskriti University,
Mathura, Uttar Pradesh, INDIA
Email id: rishisikka.ec@sanskriti.edu.in

ABSTRACT

With the introduction of satellites, communication throughout the whole world has been revolutionized. Satellite communication has benefited humanity in a variety of ways, including predicting weather, providing storm warnings, and providing a wide range of communication services in the fields of relaying television programs, digital data for a variety of business services, and, most recently, telephony and mobile communication. If satellite communication connections are utilized for voice and fax transmission to aircraft on international routes in the near future, it will not surprise the global community. Other uses of satellite communication include GPS navigation, global telephone, multimedia video and internet connection, Earth imaging through remote sensing satellites for resource monitoring, telemedicine, and tele-education services, among others. The satellite communication system is transitioning from high-cost, high-capacity trunk connectivity to low-cost multipoint-to-multipoint transmission. Satellite communication has progressed in various ways, including frequency reuse, linking numerous ground terminals across the globe, multiple spot beam communications, laser beam-based satellite communication, and the utilization of networks of tiny satellites in low earth orbit. Different application aspects, both current and future, are addressed in this article on satellite communication development. If we pool our efforts and come up with creative and low-cost solutions for the global community, satellite communication offers numerous applications and markets.

KEYWORDS: *Satellites, GPS Navigation, Remote Sensing, Telemedicine, Frequency Reuse.*

1. INTRODUCTION

The satellite communication service business has expanded at a faster rate than predicted in 1992. This expansion has been a worldwide phenomenon, as the world's economies have grown and developed to the point where more communication services are required for both corporate and consumer sectors. Consumer terrestrial mobile and internet communication services have created new possibilities for satellite communication as a result of increasing demand and recent big, fast growth of company[1]. The need for new multi-state satellite constellations to service this industry on a national and worldwide scale has been sparked by the growth of the mobile and Internet transport access industries[2]. The current and projected rise is due to growth in the aforementioned sectors, as well as an increase in worldwide TV viewership and high data rate transit. There is also a growing need for integrated satellite and terrestrial communications that will allow information to be sent smoothly between both modes of transportation.

Many countries' governments and industries have become interested in these huge and quickly expanding satellite-based commercial possibilities, and these countries are investing substantial additional money to allow them to participate in this developing market. To guarantee their long-term presence in the commercial satellite sector, several nations have set aside money for satellite R&D initiatives. The increasing worldwide demand for satellite communications services, as well as the development of satellites into new applications, has piqued the interest of the investing community. As a consequence, new satellite service providers have emerged, as well as mergers and acquisitions, the establishment of new businesses, worldwide partnerships, and the privatization of formerly public satellite service organizations. The satellite communication business has expanded dramatically, as has the number of experts and activities available[3]. Commercial communication satellite manufacturers and service providers have historically been cautious and reluctant to incorporate new technologies into spacecraft [2]. This has evolved in response to the urgent need to provide consumers' growing demand for entertainment content on television, mobile communications, and high-speed Internet access. Industry is rapidly integrating new technologies into satellites. Onboard processing and switching, more efficient solar cells, higher power components, more effective heat dissipation methods, electric-based station maintaining thrusters, inter satellite connections, huge antennas, and phased arrays are only a few examples of recent developments. antennas, antennas with multiple spot beams, and TWTAs that are better. Satellite is increasingly being seen as more than just a "bent pipe," but as an essential component of a huge global communications networking system that necessitates interoperability between satellite and terrestrial communication components, as well as compatible protocols and standards. The satellite business will have to undertake massive software operations and create new end-user services in order to integrate satellites into the global network. a larger geographic area, so that it may be received by a variety of consumers using suitable equipment Another use of satellites is observation, in which the satellite is outfitted with cameras and other sensors and simply downlinks whatever data it gathers from its vantage position[4].

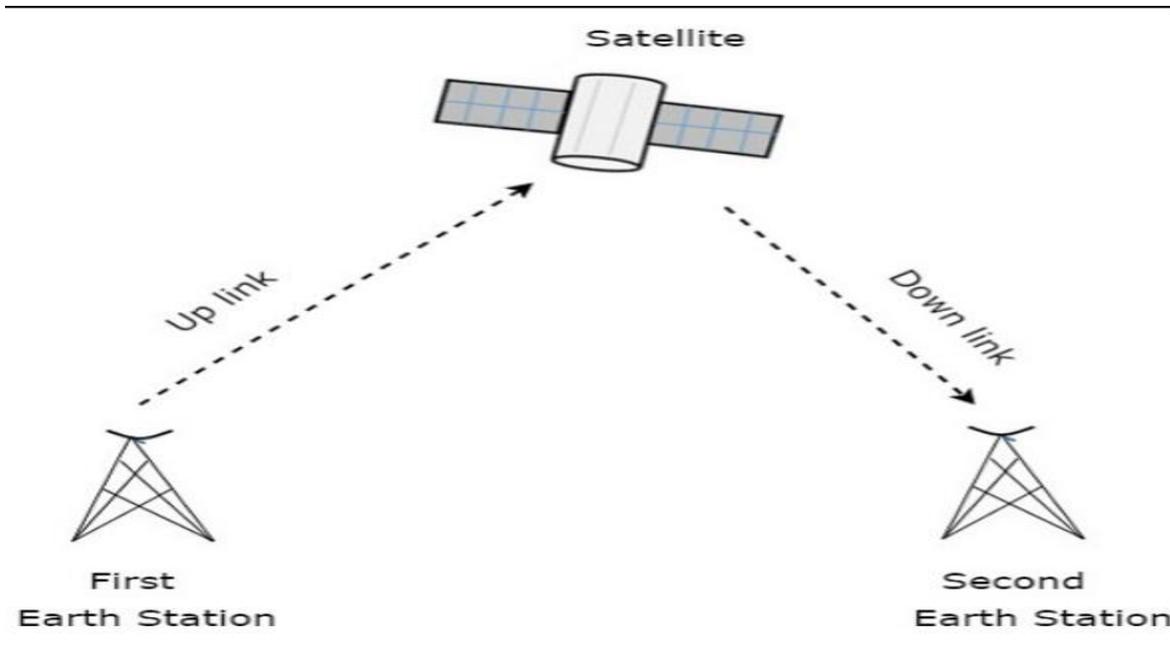

Figure 1: Diagrammatic Representation of Overview of Satellite Communication [ELECTRONIC HUB]

1.1 Advantages of Satellite Communication

- Satellite broadcasting provides extensive coverage across a wide geographic region, particularly in sparsely inhabited areas.
- The bandwidth is quite high.
- Satellite communication can quickly develop wireless and mobile communication applications regardless of location.
- It is used in a wide range of applications, including global mobile communication, private business networks, long-distance telephone transmission, weather forecasting, radio/TV signal broadcasting, military intelligence gathering, ship and aircraft navigation, connecting remote areas, and television distribution, among others.
- The coding and decoding technology in satellite transmissions generally offer security.
- It is simple to get service from a single supplier, and uniform service is accessible. It may be less expensive over large distances.
- Satellite communication is the ideal alternative since its installation and maintenance are simple and inexpensive.
- During a catastrophic situation, each Earth Station may be rapidly removed from its current position and placed somewhere.
- Ground station locations are simple to set up and maintain.

1.2 Disadvantages of Satellite Communication

- The expense of designing, developing, investing in, and insuring a satellite is greater.
- Time taken to reach the satellite from Earth may range from 270 milliseconds to 320 milliseconds. Over telephone lines, this propagation delay may produce an echo.
- Repairing and maintaining satellites is a difficult task.
- Some factors, such as weather or sunspots, may disrupt the satellite's signal, causing interference and making effective functioning difficult.
- It must be monitored and managed on a regular basis to ensure that it stays in orbit once launched.

1.2 Issue in Satellite Communication

- A new approach to satellite design, prototype, and production:

The old pattern of highly specialized, customised, developed and produced a few at a time in satellite production is currently shifting. The usage of common buses and the use of CAD tools to tailor communications payloads are currently being emphasized more. In an assembly line setting, a mass-manufactured system is used, and numerous satellites are created at once. Integration and testing are both automated to a large extent. After prototype and early production are completed, the scope and character of testing is decreased[5].

- New High-Performance Platform:

The construction of big aperture GEO systems with extremely high power systems has been one of the major technological developments in response to the deployment of LEO and MEO satellites. Commercial satellite power production was formerly restricted to 7 to 12 KW[6]. New generation designers, on the other hand, have started to propose huge flexible floppy solar arrays capable of producing 50-60 KW. Intensive attempts are also being made to enhance solar cell performance by utilizing gallium arsenide/germanium multi-junction cells, which have the potential to achieve solar cell efficiencies of above 30%. In order to build higher and higher powered satellites, simultaneous efforts are being made to enhance battery (lithium ion) and fuel cell technologies[7].

- Importance of Future Technologies

Batteries, devices, and structures for Phased Array and Multiple Spot Beam Antennas on the Ground and in Space Fuels and combustion structures for launch vehicles High frequency (>20GHz) devices Materials for electronics devices Solar cell materials and structures Network technology for high data rate, integrative satellite communications Materials for thermal dissipation Furthermore, experimental satellites are required to test new technologies that cannot be readily tested on the ground. At the system level, high altitude, long endurance platforms such as airships and loitering aircraft that fly between 65,000 and 1,00,000 feet may have an effect on satellites' future. In regional applications, such systems may be used to replace satellite communication, or they could be used in combination with satellites as a system capacity multiplier over populous regions[5].

- Issues with policies and regulations

Landing rights agreements, annual terminal licensing fees, non-tariff barriers, frequency and orbital slot allocation, adequacy and effectiveness of intersystem coordination procedures, security and privacy of information relayed on satellite systems, and other issues must be resolved in international satellite trade[8]. The necessity to create protocols for seamless connectivity of satellite, wireless, and terrestrial fiber networks is the most essential of all. Interconnection of satellite systems, especially inter-satellite connections, will be a major issue in the twenty-first century. It's a real difficulty to connect them to a low-latency terrestrial network[9].

1.3 Application of Satellite Communication

Satellites are ideal for certain applications. Broadcasting, service to mobile users such as ships, airplanes, land mobility, and emergency services, and delivering near-instant infrastructure in underserved regions are all examples of these[10]. The Internet's development has been a major role in these plans, and it shows no signs of slowing down, despite the inadequate access that most users presently have. As a result, the deployment of certain of these Ka-band systems may solve the issue of "last mile connectivity" that plagues most industrialized nations. This would be a significant application that has hitherto been overlooked by satellite systems. Other uses include:

- Traditional Telecommunication:

Direct-to-home television (DTH) or direct broadcast satellite (DBS), the enormous growth in wireless hand-held phone usage (cellular, personal communication services, and paging), and the growth in the number of personal computers in the world, increasing numbers of which are multimedia ready and are being used to internationally.

- Satellite-based atmospheric, oceanic, and terrestrial observation

i) Atmospheric monitoring

Meteorological satellites from the region's main space-faring nations are utilized to gather atmospheric data for climate forecasting. The INSAT-3 series, MATSAT, China's Feng Yung-1C, and the European metrological satellite NOAA series, among others, are all active for this purpose.

ii) Observations from the sea

In order to predict maritime storms, wind speed and direction near the ocean's surface are crucial. The operating satellites for oceanic observation include India's Oceansat-1 and Oceansat-2, China's QuikSat, KOMPSAT for monitoring ocean color, and Envisat for measuring pigment concentrations, suspended sediments, and soluble organic matter.

iii) Observation on the ground

Crop management, fertility, pest and disease information to increase crop yields and profitability, flood forecast, forestry estimation, global change studies, land cover monitoring and assessment, large area mapping, cartography, search and rescue operations, emergency disaster communication and hazard mitigation are some of the terrestrial observations carried out by remote sensing satellites. India has a four-satellite Resourcesat constellation, as well as NASA's

Landsat-7, ALOS, IKONOS-2, Quickbird1, Orbview-3&4, and other satellites that provide terrestrial observation.

- Navigation and positioning using satellites

Advanced applications that need very accurate location and tracking, such as precision mapping and surveying or monitoring oil spills and dangerous icebergs, will be enabled by GPS satellites. The same satellites will also offer improved navigation services for airplanes and vessels, as well as moving-map displays for automobiles. The NAVSTAR and GLONASS constellations, as well as the GPS-1 satellite, are all contributing to this goal.

- Space science and solar applications on the ground.

i) Application of space science

With the building of the International Space Station currently underway, a new door has opened to not just long-term studies of the space environment, but also research and industrial operations in microgravity. The International Space Station, known as Mir, will provide a more sophisticated platform for conducting space research and technological studies.

ii) Solar-terrestrial uses

Some nations are looking into the possibility of using solar electricity from space. The Solar Power System 2000 concept would use solar cells on board satellites in low equatorial orbits to generate electrical power, which would then be sent by microwave to specially built power receiving antennas in nations near the equator.

- Education and training through satellite

i) Teaching and learning at a distance

Open learning and distant education programs have been adopted by South-East Asian Ministries of Education in respective nations via satellite-based education and training in discipline open learning centers situated across the region. PEACESAT and other such satellites are utilized for education and training throughout Asia and the Pacific.

ii) Engineering

At least nine nations are undertaking small-scale experimental missions with human resource and industrial development as their goals. The Badr-B, FedSat, TMSat, and KITSAT series are among them.

- Military Relevance

In military operations, space is becoming more important. They're often employed to assist military or security-related operations like checking compliance with weapons control accords. Imagery, navigation, signal intelligence, telecommunications, early warning, and metrology are all examples of military applications. Over 270 military spacecraft, as well as 600 civil, commercial, and multifunctional satellites, are currently in orbit. These satellites are used for both military and civilian purposes.

2. DISCUSSION

Because satellite systems cover vast regions such as nations or continents, the available beam width must be shared by a large number of beams. To get around this, the frequency reuse [4] method is often used. This is based on spatially separated beams utilizing the same frequencies. As a result, the available bandwidth in the coverage region is split into a smaller number of beams. Cluster refers to a group of beams that share the entire available bandwidth. The cluster is then repeated throughout the coverage region, relying on the assumption that beams operating at the same bandwidth will be sufficiently distanced from one another to avoid interference. To allow a continuous coverage of hexagonal geometry, there is only a finite set of feasible cluster sizes. A communications satellite is a man-made spacecraft that uses a transponder to relay and amplify radio telecommunication signals, establishing a communication link between a source transmitter and a receiver at various places on Earth. Television, telephone, radio, internet, and military applications all utilize communications satellites. There are 2,224 communications satellites in Earth orbit as of January 1, 2021. Most communications satellites are in geostationary orbit, which is 22,236 miles (35,785 km) above the equator, and therefore look stationary in the sky; thus, ground station satellite dish antennas may be pointed at that location continuously and do not need to move to follow the satellite.

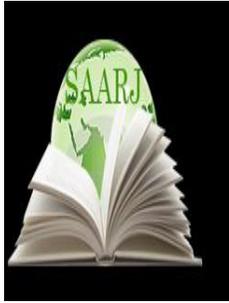

3. CONCLUSION

Satellite communication, its components, advancements in satellite communication, and current and prospective uses are briefly covered in this article. This is a one-time effort to provide a short overview of satellite communication applications. A thorough examination of the applications is still required. In our future research, we will look at the specifics of frequency reuse in satellite and mobile cellular systems. The high-frequency radio waves required for telecommunications connections move in a straight path and are therefore hindered by the Earth's curvature. The aim of communications satellites is to transmit signals around the Earth's curvature, enabling communication between geographically distant locations. A broad variety of radio and microwave frequencies are used by communications satellites. International organizations have rules governing the frequency ranges or "bands" particular organizations are permitted to utilize in order to prevent signal interference. This band assignment reduces the likelihood of signal interference.

CLIMATIC CHANGE AROUND THE WORLD: A REVIEW

Ms. Namrata Arya*

*SBAS, Sanskriti University,
 Mathura, Uttar Pradesh, INDIA

Email id: namrata.sobas@sanskriti.edu.in

ABSTRACT

Climate change is one of the main problems of our day and puts significant stress to our society and to the environment. From changing weather patterns that endanger food production, to rising sea levels that raise the risk of catastrophic floods, the effects of climate change are global in scope and unparalleled in scale. Without significant action now, adjusting to these effects in the future will be more difficult and expensive. This review deals with the idea of Global Climate Change, the related terminology, causes, consequences, remedies and its possible health impact. It highlights the need to act quickly if we are to prevent an irreversible build-up of greenhouse gases (GHGs) and global warming at a potentially enormous cost to the economy and society globally. Therefore, tackling climate change needs a “unprecedented degree of collaboration, not only between nations, but also across various levels of Governments, private sector and people.

KEYWORDS: *Climatic Change, Global, Greenhouse gases, Weather.*

1. INTRODUCTION

The evidence of climate change is compelling: sea levels are rising, glaciers are retreating, precipitation patterns are changing, and the world is getting warmer. According to the Intergovernmental Panel on Climate Change (IPCC), the current rate of greenhouse gas emissions is likely to cause average temperatures to rise by 0.2°C per decade, reaching by 2050 the threshold of 2°C above pre-industrial levels. Recent evidence suggests even more rapid change, which will greatly, and in some cases irreversibly, affect not just people, but also species and ecosystems[1].

Climate change indeed is real. Super typhoon Haiyan is the latest natural disaster that has also led credence to the reality of climate change. This sad occurrence hit land and devastated the

Philippines. This record-breaking storm is the strongest storm in history to make landfall. It tore apart buildings and left entire provinces without power or communication. The 370-mile-wide storm packed winds 3.5 times as strong as Hurricane Katrina. Winds reached 195 mph and had gusts of up to 235 mph. Walls of water as high as fifteen feet swept over the country washing away towns on many islands and washed ships ashore where homes once stood. The U.N. says, "Around 920,000 people were displaced by the storm and a total of 11.8 million people have been affected. Officials said the deadly storm left more than 3850 injured and at least 77 people reported missing across the Philippines." Climate change is a serious risk to poverty reduction and could undo decades of development efforts. While climate change is global, its negative impacts are more severely felt by poor people and poor countries. They are more susceptible because of their heavy reliance on natural resources and low capability to deal with climate unpredictability and extremes. Restoring and sustaining important ecosystems may assist communities in their adaptation efforts and support livelihoods that rely upon the services of these ecosystems. Moving towards low-carbon society may help decrease greenhouse gas emissions, increasing human health and well-being and generating green jobs[2].

Climate change is a reality of life. We need to act quickly if we are to prevent an irreversible build-up of greenhouse gases (GHGs) and global warming at a potentially enormous cost to the economy and society globally. Organisation for Economic Co-operation and Development (OECD) research indicates that if we act now, we have 10 to 15 years' "breathing space" during which change is feasible at a very moderate cost. But every year of delay decreases this breathing room, while needing ever more severe efforts to make a difference. Current financial crisis is not a cause to wait. Indeed, its macroeconomic implications will be addressed in a relatively short period, after which growth will resume, whereas the costs of inactivity on global warming will continue to become more and more expensive over time[3].

This research provides an overview of Global Climate Change with a goal to assist understand the idea, its urgency and to give an insight to the ways it impacts society and the natural environment and proffering remedies.

2. LITERATURE REVIEW

Singer & Avery in his study discloses about the Climate change and global warming, terms that are sometimes used synonymously, but they have different meanings in the sense that a 'warming' is only one phase of the larger climate system on Earth that naturally features change. Physical evidence on Earth and in space has helped scientists understand that there are many factors that can contribute to the changing of the planet's climate on a long-term basis. Examples of these factors are solar radiation levels, Earth's orbit around the sun, volcanic activity, ocean currents, and even plate tectonics. The periods of warming and cooling are referred to as interglacials and glacials, respectively, with the latter being partly characterized by enormous sheets of ice extending from the poles. Recent periods of change within human history include the Medieval Warm Period (A.D.1000-1270) and the Little Ice Age (A. D. 1270-1850)[4].

Weart in his another study discusses about the history of climate change discussion among people goes farther back in time than one might think. Weart (2007) notes that climate change was conceptualized in ancient times, with knowledge of the subject growing as the technology to study it improved over time. An important figure in climate science history who warned of possible problems was Guy Stewart Callendar, whose idea of carbon dioxide as a heat \strapping

agent was indeed borne out by computer climate simulations in the 1970s- “Even subtle changes in the Earth's orbit could make a difference. To the surprise of many, studies of ancient climates showed that astronomical cycles had partly set the Research on Climate Change 13 timing of the ice ages. Apparently the climate was so delicately balanced that almost any small perturbation might set off a great shift”[5].

Leiserowitz, (2007) In a research published by him, the argument is made that people's understanding of climate change is important to resolving the problem since it is in the public arena that political pressure develops. “Public opinion is important because it is a major component of the socio-political environment in which policy maker function. Public opinion may fundamentally force or restrict political, economic, and social action to address specific dangers. Although there is not a significant quantity of evidence from which to make conclusions regarding American citizens' view of climate change risk, numerous polls in recent years may enlighten inquiries about current thinking in the nation[6].

3. DISCUSSION

3.1 Natural Consequences:

These are already apparent, for instance, temperatures are increasing, polar caps are melting, sea level is rising, the deserts grows and the winters in Europe get progressively wetter. It has been scientifically proven that Mount Kilimanjaro over the years contains less and less snow as a result of global heating. It is unclear if this peak in Tanzania will be covered with snow at all in 50 years. It is also determined that the number of natural catastrophes grows more and more. Tsunamis, floods and severe drought are more often than in times past. In the years 1950-1960 globally 13 natural catastrophes have been recorded, against 72 in the decade 1990-1998. Now the effects are plainly apparent and most likely they will only grow in size and frequency in the future. The IPCC forecasts that climate change will become evident in the following major ways:

- By approximately 2100 global temperatures will have increased by between 1.1°C and 6.4°C. The precise rise relies on future emissions of greenhouse gases and other pollutants and on the combined action of physical and chemical processes in the atmosphere.
- Some areas of the globe will get more precipitation, with others being drier.
- In the course of the current century sea levels will increase by between 18 and 59 cm. This is because warmer water takes more space than cold water and because of the retreat of glaciers and polar ice sheets. Our knowledge of the melting of the Greenland and Antarctic ice sheets is still inadequate. This, together with the fact that there may be significant regional differences in sea level rise, implies that in certain areas of the globe the effects may be much more severe than projected by IPCC.
- The Gulf Stream, which carries comparatively warm water from the Caribbean to Europe, is projected to decrease in intensity, leading temperatures in northwest Europe to increase less dramatically than elsewhere. Standard climate models, however, make no account for a sudden shift in the Gulf Stream[7].

3.2 Economic Consequences:

Changes in global climate will have significant implications for living nature as well as the economy. Even a modest increase in mean annual temperature may have a significant effect on a region's ecology and biological diversity. Biodiversity is of vital significance for the stability of ecosystems as well as for human health. The economic impact of drought, floods and other climate change effects will become quite substantial. Some researchers estimate that these costs are set to rise to between 5 percent and 20 percent of global income. The IPCC has not yet managed to provide a rock-solid cost estimate of the consequences of climate change. It has estimated the cost of limiting further change, though. If such action is taken, global income will grow by only slightly less than if nothing is done: overall economic growth up to the year 2030 would then be 3 percentage points lower (57 percent instead of 60 percent, for example) (57 percent instead of 60 percent, for example).

Avoiding extreme climate change is also important if the "Millennium Development Goals" are to be achieved, formulated by the United Nations as follows:

- Eradicate extreme poverty and hunger.
- Achieve universal primary education.
- Promote gender equality and empower women.
- Reduce child mortality.
- Improve maternal health.
- Combat HIV/AIDS, malaria and other diseases.
- Ensure environmental sustainability.
- Develop a global partnership for development.

That climate policy and the Millennium Goals go hand in hand is readily illustrated. In regions where climate change leads to more severe drought, for example, poverty and hunger will be exacerbated rather than eradicated. Climate change will mean that malaria spreads further round the globe rather than being effectively combated. The multiple impacts of climate change on biodiversity will mean less environmental sustainability, not more. The message is clear: if climate change is not halted, the Millennium Goals will simply not be achieved[8].

3.3 Potential Health Impacts of Climate Change:

The most immediate effects on health include those related to changes in exposure to weather extremes (heatwaves, winter cold); increases in other severe weather occurrences (floods, cyclones, storm-surges, droughts); and increased production of some air pollutants and aeroallergens (spores and moulds) (spores and moulds). Decreases in winter mortality owing to milder winters may compensate for increases in summer mortality due to the increasing frequency of heatwaves. In nations with a high incidence of excess winter mortality, such as the United Kingdom, the positive effect may outweigh the negative. The degree of change in the frequency, severity and location of severe weather events owing to climate change remains unclear. Climate change, operating through less direct processes, will influence the spread of numerous infectious illnesses (particularly water, food and vector-borne diseases) and regional food production (especially cereal grains) (especially cereal grains). In the longer run and with

significant heterogeneity across populations as a result of location and susceptibility, these indirect effects are likely to have larger magnitude than the more direct. For vector-borne infections, the distribution and abundance of vector organisms and intermediate hosts are affected by various physical (temperature, precipitation, humidity, surface water and wind) and biotic factors (vegetation, host species, predators, competitors, parasites and human interventions) (vegetation, host species, predators, competitors, parasites and human interventions).

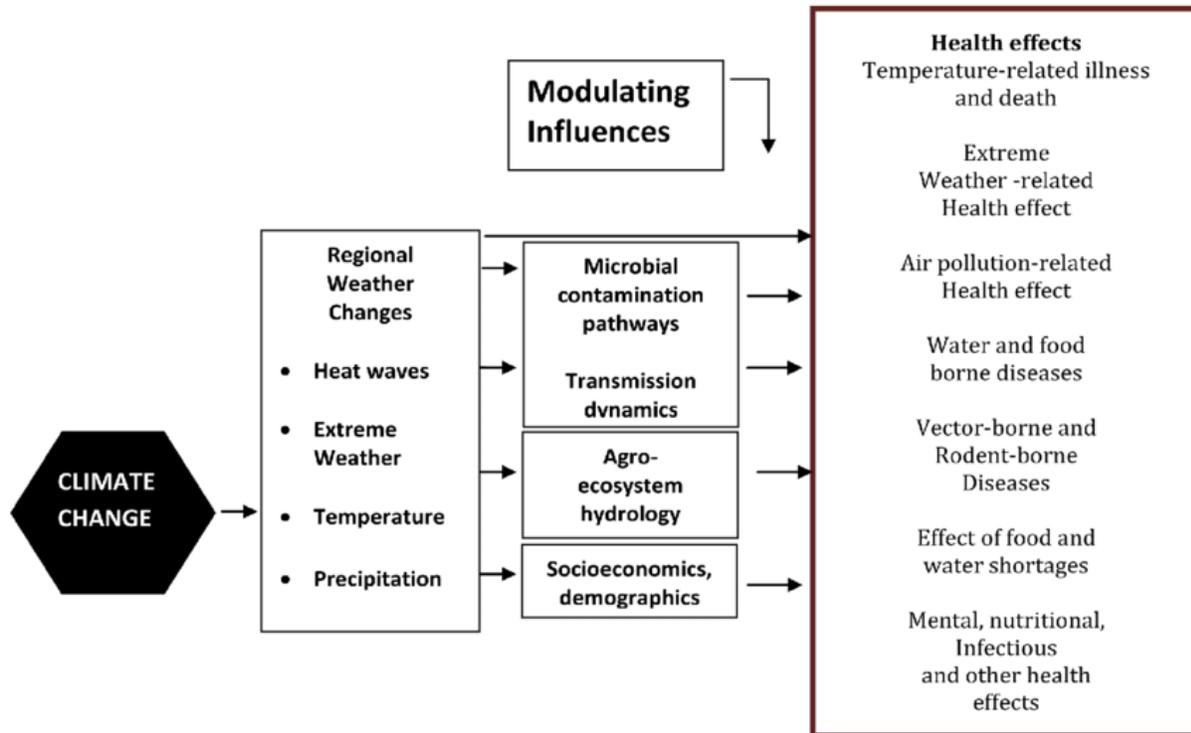

Figure 1: Pathways by which climate change affects human health including local modulating influences and the feedback influence of adaptation measures.

By reflecting the greater retention of heat energy in the lower atmosphere, global warming also impacts the atmospheric heat budget so as to enhance the cooling of the stratosphere. Should this cooling persist, the process of ozone depletion may continue even after chlorine and bromine loading (by human emission of ozone-destroying chemicals) begins to decrease. If so, the possible health implications of stratospheric ozone depletion (increase in frequency of skin cancer in fair-skinned people; eye diseases such as cataracts; and, possibly, inhibition of immunological function) would become a problem for climate change[9]. The main pathways and categories of health impact of climate change are shown in Figure 1.

3.4 Adaptation Solutions:

Adaptation is procedures by which civilizations make themselves better equipped to deal with an unpredictable future. Adapting to climate change involves adopting the proper steps to minimize the negative impacts of climate change (or exploit the favourable ones) by making the required modifications and changes. The Intergovernmental Panel on Climate Change (IPCC) defines adaptation as 'adjustment of natural or human systems in response to current or anticipated

climatic stimuli or their consequences, which moderates damage or exploits favourable possibilities. The effects of climate change may be observed all around the globe. Sea level rise, flooding, hotter summers and wetted winters are the image of present and future. The important issue is to what extent these changes will endure and how we should adjust to them. Contrary to mitigating methods, adaptive solutions do not contribute to a decrease of the climatological issues. Instead, we resign ourselves to the changes and adjust ourselves as best we can to the consequences. This implies that considerable infrastructure development will be needed: raising of dikes, upgrading of sewage systems, creating more room for water and similar measures. We must become aware of the reality that we will not always be secure any longer (from floods), but we must adjust ourselves to the changes:

- Sea level rising/floods/water nuisance.

When contemplating the rise of the sea level and the increasing potential of flooding in a nation, the Netherlands for example, there are two paths to a solution. On the one hand the Dutch can defend their nation even better by increasing the dikes and strengthening the coastal regions. But by doing this, the repercussions in case of a failure (the breaking of a dike) would only be greater. In reality, increasing dikes will only be like erecting a high protective wall around the nation, producing a sort of ‘bath tub’ at the same time. If the protection wall fails the consequences will be greater. Another adaptive approach is learning to live with floods. Instead of focusing on reinforcing the protective regions (dunes and dikes) we rather concentrate our efforts in minimizing the effects. This too will decrease the danger. After all, risk is defined as opportunity x consequence. If the opportunity stays the same, but the repercussions are less severe, the risk will drop. And precisely the limitation of the consequences can be started out on local government level. You might conceive of local regulations like “no constructions in lower parts of the country” or on the contrary “especially suited constructions in lower areas of the country”[10].

- Drought and desertification.

The UN-plan that was approved in 1994 emphasizes a “bottom-up”-approach, with which one aims to identify especially local solutions to avoid desertification along with the local people. One attempts to discover the answer in sustainable development, addressing social, economic and ecologic issues at one time. A comparable attitude requires quite a co-ordination and tight cooperation across regional, national and international authorities, but environmentalists are not persuaded that the political will to take steps is strong enough to reverse the trend. To resist the increasing desertification, in 1994 the Convention to Combat Desertification (CCD) was established, as a result of the Earth summit of 1992. The Convention, which in the meanwhile has been signed by 191 countries, came into effect in December 1996. To restore damaged ecosystems productive again is a long lasting process and needs an integrated strategy of rural development, extension of irrigation infrastructure and use of new technology. Still, it is conceivable. In China the amount of fertile soil disappearing annually decreased between 2000 and 2004. In February the Chinese government announced a plan to recover 250.000 square kilometres from the desert by 2020 by means of planting trees and grass. Also, the Chinese government intends to invest in arid areas in the effective use of water and renewable energy sources, such as wind and water. Furthermore it is the view of the UN-Environmental organization (UNEP) that when it is impossible to reverse the tide, one should make a virtue of necessity. The narrative of a report that was published 5 June read as: “As long as deserts

become more hostile and less suited for human settlement, we must be creative and take advantage of the current situation". UNEP sees a significant potential especially for the use of solar energy, fish-production, study of the therapeutic qualities of desert plants and the development of crops resistant to drought and salt. Also, new technology to create more effective irrigation systems and to desalinate estuaries may assist[3].

Heat

Temperature increase induced by climate change may in severe circumstances (hot) have a direct detrimental effect on the human health. Possible health consequences in Europe are: difficulties by heat stress, rise of the propagation of Lyme's disease, effects of poor air quality (summer smog) and an increase of allergies. Population groups at high risk (such as the elderly, children or asthmatic individuals) may suffer higher impacts (a greater illness load) (a greater sickness burden). Policy can play a significant role in the limitation of the health consequences of climate change. The Netherlands ought to be competent to resist some health consequences of climate change, by means of the maintaining/improving of existing policies or with new policy choices. Little is known regarding biological or passive adaptation of man to climate change (for example acclimatization, vaccination) (for example acclimatization, immunization). Possible policy options/adaptation possibilities are amongst others:

- Improving of living circumstances, e.g. air conditioning, ventilation.
- Improving of preventive/curative health care, e.g. people with specific educations, immunization.
- Monitoring/alarm systems.
- Public information/education.

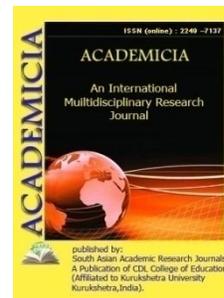

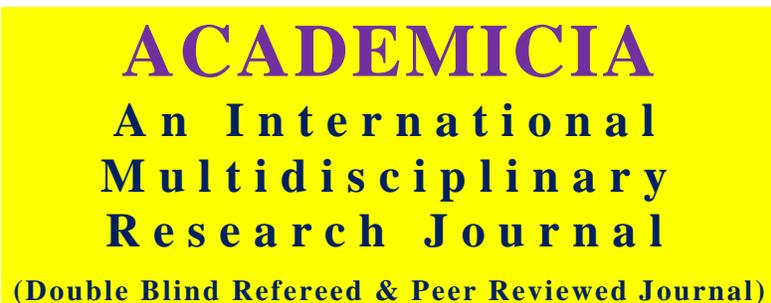

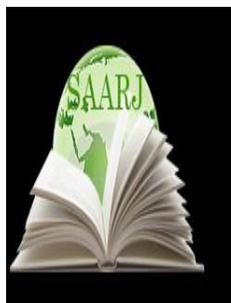

Some adaption options will be more successful and/or cost-efficient than others[4].

4. CONCLUSION

Climate change is occurring and it is driven mainly by human activities. Its effects are starting to be seen and will be exacerbated in the decades ahead unless we take action. The rising pace of global warming—courtesy of carbon dioxide and other greenhouse gas emissions from human activities—have led to climatic changes and environmental degradation, which in turn have resulted to significant difficulties in connection to illnesses and human health. Many illnesses which were previously unknown in particular climatic zones are now making their way to such regions, owing to changes in the weather circumstances. Further, several illnesses that had been believed extinct are re-emerging in regions with changed climatic circumstances that promote their return. It is therefore important that stakeholders and decision makers at industrial, government and international policy levels come up with stringent and workable means of cutting down on greenhouse gases emission to combat the spread of global warming effects, and the resultant climate change, which has produced devastating impacts especially among poorer nations. Further, there should be increased funding of adaptation and coping programs and projects in affected areas to minimize the impacts on human health and curtail the spread of diseases.

ABSTRACT

"Inter" is "mutual", "act" is to act. . The discussion can be organized in two ways: either all the subgroups are analyzing the same question, or some large topic is broken up into separate tasks. This is a kind of public discussion of the participants in the debate, aiming at persuading a third party, and not each other, that they are right.

KEYWORDS: *subgroups, persuading*

INTRODUCTION

The competence-based approach to the organization of the educational process requires the teacher to change the learning process: its structure, forms of organization of activities, principles of interaction between subjects. And this means that priority in the work of a teacher is given to dialogical methods of communication, joint searches for truth, and various creative activities. All this is realized through the use of interactive teaching methods.

The word "interactive" came to us from English from the word "interact". "Inter" is "mutual", "act" is to act. Interactivity is the ability to interact or be in a conversation mode, dialogue with someone (person) or something (for example, a computer).

The educational process is organized in such a way that almost all students are involved in the learning process, they have the opportunity to understand and reflect on what they know and what they think. The peculiarity of interactive methods is a high level of mutually directed activity of the subjects of interaction, emotional, spiritual unity of the participants.

Compared to traditional forms of conducting classes, in interactive learning, the interaction of the teacher and the student changes: the teacher's activity gives way to the students' activity, and the teacher's task is to create conditions for their initiative.

In the course of interactive learning, students learn to think critically, solve complex problems based on the analysis of circumstances and relevant information, weigh alternative opinions, make thoughtful decisions, participate in discussions, and communicate with other people. For this, pair and group work is organized in the classroom, research projects, role-playing games are used, work is underway with documents and various sources of information, and creative work is used.

The student becomes a full participant in the educational process; his experience is the main source of educational knowledge. The teacher does not give ready-made knowledge, but encourages the participants to search for themselves and acts as an assistant in their work.

Interactive forms of conducting classes:

- arouse students' interest;
- encourage the active participation of everyone in the educational process;
- appeal to the feelings of each learner;
- contribute to the effective assimilation of educational material;
- have a multifaceted impact on students;
- provide feedback (audience response);
- form students' opinions and attitudes;
- form life skills;
- promote behavior change.

Note that the most important condition for this is the teacher's personal experience of participation in interactive training sessions. You can only learn them through personal participation in a game, "brainstorming" or discussion.

INTERACTIVE METHODS, FORMS AND TOOLS OF LEARNING

1. Binary lecture (lecture-dialogue).

Provides for the presentation of material in the form of a dialogue between two teachers, for example, a scientist and a practitioner, representatives of two scientific directions. Needed: demonstration of the culture of discussion, involvement of students in the discussion of the problem.

2. Briefing.

Briefing - (English briefing from English. Brief - short, short) - a short press conference devoted to one issue. The main difference: there is no presentation part. That is, almost immediately there are answers to the questions of journalists.

3. Webinar.

A webinar (from the words "web" and "seminar") is a "virtual" workshop organized through Internet technologies. The webinar is characterized by the main feature of the workshop - interactivity. You give a talk, listeners ask questions, and you answer them. The easiest way to organize a webinar is to use the services of companies specializing in the provision of these services.

4. Video conference.

Videoconference is a field of information technology that simultaneously provides two-way transmission, processing, transformation and presentation of interactive information at a distance in real time using hardware and software computing technology.

A video conferencing interaction is also called a video conferencing session. Videoconferencing (abbreviated name of videoconferencing) is a telecommunication technology of interactive interaction between two or more remote subscribers, in which it is possible between them to exchange audio and video information in real time, taking into account the transfer of control data.

5. Video lecture.

A filmed abridged lecture, supplemented with diagrams, tables, photographs and video clips illustrating the material presented in the lecture. A series of such lectures is well suited for both distance and distance learning, and for repetition of the material studied.

6. Virtual consultation.

Self-study of the student on the study of interactive teaching materials allows him to receive the bulk of educational information, and the implementation of written assignments - to develop skills in the practical use of the concepts of the course in the study of his own experience.

7. Virtual tutorial.

It is used to consolidate and correct independently acquired knowledge and skills, develop skills in group activities and exchange experience with other participants. Tutorials are conducted using active teaching methods (group discussions, business games, case solving, trainings and brainstorming sessions).

8. Group discussion (discussion in an undertone).

To conduct such a discussion, all students present at the practical lesson are divided into small subgroups that discuss certain issues included in the topic of the lesson. The discussion can be organized in two ways: either all the subgroups are analyzing the same question, or some large topic is broken up into separate tasks. Traditional material results of the discussion are as follows: drawing up a list of interesting thoughts, making presentations by one or two members of subgroups, drawing up methodological developments or instructions, drawing up an action plan.

9. Debate.

This is a clearly structured and specially organized public exchange of thoughts between two parties on current topics. This is a kind of public discussion of the participants in the debate, aiming at persuading a third party, and not each other, that they are right. Therefore, the verbal

and non-verbal means that are used by the participants in the debate have the goal of obtaining a certain result - to form a positive impression on the listeners from their own position.

10. Business game.

A business game is a tool for simulating various conditions of professional activity (including extreme ones) by searching for new ways to fulfill it. The business game simulates various aspects of human activity and social interaction. Play is also a method of effective teaching, since it removes the contradictions between the abstract nature of the academic subject (object) and the real nature of professional activity.

11. Discussion.

As an interactive teaching method means exploration or debriefing. An educational discussion is a purposeful, collective discussion of a specific problem (situation), accompanied by the exchange of ideas, experience, judgments, opinions within a group. Discussion involves the discussion of an issue or a group of related issues by competent persons with the intention of reaching a mutually acceptable solution. Discussion is a kind of controversy, close to polemics, and is a series of statements, expressed in turn by the participants. The statements of the latter should relate to the same subject or topic, which gives the discussion the necessary coherence.

12. Dispute.

Comes from the Latin disputare - to reason, to argue. In those situations when it comes to a dispute, we mean a collective discussion of moral, political, literary, scientific, professional and other problems that do not have a generally accepted, unambiguous solution. In the course of the dispute, its participants express various judgments, points of view, assessments on certain events, problems. An important feature of the dispute is strict adherence to the previously adopted regulations and topics.

13. Imitation games.

Also known as "microworlds", they are a kind of "simulators" that develop systems thinking, decision-making skills in a dynamically changing environment under conditions of stress and uncertainty. The microworlds make it possible to simulate situations lasting several months, years or decades in a few hours, which makes it possible to assess the long-term consequences of decision-making and the likely side effects.

Simulation games are a kind of "learning laboratory" in which a real situation from the field of jurisprudence or public administration is simulated, and the participants in the experiment can apply their decision-making skills to the simulated situation. These games are based on complex simulation models based on system dynamics, agent-based modeling, or a combined approach.

14. Interview.

The term "interview" comes from the English interview - conversation. According to the content of the interviews, they are divided into groups:

- documentary interviews;
- opinion interviews;
- Interview "press conference".

The subject of the interview can be both a lecturer and students who have prepared information on a given topic.

15. Interactive (problem) lecture.

An interactive (problematic) lecture is a presentation, as a rule, by an experienced teacher in front of a large audience of students for 2-4 academic hours using the following active forms of learning:

- guided (guided) discussion or conversation;
- moderation (the fullest involvement of all participants in the lecture in the process of the material being studied);
- demonstration of a slide presentation or fragments of educational films;
- brainstorming;
- Motivational speech.

16. Information-problematic lecture

It involves the presentation of material using problematic issues, tasks, situations. The process of cognition occurs through scientific research, dialogue, analysis, comparison of different points of view.

17. Case method (analysis of specific situations).

The case method (from the English case - case, situation) is an improved method for analyzing specific situations, a method of active problem-situational analysis based on learning by solving specific problems - situations (solving cases).

The case method is the study, analysis and decision-making on a situation (problem) that has arisen as a result of past events, real situations, or may arise under certain circumstances at one point or another. Thus, a distinction is made between field situations based on real factual material and chair (fictional) situations, cases. Students should analyze the situation, understand the essence of the problem, suggest possible solutions and choose the best one.

18. Collective solutions to creative problems.

Creative assignments are understood as educational assignments that require students not to simply reproduce information, but to be creative, since assignments contain a greater or lesser element of obscurity and, as a rule, have several approaches.

19. Colloquium.

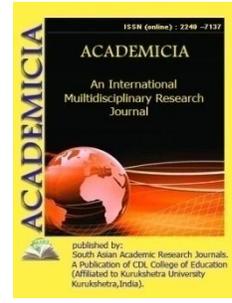

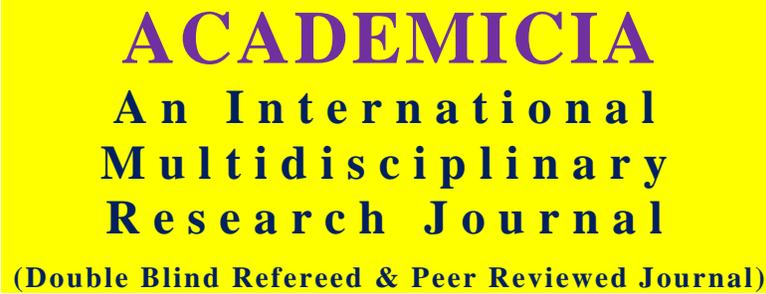

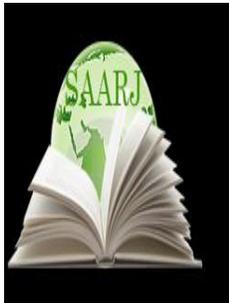

Colloquium is a type of educational and theoretical studies, which is a group discussion under the guidance of a teacher of a fairly wide range of problems (situations). At the same time, it is a form of control, a kind of oral examination, mass (frontal) survey, which allows the teacher in a relatively short time to find out the level of knowledge and skills of students of an entire academic group in this section of the course.

The colloquium, as a rule, takes place in the form of a discussion, during which students are given the opportunity to express their point of view on the problem (situation) under

consideration, to learn to justify and defend it. While arguing and defending their opinion, students at the same time demonstrate how deeply and consciously they have assimilated the studied material. The results are summed up at the end of any lesson, training. As a rule, this procedure is designed for the participants to share their impressions, feelings, and express their wishes. Summing up can be carried out in the form of filling in "sheets of revelation", questionnaires, questionnaires. The teacher can ask the participants of the seminar what new they learned, what was interesting for them, useful, suggest to remember what exercises they did, thus, consolidating the material passed. It is good if the training participants are constantly encouraged in various available ways: verbal or written gratitude is expressed, some brochures, booklets, souvenirs, etc. Or they trust those who have distinguished themselves with the most important tasks.

ABSTRACT

In this article is learned the universalism of the protagonists of Joyce Carey's first trilogy, "Herself Surprised," the second novel, "To Be a Pilgrim," and the third, "The Horse's Mouth". In the 30s and 40s of the twentieth century, the work of Joyce Carrey (1888–1957) was one of the brightest works of English literature. In recent years, his works have attracted the interest of literary scholars, translators and readers. For twenty-five years of work (1932-1957) Joyce Carey sixteen novels, more than thirty-five short stories and short stories, twenty-five literary essays, twenty-nine general education essays, four political brochures and a book on aesthetics published.

KEYWORDS: *Trilogy, Epic Series, Genre, Novel, Novel-Epic, Image, Character.*

INTRODUCTION

In the 30s and 40s of the twentieth century, the work of Joyce Carrey (1888–1957) was one of the brightest works of English literature. In recent years, his works have attracted the interest of literary scholars, translators and readers. For twenty-five years of work (1932-1957) Joyce Carey sixteen novels, more than thirty-five short stories and short stories, twenty-five literary essays, twenty-nine general education essays, four political brochures and a book on aesthetics published. Joyce Kerry volunteered for the Nigerian colonial administration in 1913, fighting against the German army in World War I. The events of this period become his first examples of creativity. In 1920 he returned to England from South Africa due to ill health [6]. Joyce Carey wrote her first trilogy in 1941-1944. The first book of the trilogy "I am surprised myself" (Herself Surprised, 1941), the second novel is called "From the path of the tourist pilgrim (To Be a Pilgrim, 1942), and the third is "From the original source" (The Horse's Mouth, 1944).

MAIN PART

We can say that Kerry's work has some objections, although it is generally accepted, after limitation, it seems universal: to have good creative qualities, but not in the form of a true literary direction. When you look at Kerry's work, it's strong around him there were protests, many contradictions. Alan and other critics of the depth of Kerry's worldview and his views on the seriousness of his theses, helped him create perfect and powerful works. 60-70 Many researchers of the years, respect the artist Kerry and Kerry's "uncertainty of understanding the world" noted. Such views are, first and foremost, R. Blum reflected in the monograph. Here's Kerry's politics The following opinion can be seen regarding the trilogy: "Heas it is, as it is taken, this is a deep uncertainty example and the desire to be happy in life under any circumstances." [3, c. 200].

Shereshevskaya M.A. (Prisoner of Grace, 1952) and (*The Horse's Mouth*, 1944), wrote the Russian edition of his novels in the preface, general information about the Kerry case, gave him a brief description of his philosophical views, where a person as a potential creative person, creator of basic ideas about conflict with the outside World highlights Researcher Carey's work is realistic in English notes his closeness to literary traditions. This has been pointed out by other authors as well. [2, c. 3-12]. In his works, the artist turns to the epic series. In general, an epic series can also arise as a result of the inability of many writers to create an epic novel, but in many cases an epic series is created as an independent and distinctive genre. Each division has its own functions and capabilities. Secular scenes from the epic series epic novel in demonstrating the integrity of the socio-philosophical concept, depth, lagging behind the criteria for the accumulation of genre features remains, but has a number of advantages, i.e. a complete variety of large and complex civilizations illuminate the realities of the area and the top ten community life Chronicle chronicles of the world's diversity can reflect the events taking place in their countries.

In general, the formula of Blum Kerry's "uncertain world" Alan Kennedy accused the author of the trilogy about "solipsism" and relativism of suspicion. The genre of the novel Point of View, that is, the cycle of novels with a large number of points of view in this case, according to Alan Kennedy, leads to the fact that the image of life, which is not far from them, belongs to external aspects. According to Kennedy, Kerry did not want to give up the opportunity to look at the world objectively, but showed that there is another concept in life that corresponds to the position of a person in society. [5, p.99].

In Joyce Carrey's novel "*Herself Surprised*", the protagonists Sarah and Jimson were happy early in their lives. With every minute they passed, every open day, he lived happily ever after. The spirit of the hero of the work The image of the sea is a lyrical companion of mood. "Even the calm sea shines on a hot day. The sun The light fell on the smooth, flat surface of the glistening water. When the waves rise, the sea becomes like people, like a spinning ballroom". The nautical theme in this novel is a free, bright and calm life that points to nature. In the days when Sarah lived by the sea he felt very happy. However, the image of the sea is slowly starting to fade. Passage with Jimson b happy days are not eternal: "Waves are sometimes unexpected, drops glisten and invade ... and again tries to run forward, but only when he reached a certain place, he broke away with a plaintive noise and turned back with a deep sigh. It was difficult for me to see this useless work and think that it will always be so; I was just glad the waves were always there. " Sarah loved Jimson, but she will never forget his cruelty, his cruelty. Sarah sees his rudeness in a cruel life, knowing that this life has driven him to madness. [1;106-107-6.]

In the words of Sarah, the author vividly described the life of the main character of the first novel by Jimson and his state of mind. He described the hardships and joys of life in connection with a natural phenomenon.

The author's second novel "*To Be a Pilgrim*", and the main character of the trilogy is a minister associated with the Liberal Party, but later during violent events, the story of Edward's life, ousted from the political arena. The image of Edward gives the author a range of insights into politics, history and revolutions. Edward intended to write a political novel in which he described "the political life How to depict war as Tolstoy described it, which is chaos and delusion, and that politics is always the same that the remaining work is the power of good people in it to be spent, and these people die by accident or from a bullet I wanted to describe. Of course, these words only described Tolstoy's legacy, not only to him, but also to him as a respected writer addressed to the genius writer of Russian and world literature is also worth noting as a tribute.

The character of Joyce Carey's second novel, Edward Wilcher, is one that reflects injustice in society through as well as Edward's political personality writing a novel and politics that are against him. Expressing hatred, innocent people suffer in the struggle means that he wanted to describe that he smoked. The last book of the trilogy - the novel "From the Source" - from the life of the artist Gally Jimson, as he himself said, provides an image of the plates. Jimson thinks less about the past than the other characters in the trilogy. There are neither long excursions into the past, nor extensive memories of a past life. Jimson is completely immersed in everyday worries and his own creativity.

J. Kerry tried to show universalism in his novels, describing the characters of the main characters of the three novels. He emphasized that they are creative individuals, no matter what field they work in. Although they appear to be contradictory in nature, they form a whole.

Kerry attached great importance to the integrity of the artwork. In his book *Art and Reality*, he writes: "In the book, all scenes and characters, all events must serve a common result, obey the essence of integrity. Otherwise, it will not find a response in the heart of the reader, will not affect his feelings. What Romannavis pays special attention to is the integrity of the forms, the emotional integrity of the entire book. "All these separate pages and chapters, like bars in a symphony, do not have complete meaning without integrity. We can say that they are waiting for their place in this wholeness, and, in the end, with the end of the last strip, the chapter, they suddenly cannot take their place. My point is that individual methods do not show their full content until the work is complete. The work as a whole is rich in parts and differs significantly from them." [4].

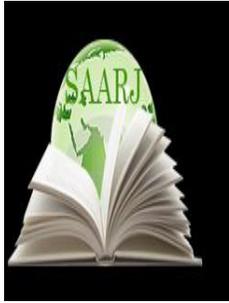

CONCLUSION

The Joyce Carey Trilogy is a triptych, that is, three works with the same general content and idea, the central part of which is the novel *To Be a Pilgrim*; the first and third novels form the sides of the triptych. The rhythm of the three parts, which is repeated in the process of narration and in the system of images, corresponds to the structure of the trilogy. Carey wanted to achieve something in the trilogy, which had not yet been done in the genre of the novel, namely, "not by comparing historical events, but by giving a deep appreciation of the three contributions in proportion to the changes."

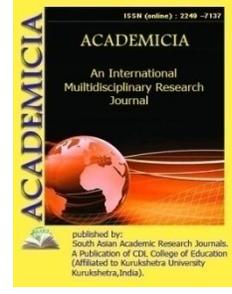

It should be noted that in the typology of English novels of the twentieth century, the epic series ranks high in providing genre diversity. As an area with a large scale and wide angle of view of the depicted event or place, as well as striving to outline "centrifugal" novels, the epic preface is structured not only at the core of the epic genre, but in general. A special place is occupied by the system of poetic features, lyrical and dramatic prelude.

ABSTRACT

Development of viral vectors that enable high efficiency gene transfer into mammalian cells in the early 1980s anticipated the treatment of severe monogenic illnesses in humans. The use of gene transfer utilizing viral vectors has proven effective in disorders of the blood and immune systems, although with many curative trials also revealing severe adverse effects (SAEs) (SAEs). In children with X-linked severe combined immunodeficiency (SCID-X1), chronic granulomatous disease, and Wiskott-Aldrich syndrome, these SAEs were induced by incorrect activation of oncogenes. Subsequent investigations have identified the vector sequences responsible for these changing processes. Members of the Transatlantic Gene Therapy Consortium [TAGTC] have jointly created novel vectors that have proved safer in preclinical tests and utilized these vectors in new clinical trials in SCID-X1. These studies have showed indications of early effectiveness and preliminary integration analysis results from the SCID-X1 trial indicate a better safety profile.

KEYWORDS: Diseases, Gene, Genetic, Therapy, Vectors.

1. INTRODUCTION

Genetic treatments employing viral vectors have increasingly been proven to have effectiveness in monogenic disorders of children. For successful gene therapy, it is necessary to create a product that enables an efficient transduction of target cells. Currently, this is done by utilizing cloned recombinant viruses to transmit genetic sequences with great efficiency. In addition, it is essential to guarantee appropriate expression of transgenes in those cells where it is physiologically required. Increasingly, modern vectors utilize chimeric promoters of mammalian genes coupled with endogenous cis-regulatory elements. Finally, the method must allow for long-term engraftment of changed gene (transduced) cells. Some of the most effective gene

therapy methods to date utilize ex vivo modification and hematopoietic stem cell (HSC) transplantation as a clinical platform to effect genetic treatments[1].

The approach for ex vivo alteration of HSC is strikingly similar to that established in the early 1980s, with some significant advances. Generally, HSCs are acquired via either bone marrow harvest, mobilized peripheral blood collection, or, less often, autologous umbilical cord blood. An HSC-enriched population of cells is produced via CD34 isolation. The resultant CD34+ cells are next cultured ex vivo in a cocktail of cytokines and then exposed to a safety-certified viral vector supernatant produced in specialist facilities according to good manufacturing practice (GMP) standards. The transduced cell product is subsequently given as an autologous hematopoietic stem cell transplant (HSCT) to the recipient. In certain procedures, the patient is subjected to preparative conditioning utilizing chemotherapy, radiation, or both as per normal HSCT transplantation protocols. In certain procedures, no conditioning is needed and these details are disease-specific. Two main benefits are achieved utilizing this gene therapy approach: 1) there is no need to seek for a histocompatible donor; and 2) there is no danger of graft-vs-host disease (GVHD) and thus no need for GVHD prevention or treatment of the patient[2].

As mentioned above, one potential illness for genetic treatment is X-linked severe combined immunodeficiency (SCID-X1). The illness is caused by loss-of-function mutations of the interleukin (IL) – 2 common gamma (γ) chain cytokine receptor. Phenotypically, infants born with this illness lack T and natural killer (NK) lymphocytes and have poorly functioning B cells leading to highly impaired immunity. The illness is deadly if neglected, frequently from otherwise very mild viral infections. Previous clinical work has demonstrated that allogeneic HSCT utilizing either matched related or matched unrelated donors (MUDs) may cure the illness frequently without any conditioning of the recipient. However, MUD transplantations in this illness are associated by higher risk of GVHD, graft failure and overall poor results of these transplants, especially when the recipient is infected at the time of transplantation. This is often the case, since individuals are commonly diagnosed owing to severe viral infections in the first year of life[3].

Previous studies have demonstrated successful gene therapy in SCID-X1. Two studies treated a total of 20 children with this illness utilizing a Moloney leukemia virus (MoLV) – based retrovirus vector producing the IL-2R γ cDNA from the viral long-terminal repeat (LTR) cis-regulatory region containing a strong enhancer element and a viral promoter (MFG- γ C). In these prior trials, effectiveness was demonstrated in 18 of 20 children treated with this vector with a restoration of T and NK cell numbers and functioning. However, 5 of 20 children in this study developed T cell leukemia linked to the insertion of the viral vector into the genome near proto-oncogenes (7) (7) These insertions resulted to dysregulated expression in four of five instances of the LMO-2 proto-oncogene involved in certain cases of de novo pediatric T cell acute lymphoblastic leukemia of these children, 4/5 were effectively treated for their leukemia with preservation of the gene-corrected immunologic function, while one kid died from therapy-resistant leukemia. Thus, although showing efficacy, these studies were also characterized by serious adverse events (SAEs) that led to the interim cessation of a number of trials worldwide and to the United States Food and Drug Administration (FDA) restriction of the use of gene therapy in SCID-X1 to rescue protocols in which eligibility would require previous failure of an allogeneic transplant[4].

2. LITERATURE REVIEW

[D. A. Williams](#) in his study discloses about aninfectious retrovirus vector that has been used to transfer a bacterial gene encoding resistance to the neomycin analogue G418 into pluripotent haematopoietic stem cells present in explanted murine bone marrow tissue. Subsequent transplantation of the cells into lethally irradiated mice results in engraftment of the animals with donor haematopoietic tissue containing the bacterial gene. This approach affords an efficient and rapid means of re-introducing genetically modified tissue into intact organisms and provides a system whereby the expression and regulation of cloned genes can be followed within the context of a well characterized developmental programme[5].

[A Joyner](#) in another study discloses about variety that seems to emerge from the commitment and maturity of stem cells, the molecular basis for this differentiation process is unclear. The insertion of cloned DNA sequences into haematopoietic progenitor cells would offer a new method for investigating this differentiating in vivo system. One laboratory has demonstrated DNA-mediated transfer of genes into mouse bone marrow cells. However, retroviruses provide a number of benefits over DNA-mediated gene transfer methods, including high efficiency infection of a broad variety of cell types in vitro and in vivo, stable and low copy integration into the host chromosome, and a specified integrated provirus structure. For these reasons recombinant DNA methods have been used to create high efficiency retrovirus vectors expressing foreign genes. We show here, employing such a retrovirus vector, the transfer of a dominant selectable drug-resistance gene into specified classes of mouse haematopoietic progenitor cells. These findings should assist the development of molecular genetic approaches to basic and clinical issues in haematopoiesis[6].

[A Fischer](#) in yet another study discusses about naturally occurring genetic diseases of the immune system offer numerous models for the study of its development and function. In a sense, their study complements the information given by the creation of genetic abnormalities in mice produced via homologous recombination methods. In this study, the latest discoveries produced in three areas are focused upon defects in T cell development and in T lymphocyte activation, and on the regulatory mechanism of peripheral immune response[7].

3. DISCUSSION

Shortly after the emergence of leukemias in the French SCID-X1 gene therapy study, a group of scientists formed the Transatlantic Gene Therapy Consortium (TAGTC) to encourage a coordinated approach in resolving the SAEs in this trial (10). (10). This group began meeting annually in a planning retreat with goals to: 1) share expertise in addressing the SAEs of the gene therapy trial in SCID-X1; 2) collaborate on vector development and preclinical studies; 3) share the costs of GMP vector production and certification; 4) develop a common clinical protocol as a platform for a multi-institutional trial and subsequently implement this trial across multiple sites; and 5) seek funding for these efforts. Vector design was based on the molecular evidence implicating the MoLV U3 region enhancer in trans-activation of LMO2 locus. Preclinical effectiveness and safety data were produced at various locations utilizing a range of in vitro and in vivo tests using both murine and human cell lines and primary cells. These results eventually led to the preparation of regulatory papers required in the United States (US), United Kingdom, and France for initiation of a clinical phase I/II study. The criteria for each of these regulatory procedures vary according to particular governmental regulations. Vector GMP manufacturing was achieved at one location utilizing temporary transfection techniques and has previously been reported[8].

The institutions making up TAGTC are listed in Table 1. The vector suggested and eventually utilized in the experiment, SRS11-IL2RG, is illustrated in Figure 1. The vector is a self-inactivating (SIN) engineered γ -retrovirus in which the U3 enhancer is removed from the 3' LTR. In this SIN design, during reverse transcription of the viral genome, the 3' LTR is replicated so that the integrated provirus is devoid of both 5' and 3' U3 enhancer regions. A variety of preclinical studies were used to compare this vector to the MFG- γ C vector used in the previous trial, including: 1) efficacy in restoring IL2R signaling in vitro; 2) reduced propensity for immortalization of primary murine bone marrow in vitro (12); 3) reduced transactivation of the LMO2 locus in a plasmid reporter assays in Jurkat T cells (13); 4) reduced insertions in proto-oncogenes in mice transplanted with transduced HSC (manuscript in preparation) (manuscript in preparation)[9].

In the United States, extensive reviews by the National Institutes of Health Recombinant DNA Advisory Committee, the FDA, local international review boards, and a study section of the National Institute of Allergy and Infectious Diseases (NIAID) led to multiple — often conflicting — recommendations for changes in the protocol. The resulting approved protocol “Gene transfer for SCID-X1 using a self-inactivating (SIN) gamma retroviral vector, a multi-institutional phase I/II trial evaluating the treatment of SCID-X1 patients with retrovirus-mediated gene transfer” was ultimately approved by regulatory agencies for opening in five sites internationally (Table 2) and is listed on Clinicaltrials.gov. The trial is sponsored in the United States by the NIAID.

The study began for recruitment at the US locations in January 2011 and to far has recruited ~50 percent of its accrual goal (nine participants) (nine patients). The longest followed patients are currently >3 years after infusion of gene modified cells. There have been no SAEs directly linked to the vector or to insertional events. Analysis of T cells in several individuals revealed expression of IL-2RG on surface of T cells at levels somewhat below wild-type T cells, as anticipated based on the weaker nature of the promoter. Efficacy trials are ongoing, however to far the vector seems to operate as anticipated with a number of patients exhibiting restoration of peripheral T cell counts and T cell activities as assessed by in vitro stimulation index and return of NK cell numbers. Tracking of recent thymic immigrants through T cell receptor excision circles indicate the functioning of the thymus in many individuals. Integration studies are underway[10].

Georg-Speyer-Haus (Frankfurt, Germany)
German Cancer Institute (Heidelberg)
Great Ormond Street, Institute for Child Health (London)
Hannover Medical School (Hannover)
Lund University (Sweden)
Mattel Children's Hospital, UCLA (Los Angeles)

Figure 1: The SRS11-IL2RG vector. The vector was derived from a murine MoloneyLeukemia virus (MoLV). The long terminal repeat (LTR) includes a deletion of the U3 region denoted by Δ, the R and U5 regions are shown. The IL-2 receptor γ cDNA (IL3RG) is expressed from an internal mammalian promoter made up of the elongation factor 1 α (EF1 α) sequences. Arrow denotes orientation of mRNA generated from integrated vector[2].

TABLE 2: PARTICIPATING INSTITUTION SITES IN SCID-X1 CLINICAL GENE THERAPY TRIAL[3].

Great Ormond Street, Institute for Child Health (London)
Hôpital Necker EnfantsMalades (Paris)
Children's Hospital Boston, Harvard Medical School (Boston)
Cincinnati Children's Hospital, U. of Cincinnati College of Medicine (Cincinnati)
Mattel Children's Hospital, UCLA (Los Angeles)

Collaborative effort across many universities making up the TAGTC has resulted to the creation of an enhancer-deleted vector expressing the IL-2RG. In preclinical investigations, the vector demonstrated better safety profile utilizing a range of in vitro and in vivo assays. This is a unique multinational cooperation with shared expenses, developmental effort, and eventual clinical testing. The clinical study, currently continuing and accumulating more participants, indicates early effectiveness. Although the follow-up is still too early to evaluate overall safety, no SAEs have yet been found linked to the vector[4].

These investigations are an example of so-called two-way translational research in which fundamental science first leads to clinical research studies, the findings of which then lead to fresh rounds of basic studies and future trials. The area of genetic treatments has continued to develop over ~25 years in a manner similar to many new technologies in which early triumphs are followed by a focus on side effects with successive new breakthroughs happening before widespread acceptance and uses. In this instance, the use of viral vectors for gene therapy applications demonstrated first results in the late 1990s and early 2000s. Vector insertional mutagenesis led to a tempering of excitement followed by studies to enhance safety, as reported in this article. The field has lately witnessed several breakthroughs in treating uncommon, monogenic illnesses utilizing novel vector technology. Ongoing study will be focused at expanding the indications and extending the uses outside highly specialized university research institutions[5].

In a Phase 1–2a trial (NCT02519036) supported by Ionis Pharmaceuticals and F Hoffmann–La Roche, published on June 13 in the New England Journal of Medicine, Sarah Tabrizi and colleagues from University College London (UK) tested an antisense oligonucleotide (IONISHTTRX) in adults with early Huntington's disease and found that the treatment reduced

the concentration of mutant huntingtin without serious adverse effects. In another Phase 1–2a clinical trial (NCT01512888), published on April 18 in the same journal, researchers from St Jude Children's Research Hospital in Memphis (TN, USA) tested a lentiviral gene therapy for babies with X-linked severe combination immunodeficiency. The findings indicated that the gene therapy combined with low-exposure, targeted busulfan conditioning had minimal acute \stoxic effects and resulted in enhanced immunity in each of the eight treated individuals.

These remarkable findings are giving fresh hope to individuals with rare and severe genetic disorders such as these. The US Food and Drug Administration (FDA) authorized three gene therapy products in 2017, including voretigeneparvovec-rzyl, the first licensed gene therapy treatment for individuals with proven biallelic RPE65 mutation that causes retinal degeneration. More than 25 gene treatments are presently in phase 3 or have shown therapeutic effectiveness in phase 1–2 studies in 2019. The FDA expects approving 10–20 cell and gene therapy products per year by 2025, which will most definitely include gene therapies targeting the illnesses listed above, as well as sickle cell anemia, heart disease, and cystic fibrosis[2].

4. CONCLUSION

Although we have reasons to be hopeful, obstacles remain before gene therapy can leap from lab to bedside for several reasons. To begin with, on-target delivery of the gene to the appropriate cells and tissues that are afflicted by the illness is essential to the success of gene therapy.

Most therapies currently being developed utilize inactivated viral vectors, such as AAV or lentiviruses, to transmit repaired genes or genomeediting machinery to fix the faulty gene. However, those vectors typically concentrate in the liver, possibly limiting the range of easily targetable illnesses. Remarkable efforts have been made to improve gene delivery vectors to transport transgenes to targeted cell populations. In their study published on March 6 in *Molecular Therapy*, Suh and colleagues from Rice University in Houston (TX, USA) created a protease-activatable AAV vector, called provector, that reacts to increased extracellular protease activity frequently observed in tissue microenvironments of heart disease. In an in-vivo model of myocardial infarction, provector may transport transgenes preferentially to areas of the injured heart with high matrix-metalloproteinases activity, with a corresponding decrease in delivery to numerous off-target organs, including the liver.

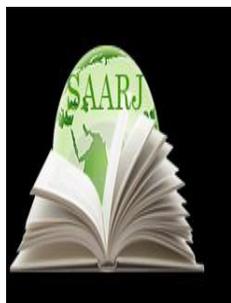

In addition, dangers of cutting-edge technology and the rarity of gene therapy for specific hereditary illnesses are the cause of many bioethical and economical problems. Off-target consequences of existing genomeediting technologies remain a significant worry and barrier to bring it into a clinical setting with acceptable and regulated safety. Even with authorized gene therapy, in the long term, treatment may produce adverse symptoms or organ damage and other side effects that haven't been documented yet in patients. Therefore, both health-care professionals and patients must weigh these dangers with the health benefit that gene therapy offers, particularly when it comes to treating a rare genetic condition that may have the potential to create serious difficulties over many decades. Furthermore, the high expenses of creating treatments tailored to a limited number of patients may make certain gene therapies prohibitively costly, and insurance coverage could be difficult to obtain.

To address these difficulties, all stakeholders—policymakers, pharmaceutical firms, scientific researchers, and health providers— must work together to guarantee that safe, effective, and inexpensive gene therapies become accessible to people in need. For scientific researchers, the

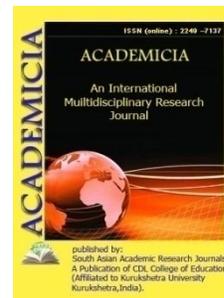

development of the best delivery systems and enhancement of the genome-editing technologies will lead to safer and more effective and cheaper gene treatments. EBioMedicine looks forward to publishing high-quality translational research on this front. For those who are suffering from severe genetic illnesses and in urgent need of efficient therapies, gene therapy is still one of the greatest possibilities for the ultimate cure.

AN OVERVIEW OF TYPICAL METHODS AND RESULTS FOR BIOSENSOR REGENERATION

Dr Prafull Kumar*

*Sanskriti University,
Mathura, Uttar Pradesh, INDIA
Email id: prafull@sanskriti.edu.in

ABSTRACT

Biosensors are excellent low-cost, portable instruments for detecting infections, proteins, and other analytes quickly. The worldwide biosensor industry is now valued over ten billion dollars per year, and it is a rapidly growing area of multidisciplinary study that is being heralded as a possible revolution in consumer, healthcare, and industrial testing. However, the expense of biosensors is a major impediment to their broad use. Many systems have been validated in the laboratory, and biosensors for a variety of analysts have been proved at the concept level, but many have yet to establish a compelling business case for adoption. Though there is a downward pressure on prices due to the development of cheaper electrodes, circuits, and components, there is also an increasing trend toward the development of multi analyte biosensors that is pulling in the other direction. One method to decrease the cost of some items is to allow them to be reused, lowering the cost-per-test.

KEYWORDS: *Biosensors, Kinetic Energy, Potential Energy, Receptors, Regenerators.*

INTRODUCTION

When the analyte interacts with the bioreceptor, a quantifiable signal is produced. Biosensors are typically characterized as a three-part system consisting of a bioreceptor, a transducer, and a signal processing unit. Sensors have been created for a wide range of analytes in areas such as medicine, food testing, environmental sensing, and process control monitoring in research and industry[1]. These sensors were created to replace conventional testing methods, which are typically technical in nature and require specialized knowledge and time, resulting in a substantial expense in their respective sectors. Although more costly sensors are utilized in research, less priced sensors have the potential to reach a broader market. The present high prices may be ascribed to the specialized nature of the equipment needed, as well as the dependence on

high-grade analytical reagents and materials; a conventional system can cost thousands of dollars up front, while each sensor transducer assembly can cost up to eighty dollars. A variety of methods are presently being explored to reduce the cost of biosensors[2].

On the one hand, enhanced printing using conductive polymer inks is being used in the creation of low-cost, disposable transducers and biosensor assemblies. This has shown to be effective in displacing costlier components and lowering system expenses. These disposable biosensors may be helpful in medical applications where cross contamination and cleanliness are concerns. Disposable sensors, on the other hand, are inappropriate for certain systems; if, for example, time course measurements are required, chip to chip variation may become a source of inaccuracy[3]. Similarly, extremely precise high-grade transducers are needed for certain applications, and the accompanying expenses cannot be avoided. In such cases, regeneration may be a significant strategy for reducing test costs. When it comes to creating biosensors that meet the requirements of the poor world, cost reduction is very essential. Biosensors for assessing food safety, water sanitation, and environmental testing are examples of proven biosensors that cater specifically to these requirements. Another critical need in the developing world is healthcare and diagnostic tools for illnesses that are presently causing high rates of death and morbidity due to avoidable causes[4].

More recently, a trend toward the creation of multi-analyte arrays of biosensors has emerged. Multiple biomarker analyses may theoretically offer a greater level of diagnostic confidence. Multi-analyte arrays, on the other hand, have the intrinsic requirement for more sophisticated transducer systems and data processing, which makes cost a major obstacle to their commercialization. Because each receptor: analyte pair will have its own unique binding physics and buffer systems that are optimized for one receptor: analyte pair may be a poor option for others, these multi analyte arrays may offer a special challenge when regenerating. A technique for repeated sampling is made possible by allowing biosensor renewal. Sensor-to-sensor variation is eliminated as a result, which is especially helpful when monitoring across time or probing comparable amounts of analyte. The development of impedimetric immune sensors is one area where chip-to-chip variation still poses a significant challenge. This problem may be completely solved by allowing regeneration. While reviewing the research, it became clear that comparing the effectiveness of various regeneration plans was difficult[5]. This was owing to the fact that different definitions of regeneration were used across the literature. In our conclusion, we suggest a set of criteria for defining "biosensor regeneration" in order to establish a consensus across the field and guarantee that it is relevant to all fields of biosensor research.

Biosensors are categorized in one of two ways: by signal transduction technique (optical, mechanical, or electrochemical) or by bioreceptor type. Catalytic sensors, which utilize enzymes, and affinity sensors, which use binding proteins or nucleotides, which includes immune sensors, are the two main groups that by bioreceptors fall under. Immunesensors are affinity sensors that detect the target analyte using antibodies or their derivatives. When discussing biosensor regeneration, it's critical to examine the bioreceptor's molecular contact with the analyte via mediating a specific response[6]. Enzymes serve as the bioreceptor in catalytic sensors, which process an analyte to produce a signal. Some of these enzymatic sensors do not need to be actively regenerated during regeneration since the analyte is consumed and the baseline signal is ultimately restored. Though some studies have documented the re-use of these biosensors, this is not active regeneration, which is a critical difference to note in the field; this process is often

referred to as passive regeneration. Another difference to make between biosensors is whether the assays directly measure the analyte or are part of a competitive assay[7].

Competitive assay-based sensors don't get their data directly from the analyte, but rather through the competitive binding or inhibition of a secondary process. The suppression of analyte detection must be evaluated with the inhibition of other stages in the test method that may potentially influence the signal when considering regeneration. Regeneration has been shown in a variety of systems, but the methods, reagents, and circumstances used in each study differ considerably. The different processes of regeneration are described in the following sections, and the most effective regeneration agents are evaluated. The attraction forces between the bioreceptor and the analyte must be overcome in all instances for regeneration to occur. When considering these forces in terms of thermodynamics, both an enthalpy and an entropic contribution must be taken into account. Because these forces are affected by the solvent environment, a regeneration buffer may be used to change them[8]. The entire energy of a thermodynamic system is defined as enthalpy. This energy may be dispersed in a variety of ways, including heat (kinetic energy) and potential energy, which can be expressed in a variety of ways, including chemical bonds and ionic or polar charges. A system will equilibrate to decrease total potential energy, according to the first rule of thermodynamics. Potential energy differences are often a significant factor in bioreceptor: analyte binding when examining interactions involved in biosensor functioning. Charge-charge interactions are frequently used to moderate interactions[8].

Depending on the iso-electric point of the amino acid residue, different amino acids may be positively or negatively charged at a particular solution. Using blood as an example (pH 7.4), there are acidic positively charged amino acids like asparagine and glutamine, as well as equivalent basic or negatively charged residues like lysine, arginine, and histidine in this environment. The bioreceptor binding region's tertiary structure is formed by these charged side groups. The interaction of charges is natural and tends to the system's lowest potential energy. Because charge is affected by the solvent environment, factors like ionic strength, pH, and the presence of competitor ions in the solvent can change the relative strength of charge interactions, allowing for more effective screening of enthalpy interactions between the analyte and the bioreceptor and thus assisting in biosensor regeneration. Typical decreases in enthalpy following antibody: antigen binding vary from as little as 26 KJ.mol⁻¹ to more enthalpically driven interactions with changes as high as -130 KJ.mol⁻¹ in extreme cases²⁷. When compared to normal values for covalent bonds, which range from 200 to 400 KJ.mol⁻¹, this is a significant shift in enthalpy. It's essential to remember that at extremely low ionic strengths, an antibody's binding may be promiscuous since any charge difference facilitates less selective binding, potentially lowering the binding species' overall stringency. High ionic strength environments, on the other hand, may screen antigen-antibody interactions and decrease binding[9]. The intrinsic chaos or disorder of a system is characterized as entropy.

According to the second rule of thermodynamics, a system's entropy will always grow, resulting in a more disordered system. This lowers the system's total potential energy; according to Gibb's Law, a process is spontaneous if the Gibb's free energy is negative. Gibb's free energy is the difference between entropy and enthalpy. Though analyte binding is thought to reduce a system's entropy, entropic compensation occurs via mechanisms such as solvent displacement. The function of solvent molecules in the system must be considered to understand this. Because the

free analyte is extremely disordered, the unbound state has a high entropy; however, the reduction in entropy when the analyte attaches is exceeded by the change in enthalpy, resulting in a negative Gibbs energy change, which explains why this is a spontaneous process. Certain systems, especially when dealing with hydrophobic analytes, have higher entropy upon binding, but this is less common. Because hydrophobic analytes cause ordered water caging at the solvent interface, this is the case. After that, a biosensor is regenerated. Biosensors have been created at the protein level. The detection of hydrophobic analytes that have been regenerated, such as fibrin. With regard to the solvent, the creation of hydration shells results in a highly ordered low entropy system, particularly near the interface, where any less order would be energetically unfavorable[10].

DISCUSSION ON BIO SENSOR REGENERATION

The increase in entropy from released water molecules outweighs the slight decrease in entropy with regard to the analyte and receptor in these situations. Entropically driven binding must be minimized by negating the effects of hydrophobic areas in order to reverse these interactions; as a result, aliphatic detergents are often employed. In an aqueous solution, this allows for the disruption of water caging and the reduction of the hydrophobic effect at the analyte-bioreceptor interface, allowing regeneration. The solvent environment at a sensor interface is a crucial parameter that affects analyte: bioreceptor binding, as described above. The most common method for renewing biosensors is to change the liquid environment chemically. By withdrawing the transducer from any assembly and immersing it in a regeneration buffer, this may be done quickly. As a result, regeneration solutions are often made up of common chemicals, making sensor regeneration a low-cost option. Though it is a basic method, it may be improved with the use of a fluidic control system, or computerized control module; nevertheless, there is presently only little demonstration. This strategy may be crucial in the creation of a field-generable bio sensor. The following is a review of the most frequent chemical methods for biosensor regeneration that have been proven. In many cases, regeneration has been accomplished by using high or low pH buffers in the system. In order to avoid permanent damage to the bioreceptor, a low pH buffer will typically go no lower than pH. A high pH buffer, on the other hand, is often restricted to a pH of about 11 for the same reason. The system is affected in two ways as a result of this. To begin with, a change in pH affects the system's enthalpic state by altering the relative charges between the analyte and the bioreceptor. The charge distributions that preserve the bioreceptor's tertiary structure change when the side groups get ionized. Decoupling of the analyte from the bioreceptor is aided by structural denaturing.

Second, a change in pH causes a change in the environment's ionic strength, which may be used to screen receptor-analyte interactions. Strong electrolytes as Ca^{2+} and NaCl may also be used to change the ionic strength. If a system is especially sensitive to changes in pH, this may be a better option for preventing permanently denaturing sensor components like the bioreceptor or changing the transducer's electrical state. Although the use of acidic / basic regeneration has been extensively documented, it has one drawback: it can only be utilized in systems where the changed pH will not interfere with the sensor signal. This makes pH regeneration in electrochemical systems, where charge may influence the sensor's baseline output, especially challenging. Another important area where pH regeneration is not appropriate is the usage of extremely delicate bioreceptor proteins. If they are readily denatured, this would be a bad approach since the bioreceptor would be irreversibly damaged. The most significant benefit of

employing acidic or basic regeneration is its cheap cost and broad applicability. In the regeneration of biosensors, detergents are often employed at low quantities.

In terms of structure, detergents are hetero-bifunctional molecules with two different regions: a polar head that is highly soluble due to its charge and an aliphatic non-polar tail. Due to their hydrophobic nature, the tail portions of the bioreceptor or analyte associate with comparable areas of the bioreceptor or analyte in an entropic ally-driven process. The polar head group extends into the aqueous phase, reducing repulsion and promoting analyte solubility⁴⁵. Detergents may be a significant component of a regeneration buffer in some biosensor systems where hydrophobicity is a major factor in the interaction of the bioreceptor with the analyte, such as in the detection of hydrophobic analytes like 2-naphthol and 3-isobutyl-2-methoxypyrazin. Milder detergents, such as Tween®, are often employed, but low quantities of harsher detergents, such as SDS, have been utilized in the past. Detergents are helpful at low concentrations and to prevent pH extremes, but they may disrupt systems like self-assembled monolayers (SAMs) and should thus only be employed in systems with a solid transducer interface. The amino acid glycine is a commonly utilized regeneration agent for a variety of reasons, including assisting separation and minimizing harm to the bioreceptor. Glycine is a low-cost, widely accessible reagent with a pH buffering range of 2-7.54. This buffering range is suitable for an acidic buffer that avoids pH extremes in certain areas. Because glycine is the simplest amino acid, it dissolves effectively in both aqueous and more hydrophobic environments and may easily mediate forces at a particularly hydrophobic interface, lowering the bound state's entropic favorability. Glycine is zwitterionic in solution and serves as a moderate screening agent for charges at the interface, reducing enthalpic pressures between the bioreceptor and analyte once again. Because it is thermodynamically preferable, glycine prefers to attach to the surface of the bioreceptor and analyte. The bioreceptor is therefore partly shielded from harm induced by the changing pH environment when exposed to a regeneration buffer. While glycine is helpful in optical and mechanical sensor systems, it may have limited use in electrochemical sensor systems since the use of low pH may irreversibly alter the sensor output.

Another well-known chaotrope is urea, which is often used in pH-sensitive settings because of its ability to maintain a neutral pH in solution. Urea was utilized to renew sensors that acquired their data via cyclic techniques, avoiding any changes to the tethering layer and signal disruption. Changing the temperature has a big impact on the structure and behavior of biological molecules like proteins and oligonucleotides. Temperature increases the kinetic energy of molecules, which may enable binding forces to be overcome. Although warming causes permanent denaturing and aggregation in most proteins, some groupings of proteins, as well as oligonucleotide base pairs in general, may be dissociated by increasing the temperature in a process known as melting. Base pairing between the nucleotides holds double stranded DNA dsDNA together at room temperature. The number of base pairs used to join the strands is directly proportional to the temperature at which the individual DNA strands acquire enough kinetic energy to overcome base pairing and split. The use of DNA Melting as a feasible technique for the regeneration of nucleic acid biosensors has already been shown. Other DNA structures, such as aptamers, may be transiently denatured in the same way as double-stranded DNA can. This has been shown for sensor regeneration utilizing biosensors based on DNA:protein interactions. Though thermal regeneration has been shown to work with nucleotide-based bioreceptors, it is restricted to this

kind of sensor since heating would destroy or denaturize the biological components of many other sensors.

Biosensors have been regenerated utilizing direct electrochemical techniques in a small number of investigations. By providing a negative potential to the sensor surface, reductive desorption of surface species was accomplished in these experiments. Though under-represented in the literature at the moment, possibly owing to its restricted application, this is an excellent solution to the issue of regeneration since it creates a very localized regeneration environment that can be carefully regulated. In one example of electrochemical biosensor regeneration, indium tin oxide electrodes were exposed to an electro reductive current to renew antibodies on the sensor surface. The transducer surface is a key concern when building a biosensor, since it is the physical substrate on which the sensor is built and to which the bioreceptor is connected. The regeneration method used is often influenced by the transducer used. Here's a quick rundown of the most popular transducer materials. Silica is also especially helpful since it can be manufactured to have smooth microscale surfaces.

Its chemical inertness prevents the regeneration buffer from reacting with the transducer surface, and its flatness allows the buffer to be readily wiped away from the sensor surface. An electrically conductive substrate is required for electrochemical sensors. Many contemporary examples do so by screen-printing carbon or metallic electrodes, which, although cost-effective, may lead to quality problems owing to the wide range of micro and Nano-topologies produced during the printing process. When attempting regeneration, especially when washing the electrodes, this local variance becomes troublesome, with rougher areas proving more difficult to renew. Other techniques for electrode manufacturing have been used to get a flatter surface, such as sputtering and vapor deposition of the conductive layer, both of which produce flat layers at the nanoscale. Extra expenses are unavoidably incurred as a consequence of such additional pre-processing. Though certain kinds of biosensors allow for direct bioreceptor conjugation to the transducer surface, there is frequently a loss of biological activity as a result; this is especially true when working with metal surfaces. Despite the fact that electrochemical biosensors are often touted as having a large potential effect in a variety of analytical areas (as the glucose biosensor's success has shown), many electrochemical sensors have yet to reach widespread popularity. Although regeneration may help improve the economic feasibility of these sensors, research has so far been restricted.

Despite the limited study, several results have been reported, with aerometric and potentiometric sensors being successfully regenerated. The aerometric sensor, for example, has been claimed to be re-used 1000 times with little signal loss despite the fact that, as previously stated, this is not "regeneration" per se. In potentiometric sensors, the current or potential changes when the analyte is present, allowing for calibration. Liu et al. utilized urea, a powerful chaotrope, to renew the sensor through 10 cycles with little signal loss in their most effective regeneration research. More instances of regeneration in potentiometric biosensors are provided, which are used in many cases to prevent the impact of strong acids or bases, which may permanently change the sensor's electrochemical characteristics. Though it's possible that the usage of Urea influenced the signal over time by altering the charge properties of the biosensor surface. Due to its dependence on binding proteins, which have a considerably larger repertory than enzymes, electrochemical immune sensors may be designed for a far broader range of analytes. They're often tested impedimetrically, which is a highly sensitive technique that relies on the capacitive

and resistive characteristics of the transducer surface. These sensors may either look at the change in these characteristics immediately after analyte binding reagent less sensors or employ reagents such HRP-tagged secondary antibodies or nanoparticles to increase the signal seen after analyte binding (reagent-based sensors). In any case, charge transport characteristics are critical in this method, and any regeneration buffers employed may change these charge-related features. Using slightly acidic glycine or mildly alkali regeneration buffer before neutralizing to reestablish a stable baseline signal, there have been a few documented instances of effective regeneration that has prevented permanent modification of the biosensor.

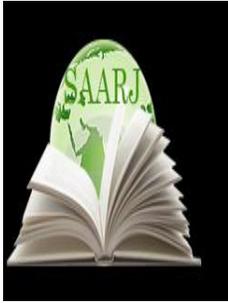

CONCLUSION AND IMPLICATION

While several other biosensors have successfully shown regeneration, optical sensors have had the most success. Optical sensors have proved to be the most effective since regeneration methods that do not alter the sensor's optical characteristics have shown to be very easy to design. Though this is also true with acoustic biosensors, regeneration has proven more effective on a smaller scale, both in terms of the number of studies and the amount of time that sensors may be reused. The use of pH is the most frequently utilized example for protein regeneration: protein interaction based sensors and low pH glycine buffer are the most widely employed agents. Low/high pH pulses are a promising option for optical and acoustic sensor regeneration. Other regeneration methods have been found to renew certain sensors, including changing the temperature, ionic strength, and using powerful detergents. These should only be used in situations when the biophysics of recognition is a driving factor, such as with hydrophobic or strongly ionic analytes. The comparison of various regeneration methods reveals how additional kinds of biosensors may be regenerated.

ABSTRACT

The article reveals the best foreign experience in the implementation of pre-trial investigation in an electronic format. The purpose of studying this experience is to resolve the issue of the possibility of introducing positive results of foreign countries into the legislation of the Republic of Uzbekistan. The analysis of the law enforcement practice of foreign countries allows us to make a well-founded conclusion that the process of transition of the pre-trial investigation stage from paper to electronic format takes quite a long time and is accompanied by various kinds of difficulties.

KEYWORDS: *Pre-Trial Investigation, Investigation of Criminal Cases in Electronic Format, Electronic Criminal Case, Foreign Experience, Law Enforcement Practice.*

INTRODUCTION

The criminal procedural legislation of the Republic of Uzbekistan in recent years has undergone serious reform, one of the areas of which has become the possibility of carrying out pre-trial investigation in electronic format.

In accordance with the Concept of improving the criminal and criminal procedural legislation of the Republic of Uzbekistan, approved by the Decree of the President of the Republic of Uzbekistan dated May 14, 2018 no. PP-3723, as one of the tasks of introducing new forms and procedures of the criminal process, the task is to ensure the effective use of information and communication technologies in forensic activities, including the introduction of the "Electronic

Criminal Case" system and "remote interrogation" [1]. In this regard, the Law of the Republic of Uzbekistan dated May 23, 2019 no. ZRU-542 to the Criminal Procedure Code introduced a number of changes and additions regarding the introduction of electronic technologies into the criminal process. In particular, it is worth noting Articles 91¹ - 91⁴ of the CPC, which states that investigative actions (interrogation, identification of persons and objects, confrontation) with the participation of witnesses, victims, suspects and accused can be carried out using technical means in the mode of video conferencing [2]. In addition, the Criminal Procedure Code has introduced norms that imply the possibility of electronic document flow in criminal proceedings.

However, it should be recognized that the national criminal justice system is at the initial stage of digitalization. Do not forget that the electronic process should consist of the automation of the trial, as well as the implementation of the investigation in electronic format with the ability to exchange electronic procedural documents.

These changes make it possible to completely transfer the stage of pre-trial investigation to an electronic format, which in turn is one of the most urgent tasks in the development of the state mechanism. The solution to this problem is a response to the challenges of the modern information society and an integral component of the strategy for the future improvement of legislation and law enforcement practice in the field of organizing pre-trial investigation. The formation and implementation of such a strategy necessitate a clear understanding of the methodological foundations in criminal procedure legislation. Without their uniform and unambiguous establishment, it is impossible to carry out pre-trial investigation in electronic format at the proper level. Such uniformity is extremely important precisely in the field of organizing pre-trial investigation in order to comply with the constitutional principle of equality of all before the law and court.

In addition, do not forget that the efficiency of justice is currently a hot topic. The judicial system is expected to operate as efficiently and efficiently as possible, but in reality, this is not always the case. As a result, the trial takes more and more time, and the consequence of this is an increase in the workload of the pre-trial investigation bodies.

This lag indicates that our system is not yet sufficiently adapted to the needs of society in the 21st century. The electronic justice system is one of the elements of public administration, which is currently considered as a way of organizing state power using information networks, ensuring the effective functioning of government bodies in real time and making the daily communication of citizens with them as simple and accessible as possible. In this context, electronic court proceedings can be defined as the use of modern information technologies in court proceedings. It provides for the automation of criminal procedural legislation and the implementation of pre-trial investigation in electronic format.

The possibility of carrying out pre-trial investigation in electronic format can be considered as one of the manifestations of the processes of globalization, which also covered the legal sphere. The history of the formation of electronic justice in the world is inextricably linked with the

informatization of wide areas of public life and the penetration of computers into the everyday life of citizens and organizations. After all, law, as a universal social regulator, not only streamlines public perception, but also, often, fixes its main changes and, having caught promising trends, actualizes one or another direction of social development.

In support of the above, researcher Woolf H.K. believes that electronic support not only helps to optimize and improve existing systems and processes, but most likely, over time, it will itself become a catalyst for radical changes. Information technologies of this kind in the near future will become the basis of the judicial system and for this reason already now deserve special attention at the highest level [3].

According to O. Martyanova, like globalization, the introduction of advanced technologies is inexorable and inevitable. A society that tries to resist them will become a victim of it. They will fly far off the sidelines of the information society to do the dirtiest work for it [4].

The legislator in matters of regulation of the activities of pre-trial investigation bodies carrying out proceedings in electronic format should, in our opinion, borrow the most successful law enforcement practices of foreign countries.

In particular, we believe it necessary to consider the best practices of Singapore, where, to facilitate the adoption of judicial decisions, all judges have access to a comprehensive set of online legal information systems, such as:

- Law Net Legal Workbench, which provides smart searches in legal databases;
- Judicial Service Database (JODB), which contains court working papers and compilations, Sentencing Rules System (SINGS), which provides sentencing criteria and information;
- Resource Priority Management System (IMPRESS), which records all past decisions in cases brought before both the Supreme Court and the subordinate courts.

Researchers Bell Gordon and Gray N. Gray believe that “Singaporean courts take a strict and businesslike approach to technology. Technology is useless if it prevents the judiciary from better meeting the needs of its users or making it more efficient. Therefore, we consciously and persistently use technology, but only if it contributes to the achievement of the goals on which the courts are based” [5]. They see technology as a strategic leverage point in their quest to provide enhanced accessibility and convenience, as well as innovative application opportunities for all who seek legal advice from specialized bodies.

In Singapore's National Economic Plan for the 21st Century, information technology has been identified as the primary engine for sustaining the country's continued economic growth in a globalized knowledge economy.

Electronic justice in Singapore in terms of organizational and legal support is implemented by means of:

- Provision of services and applications for virtual ships;
- Computerization of business management processes;
- Joint development of interdepartmental systems;
- Computerization of judicial administration and corporate services [6].

Singapore is one of the first states to provide extensive virtual judicial services to the public through multimedia applications. For the first time in the courts of Singapore, videoconferencing was used, which is currently the most versatile and productive technology of our time.

In this regard, David F. Hill commented that "the introduction of video conferencing has made it possible to overcome physical distances. This has improved the organizational framework in the normal course of the courts, allowing us to optimize the use of our limited resources and achieve targeted results with less time and cost that would otherwise have to be incurred. Most importantly, it has expanded public access to justice" [7].

Singapore, in addressing the conduct of an investigation, proceeds from the position that good case management is fundamental to an effective and efficient judicial system. Electronic business management systems were reflected in the first wave of computerization of the country and are represented by the following systems:

- System of registration and information on criminal cases;
- System of subpoenas for regulatory offenses;
- System of electronic circulation in civil cases.

In June 1999 the TICKS 2000 system was introduced to manage the affairs. The TICKS 2000 system provides online interfaces for law enforcement agencies for electronic data exchange. For users who do not have their own case management systems, the courts provide them with remote access to TICKS 2000 so that they can register and receive information about their cases online.

The "TICKS 2000" system allows you to send court documents electronically using electronic documents instead of paper [8].

In the United States, the concept of filing documents in electronic format through the Internet resources originated in 1980 and was continued thanks to the pilot projects used at that time, which subsequently made it possible to strengthen and gain the proper potential for the introduction of electronic document management in Federal Courts (2003).

Electronic justice in the United States dates back to the creation of a multidisciplinary functional system "Public Access to Court Electronic Records" (hereinafter - PACER).

PACER is a public access system for US District Courts and Court of Appeals. One important feature of PACER systems is its commercial component, that is, users can request information of interest to them for a fee.

Together with the PACER system, the “Case Management / Electronic Case Files” system (hereinafter - CM / ECF) began to operate. CM / ECF is a system that allows electronic filing and management of criminal cases.

Thus, in the United States, an electronic investigation is carried out through the functioning of two independent systems PACER and CM / ECF, where the PACER system is used for public access to electronic court records, while the CM / ECF system is used for case management and electronic filing of court records. Documents [9],

As the name suggests, the CM / ECF system is the result of a combination of tools that provide two functions: Case Management (CM) and Electronic Case File (ECF). The two elements of the system then form an integrated system, complemented by PACER, a system that provides access to electronic files via the Internet.

The list of functions provided by this system can be summarized as follows:

- keeping records (tracking requests, responses, deadlines and hearings);
- management of electronic documents, their storage, security and archiving;
- delivery of documents to the court, from it and within it;
- additional information from other parties when submitting documents [10].

Access to these systems is carried out by means of using the username and password assigned by the relevant federal court. In some courts, these data are formally equated with an individual electronic digital signature.

It is also important that the use of electronic justice systems operates around the clock, when sending criminal case materials in electronic format to the competent authorities (court, prosecutor's office, etc.) does not require any additional costs from users in comparison with sending documents on paper.

Taking into account the fact that the USA is a federal state, each court of the US state has implemented and uses its own local version of IT systems based on the common platforms PACER and CM / ECF [11], which in our opinion is a negative factor, since until now Since then, a single centralized organizational and methodological mechanism has not been developed to support the activities of the investigation bodies carrying out proceedings in electronic format, which, as a result, may negatively affect the entire e-justice system.

In addition to the positive experience in world practice, there are unsuccessful attempts to transfer criminal proceedings to an electronic format. For example, in 2005, Belgium took a step towards the digitalization of justice by introducing the PHENIX system. The PHENIX system was expected to increase efficiency and effectiveness, and to simplify and speed up the investigation process. The goal of the PHENIX system project was to transform the various

computer systems of crime investigation bodies and the judicial system into a structured, coherent whole [12].

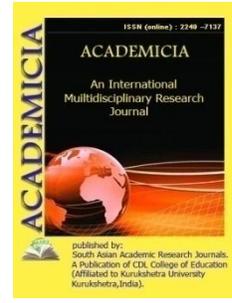

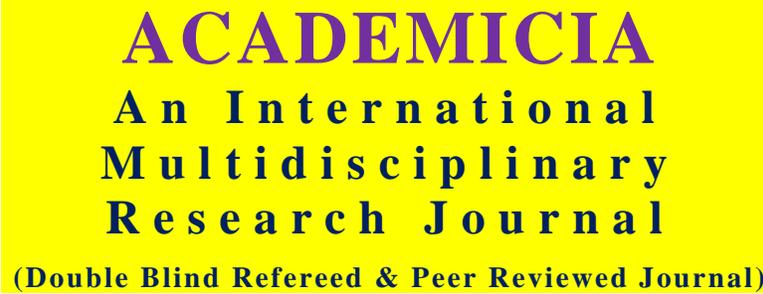

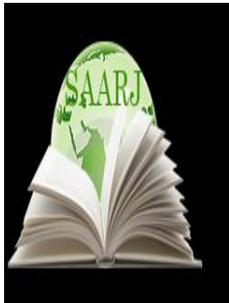

According to sources, this was one of the most ambitious projects, because the PHENIX system intended to digitize the entire legal system at once, but for objective reasons (high financial costs) it became clear that this was impossible [13]. The PHENIX project can be seen as a large-scale but unsuccessful attempt to move the investigation phase from paper to electronic format. Despite this costly setback, Belgium continues to try to bring the PHENIX project into action.

Based on the foregoing, it can be concluded that no state can be sure or even assert that its experience in administering justice in electronic format is the most technologically advanced in the world. Technologies are developing at a rapid pace and there are no prerequisites for weakening their development. In a growing and accelerating cycle of development, progressive technologies will stimulate the development of more and more innovative applications, which, in turn, will stimulate legislative bodies to develop a set of measures for organizational and methodological support of the activities of pre-trial investigation bodies that carry out production in electronic format.

SAMARKAND IS A TOURIST CITY WITH A GLORIOUS PAST

Isayev Mehroj Muzaffar ogli*

*Student of Samarkand State University,
UZBEKISTAN

Email id: mehrojisayev@gmail.com

ABSTRACT

The article tells about the rich history of the Samarkand region, the stages of the historical formation of the Samarkand region, the existing historical monuments in the region, and the origin of the geographical location of the region. Samarkand is one of the oldest cities in the world. Founded 2,750 years ago, the city was famous for its excellent climate, natural and material resources. In the 5th century BC Samarkand was included in the Achaemenid Empire, and later in 329 - in the state of Alexander the Great. From the 4th to the 5th century BC, Samarkand was the capital of Sogd, which was originally part of Greek Bactria and then part of the Kushan state. In the 6th century, it became part of the Turkish Khanate and was ruled by local authorities.

INTRODUCTION

Uzbekistan still remains a country of historical monuments that have preserved their beauty and splendor. The monuments created in our country by our creative people, preserved for centuries, fascinate the peoples of the world. Many of them are included in the UNESCO World Heritage List. Historical monuments are part of the cultural heritage of the country and the people, part of spiritual enlightenment.

The Republic of Uzbekistan the “Land of the Uzbeks” lies in the heart of Asia, between the two major rivers of Central Asia, the Syr Darya (Jaxartes) and the Amu Darya (Oxus), in the territory known since ancient times as Bactria, Maverannahr (The land beyond the river), and later on as Turkistan. Uzbekistan borders from Kazakhstan to the north, Krgyzstan and Tajikistan to the east and southeast, Turkmenistan to the southwest, as well as Afghanistan to the south.

MAIN PART

Samarkand region is one of the largest and most centralized tourist zones in Uzbekistan with a rich history. The city of Samarkand, located in the central part of the Zarafshan oasis, is one of the cultural centers of humanity in world history. This city, considered the most beautiful in the world, was called Samarkand in ancient Eastern sources, and Moroccan in Greek and Roman. In Morocco, the term Samarkand is a Greek pronunciation. In the Chinese sources of the 5th century, the name of the city is pronounced as Sivangin (Sakmangin).

Samarkand is one of the oldest cities in the world. Founded 2,750 years ago, the city was famous for its excellent climate, natural and material resources. In the 5th century BC Samarkand was included in the Achaemenid Empire, and later in 329 - in the state of Alexander the Great. From the 4th to the 5th century BC, Samarkand was the capital of Sogd, which was originally part of Greek Bactria and then part of the Kushan state. In the 6th century, it became part of the Turkish Khanate and was ruled by local authorities. Since the beginning of the 7th century, the Zarafshan Valley came under the rule of Samarkand governors. In 712, Samarkand was captured by Arab troops led by Kuteiba ibn Muslim. Beginning in the 1920s, local landowners became involved in governing Mavorounnahr and the provinces. In particular, control over Samarkand passed into the hands of the Samanids. Since then Samarkand has been the capital of the Samanid state. Samarkand, which was part of the Karakhanid state in the 11th century, was occupied by the Karakhanids in the 12th century.

In 1210, Samarkand, part of the state of Muhammad Khorezmshah, was occupied by the troops of Genghis Khan in 1220 and replaced the modern city of Samarkand.

The next period of Samarkand's rise is associated with the activities of Amir Temur. Samarkand, world renowned as the capital of the Timurid empire, has many luxurious buildings.

Although Samarkand lost its status as a capital during the Shaybanid period, it retained its status as a major economic and cultural center of the Bukhara Emirate.

After Uzbekistan gained independence in 1991, Samarkand became a major cultural center of Uzbekistan. At the same time, Samarkand was awarded the Order of Amir Temur for a great role in the history of our country and a great contribution to the development of our culture. The order was presented on October 18, 1996 by the first President of the Republic of Uzbekistan Islam Karimov. Various international conferences are currently being held in Samarkand. It is especially important to hold the International Music Festival "Sharq Taronalari" in Samarkand since 1997.

Several world-famous historical monuments have been erected in the Samarkand region, such as the Registan ensemble, the Gori Amir mausoleum, the Bibikhanim (Amir Temur) mosque and the Bibikhanim mausoleum, the Shokhi Zinda ensemble. In the central part of the city there are monuments Oksaray, Rukhobod and Chorsu. Also around the city are the monuments of Khoja Abdu Berun, Khoja Abdu Darun, Ishratkhan, Nadir Devonbegi Madrasah, Hazrati Khizr Prayer and Mosque, Sheikh Nuriddin Bashir Temple, Khoja Daniel's Tomb, Ulugbek Observatory situated.

Tourism in Samarkand is mainly centred on cultural, historical and religious sites. One of Samarkand's main historical attractions is the Registan, a UNESCO World Heritage Site. It was once "the main city square, full of markets and lined by caravanserai (roadside inns)" and the site

for royal proclamations, parades as well as executions. The square is surrounded on three sides by three madrasahs: Tilla-Qori Madrasah, Ulugbek Madrasah and Sher-Dor Madrasah.

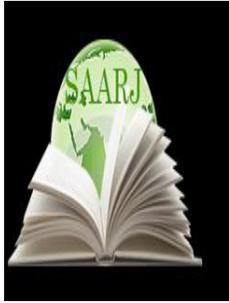

Undoubtedly, Samarkand reached the highest level of glory when it became the capital of the Tamerlane's Empire, greatest state that stretched to Bosfor. Tamerlane created strong and fearless state which was indestructible in the political sphere, but he also never forgot about the cultural and spiritual parts of life. During the rule of Amir Timur all the best architects and scientists worked in Samarkand to make this city the pearl of Eastern world of Muslims. When Tamerlane died, the power of the Empire faded; it was split and divided between Tamerlane's heirs. Ulugbek (Timur's grandson), the most famous of the heirs, was a very peace-loving person. He ruled Samarkand and its surroundings for about forty years. During his rule the science was on the highest level, many famous scientists were brought from abroad, and Ulugbek himself was a good scientist and astronomer.

CONCLUSION

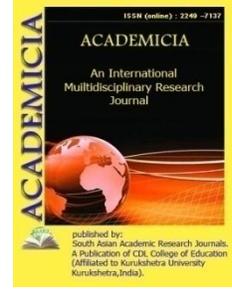

Today in the region there are 1105 archaeological, 670 architectural, 37 monuments, 18 monumental, 21 memorials, a total of 1851 objects of material and cultural heritage. There are over 1000 tourist destinations in the region, of which about 400 are currently fully usable as tourist attractions.

ABSTRACT

Mobile Cloud computing is a relatively new technology that refers to an infrastructure that stores and processes data outside of the mobile device. The Internet of Things is a relatively new technology. The Internet of Things (IoT) is a relatively new telecommunications technology that is quickly gaining traction. IoT is more particularly linked to wireless telecommunications. The primary aim of wireless network-based interaction and collaboration amongst things and objects is to achieve the goal established for them as a united entity. Furthermore, both Cloud Computing and the Internet of Things are rapidly developing technologies in the area of wireless communications. We provide a review of IoT and Cloud computing in this article, with an emphasis on the security concerns that both technologies face. We specifically integrate the two aforementioned technologies (Cloud Computing and IoT) in order to investigate the common characteristics and advantages of their integration. Finally, we will discuss Cloud Computing's contribution to IoT technologies. As a result, it demonstrates how Cloud Computing technology enhances IoT functionality. Finally, we look at the security issues that come with combining IoT with Cloud Computing.

KEYWORDS: *Internet of Things, Cloud Computing, Mobile Cloud Computing, Security, Privacy.*

1. INTRODUCTION

Mobile Cloud Computing is a relatively new technology that refers to an infrastructure that stores and processes data outside of the mobile device. The Internet of Things is a relatively new technology. The Internet of Things (IoT) is a relatively new telecommunications technology that is quickly gaining traction. IoT is more particularly linked to wireless telecommunications. The primary aim of wireless network-based interaction and collaboration amongst things and objects

is to achieve the goal established for them as a united entity. Furthermore, both Cloud Computing and the Internet of Things are rapidly developing technologies in the area of wireless communications. We provide a review of IoT and Cloud Computing in this article, with an emphasis on the security concerns that both technologies face. We specifically integrate the two aforementioned technologies (Cloud Computing and IoT) in order to investigate the common characteristics and advantages of their integration. Finally, we will discuss Cloud Computing's contribution to IoT technologies. As a result, it demonstrates how Cloud Computing technology enhances IoT functionality. Finally, we look at the security issues that come with combining IoT with Cloud Computing [1]. We study and analyze previous literature in the fields of cloud computing and Internet of Things, as well as their integration, for the purpose of this paper. The papers that made a significant contribution to our research are listed in the following paragraphs. To begin, provides an overview of the various security risks that pose a threat to the cloud. In addition, a survey was given in that was more specific to the various security issues that have arisen as a result of the nature of the service delivery models of a cloud computing system.

Moreover, an exploration of the roadblocks and solutions to provide a trustworthy cloud [2] computing environment presented in. Cloud computing is a rapidly evolving paradigm, but its unique characteristics exacerbating security and privacy concerns. Concerning the integration of Internet of Things and Cloud Computing, there have been made some previous studies. proposes a new platform for providing and supporting ubiquitous connectivity and real-time applications and services for smart city needs using cloud computing capacities. In addition, shows a framework for data collected from highly distributed, heterogeneous, decentralized, real and virtual devices (sensors, actuators, smart devices) that can be managed, analyzed, and controlled automatically by distributed cloud-based services. The applications of IoT and CC in manufacturing are investigated in order to realize full sharing, free circulation, on-demand use, and optimal allocation of various manufacturing resources and capabilities. Furthermore, a CC- and IoT-based cloud manufacturing [3] (CMfg) service system (i.e. CCIoT-CMfg) and its architecture are proposed, and the relationship among CMfg, IoT, and CC is analyzed. Finally, discusses the benefits, challenges, and future work for the application and implementation of CCIoT-CMfg. The focuses on the Cloud of Things architecture, which is a common approach to integrating the Internet of Things (IoT) and Cloud Computing. Also, in review the state of the art for integrating Cloud Computing and the Internet of Things, and examine an IoT-enabled smart home scenario to analyze the IoT application requirements.

At the end, the Cloud Things architecture, a Cloud-based Internet of Things platform which accommodates Cloud Things IaaS, PaaS and SaaS for accelerating IoT application, development, and management proposed in. In addition, includes a presentation and discussion of some of the IoT and Cloud Computing integration challenges that must be addressed in order to enable an intelligent transportation system to address issues such as high fuel prices, high CO₂ emissions, increasing traffic congestion, and improved road safety. is a demonstration of a method for developing Smart Home apps that integrates Internet of Things (IoT) with Web services and Cloud computing? [3]. The strategy focuses on four areas: embedding intelligence into sensors and actuators using the Arduino platform; networking smart things using ZigBee technology; facilitating interactions with smart things using Cloud services; and improving data exchange efficiency using the JSON data format. It also shows the implementation of three use cases, namely, assessing house conditions, monitoring home appliances, and regulating home access, to

illustrate the approach's practicality and efficiency. The offers a cloud-centric vision for global Internet of Things deployment. The most important enabling technologies and application areas that will likely drive IoT research in the near future are addressed. also shows a Cloud solution using Aneka that is built on the interplay between private and public Clouds.

Finally, it ends the IoT vision by emphasizing the need of bringing WSN, the Internet, and distributed computing together for the benefit of the technical research community. Because of the amount of data IoTs can generate and their requirement for virtual resource utilization and storage capacity, it's becoming increasingly important to integrate them with cloud computing, not only to make it possible to create more usefulness from the data generated by IoTs and develop smart applications for users, but also to make it possible to create more usefulness from the data generated by IoTs and develop smart applications for users. refers to this kind of connection as [2] Cloud of Things. Anything may become a part of the Internet and produce data with IoTs. Furthermore, in order to produce more useful services, the data created must be handled according to its requirements. Integration of IoTs with cloud computing is becoming more essential for the preceding aim. The Cloud of Things (CoTs) is the name given to this new paradigm. The authors' attention in is drawn to the combination of Cloud and IoT, which we refer to as the CloudIoT paradigm. In addition, numerous studies have looked at Cloud and IoT individually, as well as their major characteristics, features, underlying technology, and outstanding problems. These studies, on the other hand, lack a thorough examination of the new CloudIoT paradigm, which entails whole new applications, difficulties, and research concerns. focuses on some of the major problems in Cots and proposes smart gateway-based communication as a solution. Smart gateways are required for Cloud of Things to execute the sophisticated functions and preprocessing that sensors and light IoTs cannot. Finally, offers an overview of integration components, including cloud platforms, cloud infrastructures, and IoT middleware. There are also several integration ideas and data analytics methods discussed, as well as various difficulties and open research problems. Finally, we look at integration techniques and approaches for the technologies described above. The authors of concentrate [4] on Fuzzy C-Means based segmentation algorithms because of their high segmentation accuracy. Furthermore, the algorithms investigated need lengthy execution durations. In addition, the authors of use Graphics Process Unit (GPU) capabilities to speed up the execution time of these algorithms.

Finally, the authors obtain an increase in accomplishment performance of up to 8.9x without sacrificing segmentation accuracy. The primary goal of is to provide a review of the fundamental methodologies for such techniques and to identify new research trends in this field. The authors of describe several well-known techniques of face recognition in video sequences for biometric security applications and list new developments. In order to address the problem of a lack of research into effective and efficient evaluations and measurements for security and trustworthiness of various social media tools, platforms, and applications, surveys the state-of-the-art of social media network security and trustworthiness, particularly for the increasing sophistication and variety of attacks, as well as the reliability of various social media tools, platforms, and applications. In addition, the authors of emphasized a novel approach to assessing and monitoring basic and underlying platforms. Furthermore, based on signaling theory and crowd computing, the authors suggest a hierarchical design for crowd assessments, which is critical for the social media ecosystem. Each paper's results and ideas are included in Table 1.

More specifically, in Table 1, relevant information linked to the year in which the review was published, the precise authors, and as a conclusion for each article the issues and solutions that they deal with could be seen separately for each related review that was examined [3].

2. DISCUSSION

The Internet of Things (IoT) is a network of devices that communicate, exchange, and utilize data from the physical world to offer services to people, businesses, and society. The objects things have unique IDs and may operate alone or in conjunction with other items or people (identifiers). In addition, the Internet of Things has a variety of applications in health, transportation, the environment, and energy, as well as various kinds of devices: sensors, wearable devices (watches, glasses), and home automation (domestics). What exactly does it imply when devices and sensors are connected and interact with one another? What impact will the Internet of Things have on our everyday lives? GPS systems, alarm systems, and thermostats all transmit and receive continuous data in order to track and automate our everyday actions. And there's the less obvious: mosaic, mugs, clothing, and other commonplace items may all connect to a network and transmit and receive data via the Internet. Businesses explore opportunities where streaming data can generate new markets in order to drive good change or to improve current offerings. The following are some examples of sectors that are at the center of these changes

- a) Transportation-related smart solutions: Transportation-related smart solutions decrease traffic on the highways, reduce fuel consumption, prioritize car maintenance programs, and save lives.
- b) Smart power grids with more renewable: Smart power grids with more renewable enhance system dependability while lowering customer costs, resulting in cheaper energy.
- c) Patient monitoring through remote access: Patient monitoring by remote access enhances the quality of services, increases the number of individuals serviced, and saves money.
- d) Sensors in houses and airports: Sensors in homes and airports, as well as in your shoes and doors, enhance safety by transmitting signals when they are left unattended for a length of time or when they are utilized at the incorrect time.

Engine monitoring sensors that identify and anticipate maintenance problems, enhance inventory replenishment, and even set priorities in scheduling maintenance work, repairs, and regional operations are all examples of engine monitoring sensors. The field of IoT security is concerned with the protection of linked devices and networks in the Internet of Things. The Internet of Things refers to the growing number of items and entities – referred to as things in this context – that are equipped with unique IDs and the capacity to autonomously transmit data across a network. Computing devices and embedded sensor systems used in industrial machine-to-machine (M2M) communication, smart energy grids, home and building automation, vehicle-to-vehicle communication, and wearable computing devices account for a large portion of the growth in IoT communication. The primary issue is that, since networking appliances and other items are still a relatively new concept, security has not always been taken into account in product design. Embedded operating systems and software are often supplied alongside outdated and unpatched IoT devices[5]. Furthermore, buyers often forget to change the default passwords on smart gadgets, or if they do, do not use adequately secure passwords. An IoT device that has

to be directly accessible over the Internet should be segregated into its own network and network access should be limited to enhance security. The network segment should then be watched for possible abnormal traffic, and if there is an issue, action should be taken.

Since the IoT idea was originally suggested in the late 1990s, security experts have warned about the potential danger of huge numbers of unprotected devices connected to the Internet. The first IoT botnet was found in December 2013 by a researcher at Proofpoint, an enterprise security company. According to Proofpoint, devices other than PCs made up more than 25% of the botnet, including smart TVs, baby monitors, and other home gadgets.

2.1.APPLICATION

Cloud computing is the use of the Internet to offer computers, storage, services, and applications. In general, significant hardware and software improvements are needed to make smart phones more energy efficient and computationally competent. This necessitates collaboration between developers and manufacturers. Mobile cloud computing is described as the integration of cloud computing technologies with mobile devices in order to maximize the processing power, memory, storage, energy, and context awareness of the mobile devices. Mobile Cloud Computing technology is the result of multidisciplinary methods that combine mobile computing with cloud computing. As a result, mobile cloud computing is another name for this transdisciplinary area. The phrase Mobile Cloud may be seen from two perspectives: infrastructure-based and ad-hoc mobile cloud. The hardware architecture in an infrastructure-based mobile cloud stays static while providing services to mobile users. Nonetheless, many apps make use of cloud resources, but solely for storage and application-specific features like Apple's Siri (voice-activated personal assistant) and iCloud storage service. Figure 1 Shows The Cloud Computing Effect.

Figure 1 Shows The Cloud Computing Effect.

The Cloud Computing technology, like other technologies, has certain characteristics that define its operation. Following that, these characteristics are examined and described. Storage over the Internet (Storage over the Internet) is a technological framework that utilizes Transmission

Control Protocol/Internet Protocol (TCP/IP) networks to connect servers and storage devices, as well as to make storage solution implementation easier. Storage over Internet Protocol (SoIP) technology is another name for Storage over Internet technology. SoIP offers high-performance and scalable IP storage solutions by combining the finest storage and networking industry techniques. The primary goal of the Internet Service is to assist clients all over the globe in turning their dreams become realities by using the Internet's efficiency, speed, and ubiquity.

2.2.ADVANTAGES

Cloud Applications, or Applications over Internet as a scientific definition, are programs that can be written to do the job of a current manual task, or virtually anything, and which perform their job on a server (cloud server) via an internet connection rather than the traditional model of a program that must be installed and run on a local computer. Google apps, online banking, and Face book are some examples of sophisticated programs that operate in the cloud and accomplish amazing feats of computation for the unsuspecting user who just needs an internet connection and a browser Efficiency in Energy efficiency is defined as a method of controlling and limiting the increase of energy use. It may be more energy efficient to provide more services for the same energy input or to give the same services for less energy input. When a Compact Florescent Light (CFL) bulb consumes 1/3 to 1/5% less energy to generate the same amount of light as an incandescent bulb, the Compact Florescent Light (CFL) is regarded to be more energy efficient. Computationally Capable Computational cloud services take use of computationally demanding and ubiquitous mobile applications made possible by Mobile Cloud Computing technologies. As a consequence, a system is deemed computationally competent when it fulfills the criteria for delivering the desired outcomes by doing the necessary computations. Mobile Cloud Computing has certain drawbacks and limits that need be addressed throughout time to create a better and more perfect application. Before using this technology, a lot of companies, particularly smaller ones, must be aware of the restrictions. The security problem is one of the main concerns with Mobile Cloud Computing. Before using this technology, it's important to understand that all of the company's sensitive data will be handed over to a third-party cloud service provider. This may put the company's future in jeopardy. As a result, one must be fully certain that they are selecting the most dependable service provider, one who will protect the information entirely. Internet connectivity is essential for Mobile Cloud Computing. As a consequence, before using these services, the user should be assured that the outcome is favorable. Mobile Cloud Computing has a huge potential user base since owning a mobile device that is linked to the internet has become the standard in today's wireless environment Performance is another significant issue with Mobile Cloud Computing. Some users believe that performance is inferior to that of native apps. As a result, it's a good idea to verify with only one service provider and learn about their track record Latency is a term that refers to the (Delay)Latency (also known as turnaround time) in mobile cloud computing refers to the time it takes to offload a calculation and get the results from a nearby infrastructure or cloud. Data privacy is essential, and it is one of the major barriers preventing customers from embracing mobile cloud computing. As a result, in order for customers to trust the mobile cloud, application models must enable app development that includes privacy protection and implicit authentication methods [6].

2.3.WORKING

Cloud computing security, often known as cloud security, is a growing sub-domain of computer, network, and information security. It refers to a collection of rules, tools, and controls used to safeguard data, applications, and the cloud computing infrastructure [7]. Users and businesses may store and process data in third-party data centers with the help of cloud computing and storage solutions. The Cloud is used in a number of service types (SaaS, PaaS, and IaaS) and deployment [8] patterns (Private, Public, Hybrid, and Community) by businesses. Cloud computing is linked with a variety of security issues. Security problems encountered by cloud providers (organizations that offer software, platform, or infrastructure-as-a-service through the cloud) and security issues faced by their clients fall into two categories (companies or organizations who host applications or store data on the cloud). However, the burden of proof is shared. The supplier must guarantee that its infrastructure is safe, as well as their customers' data and apps, while the user must take steps to secure their application and utilize strong passwords and authentication methods. Encryption algorithms serve a critical role in ensuring safe network communication [9]. It is an important and essential instrument for data protection. The encryption method scrambles the data using "a key," and only the user has the key to decode the data. Symmetric key encryption is an essential encryption method that has been discovered via study. Only one key is needed to encrypt and decode data in symmetric key encryption. The AES algorithm is the most often employed in this encryption method. NIST has suggested that AES (Advanced Encryption Standard) be used to replace the DES algorithm. The only known successful attack against it is a brute force assault, in which the attacker attempts all possible character combinations to break the encryption. Block ciphers based on the AES algorithm. It features a configurable key length of 128, 192, or 256 bits, with 256 being the default. It encrypts 128-bit data blocks in 10, 12, or 14 rounds, depending on the key size. AES encryption is quick and adaptable, and it may be used on a variety of platforms, including mobile devices. AES has also been thoroughly tested for a wide range of security applications. This work depicts a portion of the AES algorithm. This method utilizes the original key, which is a 4x4 matrix containing the number of bytes in either instance [10].

3. CONCLUSION

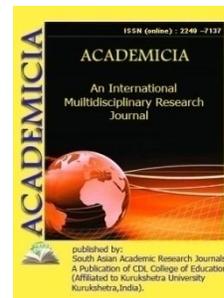

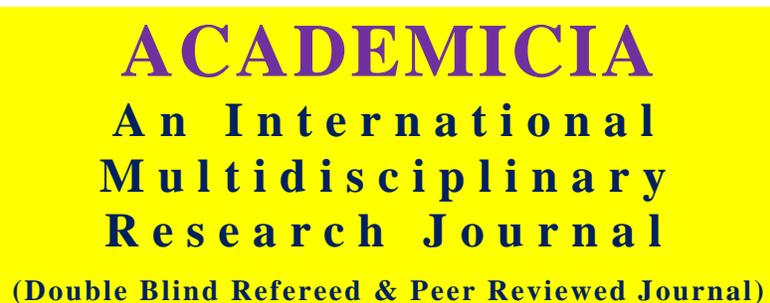

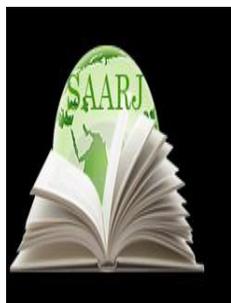

The Cloud Computing technology opens up a lot of opportunities, but it also has certain drawbacks. Cloud computing is a kind of infrastructure in which data storage and processing take place outside of the mobile device. In this article, we provide an overview of Internet of Things technology, as well as an explanation of how it works and how to utilize it. We also go through the key characteristics of Cloud Computing and the trade-offs that come with it. Cloud computing is a kind of infrastructure in which data is stored and processed outside of the mobile device. In addition, the Internet of Things is a relatively new technology that is quickly gaining traction in the telecommunications industry, particularly in the contemporary area of wireless telecommunications.

The primary aim of wireless network interactions and collaboration between things and objects is to achieve the goal set for them as a united entity. Furthermore, both Cloud Computing and the Internet of Things are fast developing technologies dependent on wireless network technology. We provide a review of IoT and Cloud Computing in this article, with an emphasis on the security concerns that both technologies face. We specifically integrate the two aforementioned technologies (Cloud Computing and IoT) in order to investigate the common characteristics and find the advantages of integrating them. Finally, the role of Cloud Computing to IoT technology

was discussed, as well as how Cloud Computing technology enhances IoT functionality. Finally, the suggested algorithm model was used to assess the security issues of the integration of IoT and Cloud Computing, as well as a presentation of how the two encryption algorithms that were employed contribute to the integration of IoT and Cloud Computing. Future study on the combination of those two technologies may be conducted in this area. In order to have a better integration model, the security problem must be addressed or reduced to a minimum due to the fast growth of both systems. These security issues discussed in this article may be used as a case study for future research with the aim of reducing them.

ABSTRACT

A contemporary demand is for protein production in adequate quantity and quality. The use of cell cultures for protein synthesis seems to be becoming more common. Expression techniques based on mammalian cells can introduce proper protein folding, post-translational modifications, and product assembly for recombinant proteins, all of which are required for complete biological activity. This review article is completely based on a literature review. In this article, the mammalian gene sequence has attracted a lot of attention. The author focused on the expression of the gene in a variety of mammalian cell lines. Potential vector methods for transferring the gene into mammalian cells included plasmid-based expression vectors, retroviral vectors, adenovirus vectors, vaccinia vectors, and baculovirus vectors. The process of transmitting genes into mammalian cells was also investigated. The uses and limits of mammalian expression systems were also addressed. The purpose of this study and the publishing of this article is to improve the understanding of researchers who are just getting started in the area of mammalian cell gene expression. The primary goal of this article, as well as its conclusion, is to make molecular techniques, expression systems, including gene expression applications in human cell lines more accessible.

KEYWORDS: *Gene Cloning, Gene, Protein, Plasmid, Vector.*

INTRODUCTION

A gene is unique piece of genetic information that is needed for the synthesis of polypeptides. In the coding sequence, you'll find the promoter, terminator, and introns. The transcription and translation of a gene are both referred to as expression. The expression of a certain gene requires the presence of a specific host. For large-scale recombinant protein synthesis, a variety of translation methods are currently available. E. coli, sought to harness insect cell translation,

yeast, as well as a number of placental mammal systems are among the techniques used[1]. Each has its own set of benefits in terms of cost, usability, including post-translational alteration profiles. The recombinant DNA technique is shown in Figure 1.

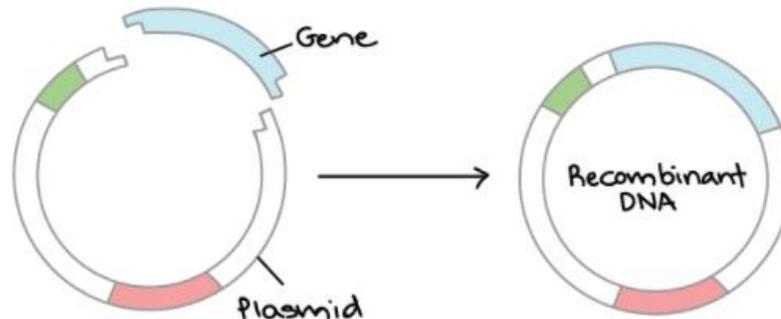

Figure 1: The recombinant plasmid is injected into bacteria in this illustration. Bacteria that contain the plasmid are chosen and cultivated.

E. coli, baculovirus-mediated insect cells expression, yeast, and numerous mammalian-based systems are among these expression systems. Each has its own set of benefits in terms of cost, usability, and post-translational modification profiles. Table 1 lists factors to consider when choosing an expression system for gene expression.

In contrast to insect cells, human cells' glycosylation results in the attachment of large, complex glycans to expressed proteins, which generally prevents crystallization. However, there are techniques for changing the glycosylation. As a consequence, glycoproteins produced in mammalian cells have been crystallized effectively. Protein expression has also been studied in mammalian cells[2]. This article is completely based on a literature review. The author looked at both modern and traditional techniques for doing a literature review. Search engines and data sources included Science Direct, PubMed, and Google. The literatures discussed in this article are not limited to a certain region, but rather come from all around the globe. The author tried to add to existing research on the topic. This paper included material from the preceding five years, up to and including 2012, as well as significant prior literature[3].

The main aim of this research is to look at the many mammalian cell lines that are used for transfection and, eventually, gene expression. The author investigated the vectors used in

transfection in mammalian cell lines. Furthermore, the author addressed several gene transfer techniques in mammalian cells. Gene expression in mammalian cell lines has gotten a lot of attention recently. The goal of this article is to provide new researchers with information on how to express genes in mammalian cell lines to get the desired protein. Readers who are new to biotechnology and interested in mammal tissue culture or gene expression may find this article helpful.

Requirements for Mammalian Expressing Systems:

The degree of expression of a gene is determined by the efficiency with which it is transcribed. Transcription begins when the RNA polymerase complex interacts with the promoter regions and moves from a 5 to 3 orientation along the gene. This produces an RNA transcript, which then separates from the gene at the transcribed signal, causing the transcript to be frozen until it can be translated. For gene expression in human cells, a good cell line and appropriate vectors are required. The vectors should be used to deliver the gene of interest into the appropriate cell lines[4].

Cellular lines:

In the past decade, protein treatments generated from human cells have revolutionized human healthcare. Protein treatments are becoming increasingly important, prompting a search for more cost-effective and efficient cell lines capable of producing high-quality protein products. Previously, viral vaccines, diagnostic, and therapeutic proteins were produced using bioprocesses based on mammalian cells. In the development of protein therapeutics, cells serve as hosts for the production of proteins. The most often used host mammalian cells are Chinese hamster ovary (CHO) cells and mouse myeloma cells, especially NS0 and Sp2/0 cells. DUKX-X11 as well as DG44, the two most often used cell lines in bioprocessing today, are two derivatives of the CHO cell line, CHO-K1 or CHO pro-3. These two cell lines were created with reduced dihydrofolatereductase (DHFR) activity. 7-8 A number of mammalian cell lines have been utilized to produce proteins, the most prominent of which being HEK 293 (Human embryonic kidney) and CHO (Chinese hamster ovary). These cell lines may be transfected with polyethyleneimine (PEI) or calcium phosphate. The Bac Mam system, for example, uses viral-mediated transduction to produce proteins in mammalian cells. This method utilizes recombinant baculoviruses for simple mammalian cell transduction, allowing for the production of milligram quantities of protein for structural studies. COS and Vero (both green African monkey kidneys), HeLa (human cervical malignancy), and NS0 (non-small cell lung cancer) are some of the other cell lines used for structural studies (mouse myeloma). Certain cell lines, such as NS0, are more difficult to transfect. The most frequent technique of transfection is electroporation, which is used solely to create stable cell lines[5].

The signals for eukaryotic synthesis of proteins, processing, and secretion are properly and efficiently transmitted when mammalian cell expressions are used. Mammalian cells recognize it. It is important to note, however, that there are variations across species.

Vectors:

Self-replicating DNA molecules known as vectors are capable of carrying foreign DNA fragments. It serves as a platform for cloning genes. After the DNA of interest has been cloned into an appropriate vector, the gene may be transfected into the host for expression. Mammalian

virus-derived vectors are often used to express heterologous genes in mammalian cells. They include viruses such as Simian Viruses 40 (SV40), polyomavirus, herpesvirus, as well as papovirus. You'll need an effective promoter as well as a selection marker to create a vector. In this article, the author has explored a wide range of vectors[6].

plasmid-based expression vectors:

An expression vector is a vector that allows the transcription and translation of a foreign gene that is inserted into it. Plasmids are self-contained circular DNA units that reside in bacterial cells. They are naturally occurring extra - chromosomal DNA fragments that are passed down from generation to generation in an extrachromosomal state. The majority of attempts to transiently generate recombinant proteins used "conventional" expression vectors with strong viral promoters, such as SV40 or adeno-associated virus (AAV) (CMV). Since it seems to be as potent as or stronger than some viral promoters, the elongation factor (EF)-1 promoter, a non-viral promoter, has received considerable support[7].

Vaccinia vectors are a kind of vaccination used to stop the spread of disease:

The vaccinia virus genome is around 200,000 base pairs of double-stranded DNA that multiplies in the host cell's cytoplasm. The vaccinia virus infects cells and produces up to 5000 virus particles per cell, yielding enormous amounts of recombinant protein. Both Pasteur-Merieux29 and Immuno AG30 have successfully used the vaccinia system to produce a range of proteins on a large scale (1000 L), including HIV-1 rgp160 as well as human pro-thrombin. Retroviruses are RNA viruses that replicate via a dsDNA intermediate. The reason for employing retrovirus as a vector is that most retroviruses do not kill the host and instead produce offspring virions over an indefinite period of time. As a result, retroviral vectors may be employed to generate stable cell lines. The second point is that viral gene expression is regulated by strong promoters, which may be controlled to govern transgenic expression. Another possibility is that certain retroviruses, including such amphotropic murine leukaemia viruses strains, have a broad host range and may infect a wide range of cell types. Exogenous gene expression systems that are based on retroviral vectors have been reported as a viable alternative for producing stable and high-expressing mammalian cell lines[8]. Many methods for transfecting mature osteoclasts and their precursors with lentiviruses and adenoviruses have been described. A retroviral vector was used to create the CD59 gene, which was then transfected into breast cells (MCF-7). Recombinant human factor was also made using the retroviral system.

As vectors, baculoviruses are employed.

Baculoviruses contain large double-stranded DNA genomes and capsids that are rod-shaped. They infect arthropods, particularly insects, in large numbers. Both the Autographacalifornica multiple nuclear polyhedrosis virus (AcMNPV) and the Bombyxmori nuclear polyhedrosis virus have been extensively used as vectors. The former is used to express proteins in insect cell lines, particularly those produced from Spodopterafrugiperda. The latter infects the silkworm in order to produce recombinant protein.

A bicistronic expression cassette has been developed and employed in a recombinant baculovirus that may be used for sustained protein synthesis in mammalian cells. The expression of a secreted protein in human cells was studied using baculovirus particles.

The process of transferring genes is as follows:

The method for introducing the foreign gene into mammalian cells, as well as the regulatory elements utilized to guarantee efficient mRNA expression and protein synthesis, define the vector used. There are two primary methods for introducing foreign DNA into human cells. Viral infection causes the first, whereas chemical liposomes, calcium phosphate, DEAE-de-xtran, and polybrene, as well as physical electroporation and microinjection methods, cause the second. It has been shown that calcium-phosphate, PEI, and electroporation may be used as vehicles/approaches for large-scale transient gene expression.

The bulk of commercially available DNA transfer products are offered in small quantities and are not designed for use in reactors or with large cell masses. Calcium phosphate and PEI transfer DNA by forming complexes with DNA that are subsequently taken up by cells through endocytosis when the conditions are appropriate. This author has also written on several cell transformation methods.

Mammalian expression system application:

The first biologic approved from a mammalian bioprocess platform was tissue plasminogen activator (tPA), which was created by Genentech Inc. in 1987. Mammalian cells now outnumber E. coli, yeast, transgenic animals, and insect cultures for biopharmaceutical products: biopharmaceuticals approved between 2006 or 2010 were made in cell cultures, in E. coli, four in yeast, three in transgenic animals, as well as two in insect cultures.

Production of monoclonal antibodies:

Therapeutic proteins, such as monoclonal antibodies, are now manufactured in mammalian cells for commercial purposes (mAbs). African green monkey kidney (COS) cells may be appropriate for producing modest quantities of mAbs, such as for exploratory study. They've been used to make active antibodies on a brief basis since 1987. However, since their ability to produce decreases with time, they are not the ideal cells for large-scale production processes. Actually, if large-scale production is the objective, CHO cells, which are gaining favor in the lab, are the most often used cells for this purpose. There were also cell engineering instructions for the production of mAbs. The use of heterologous promoters, enhancers, and amplifiable genetic markers may increase antibody and antibody fragment production. High amounts of chimeric antibodies and recombinant antibody fragments were generated using low copy number cell lines, much beyond those seen in parental hybridomas.

Production of urokinase:

Urokinase is a serine protease that activates plasminogen and converts it to plasmin to break fibrin clots. Urokinase, as a consequence, is an effective anti-thromboembolic agent. The demand for urokinase has increased significantly in recent years, and current production levels have not kept up. Mammalian cell lines are increasingly used for recombinant urokinase production because they allow for post-translational alterations. CHO cells are excellent hosts for the production of recombinant urokinase because they grow so well in the bioreactor.

Production of follicle stimulating hormone:

Follicle-stimulating hormone is produced by the anterior pituitary's gonadotropic cells (FSH). FSH is necessary for follicular growth and development in females. Men must start pubertal spermatogenesis and sustain adult human spermatogenesis quantitatively. The structure and

actions of glycoprotein hormones, as well as their therapeutic use in the treatment of infertility, have been studied using recombinant gonadotrophins. Because of their abundance, they are free of contaminating hormones, so their structure or function may be studied in great detail. Several groups have produced and reported on the effects of human recombinant (rec) FSH generated by transfected CHO cells. Recombinant rat FSH generated by CHO cells was purified and functionally characterized. The cynomolgus monkey was also used to study the cloning and expression of the gonadotropins luteinizing hormone and FSH.

The following are examples of other mammalian expression systems:

Using novel mammalian cell lines with reporter genes, researchers were able to detect environmental chemicals that activate endogenous aryl hydrocarbon receptors or estrogen receptors. Hemophilia B is a genetic coagulation system disease that affects one out of every 30,000 males worldwide. Recombinant human Factor IX has been used to treat hemophilia B. (rhFIX). The steady and high-level production of recombinant Factor IX in a human hepatic cell line was reported. The cytomegalovirus (CMV) promoter, for example, is used to induce high-level messenger RNA transcription. Codon optimization for the target cell type, GC/AT ratio balance, and signal sequence alteration have all been shown to improve mRNA processing as well as secretion. Gene-targeting technologies, chromatin opening elements, as well as attachment regions have all been included into vector optimization to improve end product output[9]

DISCUSSION

A contemporary demand is for protein production in adequate quantity and quality. The use of cell cultures for protein synthesis seems to be becoming more popular. Expression techniques based on mammalian cells can introduce proper protein folding, post-translational modifications, including product assembly for recombinant proteins, all of which are required for complete biological activity. To select an optimal expression system, just the productivity, purpose, bioactivity, and physicochemical characteristics of the target protein, as well as the cost, convenience, as well as safety of the system itself, should be considered. In order to get more efficient proteins with high biological activity, new mammalian cell lines, vector systems, and gene expression methods are now required. In this paper described the cell lines, vectors, including transfection method used in mammalian expression system, which is very helpful for researchers new to animal biotechnology. In the last two decades, mammalian cell protein levels have been the most common technique of recombinant protein synthesis for therapeutic use, accounting for more than half of all biopharmaceutical products on the market, including hundreds of clinical trial candidates. The discovery and production of new cell lines, as well as the entrance of novel genetic mechanisms in expression, gene control, and gene targeting, have all made significant progress.

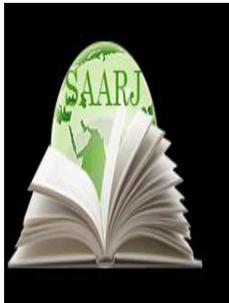

CONCLUSION

Correct protein folding including post-translational alterations, which are often needed for full biological function, may be introduced via mammalian cell-based production techniques for recombinant proteins. The main conclusion reached by the author is that he has examined the most recent developments in the field of mammalian expression systems, which are significant in animal biotechnology. In this paper described the cell lines, vectors, including transfection method used in mammalian expression system, which is very helpful for researchers new to

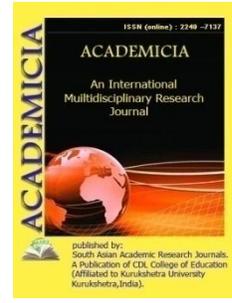

animal biotechnology. In the last two decades, mammalian cell protein levels have been the most common technique of recombinant protein synthesis for therapeutic use, accounting for more than half of all biopharmaceutical products on the market, including hundreds of clinical trial candidates. The discovery and production of new cell lines, as well as the entrance of novel genetic mechanisms in expression, gene control, and gene targeting, have all made significant progress. Only the productivity, bioactivity, and purpose of the interest protein, including its physicochemical characteristics, as well as the cost, simplicity, and security of the system itself, may be utilized to choose an optimal expression system. In order to obtain more efficient protein with high biological activity, new human cell lines, vector methods, and gene expression methods are now required.

METHOD OF EXPERIMENTAL STUDY OF SHEAR STIFFNESS OF PROFILED FLOORING DIAPHRAGM

Rahimov Qaxxorovich*; **Choriyev Anvar Dzhumayevich****;
Mirkamol Polatov Rasuljonovich***

*Professor Akrom,

**Scientific Researcher,

Samarkand State Architectural and Civil Engineering Institute,
 Termiz State University, UZBEKISTAN

***Lecturer,

Termez State University, UZBEKISTAN

ABSTRACT

The article presents the methods of conducting experimental studies of the shear stiffness of diaphragms made of profiled flooring. The issues of testing for shear fragments of profiled flooring, as well as testing for cross-section connections of profiled sheets with each other and with the elements of the frame of buildings are considered.

KEYWORDS: *Rigidity, Diaphragm, Profiled Flooring, Horizontal Load, Wind Load, Experiment, Shearing, Joining, Frame.*

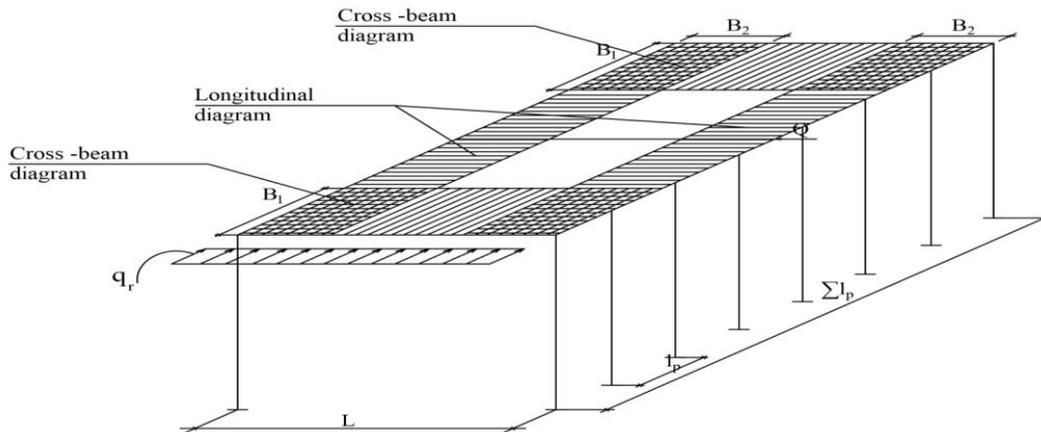

INTRODUCTION

The stiffness of a profiled floor diaphragm is characterized by the amount of shear forces generated by the horizontal forces acting on the building in the longitudinal and transverse directions. Such forces mainly include wind pressure force, force generated by bridge cranes, and seismic forces.

MATERIALS AND METHODS:

The stiffness of the profiled floor diaphragm is often due to the fact that its roof load-bearing elements are attached to the prongs (sarrov). Profiles to which the profiled bearings are fastened must have high strength against torsion. They are therefore fastened to the load-bearing structures using bolts and brackets. It is recommended to fasten the profiled lining to the load-bearing structures of the roof by means of self-drilling bolts in the connecting diaphragms, and

by using rivets combined to fasten the lining in the longitudinal direction along the corrugation. To assess the true displacement of the diaphragm in the profiled bed, it will be necessary to conduct experimental studies involving two types of tests.

1. Try to move the profiled floor fragments;
2. Trying to cut the joints of profiled roofing, forming a floor with the elements of the frame and the frame of the building;

RESULTS AND DISCUSSION:

The tests are carried out in a rectangular reinforcing frame made of high-strength steel elements, the size of which is 3x6 meters. On one side of the horizontally placed frame, the long side is firmly attached, and the other sides are in a free position. The long sides are joined by one or two transverse elements in the center or at a distance of one third (Fig. 1).

The long and short thighs of the ram are raised to the long thighs of the ram with the help of cylindrical hinges. The test specimen in the form of a 3x6 meter sloping frame should be attached to the elements of the reinforcement frame as shown in the actual obstruction design. All joints with the reinforcement frame must be arranged flat on the page.

Various types of corrugated profiled metal sheets and various bonding methods can be used to prepare the test sample. The frames are placed on the long side of the frame in a corrugated or transverse direction.

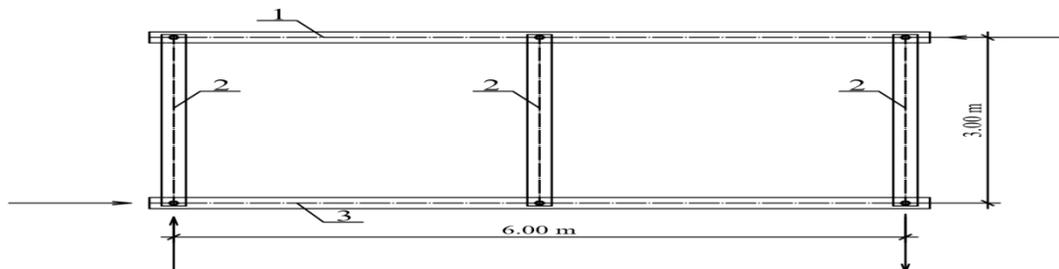

Fig. 1. Scheme of load equipment

- 1-moving part
- 2-cross-beam
- 3-unmoving part

The moving experimental loads are placed horizontally along the free longitudinal side of the reinforcement frame. Before closing the floor, the frame is stretched, that is, the specific resistance of the frame to slipping is determined. The first sample is tested by constantly increasing the load until it loses its carrying capacity.

The second sample is loaded step by step with a load equal to 1/10 of the strength limit of the first sample, but not greater than 2.0 kN. At each stage, the load is held for 5 minutes, then the loads are completely removed and the load is increased to the amount of the next stage.

In the third sample, the first and second samples are tested with no variable sign (direction) equal to 0.4 of the average value of the average strength limit obtained according to the test results.

During the test, the probability that the free longitudinal side of the reinforcing frame slides in the direction of the shear force and the accidental displacement of the fixed longitudinal side of the frame is determined.

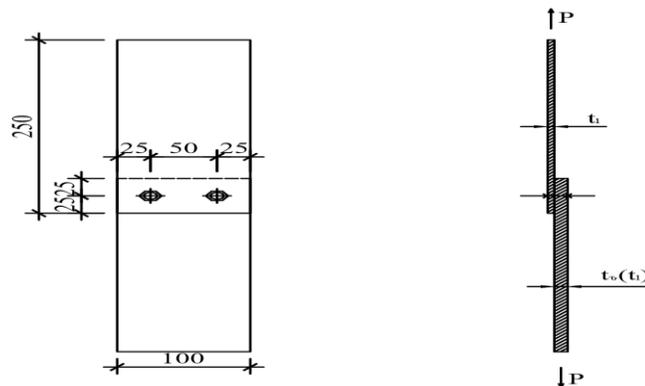

Fig.2. The sample for testing of joining flooring
 t_1 -thickness of profiled flooring
 t_2 -thickness of construction shelf, load-bearing

DISCUSSION:

Figure 2 Testing of profiled floor joints;

Screws, bolts and cracks are used to connect the profiled sheets to the construction and materials (Fig. 2).

Simple samples should be independently tested to determine the strength and stiffness characteristics of the floor joints affected by the moving loads. (Figure 2).

The thickness and quality of the sheets used for the samples must match the floor and the carcass elements that support it. Each type of compound is tested in at least 10 samples. The first sample is tested with a constant overload until a state of degradation occurs, while the remaining samples are tested step by step at 1/10 of the same destructive force, but not more than 0.5 kN.

At each stage, the load is held for 5 minutes, then all the loads are removed and the loads are increased to the amount of the next stage. Testing of joints with different sign loads is possible only if the sign of the driving forces acting on the profiled floor is also different.

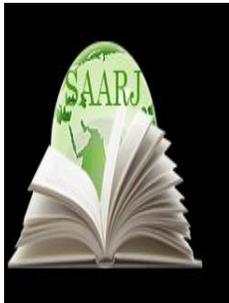

CONCLUSION:

In the process of sampling the joints, it is determined that the joints of the joints are displaced according to the amount corresponding to the test load and the load-bearing capacity of the joints.

The test results can be used in the design of frame structures and fastening systems of buildings, including floors and panels made of profiled metal sheets.

THE IMPORTANCE OF THE INTERNATIONAL HASSP SYSTEM IN THE PRODUCTION OF QUALITY AND SAFE CONFECTIONERY PRODUCTS

Fayziboev Pirmamat Nurmamatovich*; **Raximova Durdona Jurakulovna****

* PhD, Associate Professor,
 "General Hygiene and Ecology",
 Samarkand State Medical Institute, UZBEKISTAN

**Assistant,
 Department of General Hygiene and Ecology,
 Samarkand State Medical Institute, UZBEKISTAN

ABSTRACT

Nowadays, confectionery products in the European Union allow to fully satisfy the demand of the population for this product. However, to date, the negative effects of confectionery products in the oral cavity using the NASSR international system have been shown to reduce the threat to human health, as well as the effects of national types of confectionery products such as n ovvat, zarnovvat on oral cavity and dental caries. The effect has not been studied. It should be noted that bacterial poisoning from confectionery is one of the most important problems in the field of epidemiology and food hygiene.

KEYWORDS: *International System of Confectionery Products.*

INTRODUCTION

Food contamination has enormous economic consequences in all countries of the world and has a negative impact on human health.

One of the most pressing issues in bringing modern Uzbekistan to the world market is the production of quality and safe food products through the use of the international system HASSP [1].

Improving the system of quality and safety of food, confectionery, vegetables and melons is one of the priorities of state policy.

In this regard, the Action Strategy for the five priority areas of development of the Republic of Uzbekistan for 2017-2021, adopted by the President of the Republic of Uzbekistan Sh.M.Mirziyoev, is the most important policy document that defines the priorities of this state policy.

The Risk Analysis and Critical Checkpoints system is an excellent food quality management system focused on the production of safe food products.

Food production enterprises in the application of the international system (HACCP Hazards Analyzis and precise control of the Critikal Control Point - points of analysis to evaluate factors) [2], the confectionery industry is the most important agro- industry is one.

The Food and Agriculture Organization of the United Nations (FAO) and the World Health Organization (WHO) co-funded the Food Security Commission (Codex Aliementarius Commission) in 1993. A manual has been developed. HASSP defines the requirements of the entire chain of production, that is, the system of food safety, which can be applied from the initial raw material to the final product. These system requirements can be applied independently or in combination with quality management systems based on ISO 9000 standards. [6].

Research Objective: To develop and implement the XACCP international system in food enterprises by assessing risk factors for contamination of confectionery products, developing and implementing a modern critical control system to ensure and maintain their quality and safety at the required level . In addition, to study and reduce the risk factors for the problem of safety of confectionery products for human life and health.

Object and Methods of Research: Objects of research are hygienic and bacteriological methods, statistics, surveys on the results of physicochemical and microbiological examination of raw materials and finished products from confectionery enterprises in the determination of milk ration and contamination of food products.

Results Of The Study: Using the international system HASSP, critical control points were identified, taking into account the critical views in the work process, the characteristics of the technological process, equipment used, quality of raw materials and climatic conditions of the regions. In some cases, there has been an increase in the use of various additives, technological additives, and artificial flavorings, flavor enhancers to improve the appearance, taste characteristics, and sometimes the shelf life of food products. It became clear that according to SanPiN №0257-08 [4] in Uzbekistan, the existing hygiene requirements in the production of bread are not based on the assessment and analysis of the risk of contamination of confectionery products.

It should be noted that each product type has its own characteristics, they are in the process of processing the raw materials, as a result of a change in the chemical composition and structure may be made without taking into account the technological instructions provided by the manufacturer on the basis of areas of the recipes does not have a scientific basis and arbitrary was found to be included with .The use of such products among the population living in hot climates often leads to food poisoning.

Based on the results of radiological and laboratory studies , the toxic elements in raw materials and finished products did not differ from the standards specified in SanPiN № 0366-

19 "Hygienic requirements for food safety" [5]. Bacterial poisoning from perishable confectionery products is one of the most important problems in the field of epidemiology and food hygiene. It should be noted that the HASSP system also includes technical norms and rules, management principles and other recommendations. The HASSP concept involves the systematic identification, management and assessment of risk factors that have a significant impact on product safety. The HASSP system is one of the food safety systems adopted by international an organization that has proven its effectiveness. The use of the HASSP system allows the transition from testing the final product to the development of prevention methods in ensuring food safety. Codex Alimentarius the Commission's control of food products, according to technical norms and rules, the right hand - commemorating the regulatory requirements of each country, taking into account the importance for the future of the Code Alimetarius one of the main recommendations of the Commission of confectionery products aimed at guaranteeing the security of confectionery products under development and the application of the international HASSP system in cultivation.

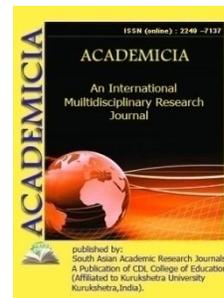

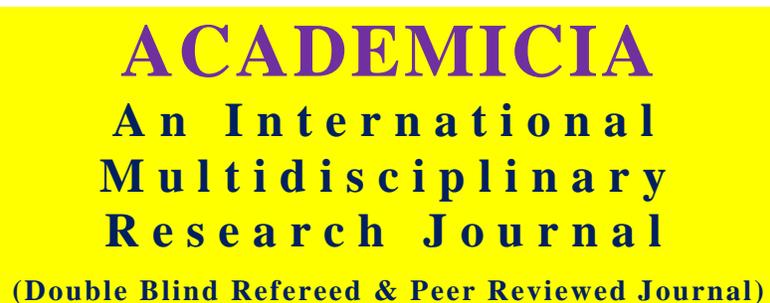

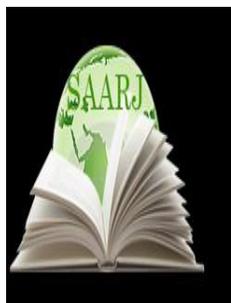

This will open up new avenues of development for the manufacturer who has developed and implemented a food safety system.

CONCLUSIONS

1. At a time when there is a strong competitive environment, along with increasing the range of food products, it is necessary to focus on its quality and safety. Because quality and safe food will be convenient and safe for both domestic and foreign buyers.
2. The concept of HASSP allows carrying out controls to ensure the safety of food products in the transition from the preparation of food raw materials to the final consumer product through the entire food chain, to identify risk factors.
3. The use of the HASSP system allows developing methods to prevent the occurrence of various types of food poisoning, while ensuring food safety.

Mathura, Uttar Pradesh, INDIA

Email id: hodbio-tech@sanskriti.edu.in

ABSTRACT

Plant breeders may use somaclonal variation as a technique. The study looks at the best places to use this technology and the variables that restrict or enhance its chances of success. (1) the degree of deviation from ordered development, (2) the genotype, (3) growth regulators, and (4) the tissue supply are the major variables that affect the variety produced by tissue culture. Despite growing knowledge of how these variables interact, it remains impossible to anticipate the result of a somaclonal breeding effort. Somaclonal variation has resulted in the creation of new varieties, but in many cases, better variants were not chosen because (1) the variance was all negative, (2) significant improvements were also greatly changed in negative ways, (3) the modifications were not novel, or (4) the modifications were not steady after selfing or crossing. Somaclonal variation is less expensive than other genetic modification techniques. It is also more generally applicable at the moment and does not require confinement measures. It's worked best in crops with restricted genetic systems or genetic bases, where it may offer a quick source of variety for crop development.

KEYWORDS: Genetic, Soma clonal variation, Tissue culture.

INTRODUCTION

Tissue culture is an enabling technique that has spawned a slew of new tools to aid plant breeders. These technologies may be used to enhance the speed or efficiency of the breeding process, expand the accessibility of existing germplasm, and generate novel crop variety. Micro-propagation, embryo rescue, another culture, in vitro selection, somaclonal variation, somatic hybridization, and transformation are some of the techniques used. Somaclonal variation has a special place among them since it is both a benefit and a drawback of tissue culture methods. It was not anticipated that the asexual culture process would result in variety. The uncontrolled generation of non-'true-to-type' plants continues to be a concern in almost all other applications

of plant tissue culture. Larkin and Scowcroft, who examined the topic in 1981 and were among many writers at the time to call attention to its potential applications for crop development, were the first to characterize soma clonal variation as such. Their predictions were mainly based on reports of widespread diversity in plants produced from potato protoplast or explant cultures. Soon after, a slew of reports appeared in a variety of species, indicating that somaclonal variation was ubiquitous and therefore presumably available to all plant breeders[1]. Since then, many genuine efforts to enhance crops via somaclonal variation have been undertaken, and although many have failed, there have been noteworthy triumphs (see below). As a result, our starting point is that somaclonal variation is a tool that plant breeders may utilize. The questions that will be answered here are about where this tool can be used most effectively and what variables restrict or enhance the instrument's ability to be used successfully[2]. This evaluation will be limited to the direct application of somaclonal variation for plant breeding due to a lack of space. The application of somaclonal variation for hybrid introgression and then in vitro selection of plants with better stress tolerances, such as temperature, is discussed elsewhere in the proceedings.

As a tool, how dependable is somaclonal variation?

The issue of somaclonal variation's reliability as a breeding technique may be divided into three parts: (a) Is there always variety in in vitro culture? (b) Is it always possible to restore useful variation? (c) Is somaclonal diversity in all crop species beneficial? Is there always variety in in vitro culture? It is impossible to say that in vitro cultivation will always result in variety. In reality, there are a lot of variables that affect whether or not variation is created, as well as how much variation is generated. (1) the degree of deviance from organized meristematic development, (2) the genetic makeup of the starting material, (3) the growth regulators in the medium, and (4) the tissue source are all variables to consider.

The degree to which growth is deviated from meristematic organized growth. In culture, growth may come from pre-existing meristems or from a disorganized form called a callus, from which organized structures emerge through somatic embryogenesis and organogenesis. Disorganization of development is a major component of somaclonal variation, implying that the restrictions that work to remove genetic variants in normal meristems are repressed or that processes of genetic instability are activated in disorganized growth. In general, the larger the deviation from organized growth and the longer the period spent in this condition, the higher the likelihood of somaclonal variation. It is more acceptable to use this criterion rather than making broad generalizations about the degree to which various tissue culture methods are linked to somaclonal variation. This is due to the fact that the amount of time spent in a disorganized state varies greatly from system to system and even from species to species. Cell suspension cultures, for example, are thought to be genetically unstable, whereas protoplast culture is linked to large levels of somaclonal variation. Nonetheless, since the cultures are extremely stable, spruce (*Picea mariana*) seedlings regenerated from protoplasts of embryogenic cell lines are expected to be devoid of somaclonal variation. Protoplasts produced from these embryogenic cultures may directly create embryos[3]. The individual's genetic makeup There is a growing body of data that suggests somaclonal variance is genotype-dependent. In reality, it may be difficult to distinguish genotype effects from variations in tissue culture response since the latter is also genetically controlled, although a number of studies have shown that genotype can affect somaclonal variation regardless of regeneration method. The genotypic element's precise nature must be

determined since plant breeders will want to utilize somaclonal variation as a tool in particular lines or cultivars and will want to know if their genotypes will respond to variability. Unfortunately, this is not a simple issue to address, since genotypic differences are caused by a variety of variables, which interact in complicated ways.

The cultural setting?

There's a lot of evidence that the medium you choose, and especially the concentration of growth regulators in it, has an impact on somaclonal variance. It's conceivable that growth regulators have mutagenic properties. 2,4-D, a synthetic auxin, has been found to enhance the frequency of blue to pink mutations in the *Tradescantia* stamen hair system and to cause substantial increases in the frequency of sister chromatid exchanges in *Allium sativum* root-tip cells. However, there are few instances of this kind, and the majority of data suggests that growth regulators influence somaclonal variation during the culture phase by affecting (1) cell division, (2) the degree of disorganized development, and (3) the selective proliferation of particular cell types.

Source of tissue

When regeneration is accomplished from various tissue sources, there may be differences in the frequency and type of somaclonal variation. In general, the older and/or more specialized the tissue, the better the odds of recovering diversity in the regenerated plants. Gross alterations in the genome, such as endopolyploidy, polyteny, and amplification or diminution of DNA sequences, often follow somatic differentiation in normal plant growth and development, resulting in these consequences. This issue is further confounded by genotype, since there seem to be two classes of plants depending on the amount of genomic diversity present in the soma (polysomatic or non-polysomatic plants, respectively). Differentiated cells in non-polysomatic plants are kept in the same ploidy state as the zygote, while differentiated cells in polysomatic plants may have polyploid, polytene, or even aneuploid constitutions. The impact of tissue source would be greatest in polysomatic species, however although there are certain plants that fit into this category, it is not always obvious which kind of plant is being utilized. In *Solanum brevidens*, 70 percent of plants regenerated from cotyledons were tetraploid, while only 20% of plants regenerated from leaf fragments were tetraploid. Plants grown from cultured petals were more floriferous and had a greater frequency of abnormalities than plants grown from pedicels in *Chrysanthemum*. Plants regenerated from stems did not vary from controls in fragrant *Pelargonium*, while regenerants from root and petiole parts had a wide range of shape[4].

It always possible to restore useful variation:

In almost every instance where comprehensive field experiments on somaclones have been conducted, there has been strong evidence that *in vitro* cultivation has caused alterations in agronomic characteristics. However, better variations have not been chosen for breeding purposes in the majority of instances, due to one or more of the following factors: The shift was in the wrong direction. For example, in a three-year field evaluation of seed progenies of tissue culture-derived spring wheat plants, researchers found that nearly all of the regenerated lines yielded less than the controls, concluding that the tissue culture process had produced "an array of agronomically inferior genotypes." Similarly, a field assessment of barley somaclones revealed that the little variation found was entirely negative in value[5].

When it comes to good improvements:

Other parts of the plants were also impacted. Higher grain protein levels in the seed progenies of regenerates were linked to poorer yields in the spring wheat field study mentioned above. Similarly, several of the potato plants reported as having increased disease resistance by Shepard and colleagues were subsequently shown to be aneuploidy. Not all of the modifications made were new. Variations in the inflorescence were among the most frequent types of alteration in a study of somaclonal variation generated in seven cultivars of plantains (*Musa* spp.). Reversion to a normal French plantain bunch form of inflorescence occurred at a frequency of 2.7% in the False Horn plantain 'Agbagba'. However, such 'French reversion' has been observed in conventional propagules as well, albeit at a considerably lower frequency (0.7 percent)

Is somaclonal variation as effective in all crops as it is in some?

It is true that somaclonal variation has resulted in the development of new varieties of Paulownia tomentosa tomato or celery, sugar cane,. It should also be noted that, despite so many intensive efforts, the technique has proven completely ineffective in many other crops, including wheat, maize, as well as barley. It may be able to predict which crops somaclonal variations is more likely to work as a crop enhancement technique by looking at some of the successful instances[6].

Stress and genetics have an impact.

Somaclonal variation may be induced by stress during tissue culture. Various genomes, on the other hand, react in different ways. stress-induced variation, implying that somaclonal There are genotypic components to variance. The distinctions in Differences in genetic make-up are linked to stability. where certain elements of the plant DNA cause them to grow During the cultural process, the environment becomes unstable. This may be a better option. Repeated DNA sequences may be explained by the repetitive DNA sequences, which can Plant species vary in quality and quantity (Lee). Phillips (1988) and others). A cultivar's inherent fragility was a significant issue. impacted the development of dwarf off-type banana tissue culture. The cv. 'New Guinea Cavendish', for example, possessed a In vitro, cv. 'Williams' has a greater degree of instability. In the same way, dwarf off-types remained stable in vitro. tissue culture, as well as the tissue culture conditions that resulted in disadvantages and disadvantages of somaclonal variation compared to other tools.

Many writers have argued that selecting for incremental improvements in existing varieties by running the best available lines through a tissue culture cycle is an obvious approach for using somaclonal variation in breeding. However, it will not be regarded an economically feasible technique until variations of a specific type can be produced more easily via somaclonal variation than from other approaches. One of the most significant drawbacks of somaclonal variation, which makes it relatively difficult to use, is that, despite the discovery of variables influencing a plant species' variation response, it is still impossible to anticipate the result of a somaclonal program. In reality, for many crop species where general molecular genetic information is inadequate, small scale pilot experiments are the only method to determine if a broad range of somaclonal variation will be produced under a given set of culture conditions. Even yet, there is no assurance that a particular characteristic of interest will be positively changed. Other significant issues include the huge number of inferior lines produced and the fact that some of the modifications are not stable. In contrast to these drawbacks, somaclonal variation has a number of benefits. It is a less expensive type of biotechnology than somatic

hybridisation and transformation, and it does not require any 'containment' processes. There are more plant species accessible in tissue culture systems than can be handled through somatic hybridisation and transformation at this moment. It is not required to have discovered the trait's genetic origin, or even to have isolated and cloned it in the case of transformation. Novel variations have been discovered among somaclones, but genetic cytogenetic data suggests that transit through tissue culture may change the frequency or distribution of genetic recombination events. This indicates that variation may come from places other than the regions of the genome that are accessible to conventional as well as mutant breeding[7].

Advantage

The benefits include:

- It is less expensive than other genetic modification techniques and does not need 'containment' processes.
- There are more plant species accessible in tissue culture systems than can be handled through somatic hybridization and transformation at this time.
- It is not required to have discovered the trait's genetic origin, or even to have isolated and cloned it in the case of transformation.
- Novel variations have been discovered among somaclones, and evidence suggests that transit through tissue culture may change the frequency and distribution of genetic recombination events. This means that variation may come from places in the genome other than those that are accessible to conventional and mutant breeding.
- If somaclones are produced via cell culture, there is no way to get chimeric expression Crops with restricted genetic systems (e.g., apomicts, vegetative reproducers) and/or narrow genetic bases have had the greatest success with somaclonal diversity. In the case of ornamental plants, for example, the use of in vitro-generated diversity has become standard practice in many commercial breeding operations.

Disadvantages

One of the major drawbacks of somaclonal variation that makes it relatively difficult to utilize is that, despite the discovery of variables influencing a particular plant species' variation response, the result of a somaclonal program cannot be predicted since it is random and unreliable. Furthermore, since many genetic alterations are caused by point mutations or chromosomal rearrangements, the majority of R1 segregates. As a result, selecting individuals with gains in the R1 generation for quantitative characteristics like yield is almost difficult. Though many horticultural crops have developed ways for selecting somaclones resistant to different biotic and abiotic stressors, there are currently no in vitro selection methods for complex characteristics like as yield, soluble solids, sweetness, texture, or shelf life.

LITERATURE REVIEW

Michael W. Bairu et al. studied about the plant tissue culture has become one of the most important techniques in plant science research. It's widely used in the cultivation, conservation, and enhancement of plant resources. The existence of somaclonal variation in populations generated from tissue culture has had a detrimental impact on tissue culture's usage and

continues to be a significant concern. It is, on the other hand, a source of new desirable clones/variants with improved agronomic characteristics. We describe the potential causes, detection techniques, and desirability of variations in this review. One of the most studied and discussed subjects is somaclonal variation. As a result, we limited ourselves to presenting a few instances that might serve as useful references for researchers looking to discover and/or describe somaclonal variations while conducting research and manufacturing utilizing tissue culture. The detrimental consequences of somaclonal variation are highlighted. This study does, however, contain instances of certain beneficial variations that arise from somaclonal variation[8].

M. Karppler et al. studied about the Somaclonal variation is expressed as cytological defects, frequent qualitative & quantitative phenotypic mutation, sequence alteration, and gene activation and silencing, activation of dormant transposable elements and retrotransposons suggests that epigenetic alterations occur during culture. Epigenetic activation of DNA elements also indicates that epigenetic alterations may be implicated in cytogenetic instability through heterochromatin modification, as well as phenotypic variance via gene function regulation. The fact that DNA methylation patterns are extremely varied across regenerated plants and their offspring suggests that DNA changes in culture are less permanent than in seed-grown plants. The relative significance of epigenetic vs sequence or chromosomal variation in regulating somaclonal variation in plants will be determined in future study[9].

Somaclonal variation, as defined by G. C. Mgbeze et al, refers to any phenotypic or genotypic changes that occur as a result of in vitro cultivation. Fruit mantling and irregular vegetative development are common symptoms in oil palms. Tissue culture is still the only way to micropropagate oil palms since their biological features prevent traditional vegetative propagation. The early success of plantlet generation prompted several oil palm groups to investigate the method of in vitro propagation. Despite the fact that oil palm tissue culture is highly established, it nevertheless faces many difficulties. Somaclonal variation, which was originally discovered in 1986, is one of the most prominent. They can only be detected after the palms begin to bloom, which occurs after two to three years in the field. Floral irregularity in the oil palm has not been completely eliminated or avoided. Several methods, such as lowering hormone levels, preventing fast-growing calluses, and shortening the culture time, have decreased the issue to tolerable levels of 5%. The reasons behind somaclonal variation in the oil palm are addressed, as well as the variables that influence it[10].

DISCUSSION

Tissue culture is an enabling method that has resulted in the development of a plethora of new tools to assist plant breeders. These technologies may be used to speed up or improve the breeding process, make current germplasm more accessible, and create new crop varieties. Some of the methods utilized include micropropagation, embryo rescue, another culture, in vitro selection, somaclonal variation, somatic hybridization, and transformation. Because it is both an advantage or drawback of tissue culture techniques, somaclonal variation has a unique position among them. Any phenotypic or genotypic changes that occur as a result of in vitro culture are referred to as Soma clonal variation. Fruit mantling and irregular vegetative development are common symptoms in oil palms. Tissue culture is still the only way to micro propagate oil palms since their biological features prevent traditional vegetative propagation. After selfing or crossing, the changes were not consistent. Other genetic alteration methods are more costly than

Soma clonal variation. It is also more widely applicable at the present and does not need the use of restraints. It has been most successful in crops with limited genetic systems or genetic bases, where it may provide a fast source of diversity for crop growth. In crops with restricted genetic systems and/or narrow genetic bases, it is most likely to be regarded a viable technique.

CONCLUSION

Tissue culture is an enabling method that has resulted in the development of a plethora of new tools to assist plant breeders. These technologies may be used to speed up or improve the breeding process, make current germplasm more accessible, and create new crop varieties. Based on these debates, the only conclusion that can be drawn at this time is that, although soma clonal variation is a tool that breeders may employ, it is not a precise instrument and can only be controlled to a limited extent. Despite this, it may provide a quick and easy source of variety for use in breeding programs. In crops with restricted genetic systems and/or narrow genetic bases, it is most likely to be regarded a viable technique.

THE DEVELOPMENT OF INSECT FARMING

Dr Pramod Kumar*

*Sanskriti University,
 Mathura, Uttar Pradesh, INDIA
 Email id: farm.agri@sanskriti.edu.in

ABSTRACT

Agriculture has developed separately in three insect orders: once in ants, once in termites, and seven times in ambrosia beetles. Agriculture has evolved independently in three insect orders. Despite the fact that these insect farmers are very distinct from one another in certain respects, they are surprisingly similar in many other aspects, which suggests that they have evolved via convergent evolution. All of them reproduce their cultivars as clonal monocultures inside their nests, and in the majority of instances, they propagate them clonally over several farmer generations as well. Despite the fact that long-term clonal monoculture presents unique challenges for disease control, insect farmers have developed a variety of strategies to manage crop diseases: they (a) isolate their gardens from the surrounding environment; (b) monitor gardens closely, controlling pathogens as soon as disease outbreaks occur; and (c) occasionally access population-level reservoirs of genetically variable cultivars, even while maintaining their own gardens. Rather of cultivating a single cultivar purely for nutrition, it seems that insect farmers produce, and potentially “artificially select” for, integrated crop-microbe consortia, which are then distributed across the field. It is possible that crop domestication occurred in the setting of coevolving microbial consortia, which may account for the agricultural success of insect farmers that has been documented for 50 million years.

1. INTRODUCTION

In the animal world, the cultivation of crops for food has occurred just a few times in the history of the species. The fungus-growing ants, the fungus-growing termites, the ambrosia beetles, and, of course, humans are among the most well-known and clear instances of this phenomenon. Agriculture has become increasingly important for humans, who began the transition from an

ancestral hunter-gatherer existence to farming only about 10,000 years ago. In a global economy with projected food shortages, sustainable, high-yield agriculture has become critical for survival, and numerous research programmes are currently dedicated to the optimization of agricultural productivity in the context of growing environmental challenges. People have made significant advances in agriculture via a mix of intelligence, innovative planning, and a healthy dose of chance and good fortune, among other factors. Although nonhuman agricultural systems, such as fungus-growing insects, have been studied in the past, humans have not looked at them for potential insights for improving agricultural methods[1].

This lack of applied interest in insect agriculture is most likely due to a widespread assumption that human agricultural systems operate in a fundamentally different way than insect agricultural systems, which is unfounded. Humans, on the other hand, have gained a great deal of practical knowledge by studying the adaptive characteristics of other species closely, and similar issues such as crop diseases afflict all farmers, regardless of their phylogenetic positions or the crops they grow. It may be fruitful to examine the short- and long-term solutions that have evolved convergent in insect agriculture for possible application to human agriculture due to the universality of crop diseases in both human and insect agriculture due to the universality of crop diseases in both human and insect agriculture. The purpose of this review is to provide such a synthesis[2].

1.1 Behavioral and Nutritional Characteristics:

Agricultural practices such as insect fungi-culture and human farming have many similarities, including (a) the routine planting of sessile cultivars in specific habitats or on specific substrates, including the seeding of new gardens with crop propagules that are selected by farmers from mature gardens and transferred to novel gardens; (b) cultivation aimed at improving the growth conditions for the crop, or (c) cultivation aimed at improving the yield of the crop. The insect farmers' obligate reliance on their cultivated crops may be easily shown via the experimental removal of their cultivated crops, which results in decreased reproductive output, higher mortality, or even the definite death of the cultivar-deprived insect (see Figure 1). Planting and harvesting are not required to be done with deliberate purpose according to our concept of agriculture. It is undeniably true that conscious planning, learning, and teaching have hastened the evolution of sophisticated agriculture in humans, but it seems unlikely that this has occurred in insects[3].

We have limited our review to fungi-culturists who specialize on ants, termites, and beetles. Aspects of hemipteran insect husbandry that are similar to human animal husbandry, such as the caring by ants of hemipteran insects, are not included in this study. Also excluded from consideration are cases that do not meet all four of the requirements of agriculture as defined above, such as the ant *Lasius fuliginosus*, which promotes fungal growth in the walls of its nest, because the fungus is apparently not grown for food, but rather for the purpose of strengthening the walls or providing antibiotic protection to the walls. On the same reasons, we rule out a number of potential instances of early agricultural development[4].

The snails of the genus *Littoria*, for example, may "proto-farm" fungus by producing plant wounds that get infected with fungal growth that is a component of their food supply, but they do not actively inoculate the plant wounds or otherwise cultivate the fungi. Invertebrates in particular are likely to have many more such proto-farming species yet to be discovered, and all

known insect agriculturists are likely to have descended from proto-agricultural predecessors who were similar in many ways. The comparison of these proto-farming insects to “primitive” human agriculture is outside the scope of this study.

1.2 Understanding Agriculture:

We will examine agriculture as a form of strong co-evolutionary interaction, as described by the nutritional and behavioral requirements listed above, in which natural selection operates on both farmers and crops as interdependent lineages that are mutually reinforcing each other's development. When it comes to agriculture, our co-evolutionary approach takes into account not only the interactions between a specific farming insect and a single cultivated crop, but also the interactions between the insect garden insect and other pathogenic and mutualistic microbes that have recently been discovered in insect gardens. Some of these microorganisms, like the cultivars, are also controlled by the insect farmers for particular reasons, just as they are with the cultivars. A more accurate description would be that an insect garden is not a pure monoculture, but rather an ecological community that has been sequestered and designed to include various interacting microorganisms, some of which are helpful to the farmers and others that are harmful. The nature of insect-microbe interactions in gardens, the evolutionary origins of these interactions, and the convergence and divergence of evolutionary trajectories that culminated in the extant insect agricultural systems will all need to be investigated in order to gain a comprehensive understanding of the principles of insect agriculture[5].

1.3 Introduction to The Insect-Agriculture Systems:

Ants, termites, and beetles are the only three insect families that have been studied for their ability to develop behaviorally sophisticated systems of insect agriculture.

1.3.1 Ant Fungi-culture:

The fungus-growing ants are a monophyletic group in the tribe Attini, consisting of about 220 known species and many more undiscovered species. Attine ants are found exclusively in the New World and are at their most diverse in the wet woods of tropical South America, where they are thought to have originated in their supposed evolutionary home. When it comes to food, ant larvae and adults are obligate agriculturists. Their produced fungus is the only source of nutrition for the larvae and a significant source of nutrition for the adults. Despite the fact that adults may augment their meals by consuming plant fluids, the grown fungus are nutritionally adequate to sustain the ants even in the absence of extra nutrients from other sources such as plants. When daughter queens carry tiny pellets of natal-nest mycelium inside their infrabuccal pockets, which are pouches found in the mouthparts of all ants, garden fungus are transferred vertically through generations. Worker castes of the evolved leafcutter ants consist of a diverse group of workers with differing sizes and physical characteristics, each of which is trained to perform a specific job[6].

A number of distinct ant lineages grow their fungus on a variety of diverse surfaces. While the leafcutting genera *Atta* and *Acromyrmex* mainly utilize freshly cut leaves and flowers as their primary gardening substrate, the ancestral gardening substrate used by the so-called lower attines includes flower parts, arthropod frass, seeds, wood pieces, and other similar plant detritus. Although each attine system has its own set of symbionts, all attine systems include at least four of them: (a) fungus-growing ants; (b) their fungal cultivars; (c) mutualistic antibiotic-producing

actinomycete bacteria; and (d) garden parasites from the ascomycete fungal genus *Escovopsis*. Additional bacteria and yeasts may be found in attine gardens, and they may work as mutualists, for example, by secreting digesting enzymes or antibiotics to benefit one another.

1.3.2 *Fungal Farming:*

Of the more than 2600 species of termite known, approximately 330 species of the Macrotermitinae subfamily grow for food a specific fungus of the genus *Termitomyces*. Nests are usually established by the future queen and a single reproductive pair. They firmly lock themselves in a hard clay cell where they bring the first sterile workers' brood. In most termite species, a new colony has a fungal strain from windy sexual activity *Termitomyces* spores soon after nest establishment and starts building the first gardens. These spores originate from fruiting organisms (mushrooms) originating from mature termite colonies. The production of the fungus seems to have been approximately timed with the period in which the first foraging workers emerge from a new nest a few months after the nesting phase. Termite gardens are developed on dead plants, which are only degraded partly, such as leaf litters, dead grass, dead woods, or dry leaves[7].

Termite Gardens are constructed of spore-containing faecal pellets in rooms constructed within the mound or distributed in the ground by the termites. Faecal pellets are continually added to the top of the comb and fungal mycelium quickly penetrates the new substratum. After many weeks, the fungus begins to form vegetative nodules, which the termites eat. These nodules are a rich nitrogen, sugar and enzyme source. The nodules are also coated with indigestible asexual spores (conidies), such that their consumption is used to inoculate the faeces with spores that pass through the intestine undamaged and are subsequently placed in new comb with the deposition of faecal material. Mature pebbles are also used, although nutritionally lower than nodules.

1.3.3 *Beetle Fungal Farming:*

About 3400 of the 7500 species in the weevil subfamily Scolytinae make up Ambrosia beetles. Although certain types are especially specialized in colonizing piths, big seeds, fruit and leaf petioles, most ambrose beetles build tunnel networks in tissue of the plants. The word ambrosia refers to fungus grown by beetles on gallery walls, where they eat as a sole or almost exclusive source of sustenance. The beetles rely on the fungus from which vital vitamins, amino acids and sterols are obtained.

In Xyleborini, a huge monophyletic tribe of about 1300 species, the most sophisticated fungicians are among the ambrosia beetles. We concentrate mainly on this group of ambrosian beetles in our review. While the lives of the Xyleborini vary widely, most have a number of fungal features. In the Xyleborini, there is a gendered division of labor; only women do horticultural chores, while men are short-lived and flightless. After mating, women scatter to the new host substratum and carry the fungus in specific pockets called mycangia. Once inside a new hostel, founders lay eggs and tender the resultant garden and brood on the walls of the dug tunnels. They are able to regulate the development of the fungal crop and, in some cases, the composition of its various fungal species, in ways not completely understood. If the woman dies, the garden is soon overtaken by polluting fungus and bacteria, leading to the death of the brood[8].

The ambrosian xyleborin beetle gardens are not, as previously thought, pure monocultures, but are usually made up of a mixture of mycelial fungi, yeasts and bacteria. These combinations were called multi-species complex academics, who proposed that the beetles can utilize weak substrate such as wood rather than any particular microorganism, as a whole. However, majority of the studies that followed showed that one "principal" fungus always prevails in kite gardens. Moreover, beetles usually only contain the main *Mycangium* fungus, and the cultivation effort of the female beetles tends to prefer the primary fungus that gives the most nutritional advantage. Some auxiliary fungus also assists the growth of beetles, although their survival alone is frequently severely decreased. The main fungus as the intended crop is affected by these findings while secondary fungi, yes and bacteria are contaminated by "weeds" or may be furthermore used in the gardens, alongside the predicted function of auxiliary bacteria and Yeasts in attine gardens.

1.4 Insect Agriculture Evolutionary Origins:

Phylogenetic analyses show nine distinct insect farming origins. In Amezzo, fungal production occurred just once, presumably in the rainforest of the Amazon. In termites' fungal production also had a single genesis, in the African rainforest about Mya. In ambrosian beets, however, farming occurred seven times independently from Mya, six times in different nonxyleborin lines, and once in the Xyle-Borini ancestor around Mya. While macrotermitin and xyleborin common ancestors each domesticated a single, unique major cultivar clade to which their offspring have adhered throughout all subsequent development, attine ants have connections with numerous, independently domesticated crop lines. Interestingly, there are no documented instances of reversals in the nine agricultural insect lines from agricultural to non-agriculture, which suggests that the shift to fungal production is a dramatic, potentially permanent transformation that is very restrictive to future development.

For the autonomous development of insect agriculture, two major models have been proposed, the 'consumption first' vs the 'transmission first' models. In the first model of consumption, an insect lines start incorporating fungus into their more generalist diet, then become specialized fungi, and ultimately develop adaptations to grow fungi. In the first type of transmission, the insect lines begin to associate with a fungus as a carrier for the fungus and then nourishment is derived from it and then ultimately becomes a fungal cultivator. A third option is the development of an insect pulsation association, because the insects initially utilize fungus as a source of antibiotic substances, such as *Reticulitermes speratus*, which derives antibiotic protection against mixed-egg piles of fungal sclerotics. Finally, insect-associated fungi may undergo even more complex evolutionary processes from the exploitation of a pre-existing insect-pilon connection by one insect lineage in a common nest habitat. When these fungi adapted to insects are encountered. The evolutionary connections between beetle and ant fungi, however, are not supported in the latter theory and inconsistent with the estimated times of genesis of such insect fungal partnerships.

It is unknown for attine ants whether agriculture originated from a condition of ancestral fungal, antibiotic acquisition or fungal vectoring. The termite agriculture most probably came from the first consumption path, since many non-farming termed species seek and feed on fungal-infested wood, which indicates that non-farming predecessors of the farming termites may also have feed on fungi. Even before the formation of fungi, the non-agricultural ancestors of fungal beetles seem to have linked them, since many of their more primitive nongardening scolytines are fungal

vectors without any apparent reliance on their fungal companions. This indicates that the fungi are not nutritionally dependent on the roots of fungal production in the different lines of the ambrosia beetle. However, a lot of non-ambrosian scolytines carry in mycangias fungus and feed on ungardened mycelium like larvae which colonize host plants and feed as new adults on spore layers which line the pupal panes. Some of the seven agricultural origins in beetles therefore seem to have been following the first path of transmission, while others followed the first route of consumption[9].

Insect farming is confined to growing of fungus instead of plants, predominant in human farming. While it is true that certain insects are specialized in host plants which they defend from other herbivores, none of them have all four agricultural components mentioned above. One may question whether circumstances led insects to develop fungal instead of plant farming. Indeed, fungal agriculture has many benefits over plant farming, and plant features may even prohibit simple cultivation. Firstly, unlike fungus, plants usually have strict light and space needs, excluding them in underground or otherwise confined nests of insects from cultivation. Such nesting behaviors may promote fungal growth via the protection of food crops from undesirable consumers and wind-dispersed pathogens. In addition, fungus may be kept continuously in a non-sexual mycelial form, which provides a more constant food supply, as opposed to plants, which typically need frequent pollination for long-term culture. Thus, although seeds and plants may be collected easily, fungi are probably more cultivable, which explains the prevalence of fungal rather than plant agriculture among insects.

Ant, termite, and the vast majority of beetle agriculturists are gregarious creatures. Each and every one of the ants and termites is eusocial, as shown by the distribution of reproductive labor among workers, cooperative brood care, and generational overlap. In the known ambrosia beetle world, only one species is considered eusocial; the others are sub-social, in which a single female is responsible for her brood, or communal, in which multiple fertile females work together to care for their broods and garden. Sociality may have aided in the development of agriculture because of the natural benefit that agriculture has in the division of labor, which allows for the partitioning of agricultural duties and the enhancement of agricultural efficiency, which is advantageous to agriculture[10].

Farmers of ants and termites, for example, divide their agricultural tasks into a series of conveyor-belt-like stages that are divided among different worker castes, each of which is specialized in a single main task: foraging; processing and cleaning substrate before incorporation into the garden; planting mycelium onto new substrate; monitoring and weeding of the garden; or disposal of diseased or senescent garden. Because of the logistical challenges associated with researching beetle behaviour in their hidden tunnels, task partitioning has not been studied in ambrosia beetles too far. Task partitioning is expected to improve efficiency in a variety of situations, including protection against nest and garden thieves, disease monitoring in gardens, and modifying optimum growing conditions for crops.

2. DISCUSSION

The development of clonal monocultures over an extended period of time is perhaps the most remarkable characteristic of insect agriculture. Monoculture increases agricultural efficiency through economies of scale, and clonality preserves the desirable properties of the crop by preventing sexual recombination. However, these advantages come at a cost of two things: one is

the loss of genetic diversity, and the other is the loss of genetic diversity. Due to reduced genetic diversity in the crop, there is an increased susceptibility to the rapid spread of disease mutations, as well as a decreased resistance to fast-evolving diseases as a result of this increased vulnerability. Human and insect farmers are also subject to these economic trade-offs.

Instead of a single, “magic bullet” strategy, the insect farmers' solution to the monoculture-disease problem appears to be a combination of several strategies, including (a) crop sequestration, (b) intensive monitoring of crops for diseases, (c) access to a population-level reservoir of crop genetic variability, and (d) management of disease-suppressive fungi. Large-scale crop sequestration is the least practical of these techniques in human agriculture because human foods need exposure to sunlight and because greenhouse farming is prohibitively expensive in comparison to other methods. It is possible for some crops (for example, in greenhouse environments) to conduct intensive (e.g., daily) disease monitoring of every single crop plant; however, hourly monitoring of the kind carried out in insect agriculture appears to be prohibitively expensive for human agriculture as a whole, according to the authors.

Designing human agricultural systems that more effectively take use of microbial consortia that are known to have positive roles in crop nutrient absorption and disease resistance is a new strategy that is now being pursued. Microbes in the rhizosphere have long been recognized as important partners in the production of some crops and trees. Recent research has shown the existence of disease-suppressant bacteria that reside on the root exudates of crops and generate antibiotics that defend the crop against infections. Microorganisms from the phyllosphere and endophytic microbes have both been shown to have disease-suppressive effects on agricultural plants in studies. Research on rhizosphere, phyllosphere, and endophyte microorganisms of human crops is a relatively young area, and there are still many helpful microbes to be found and put to use in the agricultural sector in general.

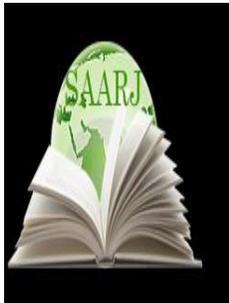

3. CONCLUSION

Perhaps it is through methods like these that humans can gain the greatest insight from insect farmers, especially if disease-suppressant microorganisms are ever to be introduced into human agriculture. When developing these strategies, agriculturists should keep in mind that current human crops were not necessarily selected for their abilities to interact with auxiliary microbes during the domestication process, i.e., the alleles in the wild ancestors that were optimally mediating such interactions may have been lost during the domestication process. It is possible that studying the microbial consortia associated with the wild populations from which the ancestors of human-domesticated crops were initially originated would be necessary to conduct a thorough assessment of the potential applications of auxiliary microorganisms in agriculture. This kind of domestication within the context of coevolving microbial consortia may very well be the main factor explaining the insect farmers' 50-million-year-old agricultural success.

LEXOCO-SEMANTIC CHARACTERISTICS OF THE ADJECTIVE IN ITALIAN

Gulyamova Malika Yakubovna*

*Teacher of "Spanish and Italian Languages",
 Department of Samarkand State Institute of Foreign Languages,
 UZBEKISTAN

ABSTRACT

The structural and semantic criterion of differentiation of qualitative and relative adjectives in Italian is considered. It is argued that relative adjectives are derived from other words, which they are motivated by, whereas qualitative adjectives are primitive in the form of expression and polysemous in the language system.

KEYWORDS: *Semantic Criterion, Subject Attribute, Native Adjective, Modal Features, Motivation, Semantic Derivation.*

INTRODUCTION

An adjective is a linguistic category that serves to characterize objects and phenomena of reality and is associated with the anthropocentric paradigm in linguistics. An adjective, characterizing a noun, is "attached" to it and in some languages acquires its grammatical features, for example, gender and number in Russian, German and Romance languages. In other languages, for example, English, the adjective remains free from this agreement with the noun. At the same time, in both cases, the adjective, unlike the noun, does not have its own denotation. By characterizing a thing, an adjective informatively enriches a noun with its semantic or evaluative feature defined by the subject in relation to the object, subject, his actions or their description.

Based on the semantic criterion in Italian, different lexical and semantic groups of adjectives can be distinguished: adjectives of the form (rotondo - round, quadrato - square), colors (rosso - red, pego - black), parametric adjectives (basso - low, alto - high). A significant group is represented by evaluative adjectives (buono - good, malo - bad, intelligente - smart, stupido - stupid), they also include adjectives denoting the physical and mental properties of people or animals (vigiloso - strong, debole - weak, malato - painful, nervoso - nervous).

In this study, we will focus on two groups of adjectives: qualitative and relative, which have an evaluative character and assume an anthropocentric approach to the study of this lexical and grammatical category.

Qualitative adjectives denote the signs of objects and events inherent in the things themselves, including the properties of objects perceived by the senses: color, space, physical properties. And in this regard, qualitative adjectives are considered primitive in the form of expression, primary and at the same time complex in their content, since they are initially characterized by ambiguity. That is why the denotative component of the meaning of qualitative adjectives is leveled, tends to zero. For example, any object and any phenomenon can be beautiful: a person, a flower, a sunrise, a river, a forest. In other words, qualitative adjectives, characterizing the internal properties of objects, can also be comprehended in abstraction from the objects themselves. At the same time, in addition to the cognitive and semantic component of a qualitative adjective expressing the main feature of beauty, there is also its subjective assessment.

Qualitative adjectives are extremely diverse in semantic features. As we have already noted earlier, the denotative block of information of a polysemous word is associated with a typical image, and, consequently, its semantic space, growing out of the basic archetypal or prototypical meaning, is able to acquire a number of other meanings [2]. Such semantic features of the main meanings of the adjectives we study include adjectives with the meaning of a sign of shape, size, property, color, taste, smell, etc.

For example, the adjective *diritto* (direct) indicates the primary sign of the form.

In Italian, the adjective *diritto* has the following meanings: 1) straight in the form of a line (*via diritta* - a straight path); 2) straight, honest, fair (*rigare/filaredritto* - behave flawlessly); 3) right; 4) dexterous, resourceful; 5) literal (about the meaning of the word).

In Russian, the adjective *direct* has no meaning: 1) прямой по линии; 2) без сутулости, 3) имеющий поступательное направление; 4) осуществляемый без промежуточных этапов; 5) буквальный (о значении слова); 6) правдивый, откровенный, нелицемерный; 7) подлинный, настоящий, неподдельный.

Let's compare the meaningful volume of adjectives with the denotative value of the *stretto* (narrow) size.

In Italian: 1) narrow, tight (*scarpestrette* - narrow shoes), 2) compressed (*pug-nistretti* - clenched fists), 3) strict, precise (*strettaregola* - strict rule), 4) urgent, urgent (*lo stretto necessario* - the most necessary), 5) close (*parentestretto* - close relative), 6) phonetic term *vocale stretta* "closed vowel".

In Russian: 1) небольшой по ширине; 2) тесный (об одежде, обуви и т. п.); 3) ограниченный; 4) лишенный широты взглядов, кругозора; 5) лингвистический термин узкий гласный звук.

Consider adjectives with a denotative property value using the example of *fragile*.

In Italian: 1) fragile, brittle (*merce fragile* - fragile goods), 2) weak, fragile (*salute fragile* - poor health), 3) weak, malleable (*la fragile natura umana* - weak human nature), 4) short-lived (*una fragile speranza* - weak hope).

In Russian: 1) ломкий; 2) недолговечный. 3) требующий бережного обращения; 4) нежный, изящный; 5) болезненный, слабый.

Unlike qualitative adjectives, relative adjectives express qualities and properties by indicating a relation to another subject.

Recall the semantic characteristic of a relative adjective given by E.M. Wolf: "the relation established between an object (or feature) and another object whose feature is indicated by an adjective" [3. p. 397]. A similar definition is found in the Italian linguist Marcello Marinucci: "Gliaggettivi di relazione non designano qualità, bensì esprimono la relazione che intercorre tra il nome a cui si riferiscono e il nome da cui derivano: popolo italiano, cucina francese, unione europea" (Relative adjectives do not mean qualities, but rather express the relationship that is introduced between the name, to which they belong and the name from which they are produced: Italian people, French cuisine, the European Union, etc.) [5. p. 111].

Indeed, the distinguishing feature between the meanings of qualitative and relative adjectives is the introduction of the following predicates for the definition of relative adjectives: "consisting of" or "made of", "similar to" or "related to", etc. Yu. D. Apresyan described in sufficient detail such types of relative adjectives in models of regular polysemy: 1) being X (military operations), 2) containing X (gold sand), 3) made of X (gold ring), 4) causing X (gold mine)..., 7) intended for X (military operation) [1. pp. 509-523].

M. Marinucci also gives a detailed description of relative adjectives, considering the types of relations between a noun and an adjective derived from it. This is a relation with the meaning of the territory: *zona periferica* (peripheral zone), *via centrale* (central street); the relationship between object and matter: *statua marmorea* (marble statue), *scultura lignea* (wooden sculpture)-, the relationship between the disease and the diseased organ *enfisema polmonare* (emphysema of the lungs or pulmonary)-, the relationship between the action and the organ that is subjected to it: *trapianto cardiaco* (heart transplant)-, the relationship between the individual and the institution: *studente liceale, universitario* (student of the lyceum, university) [5. p. 111].

As we can see, relative adjectives characterize objects and phenomena through a network of relationships and connections with objects of the real world. That is why relative adjectives are based on their motivation by other units of the language, that is why they are semantically, morphologically and syntactically derived, that is why they can be structurally and/or semantically segmented.

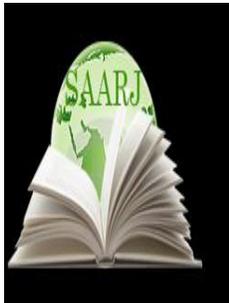

Thus, the differentiation of qualitative and relative adjectives is based on a certain difference in the semantic essence of each of the categories. Qualitative adjectives are most often native adjectives, characterizing, and relative adjectives are derived and specifying in content. And this is typical of both Russian and Italian adjectives.

In conclusion, we note that the semantic boundary between qualitative and relative adjectives is not always clearly expressed, because both tend to acquire each other's meanings. So, qualitative adjectives develop relative signs of meaning, for example, a deaf consonant, thumb, high fashion. And, accordingly, relative adjectives are able to acquire qualitative signs of meaning: a heart of stone, nerves of steel, a disservice. The similarity in meaning of qualitative and relative adjectives is explained by the fact that behind this class of words there is a single, fundamentally

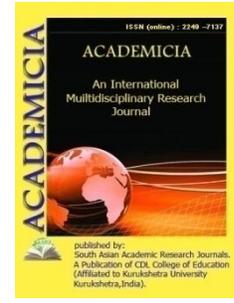

indivisible concept of "quality", various conceptual features of which are reflected in the semantics of both qualitative and relative adjectives.

PROFESSIONAL SOCIALIZATION OF YOUTH AS A PEDAGOGICAL PROBLEM

Begmatova Dilnoza Mukhtarovna*

*Associate Professor,
 Doctor of Philosophy (PhD) in Pedagogical Sciences,
 Samarkand State Institute of Foreign Languages,
 UZBEKISTAN

ABSTRACT

The article discusses the problem of developing the foundations of the system of professional socialization of young people, presents the stages of professional-role socialization, and indicates the pedagogical and organizational actions of educational, scientific and industrial institutions aimed at solving the problems of continuous professional socialization of the individual.

KEYWORDS: *socialization, professional socialization, professional orientation, professional choice, consolidation of professional choice.*

INTRODUCTION

Currently, our country is developing in the context of the process of globalization, the essence of which researchers in this field define as the transformation of the world into a single whole, a complex of cross-border interactions between individuals, enterprises, institutions and markets, which manifests itself in the expansion of flows of goods, technologies and financial resources. , In the steady growth and strengthening of the influence of international institutions, in a significant expansion of the scale of communication and information exchanges.

The globalization process is accompanied by a number of negative trends:

- The loss of the identity of states;
- The political and economic influence of transnational corporations dictating their will to entire states and peoples;
- The toughening of the division of countries into leading and led in economic, political and cultural relations.

Educators should be aware of this and consider the negative impact that the process of globalization can have on the formation of students in the process of their socialization:

- Loss of identity of the individual, sense of citizenship and patriotism towards their homeland;
- The introduction of negative trends in the culture of relationships: aggressiveness and violence as a means of defending their interests;
- The cult of profit and enrichment in any way, etc.

Analysis of the new socio-economic conditions indicates the need to return the issues of upbringing and socialization of the younger generation to the circle of state priorities at all levels of education. However, in the absence of a national idea, amorphousness of goals, abstractness of value orientations, ideological vacuum in the context of the transformation of Uzbek society, destabilization of the economy and falling living standards of most of the population, the development of a new paradigm for educating young people is very problematic.

In these conditions, the way out consists in concentrating the attention of pedagogical science and practice on the social and professional formation and development of the younger generation, on the connection between the formation of socially significant personal qualities of young people with their professional training.

This idea was clearly reflected in the Concept of Modernization of Uzbek Education, which defines the strategic goals of vocational training of young people as follows: "The main goal of vocational education - preparation of a qualified employee of the appropriate level and profile, competitive in the labor market, competent, responsible, fluent in his profession and oriented in related fields of activity, capable of effective work in the specialty at the level of world standards, ready for continuous professional growth, social and professional mobility; satisfaction of the needs of the individual in obtaining appropriate education. Solving the problem of radically improving the system of vocational education, the quality of training of employees in close connection with the development of fundamental and applied science is of decisive importance for the future of the country" [1].

The achievement of this goal is closely connected with the creation of conditions for the socialization and professional and personal formation of students, consisting in the development of personality in the process of obtaining general education and ensuring its readiness for competent professional activity. At the same time, a very important psychological and pedagogical aspect is the optimal ratio of personal, social and professional development of future specialists.

In this regard, there is a problem of developing the basics of the system of professional socialization of young people.

A.V. Mudrik reveals the essence of socialization as follows: "Socialization is the development of a person throughout his life in interaction with the environment in the process of assimilation of social norms and cultural values, as well as self-development and self-realization in the society to which he belongs" [4, 15].

Socialization, formation and development of personality includes three interrelated processes: general socialization, professional role socialization (mastery of professional role functions,

norms, relationships), professionalization (a certain degree of mastery of professional activity, specialty, professional skill).

Some researchers attribute general socialization to the primary socialization that an individual undergoes in childhood and as a result becomes a member of society. Secondary socialization consists in the fact that an already socialized individual is included in new sectors of the objective world, in this regard, secondary socialization acts as "the acquisition of specific role-based knowledge when roles are directly or indirectly related to the division of labor" [4].

In this regard, in solving the question of a person's own place in society, the value attitude of young people to choosing and obtaining a profession is extremely important. For a person can determine and assert his place and role in the transformation of society only through his work related to a particular specialty. Professionalism is a stage of socialization, which is a continuation of professional role-based socialization. It is the result of mastering a certain skill and professionalism in practical activities. For a particular person, a profession is a socially fixed area of his possible labor actions, a source of existence and a means of personal self-realization.

Professional role-playing socialization is a time-stretched process that consists of the following stages:

- Vocational guidance on a wide range of employment of people and their professions;
- Formation of professional intentions;
- Choice of profession;
- Consolidation of professional choice;
- Active and conscious mastery of the profession;
- Productive creative labor activity in the acquired profession;
- Striving to expand their professional range through additional education;
- Setting to achieve a high level of professional excellence;
- Striving for promotion;
- Readiness to master a related profession;
- Active development of a new profession;
- Adaptation to a new profession in the event of a forced change of the previous one;
- Transfer of professional experience to colleagues and youth.

In the context of determining approaches to solving the problem formulated above, a number of difficulties that stand in its way should be noted. First of all, it should be noted that each of the above stages of professional socialization is a rather complex system, consisting of interrelated components, united by a common goal. For example, career guidance includes the following components:

- Professional education;
- Professional motivation, development of interests, inclinations of students for various types of activities;
- Professional advice;
- Professional diagnostics;
- Professional selection;
- Professional adaptation;
- Professional education, etc.

Another equally difficult factor standing in the way of developing a system of continuous professional socialization of the younger generation is that, for objective reasons, their implementation is called upon to be carried out not only by representatives of various levels of education (preschool, primary, secondary and higher), but also by various agents of socialization (parents, employees of various institutions, representatives of the media, etc.).

Among the factors complicating the solution of the problem, it should also be noted that the development of the theoretical foundations of the design and technology of the implementation of the above stages of the system of professional socialization of youth is conducted by teachers of various levels of education, representatives of different sciences (philosophy, sociology, cultural studies, psychology, didactics, economics, etc.) without sufficient mutual coordination.

The way out of the indicated and other difficulties in solving the problem, obviously, should be sought in a number of directions. First of all, on the basis of the achievements of the above and other sciences, it is necessary to determine the polytheoretical prerequisites and conceptual provisions, to design on their basis a system of professional socialization of young people. For experimental testing of the effectiveness of such a system, organize educational, scientific and production complexes, which include educational, scientific and industrial institutions of the microdistrict on the rights of autonomy, coordination and observance of the principle of unity and continuity of pedagogical and organizational actions. To carry out a coordinated implementation of the designed system and introduce its positive results into the practice of the region.

To begin the coordination of pedagogical actions, we will give a brief description of the directions before the labor professional socialization of young people, including the period of a person's life before the start of independent work in the profession. We hope that this characteristic will be the basis for coordinated actions of families, educators, enterprises and members of the public on the professional specialization of the younger generation.

Thus, the task of professional socialization of preschoolers consists in the labor education of children and familiarizing them with a wide variety of people's work activities related to the performance of physical work, the management of mechanisms and other actions understandable to them. During this period, children watch with interest the work of drivers of all types of transport, utility workers: electricians, plumbers, locksmiths, janitors, landscaping service workers, carpenters, painters, plasterers, etc. They are also interested in their parents' home classes. It is very important during this period to attract children to participate as much as

possible in the work of adults, the development of self-service skills. Professional socialization should also consist in organizing walks by parents or kindergarten teachers to a house under construction, a trolleybus depot, a river station, etc.

The main task of the primary school level in professional socialization is to instill in students' certain skills, a love of systematic academic work, reading books, and continuing their acquaintance with a wider range of professions. This is largely helped now by books. Schoolchildren are more widely acquainted with the work of people of intellectual labor. Now they observe the work of a teacher, have an idea of the work of a doctor, are interested in the content of the specialty of parents. During this period, parents need to take their children to their workplace, familiarize them with the work they are doing, with the content of the work of their colleagues. The professional and social work of the class teacher with students should be carried out in the form of small excursions to objects where you can introduce them to a wide variety of working and agricultural professions. It is useful to conduct during this period an excursion to the post office, telegraph office, printing house, machine repair shop, bakery, farm, working tractor, combine harvester, fruit and vegetable farming. Labor education in the family and school during this period should develop along the line of further improvement of self-service skills, participation in work at the school experimental site, in the garden, vegetable garden, in the collection of secondary raw materials, etc.

In grades 5-7 of the school, it is necessary to expand extensive work on professional socialization, related to familiarizing schoolchildren with all the variety of professions in service types of work (salesman, cook, tailor, waiter), workers of mass professions in industrial and agricultural enterprises: locksmith, turner, welder, electrician, builder, installer, field breeder, gardener, animal breeder, machine operator, engineer and technician. This work should be carried out by organizing excursions to various local enterprises: factories, construction sites, nearby cooperative enterprises, by inviting people to work lessons, in the process of holding meetings with specialists of various professions, entrepreneurs.

It should be borne in mind that the choice of profession at this time is significantly influenced by the nature of the work of parents, their attitude to their official duties, the degree of dedication of children to the content of their work.

In adolescence (grades 8-9), it is necessary to help students determine their future professional activity in a fairly specific direction based on the individual characteristics and abilities of students. After all, by the end of the ninth grade, a student must decide on the form of further education: whether to continue his education in secondary school, whether to enroll in a technical school or college, whether to go to work and continue studying in evening school. Since the question of choosing a profession at this time is moving from a theoretical to a practical plan, it is very important to organize pre-professional training in these two years so that students do not have mistaken in choosing their future life path. But just by this time, when students get acquainted with a wide range of specialties, they are experiencing significant difficulties in finally choosing their path, since they are already familiar with cases of young people's disappointment in choosing a profession.

During the period of study in grades 10-11, it is necessary to help high school students determine their final professional choice based on their individual abilities.

The teacher knows the abilities of his students better, and it is easier for him to help them develop and improve these abilities. To help one student choose the direction of specialized training, enroll in a radio engineering circle, instruct another to write an essay on a topic closely related to the specialty, a third to choose a book corresponding to his inclinations, etc. Of extremely great importance in determining the vocation, the touchstones of a well-chosen direction of study are school electives. It would be advisable to organize in schools not only electives in theoretical disciplines, but also to introduce technical and technological electives in working professions and specialties of service work. University collectives are called upon to provide great assistance to schools at this time. In the experience of the Samarkand region universities, such active forms of professional socialization of high school students as the organization of schools for young mathematicians, chemists, physicists, technicians, philologists, journalists, actors have justified themselves.

Open days at universities in individual profile departments and specialties have become very popular. Along with this, teachers and university students conduct conversations about specialties at school evenings, classroom meetings.

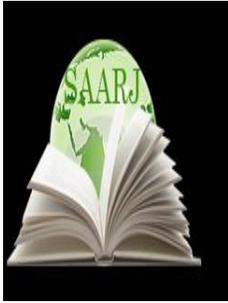

A particularly effective role in the professional socialization of high school students is played by traditional evenings of meeting school graduates with their pets. Many universities send special student propaganda teams to rural areas during the summer holidays to conduct vocational orientation and social work among rural youth. A lot of work in this direction is carried out during the summer holidays by fighters of student construction teams. With their work in construction, they show young people examples of a creative attitude to work.

The efforts of pedagogical collectives of professional educational institutions should be aimed at ensuring the professional stability of students, at actively mastering the profession they receive, at ensuring the creative return of young specialists from the first days of their independent production activity.

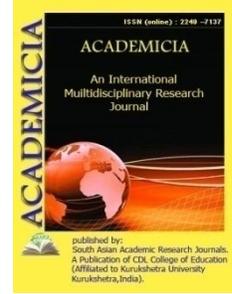

For further professional socialization, the collectives of industrial institutions are called upon to create conditions for the creative self-development of young professionals, to support them in achieving professional skills and subsequent professionalization.

ABSTRACT

Modern farming enables the easy migration of insect pests and illnesses from plant to plant, devastating cropping regions. According to the resistance and the theory of the adversary, increasing diversity of plants lowers quantity of plagues and damage. The growing diversity of plant species may improve the management of insects through bottom-up and top-down mechanisms, based on considerable study. Despite this support, logistical and financial constraints have precluded broad adoption of pesticide management and techniques for diversification of output. Intraspecific genetic diversity has been shown in both fundamental and practical research to enhance ecosystem stability and function. Planting cultivar mixtures may be a more viable way of enhancing genotypical variety of plants. Our aim is to combine data supporting intraspecific variation in order to achieve a viable pest management strategy for field insect pests. We have found important evidence that genotypical variety improved the fitness and productivity of plants in both wild and agricultural settings. Intra-specific variation may, according to many lines of research, assist to improve insect pest control. Empirical data or practical techniques of application in agricultural systems are seldom found. Limited usage of this method, therefore. Intraspecific varieties of plants enhance plant performance by decreasing pest population and promoting niche division. Further research is required to reduce the use of pesticides and increase production. Intraspecific crop diversity with low costs or changes to production may be introduced. Intraspecific diversity has been a popular and sustainable management approach because of the benefits of biodiversity for yield stability.

KEYWORDS: Agriculture, Cultivar, Genotypical, IPM, Pest Management.

1. INTRODUCTION

Many integrated pest management (IPM) academics and practitioners have aimed at developing sustainable management programmes that are more robust and less dependent on synthetic pesticides. Agricultural systems typically concentrate on sustainable insect pest management programmes utilizing crop types that are more tolerant to or resistant to pest attacks and methods to agriculture which enhance their natural enemies' efficacy in reducing pest populations. Various plant species combinations have been investigated, whether in agricultural fields or adjacent non-crop regions, in order to enhance both their impacts on bottom up and top down in crop fields. However, while there is potential to enhance the control of plagues, pest management techniques based on harnessing the diversity of plants, such as non-crop plants at field boundaries or intercrops within fields, are not commonly used by conventional farmers in developed countries because the mechanical production is costly, time consuming or logistically challenging. Given these constraints, an IPM strategy must be developed which increases the variety and the structural complexity of agro-ecosystems, but which does not demand exceptional changes in agricultural or monetary investment practices on the part of farmers[1].

An emerging corpus of natural system literature has shown that genotypic variety may play a significant part in the structure and fitness of arthropod populations. Fewer study has been done in agricultural environments to demonstrate, despite claims made to the contrary, the impact of intraspecific variation on pest control. However, many lines of research indicate that increasing genotypical variety in agricultural fields may significantly enhance the management of insect pests and crop outcomes in an economically and ecologically sustainable way. Our aim was to examine the literature on natural and agricultural systems within the framework of a conceptual framework which shows the many ways under which plant growth and output may improve on intraspecific or genotypical variation. We define 'genotypic diversity' as genetic variance across species variations and regard 'genetic diversity' as a population assessment of variation or associations within a variety. Although both words are interchangeable, we concentrate on the former[2].

1.1 Background:

In the United States and globally, the vast majority of agricultural fields are planted with single genetic variants. In the past, every plant in a field is almost genetically the same as its neighbor. These cultivars feature consistent agricultural characteristics, such as height, germination, period of development, seeds and protein content, so as to simplify agriculture logistics and optimize output. However, low genetic variability is a responsibility which leaves agricultural fields susceptible to insect invasion and breakdown. If all plants in a field are vulnerable to the same plague species, the plague populations expand quickly, once they enter a field. For example, when insect pests like the Mayetiola destructor hessian fly Say defeat resistant cultivars, agricultural fields may rapidly be devastated. In other instances, just one insect or disease may be resisted or resisted by the plants. The greatest crop production is thus obtained with frequent use of pesticide, which has detrimental impacts on non-target species and human and environmental health. To decrease the intensity of pests and insecticides, alternatives to single species/genotype planting are necessary[3].

As well as being less resistant to pest attacks, monotypic plant fields are particularly prone to spoilage due to a lack of natural enemies and biological control services. In general, monocrops

are less natural enemies than polycrops (or crops in non-crop plants), where the outbreaks of pests are rare. A shortage of overwintering sites implies that every year natural enemies have to invade agricultural fields to give pests a head start. In addition, agricultural areas are frequently poorly settled by natural enemies due to the absence of food from plants and prey, and other resources, such as suitable microclimates and oviposition. In addition, artificial selection for certain features has affected tritrophic interactions in some plant species, such that natural enemies cannot contribute to herbivorous control of agricultural variety as effectively as in the case of wild cousins. In conclusion, management activities such as the usage, cultivation and harvesting of pesticides further disrupt natural adverse populations in agricultural fields[4].

1.2 Associate Diversity:

A great deal of study has focused on the advantages of plant variety and its impact on insect diversity and herbivorous control. Our objective is not to examine this amount of research, but we will emphasize a few points on the advantages and difficulties of plant variety and the management of plagues. Firstly, species mixes or polycultures may adversely affect arthropod pests by limiting their capacity to search for preferred host plants, which means that they cannot simply migrate from host to host, delaying their propagation across agricultural areas. Second, increasing diversity in either cropland, adjacent crop areas or regional improvements through landscape scales can also enhance top-down control by providing floral resources, alternative prey and suitable microclimates to enhance enemy natural fitness, abundance, diversity and spring habitat. Third, despite the advantage of substantial pest control associated with some of the diversification methods, efficacy seems to be uneven and context-dependent. Fourthly, it should be noted that growing variety of plant species frequently involves significant logistical and/or economic difficulties. For example, producing more than one crop in one single field is not feasible with current agricultural equipment and diversification via non-crop areas may cut down on productive acreage. For example, with dubious economic advantages and considerable difficulties, farmers seldom adopt methods to enhance plant variety for better pest management[5].

1.3 Benefits of Genotypical Diversity:

A method to enhancing variety in agricultural systems that is more feasible and encouraged is to enhance genotypical diversity of plants within species. This strategy goes against large-scale monotypic crops dominating agriculture. But fundamental evolutionary theory implies that intra-specific variation is of tremendous importance. After all, genetic diversity is the foundation of natural selection and, without this selection, populations risk extinction since they cannot withstand the range of problems they encounter in their environment. In addition, it is evident that a lack of genetic diversity may lead to certain undesirable populations-level occurrences, such as inbreeding and bottlenecks. Maybe it is thus not unexpected that a growing corpus of empirical research in both animals and plants show the benefit of greater intraspecific variety.

For years, it has been known that intra-specific variety offers flexibility for populations in a number of situations to thrive. However, a recent collection of research has shown that genotypical diversity has an emerging impact on system productivity and resilience. Colonies formed by multiplying Queens of honeybees, for example, are much more productive than colonies produced by single-paired queens (more waggle dances, higher rates of drinking, foragers using further food sources). Similar autotrophic effects were observed. Genotypically

different mixes of the *Chlamydo-reinhardtii* Dangeard algae grew 10% higher than genetic monocultures of the same species in laboratory experiments. The pots planted with *Arabidopsis thaliana* (L.) genetic mixes were 17 percent more prolific than the monocultures under semi-natural circumstances. Boosted levels of intraspecific variation in field plots have also increased production of *Solidago altissima* L's above-ground biomass by 36%. In these instances of higher plant production, geno-typically diverse plants may use more of the available resources than monocults, possibly owing to the complementarity of varieties. Importantly, recent study has shown that genotype diversity's impact on primary output may be comparable to that of plant variety. The mechanism(s) underlying comparable effects of plant species and genotypic diversity are yet to be understood, although arthropods seem to be one of the contributing elements[6].

In addition, genotypically different groups are known to withstand diseases better. This is because a wider variety of genotypes in different populations will have decreased infections susceptibility. Diseases will therefore not spread so readily throughout the community. This enhanced disease resistance has been shown experimentally for a variety of species, including vertebrates (e.g. frogs), invertebrates (e.g. honeybees), and plants (e.g. willow).

A growing literature also shows that intrinsic variety in natural plant systems may have a significant impact on arthropod populations and herbivory, frequently spreading to plant production. Similar to the impacts of plant diversity, genotypical variety plays a significant role in structuring insect populations and generating many trophic level environmental interactions. In fact, some of the work has even led to conclusions that 'plant genotype can be one of the most important ecological factors in the formation of tritrophic groups' and that plant genotypic diverse influences arthropod communities, including natural enemy species, mostly in relation to soil microbes, fungi and the plants. For example, a genotypically diverse seedling of willow has suffered up to 50 percent less leaf beetles damage than willow monocultures as beetles are preferably grown in patches of more appropriate hosts (e.g. hypothesis for resource concentration) and have difficulty finding palatable willow varieties when grown in mixtures.

Likewise, two US-born plant species study has shown that genotypic plant variety may also lead to fewer herbivories, albeit via another method. In such instances, the increasing phenotypic variety linked to rising levels of genotypic diversity has improved the diversity of arthropods, particularly those of natural enemies that restrict herbivorous insect populations, leading to increased production of superficial biomass. Genotypic variation may significantly influence the quantity and conduct of the natural enemy. These effects are often caused by phenotypic variety which follows genotypic variation and may affect the number of natural enemies even in the case of identical herbivore populations. Examples of genotypic variety encourage huge populations of insect herbivores. Caterpillars that fed on *Arabidopsis* genotypically different plants produced a total biomass 19% higher than monoculture-grown caterpillars. Although it has not been clearly examined the mechanism driving high caterpillar biomass, a combination of food products with different nutritional quality may enhance caterpillar development rates. Similarly, several *S. altissima* plots enhanced the growth rate for the aphid population in comparison to monotypical plots. In this research, aphids migrated from highly populated, fewer resistant genotypes to less populated and more resistant genotypes where population growth may rise, thereby contributing to the findings among other processes of aphid migration between high and low-competitive hosts.

Research has shown that increasing genotypical variety in plant communities improves resilience to abiotic stress and stochastic events like higher temperatures or disturbances, along with bottom up and top down impacts on herbivorous abundance or plant health. Eelgrass biomass, for example, rose by as much as 30 percent in the face of severe temperatures, while planting variety expanded from one to six genotypes. This indicates that, in the face of abiotic stress, more genotypically varied populations may retain their production rather than monoculture. Genetically different populations may also rebound from perturbation more rapidly, such as vertebrate pasture, and even better withstand invasion. In this latter instance, weed biomass was 32 percent lower in *S. altissimago*-types, as a result of a combination of genotype diversity and identity effects, than in monotypical plots. This data indicates that genotypically varied populations may be more stable and robust to increasing stress, as anticipated under many global climate change scenarios[7].

The different data shows strongly that increasing genotypical variety in a broad range of systems may improve productivity and resilience. While there is still much to learn about the role of genotypical diversity in ecological interactions and ecosystem functions, the current evidence is particularly attractive for agriculture, as productivity, herbivorous resistance and resistance to abiotic stress are essential features of sustainable crop production. In addition, genotypical diversity may be introduced with very modest modifications in farming technique. If the theoretical and empirical findings continue to confirm the significant impact of genotypical variety on plant production, a simple new approach to agriculture may revolutionize planting and agricultural productivity methods.

1.4 Treatment of Diseases:

Monoculture has been created to optimize the potential for development of better genotypes and genetic uniformity (e.g. seedling, maturity) is related to harvesting and processing, but genetic uniformity is also disadvantaged by the uniform susceptibility to pests. Uniformity-related vulnerability may be reduced by increasing the number of cultivars in fields in order to enhance genotypical variation. The resultant 'cultivar mixes' are described as mixtures of genotypes "which differ for various characteristics, including illnesses, yet have adequate resilience to growing together." "Cultivar mixtures" Almost 50% of Europe's wheat fields and tens of thousands of hectares of China's rice are cultivar mixes. In the USA, 18% of soft winter wheat planted in the state of Washington in 2000 and 7% of Kansas planted in 2001 were cultivar mixes. Typically, these blends are random blends of five cultivars that are susceptible to significant illnesses and produce over 30 per cent better than monocultures when disease occurs while yield is maintained, or even slightly improved when the disease is absent. Most importantly, mixture-related logistics, in especially in tiny grains where cultivar mixes were most popular, did not impede output[8].

1.5 Other Advantages of Agroecosystem Genotypical Diversity:

In order to enhance output and other agronomic advantages, additional ecological mechanisms are being developed in genotypically diverse plants, as well as arthropod and disease control. Increased levels of genotypic variety may lead to increased floral abundance and greater diversity and quantity of floral visitors, which might lead to increased genotypical diversity. Similar to plant communities with abundant species, geno-typically diversified plants are abler to withstand invasions by other plant species. The types of wheat vary considerably in their fight

against weeds and mixing varieties with different competitive capabilities may substantially enhance weed removal and production[9].

Genetically varied fields tend to provide modest but substantial improvements in production as a consequence of intergenotypic light, soil and water interactions. This yield advantage was calculated at 5.4% and 11% correspondingly for wheat and soybeans. This impact is due partly to the complementarity of farmers, which means that the mixture as a whole is able to utilize resources in the field better since cultivars operate slightly different microniches in direct competition, because of distinct processes. Some wheat combinations were also more productive under low organic circumstances. Some oat combinations have yields up to 9 percent in the face of drought stress, indicating that genotypic diversity may contribute to buffer agriculture against climate change extremes[10].

Another significant advantage from cultivar mixes is the consistency of output, which enables farmers to better anticipate their yearly production and to minimize risk. Due to numerous biotic and abiotic variables, a specific monoculture may or may not be the highest performing variety, but these factors are likely to be changed next year. A crop mix reduces this yearly uncertainty because stability comes from complementing variations in crops that tend to balance. The impacts of biodiversity on 'portfolio' or 'insurance' may therefore stabilize agricultural yields in various biotic and abiotic situations.

2. DISCUSSION

It offers tremendous potential for improving disease resistance, decreasing insect abundance, and increasing crop production in agricultural fields by increasing the variety of genotypes within a field. Due to the over-reliance on synthetic pesticides, the development of resistance has triggered a vicious cycle of resistance that is unsustainable and laden with ramifications that include deterioration of human and ecological health. As a result, farmers need alternative pest control methods to preserve their crops and earnings while also reducing their dependence on pesticides. Consumer demand for agricultural goods produced more responsibly with little or no pesticide residue has also resulted in the fast expansion of the organic crop industry, which now includes crops grown for human and animal use. These farmers have few choices for pest control, and cultivar combinations would be very beneficial to them if they were planted.

When looking at things from an evolutionary standpoint, planting fields with more than one type of seed makes sense since mixed fields would be less susceptible to environmental disturbance, whether it is caused by humans or by nature. As a result, varied cultivar combinations are a popular and successful method of managing diseases in wheat, rice, and other crops throughout Europe, Asia, and a few areas of the United States. Research from natural systems also shows that insect herbivore populations may be significantly affected by intraspecific plant variety, which is consistent with previous findings. We now need to do applied research to see whether or not these many lines of evidence may lead to better insect pest management via the use of cultivar combinations. The following conceptual framework, which is based on interactions seen in some of the material examined here, is provided to assist in directing this research: a conceptual framework Interactions among plants, herbivores, and natural enemies that are anticipated to be affected by genotypic diversity are presented in the framework, as are some of the processes that may be driving these interactions. In order to encourage hypothesis-driven research into how these relationships affect insect pest management in agricultural systems, the

following vision is presented: These interactions, as shown in at least one crop species and a sea grass, may also serve to protect agricultural systems against abiotic extremes such as those anticipated to be imposed by climate change.

Efficacy of intraspecific crop variety as an insect control strategy is being investigated at all levels of the research process, from fundamental ecology through farmer application. Examples include determining the number of cultivars that provide the most yield while maintaining the highest level of stability, as well as determining if this number can be used across crop species and management methods (e.g. organic vs. conventional). Also required is investigation into how various pests and natural enemies react to intraspecific variation, as well as whether guilds of pests, such as aphids, behave in a comparable manner to one other. Due to the fact that the majority of natural-systems research has been conducted in very small plots, conducting large-scale experiments in field crops would not only be necessary to determine efficacy for growers, but it would also greatly advance our understanding of how intraspecific diversity affects the food web and trophic dynamics.

This research is particularly important since combining resistant and non-resistant varieties in the same field should prevent the development of resistance to resistant kinds (i.e. improve durability of resistance; Gould 1986a). This technique is credited with helping to reduce resistance to transgenic Bt crops in part because it involves planting susceptible varieties alongside insect-resistant Bt types to provide a safe haven for Bt-susceptible pests throughout the growing season. Because plant resistance characteristics are often among the only weapons available for controlling certain pest species, research is required to define levels of resistance to insect herbivores in different crop species, as well as to discover novel forms of resistance. New resistant types may then be created and integrated into cultivar mixes, which will aid in the preservation of the effectiveness and durability of such instruments.

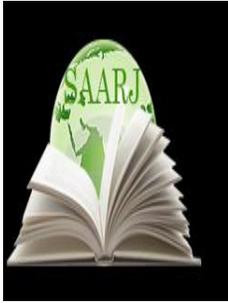

3.CONCLUSION

Many advantages appear to be gained from cultivar mixtures. As long as the agronomic characteristics of the varieties are similar, farmers should not be required to alter production practices such as planting and harvesting times, nor should they be required to make any financial investments in new equipment. Important because logistical and economic considerations are the main impediment to the adoption of innovative, environmentally friendly pest-farming methods in the first place. Using cultivar mixes does not seem to provide significant economic or logistical difficulties, and in fact, it may have positive effects on both the economy and output. Growers have a high possibility of reducing insect issues while maintaining or even boosting yields if they strategically increase genotypic variety. Such environmentally friendly pest control methods should be further investigated.

THE BROWN PLANT HOPPER AS A RECURRENT DANGER TO HIGH-YIELDING RICE CULTIVATION

Dr. Pramod Kumar*

*Sanskriti University,
Mathura, Uttar Pradesh, INDIA
Email id: farm.agri@sanskriti.edu.in

ABSTRACT

The brown planthopper (BPH), Nilaparvatalugens, which erupted occasionally in tropical Asian rice in the sixties, became a great danger after the adoption of green revolution technology by farmers in the 1960s. In the 1980s and 1990s, management and regulatory reforms highlighted non-insecticide methods to prevent BPH epidemics. However, as main method for managing rice insect pests, pesticides have reappeared and recent planthopper outbreaks have occurred in record numbers in tropical Asian nations. Our examination of variables contributing to the epidemics shows that pesticides are mainly the most significant outbreak contributor in terms of their negative impact on natural enemies. BPH resistance to insecticides and particularly Imidacloprid enhanced the likelihood of outbreaks because farmers used increasing amounts of pesticide to fight resistant populations. Similarly, excessive use of nitrogen fertilizer in hybrid rice, in particular, has enhanced the epidemic risk. Other variables that are less established are causing outbreaks, however we explore the potential that high outbreak synchrony in geographically dispersed BPH populations may indicate a 'Moran effect' as a climate that favors the above-average growth in the populations of BPH. We further assume that BPH works as a meta population, and that recurrent outbreaks may thus constitute a natural occurrence which would need plant hoppers to return to the empty regions in order to maintain genetic interconnections between subpopulations. We finish by recommending a number of research and policy reforms to better understand the origin of BPH outbreaks and to create sustainable management methods to avoid repeat outbreaks.

KEYWORDS: Fertilizers, Green Revolution, Insecticide, IRRI, Planthopper.

1. INTRODUCTION

Starting in the 1960s, rice production in tropical Asia was developed from a low-yielding conventional system using farmers' rice lands produced with modest artificial input to a high yield scheme based on GM crops, synthetic fertilizers and synthesized insecticides. The first high-yielding rice variety for tropical farmers was IR8 created by the International Rice Research Institute (IRRI) and launched in the Philippines in 1966. IR8 generated 10 t ha⁻¹ in favorable growth conditions compared to 1 t ha⁻¹ for conventional rice. IR8 expanded rapidly throughout tropical Asia and helped substantially to rice output in regions facing food scarcity[1].

Technologies of the Green Revolution rapidly dislocated conventional techniques of rice production in several regions (Jennings, 1974). In the Philippines, within three years following the introduction of IR8 in 1966, 40 percent of Riceland was planted with enhanced cultivars. The Philippines' new-tech rice output grew an average of 12.4% each year from 1967–68 to 1971–72. Compared to conventional cultivars (160-200 days), new rice cultivars achieved maturity very fast. This meant that farmers using irrigation systems might harvest two or three plants of the same rice field per year. Monocultures in many irrigated regions of new high yielding cultivars emerged year round. Artificial fertilizers and pesticides were the high yield system's trademark characteristics. Genetically modified crops produced little better than conventional cultivars without fertilizers. Farmers viewed chemical pesticides as an insurance to preserve fertilizer and other investments. As seen in many Philippine regions, insecticide usage increases in high yield agricultural systems. About 60% of the Philippine farmers in the 1966 decade before IR8 was available were to use some pesticides; in the late 1970s about 70% of farmers who planted high-yielding rice varieties regularly used insecticidal treatments for rice. Researchers have discovered that farmers treat high yield rice (sowing seed beds and main crop) 1-10 times (average 1.4-3.2) in 40 different crops with pesticides, in the Philippine region of Nueva Ecija, the largest irrigated rice area of southeast Asia (comprising 64 distinct brands). The National Agricultural Research and Education Systems (NARES) and the green revolution-driven chemical corporations advised rice farmers with pesticides to increase crop yields and prevent catastrophic pesticide losses. Insect outbreaks, which paradoxically have frequently been caused by pesticides, have strengthened farmers' dread of insect pests and the necessity to use chemical substances. Even when breeders integrated pest resistance in high-yielding crops, farmers continued to treat rice regularly. Some governments have given low-cost pesticides to ensure that farmers spray rice crops frequently. In Indonesia, for example, government subsidies for pesticides amounted to 179 million dollars in 1986, which represented about 0.17% of the country's GDP and 0.8% of the government's overall expenses. Indonesian government spending on insecticides amounted to almost \$1.5 billion between 1976 and 1987. However, few farmers have been taught to correctly apply pesticides. In the Philippines rice farmers questioned by researchers sprayed around 80% of pesticide treatments to the incorrect pest or when pests were not an issue. Due to inadequate application equipment, N 75% of the active component of a pesticide was found in the water of the rice fields instead of the target region. Despite the conviction of farmers that pesticides are needed to preserve the rice crop, many assessments have shown that insecticides are seldom required for successful rice production[2].

1.1 The Brown Planthopper (BPH) Revolution:

An unexpected issue with the rice green revolution was the recurrent brown planthopper outbreak (BPH). This bug is made from grown rice, numerous wild *Oryza* and the herb *Leersiahexandra* Swartz. Diagnostic indicators and the study of genetic distance using RAPD – PCR showed the potential of BPH sibling species between the population of rice and *Leersia*. BPH eats into the vascular tissue of plant leaf blades and leaf sheaths and ingests the sap by inserting its styles. Populations concentrate at the base of the plant and following canopy closure achieve maximum density. Heavy infestations may cause rice plants, known as the "hopperburn," to dry and wilt completely. The pest also transmits ragged stunt virus and grassy stunt virus to plant diseases. BPH in tropics can complete around twelve generations per year, while in temperate regions only 3 generations per year. Around the Red River Delta of Vietnam is the northern geographical limit of winter breeding for the species. In Asian tropics and subtropics, it occurs throughout the year and extends its scope to the north when rice becomes accessible in temperate regions of China, India, Japan and Korea (Perfect and Cook, 1994). Weather-facing migration guarantees that part of the migratory population reaches a distance of several hundred km. However, BPH does not live in temperate regions during winter. BPH infestations in temperate settings are caused by annual migration from tropical Asia and China. Return migrations of BPH populations (north-south) were examined across China and India throughout the fall. Such movements may assist to explain how in the southern overwintering populations migrants are sustained over a great distance[3].

Planthopper epidemics in rice happened hundreds of years before the Green Revolution in the 1960s, according to experts. Outbreaks reportedly occurred about 18 AD in Korea and 701 AD in Japan. After the discovery in 1670 of whale oil as an insecticide, followed by slaked and bitter lime, leafhoppers and planthoppers were said to have been flourishing in Japan. Confirming early claims such as BPH epidemics poses taxonomic issues, since *N. lugens* species were not identified until 1854. However, before 1966, the year when IR8 was adopted, Fiji, Japan, Korea, Solomon Islands, Taiwan and perhaps more nations verified BPH occurrences. The most significant epidemics occurred in temperate regions, including Japan and Korea, before the green revolution. Tropical outbreaks were usually limited and happened seldom[4].

In 1977 IRRI organized an international meeting to address the danger posed by BPH outbreaks to the new high-yield tropical rice in order to evaluate the issue and to establish prioritized research and training initiatives for improved control of the pest. The conferences concluded that the intensification of rice crops and their related technologies had caused major changes to the rice environment, promoting BPH epidemics, especially in irrigated regions where farmers grow 2 or 3 rice crops year. The constant rotation of mono-crops across wide regions offered numerous BPH habitats that allowed the population to breed almost all year round and increased the reproductive capacity of the plague due to the excessive use of nitrogen fertilizer. The frequent use of pesticides worsened the issue by eliminating natural enemies which controlled the populations of BPH. The conferences stressed the need of creating rice cultivars that are genetically resistant to BPH while recognizing that the pesticide is able to adjust to the resistant cultivars. IR26 was the first high yield rice cultivar with BPH resistance introduced in 1974 by IRRI[5]

1.2 IPM Solution:

The IRRI (1979) emphasizes integrated pesticide control as a management approach to avoid outbreaks of BPH. A term established by the Environmental Quality Council from the former integrated pest control term, IPM utilizes several techniques for preventing pest populations from reaching harmful levels. IPM combines pest-resistant cultivars, fertilizer management, agronomic practices that conserve and increase the impact of predators and other natural biological control products and, when necessary, the cautious use of pesticides based on need rather than on prophylactic treatment instead of relying on one single pest control technique.

In 1980, the Food and Agriculture Organization of the United Nations (FAO) provided technical support for tropical Asian nations to start a large programme for rice IPM to improve economically and ecologically sound pesticide management. Between 1980 and 1989, the programme underlined pesticide monitoring, resistance of host plants, wise use of pesticides, natural enemies of pests and demonstrations on the ground that offered farmers first-hand experience with IPM techniques and environmental ideas. There was a working group headed by designated NARES in each component. In the mid-1980s, the Indian, Philip-pine and Indonesian governments proclaimed national IPM strategies. Indonesian authorities have prohibited 57 pesticides suspected to promote BPH breakdown and have also ceased subsidizing pesticides. The change in policy to restrict pesticides saved the Indonesian government approximately 100 million dollars per year and decreased the import of pesticides by two thirds. The FAO initiative cost about US\$650,000 in Indonesia between 1985 and 1988.

FAO-IPM highlighted intensive on-farm training at farm schools (FFS) in order to enable rice farmers to adopt IPM with little technical support. The IPM programme educated farmers in several nations from 1980 to 2002. Data from Malaysia and Myanmar is not available, but FFS-trained N2 million rice farmers from 1989 to 2000 in the other eleven countries. According to academics, just 1-5% of all farmer's homes in these nations were for FFS-trained farmers. More than 90 percent of all FFS graduates included six of the nation's participating in the FAO programme. IPM educated farmers decreased their usage of secticide by 50–80% while maintaining or increasing their rice production. The biggest effect was in Indonesia, where approximately 1.5 million farmers were trained in IPM. In combination with IPM training and pesticide regulations, the usage of insecticide on rice by IPM-trained farmers in the Java province has dropped 75 percent.

In 1991, IRRI started its complementary Pesticide Reduction Program (FPR) to address farmers' misunderstandings regarding leaf-keeper controls. IRRI studies have shown that leaffolders seldom affect the production of rice when untreated; nevertheless, rice farmers believe that if not managed, such insects would lead to significant yield losses. Surveys revealed that most insecticidal treatments were targeted at leaffolders during the first 30–40 days of rice cultivation. In the first 30–40 days of FPR trials, the participating farmers sprayed insecticide spray to the majority of their crops as they typically (usually 1–3 times) but left a section (around 1100 m²) of each crop unprocessed. During harvest, the farmer determined yields from both sides and then compared the findings with adjacent farmers who had carried out similar studies. Participating farmers typically experienced economic advantages immediately when they stopped early treatments and became ambassadors when they disseminated a message of "no spray" to other farms. In some regions, government authorities have started supplementary media efforts utilizing radio, TV, printed and other communication channels to urge more farmers to

discontinue rice pesticides early in the season. FPR initiatives at many places in Southeast Asia eradicated rice without loss of production of 50-80 per cent of pesticide usage. The biggest effect occurred in the Vietnam Mekong Delta. Surveys found that the average number of pesticide springs per rice crop was decreased from 3.1 to 1.0 between 1992 and 1997. The FPR initiatives have reduced pesticide usage by 50 percent in approximately 2 million rice fields across the Delta[6].

1.3 Hormesis Caused by Insecticide:

Not only can insecticides enhance the probability of pest breakout by disturbing natural enemy activities, they may also encourage the growth of pesticides via hormesis. Researchers demonstrated that in adults with BPH who evolved from the nymphs, sublethal dosages of methyl parathion and decamethrin had been given topically to 5th Instar BPH nymphs. Sublethal dosages of certain pesticides enhance female fertility of BPH by promoting changes in nutrients of rice crops. Researchers discovered that the reproductive stimulation caused by pesticide differed in rice cultivars, insecticides and the application rate of insecticides. Sublethal uses of deltamethrin insecticide resulted in substantially more brachypterous adults of (flightless) BPH compared to imidacloprid or triazophos in sublethal treatments. The greatest reproductive rate of BPH occurred on triazophos-treated plants. Treatments for both susceptible BPH (TN1) and resistant rice crops of all pesticides were tested at increased soluble levels of sucrose in 3rd and 5th-star nymphs and adults from the nymphs fed on insecticide treated rice plants. Adults from nymphs that have been feed on treated plants had substantially higher levels of crude fat than adults from non-treated plant-fed nymphs. In BPH-susceptible cultivars, reproductive stimulation due to pesticide treatment was more apparent.

The findings of this research show that theoretical applications of sublethal insecticide may enhance BPH migratory ability since the plant-humpers gain more fat and sugar for flight when fed rice plants treated with insecticide than if fed on untreated rice plants. Researchers discovered that Philippine rice farmers frequently use pesticides in large quantities and apply sprays at rates below the insecticide manufacturers advised in order to save time and money. In addition, since BPH populations develop near the base of the rice plant over time, the closed canopy may protect them from spray droplets. Study findings indicate that farmers' use of the sublethal rates of particular pesticides may both improve BPH's reproductive capacities and raise theoretically the risk of BPH outbreaks even when these insecticides did not damage natural enemies[7].

1.4 Resistance to Insecticides:

BHC genetic resistance emerged approximately 15 years after the pesticide was sprayed on the country's rice in 1967 in BPH populations in Japan. In the late 1960s and 1970s, researchers discovered resistance to BPH in the experimental farm of IRRI in the Philippines and resistance to organophosphorus or carbamate insecticides in Taiwan in the 1970s. BPH resistance to organochlorine, organophosphorus, carbamate and pyrethroid pesticides was recorded in many Asian nations in the early 1990's. Until recently, resistance reports were mostly produced in temperate regions in BPH populations. Widespread usage of neonicotinyl chemicals in tropical and temperate regions has increased problem resistance. Laboratory testing in China, India, Japan, Indonesia, Malaysia, Taiwan, Thailand and Vietnam have demonstrated imidacloprid resistance in 2008 in populations with BPH. The use of imidacloprid in order to manage BPH

was reported by rice growers in many countries. BPH imidacloprid resistance has caused particularly severe difficulties for Chinese rice growers.

From 1996 to 2006, 42 field samples of BPH from eight Chinese provinces were tested for imidacloprid resistance. Most of the BPH populations remained sensitive to imidacloprid between 1996 and 2003 except in Guilin where there was modest resistance in 1997. However, BPH populations from several regions showed high to very high levels of resistance in 2005. Within a just 2 years, the Nanning population grew by N 200 in resistance. BPH acquired N 800-fold resistance to imidacloprid in other places, particularly in southeast China. In several rice-growing regions with each BPH generation, farmers sprayed to avoid the emergence of the plague. The extended residual activity and excellent effectiveness of Imidacloprid make it a favorite insecticide for BPH treatment in many regions. Trends indicate that continuing extensive usage of pesticide in China and in other countries exacerbates the genetic resistance issue in BPH populations.

As BPH migrates over vast distances, it appears that the frequent influx of immigrants from regions of low pesticide use will slow down resistance to insecticides. In China, however, imidacloprid has been used extensively to reduce BPH both in the emigration region and in immigrant areas. Imidacloprid was also extensively utilized in Southeastern Asia where rice-year-round population BPH developed and in the next year it became the main source of northbound mid-gration for China. Therefore, when imidacloprid resistance develops, resistant BPH migrants may transmit their imidacloprid resistance over vast distances rapidly [8].

The issue of resurgence and subsequent outbreaks of BPH may be exacerbated by pesticide resistance, since farmers must use increasing amounts of insecticide to fight resistant populations. In addition, as stated, researchers have shown that imidacloprid foliar sprays for rice may enhance lipids and soluble sugar in BPH nymphs and adult plant feed. BPH populations that have survived treatments of imidacloprid may potentially travel across typical distances and thus serve as a particularly significant conduit for the transmission of the imidacloprid-resistance alone into other regions.

1.5 Usage of Fertilizers in Rice:

Crossing two inbred lines, the hybrid rice created occupies considerably more Asian Riceland. Hybrid rice currently accounts for 60% of the Chinese rice. Although hybrid seeds may cost twice as much as non-hybrid seeds, farmers' earnings may be much greater since hybrids produce 16–20 percent more than their income parents. Larger crop populations and frequent breakouts in farmers' fields of hybrid rice have been observed. The thick canopy of the hybrids, resulting from more robust vegetative growth, seems to make it easier to migrate or disperse insects. The hybrid plants are more effective at absorbing nitrogen and using nitrogen than their inbred parent lines. The increased intake of nitrogen and the efficiency of hybrid usage may lead to more nitrogen accessible for BPH and other pests. In addition, the total absence of or poor genetic resistance of hybrids makes plants more vulnerable to insects. The major hybrid rice varieties are vulnerable to WBPH in China, and only approximately 12% of newly created varieties have had resistance to BPH in field testing.

1.6 Cultivars Impact On BPH:

The development of better rice cultivars with resistance to insects and diseases is an important goal of rice breeding. High-yielding cultivars with BPH resistance, other insects and diseases greatly contributed to the rice production in tropical Asia. IRRI is the world's leading rice breeding institution and has provided rice producing nations with thousands of enhanced breeding lines. An estimated 50% of the world's rice acreage is planted in IRRI or its progeny[9].

IRRI began a rice breeding effort for BPH resistance shortly after researchers discovered pest resistance to rice sources in 1967. Many Asian nations have begun similar programmes. *Bph1* and *bph2* were the first two resistance genes. Twenty-one BPH resistance genes from farmed and wild *Oryza* species have already been discovered. The production of rice with a lasting resistance to BPH is a significant problem, given the history of the pesticide adaptation to resistant crops. Pesticides adapted to IR26, the first high producing BPH-resistant cultivar, within two to three years after distribution to farmers. For a relatively brief period, several BPH-resistant cultivars have remained viable. Although certain BPH-resistant cultivars, in particular IR36 and IR64, have shown increased durability, BPH continues to be a nemesis for plant breeders[10].

In addition, scientists have discovered many BPH toxins from non-rice sources which have promise for transgenic rice plants specially built to withstand BPH in addition to the natural sources of BPH resistance in *O. sativa* and its natural relatives. As far as we know, no transgenic rice types are being cultivated commercially although many modified kinds for marketing have been authorized. Plant breeders are particularly interested in *Galanthusnivalis* agglutinin (GNA), a transgenic rice plant that expresses the use of snowdrop lectin in plant hoppers. Transgenic GNA plants showed resistance to BPH and WBPH as well as green leafhoppers (*Nephotettix* sp.). GNA plants are the closest to marketing among the transgenic rice plants available.

2. DISCUSSION

Climate change predicts that interaction and combined effects of high temperature and humidity, drought, salt and submergence will have negative consequences on rice production. How BPH, other pests, natural enemies and ternate progeny are affected by such abiotic stressors is unclear while little study has given insight. In laboratory experiments, BPH eggs and adults' survival was reduced at temperatures of 35°C compared to 25–30°C. In addition, greater temperatures impacted BPH instars and populations differently, owing to their differing intracellular symbiotic death rates. The greatest rice pest fauna has moved from stem borers to dops, cycadellids and, more recently, to rice bugs and migratory populations of dops, such as BPH and WBPH, in Japan in the last half-century. In Japan, the average surface temperature increased by 1.0°C from 1961 to 2000. Researchers have forecast that global warming may benefit natural enemies by increasing the number of generations of their prey. However, some research has indicated that unique reactions to increasing temperatures may result by changing their phenologies, distribution ranges or migratory patterns in distinctions between pests and enemy population.

The assessment of reactions to large-scale impacts such as climate re-inquires information on local population dynamics in spatial scaling. Due to a hazy database of past outbreaks in tropics, it is difficult to test the idea that the climate may have caused a Moran effect for BPH populations in recent years. Data consistently documented over extended periods at representative sites is needed. During 1957–2009, researchers investigated the connection between ENSO occurrences and BPH outbreaks at the mid and lower levels of the Yangtze

River. In the years and outbreaks of La Niña, they found no obvious connection. BPH epidemics occurred, however, primarily in the El Niño and three years following El Niño.

3. CONCLUSION

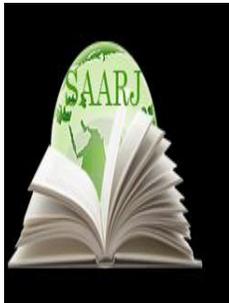

It is tempting to infer that inputs controlled by humans like pesticides or insecticides in conjunction with nitrogen fertilizers, for example, were fully responsible for the simultaneous tropical rice BPH epidemics in various parts of Asia soon after and even more recently. However, less visible natural governance elements may have produced an environment which favors a rise in pest populations that is higher than normal regardless of their human contribution. The high overall synchronization in BPH's geographically segregated populations may show that a "Moran effect" like the climate had an important impact. Researchers have anticipated that autocorrelation in population fluctuations will equate to autocorrelation in environmental noise, if population synchronization is driven by an environmental variable such as temperature. His prediction anticipated that all impacted populations would be subject to the same linear density regulation on a logarithmic scale and that the correlation in fluctuations between two population populations would always be the same regardless of the starting population sizes. Spatial correlations of ecological factors, generated, for example, by comparable temperatures, were originally proposed as sync agents for the size fluctuations of spatially separated populations. The Moran effect may play a significant role in driving sync in a number of ecological processes, irrespective of size. Natural enemies and BPH-resistant cultivars should be anticipated to have less influence on regulation of the density of the BPH in such an environment which will allow for more rapid BPH growth and natural enemy destroying pesticides would therefore have an above average negative impact.

LINGUISTIC PERSONALITY AS AN OBJECT OF LINGUISTIC RESEARCH

Sharapova Lola Stanislavovna*

*Senior Teacher of "Spanish and Italian Languages",
 Department of Samarkand State Institute of Foreign Languages,
 UZBEKISTAN

ABSTRACT

In modern linguistics, one of the central issues is the phenomenon of linguistic personality. The concept of a linguistic personality is in demand in humanitarian knowledge, since its development makes it possible to advance towards solving a number of theoretical and practical problems facing scientists. At the same time, despite the large number of references to this concept both in the framework of general linguistics and in other branches of linguistics, the problem of developing methods for analyzing a specific linguistic personality remains debatable. This requires researchers to theoretically substantiate the use of various general scientific and specifically linguistic methods and methods in the study of such an object as a linguistic personality.

KEYWORDS: *Linguistic Personality, Verbal-Semantic, Cognitive And Pragmatic Approach, Linguocultural Community, Linguocultural Approach.*

INTRODUCTION

Linguistic personality is one of the urgent and promising problems of modern cognitive and communicative linguistics. Recently, the problem of linguistic personality has been actively considered in various aspects, psycholinguistic, sociolinguistic, culturological, linguodidactic, functional, emotive, and pragmatic, text semantics, etc. [2, 41]. This problem is of particular interest to linguists in the light of the proposed Y.N. Karaulov's new approach is "there is a linguistic personality behind every text" (in contrast to the main thesis of linguistic research of the last half century "there is a language system behind every text") [5, 39].

The term "linguistic personality" was first used by V.V. Vinogradov in 1930. In the book "About fiction" he wrote: "... If we rise from the external grammatical forms of language to more internal ("ideological") and to more complex constructive forms of words and their combinations; if we

recognize that not only the elements of speech, but also the compositional techniques of their combinations associated with the peculiarities of verbal thinking are essential signs of linguistic associations, then the structure of the literary language appears in a much more complex form than the planar system of linguistic relations of Saussure. And the personality, included in different of these "subject" spheres and including them in itself, combines them into a special structure. In objective terms, all that has been said can be transferred to speech as a sphere of creative disclosure of the linguistic personality" (2, 41-43).

Modern linguistics considers a linguistic personality depending on the type of culture. In his work, N.I. Tolstoy suggests the following types: elite - based on literary language, folk - in dialect, traditional-professional - in argot, "third culture" - in vernacular. The works of O.B. Sirotinina and her students are also widely known, which justify the identification of a medium-literary type of linguistic personality as a person with higher education, which is characterized by individual violations of the qualities of good speech (2, 41-43).

Y.N. Karaulov distinguished three levels of linguistic personality: verbal-semantic, cognitive and pragmatic. The units of the first level are individual words as units of a verbally associative network. The units of the second are concepts, ideas, concepts that each linguistic personality develops into a more or less ordered picture of the world, reflecting the hierarchy of values. The units of the third are oriented towards pragmatics and manifest themselves, according to Y.N. Karaulov, "in the communicative and activity needs of the individual" [5, 30].

V.I. Karasik considers a linguistic personality as a basic national-cultural prototype of a native speaker of a certain language fixed mainly in the lexical system, a kind of "semantic sketch" compiled on the basis of worldview attitudes, value priorities and behavioral reactions reflected in the dictionary [6, 2-7]. Most linguistic concepts emphasize the relationship between language and speech activity. According to G.I. Bogin, a linguistic personality is understood as a person as a native speaker, taken from the side of his ability to speech activity [4, 3]. According to S.A. Sukhoi and V.V. Zelensky, a linguistic personality is a set of features of verbal behavior of a person using language as a means of communication [13, 44].

Skills characteristic of the highest level of speech ability of a linguistic personality can also be considered the ability to purposefully, competently compose texts that meet the pragmatic conditions of communication, stylistically and situationally relevant, expressive; the ability to understand hidden meanings, subtext and use it in one's own speech; the ability to adequately assess a specific situation of speech communication and implement the appropriate model of speech communication, correct in ethical and aesthetic terms.

It is no secret that in some countries there are cases when even fully grown, fully formed specialists with higher education do not know the forms of speech etiquette (even such simple cliched forms as greetings, expressions of sympathy, congratulations, compliments, etc. cause difficulty), do not know how to communicate with seniors by age and position (including by phone), do not consider it necessary to simply listen to another person, do not know how to read kinetic information. They are afraid or do not know how to resist the impoliteness and rudeness of opponents. This leads to stiffness, tightness, fear and avoidance of communication, inability not only to conduct a conversation in the right direction, calmly, adequately defend your point of view, but even just to present it in a form accessible to other people.

The study of a linguistic personality-a native speaker with a complex inner world, his own attitude to fate, the world of things and the people around him, is currently multidimensional, large-scale and attracts related sciences.

Thus, a linguistic personality is a personality that manifests itself in speech activity, a personality in the totality of the texts consumed and produced by it. Each linguistic personality is unique, has its own "knowledge" of the language and the peculiarities of its use. At the same time, a linguistic personality always belongs to a certain linguistic and cultural community.

At the moment, modern linguistics has developed many approaches to the study of linguistic personality; each approach has its own methodology of study. Thus, the linguoculturological approach considers a linguistic personality from the point of view of national-linguistic specificity, in other words, in its linguistic ethnography [3, 29].

Using this approach, the ethnospecific linguistic personality traits expressed in texts as products and signs of a certain culture are investigated. Linguoculturology is characterized by the study of a collective cultural-historical image or "national-cultural prototype of a native speaker" [10, 112]. Therefore, the subject of the study is the image of a linguistic personality formed by many incarnations of different individuals of the language. Accordingly, linguoculturology turns its attention to the relationship "language - culture - ethnicity", setting the researcher the task of studying the material and spiritual culture embodied in a living national language and manifested in linguistic processes, in which a linguistic personality is formed.

One of the most significant in this direction is the method of commenting. This method consists in the fact that additional information about the spheres of use and frequency of use of these units, about their various connotations, which are characteristic of this culture, is given to a word or phrase denoting the reality of any ethnoculture [7]. In our opinion, this approach can be useful when analyzing a specific linguistic personality, as it will allow to recreate the "national-cultural prototype of a native speaker".

The commenting method is an effective tool within the framework of the linguoculturological approach, since it allows us to determine how much the linguistic personality under study corresponds to the national-cultural prototype of a native speaker. However, such a reconstruction of the national-cultural prototype of a native speaker is somewhat one-sided. The limitation of this method is that the definition of the national-cultural prototype of a linguistic personality is based on texts that are always limited in genre, ideological-thematic, stylistic terms.

These limitations inevitably affect the appearance of the constructed linguistic personality. Another approach to the study of a linguistic personality is a sociolinguistic approach, in which a linguistic personality is considered as a carrier of linguistic features - phonetic, lexical, morphological, syntactic, correlating with its social characteristics, belonging to a particular language or speech collective, social status, role in a communication situation [1, 3].

At the same time, the main sociolinguistic method is the method of correlation analysis, accompanied by a comment evaluating the nature of such correlations. The text in this direction acts as a material that allows reconstructing socially conditioned linguistic and speech personality traits that are common to a language or speech collective [8, 109].

When conducting such an analysis, the specified social characteristics act as independent variables, and the communicative characteristics act as dependent ones. The relationship between these values is expressed in the mutual consistency of the observed changes [11, 256].

The main advantage of this method is the accuracy of measurements. The use of this method in the analysis of a specific linguistic personality allows us to determine how much speech personality traits correspond to the main characteristics of the social group to which the personality under study belongs.

The linguistic personality in the linguopragmatic approach is studied from the point of view of its interactive beginning, that is, the subject of research within this approach is the ability of a person to communicate as an activity [12, 216].

The linguopragmatic approach offers a functional model of a linguistic personality, bringing to the fore its activity principle, manifested in the processes of selecting language signs according to the goals and objectives of communication. The main method of this approach is the method of linguistic modeling.

The task of linguistic modeling is "to establish certain structures, but not to search for new linguistic facts, to bring into the system empirically obtained linguistic data, which makes language categories clearer, more defined, as clearly formulated and systematized as possible" [9, 52].

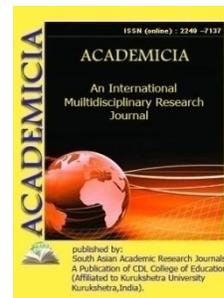

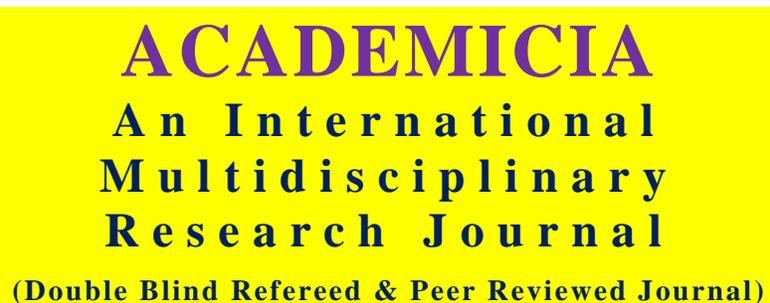

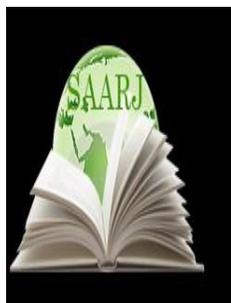

The model is a specific object created for the purpose of obtaining information, reflecting the properties, characteristics and connections of the original object of arbitrary nature, essential for the task being solved by the subject.

Summing up, it should be said that each of the analyzed approaches presents effective methods of analyzing the linguistic personality only in specific aspects of its manifestation. Therefore, when studying a linguistic personality as an integral phenomenon, an integrated approach to its analysis is necessary, taking into account specific interrelated qualification features: linguoculturological, sociolinguistic and linguopragmatic. The application of an integrated approach to the analysis of the linguistic personality will allow you to get a complete and multifaceted idea of the studied linguistic personality.

UZBEKISTAN

ABSTRACT

This article discusses aspects of Uzbekistan's environmental policy in the context of the environmental crisis in the South Aral Sea region. This document was adopted in order to further ensure a favorable state of the environment and the rational use of natural resources, the introduction of environmental foundations of sustainable development in the economic sector. The organization of work and control over the implementation of the Program is entrusted to the State Committee of the Republic of Uzbekistan for Nature Protection.

KEYWORDS: *Environmental Policy, Context, Environmental Crisis, South Aral Sea, Document, Favorable State, Environment, Natural Resources, Environmental Foundations, Sustainable Development, Economic Sector, State Committee, Nature Protection.*

INTRODUCTION

At present, the purposeful policy of any state to maintain ecological balance in the biosphere is ecological safety, which contributes to the creation of favorable living conditions for the population and their interaction with the natural environment. The system of environmental safety of the state presupposes the presence of certain protective mechanisms of a person against environmental threats caused by natural factors - natural elements and human intervention in the natural environment, leading to an imbalance in the ecological system [16].

At the Global International Forum "Johannesburg-2002" the Development Program for the XXI century was presented as a vector for active action of all countries in the field of environmental protection. The approved Program in world practice is a document aimed at ensuring environmentally safe sustainable development, taking into account the satisfaction of the needs of the present and ensuring the interests of future generations. In an official UN document, the

integral concept of “sustainable development” is proposed, which combines the main problems of preserving and restoring the natural environment and ensuring a decent life for all generations [26].

The main findings and results

An environmental assessment mechanism and, in a broader sense, an integrated analysis of the state, impact and protection of the environment, as well as the use of natural resources in the Republic of Uzbekistan.

The environmental safety policy of the Republic of Uzbekistan is carried out on the basis of the Constitution, documents of the Legislation of the Republic of Uzbekistan, the principles of the Declarations on the Environment and Sustainable Development, taking into account the obligations assumed arising from international conventions and agreements, as well as the legislative experience of foreign states [26,27].

Currently, in Uzbekistan, including the Republic of Karakalpakstan, continuous activities are carried out in the field of environmental protection, rational use of natural resources, improvement of sanitary and environmental conditions.

In accordance with the current regulatory and legal documents, the economic mechanism of environmental protection of the Republic of Karakalpakstan includes both incentive elements (positive motivation) and instruments of coercion (negative motivation), with the latter clearly prevailing. Some of the economic management instruments provided for by legislation are still not applied or are applied on an extremely limited scale.

The basis of the ecological and socio-economic mechanisms of environmental protection in the Republic of Karakalpakstan is made up of economic sanctions for environmental offenses.

Over the years of independence, Uzbekistan, including Karakalpakstan, has practically re-examined the legal framework of environmental legislation, which is fundamentally different from the previous one. Instead of the administrative-command principle of environmental management, a transition is made to ecologically-economically sound methods of rational environmental management.

The problem of the Aral Sea began to form in the 60s of the XX century. Intensive development of new lands, development of irrigated agriculture, construction of collector and irrigation systems throughout Central Asia, continued growth in water demand for domestic and industrial consumption, as well as systematically repeated dry years, created the conditions for one of the largest global environmental disasters in recent history - the drying up of one of the most beautiful bodies of water in the past on our planet [15, 18, 20].

The progressive process of desertification and soil degradation in the Aral Sea region is accompanied by the loss of land resources, deterioration of the quality of natural pastures and hayfields, where there is an active salinization of lands. In many territories, a large accumulation of salts has occurred in the soil and groundwater, which negatively affects the cultivation of various agricultural crops [13, 23].

In 1992, the Law of the Republic of Uzbekistan “On Nature Protection” was adopted, which established the legal, economic and organizational foundations for preserving the conditions of the natural environment, rational use of natural resources. The purpose of this Law is to ensure a

balanced harmonious development of relations between man and nature, to protect ecological systems, natural complexes and individual objects, to guarantee the rights of citizens to a favorable environment [1].

In October 1995, Uzbekistan joined the Convention on Biological Diversity and began to develop the National Strategy for the Conservation of Biological Diversity (NSCBD) [11] (1998). The Republic of Uzbekistan at a high official level declared its intention to protect and use biological resources of the environment without damage. However, the modern structure and management of protected natural areas have not undergone fundamental changes since 1990. Further development and improvement of the network is constrained by the lack of funds. Since the signing of the NSCBD on the conservation of biological diversity [28] (Resolution of the Cabinet of Ministers of the Republic of Uzbekistan № 139 dated April 1, 1998), the development and improvement of the network of protected areas is the country's top priority in the field of biological diversity conservation [3, 11].

The Cabinet of Ministers of the Republic of Uzbekistan adopted a Resolution dated May 27, 2013 "On the Program of Action for Environmental Protection of the Republic of Uzbekistan for 2013 -2017". This document was adopted in order to further ensure a favorable state of the environment and the rational use of natural resources, the introduction of environmental foundations of sustainable development in the economic sector [6, 7]. The organization of work and control over the implementation of the Program is entrusted to the State Committee of the Republic of Uzbekistan for Nature Protection.

This Program has been prepared on the basis of the National Action Plan for Environmental Protection of the Republic of Uzbekistan (NPEP) and is aimed at implementing environmental measures in terms of environmental support of economic reforms in Uzbekistan and creating conditions for socio-economic development and achieving the goals of sustainable development of the country. Based on the provisions of the new Program, the environmental policy of the republic is aimed at implementing the transition from the protection of individual elements of nature to the universal protection of ecological systems, guaranteeing optimal parameters of the human environment and harmonizing the relationship with the mechanisms of development of economic sectors according to the principles of "green economy" [4, 5, 21].

This Program provides:

- rational and comprehensive use of natural resources, including water, land, mineral and biological resources;
- phased reduction of air pollution, water and land resources through the introduction of environmentally friendly technologies and improvement of technological processes in production;
- improving the mechanism for monitoring the natural environment for regular assessment and forecasting of its socio-ecological state;
- implementation of a set of measures to restore and improve the ecological state in the ecological disaster zone - the Aral Sea region and in other ecologically unfavorable territories of the country;

- providing the population with clean drinking water and improving the system of sewerage networks and treatment facilities in large cities and towns;
- development of scientific and technical potential and the use of achievements of science and technology in the field of environmental protection;
- development and expansion of the network of protected natural areas;
- improvement of environmental legislation and the regulatory and methodological base in the field of environmental protection, environmental education and education for sustainable development, as well as the promotion of environmental knowledge;
- further development of regional and international cooperation in solving environmental problems [3, 10. 12].

One of the results of the environmental policy of the Republic of Uzbekistan is the stabilization of ecosystems and the improvement of the quality of the environment in areas with an increased risk to human health. Measures are being actively carried out to rehabilitate the consequences of the Aral Sea crisis, the ecological situation in the Aral Sea region - construction of small local reservoirs, drinking water supply lines is underway.

At the national level in Uzbekistan, the National Commission for Sustainable Development (NCSD) has been operating since 1997, which was then transformed into a working group under the coordination of the Government of the Republic of Uzbekistan. In 1998, experts from the ministries and departments of Uzbekistan developed the Concept of Sustainable Development of the Republic of Uzbekistan, approved by the NCSD.

On June 28, 2012 in the city of Nukus, Republic of Karakalpakstan, an introductory meeting and presentation of a new UN initiative in Uzbekistan - the Joint Program "Ensuring the livelihoods of the population affected by the Aral Sea crisis". The event was attended by national partners, representatives of regional and district authorities, representatives of communities and the media. The participants of the meeting discussed the main directions of the Program's activities and offered their recommendations for its successful implementation. The Aral Sea, located in the heart of Central Asia and formerly the fourth largest lake in the world, has become shallow and today is 30% of its former size. Such environmental changes in the region adversely affect the economy, social sphere and livelihoods of the population.

In the past, several initiatives have been successfully implemented in the region by the United Nations Development Program and the World Bank in close cooperation with the Government of the Republic of Uzbekistan. However, the living standards of the population of the most remote regions, such as Muynak, Shumanai and Kanlykul, need further improvement. During his visit to the Aral Sea region, UN Secretary General Ban Ki-moon emphasized the negative impact this crisis has on the human security of the population and called it "one of the worst environmental disasters in the world". In particular, it was decided to launch a Joint UN Program aimed at improving the well-being of the population through creating additional sources of income, improving the health care system, and developing infrastructure, by combining the efforts of 5 UN agencies in the Republic of Uzbekistan including the United Nations Development Program (UNDP), the United Nations Educational, Scientific and Cultural Organization (UNESCO), the World Health Organization (WHO), the United Nations Population Fund (UNFPA) and UN Volunteers (UNV). The UN Joint Program was developed in close cooperation with the

Government of the Republic of Uzbekistan and is aimed at improving the well-being of the most vulnerable segments of the population in the region.

The program envisages providing support to local communities in improving their access to basic socially significant infrastructure, including access to clean water and gas through the development and implementation of community development plans. The program will assist in creating new sources of income for entrepreneurs and farmers through the introduction of advanced agricultural and pasture management practices, as well as planting new types of crops and trees. In addition, the Program will support women's and youth entrepreneurship through the development of local handicrafts and tourism areas.

It should be noted that the Joint Program is aimed at improving the human security of the population, which implies the creation of an effective management system, improved income, health care and environmental safety, for sustainable livelihoods and dignity of people. In this regard, to promote the concept of human security in all areas of the Joint Program, the UN Trust Fund for Human Security provided funds in the amount of US \$ 3.8 million.

Today, it is quite obvious that a complex of environmental, socio-economic and demographic problems has arisen in the Aral Sea region, which in origin and level of consequences are of an international, global nature.

This understanding was also confirmed in the 2005 UN Report on Human Development in Central Asia, which noted that the depletion of the Aral Sea has not only regional but also global significance [22, 23].

In order to stabilize the ecological state in the South Aral Sea zone, the Government of the Republic of Uzbekistan is taking measures, including to attract investments to restore the water infrastructure of the region and create conditions for the economic activity of the Aral Sea population [10]. The "Drainage project of Uzbekistan. Project for diverting drainage from South Karakalpakstan" with the participation of the World Bank in the amount of 75 million dollars US, which contributes to the improvement of the reclamation state of the lands of Karakalpakstan on an area of 100 thousand hectares and direct drainage water to the reservoirs of the Aral region.

The IFAS Agency is carrying out a number of projects in the Aral Sea area for the restoration of wetlands. One of them is the IFAS / GEF / World Bank Project "Water Resources and Environment Management", within the framework of which activities for the restoration of Lake Sudochoye were carried out in the amount of about 3 million US dollars.

The project "Creation of local reservoirs in the Amu Darya delta" is a continuation of the work begun on Lake Sudochoye. As a result of the project, the water area of the delta lakes reached 150 thousand hectares. Expansion of the water table of local reservoirs up to 230 thousand hectares is planned.

With the attraction of GEF / UNDP grant funds, projects are being implemented to restore forests in the Amu Darya delta, as well as to strengthen the sands on the drained bottom of the Aral Sea. Social and economic problems are also being addressed within the framework of these projects.

Rehabilitation of the water infrastructure in the Amu Darya delta is already yielding results. So, for example, the fish catch in 2009 amounted to about 1200 tons, the fodder base of animal

husbandry was strengthened, favorable conditions for the breeding of fur-bearing animals, marsh and waterfowl were created, the area of forest-tugai thickets increased [21].

In order to improve the ecological state in the Aral Sea zone, over the past 20 years, forest plantations have been carried out on an area of about 740 thousand hectares, incl. on the drained bottom of the Aral Sea 610 thousand hectares. For forest plantations, salt-tolerant crops are mainly used, which fix moving sands and significantly reduces salt-dust transfer [25].

Currently, a number of projects are being initiated for a total amount of US \$ 372 million, aimed at increasing water availability and improving the reclamation state of the lands of the Southern Aral Sea region. For the implementation of projects and programs aimed at the environmental improvement of the Aral Sea zone in Uzbekistan, over 1 billion US dollars have been spent in the last 10 years alone, including about 265 million dollars due to foreign loans, technical assistance and grants.

The success of the measures implemented by Uzbekistan entirely depends on the sustainable provision of water resources to the Southern Aral Sea region, which in turn depends on the water management policy of the countries located in the upper reaches of the Amu Darya transboundary river basin, the main source of water supply to the Aral Sea in general, and South Aral Sea region in particular [15].

In order to prevent further deepening of the ecological crisis, as well as to improve the existing ecological situation in the Aral Sea basin, by the decision of the Heads of the five states of Central Asia, the International Fund for Saving the Aral Sea (IFAS) was established in 1993 with the Executive Committee in Almaty (Kazakhstan).

The main tasks and goals of the IFAS activities are:

- financing and lending of joint interstate environmental and scientific-practical programs and projects aimed at saving the Aral Sea and improving the environmental situation in areas affected by the Aral disaster, as well as solving common social and environmental problems of the region;
- financing of joint fundamental and applied research, scientific and technical developments to restore ecological balance, rational use of natural resources and environmental protection;
- mobilization of funds for joint measures to protect the air basin, water and land resources, flora and fauna, etc.

The main directions of the IFAS activities to improve the ecological and socio-economic situation in the Aral Sea basin were determined by programs of specific actions approved by the Heads of State of Central Asia: ASBAM-1 (1994-99), ASBAM-2 (2003-10), ASBAM-3 (2011-15). The objectives of these programs included the creation of artificially watered landscape ecosystems on the territory of the Amu Darya and Syrdarya deltas and adjacent areas of the drained bottom of the Aral Sea, the development and implementation of programs to provide clean drinking water, improve the health of the population, implement programs to combat natural disasters, and contribute to solving social programs of the region, combating desertification, development of wetlands and other.

According to a number of researchers, environmentally sustainable development is development in which the well-being of people is ensured by the preservation of sources of raw materials and

the environment. The level of emissions should not exceed the assimilation capacity of nature, and the use of non-renewable resources should correspond to their reimbursement by replacing them with renewable components, as several approaches to environmental problems have been identified:

1. Inertial, which assumes “development as usual”, but more efficient, with continued growth and pollution control. Economic growth pays for pollution and technological development.
2. Technological transformation, in which technological development ensures a more complete development of resources and their conservation, as well as tight control of pollution.
3. Social transformation, implying a rapid awareness of the threats associated with the destruction of the environment, a breakthrough to a new worldview and a new system of values based on global collective action; transition from quantitative growth to qualitative development.

Recently, environmental management has been based on the Green Economy Concept. According to UNEP expert estimates, the “green economy” is interpreted as an economy that increases the well-being of people and ensures social justice and at the same time significantly reduces environmental risks and environmental degradation.

For the development of the Republic of Karakalpakstan on the principles of “green economy” it is necessary to implement a number of measures. The most important is the transition from environmental to environmental and economic management: if the first approach is associated with the formulation of tasks, including restrictions and framework conditions for their implementation, then environmental and economic management allows you to choose the most effective ways to solve them.

Taking into account the new conditions and historical realities of the state of nature, the problem of the evolution of the ecological environment interacts with the security of Uzbekistan, including Karakalpakstan. The approach to the practical implementation of this task determines the development strategy of the state. In these scientific developments, the role of state structures in the management of the ecological sphere is analyzed, the issues of increasing the efficiency of state management of the interaction of the “man-nature” system are raised [16, 17].

CONCLUSION

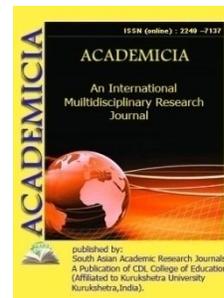

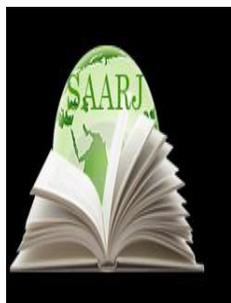

The existing ecological crisis in the South Aral Sea region testifies to the inextricable relationship of metamorphisms in nature and society. In this regard, a dilemma arises: will a repetition of this situation occur or whether there have been similar developments in the processes. In any case, in the presence of links between society and nature in the past, the existing relationships of the “society-nature” system will also help to achieve socio-ecological stability in the present and in the future. Until now, studies of the history of the development of human civilization and the history of nature in the Aral Sea region were in parallel development, independently of each other, such interrelationships of ecological processes in nature and in society were sometimes ignored.

ABSTRACT

Camelina is an underused Brassicaceae oilseed plant with significant agronomic potential in temperate areas for biofuel and vegetable oil production. Camelina is resistant to alternaria black spot and other diseases and pests, unlike other Brassicaceae. The camelina genome was sequenced and found to have an undifferentiated allohexaploid genome with a high number of genes and a low proportion of repetitive DNA. Because camelina and the genetic model plant Arabidopsis have a tight connection, this review will look at the possibility of converting fundamental Arabidopsis findings into a camelina oilseed crop for food and non-food uses. Recently, camelina has effectively expressed Arabidopsis genes for drought tolerance, enhanced photosynthesis, and overall productivity. Furthermore, gene constructs affecting lipid metabolism pathways have been engineered into camelina for the production of long-chain polyunsaturated fatty acids, hydroxy fatty acids, or high-oleic oils in specific camelina strains, which is of great interest in human food, industrial, or biofuel applications. These findings support camelina's promise as a biotechnology platform in biorefinery applications, indicating that further breeding and genetic research is needed to combine agronomic potential, distinctive oil quality characteristics, and biosafety in an agricultural production system.

KEYWORDS: *Biofuel, Brassicaceae, Camelina, Genetic, Linolenic Acid.*

1. INTRODUCTION

Camelina is a Brassicaceae family oilseed crop that grows well in temperate climates. Camelina is an East European/West Asian plant that has been used since the late Neolithic Era in South-East Europe, when it was domesticated. Cultivation of camelina was verified from West Asia through the European peninsula and northward to Scandinavia during the Iron Age. Camelina

agriculture has been reduced throughout time as a result of competition from a variety of other crops.

Camelina has reawakened interest in the 1980s as a result of increasing demand for both food and biofuel oils, and pilot-scale production facilities have been built in both Europe and North America. Camelina has also been described as a low-input oilseed crop that has exceptional resilience to common and widespread Brassicaceae diseases and pests. As a result, camelina-derived biofuels have been regarded as sustainable jet fuel or diesel replacements, decreasing greenhouse gas emissions by 75–80% when compared to petroleum-based products based on life cycle evaluation[1].

Camelina may be economically viable in on-farm biofuel generation under certain market conditions. Apart from biofuel and other non-food applications, camelina oil has a new potential as a vegetable oil for food applications: Camelina oil is a unique source of alpha-linolenic acid, an important omega-3 fatty acid with many health advantages. Because the amounts of linolenic acid in soybean and canola oils have been decreased to minimize the health concerns associated with the production of trans fatty acids during processing and to improve shelf life, camelina oil may be used instead to supplement linolenic acid in healthy diets.

Camelina is a self-pollinating crop with modest outcrossing rates in rows 20 to 60 cm apart, ranging from 0.01 to 0.28 percent. Seehuber studied the genetic diversity in agronomic and seed quality characteristics of camelina germplasm accessions in the 1980s and launched the first camelina breeding programme, which focused on the creation of base populations for future yield enhancement. Breeding operations were then conducted in a number of European nations, as well as the United States and Canada. Meanwhile, genetic engineering techniques have been effective in altering the fatty acid content of camelina oil in order to produce certain fatty acids of interest, such as fish oil-like long chain omega-3 fatty acids. Camelina is closely related to the genetic model plant *Arabidopsis thaliana* (L.) Heynh., implying that genetic and genomic techniques established in *Arabidopsis* may be used to Camelina. As a result, camelina seems to have the potential to serve as a biotechnology platform for a variety of food, health, biofuel, and non-food oilseed uses. As a consequence, the goal of this study is to summarize plant breeding and biotechnology findings in order to highlight potentials and future research requirements for expanding camelina's use as a sustainable oilseed crop[2].

1.1 Camelina Oil:

1.1.1 Camelina Grain Yield:

A new crop's ability to compete in terms of agronomic performance with existing oil crops is a critical element in its economic viability. Camelina oil and biofuel production would have a lower environmental effect if seed yields were higher. Camelina has been identified as one of the most promising new crops for oil production in temperate areas, owing to its broad adaptability, cheap input requirements, short crop cycle, and other benefits. Despite its recent breeding history, camelina trials have shown acceptable yield performance and other positive agronomic characteristics when compared to other new crops, which may be attributed to camelina's lengthy history of adaptability.

Low yields may suggest a poor crop establishment due to drought stress, non-optimal sowing timing, or other unfavorable environmental effects, while grain yields of over 3000 kg/ha have

been obtained using genebank accessions, newly created cultivars, and breeding lines in favorable conditions. There have been significant genetic variations in yield stability across genotypes over a greater number of trials, suggesting that breeding for particular environment adaption or wider stability may enhance yield performance[3].

Camelina oil content has also shown significant fluctuation, ranging from 30 to 49 percent, similar to grain yield. Significant genetic variation as well as genotype by environment interaction have been reported in specific studies for both grain yield and oil content, suggesting that selection for better yield or oil content might be effective. Significantly favorable relationships between grain yield and oil content have been found for various oilseeds. Researchers found negative correlations between the two characteristics across a group of camelina genotypes in certain settings, highlighting the need of tracking the grain yield/oil content connection of individual populations when breeding for oil production[4].

1.1.2 Camelina Oil Fatty Acid Composition:

A few main fatty acids, such as palmitic, oleic, or linoleic acid, predominate in most established oil crops. Medium-chain fatty acids, such as capric or lauric acid, are produced in a few new oilseeds, such as cuphea, while hydroxy fatty acids, such as lesquerolic acid, are discovered in lesquerella. Erucic acid is also produced in most Brassicaceae oilseeds, such as non-canola-quality rapeseed cultivars or crambe. When compared to conventional vegetable oils, such uncommon fatty acids have distinct physicochemical characteristics and a broader spectrum of oleochemical reactions for a variety of uses. Camelina seed oil is unusual in two ways: (i) the main fatty acid is polyunsaturated alpha-linolenic acid; and (ii) the concentration of erucic acid is low for a Brassicaceae species, while eicosenoic acid is produced as a long-chain fatty acid. Linolenic acid levels range from 30 to 43 percent, depending on genotype, agronomic treatment, and environmental factors. After earlier planting, at a greater N-fertilizer rate, and in seeds with a bigger 1000-seed weight, a winter-sown cultivar had higher linolenic acid content than a spring-sown cultivar. As with other oilseeds, the amount of linolenic acid seems to be lower in warmer regions like Spain than in colder climes like northern Germany. Linseed oil is the only vegetable oil that has a greater linolenic acid content than camelina oil. In most instances, camelina oil has less than 3% erucic acid, while eicosenoic acid levels vary from 11 to 19 percent, and saturated fatty acids are frequently found in quantities less than 10%. In mutant populations, there is a little more diversity in fatty acid composition[5].

Specific mutant genotypes could be used in crosses within selection programmes to change the concentration of individual fatty acids, similar to other oil crops: linolenic acid content could be increased for technical applications, but it should be reduced for camelina biodiesel applications due to a number of drawbacks associated with the chemical properties of linolenic acid methyl est. Furthermore, the amount of erucic acid in food may be decreased for food safety concerns, since greater erucic acid consumption has been linked to heart lipidosis in animal studies. Via conclusion, camelina oil's unique fatty acid composition suggests that it has significant fatty acid desaturase and elongase potential, both of which may be increased in genetic engineering methods to produce customised fatty acid profiles. Camelina also contains a seed protein, which seems to be a useful by-product but will not be discussed in this study.

Camelina can thus be grown as a winter or spring-sown crop in semi-arid, temperate, or even short-season environments such as Canada and the northern United States, as well as Central and

Northern Europe and Asia, for biofuel and food oil production, based on the agronomic and oil quality characteristics described above. Camelina has a similar response to nitrogen fertilizers as other oil crops, and its current yield level makes it competitive with other oil crops and for on-farm biofuel generation[6].

1.2 Camelina Disease:

Camelina, being a member of the Brassicaceae family, is susceptible to the same pests and diseases that threaten other cruciferous crops. Surprisingly, two fungal diseases that are critical to the global production of Brassica crops are entirely absent from the illness data. While no source of resistance has been identified within the Brassica genus, camelina resistance to *Alternaria* spp. has been reported by a number of writers. *Alternaria* spp. containment in *C. sativa* and *A. thaliana* has been linked to the synthesis of two indole phytoalexins, camalexin and methoxy-camalexin. Camalexin has structural similarities with the synthetic systemic fungicide thiabendazole, however it is not found in any other farmed crucifer species. Although camalexin has direct antimicrobial action against *Alternaria* spp. *in vitro*, it is possible that it also contributes to *Alternaria* resistance indirectly by inhibiting the synthesis of the *Alternaria* toxin destruxin B. It was also shown that *C. sativa* can detoxify destruxin B[7].

The economic significance of black spot disease for Brassica crop production throughout the globe, along with *C. sativa*'s full resilience, has made it an ideal option for intraspecific hybridizations with other Brassicas. However, significant cross-incompatibility and ploidy variations between *C. sativa* and farmed Brassica species make *Alternaria* resistance transfer problematic. Insufficient rhizogenesis and sterility of the hybrids hindered attempts to transfer camelina-derived *Alternaria* resistance to *B. carinata* and *B. oleracea* via protoplast fusions.

Furthermore, resistance transfer based on camalexin elicitation may not be as simple as one would think: detoxification of the phytoalexin brassinin in *L. maculans* cultures rose significantly in the presence of camalexin. This indicates that, while improving *Alternaria* resistance, adding the camalexin route into plants that produce brassinin, such as *B. napus*, may also increase sensitivity to *L. maculans*. Finally, the implications of expressing a phytoalexin in a new plant species must be thoroughly studied.

The most common disease of Brassica crops is *Leptosphaeria maculans*, which causes blackleg or stem canker. Despite the fact that camelina is essentially resistant to this disease, making it an appealing source of resistance for improving vulnerable Brassica crops, relatively little study has been done to explain the processes behind camelina's blackleg resistance. Phytoalexin production may be one of the key reasons once again.

Camelina shows diversity in resistance to damping-off and root-rot, sclerotinia stem rot (and downy mildew) in addition to full resistance to black spot and black leg disease, suggesting that the creation of resistant cultivars is possible. Camelina, on the other hand, is vulnerable to diseases such as clubroot, white rust, and aster yellows, which may represent a danger to increased camelina output unless resistant cultivars or appropriate management techniques can be developed.

Flea beetles are a major pest of canola and mustard crops in the northern Great Plains of the United States and Canada. Flea beetles may be seen on camelina plants in the wild, but they do not eat on them. Feeding on camelina does not begin until the beetles have been trapped to the

plants for many days. However, once feeding began, it tended to continue, suggesting that *C. sativa* resistance to *Phyllotreta* may be due to a lack of feeding signals rather than the presence of feeding deterrents. Insects' assessment of the chemical makeup of the plant's surface and volatile chemicals determines whether or not they would accept it as a host plant[8].

Glucosinolates are a class of compounds present in and on the surfaces of cruciferous plants that may function as insect pest repellents or attractants, and have been demonstrated to have a role in the identification of host plants by insects like the flea beetle. Because *C. sativa* has a low amount of glucosinolates, it may not provide enough chemosensory cues to stimulate eating. Second, none of the farmed Brassica species have three glucosinolates that *C. sativa* has. As a result, in addition to quantitative variation in glucosinolate concentration, qualitative variation in glucosinolate content may also play a role in host selection.

Only a few studies indicate camelina's resistance to other insect pests, and the camelina/flea beetle system is the best-studied relationship between this plant species and insects. Diamondback moth and mustard sawfly have been found to be deterred by *C. sativa*. Female cabbage root flies also did not lay eggs on *C. sativa* plants. The cabbage seedpod weevil seems to be resistant to *Camelina* as well. Although the second study's test findings were ambiguous owing to poor plant growth, they were backed up by the discovery of a significant decrease in *Ceutorhynchuspallidactylus* leaf area consumption in *Camelina alyssum* compared to *B. napus*. Camelina's unique features of insect pest resistance may aid in the modulation of feeding cues in crops such as *B. napus*, reducing the effect of insect pests on Brassica crops.

1.3 Genetic Resources and Applications in Genomics:

Several collecting institutes preserve camelinagenebank accessions, although the number of accessions accessible in most collections is relatively low, reflecting camelina's minor significance as a field crop in the past. As of June 2014, EURISCO, the European database of plant germplasm collections, has a total of 793 accessions of *C. sativa*. The majority of camelina accessions are kept in Germany, Poland, the Czech Republic, Bulgaria, and Austria, according to the EURISCO catalogue, although many accessions seem to be duplicated in national inventories. According on taxonomic searches as of June 2014, the Plant Gene Resources of Canada database has 137 *C. sativa* accessions, while the USDA National Plant Germplasm System holds 44 accessions[9].

The researchers examined the phenotypic variety of agronomic and seed quality characteristics in a group of camelinagenebank accessions, highlighting significant variance and high heritability for time to flowering, plant height, and 1000-seed weight, with less variation for fatty acid concentrations. Researchers divided 130 accessions into four groups based on seed size, seed oil, and protein content; they found 15 polymorphic RAPD markers for a sample of genotypes, however there was no correlation between genetic and phenotypic estimates of variety. From a camelina genomic DNA library, researchers created SSR markers. While the majority of their SSR primer pairs amplified multiple fragments, they were able to select a number of useful polymorphism primers for grouping 40 genebank accessions into different groups.

Scholars utilized sequence analysis of the ITS region as a marker system to distinguish between *Camelina* species and identify interspecific hybrids. Researchers used AFLP markers to create a genetic linkage map and found QTL areas for seed production, 1000-seed weight, plant height,

oil content, and individual fatty acid concentrations in a bi-parental population, showing the viability of marker-assisted selection.

However, future camelina breeding may benefit significantly from high-density genetic maps and genomic information obtained from modern genome and transcriptome sequencing methods, thanks to recent advances in sequencing and analytics. Transcriptome analysis of developing camelina seeds, for example, revealed several genes involved in seed storage protein and lipid biosynthesis metabolism; this information could be used in gene suppression or transgene expression approaches to improve camelina seed quality by targeting specific protein or lipid properties.

1.4 Camelina Breeding Methods:

Camelina flowers are tiny and seldom visited by insects. As previously stated, camelina outcrossing rates are extremely low, comparable to soybean outcrossing rates, and outcrossing occurs only over short distances. Honey bees, wild bees, and other insects visited the flowers, but seed set parameters did not vary substantially between open pollination and self-pollination. As a result, camelina may be classified as a mostly autogamous species.

Pure line breeding seems to be the technique of choice for cultivar creation based on camelina flowering biology. Segregating generations may be managed via pedigree or bulk breeding methods after artificial hybridization. The single-seed descent method has been used in camelina breeding and mapping experiments for rapid generation advancement to homozygosity; because spring-types of camelina do not require vernalization, three to four generations of a segregating population could be grown per year in a greenhouse, similar to rapid cycling brassicas.

In camelina, mutation induction techniques have been employed in addition to hybridization to create new genetic diversity. Seed treatment with EMS or seed irradiation with gamma rays from a ⁶⁰Co source have both been successful in changing the fatty acid content. Camelina was also effectively treated with EMS seed to decrease its susceptibility to acetolactate synthase inhibitor herbicides, giving resistance to imazethapyr, sulfosulfuron, and flucarbazone[10].

Another significant method for speeding breeding programmes is the generation of double haploids obtained from other cultures or isolated microspores. The best rate of embryogenesis was reported in the Camelina protocol for microspore embryogenesis, when small floral buds of <1 mm buds were used which looked like the late-uninucleate stage of the development of the microspore; some 70% of regenerating plants had spontaneous chromosome twinning with normal seed set but the efficiency of double-shaped production.

2. DISCUSSION

Camelina is considered a platform for the generation of bio-industrial petroleum. In addition to an adequate yield and processing capacity, fully established methods for breeding and enhancement of traits are available in genetic engineering because of the high gene sequence of genes between Arabidopsis and camelina. Genetic transformation methods based on the transformation of the agrobacterium-mediated floral dip have been established and in recent years have produced a series of effective transformation reports. In camelina, the genes for changing the fatty acid content, increased seed and oil production or dryness resistance were expressed in addition to selection markers.

RNAi removal of fatty acid desaturase (FAD2) and elongase (FAE1) genes has led to lower linoleic, linolenic and eicosaenoic acid concentrations, whereas the amount of oleic acid accumulated at 66%; camelina strains with high oils are of considerable value for biofuel production and further technical uses, as biodiesel with low oxygenation is of high linolenic acid. Compared to spontaneous genetic or environmental changes in the content of fatty acids, suppression lines have a significant effect on the adaptation of oils. Other types of camelina made from desaturase fatty acid and elongase cassette genes have generated up to 31% eicosapentaenoic acid, or up to 14% docosahexaenoic acid, both of which have a distinct medical and nutritional significance and are now supplied mainly by marine fish oils.

Camelina lines overexpressed the GTP-binding protein signalling AGG3 showed an increased efficiency in photosynthesis, associated with higher fruit, 1000-seed weight, seed yield and oil content than controls, showing that quantitative agribusiness can be developed through regulations on plant organ size. The increased resistance to the drought, which has been obtained via the overexpression of an arabidopsis gene for cuticular wax biosynthesis on camelina leaf surfaces, is an essential application with special importance for biofuel production at marginal soil.

The examples show the potential of camelina to translate fundamental genetic and biotechnological findings into various biorefinery applications for agricultural biofuel and other vegetable oils. In addition, because of the minimal danger of outcrossing, no crossing with common Brassicaceae species, and a limited potential for weeds compared to other Brassicaceae, genetically modified camelina also has a low level of biosecurity and is therefore ideal for platforming plants.

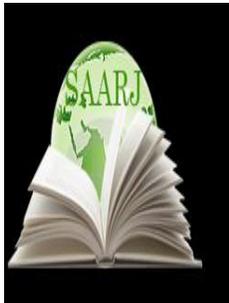

3. CONCLUSION

Although camelina has considerable agronomic potential and a unique composition of fatty acid, grain yield and oil content are important breeding objectives for making the crop more competitive to other widely known olive seeds. Due to the synthesis of phytoalexins, camelina is resistant to key Brassicaceae diseases and may also serve as a model for resistance to other significant species. Since the camelina genome is allohexaploid with many unquiet gene loci, genomic selection may speed up breeding progress with phenotypic selection, since it can deal with complicated epistatic effects more effectively. The sequence collinearity of Arabidopsis may be used in many genomic and transgenic methods such as lipid biosynthesis metabolic engineering. Further study is required to maximise the content of target fatty acids in transgenic camelina strains while avoiding unwanted metabolomic byproducts, seed protein engineering and problems of biosafety.

ABSTRACT

Maize is the third most significant crop of nation after rice and wheat and is grown round the year. Its grain is utilized as feed, food and industrial raw material. Enormous progress has been achieved over past six decades to increase yield potential via genetic improvement and relieve impacts owing to different biotic- and abiotic-stresses. This study provides an overview of methods pursued in genetic improvement of maize and evaluates their effect on productivity and output of the crop. Development of cultivars with tolerance to abiotic-stresses and resistance to diseases has been a key issue in maize development. Improved goods have been provided to farmers by both governmental and commercial sectors engaged in maize seed manufacturing and distribution. As a consequence, area under better cultivars has been growing steadily, and now about 65 percent of maize land is under improved cultivars (mainly hybrids) (mostly hybrids). Adoption of high-yielding cultivars, better production techniques and increasing demand of maize resulted in higher output and productivity. Future possibilities of maize production and development techniques in context of climate change and in ensuring nutritional security are also addressed in this study.

KEYWORDS: *Crop, Germplasm, Genetic Improvement, Nutrition, Production.*

1. INTRODUCTION

Maize is planted in 184 million ha in 165 countries, producing 1016 million tonnes of maize worldwide and producing 5.52 tons/ha. It has become the grain which has the world's biggest output, which in 1996 exceeded rice and wheat in 1997, with production growing twice the annual pace of rice and three times the annual rate of wheat. India produces 9.0 million hectares of maize and is fourth behind the USA (35.5 million ha), China (35.3 million ha) and Brazil (15.4 million ha). Maize is the third largest rice and wheat crop in India. It uses its grain as feed,

food and industrial raw materials (Figure 1). It is planted in the nation throughout the year, although most (83%) of it is grown in rain or Kharif (July - October), followed by winter or rabi (November to April) (15%) and spring (February - May) (2%) seasons. Karnataka, Andhra Pradesh, Maharashtra, Tamil Nadu, Rajasthan, Bihar, Uttar Pradesh and Madhya Pradesh are among the major maize producing states and account for about 80 per cent of the country's total maize area and comparable output. As a food crop, maize is used more widely than other main crops, since a range of products are created from it and different kinds of maize such as quality protein maize (quality protein maize, pop maize, sweet maize, baby maize, etc.) are offered[1].

The area and maize output have increased continuously since 1950. (Figure 2). The area rose from 3.3 million to 9.0 million hectares and in 2013–2014 output grew from 1.7 million tonnes, to 24.4 million tonnes. The growth in production and extension of the area in Andhra Pradesh, Karnataka, Maharashtra and Tamil Nadu in the past 10 years has been extremely fast. The region, on the other hand, has seen a decreasing tendency in Madhya Pradesh, Uttar Pradesh, Jharkhand and Punjab in recent years. In India, maize by tradition is a kharif seasonal crop but currently grows in the rabi and spring seasons[2].

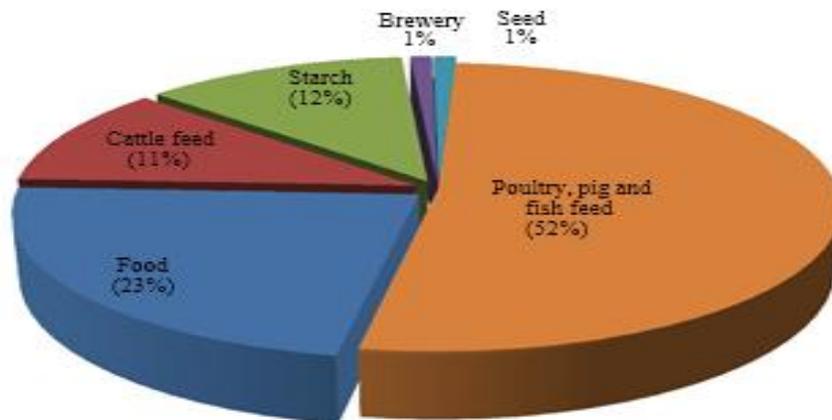

Fig. 1 Utilization pattern of maize grain in India

The production of maize in a variety of ecologies throughout the nation is susceptible to different abiotic and biotic stressors. These include high humidity and temperature, illnesses and insect pests. There have been concerted attempts to relieve the impacts of these stressors and to increase the yield potential through genetic improvement and better management. Consequently, huge progress in this area has been achieved during the last six decades. This study provides an overview of genetic enhancement methods pursued by maize in India and evaluates its effect on crop yield and output. In addition, possibilities for maize growing and improvement strategy are addressed in the context of climate change and nutritional security[3].

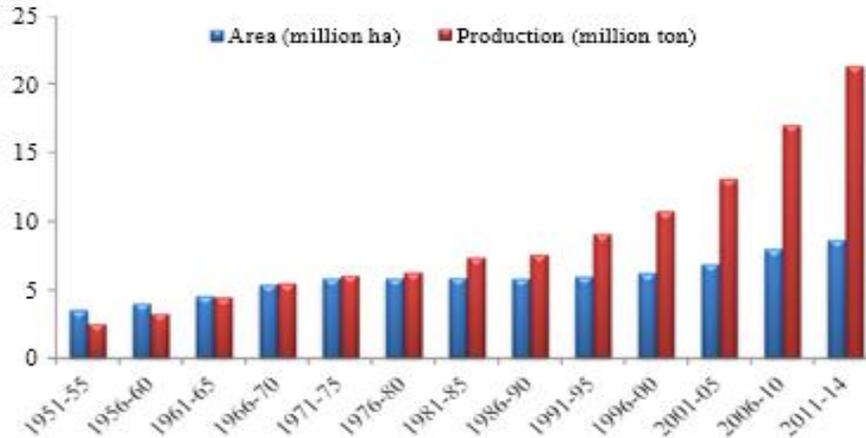

Fig. 2 Trends in area and production of maize in India since 1951

1.1 Genetic Enhancement:

1.1.1 Collection, Introduction and Use of Germplasm:

Different germplasms are a must for a successful crop enhancement programme. There have been intensive attempts to gather indigenous diversity and import alien germplasm. The studies have shown that in the Himalayan area there are land-races with primitive features called 'Sikkim Primitives' that are distinct from primitive Mexican races, e.g., Nal-Tel and Palomero. Therefore, considerable efforts have been undertaken to gather germplasm from the North East Himalayan NEH area. The Indian maize races have been categorized, based on the assessment of these and other collections, as primitive, advanced, recent introductions and hybrid races. In addition to races, many significant local variations were found, generally called according to the area in which they were mostly grown. The indigenous germplasm was big, poor yielder and mostly flint. Compared to foreign germplasm, it exhibited little diversity in Central and South America in particular. Still at that time, indigenous germplasm had a particular importance, since it developed in harmony with the prevailing agro-ecological factors and thus is anticipated to respond better to regional pressures. In the development of populations, heterotic pools and inbreds, indigenous germplasms have been utilized. The local germplasm's molecular characterization showed the varied nature of maize germplasm in India[4].

The Rockefeller Foundation also brought germplasms from various nations, notably the USA, Mexico, Colombia, Peru, Venezuela and Caribbean islands in the 1950s. Some introductions were utilized as commercial cultivars immediately. At the national genetic resources office in New Delhi, about 10,000 accessions (indigenous and exotic collections) are under long-term conservation at the National Gene Bank. Most exotic germplasms come from tropical and subtropical sources. Certain germplasms have been characterized for particular characteristics such as biotic and abiotic stressors, and nutritional quality criteria, such that over 30 sources with unique traits that are of enormous value in the breeding programme have been identified.

1.1.2 Improving The Quality of Nutrition:

The maize protein level of lysine and tryptophan is low, making it nutritionally inferior. The nutritional advantage of recessive opaque2 (o2) was discovered in India to improve the nutritional quality of maize by 2–3 times lysine and tryptophan as compared to normal maize.

The discovery led to the introduction of o2 alone into an elite genetic background. These efforts resulted to the successful creation and release throughout 1971 of three o2 composites, namely Shakti, Rattan and Protina. These enhanced maize varieties were not however popular, mainly because of the chalky look and unfavorable pleiotropic effects of o2, such as soft endosperm that rendered o2 growers more susceptible to attacking stored grain insect pests. Wishful mix of endosperm modifiers in the o2 backdrop. The outcome was hard endosperm-based genotyping of O2 in Mexico. In India, accumulation of CIMMYT germplasma modification in particular resulted in the introduction of Shakti-1 in 1997, the first harsh endosperm-based o2 composite. In 2001, the first QPM hybrid in India, 'Shaktiman-1' (a white three-way kernel cross), was launched and 'Shaktiman-2' (the white kernel-based SCH) was introduced in 2004. 'Shaktiman-3' and 'Shaktiman-4' were initially launched in the yellow kernel during 2006, followed by 'Shaktiman-5' in 2013. These QPM hybrids have been tailored to the state of Bihar. Later, many single-cross QPM hybrids with greater adaptation to the country's various agro ecologies have been produced.

The use of molecular markers to enhance maize in India resulted to the commercial release of the first marker aided selection (MAS) maize product (Vivek Quim-9) in 2008, combined with marker-based background selection. In 2012, a single cross QPM hybrid was published for the state of Uttarakhand from the MAS-derived Vivek QPM-21. Currently markers are used in quality breeding programmes for the faster production of QPM hybrids. The parental inbred QPM version of many commercial one-cross maize hybrids has been produced and experimental hybrids are being tested for agronomic performance assessment. Opaque16 (o16) is introduced into the o2 genetic background of a quality breeding programme to further enhance lysine and tryptophan in endosperm. The mutant o2 and o16 combinations provide a 40–80 percent improvement in lysine compared to just o2o2 genotypes[5].

The enhancement of maize vitamin A is a new emphasis in India. While conventional yellow maize has enormous natural diversity in carotenoids, lutein and zeaxanthine, which have little provitaminA action, are mostly carotenoids. The main carotenoid pro-vitamin A is b-carotene at minute concentrations. Multi-location assessment of a wide range of yellow corn infusions showed a 0.1–2.0 ppm level of b-carotene below the desired level of 15 ppm in the maize kernel. A unique b-carotene hydroxylase alone (crtRB1) which enhances b-carotene by preventing its conversion to other components was incorporated into seven elite inbred parents with MAS. The reconstituted hybrid form exhibited a huge increase in the b-carotene kernel with a mean of 17.5 ppm, whereas the original hybrids were 2.1 ppm. Research initiatives have also been started in India to produce multi-nutrient rich maize. A QPM hybrid form of provitamin-A-rich is presently being tested in multi-location locations. In addition, in conjunction with CrtRB1, uncommon allele lycopene epsilon cyclase (lcyE), which pushes the lycopene flow toward b-carotene, is also used for additional enrichment of b-carotene in the genetic background of commercially available QPM hybrids[6].

Research has also been started in India on the creation of maize with high iron (Fe) and zinc (Zn) mineral density. Analyzes of large sets of indigenous and foreign maize inbreds showed significant potential to increase Fe and Zn levels via breeding. Identifying QPM inbreds with high Fe and Zn also offers further advantages in the use of endosperm for high lysine and tryptophan. Zn-transporters' genome-wide analyses may identify some important genes responsible for Zn build-up in maize kernel. In addition, a marker-assisted introduction of low-

phytate mutants into top normal inbreds of maize has been conducted to improve the bioavailability of Fe and Zn. The findings are promising since these MAS-derived lines are suitably low in phytate.

1.2 Corn Specialty:

In recent years, demand for specialized maize has risen by several folds. Sweet maize has evolved among many varieties as one of the most significant types of speciality maize, utilized mostly as fresh, processed vegetables and snacks. The first composite of sweet maize called 'Madhuri' was launched in 1990. Additional attempts to create various sweet maize cultivars resulted to the development of several additional sweet maize cultivars such as Priya, Win Orange and HSC 1. Sweet maize hybrids are currently being developed in the genetic field of *sucary1* (*su1*) or *shrink 2* (*sh2*). Identification of closely related SSR markers for *su1* and *sh2* has also given the elite genetic background a new dimension to the marker aided introgression of these genes.

Popcorn and baby corn are also cultivated, especially in the peri-urban region. In 2004 the first infant variety, VL-78, was launched. The public sector groups have also released a few pop maize collages. Quantitative characteristics loci (QTL) have been discovered for several appearance characteristics in maize, giving a possibility to integrate them into the elite flint genetic field via MAS.

Starch was one of the major by-products of maize grain and 12% of the maize produced now is utilized in the starch industry. A three-way, starch-rich hybrid 'Histarch Hybrid Makka' was launched in 1993. HM-13 just launched a SCH with increased starch content in grain. In addition, several waxy maize inbreds were also produced and utilized in the breeding effort. Genetically, many inbreds of high oil have been created and are significant in the variety development, since in chicken business high oil feed is desired.

Efforts to improve maize crops for fodder production to address the requirement for the mixed crop farming system resulted in the distribution of African Tall green feed to the whole nation in 1982. Composite APFM-8 was introduced in 1997 to cultivate in the country's southern area. In 1992 and 2008 respectively, J-1006 (for Punjab) and PratapMakka Chari 6 were published. The further popularization of sweet maize and baby maize varieties also gives the agricultural system a new dimension since they offer adequate feed after the ear harvest.

1.3 Improving Disease and Resistance to Insects:

Although there have been over 30 cases of illness recorded in various Indian areas, significant diseases include turquoise leaf blight, maydis leaf blight, complicated post-flowering stalks, leaf banding and sheath blight, sorghum downy mildew, bacterial stalk red and brown strip downy mildew. These diseases occur depending on the prevailing environment (temperature, precipitation and wetland), cultural practices (planting density) and maize crop variety in various agro-ecological areas. Such illnesses cause huge losses in both the amount and quality of grain produced under favorable circumstances. Resistance breeding of host plants has been focused, because resistance to host plants is sustainable and cost-effective. Following a thorough knowledge of the epidemiology of many diseases, field checking methods were developed, capable of distinguishing resistant and susceptible lines and utilized widely in breeding programmes for resistance. Cultural and chemical methods were also developed to manage these

diseases, in addition to the use of host plant resistance. However, chemical control methods are mainly limited to plots of seed production and to commercial hybrid seed treatment supplied to farmers[7].

Three insects - stem borer, pink stem borer and shooting fly - in India are the major problems. These are usually managed by the use of pesticides. In addition, germplasm under artificial infestation are continually assessed to discover resistant sources of these insect pests. Antigua Group 1 has attracted attention as a resistant source for a long time. It was also utilized as a hybrid ganga male parent (CM 500). Recent attempts via cyclic selection and artificial inbreeding in order to enhance moderately resistant sources have been fairly successful in minimizing leaf damage. Resistance to pink borer is also observed in inbreds. Maize grains are also infected by a broad variety of storage insect pests that have resulted as voracious feeders of cereal grains, including rice weevil and Angoumois grain moth. Grains are typically kept in jute bags in poor nations such as India that frequently absorb humidity during the rainy season and provide favorable circumstances for weevil infestations. A large screening of several inbreds, including QPM, pop maize and candy maize has led to the discovery of rice weevil-resistant sources. These sources of resistance are promising their objective use in the breeding programme. Furthermore, in recent years, biological control via *Trichogramma chilonis* has gained importance. Integrated pest management approach may also offer ways to control insect pests in a sustainable manner[8].

1.4 Improving The Tolerance of Abiotic Stress:

Maize is mainly cultivated (over 80 percent) during rainy season and the availability of moisture is seldom sufficient for maize of Kharif. The crop is also susceptible to dependent / intermittent excessive moisture / water recovery or drought at key development phases, often within the same season. Rabi maize acreage is frequently limited (15 percent) by protracted low-temperature regimes in most areas of India, with the exception of South India, in December and January. In crucial periods of development, particularly during early planting and blooming phases, cold stress may induce permanent physiological damage to maize plants, leading to significant production losses[9].

The impact of climate change, which is plainly shown by the increasing frequency of severe weather, presents additional difficulties for an already sub-optimal/challenging environment. Several climate modelling studies have shown a faster rise in daytime and night time, intense and concentrated rainfall within restricted days, which causes shorter-term water logging and leaves severe dry days in the Asian tropics for the remainder of the season. This is evident in a recent Indian Meteorological Department study based on previous 110 years, which showed that while the overall rainfall has not changed much in recent years, the frequency of wet days has dropped dramatically and this has resulted in the high availability of humidity. In various areas of maize production, such changes are already seen in many ways, in terms of changing seasons and increased rates of severe weather events, such as drought, water collecting and heat combined with new/complex diseases[10].

2. DISCUSSION

A well-organized seed production programme is vital in order to fully exploit the benefits of enhanced hybrid cultivars. Compared to hybrids and composites, inbred lines need a distinct package of production technologies, such as crop geometry and the reduction in fertilizer and water management. Previously, inbred parents' agronomy did not get much attention. During these last two decades the agronomy of inbred lines has received appropriate attention, as well as the creation of high-yielding inbred lines have made excellent progress. In addition, the modernization of seed processing and packaging has improved significantly.

Both the governmental and commercial sectors participate in the manufacturing and distribution of maize seeds. In addition to generating certified hybrid seed, the public sector provides the breeder and founding seed of parental hybrid lines to the private sector. The seed production activities are being conducted by the NSC, 15 State Seed Corporations (SSC), several State Departments of Agriculture and Agricultural Universities. Recently in Rajasthan and West Bengal, a seed village idea was established to grow certified seed in accordance with specific arrangements of government to enhance food safety and nutrition. The private sector, like always, has a significant stake in the seed business. Due to favorable growing conditions and sufficient seed processing facilities, the majority of seed production is carried out during the rabi season in Andhra Pradesh.

Public sector entities undertake hybrid seed manufacturing and sale of public-sector maize hybrids, but enough seed is not produced to satisfy demand. Therefore, public-private partnership (PPPs) has been formed between public-sector research institutes and small and medium-sized private seed businesses for development and commercialization of public-species hybrids. This is of tremendous assistance in prompt distribution and replacement of newly released cultivars. Another example of PPP is the assessment of hybrids in the private sector by coordinated project centers throughout India. Under addition to the existing tests of private-section hybrids in the All India Coordinated Research Project (AICRP) method and the seed production outsourcing and marketing by the private sector of public-species hybrids, the PPP model must nevertheless be strengthened. In the context of successful PPP models such as Germplasm Enhancement of Maize (GEM) in the United States and TAMNET in Asia, future partnerships must collaboratively increase the germplasm of different goals in order to promote the creation of better germplasm.

3. CONCLUSION

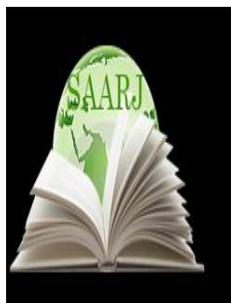

In future, demand for maize is projected to increase. The key drivers of maize demand in India are (a) increased demand by the poultry and piggy sector, consuming more than half of domestic production, (b) growing urbanization leading to increased demand for processed foodstuffs, such as corn flakes, bakers, etc., (c) increasing organized dairy sector, requiring more fine cereals and more concentrate from the maize sector and (d) increasing domestic prices. The anticipated development of feed-based industries suggests that maize consumption would increase in India from the present level of 25 million tonnes, to 45 million tonnes, by 2030. India should be able to achieve more than this goal by expanding the genetic improvement programme and by developing adequate agro-interventions and appropriate regulations.

Germplasm base diversification Only by constant infusion of more and more varied elite germplasm from temperate areas can the continual increase in production be accomplished. Only a portion of the broad genetic diversity in maize has been used thus far. Without disrupting

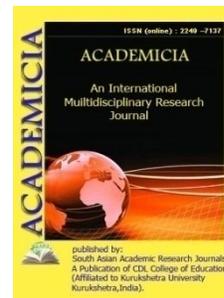

heterotic groups, recycling current elite lines may further improve output in the near run. However, extending the germplasm base to include characteristics such as drought and water tolerance, diseases and insect resistance, superior nutritional qualities, good standing and the required characteristics for climate resilience are particularly useful in order to sustain long-term genetic productivity and stability gains. To date, little emphasis has been paid to the exploitation of temperate germplasm. Temperate material is a potential source of hybrid-oriented germplasm diversity. The genetic basis for speciality maize and forage maize germplasm, accessible from Indian maize farmers, has to be extended quickly.

CREATION OF 3D MODELS OF HISTORICAL MONUMENTS APPLICATION OF DIGITAL TECHNOLOGIES

Xodjayeva Mavlyuda*

*Associate Professor of Modern Information and Communication Technologies,
 International Islamic Academy of UZBEKISTAN
 Email id: m.xodjaeva@iiu.uz

ABSTRACT

The article is devoted to the use of modern information and communication technologies in organizing virtual tours to places of interest and monuments, which describes the problems of developing virtual tourism. Also included are software for developing virtual travel experiences such as 3ds Max, Lumion 6.0, Adobe Photoshop, Adobe Premiere Pro and Adobe After Effect. The software complex was developed on the example of the complex "Shaikhovanda Tohur" which is located in the city of Tashkent.

KEYWORDS: *IT, Education, Programming, Development, Scratch, Code.Org, 3ds Max, Lumion 6.0, Adobe Photoshop, Adobe Premiere Pro, Adobe After Effect. Islam, Digital Technology, Lan, Information And Communication Technology Education.*

INTRODUCTION

As you know, today the process of integration and globalization is deepening and covering all areas. The unique treasures of the world treasury of science and culture are presented to the general public. This is especially true for today's young people, and for those who have a deeper knowledge. Education systems also play a role in this process. Digital technologies, especially modern information technologies, especially the widespread use and development of the Internet, are a topical issue today. Such technologies create unique opportunities for our young people to have open and wide access to the global information system, to develop their intelligence and professionalism.

LITERATURE REVIEW

The strategy we used to create the search strings was as follows [2] [21]: • Finding papers about creation of 3d models of historical monuments. • Listing keywords mentioned in primary studies which we knew about. • Use synonyms word (usage) and sub subjects of digital technology in

education such as (creation of 3d models, historical monuments). • Use the Boolean OR to incorporate alternative spellings and synonyms. • Use the Boolean AND to link the major terms from population, intervention, and outcome. The complete search string initially used for the searching of the literature was as follows: digital technology AND historical monuments. It has been highlighted in [5] [18] that there are two main issues on conducting an SLR search which are the sensitivity and specificity of the search. In our preliminary search, when we used the complete search string defined above we retrieved a very high number of articles. For instance, Google scholar, Scopus, ProQuest education, IEEEExplore, Science Direct, Springer Link retrieved more than two hundred results. Therefore, we have deepened our search and used this search string: (Adoption OR Usage) AND (historical monuments OR “3d models”) AND (2d, 3d models OR digital technologies). The revised search string has given us a reasonable number of studies and we finally selected relevant empirical studies

ANALYSES AND RESULTS

3D modeling or CAD (Computer-aided design) refers to the creative process of building a model in three dimensions (known as x,y,z) using a dedicated software package like Maya, Houdini, Blender, Cinema 4D, or many others. The major aim of this paper is to present a non-destructive GIS-based method for a frescoes and Icon analysis part of the cultural heritage [1].

CAD has been used for years in many industries to create a database for manufacturing, to improve the quality of design and communications through documentation. As a result, most brands find that 3D content already exists in their manufacturing process[2].

The first 3D models were created in 1960s. Back then, only those professionals in the field of computer engineering and automation who worked with mathematical models and data analysis were involved in 3D modeling.

A pioneer of 3D graphics is Ivan Sutherland, the creator of Sketchpad. This revolutionary program helped to create the first 3D objects – 3D is what it is today thanks to Sketchpad. Sutherland, along with his colleague David Evans, has opened the first ever department of computer technologies at the University of Utah. They attracted numerous talented professionals from all over the country who helped contribute to the development of the industry. Edwin Catmull, a current head of Pixar Animation Studios and Walt Disney Animation Studios, was one of Sutherland’s students [3].

Sutherland and Evans opened the first 3D graphics company in 1969, calling it simply “Evans & Sutherland”. Initially, 3D modeling and animation was used mostly on television and in advertisement, but with time, its presence in other areas of life increased greatly.

The proposed methodology is based on the combination of topographic surveys, digital photogrammetry and image processing techniques by means of four control points and one photography of the target at least, that become metric rectified image at any plane defined by the user. It is possible to quantify any physical characteristic of the surface of a fresco as well as alterations on its surface that produce deviations from flatness. The Bundle adjustment was applied to a 2D reconstruction algorithm instead to a 3D reconstruction algorithm to control fresco, from the Ramet Monastery[7].

There are many reasons and motives for digital modelling of real world objects, including: virtual reconstruction of historical artifacts icons and frescoes that no longer or only partially

exist, digital documentation of pictures for restoration purposes in case of fire, flood, etc.; ability for virtual interaction without the risk of damage; production of e-learning data for educational resources; virtual tourism; virtual museum exhibits; and interactive visualisation of the objects [1].

Conditions are being created for the free and creative work of people, especially young people, through innovative technologies in education and training based on science, technology, digital technologies and artificial intelligence systems.

The importance of innovative technologies in the education system largely depends on the development of information technology in the big picture. At present, as a result of the development of information technologies in our country, the prospects for the production of national programs are being developed. It is very important to bring up young people in the spirit of patriotism and to bring them up with high knowledge and morals like our ancestors [9].

In this regard, the role of modern virtual technologies in preserving the material and spiritual heritage, as well as their transmission to future generations is invaluable. Software developments based on virtual and augmented reality technologies are proof of our point. Nowadays, when we divide virtual technologies into two groups based on virtual reality, the first ones are appreciated by game developers and sellers. While the former uses virtual reality to achieve the full immersion effect of a game or virtual journey, the latter is prepared to invite customers to “try out” clothing or furniture [11].

Today, virtual reality technologies are spreading to other areas as well. For example, in education, a virtual environment helps to visually explore anatomy, architecture, or ancient civilizations. Virtual and augmented reality of digital technology now helps to better understand material and make learning more interactive. If we talk about the direction of multimedia technology to create three-dimensional graphic images, this direction is also relevant, including applications such as AutoCad, 3DMax, Blender, 4D CINEMA, Blender, Maya. The products of world-famous cinematography companies such as WarnerBrothers, Colambo Pictures, Sony Animation, Dream Works are produced in the three-dimensional graphics programs listed above. Currently, the widespread introduction of AutoCAD and 3D MAX programs in the process of creating a graphic model of historical monuments and artistic decorative elements is effective[18].

There is a technology of computer modeling, the purpose of which is to reflect in computer memory the process of understanding the nature around us, the events that take place in it, and changes in society, using modern methods. The use of programming languages in computers has made a serious breakthrough in mathematical modeling.

Different types of process models studied on computers (graphics, diagrams, animations, animations, etc.) can be created on a computer screen. An example of the work being done in this direction is a virtual model of the Minor Mosque in Tashkent (Figure 1).

Figure 1 Minor mosque project

A three-dimensional model of the object was created using the capabilities of 3D MAX software. Like all graphics programs, this program requires a high-quality computer. First of all, digital objects are 3D (three-dimensional) models created in a free space using computer software[21].

Today computer technology is used by 3D editors to create three-dimensional compositions. They have two distinct characteristics. First to properly control the interaction between the surface properties of the object and the light source to show the three-dimensional nature of the object being depicted. The second is that it allows you to create three-dimensional animations. That's why three-dimensional graphics editors are called 3D animators.

The rapid development of digital and information and communication technologies and the updating of its hardware and software, the application of 3D max modeling, three-dimensional image modeling, three-dimensional representation of space and objects, images, drawings and geometric figures Indicates that there are options for creating a 3D model [15].

Three-dimensional graphics are widely used in engineering design, architectural construction, construction of computer models of physical objects. Three-dimensional graphics is one of the most complex and comprehensive areas of computer graphics. Users working with three-dimensional graphics should have knowledge in one of the areas, such as designing, lighting, moving objects and cameras, using sound, applications, and using presentation effects [9].

The use of programming languages in computers has made a serious breakthrough in mathematical modeling. Different types of process models studied on computers (graphics, diagrams, animations, animations, etc.) can be created on a computer screen.

Looking back, it was hard to imagine the capabilities of today's computers. At the same time, three or more software developments are being developed in information technology, the visuals of which are astonishing. Modern forms of modeling began to emerge.

When creating a three-dimensional model of an object using the capabilities of the 3D MAX program, this program, like all graphics programs, requires a high-performance computer [17].

This process can be seen in the example of the historical monument of Sheikh Khovand Tokhur, one of the sacred places in Tashkent. Exports and stores the finished object in 3D MAX and imports it into Lumion. In this program, materials are provided to the object and made ready (Figure 2).

Figure 2. General view of Sheikhhovanda Tohur Mosque

The main view of the Shaykhovanda Tohur complex created with the help of the Lmion program (Figure 3)

Figure 3 General view of the Shaykhovanda Tohur complex

The potential of multimedia technologies in the development of virtual models of historical monuments is also unique. Multimedia technologies provide information exchange between the user and the computer using sound (speech, music, noise), graphics (pictures, images, photos, drawings) and animation (videos, cartoons).

It is also gaining ground in a number of areas. The development of multimedia technologies is based on applications that work with objects of three or more sizes. Among various industries, these programs are used in architecture and construction, design and modeling. It was in these applications that only 2 sides of the object were represented, and now concepts such as 3D, 4D Cinema, 5D and even 7D are beginning to emerge. The following large-scale applications have the opportunity to learn more about the object than ever before. Spatial movements on the models, animations are performed in Blender, MAYA programs [21].

The development of the industry is the basis for tourism, as well as virtuality in all areas. In particular, architecture and design are unimaginable without modeling.

When creating three-dimensional models, a three-dimensional model of an object allows the user to have a better idea of the object.

Using models and algorithms, the created object will look like the original. Additional effects on the model will depend on the inner world and imagination of the designer. 3D effect models of travel routes will help to attract more tourists. The development of the multimedia industry can be seen in the example of these applications. We can also see the capabilities of 3D MAX in the example of LUMION 6.0, which can work in sync with this program. LUMION 6.0 is a great practical utility for the rendering part of a modeled object.

A number of computer applications play a key role in creating models of not only travel routes, but also any objects. Modeling is the visualization of an object in computer memory so that complete information about the object can be obtained [15].

Modelling accuracy depends on requirements such as level of detail; a sample of live survey data will be utilised as ground truths to evaluate the accuracy of the mapped parametric data both as individual models and integrated models. Mapped detail behind the surface of the structure, which is based on historic detail, will be compared for accuracy with existing survey data of the surveyed structure where detail is available from previously carried out destructive surveys and openings of buildings [19].

There is a growing interest in historical monuments and their visits. It is no exaggeration to say that the creation of 3D models of historical monuments and their introduction in travel itinerary will increase the interest in them. Visual models of historical monuments in our country can be created using 3D Max and other modern software (Figure 4).

Figure 4. Sheykhovanda Tohur ”complex interior

CONCLUSION

In the age of digital technology, especially virtual technology, people need to be constantly on the move. Constant physical exertion can lead to physical and mental exhaustion. The developed software helps a person to have a spiritual rest. The user can organize a virtual tour of the house, place of work, or otherwise to the site. The user will also have a basic understanding of step sets. The presentation of the studied processes and events through computer technology, the creation of models of sacred sites based on virtual reality and its presentation to the general public are important as they increase users' interest in historical monuments.

Today, with the help of such virtual reality, it is possible to visit other countries and attractions, museums and even sunken ships.

The use of digital technologies in various fields plays an important role in shaping the worldview of young people:

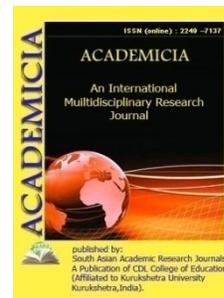

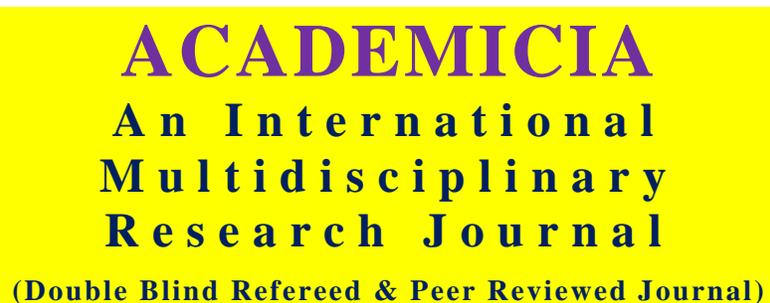

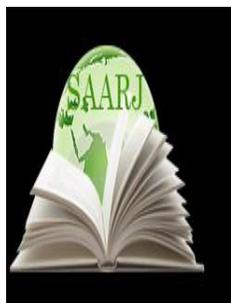

- The fact that the majority of the population of the country uses the opportunities of the Internet in the field of Internet and information technology;
- The ability to more accurately represent the image of a real object in the elements of multimedia design of historical monuments and monuments through graphic programs;
- The deep penetration of multimedia in all areas of information technology;
- That the state pays attention to measures aimed at understanding national identity and deepening the assimilation of religious values.

The implementation of the above goals and objectives will ensure the effectiveness of digital technologies, educational innovations, the positive impact on the worldview of young people, the revival of historical thinking of young people, the consolidation of national identity and values in the minds of our people, especially in youth.

Email id: sh.ochilov@inbox.uz.

ABSTRACT

The article discusses the improvement of the methodology for the development of environmental competencies of students and pedagogical aspects to improve the technology for the development of environmental competence of students in the interdisciplinary teaching of physics. There are also new integrative model of physical education and the algorithm of its organization for the development of environmental competence among students.

KEYWORDS: *Ecological Competence, STEAM, Integrative Model, Ecology, Interdisciplinary Learning, Diagnostic Modules, Energy*

INTRODUCTION

In our country, the advantage of training based on a competency-based approach to education is provided, teaching students to use effectively in various situations encountered in personal, professional and social life.

The draft state educational standards provides for the formation of students' general competencies concerning the support and the subject. Core competencies - special attention is paid to the abilities, skills and activities that a person must possess for successful prosperity in society, regardless of what profession he has. From the core competencies, the "Competence of Nature Protection and Ecological Culture" was created in the following order:

- Explanation of ecological processes taking place in living and inanimate nature by means of physical laws;
- Preservation of the environment (water, air, land), their economical use;

- The influence of physical fields (noise, electromagnet, radiation) and the improvement of methods and means of protection against them;
- Rational use of natural resources, human influence on nature, study of global and regional environmental problems;
- explanation of the use of electric energy obtained by traditional methods, natural resources, their economical use and the study of ways to obtain alternative energy;
- Analysis of physical methods and means and life examples in the development of environmental monitoring of the environment.

In order to achieve an effective solution to the above problems, a systematic approach should be used in the environmental education of teachers, specialists in the field of education of the system of interdisciplinary teaching of the student's environmental competence.

When studying the global environmental education system in Germany, a direction is given to the formation of the behavior of environmental responsibility among the younger generation, in Austria, the environmental education program is included in the school curriculum, in the United States of America, the issue of deep implementation of the content of educational subjects in the content of environmental education in general education schools is considered, in the People's Republic of China, the history of environmental education covers a period of more than 30 years, there is proposed the inclusion of an ecology course in all educational institutions.

Practical work is being carried out in our country on the basis of a number of laws, regulations, orders on the issue of nature protection in the environmental education system. An ecological party has been established in Uzbekistan, and the Ecosan movement has been organized on a voluntary basis. Faculties of ecology are being created in higher educational institutions, a plan of the national movement for environmental protection of nature and stable development of the Republic of Uzbekistan has been drawn up. It pays special attention to improving the ecological situation on the territory of Uzbekistan; protection and improvement of the environment; rational use of land and water resources in order to preserve for the future generation; development of non-traditional energy sources and renewable energy sources.

"Improving the methodology for the development of environmental competencies of students in the interdisciplinary teaching of physics" it is about a rapidly and intensively developing society, science and technology, compliance with new production requirements, the ability to anticipate, bring to students not only the theoretical foundations of knowledge and skills, but also on the basis of acquired knowledge to develop their personal qualities, guide their individual qualities to set goals, study environmental problems arising in the future in personal, professional and social activities and develop the necessary environmental competencies for them to take measures to eliminate them.

The ecological and pedagogical model of the development of ecological competence of students in interdisciplinary teaching of physics is as follows (see Figure.1).

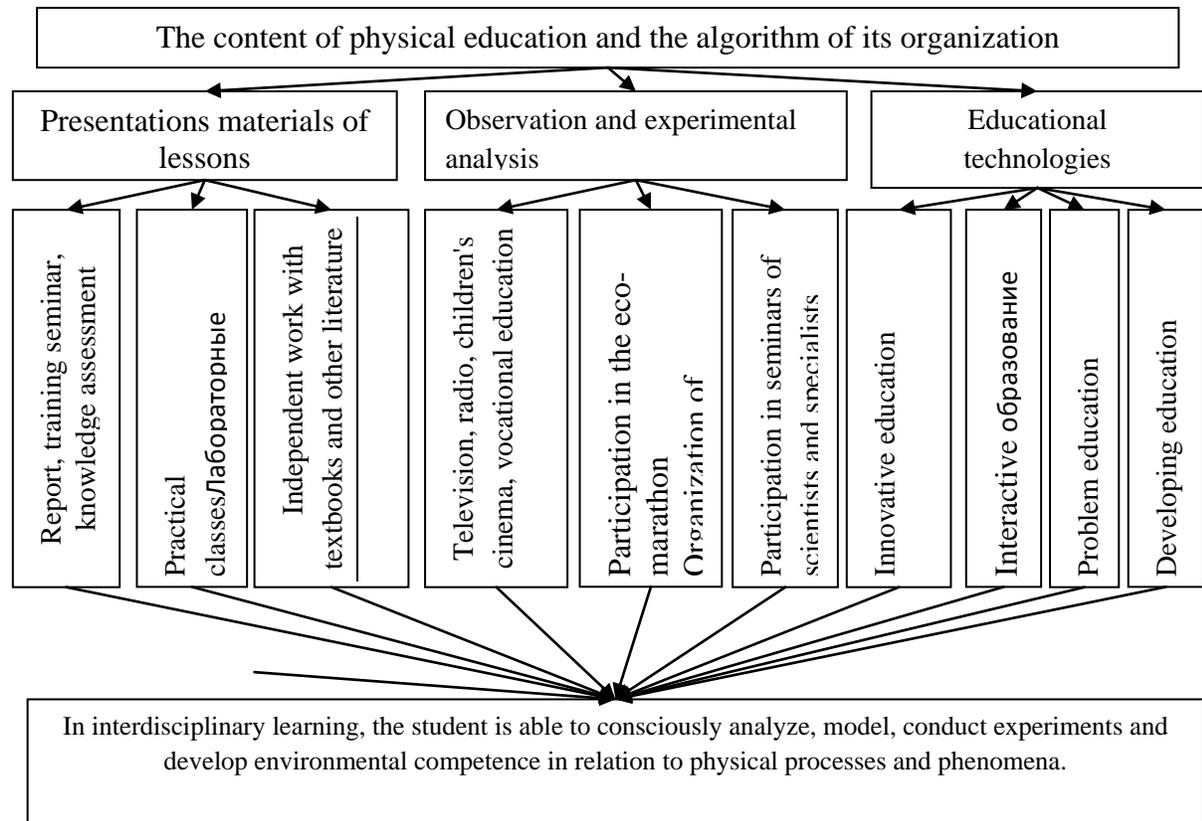

Fig. 1. Ecological and pedagogical model of the development of ecological competence of students in intersubject teaching of physics.

1. The first stage of the development of the student's ecological worldview is a lesson. In interdisciplinary teaching, a student can form knowledge of environmental competence through the following subjects: chemistry, biology, social studies, geography.

Students of grades VIII-IX have a very deep knowledge system in mathematics and physics. Especially the students of grades X-XI are in close active contact with the environment and society. Making reasonable use of these opportunities of students, a system of knowledge on their environmental competence has been created.

2. In observation and experimental analysis, the student uses the following sources: radio, television, Internet sites, international events and messages, events taking place in the country and the region, covered in newspapers and magazines; the logical structure of research works carried out in the field of ecotourism has been developed, changes in social life have been analyzed.

3. Pedagogical technologies - formed in the XVII century on the basis of the didactic tendencies of Ya.A. Komensky, are developing in the direction of the class-lesson system, which is currently most used in the countries of the world. The interdisciplinary teaching of physics uses "Developing educational technologies" and their types.

With the development of the student's environmental competence, when teaching physics with interdisciplinary communication, the requirement of training in direct connection with the

complex of the sphere of influence of physical fields on the environment, mechanisms, degree and methods and means of protection against them increases. Physical fields include the following: the development of technological progress, sound waves, noise generated during production, electromagnetic field, X-ray radiation, radioactive radiation, the flow of charged particles.

Examples of topics of the physics program in the development of environmental competence of students on the basis of integrability are given.

In lessons 61, 62, 63, 64, 65 about the "Sound phenomena" of Chapter VII of the physics textbook for the sixth grade. After a full explanation of the topics, the students are shown the negative effects of sound on living organisms. A sharp increase in the heart, cardiovascular system, gastrointestinal, hypertensive diseases of people is associated with noise, in the open air a person does not

In the IX class when explaining the topic to students "Evaporation and condensation": 1. The device, application and actions of the "Solar Water Desalination Plant", which turns salt water into fresh water, are described in detail. 2. Explains how evaporation occurs in plants, deterioration of the quality of consumption of vegetable products, carrots, potatoes and other vegetables, as a result of evaporation of moisture from their composition, it is indicated that in order to preserve useful properties, their constant storage at normal temperature is necessary. 3. When chemically solid and liquid substances evaporate, diffusion, spreading in the environment, pollutes the air. A person breathing such air can get poisoned, careful use of them is necessary.

In the physics program for the eighth grade on the topics "Power plants and their types", "Accidents of electrical networks", it is of great importance to explain to students traditional, non-traditional ways of generating electricity and new types of energy of the future.

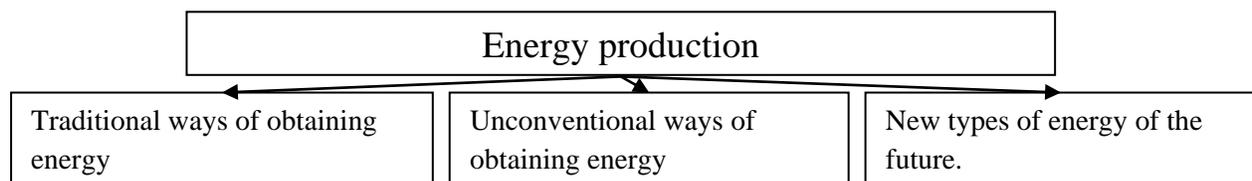

Fig. 2. Traditional, non-traditional ways of obtaining energy and new types of energy of the future

Currently, a nuclear power plant is being built in our country. Its total energy balance is the production of 2.4 GW of electricity. This will save more than $3 \cdot 10^9$ m³ of natural gas per year. The annual reduction of environmental pollution by harmful gases is explained to students, that is, up to $14 \cdot 10^6$ tons of carbon dioxide (CO₂), up to $36 \cdot 10^3$ tons of nitrogen dioxide (NO₂).

When explaining non-traditional methods of generating electricity to students, the limitlessness of raw materials for energy reserves is explained, unlike traditional methods by their ecological purity and restoration. Among these methods, solar panels and wind generators have been well studied and widely practiced in recent years, and energy production with their help has been established.

For our country, one of the promising non-traditional methods is bioenergy. Currently, many projects of biogas production plants have been developed. This installation.

When studying these topics, the environmental aspects related to this topic are explained in detail.

The concepts of students on the economical use of fuel reserves used in traditional methods of energy production; on solving environmental and safety problems related to energy production; on the development of non-traditional methods of energy production are analyzed and improved.

XI class chapter IV. In lessons 33,34,35,36 in the section "Electromagnetic waves and optical waves", after a full explanation to those students, the negative consequences of the constant use of cell phones in our daily activities and the danger to life of the waves emanating from them are explained on scientific and life examples, the concept of their biological and hygienic effects are related to the knowledge gained on the subject of biology.

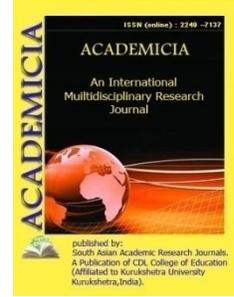

The analysis of what to sit for a long time near a color TV, a long conversation on a cell phone, long-term use of information and communication technologies has been carried out and improved.

ABSTRACT

In three insect orders, agriculture has developed independently: once in ants, once in termites, and seven times in ambrosia beetles. Despite the fact that these insect farmers are very distinct in some respects, they are strikingly similar in others, implying convergent evolution. Within their nests, all reproduce their cultivars as clonal monocultures, and in most instances, clonally over many farmer generations. Long-term clonal monoculture poses unique disease management challenges, but insect farmers have developed a variety of methods to combat crop diseases: They isolate their gardens from the rest of the world; they keep a close eye on them, controlling pathogens early in disease outbreaks; they occasionally access population-level storage tanks of genetically variable cultivars, while still propagating clonal monocultures across generations of farmers; and they manage, in addition to the primary cultivars, a variety of auxiliary microbes that provide disease suppression. Insect farmers seem to cultivate, and potentially “artificially select” for, integrated crop-microbe consortia rather than cultivating a single cultivar purely for nutrition. Crop domestication in the context of coevolving microbial consortia may, in fact, explain insect farmers' agricultural success.

KEYWORDS: *Agriculture, Beetles, Cultivars, Escovopsis, Macrotermite.*

4. INTRODUCTION

Crop cultivation for nutrition has only developed a few times in the animal world. Fungus-eating ants, fungus-eating termites, ambrosia beetles, and, of course, humans are the most well-known and clear examples. Sustainable, high-yield agriculture is becoming critical for survival in a global economy with projected food shortages for humans, who began the transition from an ancestral hunter-gatherer existence to farming only about 10,000 years ago. Various research programmes are currently devoted to the optimization of agricultural productivity in the era of

increasingly environmental challenges. Humans have progressed in agriculture via a mix of intelligence, innovative planning, and a fair amount of chance and luck. Humans, on the other hand, have not yet looked at nonhuman agricultural systems, such as fungus-growing insects, for potential ideas for bettering agricultural methods[1].

This dearth of applied interest in insect agriculture is most likely due to a widespread belief that human agricultural systems are fundamentally different from insect systems. Humans, on the other hand, have learnt a great deal by studying the adaptive characteristics of other species, and similar issues like crop diseases afflict all farmers, independent of their phylogenetic locations or the phylogenetic positions of their crops (plant, fungus, or otherwise). Because crop diseases affect both human and insect agriculture, it may be worthwhile to look at the short- and long-term remedies that have converged in insect agriculture for potential application in human agriculture. This review's aim is to create such a synthesis[2].

4.1 Agricultural Evolution:

A comparison of ant, termite, and beetle fungi-culture reveals a number of convergent and divergent aspects of agricultural development.

4.1.1 Cultivar Transmission:

Fungal cultivars are transferred vertically by trophophoresy from parent to child generations in attine ant and xyleborine beetle agriculture. Female reproductive ants and beetles obtain inocula from their natal gardens, transport it in specialized pockets during early life dispersion flights, and utilize it as a starting culture for their new gardens. Trophophoretic vertical transmission also occurs in two macrotermite groups, with the exception that one of these two groups (the sole species *Macrotermes bellicosus*) transmits the fungus through the king, while the other group (the genus *Microtermes*) transmits the fungus by the queen. The remaining macrotermitines, in the rare instances where fungal transmission has been investigated, depend on horizontal absorption of fungal crops from the environment in each generation[3].

4.1.2 Crops Specialize:

The assumption of clade-clade communitives and topological congruence here between phylogenies of insect farmers as well as those of their cultivars is based on vertical transmission of cultivars. Indeed, significant groups of farmers (huge clades or paraphyletic classes, for example, the lower attine ants) rigidly specialize on major groupings of matching fungal cultivars in all insect farming systems. Higher (i.e., wide) phylogenetic levels show the anticipated farmer-cultivar congruence, perhaps due to ancient evolutionary codependencies that prevent farmers from switching to cultivars outside of their specialized main cultivar groupings.

However, phylogenetic patterns show that insect-farmer species sometimes move between fungal species or strains within these tightly restricted main cultivar groupings. This combination of lower-level, within-group switching and higher-level major-group specialization in insect farmers would be analogous to defined clades of specialized wheat-farmers, rice-farmers, potato-farmers, bean-farmers, etc. in humans, each of which is able to switch between varieties within their area of specialization (e.g., between wheat varieties and closely related species *suida*). Switches to new main cultivar groupings among insect farmers have been very uncommon evolutionary occurrences[4].

4.1.3 *Cultivar Specialization:*

Though low-level switching between cultivar species and strains within major cultivar groups happens on occasion throughout evolutionary time, most insect farmer species interact with just a small subgroup of cultivars for long ecological periods (species or strains). For example, every attine ant species studied so far cultivates just a single phylogenetically restricted set of cultivars (e.g. a single fungus species), implying species specificity between ants and cultivars at relatively early stages of evolutionary diversification. Only one main cultivar of ambrosia beetles is linked with a certain beetle species within a geographic area, similar to ants.

Despite the fact that most beetles are linked with a species-specific main fungus across their entire geographic ranges, certain beetle species are associated with various primary cultivars in different geographic areas. There is a lot of diversity in cultivar specialization among macrotermite species: Some macrotermite species are restricted to a single, unique cultivar, while others grow a wide range of fungal cultivars, which they sometimes share with other macrotermite species. Distinct cultivars may serve different main roles, supplying specialized, termite-adapted enzymes in some instances, while providing generalist food in other circumstances[5].

4.1.4 *Cultivar Sharing and Exchange:*

Even while each attine ant species specializes in a particular cultivar species, a given cultivar species may be cultivated by multiple sympatric ant species, and these sympatric ant species are not always closely related (e.g., they may represent different ant genera). Cultivar transfer between ant species may take place in a number of ways, both direct and indirect. Raids on adjacent colonies or, in polygynous organisms, cofounding of colonies by multiple queens who swap cultivars or recombine them in the cofounded garden are examples of direct routes. Cultivar breakouts from gardens, followed by a free-living (feral) life, and then reincorporation into a symbiosis when a separate attine colony imports the free-living strain into its nest, are examples of indirect routes.

The existing phylogenetic data for ambrosia beetles indicates to cultivar sharing across sympatric beetle species, although few studies have looked into this. As with the ants, distantly related ambrosia beetle species are occasionally linked with the same cultivar, implying fungal exchange, either direct or indirect. When various female beetles inhabit the same tree and the fungal companions cross-contaminate neighboring galleries, cultivar exchange across and among beetle species may occur. Most macrotermite species acquire their fungus horizontally each generation, unlike attine ants and ambrosia beetles, which all transfer their cultivars vertically between generations. This means that novel termite-cultivar combinations emerge every generation, making cultivar interchange across species and lineages of the same species easier. Cultivar studies of sympatric macrotermite communities show that cultivars are often exchanged across lineages via interspecific cultivar exchanges. In macrotermitines, intra-specific cultivar exchanges have not been studied yet[6].

4.1.5 *Sexual vs. Asexual Cultivar Propagation:*

All vertically transmitted insect cultivars, including attine ants, ambrosia beetles, and termites in the genus *Microtermes*, as well as the species *Macrotermes bellicosus*, seem to be reproduced asexually by their insect farmers over many farmer generations. Horizontally transmitted termite

cultivars, on the other hand (propagated by all other macrotermitine genera), go through normal meiosis and sexual recombination.

DNA fingerprinting studies in attine ants show that all gardens of a single leafcutter colony contain a single cultivar clone (monoculture); that identical cultivar clones occur in different colonies of the same geographically widespread attine ant species; and that different sympatric ant species share genetically identical culti on occasion. Attine cultivar clones, in contrast to popular belief, are not old. Although attine crops are clonally propagated over many ant generations, recombination events involving either sexual (meiosis, mating) or parasexual (e.g., mitotic recombination, exchange of haploid nuclei) activities occur on a regular basis. The following are examples of evidence supporting recombination on a rare basis:

- I. Fruiting structures (mushrooms), which are found in almost all species of attine ants, defying the assumption that fruiting capacity would be lost over millions of years of strict clonality;
- II. Allele sequence divergence rates in attine cultivars that are comparable to those seen in closely related, sexually reproducing fungus; and
- III. Lower attine ant cultivars with tight genetic ties to free-living fungal populations, implying that these fungi are capable of migrating in and out of the symbiosis, that cultivar and wild lineages may frequently interbreed, or both. The genetic and natural-history data combined indicate mostly asexual cultivar propagation inside ant nests and over several generations, with occasional genetic recombination events.

A single cultivar monoculture is cultivated in a single termite colony, similar to attine ants. The *Termitomyces* cultivar is reproduced asexually inside termite nests by inoculating new garden substrate with asexual spores and, most likely, by transferring mycelium from older to younger gardens. Although there are no known free-living populations of *Termitomyces* species that are completely independent of termite farmers, they have retained the ancestral (presymbiotic) condition of regular sexual reproduction, and most *Termitomyces* cultivars are spread horizontally via sexual spores produced by fruiting bodies (mushrooms) growing on the external surface. The termite *Macrotermes natalensis*, for example, exhibits an outcrossing mating system in its *Termitomyces* cultivar. Only termite species with vertical uniparental propagation have asexual cultivar propagation lasting many generations. Phylogenetic patterns suggest that horizontal cultivar exchange occurs across nests of the same and different termite species on occasion, but it's unclear if this horizontal exchange is linked to cultivar sexual reproduction[7].

The main fungus in xyleborine beetles are strictly asexual, while the less specialized, auxiliary fungi are often sexual. The main fungi of all other non-xyleborine ambrosia beetles show a predominance of asexual reproduction in fungal cultivars, while the more incidental fungi are frequently sexual, indicating that this may have been the original state at the beginning of the xyleborine beetle-fungus symbiosis.

4.2 Co-evolutionary Modifications:

Farmer-cultivar specialization increases the possibility for coadaptation, in which one partner's evolutionary alteration induces the other partner's reciprocal co-evolutionary modification. It is relatively easy to identify evolutionary modifications in farmer species, such as specialized morphological structures for trophophoretic transport of cultivars by females during dispersal

flight (e.g., mycangia in beetles, infrabuccal pocket in ants), modifications of mandibles and guts of beetle and ant larvae for fungus-feeding, or the suite of behavioral, glandular, and olfactory adaptations. However, since cultivated fungi are intrinsically more difficult to examine, examples of evolutionary changes in cultivars have been more difficult to find.

The hyphal-tip swellings (gongylidia) generated by higher attine cultivars and the similar nodules produced by macrotermite cultivars are the finest instances of cultivar changes. Both gongylidia and nodules are nutrient-rich structures that farmers may easily harvest, consume, and feed to larvae or nymphs. Although the ambrosia shape of the beetle cultivars indicates evolutionary adaptation intended especially for efficient intake and digestion by the beetle larvae, nutrient-rich structures are not known for beetle gardens. Ambrosial growth is made up of densely packed conidiophores with a large number of spores that can only be produced in the presence of beetles.

Nonsymbiotic fungal species have not been found to produce ambrosia. *Ambrosiella* and *Raffaelea*, two of the most important fungus associated with ambrosia beetles, are both polyphyletic, and numerous lineages within each genus have converged on the same ambrosial form, implying evolutionary convergence owing to selection. Other possible co-evolutionary modifications that have yet to be investigated include insect cultivars' ability to reproduce predominantly asexually while under cultivation, as well as the cultivars' ability to survive storage in the dispersal pockets of beetles and ants, or passage through the alimentary canal of termites[8].

4.3 Cultivar Symbiont Selection:

Insect agriculture, from an evolutionary standpoint, is an example of cooperative interaction between farmer and cultivar lineages, with one utilizing the other for its own reproductive goals. When mutant over-exploiters (so-called cheater cultivars) enter a mutualism, such cooperative relationships are often fragile and may degrade over evolutionary time. Additional farmer-cultivar conflicts are expected, which may destabilize the mutualism, but at least two evolutionary processes protect the farmer-cultivar association's cooperative nature: Inherent in vertical cultivar transmission, partner feedback is an automatic feedback mechanism in which an uncooperative partner reduces the other partner's fitness to the extent that it reduces its own fitness; and, second, partner (symbiont) choice, in which farmers prefer associations with fruitful cultivars and discriminate against inadequate cultivars in specific situations. Partner choice is a particularly essential process when the evolutionary rates of two collaborating partners vary. The slower-evolving partner (e.g., the insect farmer) is expected to have a say in which variants of the faster-evolving partner (e.g., the fungal cultivar) are used, and thus the slower-evolving farmer imposes selection favoring beneficial symbiont variants and prevents the spread of non-beneficial cultivar mutants. Termite and beetle farmers have yet to investigate symbiont choice, but ant farmers can distinguish surprisingly fine genotypic differences between cultivars, suggesting that cultivar diversity in ant gardens may evolve through an analogue of "artificial selection," such as through mutation in the garden or the import of novel strains[9].

4.4 Disease's Impact on Insect Agriculture:

Ant, termite, and beetle gardens are often invaded by “weedy” fungus, which may cohabit with the crop at low or controllable levels. The garden is rapidly overtaken by these weeds if the gardening insects are removed or if their nests are abandoned. Wood-degrading fungi of the endophytic genus *Xylaria*, for example, are present in most fungus-growing ant and termite gardens, most likely because it is introduced with garden substrate. Though weeds such as *Xylaria* do not harm the cultivar directly, they compete for nutrients and therefore reduce crop production. *Escovopsis* species, ascomycete fungi found in fungus-growing ant colonies, are specialized para-sites that eat the cultivars directly and limit the nutrients available to the ants. In termite and beetle agriculture, weed fungi and bacteria are also recognized, although they have yet to be well investigated.

Garden output is reduced by *Escovopsis* infections, which lowers ant colony development and colony survival. *Escovopsis* is a taxonomic and geographically varied species. The parasite has been isolated from colonies of every attine species throughout their geographic ranges, and some *Escovopsis* lineages have evolved to parasitize certain cultivar lines. This high degree of host specificity suggests that *Escovopsis* has had a long history of host-parasite coevolution, in which cultivars, ants, and their mutualistic bacteria have likely co-adapted to defend against *Escovopsis* attack, and each *Escovopsis* species has become narrowly specialized to overcome the defenses of some hosts but not others[10].

5. DISCUSSION

Despite the fact that attine ants clonally reproduce their cultivars through generations over short evolutionary time periods, no ancient clone has been discovered. Instead, data suggests that lower attines acquire new cultivars from wild (sexually reproducing) fungal populations on sometimes, and that both lower and higher attines acquire new cultivars from other attines' nests on occasion. Higher attines cultivars that aren't known to have free-living populations nevertheless have the capacity to fruit and show patterns of DNA-sequence variation that indicate occasional genetic recombination via self-mating or genuine intercrossing across cultivar strains. While each attine ant colony's crop is a clonally propagated monoculture at any one moment, the fungal population outside the nest has the genetic diversity and resilience required for long-term disease control. As previously stated, sexual reproduction is the norm in termite cultivars that reacquire their cultivars horizontally each generation, and sexual reproduction may also occur in termite fungus that transfer their cultivars vertically between generations. It's unclear if the ambrosia beetles' principal cultivars can reproduce sexually on occasion. Access to a population-level pool of cultivar genetic diversity is a constant characteristic of insect agriculture that may offer alternate crops for coping with illness, at least for termites and ants, and probably for beetles as well.

All insect agriculturists check their gardens on a regular basis, and no area of the garden is left unattended for long enough to enable illnesses and fungivores to develop and proliferate. Because their societies include a non-reproducing worker caste, a significant percentage of which is devoted to garden maintenance, insect agriculturists, especially ants and termites, are able to engage in such extensive surveillance. The tiny size of the garden allows or intense surveillance by a single female or a small family of females in the case of beetles. Diseases are identified and eliminated in the early stages of infection, before they may spread and cause substantial crop loss, thanks to intensive surveillance. Early identification is an efficient protection against new disease mutations that may develop higher virulence if left untreated,

since these strains may be more easily managed with conventional therapies in the early stages of infection.

Garden treatment in attine ants involves the use of secretions from their meta-pleural and mandibular glands to clean substrate when it is carried into the nest, likely eliminating some or all weeds and pathogens from the surface before it is put to the fungal garden. Although antibiotic-producing glands in fungus-growing termites have not been investigated, certain nonfungus-growing termite secretions contain antibiotic characteristics. Antimicrobial glands in ambrosia beetles have yet to be discovered and investigated. Attine ants have additional antimicrobial defense in addition to glandular secretions. Actinomycete bacteria have colonized some or all of their integuments. These bacteria are known to hinder *Escovopsis* growth, and reducing actinomycetes in colonies has been shown to enhance *Escovopsis* infection in experiments. Antibiotics are produced by garden bacteria in the genus *Burkholderia*, which defend against the garden parasite *Escovopsis* as well as entomopathogenic illnesses of ants. Actinomycetes and other bacteria are found in termite gardens, and beetle gardens have a wide variety of bacterial secondary symbionts; nevertheless, the precise functions of these bacterial companions are unclear.

6. CONCLUSION

In contrast to insect farmers, secondary mutualistic microorganisms have the ability to develop at the same pace as coevolving garden pests, allowing mutualistic insect-microbe systems to react quickly to the introduction of new disease genotypes. Although the benefits of such fast microbial antibiotic resistance are apparent, their evolutionary maintenance is unknown. One option is that each farming civilization has access to a wide variety of microorganisms from which to choose specific, desirable kinds as required. This scenario begs the issue of how the insect farmers managed to keep such a varied variety of bacteria in their colonies in the face of both microbe competition and the frequent bottlenecks of the whole microbial "library" that probably happens at the start of every new insect colony.

Alternatively, the secondary bacteria may be naturally fast-mutating, allowing for the quick emergence of new beneficial genotypes to mount an adequate defensive response. This situation begs the issue of how insect farmers identify the most advantageous genotypes and select them for selective "amplification" against certain diseases. The lack of clear developmental processes for maintaining functional affiliations with coevolving, mutualistic microbes is not trivial, and future research should assess not only the diversity of microbial genotypes within individual farmer colonies, but also the mechanisms involved adaptive symbiont-choice selection of beneficial, novel microbial genotypes. Future study should look at whether the coevolution of many mutualistic-ally aligned partners, each mustering their own defense, results in a much more evolutionarily stable disease-management approach than if the insect farmers work alone in a co-evolutionary arms race against specific diseases.

APPLICATION OF SATELLITE NAVIGATION SYSTEM FOR EMERGENCY WARNING

Mr. Manoj Kumar Ojha*

*SOEIT, Sanskriti University,
Mathura, Uttar Pradesh, INDIA
Email id: manoj@sanskriti.edu.in

ABSTRACT

In the event of an emergency, one of the most important duties of any government is to convey and distribute safety information and warnings to the general population. New media, mobile technologies, and the associated expectations of personalized warnings to personal mobile devices are challenging the old paradigm of a government monopoly system providing warnings via a broadcast method. In the provision of emergency warnings, location-based emergency services and smartphone notifications are becoming more common. Several nations across the globe, including Australia, have embraced these innovative emergency service models. The Australian National Emergency Alert (EA), for example, is a phone-based service with location-based features. The idea of using global satellite navigation systems, such as the Japanese satellite system, in the area of emergency warning and alerting is introduced in this article. The Japanese satellite warning system may be customized to send real-time location-based emergency alerts to people's mobile devices without being limited by ground-based communication technology. The great resilience of satellite-based communication against communication network overload and loss of ground systems and network infrastructure during a catastrophe is a significant benefit. During disasters, this allows individuals to receive critical information from anyplace (outdoor) and at any time. A satellite-based warning system may potentially be utilized in conjunction with current warning systems as a complementing technology. This paper looks at the benefits and drawbacks of utilizing satellite navigation systems to provide emergency and disaster alerts and security messaging.

KEYWORDS: System, Navigation, Alerting, Warning, Satellite.

1. INTRODUCTION

Emergency and catastrophes have severe personal, economic, and environmental effects that are widely acknowledged. The Indian Ocean Tsunami, Victorian bushfire disaster in Australia, and the Tohku Earthquake and Tsunami in Japan are just a few examples of tragedies that highlighted the critical importance of preparedness, early detection, and warning communications in reducing losses of life, property, and environmental damage[1]. A 'warning system' is a method of gathering information about an approaching emergency, the nature of the threat, conveying that information to those who are likely to be impacted by it, and allowing those in risk to make educated choices and respond quickly. Functional warning systems have been proven in many studies to be a valuable tool for saving lives and minimizing property damage. In the emergency management process, the early warning and preparation phase is critical for achieving a sufficient degree of preparedness to respond to possible threats. Emergency plans are created in this phase to define processes such as evacuation and emergency escape routes, among other things. The United Nations International Strategy for Disaster Reduction specifies four interdependent components for early warnings, including information distribution through communication networks that provide timely and accurate warning signals (United Nations International Strategy for Disaster. Warning systems must be backed by dependable communication networks with good interactions between important stakeholders, decision-makers, and the general public in order to operate successfully. State emergency response agencies have traditionally relied on one-way, top-down communication channels to convey warnings[2]. Warnings and safety information are often delivered through technologies such as sirens, radio, and television. A recent re-examination of emergency warning systems, on the other hand, shows a steady progression toward incorporating two-way participatory approaches leveraging new technologies and collaborative information sharing tools, such as the powerful combination of the Internet, mobile, crowd-sourcing, and social networking technologies[3]. In a growing number of nations across the globe, including Australia, mobile location-based emergency services have become an established component of government plans[4]. This significant shift in communication roles from command to conversation reflects the rapid rate of change in modern communication patterns and information sharing technologies. Satellite navigation systems are a novel and developing technology. There hasn't been much study done to see whether it's possible or useful. In critical circumstances when ground-based communication channels are restricted or unavailable, the importance of coordinating emergency procedures with location-awareness exercises cannot be overstated. The Japanese and Australian governments officially agreed in mid-2014 to collaborate to promote the use of information and communications technology (ICT) and to enhance collaboration for the development of geospatial information projects utilizing the Japanese satellite navigation system. One example of a satellite-based navigation system is the Japanese Quasi-Zenith Satellite System (QZSS). While the satellite trajectory design was mainly designed for Japanese consumers, it also benefits neighboring East Asian nations including Australia[5]. The use of a satellite navigation system for emergency warning and alerting is discussed in this article. The suggested system may provide real-time warnings with location-based information, allowing users to adopt appropriate risk mitigation measures during disasters.

1.1 Warning Systems on the Mobile:

For the transmission of essential safety information and warning messages to individuals about imminent hazards and catastrophe risks, several, redundant communication channels are needed. Multiple communication channels improve the efficacy of emergency alerts by expanding their reach, allowing others to get through if one fails. Additionally, having several ways to convey emergency information may serve as a kind of confirmation reinforcement. People often seek confirmation from various sources when they hear surprising news. Traditional communication methods including door-to-door, signs, sirens, loudspeakers, radio, television, fixed phone network, and the internet have long been used to warn people of imminent hazards and distribute safety information[6]. Outdoor sirens and loudspeakers are effective in terms of attracting attention, but they are ineffective in terms of conveying information. Radio, television, and the Internet offer information on emergency situations to a broad audience. These, on the other hand, can only fulfil the information role of warnings and transmit them passively. The people must tune in to particular communication channels. Although door-to-door notification and a fixed phone network can actively notify and warn people of impending danger, their coverage is limited to a local scale, making them ineffective operationally. In different physical and social settings, these different methods of communicating warning and safety information are not equally effective at providing an alert. In the last decade, new media and communication technologies have emerged as effective means for disseminating warning messages and safety information. In today's culture, mobile telephony or cellular network technologies have grown widespread, and the proliferation of mobile phones offers the potential to deliver "personalized" lifeline information during crises and catastrophes. Several governments around the world have embraced and effectively used mobile telephone warning systems as a supplement to traditional well-established warning channels[7].

The common Short Message Service (SMS) and Cell Broadcast Services are maybe the two most practicable mobile telecommunication technologies that meet the criteria of mobile phone emergency alert information service (CBS). Uniform text messages are delivered point-to-area to all users within a specified geographic region defined by cell towers using CBS. It may also be transmitted to all cells in a carrier network and offers a wide range of channels for broadcasting various types of service messages (such as weather updates, public health advice etc). Users of CBS, on the other hand, must set their mobile phones to a particular channel in order to receive messages, exactly like they would with a radio broadcast. As a consequence, CBS is immune to network saturation. The Netherlands was the first country in the world to implement a national emergency warning system (Netherlands Government, 2012). Another example of CBS is the United States' Wireless Emergency Alert (WEA).

1.2 Proliferation of Smartphones and Location-Based Services:

Not just in terms of communication, but also in terms of information acquisition, Australian society is becoming more mobile. According to a 2013 study, the number of Australians using cellphones has increased. In comparison to the previous year, 88 percent of respondents possessed a smartphone this year, up from 76 percent. Smartphone ownership is expected to rise to 93 percent by August 2014, based on purchase intentions of mobile phone users (Mackay 2013). Almost all smartphones now come with a built-in GPS receiver and maps that allow users to pinpoint their exact position. Indeed, with the widespread use of smartphones, geospatial technology usage has skyrocketed. Smartphones are being hailed as the modern-day digital

"Swiss Army knives" of consumer electronics, capable of handling functions formerly reserved for specialist gear such as cameras, computers, and GPS receivers. People with active mobile devices who are situated within a specified geographic region of the disaster get notifications and pertinent safety information from location-based emergency warning systems. It may also be used to determine a mobile device's geographic position after the user has made an emergency phone call or sent a distress SMS seeking assistance. The Enhanced-911 (E911) location-based emergency call service in the United States is one example. For calls to 911, E911 requires telecommunications providers to identify a person and transmit the location of his or her mobile phone to the closest answering center. People in emergency situations may benefit from using location-based emergency warning systems. The Australian government enhanced EA in 2013, allowing location-based alerts to be broadcast based on the mobile handset's last known location at the time of the emergency as well as its registered address. Mobile phones with a registered address in the affected region, as well as users who are mobile but in the impacted area, will be informed of the emergency as a result of this improvement. A system like this is seen as a useful tool for rapidly delivering important information within a specified geographic region to the intended receivers of the messages. Mobile telecommunications services, on the other hand, are heavily reliant on network and underlying infrastructure, which may jeopardize their capacity and dependability. One drawback of such a system is that it loses effectiveness when a geographic region becomes bigger and/or in places where there is no mobile network. This method of communication works well in cities, but not so well in smaller rural areas where cell service is patchy or non-existent. Dareel, a Victorian village in the state's western region, was devastated by fire in 2013, destroying 16 houses and 18 structures. The emergency coordination operation during the fire was hampered by patchy cellphone service. The text message is delivered from point-to-point to a specified group of phone numbers using SMS. Unlike CBS, this channel is an individual addressable channel, which means that the messages are targeted to a specific person. However, if a large number of SMS messages and/or phone calls are sent at the same time, SMS is vulnerable to network congestion and message delivery failure. Delays may happen, and they might lead to delivery failure, particularly in an emergency. Despite this, SMS is a well-established and extensively used communication system. SMS offers the advantages of supporting delivery confirmation and having a 'store and forward' method. The message is kept in the Short Message Service Centre (SMSC) network during periods of unavailability network coverage or temporary breakdown and sent when the recipients become accessible.

1.3 Navigation Satellite Warning System:

Another method of communication utilized by many nations and organizations across the globe to broadcast emergency alerts is satellite-based communication. J-Alert, a national warning system in Japan, is an example of how Superbird-B2 is used. Warning messages will be transmitted through a communication satellite. COSPASSARSAT International The GNSS receiver included in smartphones, which provides accurate location information, may be used to correlate safety information received from the satellite, making the information relevant to intended users at a particular moment and within a specified geographic region. Existing warning systems may be supplemented and improved using GNSS. With the launch of the ALIVE (Alert interface through EGNOS) Concept in 2005, Europe has been working on emergency messaging services utilizing the EGNOS and Galileo satellite navigation systems. Following up studies have looked at the technical and non-technical benefits, as well as the advantages, of using

GNSS satellites for disaster warning. Another well-known satellite-based search and rescue program is the (SAR), System for detecting and disseminating distress alerts. The system is the most well-known name for it. that identifies and locates airplanes, ships, and backcountry emergency beacons hikers who are in trouble (COSPAS-SARSAT 2014).

In general, satellite communication services include resilient, and may be extended with geographic data to indicate which areas the system should be used in. The information is useful. The usage of a satellite phone, on the other hand, is not as popular as it once was. to cellular phones Furthermore, satellite communication service maintenance and Both service providers and users bear the costs of operation. The navigation satellite emergency system combines the advantages of both mobile and fixed systems. Satellite-based communication and communications services Satellites for Global Navigation The Global Navigation Satellite System (GNSS) is a generic name for satellite-based navigation systems, which include the GPS[8]. GPS in the United States, GLONASS in Russia, and many more new and upcoming constellations, including as The Galileo and BeiDou systems in Europe and China, respectively. These technologies offer accurate positioning in the environment. Using radio navigation signals, three dimensions, time, and velocity may be achieved. GNSS stands for Global Navigation Satellite System[9]. The receivers receive the signals in a one-way system, with no engagement from the receivers. relating to satellites Regional navigation satellite systems and satellite-based navigation systems are also available. SBAS, such as the United States' WAAS a Europe's European Geostationary Orbital or The European Navigation Overlay Service (EGNOS) and India's GAGAN are two systems that seek to supplement GNSS. In addition to increasing efficiency and lowering operational costs, GNSS adoption Many new location-based services have benefited from technological advancements (ACIL)[10].

Another SBAS created by Japan Aerospace Exploration Agency is the Japanese Quasi-Zenith Satellite System (QZSS). When fully operational in 2018, three QZSS satellites in highly inclined elliptical orbits (HEO) and one geostationary satellite will provide 24-hour coverage. The QZSS satellites' orbit design offers continuous coverage at a high elevation angle, improving satellite navigation in regions of Japan where conventional GNSS satellite positioning capabilities are challenged, such as central metropolitan areas. While the orbit design is mainly aimed for Japanese consumers, it also benefits neighboring East Asian nations including Australia.

The footprint of the QZSS satellite is launched on September 11, 2010, the first QZSS satellite was launched. QZSS has a unique feature in that it may transmit brief emergency messages in addition to the usual GNSS navigation signals used for Position, Navigation, and Timing (PNT). A GNSS/GPS receiver integrated in mobile phones or in in-car navigation systems can receive the signals straight from the satellite. The data would be interpreted and displayed by application software or an app. Given the near-universal usage of mobile phones and in-car navigation systems by virtually everyone, the potential coverage and reach of alerts delivered to these personal devices is expected to be considerably higher than existing methods could accomplish.

Another aspect of the QZSS alert messaging system is that, in addition to the broad area coverage given by the satellite system, the receivers also transmit accurate location information through their integrated GNSS/GPS capabilities. This manner, based on the nature and content of the catastrophe information, alarm messages may be delivered to a particular region, and only those receivers inside that area will be triggered. Knowing the approximate location of a

potential catastrophe, the targeted users might be informed, but those outside the disaster region would not be. In comparison to existing methods of delivering warnings through personal devices, the satellite-based system provides a number of benefits for real-time catastrophe notifications. The following are some of the benefits:

- In an emergency, GNSS with location-based information may be utilized. This allows high-priority and targeted messages to be sent to specific areas and groups;
- The service can cover a large area at once – for example, the entire country of Australia – due to its wide area broadcast footprint, and there is no limit to the number of people who can be warned at the same time within the broadcast area
- The messages can still be received even when terrestrial communications are disrupted. This provides redundancy
- Because the system is not reliant on mobile phone coverage, it can reach individuals wherever they are, regardless of whether or not they have access to a phone.

2. DISCUSSION

A satellite navigation system, often known as a satnav system, utilizes satellites to offer autonomous geospatial location. It uses time signals sent along a line of sight by satellites to enable tiny electronic receivers to calculate their position (longitude, latitude, and altitude/elevation) with great accuracy (within a few centimeters to metres). The system may be used to provide position, navigation, or track the location of anything that has a receiver attached to it (satellite tracking). The signals also enable the electronic receiver to determine the current local time to a high degree of accuracy, allowing for time synchronization. Positioning, Navigation, and Timing are the terms used to describe these functions (PNT). Satnav systems work without the need for a phone or internet connection, but these technologies may improve the accuracy of the location data. A global navigation satellite system is a satellite navigation system that has worldwide coverage (GNSS). The Global Positioning System (GPS) of the United States, Russia's Global Navigation Satellite System (GLONASS), China's BeiDou Navigation Satellite System (BDS), and the European Union's Galileo are all fully functioning GNSSs as of September 2020. The Quasi-Zenith Satellite System (QZSS) is a (US) GPS satellite-based augmentation system designed to improve GPS accuracy, with satellite navigation independent of GPS expected to be operational by 2023. In the long run, the Indian Regional Navigation Satellite System (IRNSS) intends to grow to a worldwide version.

3. CONCLUSION

The government has a major operational and logistical difficulty in providing an emergency warning system that can communicate time-critical safety information 'wherever to whoever it is required' during disasters due to Australia's enormous geography. It would require a significant financial investment in the network and supporting infrastructure, which may not be feasible. The provision of safety information through a GNSS-based system is possible because it combines the benefits of both mobile phone-based service and satellite communications while overcoming their shortcomings. The great resilience of satellite-based communication against communication network overload and collapse of ground systems and network infrastructure during a catastrophe is its main benefit. It also offers scalability of coverage for mass public warning, and its operation may be less expensive than existing warning systems. Despite the

widespread availability of GNSS-based technology, the use of GNSS in emergency warning and alerting in Australia is still in its early stages. Research on the feasibility and implications of GNSS technology inside the national emergency warning system is, for the most part, sparse. This is due to the satellite-based warning technology's partial immaturity, which will soon change with the arrival of additional GNSS satellites and augmentation systems. Thinking beyond the immediate obstacles, defining technical and non-technical needs, and comprehending the operational environment in which the technology may be utilized as "added value" to current warning systems remains a problem.

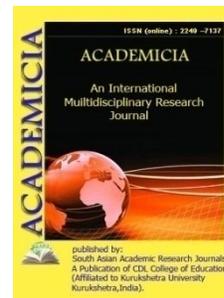

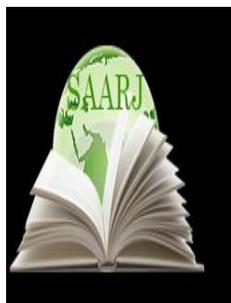

The Japanese satellite system, known as QZSS, is capable of sending warning messages to people's mobile phones. The gadgets may be programmed to receive emergency alerts depending on their position at a particular time and within a defined geographical region. As a result, it has the potential to solve some of the limitations of conventional warning systems. Although a GNSS-based warning system is unlikely to replace current systems, it may supplement and enhance them by offering an independent method of transmitting location-based alerts. Building effective methods that develop over time by adopting newer technology is a continuous requirement. As other GNSS systems, such as Galileo and BeiDou, mature and gain emergency alert capability, Australia will have the opportunity to be an excellent test bed for GNSS-based emergency services and be the first to innovate with new tools and products due to the continent's geographical location relative to all of these global navigation satellite systems.

INTRODUCTION

Ethylene is the most widely used organic substance in the world and is widely used as a starting semi-finished product in the chemical and petrochemical industries. At present, the annual demand for ethylene is 180 mln. more than a ton. To date, the following methods of ethylene production in the world practice are of great interest to scientists:

- 1) Extraction of ethylene by oxycondensation of methane;
- 2) Extraction of ethylene by methyl chloride from methane and its pyrolysis;
- 3) Obtaining a synthesis gas from methane and extracting methanol and ethylene from methanol.

Among the above methods, the methane catalytic oxycondensation reaction is the simplest and single-step method, which has not been introduced into the industry due to the lack of a stable

catalyst with high activity and efficiency. To date, catalysts with high catalytic activity, selectivity, and efficiency have been developed for this reaction. Such catalysts include MeMnW / SiO₂ (Me = Li, Na, K) [1-3] and (MoO₃)_x · (ZnO)_y · (ZrO₂)_z [4-6].

The second method involves the reaction of obtaining ethylene by pyrolysis of methyl chloride obtained by oxychlorination of methane. The main reactions that take place in this process are as follows:

The main catalysts in the pyrolysis of methyl chloride are SAPO-34 and SAPO-18 [7-13].

The process of obtaining ethylene from natural gas via methanol involves the following reactions:

1) Synthesis gas extraction:

Part of the experiment

YuKTs from kaolin in Pakhtachi district of the Republic of Uzbekistan [15-22] were used as porous carriers in the study. The catalyst was prepared as follows: a 30% solution of CuCl₂, KCl, ZnCl₂, MnCl₂ was injected into 100 g of YuKTs for 12 hours. The catalyst was then separated from the solution and dried at 350–4000C in a nitrogen stream for 3 h and reduced to a granule size of 5–7 mm.

Chromatographs LXM-80 (thermal detector) and Crystal 2000 (flame ionization detector) were used for the oxidation reaction of methane.

EXPERIMENTAL RESULTS AND THEIR DISCUSSION

Catalysts of various compositions were prepared for the catalytic oxychlorination reaction of methane and their catalytic activity was tested. The results obtained are presented in Table 1 below.

TABLE 1 INFLUENCE OF METHANE OXYCHLORINATION REACTION PRODUCT YIELD CATALYST COMPOSITION

№	Catalyst composition (in the ratio of goods)	% акт	Conversion rate, %			CH ₃ Cl ₂ , Sselectivity
			HCl	CH ₄	O ₂	
1	CuCl ₂ ·KCl·0,3LaCl ₃ /SiO ₂	8	76,3	36,8	45,4	96,2
2	CuCl ₂ ·KCl·0,3P3ЭCl ₃ /SiO ₂	8	80,3	42,5	56,8	96,8

1,1-дихлорэтан	0,003	0,002	0,000	0,000	0,000	0,0000	0,0000	0,0000

Хлороформ	0,003	0,002	0,03	0,025	0,002	0,0017	0,0013	0,0012
ЧХУ	0,000	0,0000	0,00	0,001	0,001	0,0002	0,0002	0,0001

Based on the results obtained, the contact time methyl chloride (Pic. 1),

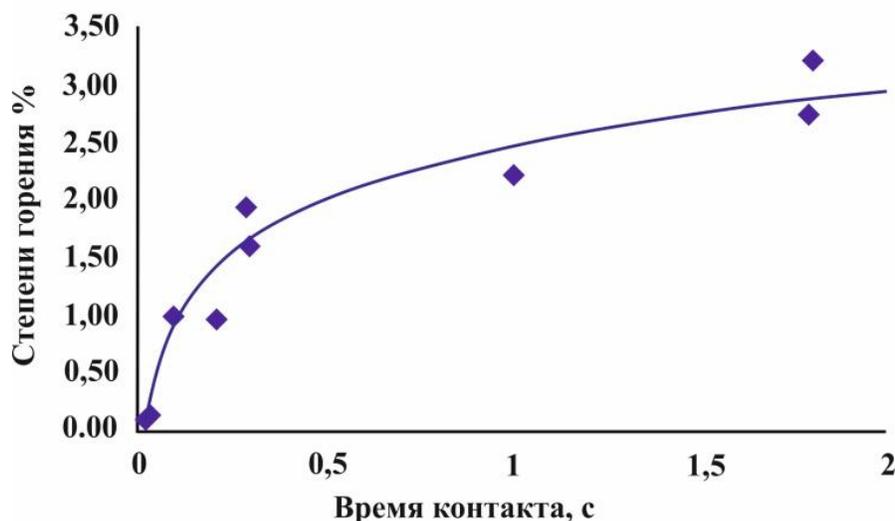

polychloromethanes (Figure 2)

and combustion products (Figure 3)

**Зависимость степени горения от
времени контакта**

graphs of dependence were formed.

When the contact time is less than 0.3 s, the amount of methyl chloride increases as the rate and selectivity of the methane oxychlorination reaction shifts towards methyl chloride formation. This is primarily due to a decrease in the rate of combustion. Second, the smaller the contact time, the less time it takes for the methyl chloride formed in the reaction to undergo a series of reactions with the formation of methylene chloride, chloroform, and carbon (IV) chloride. As can be seen from the table, the formation of carbon (IV) chloride is not observed in the range of 0.03-0.1 sec.

Kinetic laws of methane oxychlorination reaction

As a result of the study, the following optimal conditions for the oxidation of methane were determined: catalyst composition, $(\text{CuCl}_2)_x \cdot (\text{KCl})_y \cdot (\text{ZnCl}_2)_z \cdot (\text{MnCl}_2)_k$, size of catalyst fractions $0.7 \div 1.2$ mm, $P = 0$, 1MPa, gas flow rate 17.2 l / h, contact time 0.8, linear flow rate 10.2 cm / sec.

The total gas flow rate in the reactor remained unchanged due to the change in the nitrogen flow rate. These conditions ensure that the reaction takes place in the kinetic field. The effect of additional products (methylene chloride, chloroform, carbon (IV) chloride, and products of complete oxidation reaction of methane) was not taken into account, as the selectivity of the process relative to methyl chloride under kinetic conditions is higher than 95%.

To calculate the activation energy

$$E_a = - \frac{R \cdot \ln \left(\frac{k_{T_1}}{k_{T_2}} \right) \cdot T_1 \cdot T_2}{(T_2 - T_1)}$$

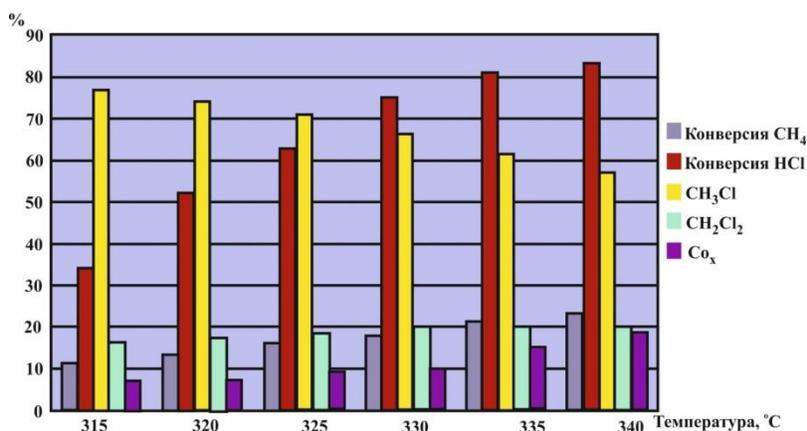

formula was used.

k_{T_1} was calculated according to the following formula:

$$k_{T_1} = \frac{R(CH_3Cl)}{P_{CH_2}^{0,7} \cdot P_{H_2O}^{0,44}}$$

We did not take into account the concentration of HCl in the calculation because its value is approximately 1. Thus, the activation energy is 96.74 kJ / mol

The selectivity of methyl chloride formation depends on the temperature at which the methane oxychlorination reaction takes place. The selectivity of methyl chloride formation decreases with increasing temperature, while the selectivity of methylene chloride formation increases. In the oxidation reaction of methane, the formation of products of the deep oxidation reaction of methane in the range of 315-3400C increases to 315-3400C. The results obtained are shown in Figure 4 below.

The texture characteristics of the catalyst were determined after 100 h of the methane oxychlorination reaction. The samples were dried in vacuum at 2500C before studying the sorption properties.

Nositel (YuKTs), a newly prepared catalyst (CuCl₂)_x · (KCl)_y · (ZnCl₂)_z · (MnCl₂)_k, and the mass loss of samples after hours of use were 0.56, respectively; 2.28; and 0.90%.

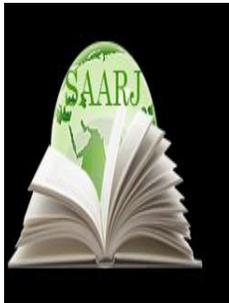

CONCLUSION

The kinetic laws of the catalytic oxychlorination reaction of methane (CuCl₂)_x · (KCl)_y · (ZnCl₂)_z · (MnCl₂)_k in the catalyst, the ratio of the starting materials N₂: CH₄: HCl: O₂ = 5: 12: 2: 1 mol and 0.1 MPa was studied at pressure.

ABSTRACT

Electronic form of assessment of students' knowledge in the field of construction drawing in higher education.

KEYWORDS: *Construction, Independent Learning, Test, Drawing, Computer Graphics, Graphics Software, Construction Drawing.*

INTRODUCTION

The current advances in science and technology have changed the requirements for graphic training of university students. The technology of teaching graphic sciences has developed significantly. The modern educational space is filled with the latest software and multimedia graphics packages and complexes. One of the main requirements for student competencies in the curriculum is the acquisition of computer graphics. Therefore, today there is a need to improve the teaching of graphic sciences, especially construction drawing.

MATERIALS AND METHODS

Yu.F. Katkhanova notes: "The high pace of development of computer technology leads to a natural reassessment of the attitude not only to the existing knowledge system, but also to the search for new ways to improve traditional teaching methods and techniques."

The difference between methodology and technology can be explained as follows:

- Methodology, in our opinion, is the content of education aimed at the goals of teaching, a joint set of teaching organization. Methods, techniques, and methods or methodological systems that have the same content can produce two different outcomes for two teachers;

- When using pedagogical technology, different teachers can achieve the same results, even if they use different approaches, different tools and methods.

Learning technology is a means of teaching in which the primary function of the task is to perform the task with the help of human management. In educational technology, the focus is on teaching aids: the educator does not teach students, but directs them to activities, acts as an incentive, and manages the educational tool. The teacher's pedagogical skills include the selection of relevant content, the use of effective teaching methods and tools in accordance with the program and pedagogical objectives.

One of the most effective ways to choose technology is through a multimedia approach. The following are important factors to consider when choosing a technology for your learning:

- The importance of using new technologies in the learning process to achieve the goals of education, not the technology itself;
- In addition to the most modern, expensive technologies, cheap and traditional technologies can be effective;
- learning outcomes do not depend on the type of information and communication or information technology, but on the quality of course creation and transmission;
- It is important to pay attention to the personal characteristics of students, the specifics of the field of study, the content of assignments and exercises in the selection of technologies.

Technology does not negate or replace methodology, didactics and educational theory. It develops specific algorithms, constructs the learning process, and identifies clear and definitive ways to achieve guaranteed results.

A modern lesson is a set of non-standard ways and means of teaching, in which the teacher mobilizes all his skills to achieve certain educational goals and engages students in the process. Their ability to focus on learning new things. It is the use of non-traditional forms of education.

According to LOMokresova, the use of innovative forms of education in the teaching of graphic sciences: teaching students to make product drawings using computer graphics, reading video lectures with the help of multimedia equipment, teaching science on electronic media for independent study. It is connected with the creation of a methodological fund, the use of existing methodological resources through the conversion of the main methodological developments of the department into electronic form, and others.

According to S.A. Freiberg, the search for answers to the traditional question of didactics determines the results of the search for teaching methods. But the teaching method is complex, multidimensional, and there are no "pure" methods. In any educational process, several methods are involved at the same time, complementing and interchanging.

Based on the analysis of LV Pavlova's experience of innovative teaching methods, the quality of learning materials in engineering and computer graphics depends on different teaching methods, for example, associative-cooperative method and descriptive analogy method increase the

success of teaching. The purpose of these methods is to develop spatial imagination, the formation of creative, cognitive and engineering-design maturity of students.

Researcher TVChernyakova, using the model teaching methodology of the subject "Computer Graphics", identified the level of teaching methods, all components, ie scientific advice, their interrelationships, principles, methods, tools and forms, and developed scientific recommendations for teaching science. This model provides psychological and pedagogical training of students in the teaching of "Computer Graphics" to university students, the need to master the subject, to determine the level of interest in science on the basis of levels, methods, tools and forms.

While OAKrainova developed a scientific and methodological basis for the design of a methodical system of teaching computer graphics in universities for the specialty "Computer Science", ANKostikov scientifically substantiated the methodology of teaching computer graphics to future teachers of computer science, providing them with in-depth knowledge and logic. Recommendations were given to ensure the connection of computer graphics with computer science, the development and preparation of educational and methodical complex of "Computer Graphics".

In his research, EI Roziev created an integrative course "Graphics" and developed a method of teaching it. It describes the problems of teaching Computer Graphics and its connection with other subjects, as well as the graphic requirements that a teacher of this subject must have.

Korean scientist Z.Zuo conducted research on the introduction of computer technology in the teaching process of "Computer Graphics" and the improvement of teaching. In his research, he argued that Computer Graphics should be integrated with the disciplines of Descriptive Geometry and Engineering Graphics.

In her research, AB Puzankova believes that the use of appropriate pedagogical technologies is required to significantly reduce the number of students with learning disabilities at all stages of education through the computerization of general technical subjects.

According to JJ Djanabaev, it is necessary to accelerate the educational process, purposeful information preparation and computerization. The use of new pedagogical technologies in teaching, computerization, provides the basis for accelerating the learning process.

All teaching methods have their strengths and weaknesses, so they need to be used in harmony, depending on the purpose, the circumstances, and the time available. The quality of education is the sum of the quality of teaching and upbringing.

RESULTS AND DISCUSSION

Yu.K. Babansky highlights the 7-step algorithm of "effective choice of teaching methods":

1. Decide whether the material will be mastered independently or under the guidance of a teacher. If the student is able to study the material independently and deeply enough without extra time and effort, the teacher's help will be superfluous.
2. Determining the compatibility of reproductive and productive methods. If conditions allow, attention will be paid to productive methods.

3. Determining the compatibility of inductive and deductive logic, analytical and synthetic ways of knowing. If an empirical basis for deduction and analysis has been developed, deductive and synthetic methods are fully suitable for adults.
4. Measures and means of compliance with oral, visual, practical methods.
5. Address the need to introduce incentive methods for students.
6. Methods of control and self-control, interval, definition of "points".
7. Develop resource options for deviations from the planned learning process.

We agree with Ye.Yu.Jokhova, taking into account the conditions of teaching engineering computer graphics, the time allocated to science and the specifics of graphics programs. In her research, Ye.Yu.Jokhova cites the peculiarities of computer-assisted teaching methods. According to the author, there are four main types of computer-assisted learning:

- Demonstration explanation;
- reproductive;
- problematic;
- research methods can be used.

The reproductive method of teaching using computer technology allows the teacher and the computer to master the knowledge transmitted to the student and to increase the material studied and apply it in similar situations, to organize the activities of the student. The use of this method with the help of a computer can significantly improve the quality of the organization of the educational process, but it does not allow to radically change the educational process compared to the traditional scheme (without a computer). The use of problem and research methods in this regard is more reasonable.

Problem-based learning uses the capabilities of a computer to describe and organize the learning process and to find solutions to a particular problem. The goal is to maximize student motivation. It involves solving different types of problems based on the knowledge gained in the learning process, as well as extracting and analyzing a number of additional knowledge needed to solve the problem. At the same time, special attention is paid to the skills of collecting, analyzing and transmitting information.

The research method of computer-assisted teaching provides students with independent creative activity in the process of conducting scientific and technical research on a particular topic. The use of this method is the result of active research, discovery and play. As a result, it is more successful than any of the other methods listed above. The research method of teaching involves the study of the ways in which objects and situations affect them. To be successful, you need an environment that responds to influences.

Undergraduate training requires the judicious use of classroom time to ensure that learning objectives are met in a context of reduced learning time.

In our opinion, it is appropriate to pay attention to the following factors that determine the effectiveness of education: the form of training;

- Selection of optimal combinations of teaching and control methods;

- Speed of training;
- Scientific, systematic and consistent connection of study with life;
- The optimal set of educational tools.

Modern pedagogy includes more than 20 organizational forms of teaching. Historically, as a method of communicating knowledge through communication, lecture is still one of the most intensive and important didactic systems, aimed at achieving the goals of the early and basic stages of education. The lecture began with a transition from individual to group training. The report lays the foundations for cognitive and cognitive activities such as attention, memory, imagination, and an adequate system of thinking. The lecture usually includes explanatory material that requires teaching methods such as proof and justification. Lectures are still the most common and important form of teaching.

There are two main types of cognition: verbal, speech-based, and visual. Some students have a tendency to accept verbal information, while others are required to convey information through images. At such times, it may be helpful to combine the two into a series of lectures. The demonstration method is a continuation of the historically established method of transmitting the experience of the older generation to the younger generation, which is based on the "do as I do" rule. Modern interpretations of this method include visual representations of events, processes, problem-solving methods, and ways to use a variety of tools. Demonstration does not involve unconsciously copying certain actions that lead to the desired result, but is one of the components in getting your opinion on the topic being studied. According to LB Grigorevsky, there are not enough textbooks and manuals on the subject of engineering computer graphics, which is one of the disciplines of engineering graphics, so lectures are one of the most important and basic means of conveying information to students. In addition, the teacher provides information on the new course in the form of separate topics and sections, which the student should collect from various sources.

The visual organization of the learning process in construction drawing also leads to the comprehension of the demonstration learning materials, their conscious and thorough mastery, and the stabilization of attention. Demonstration materials should be appropriate to the type and topic of the lesson, appropriate to the student's age and level of knowledge, and their use should be organized using effective methods and tools. Visual aids in Construction Drawing can vary depending on the type of lesson and the topic. Including:

Printed materials (posters, handouts, etc.).

Materials in electronic form (presentations, forms, pictures, etc.).

Animated materials (multimedia e-books, e-textbooks, etc.).

Virtual models (details, house models, machine mechanisms and models).

You can use ArchiCAD, AutoCAD, 3ds Max, Revit, Sketchup to create virtual object models. Because these programs are designed for computer modeling. For teachers of construction drawing, it is recommended to create mainly in ArchiCAD. First of all, the ArchiCAD program is adapted to international standards and provides all-round convenience for the teacher. Second, the program is designed to work in accordance with the rules of the construction industry.

The visual model of the virtual model of the created object, that is, in terms of design, has a wide range of possibilities in the graphics program ArchiCAD itself, in which the material and color of the building is much more convenient than other graphics programs. The reason is that in the process of creating a model of the building, the program itself offers standard materials in accordance with the building components. This brings a number of conveniences to students. ArchiCAD has many advantages in working with virtual building models, making it interesting and understandable for the user.

MS Word, PhotoShop, CorelDraw can be used to make posters. It is recommended that construction design teachers use MS Word and PhotoShop. It is convenient for teachers to enter and design texts using MS Word. PhotoShop has the ability to process and design images.

MS Word, ArchiCAD, Revit, Paint NET can be used to prepare handouts. With the help of these programs, teachers have the opportunity to design the text, graphic assignments and drawings required for the handout, the quality of which is based on modern requirements.

Multimedia lesson plans can be created using Adobe Flash, ArchiCAD, Snagit. Adobe Flash is one of the most convenient programs for animating various drawings and tasks in the field of construction drawing. ArchiCAD helps you create building facades, building models, and view them from different angles, trim, color, and more. The Snagit program is designed to videotape the process on a computer screen. With the help of Snagit video recording of all activities performed in the ArchiCAD graphics program and its widespread use in all types of educational process, it is possible to set a high level of mastery of students.

In today's world of technology, there are e-books, textbooks, manuals, and more. They are mostly verbal and serve as a source of information for users. There is a need to create a multimedia e-book on the subject of construction drawing. In this case, the study of theoretical information on the subject will give students a clear idea of the graphic drawings in the form of animation. Based on this, it is possible to perform the tasks correctly based on this knowledge in the process of performing graphic tasks. If you encounter a problem while completing a graphic task, you can use problem-solving examples on the topics in the task set section of the multimedia e-book. The advantage of this is that when faced with a problem in the execution sequence, it is possible to have a clear understanding by going back.

The e-textbook covers the didactic cycle of the whole educational process: theoretical data, animation of problem-solving sequences, use in the educational process, control of the level of knowledge and the availability of information retrieval system. differs from other textbooks.

The use of color computer animation allows you to control the process of extracting and presenting the necessary information, high-quality graphics, video fragments, schemes, formulas, the subjects of the studied subject are presented in a series of presentations or connected in the form of a branched dynamic chain. .

The multimedia e-book is used for the following lesson purposes:

Learning objectives: to teach students the theoretical information on the subject through spatial imagination and to organize the implementation of graphic tasks on the basis of this knowledge in the course of practical lessons.

Educational goal: to gain a clear understanding of the sequence of theoretical and practical knowledge on the subject through spatial imagination and its application in real life as a necessary tool, to develop the skills of independent work and creativity.

Developmental Objective: To develop the ability to turn knowledge into a skill and a skill into a skill based on the spatial imagination developed on the topic being studied and to work independently.

The use of computers as a didactic tool in the development of design and technological creativity of students gives effective results. This is because a modern computer tool is a useful tool for the ability to apply theoretical knowledge in practice and to quickly and objectively determine the level of mastery of the acquired knowledge and skills.

A video lesson is a lesson plan that helps a user (student, specialist, etc.) to see and hear specific knowledge and skills in a video format, both visual and audio.

There are the following types of video lessons:

Directly observe the process of Lesson 1 and involve the educator (speaker-teacher), who will have the opportunity to see, hear, learn and master the information.

2 describes a process that can only be performed aloud or silently without the participation of the given educator.

Therefore, as mentioned above, the organization and application of video lessons in the educational process is relevant today.

There are video lectures on science in Uzbek. But there is not enough information about practical training. In particular, the lack of video tutorials for drawing a sequence, ie an algorithm, does not meet today's needs. This can be used as an example of drawing assignments. Because in each lesson, the teacher draws and explains to the students a sample assignment on the topic of the practical lesson. Observations and analysis show that students are given a variety of questions and problems in the process of completing the assignments independently. If the student is someone who gives insight or advice to complete the task, he or she will complete the task. Students are often at home during practical assignments, when there is no one to teach them. As a result, the student can find his teacher the next day (if he can find one) and ask him to draw places he does not understand. Otherwise the work will not be completed.

Video tutorials can be a positive solution to these problems. Students can download video lessons on computers, tablets and smartphones. This allows students to repeat the lesson as many times as they want (that is, until they have mastered it). This will ensure that the student's learning is at the required level.

Students should be able to draw and read drawings, graphs, and shapes in the technical sciences. This requires a good set of assignments. The need to redesign a set of quality graphic assignments is pending. To find an optimal solution to this problem, it is necessary to create an electronic version of a set of graphic tasks in science.

Level Graphic Task - Develop students' graphic assignments from simple to complex.

M. Sroka, B. Radovan, T. Jelena, H. Stachel, Zongyi Zuo, Kaiping Feng, Bing Chen, J.J. Djanabaev, A.K. Hamrakulov, N.D. Yadgorov, D.S. Saidakhmedova, A.A. Kakhkharov,

D.Sh.Dilshodbekov and others, TSBorichevsky, VPMatanov, LMPyjevich, P.Odilov, A.Ashirboev, T.Rixsiboev, A.Valiev gave scientific recommendations on creation of graphic tasks.

PV Zelyonyy and Ye.I. Belyakova developed a set of tasks on engineering graphics, focusing mainly on the department of descriptive geometry. In addition, graphic tasks are not divided into levels of complexity.

PV Zelyonyy and Ye.I. Belyakova developed a set of tasks from engineering graphics to projection drawing. They are also presented in the form of colored details, as well as isometric (clear) images. But the principle of simple to complex is not taken into account.

Written by Volkhinym K.A., Ilyushenko P.V. These options are available. But the tasks are not divided into levels of complexity.

The science of computer graphics, which is being studied today as part of the science of construction drawing, has such opportunities that it greatly contributes to the quality of the set of tasks being created in a short period of time. One of the best ways to handle this is to use ArchiCAD graphics software. This program makes it easier to develop science assignments than other programs.

For example, ArchiCAD graphics software can be used to create building design work, style part design, line types, building model, cuts and sections, and more.

Particular attention should be paid to their level when reorganizing the set of assignments on the topics. This results in an increase in spatial imagination and the development of creative and logical performance skills.

Creating assignments in the field of "Construction Drawing" from simple to complex and applying them to the learning process has a positive effect on the development of students' spatial imagination. Because as the level of the task increases, the student is required to have a strong spatial imagination. A student with a developed spatial imagination can think creatively. As a result, they develop creative skills based on their knowledge and have the opportunity to create and implement new ideas.

The work of Zorana Jelly, Branislav Popokostantinovic and Misa Stojicevic also mentions the use of virtual teaching methods in the teaching of engineering graphics. It is also recommended to provide drawings and a 3D model of it, as well as the possibility of creating virtual detail models. However, there is no approval for level assignments.

According to the experience of Zongyi Zuo, Kaiping Feng, Bing Chen, "... it is effective to use the possibility of 3D modeling of computer graphics to hand-drawn sketches. Students complete most of the assignments throughout the semester using computer graphics. Using ArchiCAD and other 3D software to create three-dimensional graphic tasks on a computer based on the design, seeing them directly will help students develop their imagination. "

One of the main goals in teaching the subject "Construction Drawing" in our country is to re-analyze and group the topics and to distinguish those that are suitable for organization on the basis of computer graphics and to develop skills in computer drawing and modeling based on modern requirements. The use of a set of level assignments in the teaching of "Building Drawing" is effective and gives positive results.

Now let's look at the order in which a practical exercise is conducted.

The first phase of the training includes: the interfaces and basic toolbars of the ArchiCAD graphics program, which are related to the construction industry; coordinate systems; two- and three-dimensional drawing environments are re-explained and demonstrated to students using the comparison method. Students will be introduced to the graphics program. They try to understand the similarities and differences between the program's interface, toolbars, and commands. The teacher teaches the students, the students practice on the computer.

For example: Explain the choice of two-dimensional or three-dimensional media in applications. When you start ArchiCAD, you can select a two- or three-dimensional environment from the Info menu, or you can switch from the keyboard to the two-dimensional or three-dimensional state using the F2 and F3 keys. ArchiCAD software allows you to change the environment at any time (Figure 2).

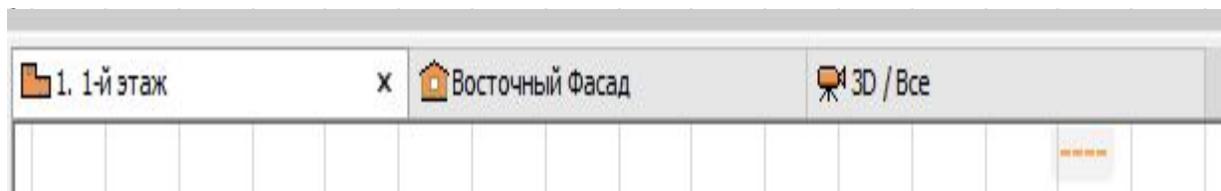

Figure 2. Selecting a working environment in Archi CAD

The second stage of the practical training includes: drawing two-dimensional (flat) drawings of different complexity; sizing; change line types, colors, and thicknesses; adjust the drawing font; drawing and saving graphics are taught by comparing the hardware and commands of graphics programs. The teacher shows an example and the students repeat it in a graphic program. Once the teacher has completed the sample, students will be able to complete a simple task on their own.

For example: explain how to do a three-room project work drawing.

The teacher will explain this task in ArchiCAD, which is one of the most convenient programs for the construction industry. Students follow the teacher's instructions on the computer one by one. In ArchiCAD, you can draw arrows (anywhere on the Constructions toolbar) using the Grid axis command to draw. The outer and inner walls of the project work on the arrows (using the command "Wall" in the toolbar "Construction") are drawn. Before drawing, the wall thicknesses and heights are adjusted by entering the dialog parameter command of the Wall command. When straightened, the outer and inner walls are drawn along the given axes. When the walls are finished, the frames and doors open. The frame and door are opened by the "Door" and "Window" commands in the "Constructions" panel.

In the third phase of the workshop, students will be taught how to build and trim three-dimensional virtual models of a building based on a drawing history by comparing the equipment and commands of graphics programs. The teacher shows an example and the students repeat it in a graphic program. Once the teacher has completed the sample, students will be able to complete a simple task on their own.

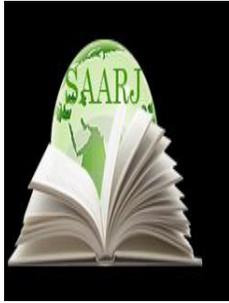

CONCLUSION

At the final stage of the practical training: the task is to create a clear picture of the project work. One of the advantages and disadvantages of the ArchiCAD graphics program is that it allows you to draw a clear image while drawing a two-dimensional drawing. The teacher does not take the time to draw a clear picture. Spends extra time simply making the necessary changes to the image.

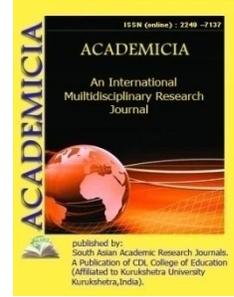

Graphics programs allow students to expand and enrich their knowledge. In addition, students will be able to independently master the program by identifying the strengths and weaknesses, similarities and differences of the programs. The method used develops students' motivation to learn the subject and teaches them to compare other design programs in the modern graphics software market. In this way, they will be able to choose the most appropriate program for their activities.

ABSTRACT

Cloud computing is a fast-growing technology that allows businesses to use on-demand computer and data services on a daily basis. The most significant contribution is the development of a new genetic algorithm model for workflow planning. One of the major issues here is the scientific planning of large activities in a heterogeneous cloud environment. Other public cloud computing issues are equally significant. These include meeting customer service quality requirements including scalability and reliability, as well as optimizing resource user use rates. Workflow Scheduling is primarily concerned with job assignment in order to achieve the required workload balance while making the greatest use of available resources. Specific workflow planning problems in the cloud computing sector should be addressed by providing various pay-on-demand and cloud-based services that meet the relevant performance criteria and system structure distribution. This paper proposes a novel paradigm for combining cloud-computing resources with local computing components. The finished-time calendar algorithm is at the heart of this system, balancing the performance of the application schedule with the expenses of utilizing cloud resources. The testing and comparisons with other methods revealed the potential benefits of our proposed algorithm.

KEYWORDS: *Cloud computing, Cyber-Physical, Cloud Systems, Dependability, Workflow scheduling,*

1. INTRODUCTION

In recent years, cloud computing has been a growing field of research. A considerable variety of methods to distinct Workflow Scheduling issues have been presented. Due to its direct influence both on the customer and the supplier of services from diverse angles, the cost problem remains of importance (i.e. QoS, system functionality, and system architecture)[1].

Recent developments in computer, communication and control technology offer significant potential to connect physical processes to cyber space and to develop cyberspace systems. For example, automotive, industrial, social, production, smart home, construction, and community-based systems such as CPS applications[2].CPS storage and calculation resources are often restricted, as (1) the size and embedding of cyber components is generally tiny in their surroundings; and (2) some CPS own resources which are suitable, but cost unbeatable for larger usage. Fortunately, cloud computing and IoT technologies would assist the CPS in addressing this problem, because integrating CPS in cloud computing infrastructures may not only enhance cyber-physical device interaction, but also facilitate large-scale data analysis and storages[3]. Cyber-physical cloud systems have therefore garnered considerable interest, both in academia and business, as a viable paradigm.

Cloud computing might in many ways increase system performance. Migration from an internal cybernet to the cloud can, however, lead to a range of security and dependability problems. Due to the complexity of cloud systems, on the one hand, Cyber-Physical Cloud Systems hardware and software are more susceptible to permanent (driven to severe) mistakes and transitory errors (leading to soft errors). On the other hand, owing to the usage of external calculation, communication, and storage resources which cannot be trusted, the security threats to cyber-physical cloud systems are raised.It is therefore very important to create new methodology in cyber-physical cloud systems to solve dependability and security problems[4].

Cloud computing might in many ways increase system performance. Migration from an internal cabernet to the cloud can, however, lead to a range of security and dependability problems. Due to the complexity of cloud systems, on the one hand, Cyber-Physical Cloud Systems hardware and software are more susceptible to permanent (driven to severe) mistakes and transitory errors (leading to soft errors)[5].Cyber-Physical Cloud Systems' security vulnerabilities are raised because of the utilization of external and unsustainable compute, communication, and stocking resources. It is therefore very important to create new methodology in cyber-physical cloud systems to solve dependability and security problems. Workflow has been a successful and widely recognized paradigm for describing data-intensive applications used in cyber-physical cloud systems. There are a number of tasks and dependences of data/control between tasks that create an application for working flow. Directed acyclic graphs that may be used to define workflow applications with tasks and edges that represent data/control interdependence[6].

Typically, a time limit (i.e., in real time need) to ensure the quality of the service is linked with each Workflow application. The objective of this article is to address dependability and safety issues in order to plan workflows on cyber physical cloud systems in real time. Given that transient defects are more frequent than permanent defects, and that real-world systems are generally needed to meet certain levels of protection[7], we are specifically looking for problems in maximizing soft-error reliability for Cyber-Physical Cloud Systems workflow applications while respecting lifetime constraints and safety requirements.

1.1 Slack-Aware Fault Tolerance:

Slack is inactive as duties for the workflow application are completed early. The illustration of slack is shown in Fig. 1. The four tasks τ_1 - τ_4 are performed at instance 10 and time is instance 15 of the application deadline. The slack produced is thus 5. This study largely uses the system slack to allocate recoveries to unsuccessful jobs to improve dependability of the system soft error. In order to assign slack, we utilize the First-coming rule to a core that may be shared via all tasks assigned to this core[8]. Moreover, recuperation is only allocated to a job when there is no lower amount of time available to finish a task which is explained by

$$P_i^{rec} = \begin{cases} R_i(F_{max}) \times \sum_{l=1}^k P(\mathcal{M}_{i,l}), & \text{if } K > 0 \\ 0, & \text{otherwise} \end{cases} \quad \dots (1)$$

Where K is the number of schedule modes meeting the slack constraint that

$$wc_i/f_i + RT(\mathcal{M}_{i,l}) \leq \Omega \quad \dots (2)$$

For Prec it is essential to calculate the $RT(\mathcal{M}_{i,l})$ as well as $P(\mathcal{M}_{i,l})$ retrieval times of each schedule M mode. Note that slack may only be utilised to retrieve a failed task if the slack is available more than the recovery time for the job[9]. The slack cannot be used for a failed job with a longer recovery time. Therefore, we may search in M-mode and determine RT using an iterative method for the failing tasks $RT(\mathcal{M}_{i,l})$. The $P(\mathcal{M}_{i,l})$ probability is defined by the soft-error reliability of the M-mode tasks are given by

$$P(\mathcal{M}_{i,l}) = \prod_{\tau \in P(\mathcal{M}_{i,l})} (1 - R\zeta) \times \prod_{\tau \in P(\mathcal{M}_{i,l})} R\zeta. \quad \dots (3)$$

```

1 initialization:  $RT(\mathcal{M}_{i,\ell}) = 0$ ;
2 for each failed task  $\tau_{\zeta}$  in  $\mathcal{M}_{i,\ell}$  do
3   if  $\frac{wc_{\zeta}}{f_{\zeta}} \leq \bar{U}$  then
4      $RT(\mathcal{M}_{i,\ell}) = RT(\mathcal{M}_{i,\ell}) + \frac{wc_{\zeta}}{f_{\zeta}}$ ;
5      $\bar{U} = \bar{U} - \frac{wc_{\zeta}}{f_{\zeta}}$ ;
6   end
7 end

```

Figure 1: Algorithmic Step By Step Explanation of the Calculation of the Recovery Time RT

1.2 Determine the Priority of Tasks

The suggested workflow planning algorithm that determines jealously the priority of activities in order to improve soft-error system dependability is given. The algorithm is based on the following findings.

- Due to slack limitations, it is impossible to constantly provide better system soft-error reliability for additional jobs with short run time to get recovery. Instead, it might severely affect the dependability of the soft-error system. This is because jobs with high execution times may not slow down to rework and so reduce the soft-mistake dependability of the system significantly.

- The fact that additional jobs are allowed to recover is only useful when the workflow schedule meets in order to increase system dependability.

Theorem 1.

```

Input: A workflow meeting the conditions in Theorem 1;
1 use a DAG  $G = (T, E)$  to represent this workflow;
2 if  $(\tau_i, \tau_j) \in E$  then
3   | set  $p_i > p_j$ ;
4 end
5 else
6   | if  $\frac{wc_i}{F_{max}} > \frac{wc_j}{F_{max}}$  then
7     | set  $p_i < p_j$ ;
8   | end
9 end

```

Figure 2: Algorithm Explaining Step by Step Implementation of Deciding the Priority of Tasks in the Workflow.

1.3 Lifetime Reliability-aware Frequency Scaling

Tasks are required for increasing system soft error reliability and slackness at the highest frequency scaling in this job. The highest frequency scaling may, however, lead to excessive temperature on the semiconductor and exceed the reliability limitation. This is why it is important to scale the operating frequency scaling of jobs. However, the reliability of soft errors and time performance are also unfavorable. To solve this problem, we offer a heuristic method that reduces the operating frequency scaling of jobs selectively and dynamically for a lifetime[10]. Taking it into account that

(1) If a high priority job fails, it is likely that slack is used for recovery and hence has an influence on the soft-error reliability of low priority activities and

(2) Maximum frequency scaling recovery would not have a major effect upon system reliability, because a task's failure likelihood is generally modest, the suggested heuristic method maintains high priority works and restoration frequency scaling while scaling low priority tasks operational frequency. Saving power efficiency is an energy-time ratio when the operation frequency scaling of a job is scaled between 1 and z . The effectiveness of the job μ_i is represented by scaling its operation frequency scaling from F_1 to F_z

$$PE_i(F_l, F_z) = \frac{Pow_i(F_l) - Pow_i(F_z)}{e_i(F_z) - e_i(F_l)} \dots (4)$$

Here in which the energy consumption as well as completion time of operation i at frequencies (F_l, F_z) , correspondingly, is $Pow_i(F_l)$ and $e_i(F)$ along with $Pow_i(F)$ but in general mostly with $e_i(F)$.

```

1 for  $\tau_i \in T_{Low}$  do
2   |  $l_i = L$ ; //  $l_i$  is the frequency level of  $\tau_i$ 
3 end
4 while  $MTTF_{sys} < MTTF_{thresh}$  do
5   |  $PE_{max} = 0$ ,  $\tau_{select} = \tau_N$ ; //  $\tau_N$  is the task with the
   | lowest priority
6   | for  $\tau_i \in T_{Low}$  do
7     | if  $\bar{U} > e_i(F_{l_{i-1}}) - e_i(F_{l_i})$  &&
       |  $PE_i(F_{l_i}, F_{l_{i-1}}) > PE_{max}$  then
8       |   |  $PE_{max} = PE_i(F_{l_i}, F_{l_{i-1}})$ ;
9       |   |  $\tau_{select} = \tau_i$ ;
10      | end
11   | end
12   |  $f(\tau_{select}) = F_{l_{i-1}}$ ; //  $f(\tau_{select})$  is the operating
   | frequency of  $\tau_{select}$ 
13   |  $\bar{U} = \bar{U} - (e_i(F_{l_{i-1}}) - e_i(F_{l_i}))$ ;
14   | update  $MTTF_{sys}$ ;
15 end

```

Figure 3: Algorithm Explaining the Procedure of Scale the Frequency Scaling of Low-Priority Tasks

1.4 Simulation Setups:

Algorithm 3 sums together the overall flow of our heuristic frequency scaling. In view of the schedule of low-priority tasks in set T_{Low} , the algorithm initializes the operating frequency of tasks to the greatest level, and then iterates the operating frequency scaling of jobs to a lifespan limit. The algorithm evaluates each job's power-saving performance when its operational frequency is scaled and finds the task with the highest power-saving effectiveness and meets the slow limit (i.e., the real-time constraint). The slack and system must be updated as long as the specified task's operation frequency scaling is scaled. This paper formulates the workflow scheduling problem of maximizing soft-error reliability for Cyber-Physical Cloud Systems under system lifetime reliability, security, and real-time constraints. This paper proposes a hybrid approach that enhances the dependability of soft error by stating tasks and allocating retrieval dynamically. Security services maintain security systems and dependability for life is assured by the scaling of frequency scaling of low priority activities. To justify the effectiveness of our hybrid suggested strategy, this paper conducts a range of simulation tests. Our results are compared with those of one baseline and four competing techniques for the suggested algorithm. To solve the aforementioned problem, we propose a dependable workflow scheduling scheme. Specifically, this paper makes following contributions. Results of simulations showed that, compared to basic and competing techniques, proposal can produce better schedules with a less likely failure and more workability.

This research suggests a CPCS hybrid workflow strategy to enhance the reliability of the software under lifespan limitations, security and working flow deadlines. In our system, slack is used to recover failed jobs and therefore increase the dependability of soft error or to improve the safety of the system through use of security services. All workflow jobs share the slack available

in the system. The hybrid system first assesses the priority of the work and, using three important algorithms, allocates the maximum frequency scaling to all jobs and explains their periodical uses. Using the highest frequency scaling, recovery and security services might be slacked. The hybrid system then examines the dependability of the static workflow schedule. If not, the strategy scales the operation frequency scaling of low priority activities dynamically, thereby enhancing system dependability without breaking the deadline.

In order to recover the failed tasks the suggested algorithms employ slack and enable all jobs to share the slack in the available system. The method assesses the priority of tasks first to enhance soft-error reliability and allocates the maximum frequency scaling to every job and lastly dynamically assigns recoveries to tasks. Slack may also be utilized to leverage safety services to meet system security needs. Dynamically reducing the operation frequency scaling of low-priority tasks satisfies the lifetime reliability criterion. Extensive real-world benchmarking trials show that the approach presented decreases the likelihood of failure and improves scheduling. The corresponding softer reliability of these tasks are 0.90, 0.82, 0.74, and 0.67, respectively, in which the derived system soft-error reliability is 0.37. By assigning recovery to tasks, a higher.

2. DISCUSSION

Workflow Management System has become a new cloud computing application in the cloud environment. A number of system models and methodologies have been created for the use of the cloud workflow or Directed Acyclic Graph. A resource supply on demand with the use of the amazon elastic computing cloud for processes. Optimized cost supply for application processes using elastic resources. All of them implemented the supply of resources on the Amazon cloud platform. However, in some directed acyclic graph workflows, just a few study effort has been done to plan the problem. In this study we presented a multiple Reinforcement Learning-based directed acyclic graph cloud workflow scheduling method to resolve multiple directed acyclic graph workflow applications with varied priority submitted at various times in a cloud computing environment. The results of the experiments show that our work schedule is efficient.

Since the objective of this study is to enhance the dependability of the soft error system under lifetime, security and real-time limitations, we will also examine the feasibility of planning four kinds of workflow benchmarks using the suggested method. Of course, among all approaches employed, whatever benchmarks and failure rates are used, the suggested system may always achieve the highest timing feasibility. In comparison with others, the practicality of the suggested arrangement was improved. This improvement is due to our system's safety services and reliability-aware frequency scaling. Similar to Point of delivery observations, the planning of Rand is worse since the two approaches do not use countermeasures to prevent contraventions of restrictions. Moreover, if the rate of failure is larger than that of the lowest failed, feasibilities attained with offered schemes and comparative techniques will not be greater.

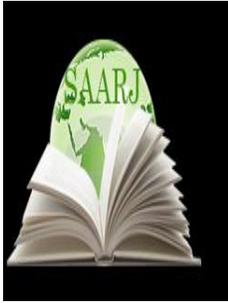

3. CONCLUSION

In this paper, we propose several directed acyclic graph scheduling programs for cloud computing based on enhancement learning. In view of the suggested system architecture, we examine the theoretical execution of cloud-based tasks and develop a new work plan using reinforcement learning to improve the time limit for certain cloud-based computing resources. This article assesses the suggested optimization of work schedules in comprehensive simulations.

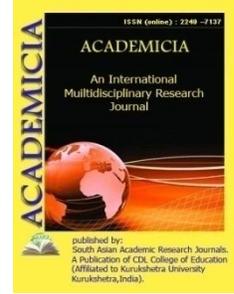

Based on empirical observations, the proposed work plan may make the best use of cloud resources and load balance in order for the minimum span of time to be achieved with resource limitation. In the cloud computing business, specific tasks of the workflow planning sector should be handled by offering distinct pay-on-demand services and distribution systems structure performance criteria for cloud consumers. This article provides a novel paradigm based on cloud computing resources integration with local computing elements. The essential component of this system is the time algorithm that balances the performance and the cost of using cloud resources in the application schedule. Our proposed algorithms have demonstrated the possible benefits of the tests and the comparisons with other approaches.

OVERVIEW OF IOT (INTERNET OF THINGS)

Mr. Rishi Sikka*

*SOEIT, Sanskriti University,
 Mathura, Uttar Pradesh, INDIA
 Email id: rishisikka.ec@sanskriti.edu.in

ABSTRACT

The Internet of Things (IoT) is a ground-breaking communication paradigm that is critical in remote monitoring and control activities. This paper provides an overview of Internet of Things (IoT)-based remote monitoring and control systems that have the potential to address societal issues in the areas of healthcare, environment, home automation, transportation, military, agriculture, solid waste management, smart metering, surveillance, consumer asset tracking, smart grid, vehicular communication system, and pilgrim monitoring. The Internet of Things (IoT) is a hot subject with significant technological, social, and economic implications. Consumer items, durable goods, automobiles and trucks, industrial and utility components, sensors, and other common things are being coupled with Internet connection and sophisticated data analysis capabilities to change the way we work, live, and play. The effect of IoT on the Internet and economy has been estimated to be as high as 100 billion linked IoT devices and a worldwide economic impact of more than \$11 trillion by 2025, according to some estimates.

KEYWORDS: *Agriculture, Internet of Things, Interaction, Sensor, Security.*

1. INTRODUCTION

What would the world be without the Internet? It's impossible to conceive a situation like this that we've never seen before. The Internet is becoming more essential for everyone in both personal and professional life nowadays[1]. Smart phones, sensors, mobile computers, and a variety of other smart items are examples of things we interact with on a daily basis. These and other IoT-related technologies have a big impact on emerging ICT and business systems. It was first referred to as the "Internet of Computers," then as the "Internet of People," and, more recently, as the "Internet of Things," due to fast advancements in ICT. Different gadgets and smart things are integrated in the IoT in order to extend the Internet and make it more accessible and individually identifiable. The connection has been improved from "anytime, anywhere" for

"anyone" to "anytime, anyplace" for "anything"[2]. In terms of ICT breakthroughs and economic advances, a lot of attention has moved to IoT-related technologies, which are generally regarded as one of the most essential infrastructures for their promotion and one of the most promising future plans. The primary goal is to make it possible for the physical world and cyberspace to interact and integrate.

Internet of Things (IoT) is seen as a cornerstone of the future Internet, with gadgets, smart items, systems, and services being able to operate intelligently and communicate in sophisticated ways. Indeed, it is a new revolution in communication technology that will give a unique identity to everything from tires to hairbrushes so that they may be addressed, linked to other objects, and share information[3]. The Internet of Things has yet to be defined precisely or uniformly. Internet of Things (IoT) is a network that links ordinary physical things with identifiable addresses to offer intelligent services, based on conventional information carriers such as the Internet, telephone network, and so on. The author of proposed a semantically correct definition of IoT as "a global network of linked items uniquely accessible, based on standard communication protocols," since its origin phrase is made up of two words: "Internet" and "Things." The true value of IoT, on the other hand, lies in its ability to connect a diverse range of heterogeneous devices, such as everyday existing objects, embedded intelligent sensors, context-aware computations, traditional computing networks, and smart objects, all of which differ in terms of design, systems, protocols, intelligence, applications, vendors, and sizes[4]. Through applications and management systems located in data centers or network clouds, these organizations are able to interact and integrate with one another to gather, produce, process, and share data. This aids in the coordinated execution of complicated processes and intelligent activities, as well as the autonomous making of choices. The fundamental premise of the Internet of Things (IoT) is to link smart devices – or things – to the Internet in a transparent manner[5]. As a result, data is exchanged across all devices, and users' information is sent in a more secure manner.

According to Cisco Systems, the Internet of Things will have 50 billion connected devices by 2020, and many physical objects, such as computers and sensor actuators, will be distributed with unique addresses and the ability to securely transfer data ranging from common daily activities to restricted medical records. The Internet of Things (IoT) is a technology that "provides an integration method for all these physical items that include embedded technologies to be coherently linked and allows them to communicate, perceive, or interact with the physical environment, as well as among themselves"[6]. The Internet of Things (IoT) is a concept that encompasses "everyone, anything, anytime, anywhere, any service, and any network" [6]. Healthcare is one of the most appealing IoT application areas, as it allows for a variety of medical applications such as remote health monitoring, fitness programs, chronic illness management, and senior care. "A self-configured dynamic global network infrastructure with standards and interoperable communication protocols where physical and virtual "things" have identities, physical attributes, and virtual personalities, and are seamlessly integrated into the information infrastructure," according to another definition of IoT. Indeed, the Internet of Things (IoT) is the result of a global network interconnecting smart objects via extended Internet technologies, as well as the set of supporting technologies required to realize such a vision (such as RFIDs, sensor/actuators, machine-to-machine communication devices, and so on), as well as the suite of applications and services that leverage such technologies to open new business and market opportunities[4].

1.1 Advantages of IoT

- **Enhanced Customer Interaction** Current analytics include blind spots and severe accuracy problems, and engagement remains passive, as previously stated. This is totally transformed by the Internet of Things in order to create a deeper and more effective connection with audiences[7].
- **Technological Optimization** The same technologies and data that enhance the consumer experience also increase device usage and help to make more powerful technological advancements. The Internet of Things (IoT) opens up a world of vital functional and field data.
- **IoT reduces waste and identifies opportunities for development.** Current analytics offer just a surface level of insight, while IoT delivers real-time data that leads to more efficient resource management.
- **Improved Data Gathering** Modern data collection has limits and was designed to be used passively. IoT takes it out of those areas and puts it right where people want to go to study their surroundings. It provides a complete view of everything.
- **AI IoT basically turns everything into a "smart" object, enhancing every area of life via the use of data gathering, artificial intelligence algorithms, and networks.** This might be as easy as adding sensors to your refrigerator and cabinets to detect when milk and your favorite cereal are running short and placing an order with your chosen grocer.
- **New enabling technologies for networking, particularly IoT networking, imply that networks are no longer only dependent on large providers.** Networks may be built on a much smaller and less expensive scale and yet be functional. These tiny networks are created by IoT between its system devices.
- **Without sensors, the Internet of Things loses its uniqueness.** They function as defining instruments, transforming the Internet of Things from a passive network of devices to an active system capable of real-world integration.
- **Passive Engagement accounts for the majority of today's interaction with connected technology.** The Internet of Things (IoT) ushers in a new era of active content, product, and service interaction.
- **Small Devices have gotten smaller, cheaper, and more powerful throughout time, as anticipated.** To achieve accuracy, scalability, and flexibility, IoT relies on purpose-built tiny devices[8].

1.2 Disadvantages of IoT:

- **The Internet of Things (IoT) generates a networked ecosystem of continuously linked objects.** Despite any security precautions, the technology provides minimal control. As a result, users are vulnerable to a variety of threats.
- **Without the user's active involvement, the complexity of IoT offers significant personal data in extreme detail.** Given their usage of numerous technologies and a wide range of new

supporting technologies, some people perceive IoT systems to be difficult in terms of design, implementation, and maintenance[8].

- Many people worry about an IoT system's ability to seamlessly connect with other systems. They are concerned that they will be confronted with several systems that are either incompatible or locked.
- Regulations apply to IoT, just as they do to any other technology used in the corporate world. Because of its complexity, the problem of compliance seems to be very difficult, even if many people believe standard software compliance to be a struggle.

1.3 Application of IoT:

- **Houses with Smart Technology:** Smart homes are one of the finest and most practical IoT applications because they take both convenience and home security to the next level. Though IoT may be used at many levels for smart homes, the finest is the one that combines intelligent utility systems with entertainment. Your energy meter with an IoT device that gives you insights into your daily water use, your set-top box that enables you to record shows from a distance, Automatic Illumination Systems, Advanced Locking Systems, and Connected Surveillance Systems are all examples of smart homes. As the Internet of Things progresses, we can expect most gadgets to become smarter, allowing for improved home security.
- **City of the Future:** Smart cities are intended to be made up of not only internet connection for individuals in a city, but also access for the city's gadgets. And we can gladly announce that we're on our way to making this goal a reality. Efforts are being made to integrate linked technology into infrastructure needs as well as certain critical issues such as traffic management, waste management, water distribution, and electricity management, among others. All of these things help to alleviate some of the problems that individuals encounter on a daily basis while also adding convenience.
- **Autonomous Vehicles:** There has been a lot of talk about self-driving vehicles. Google experimented with it, as did Tesla, and Uber even developed a self-driving vehicle that was subsequently shelved. Because we're dealing with human lives on the roadways, we need to make sure that the technology has all it needs to improve passenger and road safety. The vehicles utilize a variety of sensors and embedded technologies that are linked to the Cloud and the internet to continuously generate data and transmit it to the Cloud for Machine Learning-based decision-making. Though it will take a few more years for technology to mature fully and nations to change their laws and regulations, we are now seeing one of the greatest IoT applications[9].
- **Internet of Things (IoT) Retail Stores:** You should see the video of Amazon Go - the eCommerce giant's concept shop – right now if you haven't already. Perhaps the greatest use of technology for bridging the gap between an online shop and a physical store is this. By deducting money from your Amazon wallet, the retail shop enables you to go cashless. When you choose goods from the shelves, it also adds them to your cart in real time. If you change your mind and choose another item, the old one is removed from your cart and replaced with the new one. The concept store's greatest feature is that there is no cashier to charge your purchases. You don't have to wait in line; just walk out after picking up your items from the

shelves. If this technology proves to be successful in attracting more customers, it will undoubtedly become the standard in the future years.

- Agriculture : One of the industries that will gain the most from the Internet of Things is agriculture. With so many advancements being made in agricultural equipment, the future seems bright. Drip irrigation, crop patterns, water distribution, drones for farm surveillance, and other tools are being developed. These will enable farmers to produce a higher-yielding crop and better address their concerns
- Wearable technology: Even now, wearables are a popular subject in the market. These gadgets are used for a variety of reasons, including medical, health, and exercise. Jawbone, a wearables company, is the most well-funded of all the IoT companies.
- Smart Grids are number seven: A smart grid, for example, is a comprehensive system that employs a wide variety of Information Technology resources to allow current and new gridlines to minimize energy waste and costs. Electricity efficiency, reliability, and economics will all benefit from a future smart grid.
- Internet for Industry: The Industrial Internet of Things is made up of networked sensors, instruments, and other devices that are linked to industrial computer applications such as production, energy management, and so on. While the industrial internet is currently unpopular in contrast to IoT wearables and other applications, market research firms such as Gartner, Cisco, and others think it has the greatest overall potential.
- Telemedicine: Telehealth, often known as telemedicine, is still in its infancy. Nonetheless, it has a bright future ahead of it. IoT Telemedicine includes digital medical imaging communication, remote medical diagnosis and evaluations, video consultations with specialists, and so on.
- Intelligent Supply-Chain Management: Supply-chains have been around for a long. Solutions for monitoring products while they're on the move are an excellent example. They are certain to remain on the market for a long time, thanks to IoT technology.

1.4 Industry take advantages from IoT

- Manufacturing: Manufacturers may obtain a competitive edge by utilizing production-line monitoring to allow proactive equipment repair when sensors indicate imminent breakdown. Sensors can detect when manufacturing output is being harmed. Manufacturers can rapidly inspect equipment for accuracy or remove it from production until it is fixed with the assistance of sensor warnings. Companies can save operational costs, increase uptime, and enhance asset performance management as a result of this[4].
- Automobile: The adoption of IoT applications has the potential to provide substantial benefits to the automotive sector. Sensors can identify imminent equipment failure in cars currently on the road and notify the driver with facts and suggestions, in addition to the advantages of using IoT on manufacturing lines. Automotive manufacturers and suppliers may learn more about how to keep vehicles operating and car owners informed thanks to aggregated data collected by IoT-based apps.

- **Logistics and Transportation:** A number of IoT applications assist transportation and logistics operations. Thanks to IoT sensor data, fleets of vehicles, trucks, ships, and trains carrying goods may be redirected depending on weather conditions, vehicle availability, and driver availability. Sensors for track-and-trace and temperature-control monitoring may be included within the inventory itself. Temperature-sensitive inventory is common in the food and beverage, floral, and pharmaceutical sectors, and IoT monitoring systems that provide warnings when temperatures increase or decrease to a level that threatens the product would be very beneficial[10].
- **Retail:** IoT apps help retailers manage inventory, enhance customer experience, increase supply chain efficiency, and save operating costs. Smart shelves with weight sensors, for example, may gather RFID-based data and transmit it to an IoT platform to automatically check inventory and provide warnings when goods are running short. Customers may get customized discounts and promotions through beacons, making for a more engaging experience.
- **The Government Sector:** In the public sector and other service-related settings, the advantages of IoT are equally extensive. Government-owned utilities, for example, may utilize IoT-based apps to inform their customers of large-scale outages as well as minor disruptions in water, electricity, or sewage service. IoT applications can gather data on the extent of an outage and deploy resources to assist utilities in recovering from outages more quickly.
- **Healthcare:** The healthcare sector benefits from IoT asset monitoring in a variety of ways. Doctors, nurses, and orderlies often need to know where patient-assistance items like wheelchairs are located. When wheelchairs at a hospital are fitted with IoT sensors, they can be monitored using an IoT asset-monitoring application, allowing anybody searching for one to easily locate the closest accessible wheelchair. Many hospital assets may be monitored in this manner to guarantee appropriate use and financial accounting for the physical assets in each department.

Across all industries, there is a need for general safety IoT may be utilized to enhance worker safety in addition to monitoring physical assets. Employees in hazardous settings, such as mines, oil and gas fields, chemical and power plants, need to be aware of the possibility of a hazardous incident affecting them. They may be informed of accidents or rescued as quickly as possible when they are linked to IoT sensor-based apps. Wearables that monitor human health and environmental factors also utilize IoT applications. These apps not only help individuals better understand their own health, but they also allow doctors to monitor patients remotely.

2. DISCUSSION

The Internet of Things (IoT) offers unparalleled possibilities for further innovations and investments in ICT as a fast-emerging, fast-growing technology. Open problems and difficulties, on the other hand, arise, emphasizing research trends and necessitating greater attention. Recent research articles, studies, and surveys cover a variety of topics related to the difficulties that IoT developers confront. Because the Internet of Things is still in its early stages, problems such as large data management, analytics & mining, architectural standardization, scalability, privacy & security, clock synchronization, energy management, protocols, visualization, and QoS exist.

Furthermore, as described in social IoT and nano-IoT are new developing aspects. Such problems are likely to be addressed in the near future, and greater collaboration is required. We emphasize the necessity of paying particular attention to the following two issues: (i) energy efficiency, which is a major consideration when developing IoT systems. As the number of connected devices grows, so does power consumption; as a result, energy-efficient methods are required for creating green IoT systems. (ii) Clock synchronization, which is becoming a key technology for distributed systems that are coherent. For data integrity, improved coordination, and job scheduling, scalable time synchronization is needed. Furthermore, an IoT device may time its sleep pattern using dynamic timing synchronization, allowing it to save more energy. We anticipate more involvement in order to mitigate the effect of such technological difficulties. As a result, creating a coherent and consistent IoT world in which a thing or a smart item is able to survive, interoperate, and adapt to any environment.

3. CONCLUSION

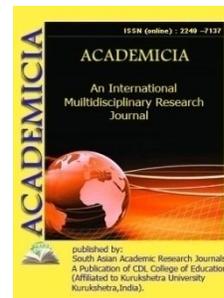

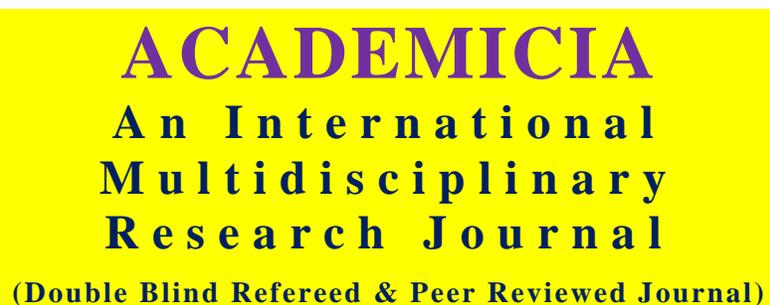

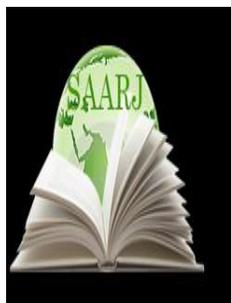

The Internet of Things (IoT) is a cyber-physical system that connects billions of disparate devices and smart things. Identification, embedded sensors, intelligent management, protocols, data storage/processing/analytics, and other technologies allow these things. In recent years, a broad variety of IoT applications have been accepted and implemented. This article presents an overview of the Internet of Things, including its vision, ideas, characteristics, and promising future. There are brief explanations of the major technologies, freshly created protocols, and the most popular IoT applications. For further efforts in the near future, the research directions/future problems are mentioned. We highlight the significance of power efficiency and temporal synchronization as future developments that, in our opinion, need greater attention and research. The most significant contribution of this article is that it pulls together the most important elements of the Internet of Things and their significance in a single document, presented in a simple and unverbose way.

SOME COMMENTS ON THE HISTORICAL BASIS OF MYTHOLOGICAL LEGENDS

Rizoeva Mehriniso Abduazizovna*

*Doctor of Philosophy in Philology (PhD),
Navoi State Pedagogical Institute,
UZBEKISTAN

ABSTRACT

This article clarifies the role and importance of myths in the genesis of the mythological genre, as well as the impact of folk art on the history and stages of development. The method of storytelling within the art forms through words was the most convenient and common method for the popularization and transmission of certain information that reflected the mythological imagination from generation to generation. An important factor in the emergence of the genre of myth was the "desacralization" of myths, that is, the loss of their importance as a sacred text expressing a particular religious view, and increasingly gaining artistic and aesthetic significance.

KEYWORDS: *Imagination, Primitive, Belief, Myth, Syncretic, Ritual, Tradition, Archaic, Folklore, Evolution, Anthropomorph, Epic, Fairy Tale, Zoomorph, Myth, Dimiurg.*

INTRODUCTION

It is known that the ancient foundations of the art of speech go back to mythological notions and primitive beliefs. archaic folklore is also the primary source from which the first buds were formed. It is recognized by many folklorists that the most ancient layer of folklore of the peoples of the world is built on the basis of mythology, which in a sense has a syncretic nature. Commenting on the historical development and fate of Altai myths, folklorist SS Katash writes: Later myths were divided into anthropomorphic and zoomorphic myths during their evolutionary development. The move away from animism eventually led to the end of the myth-making tradition".¹ Doctors of Philology, Professors M. Juraev and Sh. Shomusarov write that "myth is one of the verbal manifestations of the beliefs, religious views and early creative researches of the ancient man. The myth was created by the need of the primitive man to express certain needs of the spiritual world, that is, his own worldview. The system of mythological notions formed in ancient times as the beginning of the tradition of artistic perception of reality

was the basis for the formation of the plot series and the composition of images of epic genres in folklore. epic heroes in folk epics played an important role in the formation of the image of heroes. In the mythical creativity and performance traditions of the last periods of the primitive community system, there was a certain basis for the origin of the mythical genre. This is especially true of a situation associated with the execution of a myth or the popularization of mythological imagery. It is known that information of an ancient mythological nature was conveyed to people by narrators, priests, tribal elders who knew the myth well, through dances performed by shamans in ceremonies and rituals, and in symbolic games and handicrafts. The main means of determining the mode of execution of the myth - the sign of popularity through the word - remains the main semantic feature that determines the way of life of the mythical genre. The method of storytelling within the art forms through words was the most convenient and common method for the popularization and transmission of certain information that reflected the mythological imagination from generation to generation. That is why the form of oral performance served as the main means of ensuring the popularization of myths. This ensured that at certain stages in the history of human thought, myth was absorbed into folk oral art, and that mythology was relatively more preserved in folklore than in other forms of art. As the ancient human worldview improved and a tradition of artistic perception was formed through certain images instead of interpreting the world through mythological beliefs, mythology was "denied" by members of society as a specific form of understanding of being. Because at this time in the history of human thought, which was characterized by these complex processes, the performance and creativity of myth could not meet the artistic needs of human thinking. As a result, the main part of the ancient myths was absorbed into the first manifestations of folk art thinking, which initially appeared in a mixed form, consisting of a unit of melody, word and action. The fact that many mythological images and ancient imaginations have survived to the present day in the composition of epics, fairy tales, legends, songs and other folklore genres also shows that mythology has served as a source for artistic thinking. At the same time, the features of the myth as an "archaic genre" have not completely disappeared. According to Professor M. Juraev, "when a myth is rejected as an expression of a simple understanding of the world, its content undergoes certain changes and moves to the genre of myth. These changes are the attitude to reality ² (the transition from mythological to artistic perception of the world), the expansion of the function of myth (the reflection of moral and aesthetic views in stories created and narrated to explain reality), the renewal of myth, the transformation of mythological characters into artistic images it was based on the severing of its connection with rituals and the symbolic interpretation of the image of reality. " There is another reason why the genetic basis of the myth genre is directly related to myth: ancient myths were close to the myth genre in terms of their popularity, i.e., mainly performed in a narrative way. Therefore, at the time of the collapse of the primitive social order, when mythology was unable to meet the emerging epic thinking and artistic and aesthetic needs of people, a new form of oral prose - the genre of myth - emerged, embracing the main plots and essence of ancient myths. In other words, the mythical genre is formed by denying the traditions of myth creation and performance, which at the same time embodied the plot structure, method of performance and vital functions of the myths, which were already known among the people and formed as a complete structure in the tradition of live performance. "The legend genre is not a direct repetition or copy of an old myth, but a product of a new epic creation. A new way of interpreting, explaining, and interpreting reality has emerged in a sense as a denial of the mythological worldview. Thus, the mythological plots did not

become a direct myth, that is, the myth absorbed its elements while completely rejecting the method of mythological imagination". Professor B. Sarimsakov said that one of the most important features of medieval myths is "always living and spreading in the form of a myth, that is, through an aesthetic code."³ During the development of the historical-folklore process, mythology proved its features as one of the forms of social consciousness through the epic form of the genre of myth. Folklorist M. Juraev The sources that gave rise to folk legends and the stages of their evolution show that they are in the form of "living reality -> myth -> myth".⁴

The genre of myth also derives its function as an example of the epic genre from the myth, that is, the genre is directly related to the myth. This functional feature also led to the decline of mythic creativity, which was replaced by the tradition of artistic and epic thinking, and the entire genre of myth. Legends are meant to convey information about a fact or information to the listener, as the narration of an event in life by both the narrator and the listener is accepted as true. Mythological legends about the creation of the universe, the struggle between chaos and space, the emergence of flora and fauna, the lights of the sky, the beginning of natural phenomena are examples of myths once created by primitive people preserved in folk art through the aesthetic code. Although there are many similarities and commonalities between myth and mythological myth, it would not be correct to identify these two phenomena. In our view, myth and mythological myths have much in common in terms of the following characteristics:

1) In myths and mythological myths, the goal is to clarify the essence of certain concepts, objects and phenomena related to the being, universe, nature, celestial bodies and human life that surround man;

2) Etiology predominates in the functional direction of ancient myths and mythological myths. For in both of them the aim is to explain the essence of certain things-phenomena in the universe and in nature;

Both in the myths of primitive man about the universe, and in the mythological legends of our people to explain the causes of certain phenomena in nature, reality is expressed through concrete objects. Therefore, O.M. had entered.⁵ For example, myths and mythological legends about the moon, sun, and stars speak of a specific celestial body;

Myth is represented in ancient ceremonies through various symbolic game actions and dances, as well as narrated through words like mythological legends. Ancient notions expressed in the form of myths are conveyed to the listener in a mostly fabulative form;

Just as mythology, which served as the leading ideology of primitive society, embodied religious beliefs associated with ancient forms of religion such as animism, totemism, fetishism, and magic, so in mythological myths there are motifs, plots, and images that carry animative, totemistic, fetishistic ideas.

Another aspect that shows the commonality of myth and mythological myth is that they both have a motive of 'evolution'. In both myths and mythological myths, the emergence of a certain part of being through the transformation of a person into a certain thing is described as a motive for "evolution."

5) The genre of legend is the closest to the myth among the works of folk epic art in terms of the history of its creation, the scope of the subject, the way of expressing reality and the system of images. At the same time, mythological legends are not an exact repetition of ancient myths, but

there are a number of differences between these two phenomena, which are characteristic of different stages of the history of human worldview and thought, and these distinctive features are:

- 1) The reality depicted in myths and legends also differs depending on when it occurred, that is, according to the chronological character of the epic text. In ancient myths, "the creation of the universe is explained as the beginning of time and space
2. The time described in mythological legends is characterized by the fact that the narrator and the listener are focused on the past, ie "retrospective" in its direction, without a clear expression of the time in which they live.
3. The reality narrated in myth and legend is perceived as the expression of the event by the narrator and the listener, i.e. as the truth.

An important factor in the emergence of the genre of myth was the "desacralization" of myths, that is, the loss of their importance as a sacred text expressing a particular religious view, and increasingly gaining artistic and aesthetic significance. It is therefore incorrect to regard myths and legends as one thing, they are examples of folklore that require one another and are the product of historically different periods in terms of their creation and popularity.

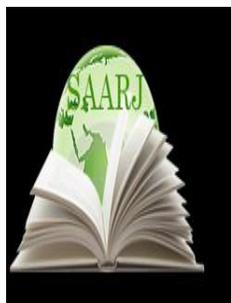

The expression of mythological ideas in the genre of myth took place in the form of a diffusion process consisting of "restoration of the socio-aesthetic code instead of the mythological code, acceptance of the mythological taboo as a social taboo, transformation of the mythological symbol into a poetic movement."The structural changes that took place in the method and forms of expression of the myth paved the way for the origin of the myth genre.

According to folklorist M. Juraev, "structural-semantic alternatives of ancient myth in Uzbek folklore are mythological legends.»⁶ In our opinion, the projects based on the mythological ideas of the ancients, that is, the re-perception of the original plots during the development of artistic thinking, reflect cosmogonic, totemistic, animistic, manistic views, that is, through the artistic perception of the tradition of mythological interpretation of the world. Oral prose works formed as a direct continuation of the performance and creativity of the myth, the successor of the myth, the popular manifestations of ancient myths in the epic form, are "mythological legends".

WORLDVIEW ASPECTS OF SYMMETRY AND CONSERVATION LAWS IN THERMODYNAMICS

Ulugbek Bekpulatov Rakhmatullaqli*

*Associate Professor,
 Navoi State Pedagogical Institute,
 UZBEKISTAN

ABSTRACT

The article discusses the stages of development of the concept of symmetry, conservation laws, entropy and dissymmetry, its characteristic functions in the form of conservation laws and principles of symmetry imposed on certain processes under certain conditions. In connection with the ideological aspect, attention is drawn to the congruence inherent in synergetic constructions and constructions based on dissymmetry. The task of the theoretical substantiation of the conservation laws is determined not only to reveal from the connection with each other, with the structure of fields, with such universal principles as the principle of the non-creativity and indestructibility of matter and motion and the principle of the unity of the attributes of matter.

KEYWORDS: *Symmetry, Asymmetry, Dissymmetry, Thermodynamics, Energy, Momentum, Inertia, Matter, Motion, Conservation Laws, Entropy, Synergetics.*

INTRODUCTION

The development of natural science, and above all physics, provides new and new data confirming the inviolability of the universal idea of symmetry, the laws of conservation and transformation of energy, matter and motion, displayed with the help of particular laws of conservation and transformation, the number of which is constantly increasing in physics.

For the human mind, symmetry seems to have a very special attractive force. We like to look at the manifestation of symmetry in nature, at the perfectly symmetrical spheres of planets or the Sun, at symmetrical crystals, at snowflakes and other things that are almost symmetrical. "Symmetry is the idea through which man has been trying for centuries to comprehend and create order, beauty and perfection", said G. Weil [1, - p. 7]. Since ancient times, the symmetry

of the forms observed in nature has made a strong impression on a person. He saw in symmetry the order, harmony, perfection brought by the almighty creator into the primordial chaos.

The modern view of symmetry: the idea of conservation, the identification of commonalities in objects or phenomena, the limitation of the number of possible options, and therefore symmetry is associated with conservation. It identifies invariants, peculiar “reference points” in our changeable, dynamic world. Thus, the order is introduced. Parallel symmetry-general, connected with the parallel symmetry-conservation – both go to the conservation laws.

Among all the laws of nature, conservation laws play a special role, being one of the methods of cognition of the hidden forces of nature. One of the characteristic features of conservation laws is that they can manifest themselves in the form of restrictions or even categorical prohibitions imposed on certain processes under certain conditions. This is often the beginning of their knowledge. When a person is faced with the fundamental impossibility of any processes, he eventually comes to the discovery of a new conserved quantity. At the same time, an important feature of conservation laws is that they generally determine the possibility or impossibility of certain processes, regardless of their specific nature. The very process of discovery and cognition by the idea of symmetry and conservation laws has passed a number of historical stages.

The connection of symmetry with conservation laws

The idea of symmetry has often served as a guiding thread for scientists when considering the problems of the universe. Symmetry determines the necessity: it acts in the direction of reducing the number of possible options, in many cases suggests those options that are possible, i.e. allows you to make predictions. For example, in 1869, D. I. Mendeleev predicted the existence and properties of scandium, gallium, and Germanium. In 1931, V. Pauli predicted the existence of neutrinos.

Observing the chaotic scattering of stars in the night sky, we understand that the external chaos hides quite symmetrical spiral structures of galaxies, and in them – the symmetrical structures of planetary systems. The symmetry of the external shape of the crystal is a consequence of its internal symmetry – the ordered mutual arrangement of atoms (molecules) in space. It is the crystals that bring the charm of symmetry into the world of inanimate nature. Each snowflake is a small crystal of frozen water. The shape of snowflakes can be very diverse, but they all have a symmetry – a turning symmetry of the 6th order and, in addition, mirror symmetry. Although there is a lot of complexity in physics, there is also a lot of simplicity and grace in it, which is largely due to the symmetry of physical laws and physical systems. The concept of symmetry not only occupies an important place in physics, but also plays a powerful role in modern physical research. To investigate the physical consequences of the symmetry of the system, we obviously need to learn something about transformations and especially about the set (set) of transformations that leave some functions of the potential type unchanged.

Mathematics, art and architecture have been paying attention to the principles of symmetry since ancient times, but they entered natural science, especially physics, relatively recently, and they were subjected to a deep theoretical and philosophical understanding only in the XIX century when their close connection with the principles of conservation was realized. With complete and quite unambiguous certainty of the laws and uncertainty of the initial and boundary conditions, we get the entire diverse range of physical phenomena and processes. The terms “symmetry” and “invariance” are often used as synonyms, at least in the physical literature, where they denote

“the property of remaining unchanged with respect to one or several different operations” [2, - pp. 96-99]. The symmetry or invariance of objects always takes place with respect to certain, clearly fixed operations. The invariance of the laws of nature is a consequence of those essential symmetries, which, however, are not fully included in their content. Without the category of symmetry, it is impossible to give a complete description of the category of the law, since each law includes certain symmetry. Therefore, the most general principles are the principles of symmetry or invariance, which permeate all modern physical theories.

The principles of symmetry and invariance, according to the famous American physicist E. Wegner, are a kind of super principle that relates to the laws of nature in the same way as the laws of nature relate to phenomena. Physical laws have symmetry with respect to a given transformation (shift, rotation, mirror reflection, etc.). Conservation laws indicate that the state of the system will not change without its interaction with other systems. These laws can be obtained directly from the condition of a particular symmetry, and therefore the scope of their application is wider than the laws of motion of classical Newtonian dynamics, phenomenological in origin and valid only for macroscopic systems and moderate velocities of movement [3, - p. 56].

The symmetry of physical laws directly applies to the laws of conservation of substances (matter, energy, momentum, etc.). At the beginning of the twentieth century, Emmy Netr showed that for differential equations derived from the Lagrange variational principle, each conservation law is a consequence of the corresponding symmetry: from time invariance follows the law of conservation of energy, rotation-the law of conservation of angular momentum, shift in space - the law of conservation of momentum, etc. These laws follow from a symmetry called the Poincare group. The connection of conservation laws with symmetries determines their leading position among all the laws of nature [4, - p. 20].

Stages of development laws conservation

The law of conservation of mass is historically the first of the conservation laws known by man. Guesses about the existence of a certain universal principle of the conservation of matter as a synonym for matter go back to the philosophers of ancient India, China, from where they penetrated into the ancient world. Thus, Empedocles believed that nothing can come from nothing and nothing can be destroyed. According to Aristotle, matter does not come from nothing, is not subject to multiplication or reduction, is not created and does not disappear, but only changes. The ideas about the eternity of matter are presented by Lucretius Kara, Democritus, Epicurus, Gassendi, Lomonosov, Dalton.

This idea was not lost in the wilds of history from antiquity to the science of the early medieval (VII – XI centuries) Islamic culture of Central Asia and was already more specifically embodied in the idea of Beruniy about the force of attraction of the earth to the center, and Ibn Sina’s theory of the driving force, introducing the concept of “aspiration” (impulse), his justification of “inertia” as a principle about preserving the amount of movement. From this understanding, the principle of inertia in the idea of R. Deckard arose, which assumes that if matter is at rest, it will not start moving by itself. There is also no reason to believe that if it begins to move, then this movement will stop by itself or weaken. To do this, it must meet something on its way that stops weakening it. This idea found expression in the works of G. Galileo, who defended the idea of preserving “natural motion”, in the understanding of which he, in a certain sense, followed the ideas of Aristotle, considering, for example, the “circular” movements of the planets as natural.

At the same time, he defended the position on the preservation of “rest” as natural, which later, after Newton's works, led to the development of such a concept of inertia, which is interpreted as a certain idea of conservation. After Newton introduced the concept of mass into physics as a measure of the amount of matter, the law of conservation of mass was implicitly introduced, that is, the idea that the amount of matter in the world should always remain the same due to the non-creativity and indestructibility of atoms.

The conservation of mass in chemical reactions was experimentally proved for the first time in history in 1755 by M.V.Lomonosov. But, for a long time, this law of conservation was not given much importance, it was considered self-evident, self-evident. In 1789, Lavoisier wrote: “Nothing happens either in artificial processes or in natural ones, and it can be argued that in every operation, the quality and quantity of the beginnings are the same, that only changes, changes have occurred” [5, -pp. 505-506]. M.V. Lomonosov in 1748 expressed in a very general form the idea of preserving matter and motion. In a letter to L. He wrote to Euler: “All the changes that occur in nature occur in such a way that as much as has been added to something, the same amount will be taken away from another... This law of nature is so universal that it also extends to the rules of motion: a body that excites another with a push to move loses as much of its movement as it gives away this movement to another body” [6,- p.160].

Quantitative analysis, as well as the atomistic hypothesis of Higgins, and then Dalton, are entirely based on the law of conservation of all matter, because the weight of Dalton atoms does not change during chemical reactions, as well as their number.

The effect of the second law of Newton's mechanics is based on the fact that force is associated with the inert properties inherent in any body, it is often interpreted as an example of the fact that mass is only a coefficient between force and acceleration, i.e. mass is a measure of inertia. Careful studies have shown that the inert and gravitational masses are numerically equal to each other and are, as it were, two manifestations of the same property of bodies. As is known, the identity of inertial and gravitational masses is the basis of Einstein's general theory of relativity, in which the geometric properties of space are related to the distribution of available masses. The theory of relativity created by Einstein at the beginning of the twentieth century showed that the dependence on speed has a mass of any origin. Mass is one of the decisive criteria for the stability of atomic nuclei: they are stable if the difference between the mass number and the charge of the nucleus does not exceed narrow boundaries. The stability of the nucleus is characterized by the binding energy of nucleons (protons and neutrons). In the physical and philosophical literature, we still meet with statements that mass is an adequate expression of matter, that mass is the amount of matter and energy, etc.

The law of conservation and transformation of energy is very important for theory and practice, for the scientific worldview. It is interesting to note that physicists themselves almost did not put their hands to the formulation of the law of conservation of energy. A significant contribution to the solution of this problem was made by: doctor Robert Mayer (1814-1878), technological engineer August Kolding (1815-1888), brewer James Joule (1818-1889), physiologist, physicist Hermann Helmholtz. Here we should also note the works of Russian academicians E. Lenz and G. Hess, which were a vivid expression of not only the conservation, but also the transformation of energy.

The law of conservation and transformation of energy was, as it were, the result of the development of mechanics. Thanks to practice, experimental and theoretical research, its deep content as a universal law of nature was revealed more and more. But the law of conservation and transformation of energy has played a particularly important role in the study of electric and magnetic phenomena. Thanks to the works of Clausius, Thomson, Maxwell, Boltzmann, Gibbs and others, since the 60s of the XVIII century, the law of conservation and transformation of energy has become a recognized tool of scientific research. There was a need for a more complete physical, as well as philosophical understanding of this fundamental law of nature. The physical analysis of it was brilliantly carried out by M. Planck in the book "The Principle of conservation of Energy" published in 1887. This allowed the rapid development of the theory of thermal processes, and led to the emergence of thermodynamics.

Conservation laws in thermodynamics.

All simple thermodynamic systems and complex objects initially contain single entities-microparticles (molecules, atoms, etc.), which eventually generate an enormous variety of structures and phenomena. Hence, we can expect the existence of few general laws that can comprehensively characterize the states of material systems. Indeed, thermodynamics is based on three fundamental laws (principles).

According to the first law of thermodynamics, when processes occur in closed systems, the total energy remains unchanged, which corresponds to the universal law of conservation and transformation of energy:

$$dU = \delta Q + \delta A \quad (1)$$

that is, the change in the internal energy of the system consists of increments with the corresponding signs of heat and work, which are not complete differentials. Only the internal energy U is a function of the state, and the heat and the work of the system are functions of the process. The work on overcoming the dissipative forces is converted into the bound energy $\delta Q = TdS$, and an equilibrium state is established in the system with a corresponding increase in the entropy S . Therefore, the law of conservation of energy can be formulated in the following form: "The energy of a material system in a certain state, taken in relation to another certain "zero" state, has an unambiguous value" [7, -p.96], i.e. it is independent of the method of transition. Thus, the first law of thermodynamics requires the energy balance of all interactions to be observed.

The formulated law is derived from the experimental fact that it is impossible to create work from nothing (perpetuum mobile) and destroy it-from the fact that "positive work can neither arise from nothing nor disappear into nothing" [7, - p. 138]. This makes it possible to interpret the energy contained in the system already "as a quantity that is independent of external actions in its meaning". The change in the internal energy of a closed thermodynamic system is equal to the sum of the thermal energy communicated to the system and the thermodynamic work applied to the system.

The second law of thermodynamics states (R.Clausius) that there is a quantity that, with all changes in a closed system, evolves in one direction – growth. This value, which is a function of the state, is entropy. The growth of entropy is an indicator of an increase in structural disorder, it establishes the existence of a fundamental asymmetry in thermodynamic systems – one direction

of spontaneous processes. And although the total amount of energy is preserved in a closed system, its distribution changes irreversibly: the inevitable loss of free energy means the loss of part of the value of energy; at the same time, the organization and structure tend to replace diversity with uniformity. From this we can say that this law plays a very special role in understanding the meaning of the arrow vector of time. The value of entropy:

$$dS = \delta Q / T \quad (2)$$

Here, a small change in the entropy (full differential) dS is equal to the ratio of the elementary heat δQ (δ is the sign of the incomplete differential), reported to the system or derived from it, to the temperature level T (on the Kelvin scale). In 1865, R. Clausius introduced this concept and explained the origin of the name of the new concept: "I propose to call the value S entropy from the Greek τροπή-transformation. I specifically chose the word entropy so that it would be consonant with the word energy, since these two quantities are so similar in their physical meaning that the consonance of their names seems useful to me" [8,- p.76].

Entropy is the most important function of a thermodynamic system that has the property of the thermal coordinate of the state, i.e. it is uniquely associated with the presence of an energy exchange in the form of heat.

Thus, the second law of thermodynamics indicates the direction of spontaneous state change – degradation (scattering, depreciation) of energy. It is valid only for a large collection of particles (the macrocosm) and does not make sense in the microcosm.

And, the ambiguity of the relationship between the concepts of chaos and entropy is also manifested in the fact that entropy, according to the second law of thermodynamics, is a "measure of the disorder of the system". In the context of the synergetic theory, entropy is the "progenitor of order" (A. Toffler). In such an interpretation of chaos and entropy, the emphasis is not on the increase in disorder (with an increase in entropy and chaos), but on the creativity inherent in the state of disorder, which carries the possibility of order formation [9, -p.658]. The concept of chaos, and its synergetic understanding, is completely congruent to the concept of dissymmetry: both chaos and dissymmetry are represented as containing the creative potential to become either order and symmetry, or completely subject the system to elimination.

In connection with the worldview aspect, the congruence of another worldview conclusion, characteristic of synergetic constructions and constructions based on dissymmetry, attracts attention [10,- p.376]. Both points of view recognize the material unity of the world at its various structural levels. And if in synergetics, in this regard, the emphasis is placed on the idea of the Universe as a "complete system" (N. N. Moïsov), then the view of this problem from the standpoint of dissymmetry was expressed by Louis Pasteur and for the first time introducing the concept of "dissymmetry" into scientific circulation, who considered the world as a "dissymmetric ensemble", explaining this by the fact that "... the properties of certain figures are not combined by a simple overlay with their mirror image" [11, - p. 383]. Continuing the theory of L.Pasteur, P.Curie, in the logic of his scientific research on the influence of the environment on the bodies in it, determined that "...they retain mainly those elements of their own symmetry that coincide with the symmetry of the environment". According to the principle of dialectical unity of symmetry and dissymmetry, every living object has one or another form of this unity [12, p. 74]. V. I. Vernadsky also noted that "there is a dissymmetry in the world, manifested in the existence of entropy in it..." [13, - p. 350]. It seems to us that dissymmetry should be understood

as a system-forming concept. This allows us to offer, as it seems to us, the most visual representation of the mechanism of self-organization. The phenomenon of self-organization should be represented as the desire of any particle to subordinate the oscillation phase of other particles to its oscillation phase, as a result of which a self-consistent interaction field, or response field, is formed around each particle. The phase correlation between the particle interaction field will lead to the formation of a self-consistent oscillating particle field. The use of a new physical invariant made it possible to discover an internal connection between all phenomena in Nature and to explain all phenomena from a unified point of view: from intra-nuclear to cosmic [14, - p.71]. From the standpoint of the dissymmetric concept of transformation, entropy is a measure of the degree of dissymmetrization of a system [15, -p.114], i.e., the growth of entropy in a system depends on the degree of its dissymmetrization. Energy is a property that allows a system to achieve specified states, or, figuratively speaking “energy creates an organization”. Then entropy determines the quality of energy, the measure of its ability to create, the “measure of creativity”, its final result.

The second principle of thermodynamics can be formulated in this form: the sum of changes in the entropy of the system and the external environment cannot decrease. Thus, the universe as a whole, i.e. as a kind of giant system, cannot return to its initial state and must (indefinitely?) strive for a state of thermodynamic equilibrium.

The entropy count starts from the absolute zero of temperature – this is the thermal theorem of V. Nernst, or the third law of thermodynamics. In this case, an absolute equilibrium of the system is achieved, i.e., the cessation of all movement of molecules in this basic energy state ($T=0, S = 0$). Only one microstate corresponds to such a macrostate, so the thermodynamic probability of the latter is $W=1$. At $T=0$, a closed system left to itself is characterized by a tendency to thermodynamic equilibrium with the highest degree of disorder, i.e. the transition from less probable states to more probable ones. The stable equilibrium condition is $dS=0$ and $S= \max$. Entropy increases only in irreversible processes (processes with dissipation). “...In the redistribution of our geological and even cosmic time, the nature of the energy of the world always changes in the same direction – an increase in thermal energy that can no longer produce work in the world... It inevitably follows from the concept of entropy of the world that the center of symmetry cannot be in the space – time of a physicist”. In other words, it is in irreversible processes that the symmetry in time is broken [13, - p. 350]. However, idealized reversible processes do not depend on the direction of time: it is possible to calculate their states not only in the future, but also in the past. In such non-dissipative (conservative, Hamiltonian) systems, the direction of time can be any. It is believed that living beings have only a non-variant past and a multi-variant future, and the present is the interval where any processes can occur. This is the area of dissymmetry, or rather, its absence, the place of the alleged bifurcation, the place where Einstein’s postulate is not relevant. In places where there is no symmetry (in dissymmetry), the principle of cause and effect may even be violated. This is a kind of time tunnel.

Of great physical and philosophical interest is the question of the relationship of the law of increasing entropy with the direction of time. It is well known that the equations of classical mechanics are symmetric with respect to the replacement of time t by $-t$, and it is natural to assume that such symmetry should be preserved in statistics based on classical mechanics. L.D. Landau and E.M. Lifshits show that this is not the case. They come to the conclusion that “in quantum mechanics there is a physical nonequivalence of both directions of time, and, perhaps,

its “macroscopic” expression is the law of increasing entropy. However, until now it has not been possible to trace this connection in any convincing way and show that it really takes place” [16, - p. 48].

Thus, it is also impossible to deduce all aspects of the conservation laws related to dynamic symmetries from the symmetry data. In this case, even the invariance of the conserved quantities is obtained only approximately. While recognizing the great importance of this aspect in the analysis of the theoretical justification of conservation laws, it is still necessary to note its limitations.

CONCLUSION

The connection of conservation laws with the principles of symmetry is accepted by physicists as so fundamental that they classify the conservation laws of modern physics depending on the types of symmetry, and they identify the conservation principles themselves with the principle of symmetry in their physical contents and “do not distinguish between symmetry and conservation principles”.

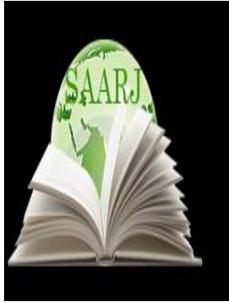

There is undoubtedly an essential connection between symmetry, asymmetry and conservation laws, but we think that it cannot be so exaggerated that the entire content of conservation laws can be reduced to forms of symmetry and asymmetry. The task of theoretical substantiation of conservation laws is not only to reveal their connections with each other, with the structure of fields, with such universal principles as the principle of the non-creativity and indestructibility of matter and motion and the principle of the unity of the attributes of matter.

Thus, the conservation laws are associated with the presence of a certain symmetry, the role of group-theoretic understanding of them becomes clear, because group theory studies the most general consequences arising from the existence of a particular symmetry.

 Mathura, Uttar Pradesh, INDIA

Email id: prasansa.zoology@sanskriti.edu.in

ABSTRACT

Neem (Azadirachtaindica) belongs to the Meliaceae family and is known for its health-promoting properties due to its high antioxidant content. It has long been utilized in Chinese, Ayurvedic, and Unani medicine, particularly in the Indian Subcontinent, to cure and prevent a variety of illnesses. An earlier discovery showed that neem and its components have a function in free radical scavenging and disease etiology prevention. According to animal research, neem and its main components have a key role in anticancer control by modulating a number of molecular pathways, including p53, pTEN, NF-B, PI3K/Akt, Bcl-2, and VEGF. It is regarded as a safe therapeutic herb that regulates a variety of biological processes without causing harm. I outline the function of Azadirachtaindica in illness prevention and therapy through the control of different biochemical and physiological processes in this paper. This paper can be used for future work for further study on Neem.

KEYWORDS: *Azadirachtaindica, Botanical Description, Effects, Healing, Neem.*

1. INTRODUCTION

Through the increase of antioxidant activity, suppression of bacterial growth, and regulation of genetic pathways, plant products or natural products play a significant role in disease prevention and therapy. Because of their low side effects and low cost, the medicinal function of a variety of plants in disease management is currently being vigorously studied. It is well acknowledged that allopathic medicines are costly and have a harmful impact on normal tissues and biological processes[1]. Many pharmacologically active medicines are produced from natural resources, including medicinal plants, as is widely recognized.

The Bible and the Quran, for example, both advocate the use of herbs in health treatment and prevention. The importance of herbs in illness management is also confirmed from an Islamic

viewpoint, with Prophet Mohammed (PBUH) recommending different plants and fruits for disease treatment. Many infectious, metabolic, and malignant illnesses are treated using neem components in Ayurveda, Unani, Homeopathy, and contemporary medicine. In many countries, several kinds of preparations based on plants or their components are extremely popular in illness treatment. Based on the fact that neem (*Azadirachta indica*), a member of the Meliaceae family widely found in India, Pakistan, Bangladesh, and Nepal, has therapeutic implications in disease treatment and formulation[2].

Azadirachta indica has a complex of components including as nimbin, nimbidin, nimbolide, and limonoids, which have a role in illness management by modulating different genetic pathways and other activities[3]. The first polyphenolic flavonoids, quercetin and β -sitosterol, were isolated from fresh neem leaves and were recognized to have antifungal and antibacterial properties. Biological and pharmacological properties such as antibacterial, antifungal, and anti-inflammatory have been documented[4]. Researchers have previously verified their anti-inflammatory, antiarthritic, antipyretic, hypoglycemic, antigastric ulcer, antifungal, antibacterial, and antitumor properties, and a review highlighted neem's numerous therapeutic roles. The function of neem and its active components in disease prevention and therapy through regulation of different biological pathways is summarized in this study.

1.1 Botanical account of Neem:

The Meliaceae family includes the neem tree, which is abundant in tropical and semitropical areas such as India, Bangladesh, Pakistan, and Nepal. It is a fast-growing tree that reaches a height of 20–23 meters and has a straight trunk with a diameter of 4-5 feet. The leaves are complex, imparipinnate, and have 5–15 leaflets apiece[5]. It has green drupes that mature to a golden yellow color between June and August. Table 1 shows the taxonomic classification of *Azadirachta indica* (neem).

TABLE 1: ILLUSTRATES THE TAXONOMIC CLASSIFICATION OF AZADIRACHTAINDICA (NEEM)

Order	Rutales
Suborder	Rutinae
Family	Meliaceae
Subfamily	Melioideae
Tribe	Melieae
Genus	<i>Azadirachta</i>
Species	<i>Indica</i>

1.2 Active Compounds of *Azadirachta indica* L. (Neem):

Because of its abundant supply of different kinds of components, *Azadirachta indica* L. (neem) has a therapeutic function in health management. Azadirachtin is the most active component, followed by nimbolin, nimbin, nimbidin, nimbidol, sodium nimbin, gedunin, salannin, and quercetin. Nimbin, nimbanene, 6-desacetylnimbinene, nimbandiol, nimbolide, ascorbic acid, n-hexacosanol and amino acid, 7-desacetyl-7-benzoylgedunin, 17-hydroxy-azadiradione, and nimbiol are among the compounds found in the leaves. Quercetin and β -sitosterol, polyphenolic

flavonoids isolated from neem fresh leaves, have antibacterial and antifungal effects, while seeds include important components such as gedunin and azadirachtin.

1.3 Effect of Neem as Anti-Inflammatory:

Plants or isolated products of plants are used to treat or function as anti-inflammatory agents. In a cotton pellet granuloma test in rats, extract of *A. indica* leaves at a dosage of 200 mg/kg, p.o. exhibited substantial anti-inflammatory action, according to the results of a research. Other research found that neem leaf extract has a substantial anti-inflammatory impact, albeit it is less effective than dexamethasone, and that nimbidin inhibits macrophage and neutrophil activities that are related to inflammation. Earlier research revealed that bark and leaf extracts had immunomodulatory and anti-inflammatory properties, whereas oil seeds have antipyretic and anti-inflammatory properties. The analgesic efficacy of neem seed oil was tested on albino rats, and the findings indicated that neem seed oil had a substantial analgesic impact at doses of 1 and 2 mL/kg, and that the oil had dose-dependent analgesic action[6].

Another research looked at the anti-inflammatory effects of neem seed oil (NSO) on albino rats with carrageenan-induced hind paw edema, and the findings indicated that NSO exhibited increasing suppression of paw edema when the dosage was raised from 0.25 mL to 2 mL/kg body weight. During the dosage of 2 mL/kg body weight, NSO inhibited edema to the greatest extent (53.14 percent) at the 4th hour after carrageenan injection. The research found that rats given a 100 mg/kg dosage of *Azadirachta indica* fruit skin carbon tetrachloride extract (CTCE) and the isolated component azadiradione had substantial antinociceptive and anti-inflammatory effects.

1.4 Wound Healing Effect:

The wound healing effect is influenced by a variety of plants and their components. Excision and incision wound models in Sprague Dawley rats were used to evaluate the wound healing activity of extracts of leaves of *A. indica* and *T. cordifolia*, and the results revealed that extracts of both plants significantly promoted wound healing activity in both excision and incision wound models. Furthermore, the tensile strength of the healing tissue of both plants treated groups was shown to be substantially greater than the control group in incision wounds. Other findings revealed that *Azadirachta indica* leaf extracts enhance wound healing activities by increasing inflammatory response and neovascularization[7].

1.5 Hepatoprotective Effect:

Medicinal herbs and their constituents serve an important function in hepatoprotection without causing any side effects. The hepatoprotective effect of azadirachtin-A in carbon tetrachloride (CCl₄) caused hepatotoxicity in rats was investigated, and histology and ultrastructure findings showed that pretreatment with azadirachtin-A decreased hepatocellular necrosis dose-dependently. Furthermore, the study's findings indicate that pretreatment with azadirachtin-A at higher dosage levels returns the rat liver to a modest degree of normalcy.

1.6 Antidiabetic Activity:

A research was conducted to assess the 70 percent alcoholic neem root bark extract (NRE) in diabetes, and the findings revealed that the neem root bark extract exhibited statistically significant outcomes in the 800 mg/kg dosage. Another experiment was carried out to investigate

the pharmacological hypoglycemic action of *Azadirachta indica* in diabetic rats, and the results revealed that in a glucose tolerance test with neem extract 250 mg/kg, glucose levels were significantly lower than in the control group, and *Azadirachta indica* significantly reduced glucose levels at the 15th day in diabetic rats.

1.7 *Role of Neem in Dentistry:*

A research was conducted to determine the effectiveness of neem mouth rinse in terms of its anti-gingivitis impact, and the results revealed that *A. indica* mouth rinse is just as efficient as chlorhexidine in lowering periodontal indices. Another research looked at the antibacterial capabilities of organic neem extracts against three bacterial strains that cause dental caries, with the findings revealing that petroleum ether and chloroform extracts had significant antimicrobial activity against *S. mutans*. *Streptococcus salivarius* was extremely sensitive to chloroform extract, while *Fusobacterium nucleatum* was highly sensitive to both ethanol and water extract. In comparison to *S. salivarius*, *S. mitis*, and *S. sanguis*, dried chewing sticks of neem exhibited the highest antibacterial activity against *S. mutans*.

1.8 *Antinephrotoxicity Effect:*

The effects of a methanolic leaves extract of *Azadirachta indica* (MLEN) on cisplatin-(CP-) caused nephrotoxicity and oxidative stress in rats were investigated, and the findings showed that the extract efficiently protects the kidney from CP-mediated oxidative damage. PCR findings for caspase-3, caspase-9, and Bax genes also revealed downregulation in the MLEN-treated groups.

1.9 *Neuroprotective Effects:*

The neuroprotective properties of *Azadirachta indica* leaves against cisplatin-induced neurotoxicity were investigated in a research, and the results revealed that morphological findings of neem before and after CP injection indicated well-preserved brain tissue. There were no changes in biochemical indicators in the neem-treated groups.

1.10 *Antimicrobial Effect:*

Neem and its constituents prevent the development of a variety of microorganisms, including viruses, bacteria, and dangerous fungus. Individually, the function of neem in preventing microbial development is explained as follows.

1.10.1 *Antibacterial Activity:*

The antibacterial effectiveness of herbal alternatives as endodontic irrigants was evaluated and compared to the conventional irrigant sodium hypochlorite, with the findings confirming that leaf extracts and grape seed extracts exhibited zones of inhibition, indicating that they possessed antimicrobial characteristics. Leaf extracts also revealed considerably more inhibitory zones than 3 percent sodium hypochlorite.

1.10.2 *Antifungal Activity:*

The effectiveness of different neem leaf extracts on seed-borne fungus *Aspergillus* and *Rhizopus* was tested, and the findings showed that both alcoholic and water extracts substantially inhibited and regulated the growth of both fungal species. Furthermore, as compared to aqueous extract, the alcoholic extract of neem leaf was most effective in inhibiting the development of both fungal species. Another finding revealed that aqueous extracts of neem cake inhibited spore

germination against three sporulating fungi, including *C. lunata*, *H. penniseti*, and *C. gloeosporioides* f. sp. *mangiferae*, and that methanol and ethanol extracts of *Azadirachta indica* inhibited growth against *Aspergillus flavus*, *Alternaria solani*.

2. LITERATURE REVIEW

Rajkumar Paul et al. discussed a review on anticancer biology on Neem[8]. A member of the Meliaceae family, neem (*Azadirachta indica*) is a fast-growing tropical evergreen tree with a strong, robust stem. Neem has been dubbed "the wonder tree" and "nature's medicine store" because of its enormous therapeutic, domestic, agricultural, and ethnomedicinal value, as well as its closeness to human culture and civilization. All components of this tree, including the leaves, bark, seed oil, and refined products, are extensively utilized in cancer therapy. This plant has purified about 60 distinct kinds of biochemicals, including terpenoids and steroids. The anticancer activities of the crude and purified compounds from this plant have been fine-tuned through pre-clinical research work done over the past decade. The plant's anticancer qualities have mostly been investigated in terms of its preventative, protective, tumor-suppressive, immunomodulatory, and apoptotic actions against different cancers and their molecular processes. The goal of this study is to comb through the dispersed material on "the anticancer biology of *A. indica*," as well as associated toxicity issues and future prospects. The compelling evidence on the anticancer biology of *A. indica* compounds demands multi-institutional clinical studies as soon as feasible. The chances for comparatively inexpensive cancer medicines may potentially be better, especially for the world's poorest cancer sufferers.

Alok Maithani et al. discussed a review on Neem[9]. Traditional medicine and medicinal plants are extensively used as a normative foundation for the preservation of good health in most underdeveloped nations. Based on knowledge acquired from traditional healers, about 121 medicinal items were developed in the past century. Natural chemical principles have grown simpler, which has aided in the creation of novel medicines derived from medicinal plants. And as a result of these facts, the global market for plant-derived chemicals – medicines, perfumes, flavors, and colorants – is worth several billion dollars each year. Because of numerous phytoconstituents found in it, as well as a variety of pharmacological properties connected with it, *Azadirachta indica* is one of the most revenue-generating plants cultivated in India. The current study focuses on the literature on *Azadirachta indica* leaves from a taxonomic, botanical, phytoconstituents, and pharmacological standpoint. Jose Francisco Islas et al. discussed a review on Neem and its impact on health[10]. For a better knowledge of the metabolic process and its consequences in the human body, global health and medical practice strive to combine traditional medicine with evidence-based medicine. Complementary medicine, such as phytotherapy, is one example. Because of its many health benefits, *Azadirachta indica* (Neem), a tree native to India and Myanmar, has been dubbed "The Village Pharmacy" or "Divine Tree" by many. Neem-derived extracts have recently been proven to be effective in a variety of applications, including insect repellent, anti-inflammatory supplements, diabetic management, and even cancer prevention. We describe the health benefits of various compounds and extracts derived from Neem, as well as the mechanisms and pathways by which Neem compounds produce their effects. We also warn that extracts produced under unsanitary and unstandardized conditions can cause health problems, with certain compounds having potentially harmful effects on the liver and kidneys.

3. DISCUSSION

Natural products or their derivatives are becoming more popular in the treatment and prevention of illnesses owing to their lack of adverse effects. Neem and its constituents have medicinal properties and have been utilized in traditional medicine throughout the globe, particularly in the Indian Subcontinent, since ancient times. Clinical investigations have shown that neem is effective in preventing a variety of illnesses. Active components have been shown to have a chemo preventive impact in a variety of tumors by modulating several cell signaling pathways. To understand the precise mechanism of action in illness management, a thorough research based on animals should be conducted for future work.

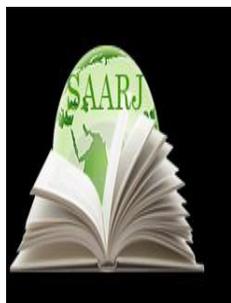

4. CONCLUSION

Neem (*Azadirachta indica*) has long been used as a herbal remedy for a range of human ailments. Researchers have been attempting to isolate the active compounds in this plant in order to determine its mechanistic, pharmacological, and clinical features using trustworthy methods. The refined version of neem is accessible in over 60 different formulations. These compounds are being evaluated on appropriate in vitro and in vivo systems to determine their anticancer and immunomodulation effects in comparison to crude neem extracts. There is strong experimental evidence that neem compounds, such as Azadirachtin A, Nimbolide, Nimbidin, and others, have anticancer effects. Their action has been studied at the molecular level. For these reasons, it is critical to perform appropriate clinical studies in order to pave the way for these medicines to be approved as anticancer medications on the market. The scientific evidence suggests that the use of appropriate medication combinations in conjunction with radiation and bioimmunotherapy may hold tremendous promise in finding a cure for cancer patients. Neem products may have certain unpleasant side effects, especially when used in large amounts. As a result, these items should only be used under the guidance and prescription of experienced medical practitioners and doctors.

A REVIEW ON RAIN WATER HARVESTING TECHNIQUES

Dr. Gopal Arora*

*SBAS, Sanskriti University,
 Mathura, Uttar Pradesh, INDIA

Email id: drgopalorora.chem@sanskriti.edu.in

ABSTRACT

Our most valuable natural resource is water, which most of us take for granted. We are more conscious of the significance of water to our existence, as well as its scarcity. Humans need water for a variety of reasons. Water covers the majority of the earth's surface (about 71 percent). Only 1% of the total volume of water accessible on the earth's surface is fresh but also drinkable water, with 97 percent being salty water, 2% being ice & glaciers, as well as 1% being fresh and potable water. In terms of average annual rainfall, India is one of the world's wealthiest countries. It's hard to believe, but Cherapunji, which receives 11000 mm of yearly rainfall, nevertheless has a severe drinking water deficit. Though India's average annual rainfall is 1170 mm, it may be as low as 100 mm in the deserts of western India. As a result, rainwater collecting techniques must be used to meet the water demand.

KEYWORDS: Rain Water Harvesting, Filter, Rainfall.

INTRODUCTION

India is classified as a developing country. Water demand is rising day by day as a result of quicker industrialization or urbanization, as well as a rise in population. India's rainfall is erratic at best. The majority of it is concentrated over a few month of the year, and the majority of it flows away, resulting in inadequate ground water recharge. There is a substantial geographical mismatch in the available water resources and the demand for water. As a result, it is becoming essential to transport water from farther away, increasing the expense of transportation. It's also a frequent observation that the subterranean water table is dwindling as a result of unregulated water extraction. Maharashtra is a state in India that spans 307,713 square kilometers and has a population of 82 million people. Over half of the population lives in rural areas where water scarcity is a concern. Due to decreasing water tables, poor water quality, and expensive operating and maintenance costs, traditional sources such as open wells, bore wells, and piped water

supplies have failed. Every year, a large quantity of water that falls on terraces is lost, and it all ends up in storm water drains. Rainwater collecting has the potential to help solve water shortages[1]

Why Collect Rainwater?

1. Rainwater harvesting is the process of collecting rainwater directly from the sky and recharging it in the ground to prevent groundwater levels from falling, or storing it in a surface or subterranean water tank. Because of the following reasons, it is best suited in today's setting. This is the most scientific and cost-effective method for replenishing groundwater and rejuvenating the water table.
2. It improves the quality of water for irrigation and household usage.
3. It produces water that is naturally soft and free of dissolved minerals, salts, arsenic, and other heavy metals.
4. It may be done at both an individual and a communal level. This manner, we may be self-sufficient in terms of household water needs, rather than relying on government or other local bodies to take action.
5. Collecting rainfall as it falls out of the sky seems to be a brilliant idea in places where drinkable water is in short supply. Rainwater has relatively few contaminants, making it one of the cleanest sources of water accessible. Where traditional water delivery systems have failed to satisfy people's requirements, rain water collecting technologies may be used.

Rainwater harvesting is the collection as well as storage of rainwater for reuse on site while preventing runoff. We may collect it in a variety of locations, such as a river or a roof, and divert it to a well, bore well, shaft, reservoir using percolation, aquifer, and so on. Shown in figure 1. We utilize it for garden watering, animal drinking, irrigation, and residential usage after appropriate treatment. It is one of the earliest and most basic ways of home water self-supply[2].

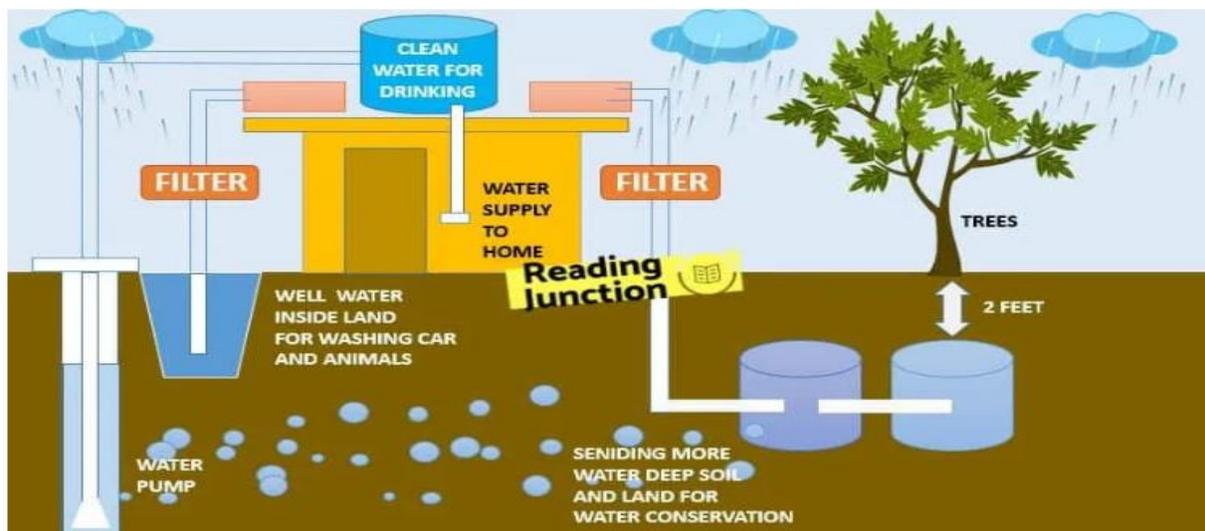

Figure 1: Illustrate Diagram Showing The How We Utilize The Rain Water[3].

Rainwater Harvesting Structure Components:

There will be three fundamental components to all rainwater collecting structures:

1. The catchment area, or the surface area used to collect rainfall.
2. A collection device for collecting or retaining water, such as tanks, cisterns, or percolation pits.
3. Conveyance system, which is a network of pipelines or percolation pits that transports water from a catchment region to a collecting device.

Rainwater Harvesting Methods:

Rainwater harvesting may be accomplished in a variety of ways. In the following paragraphs, some of the most significant techniques will be described one by one.

1. Rainwater harvesting for the Dewas Roof Water Filter:

The city of Dewas is situated in the state of Madhya Pradesh. This roof water filter was originally used in Dewas, which is why it is known as the Dewas roof water filter. Figure 1 depicts the Dewar roof water filter in detail. Sand pebbles of various sizes may be used to make it. T1 and T2 are the two caps included in this set. Always keep caps T1 and T2 closed. T2 is for backwashing the filter on a regular basis, while T1 is for backwash drainage. Rainwater enters via little stones about 6 mm in size. Cap T2 is used to provide medication for water purification. For the first two days of the rainy season, do not recharge rainwater. Maintain a clean roof at all times, particularly during the rainy season, to ensure that the quality of rainwater dropping on the roof does not degrade. This roof filter costs about Rs 800 without the connecting pipe. This filter can percolate approximately 50 m³ of water from a 100 square meter roof area in Maharashtra under normal conditions[4].

2. Rainwater harvesting for recharging:

Pit Total rainwater falling on the open plot may be recharged by digging a recharge pit if there is no well or bore well in the home. This hole may be used to collect water that runs off the plot. This pit may be filled 10 to 15 times in a single monsoon, recharging up to 200 m³ of water. This technique works well in areas where the soil permeability is high. The pit's capacity may be increased to 10 m³. Water percolation on the order of 200 m³ per year is feasible via this hole. The price of this construction is estimated to be about Rs. 7000.

Rainwater is directed to a 6 m × 6 m x 1.5 m water collecting tank near the well, and a tiny filter pit of 1.5 m x 1.5 m x 0.6 m is dug at the bottom of the main pit. Otherwise, depending on the availability of space around the well, an appropriate pit may be dug. the intricacies of agricultural runoff recharging an open well. The filter pit is filled in three equal layers with sand, pebbles bigger than 20 mm, and pebbles/boulders larger than 75 mm pebbles, and is linked to the well via a 150 mm diameter PVC pipe that extends 0.5 to 1.0 m into the well. The water tank's volume is estimated to be about 50 m³. This structure allows for the percolation of 400 to 1000 m³ of water per year[5].

Bore well recharging with rainwater:

Around the bore well casing pipe, a six-meter-diameter collection pit with a 1.5-meter depth is dug. At the bottom of the big pit, a small hole of 1.5 m × 1.5 m x 0.6 m depth is dug and filled

with filter material. After the initial layer of 75 mm stones, a 75 mm diameter PVC pipe is attached to the bore well casing pipe. The pipe is linked to an inverted elbow[6].

Recharging Trench with Roof Water

The collected roof water may be replenished using a recharge trench. Throughout the year, water may be replenished by utilizing spent water or rainfall. This recharge trench may be filled many times depending on the amount of utilized or rain water available. This technique works well in areas where the soil permeability is high. The trench's capacity may be increased to 20 m³. Water percolation on the order of 100 to 200 m³ per year is feasible via this hole. The cost of this construction may be in the region of Rs. 5000.

Recharging Tube Wells with Surface Rainwater

Depleted aquifers are immediately replenished with surface rainfall through a recharge tube well, resulting in rapid recharge and minimal evaporation and transit losses. The following is a diagram of a typical recharge tube well:

- A 50 cm diameter borehole is bored to the required depth.
- A 20 cm diameter casing, i.e. the bore well's outer pipe, is constructed with slotted perforated portions to protect against aquifers.
- The recharge tube well should be about 30 meters below the water table in the region.
- A compressor is used to fill the annular area between the borehole and the pipe with excellent gravel and develop it until it produces clear water. A filter mechanism is supplied at the top to prevent suspended particles from entering the recharge tube well.
- Small spherical boulders, stone chips, and sand are layered in this pit, with boulders at the bottom & sand at the top.
- In this hole, the top one meter of the casing component is filled with sand. To prevent suspended debris from entering the well, the top of the casing pipe is fitted with a cover that is approximately 600 mm below the sand bed.
- The air vent is supplied via a 75 mm diameter pipe linked to the recharge tube well inside the top 600 mm using a reducer tee of dimensions 200 mm x 75 mm in order to escape the air present in the casing component during the percolation process of floodwater. After that, the air releasing pipe is extended to one of the banks, where the vent is built.

The majority of suspended contaminants are filtered out of flood water when it passes through the sand. The second sand filter, which surrounds the well's slotted portion at the top, keeps any residual suspended material out. Before water enters the well, a coir covering serves as a last protective filter. Due to the placement of a slit at the top, the rate progressively drops. After the wet season, approximately one meter of sandy in the filter bed must be changed every year. Because the level of water is shallow soon after the monsoon as well as development is effective, the well is developed with a compressors once a year, right after the properly stored become empty. When the water is clear during pumping, it may be let on the filtered bed to remove the slit that has collected in the filter bed and into the well that is being built. During the infiltration process, the whole filter bed is cleaned of silt using this technique.

Using Roof Water to collect and Store Water: Tanks Rainwater from the roof surface is drained into storage tanks through gutters. There is a hand moveable gutter connector that may be manually moved to redirect the water out to avoid pollution and dust from flowing into the storage tanks. The rooftop is utilized to gather the trash. Rainwater is transported from the roof top to the storage tanks through guttering, which is often constructed of PVC.

Rain Water Harvesting For Building In Urban and Village Area: A Case Study

For research purposes, a rainwater harvesting system for the annexure building of the Govt. Engineering College, Aurangabad is being explored.

The Government Engineering College is situated in Maharashtra's area. Aurangabad receives about 700 mm of rain each year on average. The city has a population of more than ten lakh people. The town is now supplied with water by the Municipal Corporation of Aurangabad. Water is delivered to the town on alternate days due to the capacity of the water treatment facility. The institution requires approximately 350 m³ of water each day. The town's ground water level has been reduced in recent years. Rainwater must be conserved not only in the city but also in the outlying regions of Aurangabad. The significance of rainwater collecting cannot be overstated. It is recommended that each community collect roof water from at least 10 hoses. It is also planned to collect rainwater from the roof of this institute's Annex building. All civil engineering students from this institution would have a role model if this roof top rain water collecting system is built. These students will witness the system and be inspired to build roof water collecting systems elsewhere in the future. The following is a preliminary estimate[7].

LITURATURE REVIEW

Water shortage is a significant issue in many developing nations, according to B. Helmreich et al. Rainwater may be used as a source of drinking water depending on the amount of precipitation. Furthermore, effective management may help alleviate water and food shortages in some of these areas. Rainwater harvesting (RWH) is a technique for efficiently collecting surface runoff during rainy seasons. RWH systems should be based on local skills, materials, and equipment to support such technologies. Rainwater harvesting may then be utilized for rain fed agriculture or domestic water supply. Rainwater, however, may be contaminated with germs and dangerous substances, necessitating treatment before to use. Pollution may be reduced using slow sand filtering and solar technologies. Membrane technology may potentially be used to disinfect drinking water to make it safe to drink[8].

Olanike Olowoia Aladenola and colleagues investigated Rainwater collecting is one of the most promising methods for augmenting limited surface and subsurface water resources in places where the current water delivery infrastructure is insufficient to satisfy demand. Rainwater collecting is one of the measures that may be taken to mitigate the effects of climate change on water supply. Rainwater collection is excellent in Abeokuta due to the city's average annual rainfall of 1,156 mm. The intra-annual range was 0.7 to 1.0, whereas the inter-annual variability was 0.2. Each home may collect 74.0 m³ of rainwater each year. Annual water consumption for flushing, washing, and flushing was estimated to be 21.6, 29.4, and 21.6 m³ correspondingly. Except in November, December, January, and February, harvested rainwater in Abeokuta can meet family monthly water needs for WC flushing and washing. If there is enough storage, the extra rainfall saved in September and October will enough to replace the short fall in the dry

months. The opportunity for water conservation is greatest between June and September, which are the two rainiest months in Southwest Nigeria[9].

F.A. Memon and colleagues investigated the Rainwater collection is becoming a more important component of the toolbox for sustainable water management. Despite a slew of research examining the viability of deploying rainwater harvesting (RWH) systems in specific situations, there is still a substantial vacuum in information in terms of comprehensive empirical performance evaluations. Domestic networks have been studied in the literature to a limited extent, notably in the United Kingdom, but there are few contemporary longitudinal studies of larger non-domestic systems. There are very few research that compare estimated and actual performance. The findings of a longitudinal empirical performance evaluation of a nondomestic RWH system in a UK office building are presented in this article. It also compares actual performance to predicted performance using two British Standards Institute-recommended methods: The Intermediate (basic calculations) and Detailed (simulation-based) Approaches. The real over-sized tank and the smaller optimized tank had capital payback times of 11 and 6 years, respectively, based on estimated cost reductions. To conduct whole-life cost assessments, however, additional comprehensive cost data on maintenance and operation is needed. These results suggest that office-scale RWH systems may save significant amounts of water and money. They also stress the significance of data monitoring and the need for a shift to Detailed Approaches (especially in the UK) to (a) reduce storage tank oversizing and (b) increase confidence in RWH system performance[10].

DISCUSSION

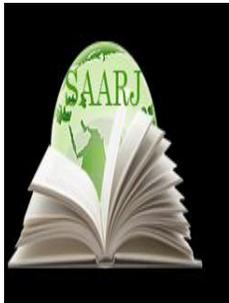

Our most valuable natural resource is water, which most of us take for granted. We are more conscious of the significance of water to our existence, as well as its scarcity. Humans need water for a variety of reasons. Water covers the majority of the earth's crust (about 71 percent). Only 1% of the total amount of water accessible on the earth's surface is fresh and drinkable water, with 97 percent being salty water, 2% being ice and glaciers, and 1% being fresh and potable water. It is the duty of both government and individuals to collect every drop of water that falls on the earth's surface. To do so, each individual must collect raindrops that fall on his roof, plot, or farm as well as recharge them underground. In this research, two examples of roof top water collecting for urban and rural areas were examined. Rainwater harvesting on the roofs of other buildings may be done in the same way. In reality, rainwater collecting methods can satisfy the basic drinking and cooking requirements of every village or hamlet in India.

CONCLUSION

Water is a necessary component of life. Everyone understands that if we do not harness existing water sources and utilize them wisely and with care, water scarcity will become a major issue. Regardless of rapid advancements in all areas of science, there is no replacement for water. As a result, different water collection methods are required. It is the duty of both government and individuals to collect every drop of water that falls on the earth's surface. To do so, each individual must collect raindrops that fall on his roof, plot, or farm and recharge them underground. In this research, two examples of roof top water collecting for urban and rural areas were examined. Rainwater harvesting on the roofs of other buildings may be done in the same way. In reality, rainwater collecting methods can satisfy the basic drinking and cooking requirements of every village or hamlet in India.

SELECTION OF METHODS OF ACCEPTANCE INSPECTION IN PRODUCTION

Ergashov Kahramon Mihoilovich*; **Erkaboyev Abrorjon Xabibulloqli****

ABSTRACT

Product quality control in production is carried out by various methods. But the most effective method is based on actual observations or calculations. This article provides an acceptance method for product quality control in production lines by various types of control. A decision is given on how to organize or draw up a product control plan, registration of control data, analysis of these results and conclusions for their improvement.

KEYWORDS: *Single-Stage, Multi-Stage, Sequential, Classification Of Methods, Operational Characteristics, Test Results, Samples, Value Of The Rejection Level, Efficiency Assessment.*

1. INTRODUCTION

Consider control plans, which are based on the principle of inadmissibility of consignments entering the goods, the quality level of which is lower than the acceptable in operation. In practice, three types of acceptance control plans are most common:

- One-stage - the decision to accept or rejected lot is made on the basis of checking a single sample from it;
- Multistage - the decision to accept or rejected a lot is made on the basis of tests ($k \geq 2$) samples, and the maximum number of samples is limited and predetermined. In practice, two-stage control is most often used, in which the number of samples does not exceed two;

- Sequential - the decision on batch acceptance, rejection or continuation of testing is made after evaluating each sequentially inspected product, and the number of products subject to inspection is not limited in advance.

Each of these plans has a number of advantages and disadvantages. One-step inspection plans are much simpler from an organizational point of view, as they provide for a basic inspection procedure in which the sample size is constant and known in advance. In other plans, the control procedures are much more complicated; their application in production requires qualified personnel. At the same time, with multi-stage and sequential control with the same average sample size equal to the sample size of one-stage control, greater reliability of decisions is achieved.

Further classification of acceptance control methods is related to the principle of classification of test results.

The fact is that the degree of suitability of products for further use can be determined in various ways. For example, you can register the exact numerical values of the parameters, or you can make one of two decisions: is the product suitable for further use or not, that is, divide products into good and defective. In the first case, they talk about the so-called quantitative quality attribute, in the second - about the alternative.

Accordingly, two main statistical control methods are distinguished: by alternative and quantitative criteria. There is also quality control (a special case of which is control by an alternative indicator), but for this method no standardized control plans have been developed and therefore it is practically not used.

Alternative trait control has several advantages over quantitative trait control. First, it is simpler both in terms of the amount of computation and its organization in production. Secondly, the control technique does not depend on the type of distribution of the measured parameters and therefore is more universal (when controlling by quantitative criteria, in most cases it is assumed that the measured parameters have a normal distribution).

However, when testing on an alternative basis, only a small part of the information contained in the observations is used, which leads to the need for a large number of measurements.

In accordance with the decision on the further use of the batch, inspection plans are divided into two types:

D1 - when the conclusion of the rejection of the batch leads to a decision to reject the batch as unfit;

D2 - when the conclusion of the rejection of the lot leads to a decision on its sorting and removal of defective products (with or without replacement of defective products with good ones).

If control is destructive, then only plans of the first type can be used; in all other cases, the choice of the type of plan is determined by purely economic considerations and specific production conditions.

Main characteristics of statistical acceptance control plans. Since, during statistical acceptance control, a judgment on the quality of a lot is made on the basis of testing only a part of the products from a lot (sample), errors associated with the rejection of good and acceptance of bad

lots are inevitable. With a random selection of products, it is possible, with a small total of defective products in the lot, to select a significant number of defective products for inspection, which will lead to a false decision about rejecting a good lot (error of the first kind). On the other hand, if the lot is littered with defective products, there may be a relatively small number of defective products in the sample, and a bad lot will be accepted (type II error).

The challenge is to ensure that such erroneous conclusions are made extremely rarely under sampling conditions, and the degree of their possibility is predetermined. Errors of the first and second kind should be taken into account when planning acceptance inspection, as well as proof tests.

To assess the effectiveness of a sampling plan, a so-called operational characteristic, or, as it is otherwise called, performance characteristic, is used. The operational characteristic of a control plan is understood as a function $P(q)$ equal to the probability of accepting a batch with a quality level q .

2. RESULTS

Let's consider the operational characteristics of the plan of continuous control.

During the inspection of each sample in the lot, the exact number of defective samples in the lot is known. If this quantity is greater than a certain critical value $M_{cr} = N_{qcr}$ (N is the volume of the batch), then such a batch will necessarily (with a probability equal to one) be rejected as not meeting the requirements of the consumer. If the number of defective samples in the sample is less than M_{cr} , then the lot will be accepted with a probability of one. At the same time, it is considered that errors associated with determining the degree of suitability of the sample are excluded. The operational characteristics of the complete control plan are shown in Figure 1.1, a. This operational characteristic will be called ideal. However, it is impossible to build a sample plan with such a performance characteristic. In these cases, the supplier and the consumer agree on two quality levels q_0 and q_m : lots with a quality level $q \geq q_0$ are considered to be known to be good, and lots with a quality level $q \geq q_m$, with $q > q_0$, are considered bad.

The interval $q_0 \leq q \leq q_m$ is considered a zone of uncertainty. Lots of this quality level are still considered acceptable. The q_0 value is called the acceptance quality level, the q_m value is called the rejection quality level.

Thus, all products are divided into three categories:

- products of the first category, the quality level of which is $q \leq q_0$;
- products of the second category, the quality level of which is $q \leq q_m$;
- products of the third category, the quality level of which satisfies the ratio $q_0 \leq q \leq q_m$.

Requirements are imposed on the control plan, which are that the parties of the first category should, if possible, be accepted, the second, if possible, rejected. In quantitative terms, these requirements are expressed in the fact that the probability of accepting a batch with a quality level $q \leq q_0$ should be less than $1 - \alpha$, and the probability of accepting batches for which $q \leq q_m$ should not exceed β .

The values α and β are referred to as the supplier's risk and the consumer's risk, respectively, and represent the probabilities of errors of the first and second kind. Supplier's risk α is the

probability of making a false decision about rejecting a good lot (the supplier risks incurring unjustified losses). The consumer's risk β is the probability of making a false decision to accept a bad batch (the consumer is at risk of incurring losses).

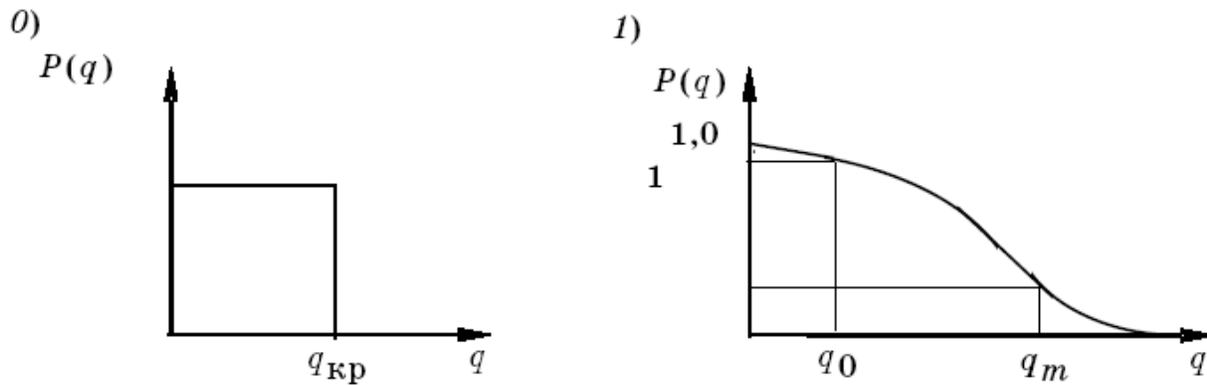

Figure 1.1. Operational characteristics of the control plan: a - continuous; b - statistical

The assignment of risks α and β provides guarantees for the supplier and the consumer regarding the rejection of good and acceptance of bad lots. In practice, the values of α and β are chosen equal to 0.1; 0.01; 0.05. Their appointment is not a statistical task, but is completely determined by the consequences of incorrect decisions (errors of the first and second kind).

Thus, if the requirements of the supplier and the consumer are formulated in the form of four numbers, for example: $q_0 = 0.01$; $q_m = 0.05$; $\alpha = \beta = 0.1$ - this means that, on average, no more than five lots will be rejected out of every hundred lots with a defectiveness level of no more than 1%, and no more than 100 lots containing 5 or more defective products will be accepted. more than five parties.

Thus, for any acceptance control plan, the equations

$$P(q_0) \geq 1 - \alpha \quad (1.1)$$

$$P(q_m) \leq \beta \quad (1.2)$$

Considering also that $P(0) = 1$, $P(1) = 0$, it is easy to imagine the type of operational characteristics of the statistical control plan (Figure 1.1, b).

Equations (1.1), (1.2) are the basis for setting an acceptance control plan, i.e., assigning the sample size and standards with which the control results are compared, and calculating the operational characteristic $P(q)$.

Consider how requirements and are assigned.

The value of the rejection quality level (q_m) is selected based on the requirements of the consumer who needs products with a quality level of at least q_m . The value of the acceptance level of quality (q_0) is set taking into account the capabilities of production, which must ensure the release of products with a quality level of $q_H \leq q_0$, where q_H is the average level of contamination of batches during the normal course of production. Only in this case, the supplier guarantees itself against a vain rejection of good lots produced in compliance with the basic requirements of the technology. As a rule, the value of q_0 is slightly larger than q_H . Otherwise,

the effectiveness of the control plan is reduced. Indeed, if the acceptance level of quality is much less than q_H , the probability of accepting lots, as can be seen from Figure 1.2, drops sharply, and the actual risk of the supplier, α_d , increases.

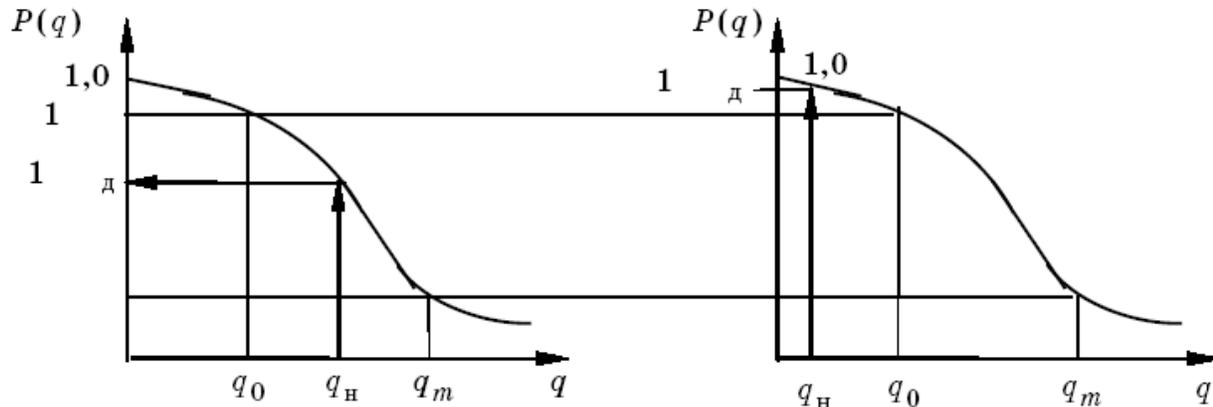

Figure 1.2. The actual risk of the supplier in case of unreasonable setting of the acceptance level of quality

If q_0 is chosen significantly greater than q_H , the actual risk of the supplier is less than α , but such a control plan will, as will be seen from what follows, actually ineffective, since it will require large sample sizes.

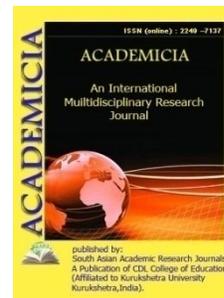

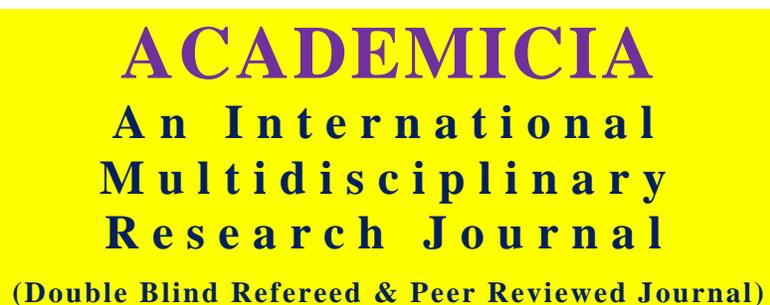

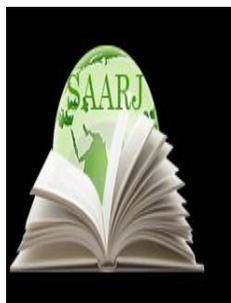

3. CONCLUSIONS

Thus, knowledge of: 1) consumer requirements for product quality, 2) the level achieved by the manufacturer, 3) the consequences of making false decisions on acceptance and rejection of lots - turns out to be necessary and sufficient for planning control tests on the principle of an unacceptable level in operation quality. A preliminary assessment of the effectiveness of the control plan is made using an operational characteristic, the nature of the right side of which must satisfy the requirements of the consumer, the left side - the requirements of the supplier, and the middle - one or the other, depending on the degree of responsibility of the controlled products. A more complete assessment of the effectiveness can be carried out taking into account the statistical assessment of the quality level of the accepted products. Such assessments in the statistical acceptance inspection are called follow-up.

ABSTRACT

The qualitative analysis of the alkaloid content of 51 samples of plant species belonging to 23 botanical families, collected in the Republic of Guinea was carried out. Among them, 5 families contain an abundance of alkaloids: they are Annonaceae, Lauraceae, Menispermaceae, Rhamnaceae and Rutaceae.

KEYWORDS: *Analyse qualitative, Alkaloids, Botanical families, Phytochemical interest, Republic of Guinea, University of Kindia.*

1. INTRODUCTION

The object of our work is the qualitative research of the alkaloid content of plants in the form of trees, shrubs and climbing plants of Guinea [1-4]. The plant samples studied (leaves, bark, stems, etc.) were collected at the Botanical Garden of Conakry and at the edge of the forest near the University of Kindia.

Alkaloid, a natural substance isolated from plants, of a basic nature, endowed with physiological activity and whose molecule generally contains one or more nitrogenous heterocycles.

Nearly 15000 alkaloids have been identified [7]. Many known alkaloids are used in medicine. For example, atropine from belladonna causes dilation of the pupil; poppy morphine suppresses pain; quinine is a remedy for malaria. Finally, it should be noted that nicotine is a powerful insecticide [2-4].

2. RESEARCH METHODOLOGY

We have qualitatively analyzed the alkaloid content of nearly 51 plant species belonging to 23 botanical families very widespread in the Kindia region [1]. Among them, 5 families contain an abundance of alkaloids: they are *Annonaceae*, *Lauraceae*, *Menispermaceae*, *Rhamnaceae* and *Rutaceae* (Table 1).

The alkaloid composition was determined in the conventional way [5-6].

2-3 g of study plant (pulverized and dried leaves) were placed in a flask (50 ml capacity) and 10-15 ml of 5% sulfuric acid solution (H_2SO_4) was poured into it. The contents were left for 4-5 hours at room temperature. After filtration, a few drops of silicon-wolframic acid solution (H_2SiWO_6) were added to the filtrate. The formation of an abundant precipitate indicates the presence of a considerable quantity of alkaloids in the plant studied.

3. RESULTS

4. CONCLUSION

In total, 51 species of plants belonging to 23 botanical families were qualitatively examined for the first time by us. Among them, 5 families contain an abundance of alkaloids. These are *Annonaceae*, *Menispermaceae*, *Lauraceae*, *Rutaceae* and *Rhamnaceae*.

It should be noted that in the future the study of the alkaloid content of the following species: *Annona muricata* L., *Annona senegalensis* Pers., *Cananga odorata* (Lam.) Hook. F., *Xylopia aethiopica* A. Rich., *Persea americana* Mil., *Dioscoreophyllum cumminsii* (Stapt.) Diels., *Cocculis pendulus* Diels. *Ziziphus mauritiana* Lam., *Fagara zanthoxyloides* Lam., *Solanum stramonium* L. would be of phytochemical interest, because these plant resources contain a considerable quantity of alkaloids belonging to several chemical structural types.

To mention gratefulness

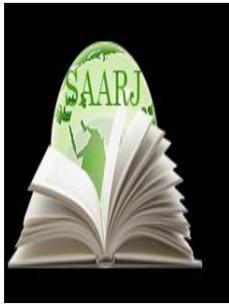

The authors express their deep gratitude to the botanist engineer **Ibrahima SYLLA** (Botanical Garden of Conakry) and to the teacher **Ousmane SOW** (University of KINDIA) for the collection and identification of the plant material.

ABSTRACT

Solar energy is a very effective method to increase the supply of renewable energy. The design and development of a microcontroller-based Solar Panel Tracking System is discussed in this article. Sunlight is a non-conventional energy source, since the author has erected solar panels to meet our electrical needs. The solar source, i.e. the sun, does not constantly face the plate due to the earth's rotation, resulting in less power being generated. The energy panel will face the SUN until the SUN appears, which should happen within a day. The block diagram below shows the device design, which contains an LDR sensor that provides maximum solar power to the microcontroller through an ADC that digitizes the LDR's performance. The controller then makes a decision based on the algorithm and tilts the panel in the direction of the LDR's greatest energy with the aid of a DC Motor. As a DC geared motor driver, the system is controlled by two relays, while the main processor is a microcontroller. A single axis protects this project, which is designed for low-power and home applications. The system can monitor and follow the Sunlight intensity from the hardware test regardless of motor speed to get maximum solar power at the output. This solar tracker system may be updated in the future using new technologies such as the Internet of Things (IOT) and utilized at home.

KEYWORDS: LDR, Microcontroller, Motor Driver, Photovoltaic Cell, Solar Panel.

1. INTRODUCTION

Energy is the most important component in a country's development. Every day, a tremendous amount of energy is generated, transferred, transformed, and consumed in the worldwide civilization. 85 % of energy is produced from fossil fuels. Fossil fuel supplies are finite, and their usage contributes to global warming by releasing greenhouse gases into the atmosphere. To ensure a sustainable power supply and a healthy environment for future generations, there is a

rising need for energy from renewable sources such as solar, wind, geothermal, and ocean tidal waves[1]. The sun is the major source of power and the fuel for most renewable energy systems, whether directly or indirectly. The photovoltaic system is one of the many renewable energy technologies that have the potential to replace traditional energy sources. A solar panel converts sun energy into electricity directly. Solar panels are mostly composed of semiconductor-based materials. Si is the primary component of solar panels, with a maximum efficiency of 24.5 %. The only method to boost a solar panel's output if high-efficiency solar panels are created is to increase the light intensity falling on it. Solar trackers are the most effective and well-tested technique for improving solar panel performance by keeping them aligned with the sun's position[2]. Solar trackers have recently gained popularity across the world as a more effective way to collect solar energy. This is a far more cost-effective alternative than purchasing extra solar panels.

The practice of designing a specific manual and/or automatic system that meets the demands of the client is known as Mechatronics system design. A designer considers and evaluates numerous elements and product designs for specific requirements that may differ from those currently in use. Certain criteria, such as size, shape, material, load, and application type, are required for every electronic/mechanical component[3]. Sensor type, rotation technique, motor weight, kind of photovoltaic panel, type of microcontroller utilized, component selection, and other aspects all impact the design of a solar tracking system.

India is a developing country that gets its energy from a range of commercial and non-commercial sources. In recent years, it has been highlighted that fossil fuel supplies are fast decreasing and that the era of fossil fuels, particularly oil and natural gas, is gradually coming to an end. The most severe issue with traditional energy sources is their negative environmental impact[4]. It is also the primary contributor to the global warming problem, which is becoming a major worry. According to the latest assessment from the Intergovernmental Panel on Climate Change (IPCC), increasing methane and nitrous oxide concentrations have caused global surface temperatures to rise. Solar energy, which is renewable in nature, is being employed increasingly frequently to address these concerns.

Solar energy is a clean, sustainable form of energy that is abundant in nature[5]. The sun is a huge sphere of very hot gases heated by fusion reactions of many kinds. The sun has a diameter of 1.39 10⁶ kilometers. When the sun is high, it subtends the earth's surface at an angle of 32 minutes (0.53°C) due to its expanded reach. Therefore, the earth's sun's beam radiation is almost identical. The brightness of the sun changes from top to bottom. The amount of energy that the earth receives from the Sun is hundreds of times more than the entire amount of commercial energy produced on Earth today. Therefore, solar energy, rather than conventional sources of energy such as fossil fuels, may be used for thousands of years. Each year, India receives 4000-5000 hours of sunshine, enough to generate hundreds of times the country's current power consumption. Photovoltaic panels must be maintained perpendicular to the direction of sun motion throughout the day for optimal energy extraction/generation from solar energy.

The goal of this article is to create an automated solar tracking system that can capture all of the available solar energy and convert it to electrical energy[6]. Natural processes in the earth's crust that take millions of years to complete create nonrenewable sources. Once they have been burnt to generate electricity, they are gone for good. Burning fossil fuels releases unwanted by-products that pollute our environment, change the planet's temperature, and put ecosystems in

jeopardy. Solar power, on the other hand, is unlimited and free of harmful toxins. The problem statement for this thesis is to monitor the movement of photovoltaic (PV) panels in response to sunlight using Light-Based Resistors, microcontrollers, and DC motors in order to collect the most amount of solar energy and convert it into electrical energy. The main goal of this project is to develop the idea of a sun-tracking solar system, which is a device that tracks the movement of the Sun regardless of motor speed. Furthermore, the goal is to increase total power production while also offering residential architecture utilizing a single-axis sun tracking system. Because the LDR, or light-based resistor, is extensively used in sun-tracking systems, it was selected as the sensor.

Because LDR is light-sensitive, this is the case. The resistance of LDR will decrease as the light intensity of events increases[7]. The AT89S52 was chosen as the controller. ATMEL's programming will provide the driver the signal to turn on the motor. With the relay to the driver, bidirectional DC motor control was employed. The motor controller was chosen because it allows the engine to revolve in both clockwise and counterclockwise directions with ease. The DC geared motor, which has a holding torque of upto 24 kg.cm and a low rpm, is another option. Last but not least, the LM7805 is utilized to convert the input voltage from the source to the 5 V output required by the integrated circuit.

1. Benefits:

A method for solar tracking is a technique for permanently guiding photovoltaic panels towards the sun, allowing you to get the most out of your PV system investment. They are helpful since the position of the sun in the sky may vary throughout the day and year as the seasons change. They are most effective in places with low horizons and no shadow from sunrise to dusk each day. The tracking array will be able to take use of the open access to the sun all year to capture every available electron. Therefore, energy production is at an all-time high, but energy consumption increases all year.

Solar panels that stand alone are a cost-effective and low-maintenance method to produce electricity. Photovoltaic panels may be constantly oriented toward the sun using solar tracking devices, which will help you get the most out of them. This is essential since the sun's position in the sky can vary slowly over the course of a day and through the seasons over the course of a year. The effectiveness of a tracking device will be determined mainly by how well it is positioned to analyze how well the panels can improve their performance. As a rule, they work best in places with low horizons and areas where there is no shade from sunrise to sunset. The tracking array will be able to take use of the open access to the sun all year to capture every available electron. Therefore, energy production is at an all-time high, but energy consumption increases all year. This is particularly true during the summer, when there are so many long bright days to enjoy.

2. Applications:

It controls movement in both the azimuthal and zenithal directions, regardless of whether a photovoltaic (PV) or concentrated solar power (CSP) plant is needed. Regardless of the sun's location, the components or mirrors are precisely aligned with the angle of the sun's rays to maximize solar energy. Solar tracking systems produce up to a third more energy than stationary PV systems, and the closer and installation is to the equator, the more effectively the PV tracking systems work, depending on the intensity of the sunlight at the installation site. Solar units must

be precisely tracked in order to focus sunlight on the target medium in concentrated photovoltaics and concentrated solar power applications. Solar trackers are used to align photovoltaic panels, lenses, reflectors, and other optical equipment to the sun. Because the position of the sun in the sky varies with the seasons and time of day, trackers are used to coordinate the collecting system in order to maximize energy production. When deciding whether to use trackers, many considerations must be taken into account. Solar panels are often installed in direct sunlight in the middle of the day, either south in the Northern Hemisphere or north in the Southern Hemisphere. Therefore, the panels are struck at an extreme angle in the morning and evening, limiting the total amount of electricity that may be generated each day. A solar tracker is a system with solar panels that follow the sun's movement across the sky during the day, ensuring that the most amount of sunlight hits the panels. In comparison to the cost of PV solar panels, the cost of a solar tracker is quite cheap. They are patented solar tracking devices with single and double axes that are very efficient[8].

2. LITERATURE REVIEW

Suneetha Racharla et al. discussed a review on Solar tracking system[8]. The greatest problem for the next half-century will be generating power from the decrease of fossil fuels. When compared to other renewable energy sources, the notion of turning solar energy into electrical energy using photovoltaic panels is at the top of the list. The watts provided by solar panels are reduced by the constant shift in the relative angle of the sun with respect to the earth. In this case, the greatest option for increasing the efficiency of the photovoltaic panel is to use a solar tracking system. Throughout the day, solar trackers bring the payload closer to the sun. The advantages and disadvantages of various types of tracking systems are discussed in detail in this paper. In comparison to other tracking systems, the azimuth and altitude dual axis tracking system is more efficient, according to the results presented in this review. However, from the standpoint of cost and versatility, a single axis tracking system is more practical than a dual axis tracking system.

Prof. Vaibhav J. Babrekar et al. discussed a review on automatic system of solar radiation tracking[9]. Because fossil fuels are a rather short-term energy supply, an alternate energy resource is required. Solar energy is being increasingly widely used as a renewable energy source. Solar modules are commonly used to convert solar energy into electricity, although the solar energy is not entirely utilized. The efficiency of solar array systems must be increased to make solar energy more usable. Solar radiation tracking is a viable method for increasing the efficiency of solar array systems. A system that regulates the movement of a solar array so that it is always aligned with the direction of the sun is known as an automatic solar radiation tracker. For the implementation of such systems, several technologies are utilized across the world. Some of these technologies are discussed in this publication.

Mahipal Soni et al. discussed an analysis of solar tracker system[10]. This report offers a research analysis of a solar tracker system for increasing solar panel efficiency. The act or practice of following something or someone is referred to as tracking. So, an automated solar tracker system is a device that follows the sun's light to extract the most amount of energy from it. Solar panels are always in perpendicular profile with regard to the sun light to maximize efficiency or obtain maximum energy. Solar tracking with mirror booster and automatic cleaning system are two technologies being investigated to improve the efficiency of solar panels. Microcontroller, LDRs, stepper motor, solar panel, mirror booster, and automatic cleaning machine comprise the solar tracker system. With the aid of a stepper motor, the LDR sensor detects the sun light falling on

the solar panel and spins the solar panel according to the intensity of the light. To increase efficiency, a mirror is utilized as a booster. The system is controlled by a programmed microcontroller that communicates with a sensor and a motor driver dependent on the movement of the sun.

Research Questions:

- How this system of solar tracking is better than the existing systems?
- Explain the components used in this solar tracking system?

3. METHODOLOGY

3.1 Design:

This electrical device's main component is a microcontroller. This is where all of the operations are managed. With the help of a microcontroller, you may position the solar panel according to the strength of the sunshine. The rechargeable battery, which is utilized to store energy by the panel, is another component. The charging control's purpose is to regulate battery charging. The battery state is received by the microcontroller unit via the control panel for charge. It features two LDR sensors, one on each side. On the unit, four LDRs form and are located in the four corners of the panel. The controller receives the output from the LDR, which detects the intensity of sunlight. The Control unit determines which way the panel should be turned to obtain the most sunlight. LDRs are also utilized in another section of the sensor, which is employed to adjust the lighting load. The server motor can rotate the panel in the desired direction. In this study, the author employed a solar panel to convert light energy into electrical energy. The Sun varies its position during the day, so the author couldn't use all of the light energy, so they created a monitoring mechanism that rotates the solar panel when the sun alters its position.

An embedded system consists of a combination of computer hardware and software, as well as perhaps external mechanical or other elements, all of which are designed to serve a specific function. Embedded systems are frequently a component of a larger, more sophisticated system. Dedicated applications are developed and embedded in systems that are intended to carry out specialized tasks. These embedded programmers must communicate with the rest of the enclosed system's components. The application's embedded components often connect with the outside non-human environment. They utilized four LDR sensors to detect light, and if the sun's position changes, the sensor changes as well. Each LDR sensor's voltage readings are sent to the microcontroller and compared to the LM324. The microcontroller compares each LDR output to each LDR output after receiving the voltage signal from any I/O pin on the controller. The motor is told to spin the solar panel on a single axis in the direction of the LDR sensor that provides the greatest voltage output when the controller discovers the highest voltage level of any LDR sensor. Figure 1 illustrates the block diagram of the solar tracking system.

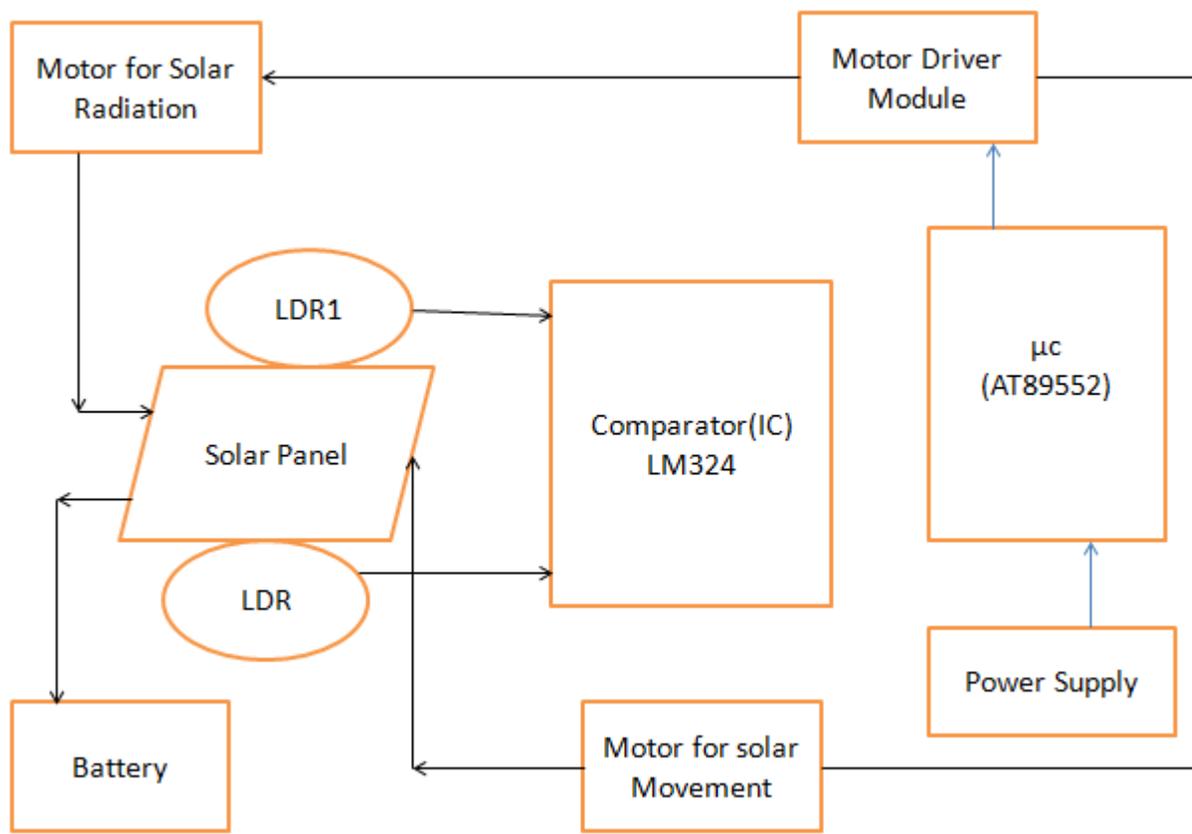

Figure 1: Illustrate the Block Diagram of solar tracking system

As a result, the battery may be recharged properly using the Solar Panel, and the author can use certain electrical equipment to rotate the 12 V DC fan on a regular basis. Using two external motors and connecting them in tandem, the author can move the solar panel in any direction. By orienting the solar panel towards the direction of the sun, the whole energy of the sun is harnessed. The LDR sensor detects light and creates the highest voltage signal, which is sent to the comparator IC, as well as other sensors, to determine the voltage level generated by the comparator IC.

3.2 Instruments:

3.2.1 Micro-controller:

In an embedded system, a microcontroller is a small integrated circuit that governs a certain operation. On a single chip, a microcontroller has a CPU, memory, and input/output (I/O) peripherals. It can be used in many machines like keywords, ovens, dryers, security systems and electrical machines.

3.2.2 Solar Panel:

A solar panel, also known as a photovoltaic (PV) module, is an installation of photovoltaic cells set in a framework. Solar panels create direct current electricity using sunlight as a source of energy.

3.2.3 LDR Sensor:

A photo resistor or a cadmium sulphide (CdS) cell is another name for a Light Dependent Resistor (LDR). A photoconductor is another name for it. LDRs are used to detect light levels in automated security lighting, for example. Their resistance reduces as the light intensity increases: an LDR's resistance is high in the dark and at low light levels, and only a small amount of current may flow through it.

4. RESULT AND DISCUSSION

The machine centers on designing the controller. The designed system was checked and some data from measuring hardware were collected and discussed. The typical solar panel was used and the intention was only to show that the built system is capable of working accordingly. For example, weather conditions are not seriously considered during hardware testing therefore the surrounding effects. In this research, researcher proposed the design and development of a microcontroller-based Solar Panel Tracking System. The device design is depicted in the block diagram, which includes an LDR sensor that supplies maximum solar power to the microcontroller through an ADC that digitizes the LDR's performance. The controller then makes a choice based on the algorithm and tilts the panel with the help of a DC Motor in the direction of the LDR's highest energy. Two relays manage the system as a DC geared motor driver, and a microcontroller controls the system as the primary processor. The future of this solar tracking system is bright as it can be used for home purposes and further, it will be modified by adapting new technologies.

5. CONCLUSION

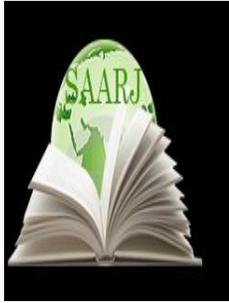

The Axis Solar Tracking System has a single prototype model that has been successfully developed. The designed system focuses on the controller part, with the primary concern being to design appropriate circuits that can control the direction of rotation of the DC-gear motor without taking the motor's speed into account. Regardless of the motor speed, the machine is capable of monitoring and following Sunlight intensity in order to obtain full solar power. The motor speed is not a significant issue as distinctive of the proposed system because the DC-gear motor has a low output rated speed and a high output rated torque. As a result, any DC-gear motor can be used in this system, regardless of the motor speed control unit, as long as the motor's speed and torque meet the specifications. In the future, the built system concept may be used to develop alternative energy sources in the home, especially for non-critical and low-power appliances.

NLP BASED SIGN GESTURES RECOGNITION SYSTEM

Mr Madhav Singh Solanki*

*SOEIT, Sanskriti University,
 Mathura, Uttar Pradesh, INDIA

Email id: madhavsolanki.cse@sanskriti.edu.in

ABSTRACT

There are many methods for identifying signs, each of which generates a word for each one. It focuses on converting sign language into an appropriate English sentence. NLP techniques are also used in addition to sign recognition. The input is a framed and split video of sign language. This booklet teaches deaf and mute people sign language. It's tough for non-blind persons to engage with blind people due to communication difficulties. To address this issue, the article suggests and describes an effective method. Language technology methods such as POS tagging and the LALR parser are used to convert identified sign words into English phrases. A number of applications are available on the market that allows blind people to interact with the world. Combining technology will not be able to address the problem of mobile sign language translation in daily activities. A video interpreter can assist deaf or hearing-impaired people in a variety of situations. People with hearing impairments will be able to learn sign language and have films translated into sign language as a consequence of this research. The present work may be used as a communication interface for both speech-impaired and non-speech-impaired individuals. It will assist bridge the communication gap between speech-impaired people and the rest of the population by capturing and analyzing signals, as well as recognizing and displaying output in the form of comprehensible phrases.

KEYWORDS: *Communication, Hearing and speech, NLP, Parsing, Sign Language.*

1. INTRODUCTION

Deaf or dumb people have a variety of difficulties when it comes to interacting with others in their everyday lives due to their hearing and speech disability. Many people with hearing and speech impairments are unable to express or utilize their skills in the outside world due to a linguistic barrier. The aim is to develop a system that will help these individuals bridge the gap

between themselves and the rest of society[1]. According to a research, India is home to 20% of the world's population with hearing and speech impairment. While hearing and speech impaired people in India communicate using Indian Sign Language, which is not widely recognized or understood by the general public, the general public uses natural language. This will need the use of an interpreter. Human interpreters are often used, although they are costly and not available to everyone.

Hearing and speech impaired people's interactions are influenced by hand movements. Tactile sign language, which comprises of hand motions and symbols, is an efficient way for them to communicate. Even if this is true, hearing-impaired individuals have communication difficulties in a society that is mainly deafeningly[2]. The interaction between sign language users is the subject of this research. Human language may be deciphered using natural language principles. It is a strong tool that combines language technology with artificial intelligence. NLP includes both syntax and semantics. Syntax is in charge of the ordering and grouping of words. Semantics includes word and phrase meanings, as well as compositional meanings. Lexical semantics determines the meanings of component words, whereas compositional semantics, which combines these components, determines the wider meaning. In Natural Language Processing, POS labeling is a critical step (NLP). This is where the recovery of information starts. Parsing, which deals with grammar, is another important method[3].

Normal people interact with one another using normal language, while hearing and speech challenged people communicate through tactile sign language. In every field, intense competition makes it more difficult for people with disabilities to participate[4]. Individuals with hearing and speech impairments will benefit from the development of an application that allows them to converse successfully with a normal person. According to surveys, India has about 2.4 million people with hearing and speech impairment, accounting for around 20% of the global total. To assist communication between a normal individual and someone who has a hearing or speech disability, an interpreter is needed[5].

The interplay of hearing and speech disability is influenced by hand movements[6]. Tactile sign language, which comprises of hand motions and symbols, is an efficient way for them to communicate. It is true that the hearing-impaired must overcome social barriers in a society that is mainly deafeningly. This research focuses on sentencing for hearing impairment interactions. Human language can be deciphered by someone who is fluent in natural language. Artificial Intelligence and linguistics are both engaged. NLP refers to a system that can convert text (words) into human language (Natural Language Processing) [7]. The POS tagging method was presented for the first time in 1960, according to NLP. It is a necessary instrument in the area of language processing. In many NLP applications, it is the simplest and most stable step. In machine translation, information retrieval, and other applications, it is the initial step[8].

2.LITERATURE REVIEW

Syed Atif Mehdi et.al discussed a review on Sensing gloves for Sign Language Recognition using artificial neural networks[9]. After that, the sensor data is classified using 24 English alphabets and two punctuation marks. The subject of dynamic gestures is investigated in this research. Because sensor gloves may be unable to detect dynamic movements, an arm gesture may be employed to compensate. The main goal of the paper's approach was to see whether a sensor glove could be used to recognize various sign languages. Because sensor gloves can only

recognize a portion of sign language, as shown in the article, additional sensors are needed to detect the full form of sign language.

Chung-Hsein Wu et al. discuss a method for forming Chinese phrases from Taiwanese Sign Language for persons with hearing problems[3]. The proposed method is intended to assist people with language disabilities in constructing sentences and correcting grammatical errors. Enhanced attribute grammar is used to translate text across languages. On the basis of context-free grammar, attribute grammar formalizes the semantics of a language. This article offers efficient methods for implementing the famous Viola Jones algorithm in a real-time environment utilizing Local Binary Pattern features for hand motion recognition.

ChandhanaSurabhi M discussed about the development of natural language interfaces to interact with robots[10]. The user will be able to access apps more easily with this approach. A technique for comparing fundamental grammar phrases to a collection of simple pictures was shown. In the method presented here, attribute grammar is utilized to show semantic analysis of natural language text. Real-time data was used to build and test an Android application with an improved algorithm. This algorithm implementation has not been used to create a robust and real-time algorithm. A significant lot of research has been done to automate the process of sign language interpretation using image processing and pattern recognition technologies.

Research Question:

- What is the importance of sign language as an interpretation language?
- What are the methods/techniques available for Sentence creation utilizing Natural Language processing Engine?

3. METHODOLOGY

3.1.Design:

Hearing and speech impaired users will perform hand gestures based on ISL using body position snippets in the initial stage of the application. A sensor glove is made by the 5DT Company. A little sensor is placed on each finger and thumb. Two additional buttons must be pressed to rotate and tilt the hand. The bend of each sensor is calculated using a value between 0 and 4095. 0 indicates that the sensor is completely stretched, while 4095 indicates that it is entirely bent. These characteristics are compared to the database for each gesture to identify the one-of-a-kind word that corresponds to it. The NLP engine takes those words and gives a sign attribute to each one based on components of speech. These characteristics are then used to construct a meaningful sentence based on the syntax of sentences in English grammar. A grammar must be developed in order to construct sentences.

It involves the following steps:

- A person who is hearing impaired signs.
- As a result of software, signs are translated into text (and video)
- The one who is hearing it reads it (and view it)
- It is important that both hearing and speech impaired talk into a microphone
- Text-to-voice software (and ASL video)

3.2. Instruments:

The movies are captured using a 2D camera. For frame extraction, the largest curvature point is utilized. The photographs with the most distinguishable coefficients are chosen for P2-DHMM training once the DCT coefficients of the images are determined. As a consequence, the data set collected may be used to extract the most important information from the subject's photographs. Using the equation for all the pictures, calculate the distance between each image and chosen training photographs.

$$D_{i,j}^2 = \sum_{n=1}^N (d_i(n) - d_j(n))^2$$

Training regarding next image Index = $\text{argmax}_i (\min (D_{i,j}))$ where 'N' is the length of image vector (No. of rows \times No. of columns).

3.3. Data Collection:

Step 1: Take video as an input. Specifications of video is as follows: Type of file: .avi, Size: 7.49mb, Length: 5 sec, Frame width: 900, Frame height: 508, Frame rate: 12 Fps as shown in figure 2.

Figure 2: Sample Frames of the Number of the Frames = Frame Time*FPS

Step 2: The following formula may be used to divide the video into frames: Framing time = number of frames*FPS as shown in figure 2.

Step 3: For Grayscale conversion, binaries the frames before converting them to black and white as shown in figure 3.

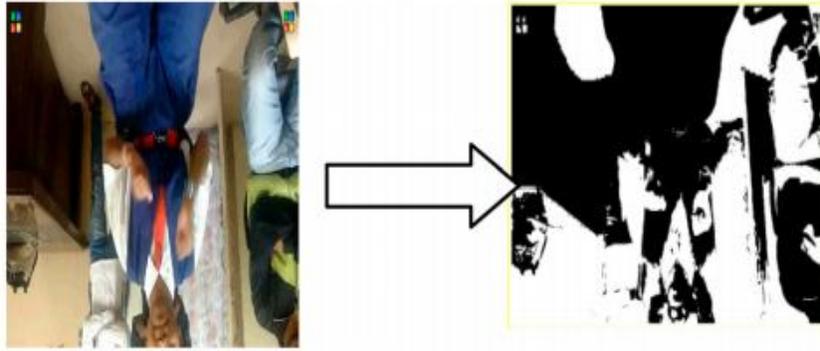

Figure 3: A Single Sample Frame from the Camshift of the Frame into Grayscale i.e. Binary Format

Step 4: Using HSV and CAMSHIFT, segmentation and tracking are conducted as shown in figure 4.

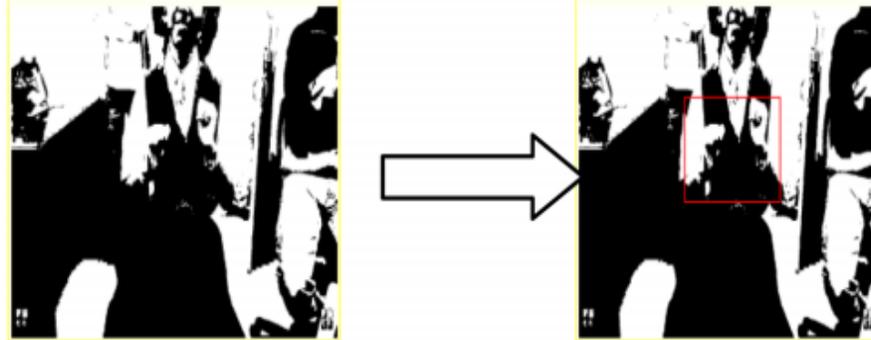

Figure 4: A Single Sample Frame from Grayscale to More Subjected Tracking to the Gesture.

Step 5: The P2DHMM method is used to extract features from the frame as shown in figure 5.

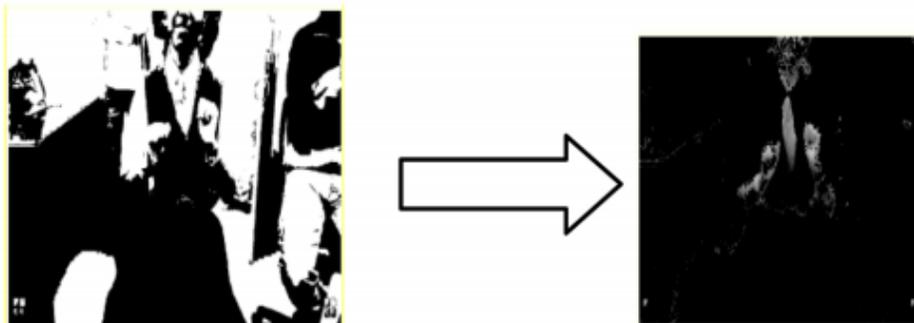

Figure 5: A Single Sample Frame from Grayscale to More Subjected Tracking for Extract Features from the Frame.

Step 6: With the help of the Haar Classifier, which identifies the model feature using 33 samples of expression, the hand movement is classified and recognized.

Step 7: Next, the NLP engine, which consists of POS tagger and LALR parser, receives the output words from the NLP engine. As the words are tagged by the POS tagger, they are then parsed by the Parser to produce sentences. The following is the POS tagging and parsing of the words above: I (N), Active (Adj).

3.4. Data Analysis:

Analysis: To provide a sense of the various gesture examples, the samples in the data gathered below were taken from snippets of several movies featuring hand asserted motions. Each of these movies is different in duration. A total of 60 videos were made with various backdrops and lighting conditions. While the number of frames in a video varies with its size, the database sample and video resolution influence the accuracy of a sign language translation system.

TABLE 1: SAMPLE VIDEOS REFERRED TO THE RECORDING AND THE SUCCESS RATE FRAME VISE

Name Of Video File	Sentence In The Video File	Duration of Video	Total Frames	Successfully Recognized Frames From Total Frames
Vid4.avi	Take your glasses off	4 seconds	60	54
Vid3.avi	Think about my idea	5 seconds	56	51
Vid2.avi	Tell me the time	4 seconds	25	19
Vid1.avi	Give me a pen	4 seconds	48	40

TABLE 2: SHORT SYSTEM AND SHORTENED MANUAL GENERATED OUTPUTS SENTENCES/PHRASES.

System Generated Output	Manually Generated Outputs
Take your glasses off	Take glasses off
Think about my idea	Think my idea
Tell me the time	Tell time
Give me a pen	Give pen

Context isn't a factor in any of the grammars we've looked at so far. The initial version of the application's grammar utilized Non-Deterministic Finite Automata. The conversion to Deterministic Finite Automata (DFA) is done in order to enhance the accuracy and results. Superior results were achieved because DFA considers each state as a distinct entity. As a result, the DFA that was generated is clear and simple. It also resulted in the grammar's ambiguity being removed, as well as a substantial increase of the grammar's area of applicability. All kinds of words and tenses are very difficult to comprehend. The software did not accept the tense as an input parameter. As a result, 33.33 percent of the phrases generated from table 2 were correct. This may be illustrated using the following example. The software only works with basic and continuous tenses of speech when it comes to simple and complex sentences. You'll only receive sentences that meet the grammatical rules if you utilize the grammar you've constructed. As a

result, it's conceivable that in certain circumstances, a meaningful sentence will be impossible to come up with.

4. RESULTS AND DISCUSSION

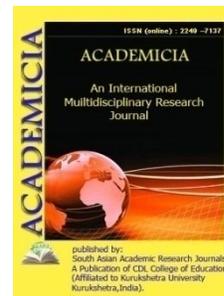

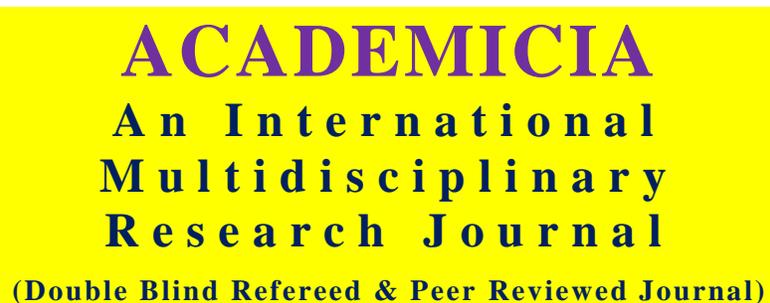

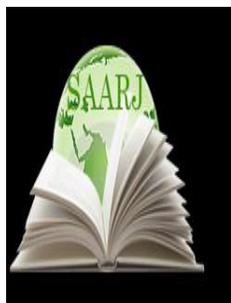

For analytical reasons, the hearing and speech impairment expert analyzed the sentence obtained from the videos. Special school instructors for hearing and speech impairments manually evaluated five films that were translated to sign language using the system's output, yielding five phrases. As a consequence, the output of this system and the manual interpretation are quite similar in terms of outcomes. As a result, it's accurate to within approximately 90% of the time. Hearing and speech challenged individuals may communicate with anybody, anyplace, with this software. This effort also supports speech-to-sign translation. Two of the most essential software components are Video Relay Service and outfit-7 (VRS). It is feasible to create a system that incorporates all of these elements. Nothing has been incorporated in our study as a crucial method of communication among speech disabled individuals except American Sign Language (ASL) (American Sign Language). All letters are signed with just the right hand, with the palm towards the spectator. In terms of manual nature and organization, SE (Sign English) is a good equal to English. People who are deaf or hard of hearing will learn English more rapidly if they are exposed to SE and other parallel signing systems. Sign words and sign markers are the two kinds of gestures used by a sign language interpreter (SE). Each Sign word corresponds to a distinct item in a dictionary of Standard English. As part of our study, we're putting the Sign Word concept into practice, which is useful for translating Sign Language into words, as well as creating Natural Language Processing (NLP) algorithms that can handle longer sentences. With the exception of one, they are signed in the same order as the words in an English sentence. In SE, ASL is the main source of signs. To prevent misunderstanding, these signals are now used in the same sequence and with the same meaning as English terms. Hearing-impaired individuals may also use this software for mobile sign translation (VSR) and UTF-7, which enables them to communicate without calling numbers in everyday activities.

5. CONCLUSION

The main aim of this paper is to illustrate the significance of sign language interpretation and to show how sign language may be translated into words to assist people with hearing and speech impairments in their everyday activities. In this research, just a few words were utilized, and only brief sentences were used to assess the findings. We want to expand our work in the future by creating a large database with the most conceivable words and developing NLP algorithms that can handle longer phrases. As with other languages, converting ISL to English is not a straightforward word-for-word translation. When it comes to recognizing pronouns, prepositions, and other grammatical elements, language learners face a number of difficulties. Prior work on NLP and gesture recognition would be very useful in creating the app. The desire for new software and novel ways to create valuable things will never go away. As a result, an algorithm must be developed in order to build the application. In the future, face emotion detection may be incorporated to the sign recognition software, which would help us punctuate words correctly. This allows us to get a deeper understanding of how someone is experiencing. If we follow specific linguistic principles, we may really contribute to the development of a sign language interpretation system with the help of sign language trainers and hearing and speech challenged people. Assistive devices for hearing impaired people are required to overcome the communication gap between hearing impaired and normal people.

UZBEKISTAN

ABSTRACT

The article examines the features of the formation of new derivatives of words from the foundations of borrowed lexical units in the German language of the latest period, establishes the most productive word-formation models for various parts of speech, reveals the specificity of producing bases of foreign language origin, reveals the indirect influence of borrowings on the word educational system of the German language.

KEYWORDS: *Word Formation, Borrowing, Neologism, Derivative Word, Borrowed Stem.*

INTRODUCTION

Modern German is strongly influenced by the English language, as evidenced by the continuously growing number of lexical borrowings. The main reason for the intensification of borrowing processes is most likely, globalization - the process of world economic, political and cultural integration and unification. Factors such as: the leading role of the United States in politics, economics, science and the entertainment industry; dominance of the English language in various social spheres; the ubiquitous spread of computer technologies and the associated tremendous acceleration of the dissemination of information; improving the knowledge of the English language among the German-speaking population; passive-wait-and-see position of the German linguocultural community in relation to English-speaking borrowings, inactivity of language policy, etc.

The active use of borrowed words in various spheres of communication contributes to the development of their derivational potential, the emergence on their basis of new lexical units of various structural and semantic types. The interaction of word formation and borrowing

processes in the modern German language is manifested, first of all, in an increase in the productivity of the primordially German word-formation models. Derived verbs and verbal units, derivative nouns and adjectives are formed from the stems of borrowed words according to traditional derivational models, which are also actively used for word production from the stems of proper German words. The bases of borrowed verbs and nouns, less often the bases of adjectives and adverbs, are most often producing ones.

The subject of research in this article is the new derivative lexemes of the German language, formed from the bases of borrowed lexical units. The linguistic material is taken mostly from the dictionary of neologisms of the German language [12; 13], and was also revealed through our own observations of neological material and corpus analysis [5].

Formation of verbs and verb units

The array of verbs and verbal units is very indicative in terms of the interaction of word formation and borrowing processes. By borrowing new non-derivative verbs such as *bladen*, *carven*, *chatten*, *dissen*, *hopen*, *mailen*, *mobben*, *outen*, *piercen*, *raften*, *scrollen*, *taggen*, *walken*, *zappen*, etc. [12; 13], a large number of non-derivative verb stems enter the German language, which can later be used to form derivative verbs and verb units with prepositional and pronoun-adverbial particles. In this case, from the side of the source language (i.e., English), we can talk about both simple and phrasal verbs. As the analysis of neological material shows, it is verbs with non-derivative borrowed stems that show high activity in German verbal word formation. At the same time, we note that non-derivative verbs with English stems can appear not only by direct borrowing, but also by converting from the stems of the corresponding nouns in German.

The bases of non-derivative verbs of English-speaking origin are actively involved in the formation of derivative verbs by prefixing (*dealen* → *verdealen*) and in the formation of verbal units with prepositional and pronominal-adverbial particles (*dissen* → *zurückdissen*). Combinatorial restrictions associated with the status of Anglicism are not observed [15, 77]. In many cases, word formation serves from a semantic point of view to indicate an intensification or to clarify the indicated action. At the same time, word-formation models with the participation of prepositional and pronoun-adverbial particles are used much more often than prefixing. *Wed*:

carven - *heruntercarven*, *hinuntercarven*, *loscarven*, *runtercarven*;

checken – *abchecken*, *auschecken*, *einchecken*;

chillen – *abchillen*, *auschillen*, *durchchillen*, *nachchillen*, *verchillen*;

dissen – *wegdissen*, *zurückdissen*;

Borrowing of English phrasal verbs is often accompanied by a partial substitution of components with native German prepositional and pronoun-adverbial particles: *to space out* → *abspacen*, *to flip out* → *ausflippen*, *to pop up* → *aufpoppen*. Also here, not in every case it is possible to be sure whether the verb in German really arose by borrowing and partial substitution, whether polygenesis takes place, or whether a synonymous verb in German caused the emergence of a new formation by analogy, as, perhaps, it has place in pairs *abspacen* - *abheben*, *besprachen* - *besprühen*.

We believe it is necessary to use the example of the verb *mailen* (the neologism of the 1990s of the last century) to show the principles by which the formation of new derivative prefixed verbs

and verb units with borrowed stems in modern German is carried out. At the same time, two factors are decisive: the meaning of the verbal stem, on the one hand and the array of verbs and verbal units already in use in the German language, on the other. Based on the corpus analysis, a number of derived verbs with the stem under consideration (bemailen, ermailen, vermailen, zemailen), as well as verbal units (abmailen, anmailen, ausmailen, durchmailen, einmailen, hintermailen, mitmailen, nachmailen, übermailen, übermailen vormailen, zumailen, herummailen, wei termailen, zurückmailen).

The verb mailen has the meaning, to send a message via e-mail. The central conceptual features of this modern way of exchanging information are, writing to someone, entering a message into a computer, expecting an instant response based on a high transmission rate, exchanging several messages in a short time, performing actions similar to telephone communication. As the analysis of the linguistic material shows, verbs and verbal units formed from the stem mailen focus attention on one or another feature of the concept under consideration or supplement it with other features.

In doing so, they rely on semantically correlative German verbs that provide comparable concepts, for example, jemandem schreiben or etwas senden, etwas mitteilen, and also mit jemandem kommunizieren, sich unterhalten. Let us illustrate this idea by comparing the following verb pairs:

- jemanden ermailen – jemanden erreichen;
- etwas vermailen – etwas verschicken/ versenden;
- etwas zemailen – etwas zerreden;
- etwas zumailen – etwas zuschicken.

The data of language analysis confirm the observation of L. Eichinger [7, 26] on the dominant role of derivative prefix verbs and verb units in the process of linguistic coding of conceptual schemes. Obviously, the "xenogeneity" of the verbal stem does not in any way establish restrictions on the functioning of verbal neoplasms.

On the other hand, the stem of the verb emailen, which also functions in German, is practically not used in the formation of verbs and verb units. Here, apparently, phonetic (prosodic) reasons play a role.

Borrowed verbs with complex stems in the source language, such as downloaden, updaten, outsourcen, as a rule, do not participate in the formation of new verbs and verb units in German. We have registered only isolated cases of using the stems of these verbs in word formation: mitdownloaden, mitupdaten, nachdownloaden.

Suffixal derivation from verb stems is known to be much less pronounced in German. In neoplasms, suffixes -ier (en) are predominantly used with the options -isier (en), -ifizier (en). English verbs get these suffixes in German if their stems are of Greek-Latin origin, and in English they end in -ate, -ify, -ize / ise, for example: to computerize - computerisieren, to globalize - globalisieren (moreover, in these cases, one cannot be completely sure of the course of borrowing through English). In some cases, these suffixes are also given to simple English verbs with foundations of Romance origin (limitieren, trainieren).

Along with the prefixation, suffixation and formation of verbal units with prepositional and pronominal-adverbial particles in the German language, a derivational method such as regressive derivation or reverse word formation is spreading under the influence of the English language. Compound nouns in -ing, borrowed from the English language, in many cases determine the formation of the verb by means of regressive derivation. For example: Powerwalking → po werwalken, Nordicwalking → nordicwalken, Mountainbiking → mountainbiken, Windsurfing → windsurfen), cf. indigenous formations Kopfrechnen → kopfrechnen, Lehnbildung → lehn bilden, Schleichwerbung → schleichwerben.

Hybrid nouns with autochthonous and borrowed components can also undergo regressive derivation; cf. Blutdoping → blutdopen, Inselhopping → inselhoppfen. This way of word formation is also productive in English. H. Schmid [14, 217] gives examples such as sun bathing → to sunbathe, sightseeing → to sightsee. Therefore, it should be noted that verbal neoplasms that arose through regressive derivation could have been formed already in English and only then borrowed into German.

In general, in the German language at the present stage of its development, as observations on the linguistic material show, nouns in -ing predominate significantly in comparison with verbs with the same stems. So, S. Loskant [11] gives about 70 nouns and only 7 verbs: Bombing - bomben, Briefing - briefen, Carving - carven, Debugging - debuggen, Outsourcing - outsourcen, Sampling - samplen, Scratching - scratchen. This discrepancy in numbers suggests that the formation of new verbs is carried out directly in the German language itself.

Another way of the emergence of new verbs with borrowed stems is derivational conversion. Converted verbs are formed in German from substantive and adjective stems, both simple (fischen, kürzen) and complex (schauspielern), and more recently from compound stem (TÜV → tüven). Also, Anglicism's can be converted without limitation. Nouns with simple, complex and even compound abbreviated stems act as starting bases for the formation of new verbs (Flashmob → flash mobben, Kickboard → kickboarden, Podcast → podcasten, Snowboard → snowboarden, SMS → simsen, MMS → mimsen, WAP → wappen).

Prefixal derivation and the formation of verbal units from substantive stems is expressed to a much lesser extent, cf. verslumen, versnoben, aufgaben, aufpeppen.

The large number of simple verb stems of English-language origin that have come to German over the past few years, apparently, explains another phenomenon of German word formation that has become widespread in recent times, namely, the reduction of complex stems of English-speaking origin to simple verb stems by truncating one of the original components, for example: downloaden → downen, inlineskaten → inlinen, kitesurfen → kiten, uploaden → uppen. In most cases, such truncated verbs serve as informal communication in the private sphere, and their formation is explained, apparently, by the principles of linguistic economy. Some of them, however, become stable vocabulary units, for example, inlinen, kiten [12; 13]. The formation of new verbs by truncating an element of the original complex or derived stem can be explained by the desire to assimilate verbs with simple stems that are massively entering the German language of the modern period. J. Erben calls the possibility of joining the class of verbs with simple stems "a stimulating factor for the appearance of abbreviated forms" [8, 93]. The productivity of this derivational type is confirmed by the abbreviated forms from the stems of proper German verbs found in the texts of German chats: fotografieren → foten, funktionieren → funzen, installieren

→ insten, programmie ren → proggen, registrieren → reggen, cf. Russian colloquial xery ← a photocopy.

Formation of derivative nouns and adjectives

In the field of the formation of derivatives of nouns from the bases of borrowed lexical units, several groups can be distinguished. The most numerous of them are verbal nouns, primarily *nomina agentis* and *nomina instrumenti*, formed from the stems of borrowed verbs using the suffix *-er*. For example: *bladen* → *Blader*, *bloggen* → *Blogger*, *carven* → *Carver*, *casten* → *Caster*, *chat ten* → *Chatter*, *downloaden* → *Downloader*, *emailen* → *Emailer*, *inlineskaten* → *Inlineskater*, *mobben* → *Mobber*, *nordicwalken* → *Nordicwalker*, *outsourcen* → *Outsourcer*, *piercen* → *Piercer*, *raften* → *Rafter*, *raven* → *Raver*, *roamen* → *Roamer*, *rollenbladen* → *Roller blader*, *scratchen* → *Scratcher*, *skypen* → *Skyper*, *slacken* → *Slacker*, *spammen* → *Spam mer*, *taggen* → *Tagger*, *voipen* → *Voiper*, *wakeboarden* → *Wakeboarder*, *walken* → *Wal ker*, *zappen* → *Zapper*, etc.

In many cases, however, it is very difficult to determine which linguistic process underlies a new derivative word - the process of word formation or the process of borrowing. The assignment of such *nomina agentis* and *nomina instrumenti* to the category of word formation or borrowing is complicated by the fact that the source language (English) also contains a word - the name of the agent or the name of the instrument of action, which formally and meaningfully coincides with the German word-formation product.

In this matter, the appropriate dictionaries are not always reliable helpers. On the one hand, it is impossible to include all neoplasms in the vocabularies of dictionaries; on the other hand, different dictionaries evaluate such controversial innovations unequally, as can be seen on the example of the lexemes *Test*, *testen* and *Tester*. According to the dictionary of Anglicism's [2, 1515] all three words are borrowings from the English language. In the dictionary of foreign words [6, p. 196] *testen* is regarded as a derivative verb formed in German from a previously borrowed noun *Test*, and the noun *Tester* is a German derivative that arose under the influence of the equivalent English noun *tester*. The reason for the different interpretation is, as in the case of word composition, that both languages have derivational models of conversion, noun → verb (*Test* → *testen*) and derivation with the meaning *nomina agentis*, verb + suffix *-er'* (*testen* → *Tester*), and analysis of usage examples allows for both interpretations. In the dictionary of the new vocabulary of the German language of the 90s of XX century a double interpretation of the emergence of a new word is allowed. So, the noun *Chatter* is interpreted as a derivative of the previously borrowed verb *chatten*, however, with the mark: "Chatter kann auch als Lehnwort interpretiert werden (Engl. Chatter)" [13, 60].

Synchronously, it is impossible to classify such new words with certainty either as borrowings or as products of word formation, since the recognition of a word by borrowing from the English language has as many reasons as there is to classify it as a word-building product in the space of the German language. According to L.P. Krysin, who investigated such cases in the vocabulary of the Russian language, "many of these alternatives do not have an unambiguous solution" [1, 197]. In such cases, we can talk either about lexical polygenesis (parallel independent emergence of new words in both languages) [3, 40], so that in order to update the vocabulary, lexical material is used that is already available in the German language, or about the possible direct borrowing from the English language, or about the strengthening of the tendency of lexical

development already existing in the German language under the influence of the English language [4, 94].

Nomina agentis are formed in modern German not only from the stems of borrowed verbs, but also from substantive and adjective stems of foreign language origin, most often with the -er suffix, for example: Beachvolleyball → Beach vollerballer, Handyparken → Handyparker, Junkmail → Junkmailer, Streetball → Street baller, all-inclusive → All-inclusivler, online → Onliner, as well as with international suffixes of Latin origin, for example, Streetart → Streetartist.

From the stems of the borrowed nomina agentis, grammatically marked by the masculine gender, the names of the females are formed. The way of word formation, specializing the sex feature, is moving [9, p. 182] by means of the -in suffix. At the same time, the markedness of the names of a masculine person on the basis of sex is manifested only in comparison with the names of a feminine person, in other cases, male names, on the contrary, is unmarked and can be used in the nomination of persons of both genders. For example: Carsharer → Carsharerin, Ca- semanager → Casemanagerin, Fundraiser → Fundraiserin, Handbiker → Handbikerin, Infotainer → Infortainerin, Loser → Loserin, Powerseller → Powersellerin, Shareholder → Shareholderin, Smartshopper → Smartshopperin, Stalker → Stalkerin, Television → Traceurin, Webmaster → Webmasterin, etc.

In the German language of the latest period, the formation of names of processes or actions in the subject plan in -isierung is also actively taking place, mainly from the bases of words of foreign language origin. In the most general terms, the data nomina actionis in -isierung denote the processes of mass distribution in modern society of what is called the nominal part of the producing basis, or the processes of endowing with a certain property named in the nominal part of the producing basis. Observations on the linguistic material show that the newly formed abstract nouns in the modern German language, as a rule, name socially significant processes. We are talking about changes that cause a mostly skeptical attitude in society. This series of abstract nouns in -isierung has an open character. In most cases, we are talking about occasional lexical innovations that realize a certain stylistic goal and are marked by the dominance of a certain pragmatic function. In the lexical meaning of such neoplasms, in most cases there is a pragmatic aspect, which conveys the predominantly skeptical attitude of the speakers to the designated process. Thus, the new formation of McDonaldisierung denotes the current trend towards rationalization and low-level unification of processes in many public spheres, by analogy with the worldwide fast food chain McDonald's. By using the designation McDonaldisierung, the speaker expresses his critical attitude towards the progressive drive for rationalization and efficiency in many areas of life in connection with the process of globalization, which is seen as universal alignment and the elimination of diversity and individuality. Compare, for example: "Die Globalization regt zu einer stärkeren Besinnung auf die eigene Identi tät an. Die McDonaldisierung führt zu einer Gleichmacherei, in der alle Konturen und Spezifika verlorengehen" (Nürnberger Nachrichten, 17.09.2008).

The word-formation model, according to which these lexical units are formed, has a great derivational potential. The analysis of the linguistic material reveals a very indicative trend in the period under study: the formation of lexical innovations of the type under consideration is characterized by the existence of missing links in the word-formation chain. Verbs can be derived from such nominal stems by explicit derivation with the suffix -isieren. But the real

prevalence of these formations is different. Abstract nouns ending in -isierung are most commonly used, and verbs ending in -isieren with these abstract nouns are often less common (for example, Even tisierung, eventisieren) or absent altogether (for example, McDonaldisierung in the absence of the verb * mcDonaldisieren).

Such neoplasms are identified through a productive name. The producing base of the name plays the role of a symbol, a conditional prototype, with which certain ideas and associations are associated in society. In the process of nomination, the knowledge that has developed under the influence of social conditions and previous experience is restored and its most essential elements are extracted to form the name of a new concept. For example: Boulevardisierung - the orientation of the media towards the entertainment of the general public, mainly through a simplified and superficial depiction of processes, events (die Boulevardisierung des Fernsehens / der Medien); Eventisierung - the transformation of an event in the field of art, science, sports or daily activities into a major entertainment and advertising event (die Eventisierung der Wissenschaften / des Alltags / Fußballs / Museumsbetriebes); Yuppisierung is the process of transforming city blocks or entire cities into elite ones intended for prosperous and wealthy young people (Yuppisierung ganzer Stadtteile / Hamburgs).

For the sake of completeness, examples of derivative nouns formed according to other derivational models that are productive in the modern German language from the stems of verbs, adjectives and nouns should be given. For example: twittern → Getwitter, Twittererei; podcasten → Podcasterei; Cybernaut → Cy bernautik; Sequel → Sequelitis.

In substantive word formation, one can also trace the indirect influence of the English language. A large number of borrowed nouns with non-derivative stems, such as Job, Boom, Shop, Bluff, Talk, from a derivational morphological point of view, correlate with endogenous (proper German) verbal nouns formed by conversion (cf. Schlaf, Ruf, Ritt). This stimulates conversion as a way of word formation in the German language, which is expressed in the emergence of new converted nouns. We believe that nomina actionis, relatively recently arising from the stems of German weak verbs, such as Dreh, Schwenk, Stau, Treff, Kick, are formed by analogy with English borrowings with non-derivative stems.

The increasing productivity of derivation with the -i suffix, which serves mainly for the formation of informal names of persons in the German language (Schlucki, Knacki, Knasti, Studi, Ersti, Grufti, Blondi, Hirni) can also be stimulated by a relatively large number of Englishisms with the -y / ie [10, 69.]. From the English language, for example, Groupie, Hippie, Junkie, Speedy, Teenie / Teeny, Yuppie, Zombie, etc. were borrowed. Both Anglicism's and German neoplasms proper show mostly hypocoristic (informally diminutive), ironic or even pejorative nuances of meaning. In both German and English, the explicit derivation can be preceded by a truncation of the original stem: cabdriver → cabby, Student → Studi. With the help of the suffix - i, new words can be formed not only from the stems of nouns, but also from the stems of adjectives, for example: schaff → Schlaffi, schwul → Schwuli, blöd → Blödi.

Adjectives are also formed from the bases of borrowed lexical units, for example: chillen → chillig, Cybernaut → cybernautisch. Relatively widespread are adjectives with the -bar suffix, formed from the stems of borrowed verbs, for example: downloaden → downloadbar, googeln → googelbar, han deln → handelbar, outsourcen → outsourcebar, scrollen → scrollbar, as well

as adjectives with the *-mäßig* suffix, formed from the stems of English *-nouns*, for example: Flatrate → *flatratemäßig*, Skype → *skypemäßig*, Spam → *spammäßig*, etc.

As the analysis of neological material shows, the English language is now strongly influencing both the vocabulary of the German language in general and the functioning of its word-formation system in particular. The bases of borrowed lexical units are actively involved in the formation of new words according to the traditional word-formation models of the German language. The class of verbs and verb units is being replenished especially intensively. The foundations of simple verbs of English origin are actively involved in the formation of German derivative verbs by prefixing, as well as in the formation of verbal units with prepositions and pronoun-adverbial particles. Borrowing of English phrasal verbs can be accompanied by the replacement of adverbial components with native German prepositional or pronominal adverbial particles. Suffix derivation from verb stems is less popular in modern German. Under the influence of the English language, such a derivational method as regressive derivation from the stems of complex nouns in *-ing* is gaining popularity. New verbs arise from the stems of borrowed lexical units also by converting and reducing complex verb stems of English-language origin to simple verb stems by truncating one of the original components.

In the field of the formation of derivatives of nouns from the stems of borrowed lexical units, the most numerous group is represented by verbal nouns of the type *nomina agentis* and *nomina instrumenti*, formed from the stems of borrowed verbs using the suffix *-er*. In many cases, however, it is very difficult to determine which linguistic process underlies a new derivative word - the process of word formation or the process of borrowing. The names of the doer are formed in modern German not only from the stems of borrowed verbs, but also from the substantive and adjective stems of Anglophone origin. From the stems of the borrowed *nomina agentis*, which are grammatically masculine, the names of females are formed by moving with the suffix *-in*. In the German language of the latest period, the formation of names of processes or actions in the subject plan in *-isierung* is also actively taking place, mainly from the bases of words of foreign language origin. Among the attribute names, adjectives with the *-bar* suffix, formed from the stems of borrowed verbs, are relatively widespread.

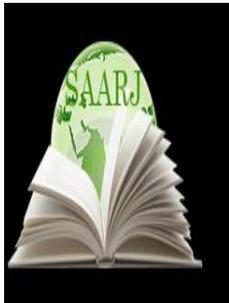

Anglicism's affect the word-formation system of the German language and indirectly: being present in the vocabulary of the German language, they play the role of structural and semantic samples for the development of productive word-formation models. A large number of borrowed nouns with non-derivative stems stimulate the formation of proper German words by conversion from verb stems. The increasing productivity of derivation with the *-i* suffix, which serves mainly for the formation of informal names of persons in the German language, can also be explained by the relatively large number of Englishisms with the *-y / ie* suffixes.

The formation of numerous derivatives of words from the bases of borrowed lexical units is a vivid evidence of their mastery in modern German. The use of lexical units of foreign language origin in order to further develop the vocabulary of the receiving language speaks of its viability, high creative potential.

"COMPARATIVE AND FUNCTIONAL STUDY OF ADVERBIAL CLAUSES OF TIME IN ENGLISH AND UZBEK"

Aziz Turaev*

*Teacher of Samarkand State,
Foreign Languages Institute,
UZBEKISTAN

ABSTRACT

The world up to the present stage of development of linguistics in linguistics, including Uzbek linguistics significant research work on the study of its theoretical foundations was carried out. Interact with different tools in terms of content and grammar two that represent a coherent whole that has the integrity of a cohesive tone and sentences made up of more simple sentences are called compound sentences. The grammatical basis of compound sentences is two or more sentences, a whole that is interconnected according to the content of its constituent parts forms.

KEYWORDS: *Punctuation, Simple Sentences, Morphological, Subject, Conjunction, Complex Sentences, Linguistics.*

INTRODUCTION

In English, compound sentences are divided into two types: connected compound sentences (compound sentences) and compound sentences (complex sentences). Linked sentences are simple, with equal rights and not subject to each other consists of sentences. Simple sentences that are part of a connected compound sentence **and, but, or**.

He speaks English but his sister speaks German.

Even if two or more sentences are connected without a conjunction, they are Uzbekas in the language, can form a connected compound sentence. In this case it will be possible to put an oath in the middle of simple sentences. Without a binder a semicolon between simple sentences in a compound sentence put:

The signal was given; the steamer moved slowly.

Subordinate clauses are two or more that do not have equal rights consists of excess sentences. In this case, one sentence is subordinate to the other. Other the sentence that explains the sentence is called the Subordinate Clause. The sentence being interpreted is called the Principal Clause. Follow compound sentence components are words in the function of connectors or connectors links to:

He thought that the train arrived at 6.15.

Follow-up questions are questions that are essentially simple pieces of speech is placed. Only the following sentence is a common form of a part of speech. So the more pieces of speech there are, the more types of sentences to follow.

Punctuation in adverbs in English and Uzbek noting that the use of symbols is also unique, the most commonly used punctuation is the different use of commas Here are some examples of cases:

The heavy rain rose and kept no one out of the house.**The man touched it and rebuilt the abandoned land.**

However, simple sentences in a compound sentence connected in English if it is connected without any connectors, a semicolon is used.

The moon is full; the stars are out.**Call me tomorrow; I will give you my answer then.**

At the same time, it should be noted that in compound sentences it is specific to the text the presence of characters is natural. This is a reciprocal of several statements observation in the presentation of a completed opinion as a result of the approach possible. However, with this we have to apply the concept of joint speech we do not want to object. The point is, it's both a simple sentence and a compound sentence when it comes to text status (e.g., paragraph status), from the term 'speech' and using the rules applied in its syntactic analysis will not happen. When we interpret them without the concept of text, of course, using traditional terms and the concept of parts of speech we can. But AM Peshkovsky commented on the term "joint speech." it is different in that several sentences are called a single sentence mentioned in the Hamoz period that it causes misunderstandings was. In our view, Peshkovsky's comment is at the level of a joint statement is inextricably linked with the presence of a text hall.

It is from this that the linguistics of the text of compound sentences complex syntactic devices in a microtext template in terms of the study of the style seems expedient. But that's also to say it is only when we take the compound sentences independently we can talk about the status of the microtext, and they are in the composition of the macrotext is active as a component of this text.

In terms of content and grammar of three or more simple sentences a compound sentence made up of compounds is called a compound sentence. This is a joint the difference between a sentence and a simple compound sentence is that if it is a simple compound sentence consists of two simple sentences, three and more simple sentences are intertwined.

In English, too, follow the preposition in compound sentences a comma is used to separate the sentence. But one smaller than the Uzbek language The difference is that in English, the

dominant sentence comes before the subordinate clause there is no comma between them; only if the subject comes before the governor's sentence comma is used.

Because Henry and Pascal arrived at the bus stop before 10 o'clock, Jeff did not see them at the station. While he waited at the train station, Jeff realized that the train was late.

Like any language unit, a sentence, especially a compound sentence, is two is a one-sided unit, i.e. it has an expression side and a content side. Long mainly the expression and partial content of the compound sentence over time aspects were studied.

A number of scientific papers devoted to the study of compound sentences to study their linguistic-theoretical issues despite their existence is still relevant. However, the conjunctions are complex although constructive microtexts are very common in communicative contexts actively applied. As it demonstrates the incomparable potential of language any research speech act while performing the task of making speech must be carried out taking into account the circumstances.

In grammar, an adverbial is a word or a group of words adverbial that modifies or more closely defines the sentence or the verb. (The word adverbial itself is also used as an adjective, meaning "having the same function as an adverb".) Look at the examples below:

Danny speaks fluently. (telling more about the verb)

Lorna ate breakfast yesterday morning. (telling when the verb's action occurred)

An adverbial clause is a dependent clause that functions as an adverb. That is, the entire clause modifies a verb, an adjective, or another adverb[citation needed]. As with all clauses, it contains a subject and predicate, though the subject as well as the (predicate) verb may sometimes be omitted and implied.

An adverbial clause begins with a subordinating conjunction—sometimes called a trigger word. (In the examples below the adverbial clause is italicized and the subordinating conjunction is bolded.)

- **Mary**, the aspiring actress, became upset as soon as she saw the casting list.

(subject: she; predicate: saw the casting list; the clause modifies the verb became)

- Peter Paul, the drama teacher, met with Mary after she came to the next class."

(explicit subject: she; predicate: came to the next class.; predicate (verb): came; the clause modifies the verb met)

- He talked carefully in order to appear fair.

- He talked carefully in order .. [that 'he'] appear fair.

(Implied subject, he, is omitted; predicate (verb): appear; the clause modifies the adverb carefully)

- The little boy preferred fierce dinosaurs, as [was] T rex.

(Subject of the clause: T rex; predicate of the clause: [was], implied; the clause modifies the adjective fierce.)

According to Sidney Greenbaum and Randolph Quirk, adverbial clauses function mainly as adjuncts or disjuncts, which parts also perform in a sentence as adverbial phrases or as adverbial prepositional phrases (Greenbaum and Quirk, 1990). Unlike clauses, phrases do not contain a subject and predicate; they are contrasted here:

- We left the convention the day before.

(Adverbial phrase; contains no subject or predicate)

- We left before the speeches.

(Adverbial prepositional phrase; contains no subject or predicate—and no verb (action) is implied)

- We left after the speeches ended.

(Adverbial clause; contains subject and predicate)

- We left after the speeches.

or, (".. After the speeches [ended]")

(adverbial clause; contains subject and predicate, but the verb 'ended' is omitted and implied).

CONCLUSION

In short, English and Uzbek are different systematic languages and are more specific than general can be seen that the sides are more. These languages are only genetic but also morphologically (typologically) distant from each other is calculated. Therefore, word formation in both languages creates a word form pronunciation, sentence construction and other grammatical features differ from each other does. The same can be said of compound sentences.

As we can see, a compound sentence in English is a compound sentence the relationship between the components, the punctuation used between them the signs are obvious when compared with the Uzbek language is a series of scientific works devoted to the study of compound sentences their linguistic-theoretical issues, despite the existence of works the study is still relevant.

However, the conjunctions are complex although constructive microtexts are very common in communicative contexts actively applied. As it demonstrates the incomparable potential of language any research speech act while performing the task of making speech must be carried out taking into account the circumstances.

SMART HEALTH CARE SYSTEM USING INTERNET OF THINGS

Mr. Manoj Kumar Ojha*

*SOEIT, Sanskriti University,
 Mathura, Uttar Pradesh, INDIA
 Email id: manoj@sanskriti.edu.in

ABSTRACT

Health is a fundamental need. It is also a human right to have access to high-quality health care. Due to a lack of resources, India is now dealing with a slew of health problems. This review article discusses the concept of utilizing cutting-edge technology, such as the Internet of Things, to solve health problems. It provides an architectural assessment of a smart health care system based on the Internet of Things that aims to serve everyone with high-quality health care. Patients' bodily parameters may be measured in real time using this system design. Sensors gather patient body characteristics and send them to an Arduino Uno, which then sends the data to the cloud via a Wifi module. This information is saved in a MySQL database server, which handles information and makes it accessible. The Android App may be used to see this information. Which may be installed on a smartphone, tablet, or computer. Authentication, privacy, security, and data management are all handled via cloud computing. If the data is abnormal, the patient and caretakers will be notified through email. Different decision-making algorithms may be used to make choices, and individuals can access the database based on them. The patient has access to their medical records. As a result, this system offers everyone with high-quality health care as well as error-free and seamless contact with patients.

KEYWORDS: *Internet of Things, Cloud server, Patient, Monitoring, Smart Health.*

1. INTRODUCTION

In today's society, health monitoring is a significant issue. Patients suffer from severe health problems as a result of a lack of appropriate health monitoring. There are several IoT devices available these days to monitor a patient's health via the internet. Health professionals are also using these smart gadgets to keep tabs on their patients[1]. IoT is quickly changing the health care sector, thanks to a slew of new healthcare technology start-ups. In this project, we'll create

an IoT-based health monitoring system that monitors the patient's heart rate and body temperature and sends an email/SMS warning when those readings exceed crucial thresholds. Thing view records pulse rate and body temperature data so that patient health may be tracked from anywhere in the world through the internet[2]. A buzzer is connected to the kit near the patient so that the patient's family are aware of the patient's severe state. The suggested system is primarily designed for situations in which physicians and patients are separated by a significant distance, and it is critical to provide the doctor with complete information on the patient's heart rate and temperature.

In terms of obtaining medical data, IoT technology offers both possibilities and difficulties. Because the data utilized is massive (Big Data), computer resources are a problem. As a result, the data must be dispersed. Furthermore, since the data is diverse in nature and is dispersed, the software method to dealing with it is via the cloud computing platform. These are made to work along with the hybrid data. To cope with the heterogeneous data, a cloud platform has been created. For industrial applications, an IoT for health care data is utilized. Sensors are used to gather information. Data is gathered using a hard wired in evaluating operational performance, and the data is linked with the technician's measurements, allowing the performance to be reviewed and determined on the basis of data[1].

The Internet of Things (IoT) is a system of interconnected computing devices, mechanical and digital machines, livestock, or people with unique identifiers that connects any object to the Internet, performs information and correspondence exchange, and realizes object intellectualized recognition, localization, tracking, monitoring, and management. It provides services based on the integration of Information Technology (IT), which is the use of computers to store, retrieve, transfer, and modify data without the need for human-to-human or human-to-computer interaction. IoT is described as "a dynamic global network architecture with self-configuring capabilities based on standard and interoperable communication protocols where physical and virtual objects have identities, physical characteristics, and virtual personalities" in this context. The IoT idea may be brought to life in the real world by combining a number of promising technologies. IoT may include identification, sensing, and communication technologies. RFID tags that interact with IoT may be identified by a unique identifier and applied to items in terms of identification technology. RFID devices may be used to track things in real time, making RFID a viable option for a sophisticated healthcare system. In terms of sensing and communication technologies, wireless sensor networks combined with IoT may provide peer-to-peer communication, while other computing and communication options in a passive system are asymmetric. It is obvious that the Internet of Things may be used to detect and communicate for a better healthcare system[3].

As a result, our study uses the Internet of Things (IoT) to gather data using sensing technologies and to communicate in order to create a smart healthcare system. Rather of applying IoT to a specific job with a limited scope, IoT may be approached with a broad scope. The Service Oriented Architecture (SOA) often necessitates the use of middleware to bridge the gap between the technical and application levels. IoT may be linked to the development of a particular application in middleware architecture[3].

Despite the fact that many academics are working on IoT middleware, there is no general middleware that can be used across all conceivable smart devices, such as smart homes, smart vehicles, smart hospitals, smart cities, and so on. Nonetheless, by expanding the scope of IoT, we

want to offer a notion of a smart hospital in this research. The power of many kinds of systems. As a result, RFID sensor networks can support sensing, and this study uses machine learning to analyze big data stored in cloud computing, which is a model for providing a simple, ubiquitous, on-demand network approach to a shared pool of configurable computing environments with minimal management effort[3]. IoT sensing devices must gather data, connect networks to store data, and evaluate data as experts to support a truly smart healthcare system. Machine learning is required to transform data into knowledge. The use of machine learning models in the area of healthcare for human illness diagnosis aids medical personnel in identifying diseases based on characteristics that are visible to the patient. In the medical sector, machine learning may be used to convert human expertise knowledge and abilities acquired via clinical experience into application software. By using machine learning, software can make correct diagnostic and treatment choices, reducing the number of needless tasks for medical personnel. As a backdrop, we examine our past research in healthcare systems focuses on contemporary technology that may be used to improve the healthcare system in two ways: research and industry[4]. We provide the blueprints for our smart healthcare system concept. The logical architecture of IoT healthcare. For improved healthcare systems, technology and data processing technology may be key high technologies[5]. The Internet of Things (IoT) aims to connect a range of activities and items in the environment so that they may interact and conduct business “anytime, anywhere, with anything and anybody, preferably utilizing any route, network, or service.” By incorporating IoT into a healthcare system, it is possible to expand healthcare systems. The Internet of Things (IoT) is a system that combines ubiquitous communication, connection, and computation with ambient intelligence[6]. It is a cyber-physical paradigm in which all real-world components may remain linked. The Internet of Things (IoT) allows people to organize their daily activities by integrating real-world components such as electronic gadgets, smart phones, and tablets that can interact both physically and wirelessly. The Internet of Things aids in the management of practically any number of devices. It seeks to bring the advantages of the internet, such as remote access, data sharing, and connection, to a variety of different application areas, including healthcare, transportation, parking, agriculture, and surveillance.

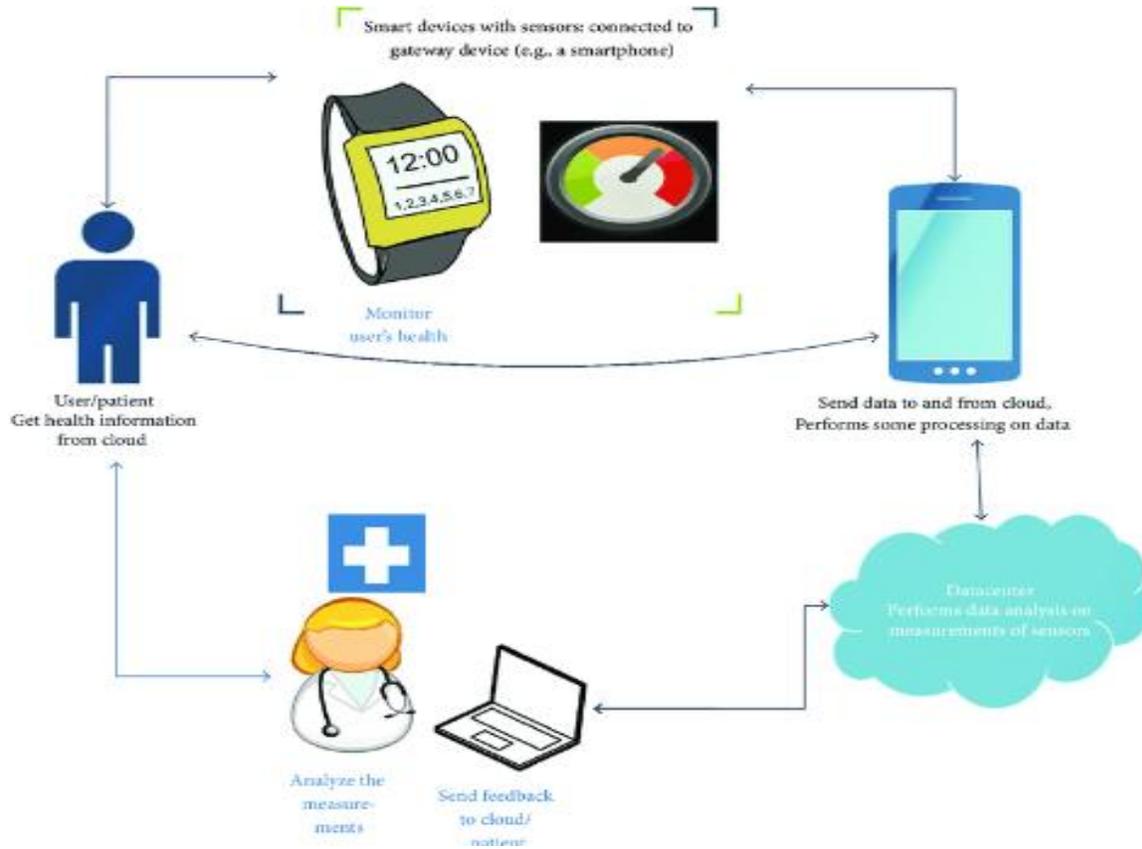

Figure 1: Diagrammatic Representation Of Smart Health Care System [RESEARCHGATE]

Using sensors, smart health monitoring devices assess the health status, such as pulse rate, body temperature, respiration rate, blood glucose rate, body posture, ECG and other factors. Various microcontroller-based systems, such as Arduino, Raspberry Pi, and others, are used to connect and operate the sensors. Sensors are used by the microcontroller to gather data. Typically, biological data is gathered and kept on servers. The gadget can determine if the patient's state is normal or abnormal based on the recorded data. This gadget gives physicians and medical assistants with real-time health care observation that they may access at any moment [7]. The device's primary benefit is its low power consumption, improved performance, great sensitivity, and ease of setup. By 2020, there are expected to be between 26 and 50 billion network-connected devices, with 100 billion by 2030. The Raspberry Pi is the most popular IoT platform. It's a low-cost Linux-based gadget. Raspberry Pi and the Internet of Things have ushered in a new age in healthcare systems. A Raspberry Pi may be turned into a mini-clinic using a combination of sensors such as a pulse rate sensor, temperature sensor, accelerometer, and respiration sensor. In many areas of the globe, these systems are in use. The primary controller of the systems is a microcontroller unit (MCU), however it does not allow parallel data processing.

The IoT is an important component of smart healthcare, since it provides significant advantages and characteristics such as identity, location, sensing, and connection. The Internet of Things (IoT) may be used to create a smart healthcare system in a variety of ways, from calibrating

medical equipment to creating a customized monitoring system. The Internet of Things (IoT) plays a major role in healthcare applications, ranging from controlling chronic illnesses on one end of the spectrum to tracking daily physical activity that may aid in achieving fitness objectives on the other[1]. The Internet of Things may be used to track medical equipment deliveries and oversee the manufacturing process. Medical data may be collected from users via IoT-based systems. The Internet of Things serves as a link between the doctor and the patient by allowing remote access, which allows the doctor to keep an eye on the patient and provide remote consultations. The Internet of Things (IoT) combines sensors, actuators, microcontrollers, CPUs, and cloud computing to provide precise findings and make healthcare accessible to everyone. The use of the Internet of Things in healthcare has prompted researchers all around the globe to develop potential frameworks and technologies that may offer everyone with convenient medical help. In addition to improving the user experience, the Internet of Things pushes the industry to automate, allowing for more research to be conducted across many platforms. A sensor/actuator, a local area network (or, in some cases, a body area network), the internet, and the cloud are all essential components of the IoT in smart healthcare. The specifications of each of these four essential components may vary greatly depending on the application and needs of the particular healthcare system. The term "smart health" refers to the use of various biometric sensors to collect human bodily data. And that sensor data may be utilized to offer smart health in a variety of ways.

- Smart health is a result of the internet of things, and the emphasis is on increasing operational efficiency and creating a cost-effective system while preserving quality, providing health records, and protecting data privacy. As a consequence, consumers get high-quality health care[8].
- One may access his or her medical data and get understanding of their physical fitness by using smart. In this area, several mobile apps and notifications are also utilized to provide alerts when data is aberrant[9].
- The pathway for smart health care is shown in the diagram below. The cloud is utilized to send data from the sensor to the patient, health care practitioner, or caretaker, who can then access the data and check on the patient's health condition[10]. Smart health care enables two-way communication between the patient and the caregiver or provider of health care.

Figure 2: Diagrammatic Representation of Pathway of Smart Health Care System [RESEARCHGATE]

1.1 Component of smart health care system:

- Intelligent Network:** IoT-driven sensors gather real-time monitoring data from smart sensors as part of the data collecting function. Sensor technology advances in the handling of data in bio optic sensors. EEG biotelemetry, ECG sensor, cardiac bit rate sensor, blood pressure monitoring, glucose monitoring, virus monitoring, and a healthcare watch are just a few of the features available. The Wireless Sensor Network (WSN) is a critical component of the IoT HEALTHCARE intelligent network. WSN technologies based on IP may be a viable option for common items. Any item, such as sensors, computers, RFID tags, or smart phones, will be able to dynamically join to the network, communicate, and cooperate effectively to accomplish various tasks when given a unique address. To be effectively controlled and maintained, the data gathered from the sensors should be accessible in cloud computing systems. As a result, data from sensors that are remotely dispersed is manipulated by a single point of software. Furthermore, industrial operations need the use of wireless communication systems to send signals obtained by distant sensors monitoring the control loop (due to the hostile environment and difficult access to the locations). This is why the study, design, and development of a remote wireless system for an industrial process have already been completed²⁸. The communication of information technology devices within the range of a personal space, usually within a range of about 10 meters, is known as a personal area network (PAN). PAN is a helpful tool for tracking the movements of elderly individuals. To create an intelligent network for IOT HEALTHCARE, WSN, PAN, and a generic network are sufficient.
- Cloud Computing:** Cloud computing, often known as on-demand computing, is a kind of Internet-based computing environment that allows computers and other computing resources to access shared processing devices and data on-demand. Through virtualization, dynamic data integration, and integrating data from many, the cloud computing paradigm offers flexible, dependable, and powerful storage and computing resources that enable high scale

computation. Cloud computing's main aim is to provide scalable and easy-to-use computer resources and IT services. It is difficult to exchange patient data in a specific hospital since the data format is incompatible with others. Exams must be repeated if a patient has to be transferred to another hospital. It's a waste of time and money. As a result, hospitals must exchange patient information in a secure manner. Furthermore, each hospital is not required to retain all raw data gathered in order to evaluate a patient's condition. As a result, cloud computing is the best solution for a storage system in IOT HEALTHCARE.
