ABSTRACT

Linguistic units that are associatively related to each other play an important role in the semantic-syntactic formation of any text. Associative units have the ability to form the text not only logically and structurally, but also to predict the content of information expressed in it. For example, the associations of cold, frost, sleet, snow, and storm, which are formed in relation to the winter lexeme among language speakers, indicate that the image of winter is reflected in the text composed of these units. Such units, known as verbal associations, serve as the basic units that make up a text, semantically and syntactically as D.Lutfullayev mentioned.¹ This fact shows that we need to learn associative features which is forming base units semantically in I of text.

KEYWORDS: *Associations, Linguistic, Semantically, Syntactically, Language, Structures, Text, Logically*
