ABSTRACT

Otechestvennaya variety of cauliflower was planted at different times in the Andijan region, to study their growth and development. Otechestvennaya variety of cauliflower was studied. It is recommended to apply 3-4 t of ammonium nitrate, 5-6 t of superphosphate and 1-2 t of potassium salt per hectare. Fertilizer, potassium salt and half of superphosphate are given before plowing, nitrate and the rest of superphosphate is given before planting or as a supplement during the growing season of plants. The head of the cauliflower is snow-white, sometimes yellowish-white and green. The bright white cabbage is delicious to eat and is well-received by the population.
