ABSTRACT

This article is a scientific study of the ethno genesis of intestinal diseases, pathology of intestinal obstruction, ethno genesis of intestinal cancer and puts forward theoretical and practical views. The important thing is not to be afraid of surgery. The patient also needs to be reassured that he or she will recover. If there are people in the family who have the disease, their children or grandchildren are also more likely to develop it. Ulcerative colitis is one of these complications in which the intestinal wall is scarred and does not wrinkle. In acute ulcerative colitis, the lining of the rectum swells and becomes red, and then ulcers appear. During treatment, the patient should have frequent colonoscopies to check the condition of the colon. [1] Otherwise, ulcerative colitis can turn into a tumor and aggravate the pain.
