ABSTRACT

The article talks about the interactive learning system. However, some information on didactics is also provided. Interactive education and its didactic potential play an important role in the psychological impact of students on the proper development of education. The acquisition of knowledge promotes responsibility and curiosity. This makes it possible to introduce a learning mechanism in separate groups depending on their interests and ability to communicate freely. The teacher uses interactive learning to develop students' abilities, independence, self-control, effective communication, working with peers, listening to and understanding their opinions, independent and critical thinking. They are able to shape such qualities as thinking, putting forward their proposals, overcoming a difficult situation.
