ABSTRACT

When analyzing mental illness in people of different ages, borderline mental disorders in adolescents are distinguished by clinical signs. The onset of mental disorders in adolescence - leads to the rapid development of pathological symptoms of the disease. The following borderline mental illnesses are common in our clinical practice today: personality traits, neuroses (obsessive-compulsive disorder), and reactive depression. When these diseases become chronic, they reduce the ability to work and the standard of living. Modern approaches to the treatment of borderline mental diseases are based on the balanced use of psychotherapy, psychopharmacological agents.
