ABSTRACT

Renal cancer (renal cell carcinoma) is a malignant neoplasm derived from the proximal tubular epithelium and is highly lethal. Kidney cancer is the 13th most common cancer in the world and 9th among men. Patients with kidney cancer, especially in the terminal stage, have a reduced quality of life and a high mortality rate. In addition, kidney cancer is a devastating disease that leads to serious physical and psychological disorders and serious social problems in patients, families and even society, which are well-known risk factors for suicide Objectives: the present study was to study the characteristics of suicidal factors in patients with kidney cancer.
